

**Tor:**  
**Anonymous Communications for  
the United States Department of  
Defense...and you.**

**Roger Dingledine  
Free Haven Project  
Electronic Frontier Foundation**

**<http://tor.eff.org/>**

**29 July 2005**

# Talk Outline

- ◆ Motivation: Why anonymous communication?
  - Myth 1: This is only for privacy nuts.
  - Myth 2: This stuff enables criminals.
- ◆ Tor design overview
- ◆ Hidden servers and rendezvous points
- ◆ Policy issues raised
- ◆ Open technical issues and hard problems

# Public Networks are Vulnerable to Traffic Analysis

- ◆ In a Public Network (Internet):
- ◆ Packet (message) headers identify recipients
- ◆ Packet routes can be tracked

**Encryption does *not* hide routing information.**

# Who Needs Anonymity?

- ◆ Journalists, Dissidents, Whistleblowers (Indymedia, bloggers, Iran, Tibet)
- ◆ Censorship resistant publishers/readers (libraries)
- ◆ Socially sensitive communicants:
  - Chat rooms and web forums for abuse survivors, people with illnesses
- ◆ Law Enforcement: (In-q-tel, Nye Kripos)
  - Anonymous tips or crime reporting
  - Surveillance and honeypots (sting operations)

# Who Needs Anonymity?

- ◆ Corporations: (Google, Wal-Mart, ...)
  - Who's talking to the company lawyers? Are your employees looking at monster.com?
  - Hiding procurement suppliers or patterns
  - Competitive analysis

# Who Needs Anonymity?

- ◆ You:
  - Where are you sending email (who is emailing you)
  - What web sites are you browsing
  - Where do you work, where are you from
  - What do you buy, what kind of physicians do you visit, what books do you read, ...

# Who Needs Anonymity?

- ◆ Government

# Government Needs Anonymity?

## Yes, for...

- ◆ Open source intelligence gathering
  - Hiding individual analysts is not enough
  - That a query was from a govt. source may be sensitive
- ◆ Defense in depth on open and *classified* networks
  - Networks with only cleared users (but a million of them)
- ◆ Dynamic and semitrusted international coalitions
  - Network can be shared without revealing existence or amount of communication between all parties
- Elections and voting

# Anonymity Loves Company

- ◆ You can't be anonymous by yourself.
  - *Can* have confidentiality by yourself.
- ◆ A network that protects only DoD network users won't hide that connections from that network are from DoD.
- ◆ You must carry traffic for others to protect yourself.
- ◆ But those others don't want to trust their traffic to just one entity either. Network needs *distributed trust*.
- ◆ Security depends on diversity and dispersal of network.

# Who Needs Anonymity?

- ◆ And yes criminals

# Who Needs Anonymity?

- ◆ And yes criminals

But they already have it.

We need to protect everyone else.

# Privacy and Criminals

- ◆ Criminals have privacy
  - Motivation to learn
  - Motivation to buy
  - Identity theft
- ◆ Normal People, Companies, Governments, Police don't
- ◆ The worst of all possible worlds

# Privacy and Hackers

- ◆ Hackers have privacy
  - Break into system
  - Destroy the logs
  - Repeat as needed
  - They don't use or need our software
- ◆ Normal People, Companies, Governments, Police don't
- ◆ The worst of all possible worlds

# Anonymous From Whom?

## Adversary Model

- ◆ Recipient of your message
- ◆ Sender of your message
- => Need Channel and Data Anonymity
  
- ◆ Observer of network from outside
- ◆ Network Infrastructure (Insider)
- => Need Channel Anonymity
  
- ◆ Note: Anonymous authenticated communication makes perfect sense
- ◆ Communicant identification should be inside the basic channel, not a property of the channel

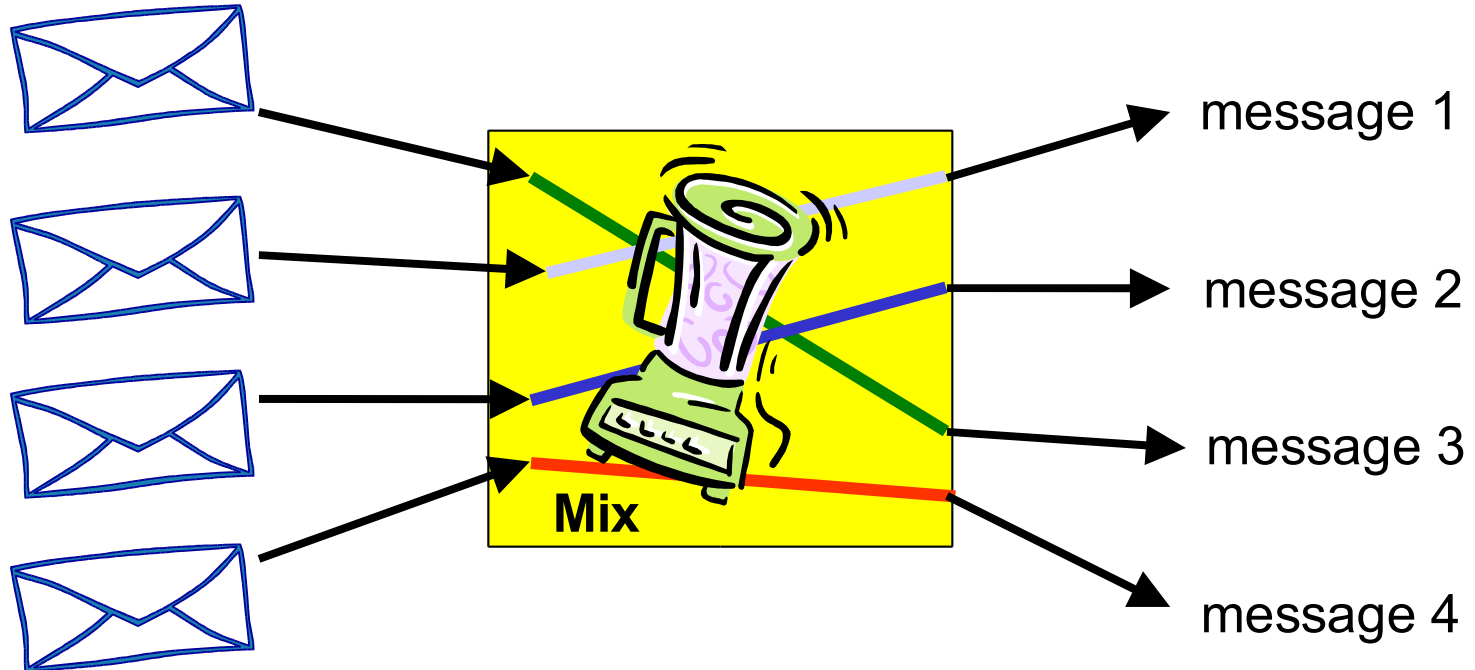

Focus of Tor is anonymity of the  
communication pipe,  
not what goes through it

# How Do You Get Communication Anonymity?

- ◆ Many technical approaches
- ◆ Overview of two extensively used approaches
  - Mixes
  - Proxies

# What does a mix do?

Randomly permutes and decrypts inputs

# What does a mix do?

**Key property:** Adversary can't tell which ciphertext corresponds to a given message

# Basic Mix (Chaum '81)

Server 1

Server 2

Server 3

# Encryption of Message

$$\text{Ciphertext} = E_{PK_1}[E_{PK_2}[E_{PK_3}[\text{message}]]]$$

# Basic Chaum-type Mix

# One honest server preserves privacy

# What if you need quick interaction?

- ◆ Web browsing, Remote login, Chat, etc.
- ◆ Mixnets introduced for email and other high latency apps
- ◆ Each layer of message requires expensive public-key crypto

# Basic Anonymizing Proxy

- Channels appear to come from proxy, **not** true originator
- Appropriate for Web connections, etc.:  
SSL, TLS, SSH (lower cost symmetric encryption)
- Examples: The Anonymizer
- Advantages: Simple, Focuses lots of traffic for more anonymity
- **Main Disadvantage: Single point of failure, compromise, attack**

# Onion Routing

## Traffic Analysis Resistant Infrastructure

- ◆ Main Idea: Combine Advantages of mixes and proxies
- ◆ Use (expensive) public-key crypto to establish circuits
- ◆ Use (cheaper) symmetric-key crypto to move data
  - Like SSL/TLS based proxies
- ◆ Distributed trust like mixes
- ◆ Related Work (some implemented, some just designs):
  - ISDN Mixes
  - Crowds, JAP Webmixes, Freedom Network
  - Tarzan, Morphmix

**Tor**

**Tor**

**The Onion Router**

Tor

Tor's Onion Routing

# Numbers and Performance

- ◆ Running since October 2003
- 250 nodes on five continents (North America, South America, Europe, Asia, Australia)
- Volunteer-based infrastructure
- Fifty thousand+ (?) users
- Nodes process 1-100 GB / day application cells
- Network has never been down

# Tor Circuit Setup

- Client Proxy establishes session key + circuit w/ **Onion Router 1**

# Tor Circuit Setup

- Client Proxy establishes session key + circuit w/ **Onion Router 1**
- Proxy tunnels through that circuit to extend to **Onion Router 2**

# Tor Circuit Setup

- Client Proxy establishes session key + circuit w/ **Onion Router 1**
- Proxy tunnels through that circuit to extend to **Onion Router 2**
- Etc

# Tor Circuit Usage

- Client Proxy establishes session key + circuit w/ **Onion Router 1**
- Proxy tunnels through that circuit to extend to **Onion Router 2**
- Etc
- Client applications connect and communicate over Tor circuit

# Tor Circuit Usage

- Client Proxy establishes session key + circuit w/ **Onion Router 1**
- Proxy tunnels through that circuit to extend to **Onion Router 2**
- Etc
- Client applications connect and communicate over Tor circuit

# Tor Circuit Usage

- Client Proxy establishes session key + circuit w/ **Onion Router 1**
- Proxy tunnels through that circuit to extend to **Onion Router 2**
- Etc
- Client applications connect and communicate over Tor circuit

# Where do I go to connect to the network?

- ◆ Directory Servers
  - Maintain list of which onion routers are up, their locations, current keys, exit policies, etc.
  - Directory server keys ship with the code
  - Control which nodes can join network
    - Important to guard against “Sybil attack” and related problems
  - These directories are cached and served by other servers, to reduce bottlenecks
  - Need to decentralize, get humans out of the loop, without letting attackers sign up 100,000 nodes.

# Some Tor Properties

- ◆ Simple modular design, restricted ambitions.
  - ~40K lines of C code
  - Even servers run in user space, no need to be root
  - Flexible exit policies, each node chooses what applications/destinations can emerge from it
  - Server usability is key to adoption. Without a network, we are nothing.

# Some Tor Properties

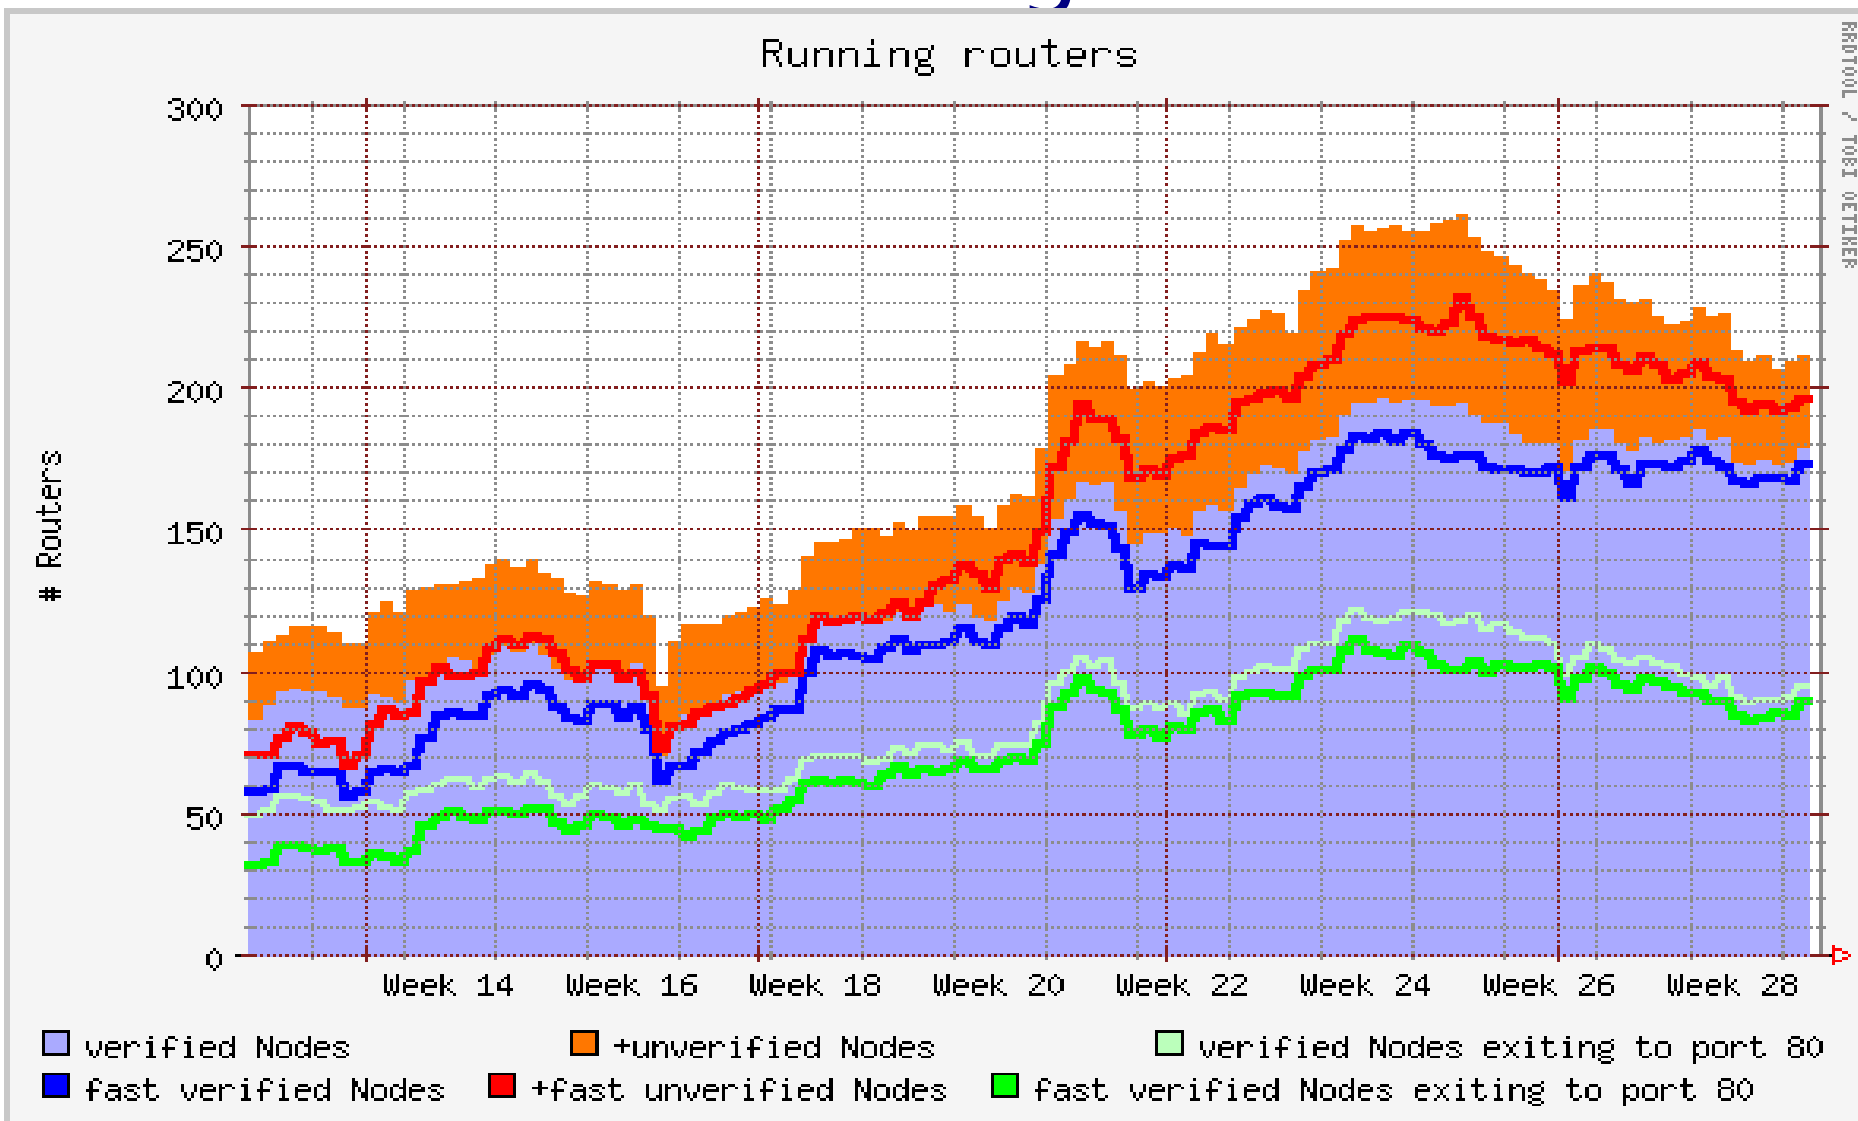

- ◆ Simple modular design, restricted ambitions.
  - Just anonymize the pipe
    - Can use, e.g., privoxy as front end if desired to anonymize data
  - SOCKS compliant TCP: includes Web, remote login, mail, chat, more
    - No need to build proxies for every application

# Some Tor Properties

- ◆ Lots of supported platforms:
  - Linux, BSD, MacOS X, Solaris, Windows, ...

(Tor servers on xbox, linksys wireless routers.)
- ◆ Deployment paradigm:
  - Volunteer server operators
  - No payments, not proprietary
  - Moving to a P2P incentives model

# Number of running Tor servers

# Number of running Tor servers

# Total traffic through Tor network

# Location Hidden Servers

- ◆ Alice can connect to Bob's server without knowing where it is or possibly who he is
- ◆ Can provide servers that
  - Are accessible from anywhere
  - Resist censorship
  - Require minimal redundancy for resilience in denial of service (DoS) attack
  - Can survive to provide selected service even during full blown distributed DoS attack
  - Resistant to physical attack (you can't find them)
- ◆ How is this possible?

# Policy issues

- ◆ Attacks we've seen:
  - Ransom note via Hotmail
  - Spam via Google Groups
  - IRC jerks --> DDoS on Tor server
  - Vin Diesel movies
- ◆ Wikipedia, Slashdot
- ◆ SORBS / spam blacklists

# Design Tradeoffs

- ◆ Low-latency (Tor) vs. high-latency (Mixminion)
- ◆ Packet-level vs stream-level capture
- ◆ Padding vs. no padding (mixing, traffic shaping)
- ◆ UI vs. no UI (Contest!)
- ◆ AS-level paths and proximity issues

# Design Tradeoffs

- ◆ Enclave-level onion routers / proxies / helper nodes
- ◆ Path length? (3 hops, don't reuse nodes)
- ◆ China?
- ◆ P2P network vs. static network

# Get the Code, Run a Node! (or just surf the web anonymously)

- ◆ Current code freely available (free software license)
- ◆ Comes with a specification – the JAP team in Dresden implemented a compatible Tor client in Java
- ◆ Chosen as the anonymity layer for EU PRIME project
- ◆ Design paper, system spec, code, see the list of current nodes, etc.
- ◆ <http://tor.eff.org/>

# Next WTH Tor talks

- ◆ Saturday night panel, 20:00: Q&A, more?
- ◆ Sunday afternoon workshop, 15:00: setting up your own hidden website on Tor.
