Welcome

The AWS Security Token Service (AWS STS) is a web service that enables you to request temporary, limited-privilege credentials for AWS Identity and Access Management (AWS IAM) users or for users that you authenticate (federated users). This guide provides descriptions of the AWS STS API. For more detailed information about using this service, go to Using Temporary Security Credentials.

Note

As an alternative to using the API, you can use one of the AWS SDKs, which consist of libraries and sample code for various programming languages and platforms (Java, Ruby, .NET, iOS, Android, etc.). The SDKs provide a convenient way to create programmatic access to AWS STS. For example, the SDKs take care of cryptographically signing requests, managing errors, and retrying requests automatically. For information about the AWS SDKs, including how to download and install them, see the Tools for Amazon Web Services page.

For information about setting up signatures and authorization through the API, go to Signing AWS API Requests in the AWS General Reference. For general information about the Query API, go to Making Query Requests in *Using IAM*. For information about using security tokens with other AWS products, go to Using Temporary Security Credentials to Access AWS in *Using Temporary Security Credentials*.

If you're new to AWS and need additional technical information about a specific AWS product, you can find the product's technical documentation at http://aws.amazon.com/documentation/.

Endpoints

For information about AWS STS endpoints, see Regions and Endpoints in the AWS General Reference.

Recording API requests

AWS STS supports AWS CloudTrail, which is a service that records AWS calls for your AWS account and delivers log files to an Amazon S3 bucket. By using information collected by CloudTrail, you can determine what requests were successfully made to AWS STS, who made the request, when it was made, and so on. To learn more about CloudTrail, including how to turn it on and find your log files, see the AWS CloudTrail User Guide.

This document was last updated on February 27, 2014.

Actions

The following actions are supported:

- AssumeRole (p. 3)
- AssumeRoleWithSAML (p. 7)
- AssumeRoleWithWebIdentity (p. 10)
- DecodeAuthorizationMessage (p. 15)
- GetFederationToken (p. 18)
- GetSessionToken (p. 21)

AssumeRole

Description

Returns a set of temporary security credentials (consisting of an access key ID, a secret access key, and a security token) that you can use to access AWS resources that you might not normally have access to. Typically, you use AssumeRole for cross-account access or federation.

Important: You cannot call AssumeRole by using AWS account credentials; access will be denied. You must use IAM user credentials or temporary security credentials to call AssumeRole.

For cross-account access, imagine that you own multiple accounts and need to access resources in each account. You could create long-term credentials in each account to access those resources. However, managing all those credentials and remembering which one can access which account can be time consuming. Instead, you can create one set of long-term credentials in one account and then use temporary security credentials to access all the other accounts by assuming roles in those accounts. For more information about roles, see Roles in *Using IAM*.

For federation, you can, for example, grant single sign-on access to the AWS Management Console. If you already have an identity and authentication system in your corporate network, you don't have to recreate user identities in AWS in order to grant those user identities access to AWS. Instead, after a user has been authenticated, you call AssumeRole (and specify the role with the appropriate permissions) to get temporary security credentials for that user. With those temporary security credentials, you construct a sign-in URL that users can use to access the console. For more information, see Scenarios for Granting Temporary Access in AWS Security Token Service.

The temporary security credentials are valid for the duration that you specified when calling AssumeRole, which can be from 900 seconds (15 minutes) to 3600 seconds (1 hour). The default is 1 hour.

Optionally, you can pass an AWS IAM access policy to this operation. The temporary security credentials that are returned by the operation have the permissions that are associated with the access policy of the role that is being assumed, except for any permissions explicitly denied by the policy you pass. This gives you a way to further restrict the permissions for the resulting temporary security credentials. These policies and any applicable resource-based policies are evaluated when calls to AWS are made using the temporary security credentials.

To assume a role, your AWS account must be trusted by the role. The trust relationship is defined in the role's trust policy when the IAM role is created. You must also have a policy that allows you to call sts: AssumeRole.

Using MFA with AssumeRole

You can optionally include multi-factor authentication (MFA) information when you call AssumeRole. This is useful for cross-account scenarios in which you want to make sure that the user who is assuming the role has been authenticated using an AWS MFA device. In that scenario, the trust policy of the role being assumed includes a condition that tests for MFA authentication; if the caller does not include valid MFA information, the request to assume the role is denied. The condition is in a trust policy that tests for MFA authentication might look like the following example.

```
"Condition": {"Null": {"aws:MultiFactorAuthAge": false}}
```

For more information, see Configuring MFA-Protected API Access in the Using AWS IAM guide.

To use MFA with AssumeRole, you pass values for the SerialNumber and TokenCode parameters. The SerialNumber value identifies the user's hardware or virtual MFA device. The TokenCode is the time-based one-time password (TOTP) that the MFA devices produces.

Request Parameters

For information about the common parameters that all actions use, see Common Parameters (p. 30).

DurationSeconds

The duration, in seconds, of the role session. The value can range from 900 seconds (15 minutes) to 3600 seconds (1 hour). By default, the value is set to 3600 seconds.

Type: Integer Required: No

Externalld

A unique identifier that is used by third parties to assume a role in their customers' accounts. For each role that the third party can assume, they should instruct their customers to create a role with the external ID that the third party generated. Each time the third party assumes the role, they must pass the customer's external ID. The external ID is useful in order to help third parties bind a role to the customer who created it. For more information about the external ID, see About the External ID in *Using Temporary Security Credentials*.

Type: String

Length constraints: Minimum length of 2. Maximum length of 96.

Required: No

Policy

An AWS IAM policy in JSON format.

The temporary security credentials that are returned by the operation have the permissions that are associated with the access policy of the role being assumed, except for any permissions explicitly denied by the policy you pass. This gives you a way to further restrict the permissions for the resulting temporary security credentials. These policies and any applicable resource-based policies are evaluated when calls to AWS are made using the temporary security credentials.

Type: String

Length constraints: Minimum length of 1. Maximum length of 2048.

Required: No

RoleArn

The Amazon Resource Name (ARN) of the role that the caller is assuming.

Type: String

Length constraints: Minimum length of 20. Maximum length of 2048.

Required: Yes RoleSessionName

An identifier for the assumed role session. The session name is included as part of the AssumedRoleUser.

Type: String

Length constraints: Minimum length of 2. Maximum length of 32.

Required: Yes

SerialNumber

The identification number of the MFA device that is associated with the user who is making the AssumeRole call. Specify this value if the trust policy of the role being assumed includes a condition

AWS Security Token Service API Reference Response Elements

that requires MFA authentication. The value is either the serial number for a hardware device (such as GAHT12345678) or an Amazon Resource Name (ARN) for a virtual device (such as arn:aws:iam::123456789012:mfa/user).

Type: String

Length constraints: Minimum length of 9. Maximum length of 256.

Required: No

TokenCode

The value provided by the MFA device, if the trust policy of the role being assumed requires MFA (that is, if the policy includes a condition that tests for MFA). If the role being assumed requires MFA and if the TokenCode value is missing or expired, the AssumeRole call returns an "access denied" error.

Type: String

Length constraints: Minimum length of 6. Maximum length of 6.

Required: No

Response Elements

The following elements are returned in a structure named AssumeRoleResult.

AssumedRoleUser

The Amazon Resource Name (ARN) and the assumed role ID, which are identifiers that you can use to refer to the resulting temporary security credentials. For example, you can reference these credentials as a principal in a resource-based policy by using the ARN or assumed role ID. The ARN and ID include the RoleSessionName that you specified when you called AssumeRole.

Type: AssumedRoleUser (p. 26)

Credentials

The temporary security credentials, which include an access key ID, a secret access key, and a security (or session) token.

Type: Credentials (p. 27)

PackedPolicySize

A percentage value that indicates the size of the policy in packed form. The service rejects any policy with a packed size greater than 100 percent, which means the policy exceeded the allowed space.

Type: Integer

Errors

For information about the errors that are common to all actions, see Common Errors (p. 32).

MalformedPolicyDocument

The request was rejected because the policy document was malformed. The error message describes the specific error.

HTTP Status Code: 400

PackedPolicyTooLarge

The request was rejected because the policy document was too large. The error message describes how big the policy document is, in packed form, as a percentage of what the API allows.

HTTP Status Code: 400

 </ResponseMetadata>
</AssumeRoleResponse>
```

AssumeRoleWithSAML

Description

Returns a set of temporary security credentials for users who have been authenticated via a SAML authentication response. This operation provides a mechanism for tying an enterprise identity store or directory to role-based AWS access without user-specific credentials or configuration.

The temporary security credentials returned by this operation consist of an access key ID, a secret access key, and a security token. Applications can use these temporary security credentials to sign calls to AWS services. The credentials are valid for the duration that you specified when calling AssumeRoleWithSAML, which can be up to 3600 seconds (1 hour) or until the time specified in the SAML authentication response's NotOnOrAfter value, whichever is shorter.

Note

The maximum duration for a session is 1 hour, and the minimum duration is 15 minutes, even if values outside this range are specified.

Optionally, you can pass an AWS IAM access policy to this operation. The temporary security credentials that are returned by the operation have the permissions that are associated with the access policy of the role being assumed, except for any permissions explicitly denied by the policy you pass. This gives you a way to further restrict the permissions for the resulting temporary security credentials. These policies and any applicable resource-based policies are evaluated when calls to AWS are made using the temporary security credentials.

Before your application can call AssumeRoleWithSAML, you must configure your SAML identity provider (IdP) to issue the claims required by AWS. Additionally, you must use AWS Identity and Access Management (AWS IAM) to create a SAML provider entity in your AWS account that represents your identity provider, and create an AWS IAM role that specifies this SAML provider in its trust policy.

Calling AssumeRoleWithSAML does not require the use of AWS security credentials. The identity of the caller is validated by using keys in the metadata document that is uploaded for the SAML provider entity for your identity provider.

For more information, see the following resources:

- Creating Temporary Security Credentials for SAML Federation in the Using Temporary Security Credentials guide.
- SAML Providers in the Using IAM guide.
- · Configuring a Relying Party and Claims in the guide.
- Creating a Role for SAML-Based Federation in the Using IAM guide.

Request Parameters

For information about the common parameters that all actions use, see Common Parameters (p. 30).

DurationSeconds

The duration, in seconds, of the role session. The value can range from 900 seconds (15 minutes) to 3600 seconds (1 hour). By default, the value is set to 3600 seconds. An expiration can also be specified in the SAML authentication response's NotOnOrAfter value. The actual expiration time is whichever value is shorter.

Note

The maximum duration for a session is 1 hour, and the minimum duration is 15 minutes, even if values outside this range are specified.

AWS Security Token Service API Reference Response Elements

Type: Integer Required: No

Policy

An AWS IAM policy in JSON format.

The temporary security credentials that are returned by this operation have the permissions that are associated with the access policy of the role being assumed, except for any permissions explicitly denied by the policy you pass. These policies and any applicable resource-based policies are evaluated when calls to AWS are made using the temporary security credentials.

Note

The policy must be 2048 bytes or shorter, and its packed size must be less than 450 bytes.

Type: String

Length constraints: Minimum length of 1. Maximum length of 2048.

Required: No

PrincipalArn

The Amazon Resource Name (ARN) of the SAML provider in AWS IAM that describes the IdP.

Type: String

Length constraints: Minimum length of 20. Maximum length of 2048.

Required: Yes

RoleArn

The Amazon Resource Name (ARN) of the role that the caller is assuming.

Type: String

Length constraints: Minimum length of 20. Maximum length of 2048.

Required: Yes SAMLAssertion

The base-64 encoded SAML authentication response provided by the IdP.

For more information, see Configuring a Relying Party and Adding Claims in the Using IAM guide.

Type: String

Length constraints: Minimum length of 4. Maximum length of 50000.

Required: Yes

Response Elements

The following elements are returned in a structure named ${\tt AssumeRoleWithSAMLResult}.$

AssumedRoleUser

The identifiers for the temporary security credentials that the operation returns.

Type: AssumedRoleUser (p. 26)

Credentials

AWS credentials for API authentication.

Type: Credentials (p. 27)

AWS Security Token Service API Reference Errors

PackedPolicySize

A percentage value that indicates the size of the policy in packed form. The service rejects any policy with a packed size greater than 100 percent, which means the policy exceeded the allowed space.

Type: Integer

Errors

For information about the errors that are common to all actions, see Common Errors (p. 32).

ExpiredToken

The web identity token that was passed is expired or is not valid. Get a new identity token from the identity provider and then retry the request.

HTTP Status Code: 400

IDPRejectedClaim

The identity provider (IdP) reported that authentication failed. This might be because the claim is invalid.

If this error is returned for the AssumeRoleWithWebIdentity operation, it can also mean that the claim has expired or has been explicitly revoked.

HTTP Status Code: 403

InvalidIdentityToken

The web identity token that was passed could not be validated by AWS. Get a new identity token from the identity provider and then retry the request.

HTTP Status Code: 400

MalformedPolicyDocument

The request was rejected because the policy document was malformed. The error message describes the specific error.

HTTP Status Code: 400

PackedPolicyTooLarge

The request was rejected because the policy document was too large. The error message describes how big the policy document is, in packed form, as a percentage of what the API allows.

HTTP Status Code: 400

AssumeRoleWithWebIdentity

Description

Returns a set of temporary security credentials for users who have been authenticated in a mobile or web application with a web identity provider, such as Login with Amazon, Facebook, or Google.

Calling AssumeRoleWithWebIdentity does not require the use of AWS security credentials. Therefore, you can distribute an application (for example, on mobile devices) that requests temporary security credentials without including long-term AWS credentials in the application, and without deploying server-based proxy services that use long-term AWS credentials. Instead, the identity of the caller is validated by using a token from the web identity provider.

The temporary security credentials returned by this API consist of an access key ID, a secret access key, and a security token. Applications can use these temporary security credentials to sign calls to AWS service APIs. The credentials are valid for the duration that you specified when calling AssumeRoleWithWebIdentity, which can be from 900 seconds (15 minutes) to 3600 seconds (1 hour). By default, the temporary security credentials are valid for 1 hour.

Optionally, you can pass an AWS IAM access policy to this operation. The temporary security credentials that are returned by the operation have the permissions that are associated with the access policy of the role being assumed, except for any permissions explicitly denied by the policy you pass. This gives you a way to further restrict the permissions for the resulting temporary security credentials. These policies and any applicable resource-based policies are evaluated when calls to AWS are made using the temporary security credentials.

Before your application can call AssumeRoleWithWebIdentity, you must have an identity token from a supported identity provider and create a role that the application can assume. The role that your application assumes must trust the identity provider that is associated with the identity token. In other words, the identity provider must be specified in the role's trust policy.

For more information about how to use web identity federation and the AssumeRoleWithWebIdentity, see the following resources:

- Creating a Mobile Application with Third-Party Sign-In and Creating Temporary Security Credentials for Mobile Apps Using Third-Party Identity Providers in *Using Temporary Security Credentials*.
- Web Identity Federation Playground. This interactive website lets you walk through the process of authenticating via Login with Amazon, Facebook, or Google, getting temporary security credentials, and then using those credentials to make a request to AWS.
- AWS SDK for iOS and AWS SDK for Android. These toolkits contain sample apps that show how to
 invoke the identity providers, and then how to use the information from these providers to get and use
 temporary security credentials.
- Web Identity Federation with Mobile Applications. This article discusses web identity federation and shows an example of how to use web identity federation to get access to content in Amazon S3.

Request Parameters

For information about the common parameters that all actions use, see Common Parameters (p. 30).

DurationSeconds

The duration, in seconds, of the role session. The value can range from 900 seconds (15 minutes) to 3600 seconds (1 hour). By default, the value is set to 3600 seconds.

Type: Integer

AWS Security Token Service API Reference Request Parameters

Required: No

Policy

An AWS IAM policy in JSON format.

The temporary security credentials that are returned by the operation have the permissions that are associated with the access policy of the role being assumed, except for any permissions explicitly denied by the policy you pass. This gives you a way to further restrict the permissions for the resulting temporary security credentials. These policies and any applicable resource-based policies are evaluated when calls to AWS are made using the temporary security credentials.

Type: String

Length constraints: Minimum length of 1. Maximum length of 2048.

Required: No

ProviderId

The fully-qualified host component of the domain name of the identity provider. Specify this value only for OAuth access tokens. Do not specify this value for OpenID Connect ID tokens, such as accounts.google.com. Do not include URL schemes and port numbers. Currently, www.amazon.com and graph.facebook.com are supported.

Type: String

Length constraints: Minimum length of 4. Maximum length of 2048.

Required: No

RoleArn

The Amazon Resource Name (ARN) of the role that the caller is assuming.

Type: String

Length constraints: Minimum length of 20. Maximum length of 2048.

Required: Yes RoleSessionName

An identifier for the assumed role session. Typically, you pass the name or identifier that is associated with the user who is using your application. That way, the temporary security credentials that your application will use are associated with that user. This session name is included as part of the ARN and assumed role ID in the AssumedRoleUser response element.

Type: String

Length constraints: Minimum length of 2. Maximum length of 32.

Required: Yes

WebIdentityToken

The OAuth 2.0 access token or OpenID Connect ID token that is provided by the identity provider. Your application must get this token by authenticating the user who is using your application with a web identity provider before the application makes an AssumeRoleWithWebIdentity call.

Type: String

Length constraints: Minimum length of 4. Maximum length of 2048.

Required: Yes

Response Elements

The following elements are returned in a structure named AssumeRoleWithWebIdentityResult.

AssumedRoleUser

The Amazon Resource Name (ARN) and the assumed role ID, which are identifiers that you can use to refer to the resulting temporary security credentials. For example, you can reference these credentials as a principal in a resource-based policy by using the ARN or assumed role ID. The ARN and ID include the RoleSessionName that you specified when you called AssumeRole.

Type: AssumedRoleUser (p. 26)

Credentials

The temporary security credentials, which include an access key ID, a secret access key, and a security token.

Type: Credentials (p. 27)

PackedPolicySize

A percentage value that indicates the size of the policy in packed form. The service rejects any policy with a packed size greater than 100 percent, which means the policy exceeded the allowed space.

Type: Integer

SubjectFromWebIdentityToken

The unique user identifier that is returned by the identity provider. This identifier is associated with the WebIdentityToken that was submitted with the AssumeRoleWithWebIdentity call. The identifier is typically unique to the user and the application that acquired the WebIdentityToken (pairwise identifier). If an OpenID Connect ID token was submitted in the WebIdentityToken, this value is returned by the identity provider as the token's sub (Subject) claim.

Type: String

Errors

For information about the errors that are common to all actions, see Common Errors (p. 32).

ExpiredToken

The web identity token that was passed is expired or is not valid. Get a new identity token from the identity provider and then retry the request.

HTTP Status Code: 400

IDPCommunicationError

The request could not be fulfilled because the non-AWS identity provider (IDP) that was asked to verify the incoming identity token could not be reached. This is often a transient error caused by network conditions. Retry the request a limited number of times so that you don't exceed the request rate. If the error persists, the non-AWS identity provider might be down or not responding.

HTTP Status Code: 502

IDPRejectedClaim

The identity provider (IdP) reported that authentication failed. This might be because the claim is invalid.

If this error is returned for the AssumeRoleWithWebIdentity operation, it can also mean that the claim has expired or has been explicitly revoked.

AWS Security Token Service API Reference Examples

HTTP Status Code: 403

InvalidIdentityToken

The web identity token that was passed could not be validated by AWS. Get a new identity token from the identity provider and then retry the request.

HTTP Status Code: 400

MalformedPolicyDocument

The request was rejected because the policy document was malformed. The error message describes the specific error.

HTTP Status Code: 400

PackedPolicyTooLarge

The request was rejected because the policy document was too large. The error message describes how big the policy document is, in packed form, as a percentage of what the API allows.

HTTP Status Code: 400

DecodeAuthorizationMessage

Description

Decodes additional information about the authorization status of a request from an encoded message returned in response to an AWS request.

For example, if a user is not authorized to perform an action that he or she has requested, the request returns a Client.UnauthorizedOperation response (an HTTP 403 response). Some AWS actions additionally return an encoded message that can provide details about this authorization failure.

Note

Only certain AWS actions return an encoded authorization message. The documentation for an individual action indicates whether that action returns an encoded message in addition to returning an HTTP code.

The message is encoded because the details of the authorization status can constitute privileged information that the user who requested the action should not see. To decode an authorization status message, a user must be granted permissions via an AWS IAM policy to request the <code>DecodeAuthorizationMessage</code> (sts:DecodeAuthorizationMessage) action.

The decoded message includes the following type of information:

- Whether the request was denied due to an explicit deny or due to the absence of an explicit allow. For more information, see Determining Whether a Request is Allowed or Denied in *Using AWS IAM*.
- The principal who made the request.
- · The requested action.
- · The requested resource.
- The values of condition keys in the context of the user's request.

Request Parameters

For information about the common parameters that all actions use, see Common Parameters (p. 30).

EncodedMessage

The encoded message that was returned with the response.

Type: String

Length constraints: Minimum length of 1. Maximum length of 10240.

Required: Yes

Response Elements

The following element is returned in a structure named DecodeAuthorizationMessageResult.

DecodedMessage

An XML document that contains the decoded message. For more information, see DecodeAuthorizationMessage.

Type: String

Errors

For information about the errors that are common to all actions, see Common Errors (p. 32).

InvalidAuthorizationMessage

The error returned if the message passed to <code>DecodeAuthorizationMessage</code> was invalid. This can happen if the token contains invalid characters, such as linebreaks.

HTTP Status Code: 400

Examples

Sample Request

```
POST https://sts.amazonaws.com / HTTP/1.1
Content-Type: application/x-www-form-urlencoded; charset=utf-8
Host: sts.amazonaws.com
Content-Length: 1148
Expect: 100-continue
Connection: Keep-Alive
Action=DecodeAuthorizationMessage
&EncodedMessage=<encoded-message>
&Version=2011-06-15
&AUTHPARAMS
```

Sample Response

```
<?xml version="1.0" encoding="UTF-8"?>
<DecodeAuthorizationMessageResponse xmlns="http://sts.amazonaws.com/doc/2011-</pre>

             },
            "item": {
```

AWS Security Token Service API Reference Examples

GetFederationToken

Description

Returns a set of temporary security credentials (consisting of an access key ID, a secret access key, and a security token) for a federated user. A typical use is in a proxy application that is getting temporary security credentials on behalf of distributed applications inside a corporate network. Because you must call the <code>GetFederationToken</code> action using the long-term security credentials of an IAM user, this call is appropriate in contexts where those credentials can be safely stored, usually in a server-based application.

Note: Do not use this call in mobile applications or client-based web applications that directly get temporary security credentials. For those types of applications, use AssumeRoleWithWebIdentity.

The GetFederationToken action must be called by using the long-term AWS security credentials of the AWS account or an IAM user. Credentials that are created by IAM users are valid for the specified duration, between 900 seconds (15 minutes) and 129600 seconds (36 hours); credentials that are created by using account credentials have a maximum duration of 3600 seconds (1 hour).

Optionally, you can pass an AWS IAM access policy to this operation. The temporary security credentials that are returned by the operation have the permissions that are associated with the entity that is making the <code>GetFederationToken</code> call, except for any permissions explicitly denied by the policy you pass. This gives you a way to further restrict the permissions for the resulting temporary security credentials. These policies and any applicable resource-based policies are evaluated when calls to AWS are made using the temporary security credentials.

For more information about how permissions work, see Controlling Permissions in Temporary Credentials in *Using Temporary Security Credentials*. For information about using <code>GetFederationToken</code> to create temporary security credentials, see Creating Temporary Credentials to Enable Access for Federated Users in *Using Temporary Security Credentials*.

Request Parameters

For information about the common parameters that all actions use, see Common Parameters (p. 30).

DurationSeconds

The duration, in seconds, that the session should last. Acceptable durations for federation sessions range from 900 seconds (15 minutes) to 129600 seconds (36 hours), with 43200 seconds (12 hours) as the default. Sessions for AWS account owners are restricted to a maximum of 3600 seconds (one hour). If the duration is longer than one hour, the session for AWS account owners defaults to one hour.

Type: Integer

Required: No

Name

The name of the federated user. The name is used as an identifier for the temporary security credentials (such as Bob). For example, you can reference the federated user name in a resource-based policy, such as in an Amazon S3 bucket policy.

Type: String

Length constraints: Minimum length of 2. Maximum length of 32.

Required: Yes

AWS Security Token Service API Reference Response Elements

Policy

An AWS IAM policy in JSON format.

By default, federated users have no permissions; they do not inherit any from the IAM user. When you specify a policy, the federated user's permissions are based on the specified policy and the IAM user's policy. If you don't specify a policy, federated users can only access AWS resources that explicitly allow those federated users in a resource policy, such as in an Amazon S3 bucket policy.

Type: String

Length constraints: Minimum length of 1. Maximum length of 2048.

Required: No

Response Elements

The following elements are returned in a structure named GetFederationTokenResult.

Credentials

Credentials for the service API authentication.

Type: Credentials (p. 27)

FederatedUser

Identifiers for the federated user associated with the credentials (such as arn:aws:sts::123456789012:federated-user/Bob or 123456789012:Bob). You can use the federated user's ARN in your resource policies like in an Amazon S3 bucket policy.

Type: FederatedUser (p. 28)

PackedPolicySize

A percentage value indicating the size of the policy in packed form. The service rejects policies for which the packed size is greater than 100 percent of the allowed value.

Type: Integer

Errors

For information about the errors that are common to all actions, see Common Errors (p. 32).

MalformedPolicyDocument

The request was rejected because the policy document was malformed. The error message describes the specific error.

HTTP Status Code: 400

PackedPolicyTooLarge

The request was rejected because the policy document was too large. The error message describes how big the policy document is, in packed form, as a percentage of what the API allows.

HTTP Status Code: 400

Examples

Sample Request

```

GetSessionToken

Description

Returns a set of temporary credentials for an AWS account or IAM user. The credentials consist of an access key ID, a secret access key, and a security token. Typically, you use <code>GetSessionToken</code> if you want use MFA to protect programmatic calls to specific AWS APIs like Amazon EC2 <code>StopInstances</code>. MFA-enabled IAM users would need to call <code>GetSessionToken</code> and submit an MFA code that is associated with their MFA device. Using the temporary security credentials that are returned from the call, IAM users can then make programmatic calls to APIs that require MFA authentication.

The GetSessionToken action must be called by using the long-term AWS security credentials of the AWS account or an IAM user. Credentials that are created by IAM users are valid for the duration that you specify, between 900 seconds (15 minutes) and 129600 seconds (36 hours); credentials that are created by using account credentials have a maximum duration of 3600 seconds (1 hour).

The permissions associated with the temporary security credentials returned by <code>GetSessionToken</code> are based on the permissions associated with account or IAM user whose credentials are used to call the action. If <code>GetSessionToken</code> is called using root account credentials, the temporary credentials have root account permissions. Similarly, if <code>GetSessionToken</code> is called using the credentials of an IAM user, the temporary credentials have the same permissions as the IAM user.

For more information about using GetSessionToken to create temporary credentials, go to Creating Temporary Credentials to Enable Access for IAM Users in *Using IAM*.

Request Parameters

For information about the common parameters that all actions use, see Common Parameters (p. 30).

DurationSeconds

The duration, in seconds, that the credentials should remain valid. Acceptable durations for IAM user sessions range from 900 seconds (15 minutes) to 129600 seconds (36 hours), with 43200 seconds (12 hours) as the default. Sessions for AWS account owners are restricted to a maximum of 3600 seconds (one hour). If the duration is longer than one hour, the session for AWS account owners defaults to one hour.

Type: Integer

Required: No

SerialNumber

The identification number of the MFA device that is associated with the IAM user who is making the <code>GetSessionToken</code> call. Specify this value if the IAM user has a policy that requires MFA authentication. The value is either the serial number for a hardware device (such as <code>GAHT12345678</code>) or an Amazon Resource Name (ARN) for a virtual device (such as <code>arn:aws:iam::123456789012:mfa/user</code>). You can find the device for an IAM user by going to

the AWS Management Console and viewing the user's security credentials.

Type: String

Length constraints: Minimum length of 9. Maximum length of 256.

Required: No

TokenCode

The value provided by the MFA device, if MFA is required. If any policy requires the IAM user to submit an MFA code, specify this value. If MFA authentication is required, and the user does not

AWS Security Token Service API Reference Response Elements

provide a code when requesting a set of temporary security credentials, the user will receive an "access denied" response when requesting resources that require MFA authentication.

Type: String

Length constraints: Minimum length of 6. Maximum length of 6.

Required: No

Response Elements

The following element is returned in a structure named GetSessionTokenResult.

Credentials

The session credentials for API authentication.

Type: Credentials (p. 27)

Examples

Sample Request

```
https://sts.amazonaws.com/
?Version=2011-06-15

```

AWS Security Token Service API Reference Examples

Data Types

The AWS Security Token Service API contains several data types that various actions use. This section describes each data type in detail.

Note

The order of each element in the response is not guaranteed. Applications should not assume a particular order.

The following data types are supported:

- AssumeRoleResult (p. 24)
- AssumeRoleWithSAMLResult (p. 25)
- AssumeRoleWithWebIdentityResult (p. 26)
- AssumedRoleUser (p. 26)
- Credentials (p. 27)
- DecodeAuthorizationMessageResult (p. 28)
- FederatedUser (p. 28)
- GetFederationTokenResult (p. 29)
- GetSessionTokenResult (p. 29)

AssumeRoleResult

Description

Contains the result of a successful call to the AssumeRole (p. 3) action, including temporary AWS credentials that can be used to make AWS requests.

Contents

AssumedRoleUser

The Amazon Resource Name (ARN) and the assumed role ID, which are identifiers that you can use to refer to the resulting temporary security credentials. For example, you can reference these credentials as a principal in a resource-based policy by using the ARN or assumed role ID. The ARN and ID include the RoleSessionName that you specified when you called AssumeRole.

AWS Security Token Service API Reference AssumeRoleWithSAMLResult

Type: AssumedRoleUser (p. 26)

Required: No

Credentials

The temporary security credentials, which include an access key ID, a secret access key, and a security (or session) token.

Type: Credentials (p. 27)

Required: No **PackedPolicySize**

A percentage value that indicates the size of the policy in packed form. The service rejects any policy with a packed size greater than 100 percent, which means the policy exceeded the allowed space.

Type: Integer Required: No

AssumeRoleWithSAMLResult

Description

Contains the result of a successful call to the AssumeRoleWithSAML (p. 7) action, including temporary AWS credentials that can be used to make AWS requests.

Contents

AssumedRoleUser

The identifiers for the temporary security credentials that the operation returns.

Type: AssumedRoleUser (p. 26)

Required: No

Credentials

AWS credentials for API authentication.

Type: Credentials (p. 27)

Required: No PackedPolicySize

A percentage value that indicates the size of the policy in packed form. The service rejects any policy with a packed size greater than 100 percent, which means the policy exceeded the allowed space.

Type: Integer

Required: No

AssumeRoleWithWebIdentityResult

Description

Contains the result of a successful call to the AssumeRoleWithWebIdentity (p. 10) action, including temporary AWS credentials that can be used to make AWS requests.

Contents

AssumedRoleUser

The Amazon Resource Name (ARN) and the assumed role ID, which are identifiers that you can use to refer to the resulting temporary security credentials. For example, you can reference these credentials as a principal in a resource-based policy by using the ARN or assumed role ID. The ARN and ID include the RoleSessionName that you specified when you called AssumeRole.

Type: AssumedRoleUser (p. 26)

Required: No

Credentials

The temporary security credentials, which include an access key ID, a secret access key, and a security token.

Type: Credentials (p. 27)

Required: No **PackedPolicySize**

A percentage value that indicates the size of the policy in packed form. The service rejects any policy with a packed size greater than 100 percent, which means the policy exceeded the allowed space.

Type: Integer

Required: No

SubjectFromWebIdentityToken

The unique user identifier that is returned by the identity provider. This identifier is associated with the WebIdentityToken that was submitted with the AssumeRoleWithWebIdentity call. The identifier is typically unique to the user and the application that acquired the WebIdentityToken (pairwise identifier). If an OpenID Connect ID token was submitted in the WebIdentityToken, this value is returned by the identity provider as the token's sub (Subject) claim.

Type: String

Length constraints: Minimum length of 6. Maximum length of 255.

Required: No

AssumedRoleUser

Description

The identifiers for the temporary security credentials that the operation returns.

Contents

Arn

The ARN of the temporary security credentials that are returned from the AssumeRole (p. 3) action. For more information about ARNs and how to use them in policies, see Identifiers for IAM Entities in *Using IAM*.

Type: String

Length constraints: Minimum length of 20. Maximum length of 2048.

Required: Yes
AssumedRoleId

A unique identifier that contains the role ID and the role session name of the role that is being assumed. The role ID is generated by AWS when the role is created.

Type: String

Length constraints: Minimum length of 2. Maximum length of 96.

Required: Yes

Credentials

Description

AWS credentials for API authentication.

Contents

AccessKeyld

The access key ID that identifies the temporary security credentials.

Type: String

Length constraints: Minimum length of 16. Maximum length of 32.

Required: Yes

Expiration

The date on which the current credentials expire.

Type: DateTime

Required: Yes

SecretAccessKey

The secret access key that can be used to sign requests.

Type: String

Required: Yes

SessionToken

The token that users must pass to the service API to use the temporary credentials.

Type: String

Required: Yes

DecodeAuthorizationMessageResult

Description

A document that contains additional information about the authorization status of a request from an encoded message that is returned in response to an AWS request.

Contents

DecodedMessage

An XML document that contains the decoded message. For more information, see DecodeAuthorizationMessage.

Type: String Required: No

FederatedUser

Description

Identifiers for the federated user that is associated with the credentials.

Contents

Δrn

The ARN that specifies the federated user that is associated with the credentials. For more information about ARNs and how to use them in policies, see <u>Identifiers</u> for <u>IAM Entities</u> in *Using IAM*.

Type: String

Length constraints: Minimum length of 20. Maximum length of 2048.

Required: Yes

FederatedUserId

The string that identifies the federated user associated with the credentials, similar to the unique ID of an IAM user.

Type: String

Length constraints: Minimum length of 2. Maximum length of 96.

Required: Yes

GetFederationTokenResult

Description

Contains the result of a successful call to the GetFederationToken (p. 18) action, including temporary AWS credentials that can be used to make AWS requests.

Contents

Credentials

Credentials for the service API authentication.

Type: Credentials (p. 27)

Required: No

FederatedUser

Identifiers for the federated user associated with the credentials (such as arn:aws:sts::123456789012:federated-user/Bob or 123456789012:Bob). You can use the federated user's ARN in your resource policies like in an Amazon S3 bucket policy.

Type: FederatedUser (p. 28)

Required: No **PackedPolicySize**

A percentage value indicating the size of the policy in packed form. The service rejects policies for which the packed size is greater than 100 percent of the allowed value.

Type: Integer Required: No

GetSessionTokenResult

Description

Contains the result of a successful call to the GetSessionToken (p. 21) action, including temporary AWS credentials that can be used to make AWS requests.

Contents

Credentials

The session credentials for API authentication.

Type: Credentials (p. 27)

Required: No

Common Parameters

This section lists the request parameters that all actions use. Any action-specific parameters are listed in the topic for the action.

Action

The action to be performed.

Default: None

Type: string

Required: Yes

AuthParams

The parameters that are required to authenticate a Conditional request. Contains:

- AWSAccessKeyID
- SignatureVersion
- Timestamp
- Signature

Default: None

Required: Conditional

AWSAccessKeyId

The access key ID that corresponds to the secret access key that you used to sign the request.

Default: None

Type: string

Required: Yes

Expires

The date and time when the request signature expires, expressed in the format

YYYY-MM-DDThh:mm:ssZ, as specified in the ISO 8601 standard.

Condition: Requests must include either *Timestamp* or *Expires*, but not both.

Default: None

Type: string

Required: Conditional

SecurityToken

The temporary security token that was obtained through a call to AWS Security Token Service. For a list of services that support AWS Security Token Service, go to Using Temporary Security Credentials to Access AWS in **Using Temporary Security Credentials**.

Default: None

Type: string

Required: No

Signature

The digital signature that you created for the request. For information about generating a signature, go to the service's developer documentation.

Default: None

Type: string

Required: Yes

SignatureMethod

The hash algorithm that you used to create the request signature.

Default: None

Type: string

Valid Values: HmacSHA256 | HmacSHA1

Required: Yes

SignatureVersion

The signature version you use to sign the request. Set this to the value that is recommended for your service.

Default: None

Type: string

Required: Yes

Timestamp

The date and time when the request was signed, expressed in the format YYYY-MM-DDThh:mm:ssZ, as specified in the ISO 8601 standard.

Condition: Requests must include either *Timestamp* or *Expires*, but not both.

Default: None

Type: string

Required: Conditional

Version

The API version that the request is written for, expressed in the format YYYY-MM-DD.

Default: None

Type: string

Required: Yes

Common Errors

This section lists the common errors that all actions return. Any action-specific errors are listed in the topic for the action.

IncompleteSignature

The request signature does not conform to AWS standards.

HTTP Status Code: 400

InternalFailure

The request processing has failed because of an unknown error, exception or failure.

HTTP Status Code: 500

InvalidAction

The action or operation requested is invalid. Verify that the action is typed correctly.

HTTP Status Code: 400

InvalidClientTokenId

The X.509 certificate or AWS access key ID provided does not exist in our records.

HTTP Status Code: 403

InvalidParameterCombination

Parameters that must not be used together were used together.

HTTP Status Code: 400

InvalidParameterValue

An invalid or out-of-range value was supplied for the input parameter.

HTTP Status Code: 400

InvalidQueryParameter

The AWS query string is malformed or does not adhere to AWS standards.

HTTP Status Code: 400

MalformedQueryString

The guery string contains a syntax error.

HTTP Status Code: 404

MissingAction

The request is missing an action or a required parameter.

HTTP Status Code: 400

MissingAuthenticationToken

The request must contain either a valid (registered) AWS access key ID or X.509 certificate.

HTTP Status Code: 403

MissingParameter

A required parameter for the specified action is not supplied.

HTTP Status Code: 400

OptInRequired

The AWS access key ID needs a subscription for the service.

HTTP Status Code: 403

RequestExpired

The request reached the service more than 15 minutes after the date stamp on the request or more than 15 minutes after the request expiration date (such as for pre-signed URLs), or the date stamp on the request is more than 15 minutes in the future.

HTTP Status Code: 400

ServiceUnavailable

The request has failed due to a temporary failure of the server.

HTTP Status Code: 503

Throttling

The request was denied due to request throttling.

HTTP Status Code: 400

ValidationError

The input fails to satisfy the constraints specified by an AWS service.

HTTP Status Code: 400
