Trend Micro Deep Security on the AWS Cloud

Quick Start Reference Deployment

Trend Micro Software Development Team
AWS Quick Start Reference Team

Contents

About This Guide

Trend Micro Deep Security is a host-based security product that provides Anti-Malware, Host Firewall, Intrusion Prevention, File Integrity Monitoring, Log Inspection, Web Application Firewalling, and Content Filtering modules in a single agent running in the guest operating system.

This Quick Start reference deployment guide describes how to deploy Trend Micro Deep Security version 9.6 on the Amazon Web Services (AWS) cloud. It contains links to AWS CloudFormation templates that automate this deployment as well as additional supporting information.

This guide covers how to deploy Trend Micro Deep Security using these templates. It does not cover other aspects of administering Deep Security. For information about administering Deep Security, see the Trend Micro Deep Security Help Center.

Quick Starts are automated reference deployments for key enterprise workloads on the AWS cloud. Each Quick Start launches, configures, and runs the AWS compute, network, storage, and other services required to deploy a specific workload on AWS, using AWS best practices for security and availability.

Overview

Before You Begin

This document assumes that you have used AWS before and are familiar with AWS services. If you are new to AWS, see the Getting Started section of the AWS documentation. You should also be familiar with the following AWS technologies:

- Amazon VPC – The Amazon Virtual Private Cloud (Amazon VPC) service lets you provision a private, isolated section of the AWS cloud where you can launch AWS services and other resources in a virtual network that you define. You have complete control over your virtual networking environment, including selection of your own IP address range, creation of subnets, and configuration of route tables and network gateways.

- Amazon EC2 – The Amazon Elastic Compute Cloud (Amazon EC2) service enables you to launch virtual machine instances with a variety of operating systems. You can choose from existing Amazon Machine Images (AMIs) or import your own virtual machine images.

- [AWS CloudFormation](#) – AWS CloudFormation enables you to create and provision AWS infrastructure components reliably and predictably, using a JSON scripting environment. This Quick Start uses AWS CloudFormation templates to configure and automate the Trend Micro Deep Security deployment.

- [Amazon RDS](#) - Amazon Relational Database Service (Amazon RDS) is a web service that makes it easy to set up, operate, and scale a relational database in the cloud. It provides cost-efficient, resizable capacity for an industry-standard relational database and manages common database administration tasks.

Cost and Licenses

You are responsible for the cost of the AWS services used while running this Quick Start. There is no additional cost for using the Quick Start. The cost of the resources created by the Quick Start varies based on how many instances you want to protect. The cost of deployment starts at $2.48 an hour. (This estimate is based on December 2015 prices. Prices are subject to change. See the pricing pages for each AWS service you will be using in this Quick Start for full details.)

Because this Quick Start uses Trend Micro AMIs from the AWS Marketplace, you must be subscribed to Trend Micro Deep Security for AWS Marketplace before you launch the Quick Start. There are two licensing options: Pay Per Use and Bring Your Own License (BYOL). See [step 2](#) in the deployment section for details and links.

Architecture

This Quick Start will set up Deep Security to protect instances in the Amazon VPC where the Deep Security Manager is deployed. You can subsequently modify your deployment to protect instances across your entire AWS infrastructure. For free assistance, please contact [aws@trendmicro.com.](mailto:aws@trendmicro.com)

The Quick Start builds the following environment in an existing Amazon VPC.
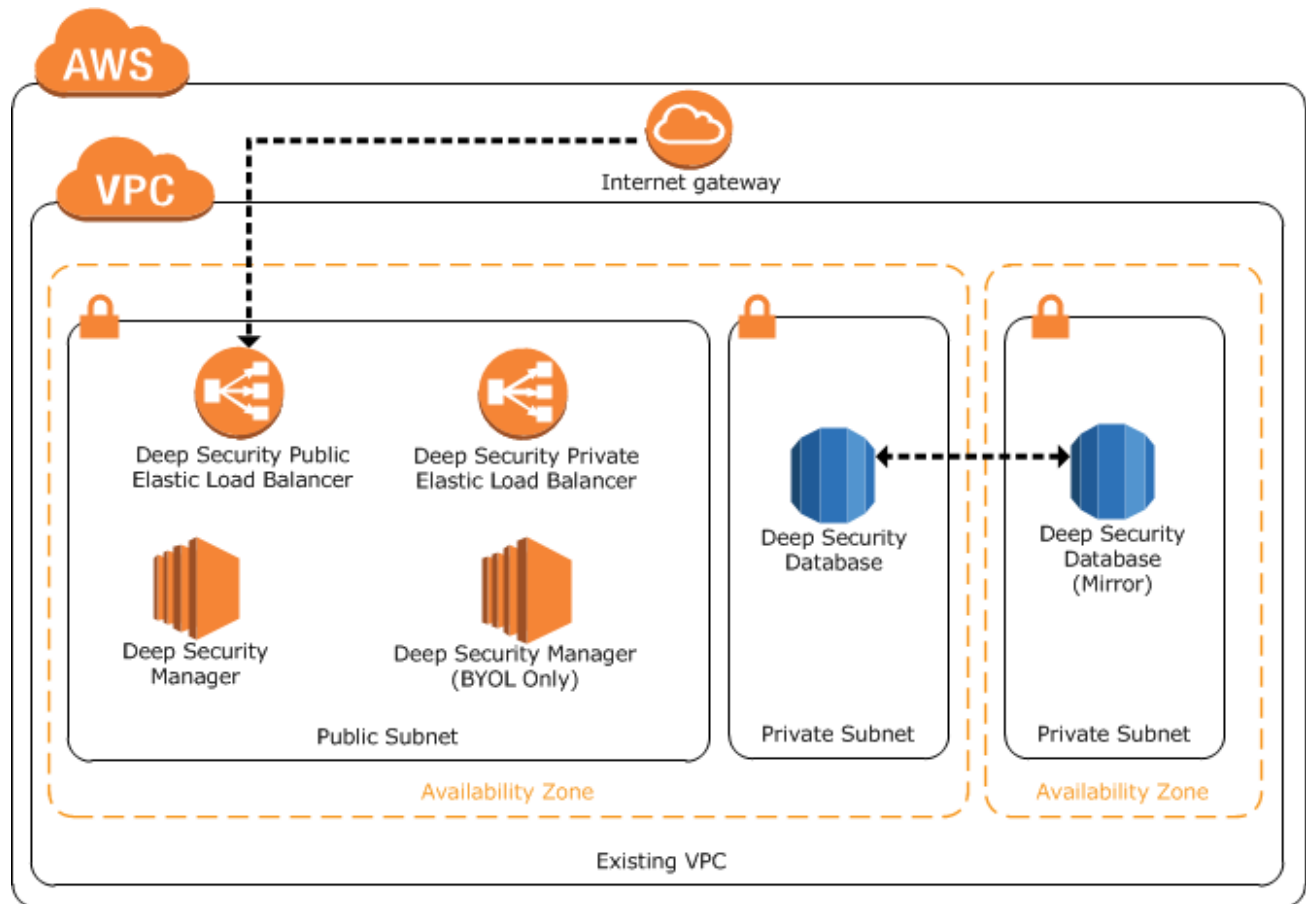

Figure 1: Trend Micro Deep Security Architecture on AWS

Best Practices

The architecture built by this Quick Start supports AWS best practices for high availability and security:

- The Amazon RDS database server used by the Deep Security Manager is deployed across two Availability Zones (where available), providing high availability at the database layer.

- The AWS security groups created by the template are configured to only allow traffic that is required.

Automated Deployment

The AWS CloudFormation templates provided with this Quick Start automate the deployment of Trend Micro Deep Security on the AWS cloud.

Follow the step-by-step instructions in this section to subscribe to Trend Micro Deep Security, customize the Quick Start template, and deploy the software into your account.

Before you launch the Quick Start, you must set up an Amazon VPC in your AWS account and subscribe to Trend Micro Deep Security in the AWS Marketplace.

Step 1. Set up an Amazon VPC

The AWS Quick Start deploys Trend Micro Deep Security into an existing Amazon VPC. Before you launch the Quick Start you must create an Amazon VPC that has two private subnets in different Availability Zones, and one public subnet with an attached Internet gateway, as shown in Figure 2.

> **Important**   Although it is possible to use the Quick Start to deploy Deep Security into a default Amazon VPC with all public subnets, this is **not** recommended because of the large attack surface it creates.

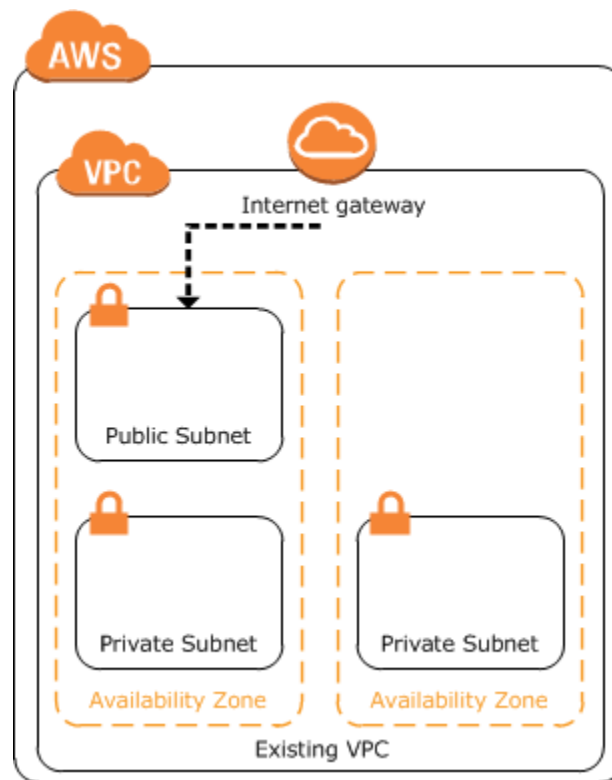

Figure 2: Prerequisite Amazon VPC Architecture

Step 2. Subscribe to Trend Micro Deep Security

The AWS Quick Start uses Amazon Machine Images (AMIs) from the AWS Marketplace. Before you launch the Quick Start, you must subscribe to Trend Micro Deep Security from the AWS Marketplace.

There are two available licensing options. To subscribe, use the following links to open the AWS Marketplace page for the licensing option of your choice:

- Pay Per Use: An hourly billed subscription that shows up on your Amazon bill. You can choose this option to protect up to 200 instances. This option comes with a 30-day trial license.

    —or—

- Bring Your Own License (BYOL): A perpetual licensing option for organizations that have more than 200 instances or that prefer traditional procurement. Please contact Trend Micro for a license key at aws@trendmicro.com.

> **Note**   The Quick Start is designed to support deployment of up to 1,000 protected instances. If you are protecting more than 1,000 instances, please contact aws@trendmicro.com for free assistance with additional deployment options.

Step 3. Deploy the Quick Start

In this step, you will launch an AWS CloudFormation template that deploys Trend Micro Deep Security into your existing Amazon VPC.

1. Sign in to your AWS account.

2. Use one of the following buttons to launch the AWS CloudFormation template. Choose the Pay Per Use template or the Bring Your Own License (BYOL) template, depending on the subscription you selected in step 2.

<div align="center">

**Launch
(Pay Per Use)**   **Launch
(Bring Your Own License)**

</div>

The template is launched in the US East (N. Virginia) region by default. You can change the region by using the region selector in the navigation bar.

This stack takes approximately 45 minutes to create.

> **Note**   You are responsible for the cost of the AWS services used while running this Quick Start reference deployment, and licensing fees for Trend Micro Deep Security. There is no additional cost for using this Quick Start. See the pricing pages for each AWS service you will be using in this Quick Start for full details.

You can also download the template to use it as a starting point for your own implementation:

– [AWS CloudFormation template for Pay Per Use option](#)

– [AWS CloudFormation template for BYOL option](#)

3. On the **Select Template** page, keep the default URL for the AWS CloudFormation template, and then choose **Next**.

4. On the **Specify Details** page, provide the details about your Amazon VPC and how you want Deep Security to be deployed in it.

   Both templates provide the following parameters:

Parameter	Default	Description
AWSKeyPairName	*Requires input*	The key pair that will be used to launch the EC2 instances that contain the Deep Security Manager. This key pair can be used to create an SSH connection to your Deep Security Manager.
AWSVPC	*Requires input*	The Amazon VPC where the Quick Start resources will be deployed. It needs to contain two private subnets and one public subnet with a connected Internet gateway.
DatabaseSubnet1	*Requires input*	The subnet where the Amazon RDS database will be deployed. This subnet must be in the Amazon VPC specified by the **AWSVPC** parameter. It is highly recommended that this be a private subnet.
DatabaseSubnet2	*Requires input*	The subnet where the Amazon RDS database mirror will be deployed. This subnet must be in the Amazon VPC specified by the **AWSVPC** parameter. It must also be in a separate Availability Zone from **DatabaseSubnet1**. It is highly recommended that this be a private subnet.
DeepSecuritySubnet	*Requires input*	The subnet to deploy the Deep Security Manager and load balancers in. This subnet must in the Amazon VPC specified by the **AWSVPC** parameter and must be a public subnet with an attached Internet gateway.
DeepSecurityAdminName	MasterAdmin	The user name used for the Deep Security administrator.
DeepSecurityAdminPass	*Requires input*	The password used for the Deep Security administrator.

The BYOL template requires the following additional information:

Parameter	Default	Description
DatabaseEngine	Oracle	The database you want to use for Deep Security. You can choose Oracle or Microsoft SQL Server.
DatabaseInstanceId	*Requires input*	The Amazon RDS instance identifier. This must be unique in your AWS account and can only contain letters. The database instance identifier is case-insensitive but is stored as lowercase.
DatabaseAdminName	dsadmin	The user name used for the Amazon RDS administrator account.
DatabaseAdminPassword	*Requires input*	The password used for the Amazon RDS administrator account.
LicenseKey	*Optional*	Enter a license key, if you have one. If you would like to deploy Deep Security as a trial, you can leave this field blank.

The PPU template requires the following additional information:

Parameter	Default	Description
ProtectedInstances	*Requires input*	The number of instances you want to protect with Deep Security.

When you finish reviewing and customizing the parameters, choose **Next**.

5. On the **Options** page, you can specify tags (key-value pairs) for resources in your stack and set advanced options. When you're done, choose **Next**.

6. On the **Review** page, review and confirm the template settings. Under **Capabilities**, select the check box to acknowledge that the template will create IAM resources. Deep Security requires this access to be able to see your AWS instances and protect them.
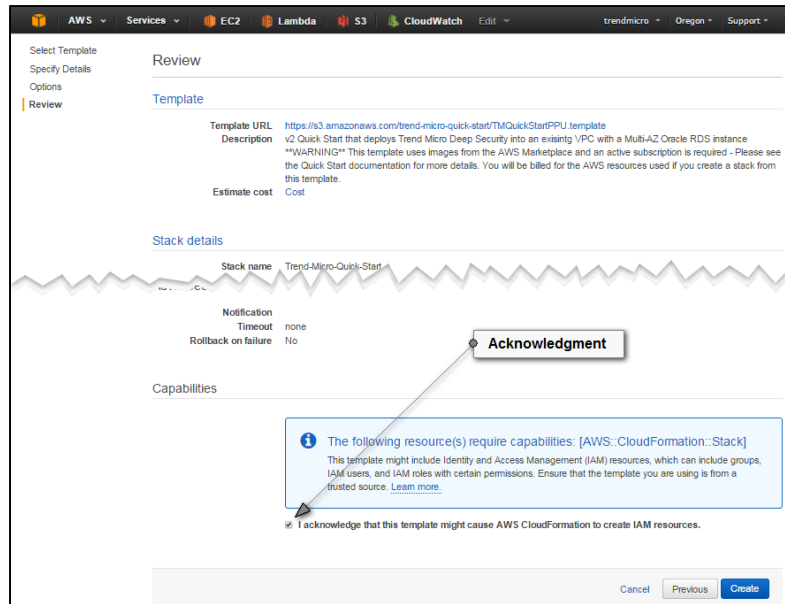

Figure 3: Acknowledging the Creation of IAM Resources

7. Choose **Create** to deploy the stack.

8. Monitor the status of the stack. When the status is **CREATE_COMPLETE**, the Trend Micro Deep Security deployment is ready.

Step 4. Log in to the Deep Security Manager Console

The **Outputs** tab of the AWS CloudFormation stack provides a URL to the Deep Security Manager web interface. Choose this link and log in using the user name and password you supplied during the launch of the template.
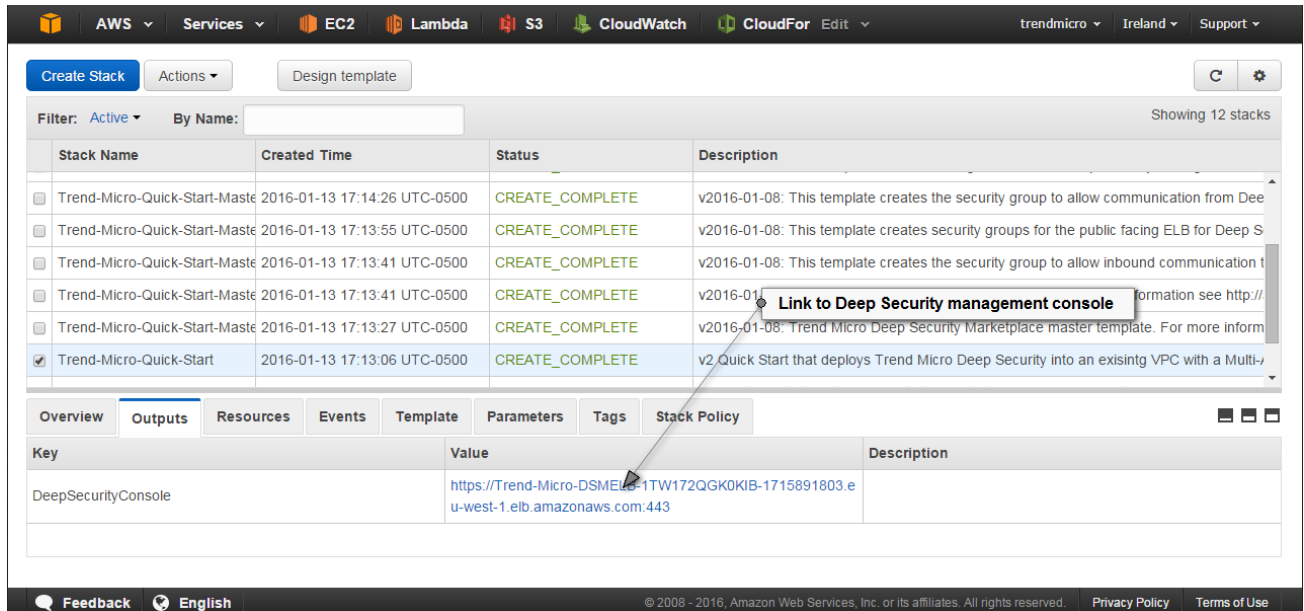

Figure 4: Choosing the Link to Deep Security Manager Console

Your browser may display a warning when you try to enter the console. This is because the Elastic Load Balancing (ELB) load balancer used by the Deep Security Manager is initially configured to use a self-signed certificate for HTTPS connections. For more information and instructions for updating the load balancer certificate, see the appendix.

Step 5. Deploy Trend Micro Deep Security Agent to New Instances

Now that you have Trend Micro Deep Security in your AWS cloud, you can start protecting your instances. For information on how to deploy agents, visit the Trend Micro Deep Security Help Center.

Appendix: Updating the Load Balancer Certificate

The Elastic Load Balancing (ELB) load balancer used by the Deep Security Manager is initially configured to use a self-signed certificate for HTTPS connections. Your browser may give you an error when you try to access the console. This is expected until you update the load balancer certificate. You can proceed through to the management console.
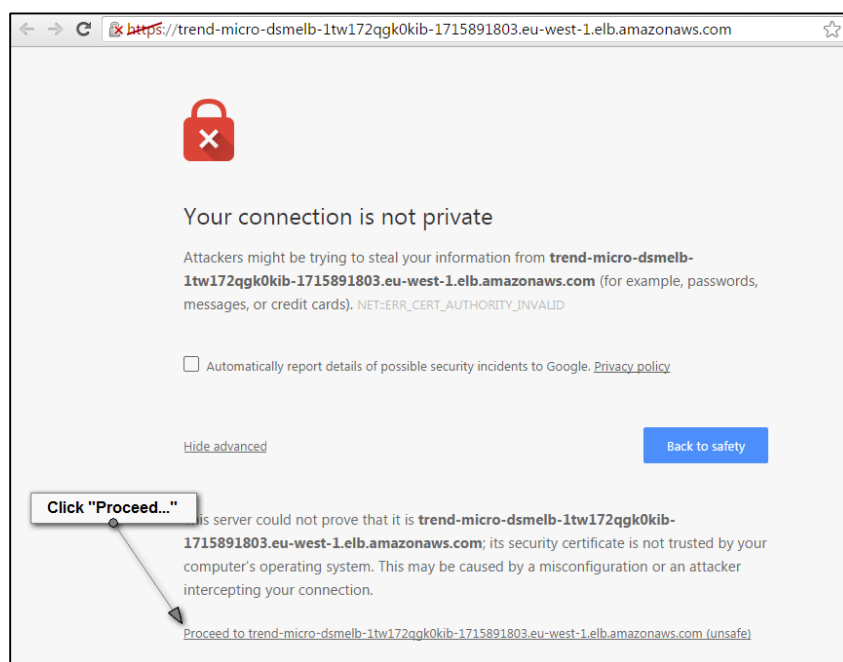

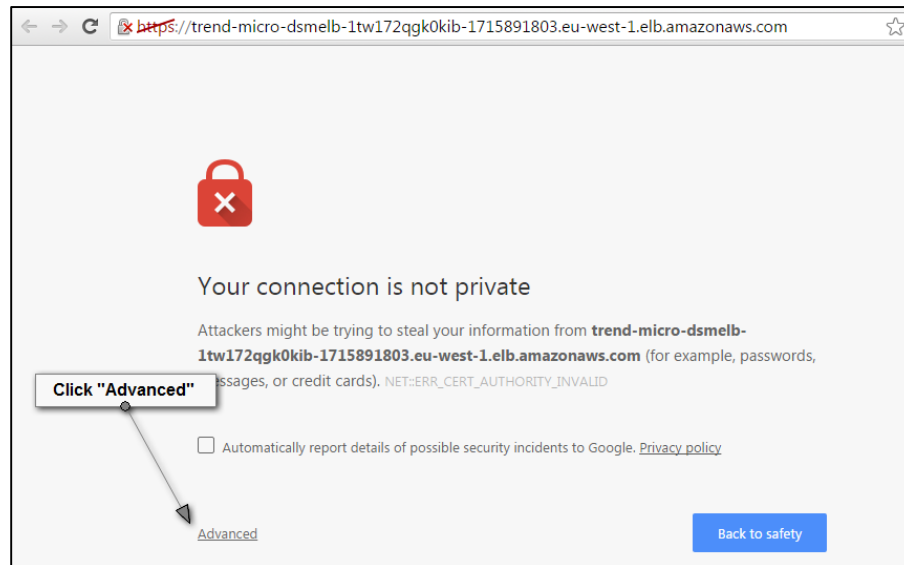

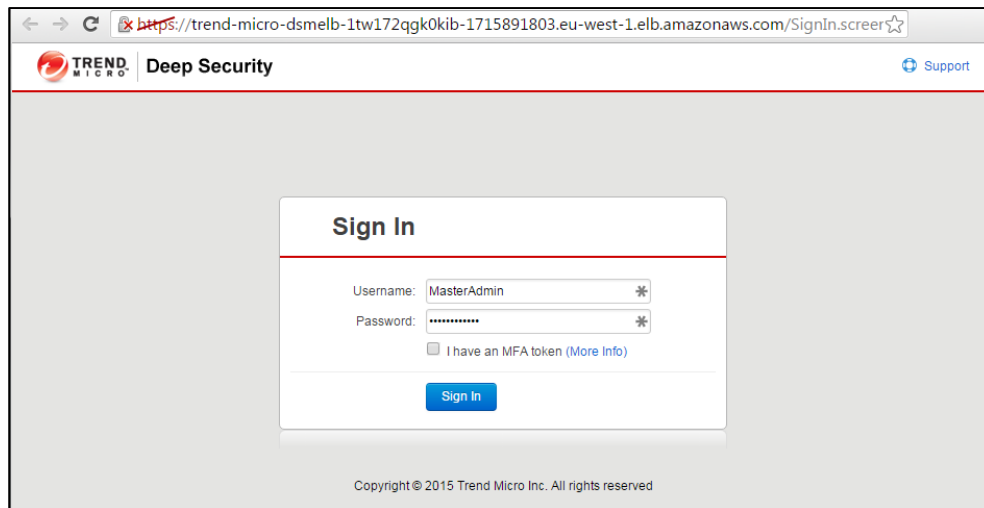

Figure 5: Accessing the Deep Security Management Console

If you are using the Quick Start as the basis of a production deployment and not as a proof of concept, we strongly recommend that you update the self-signed certificate to a certificate that is signed by a trusted Certificate Authority.

> **Note**   In order to obtain a signed certificate, you will be required by the Certificate Authority to specify a formal subdomain (for example, deepsecurityconsole.mycompany.com) and use this to access the Deep Security load balancer.

To update the security certificate of the load balancer, follow these steps:

1. Register a domain name that you will use to access the Deep Security Manager console.

2. Obtain a certificate for this domain from a trusted Certificate Authority.

3. Update the DNS settings of the load balancer to use the new domain name. Detailed instructions on how to do that can be found in the Elastic Load Balancing documentation.

4. Replace the SSL certificate of the load balancer. Detailed instructions on how to do that can be found in the Elastic Load Balancing documentation.

Send Us Feedback

We welcome your questions and comments. Please post your feedback on the AWS Quick Start Discussion Forum. For any problems, questions, or comments, please contact aws@trendmicro.com.

You can visit our GitHub repository to download the templates and scripts for this Quick Start, and to share your customizations with others.

Document Revisions

Date	Description
February 2016	Updated templates to support latest versions of SQL Server and Trend Micro AMIs, updated instance types to M4 where available, added support for the Asia Pacific (Seoul) region, improved performance
January 2016	Simplified templates and updated Quick Start for deployment on existing Amazon VPC architectures
October 2015	Updated for Deep Security version 9.6
