SUBJECT: Database of Jihadist Terrorism Prosecutions Since 9/11/2001 Project Details

Memorandum

Summary:

As per your request, our group is pleased to submit to you our database of jihadist terrorism cases since September 11, 2001. We initially obtained our sample set of cases from Schanzer (Duke University), Kurzman (University of North Carolina, Chapel Hill), and Moosa's (Duke University) recently published "Anti-terror Lessons of Muslim-Americans" study. We quickly realized, however, that this study did not capture many high-profile cases, including Collen R. LaRose (aka "Jihad Jane") and Richard Reid. Thus, we included 16 additional individuals to cover some of these missing cases.

Broadly speaking, we included cases in our study (outside of the Duke-UNC study) based upon whether or not the suspect exhibited a clear intent to do harm to the United States or its interests. Although there have been many cases which have been prosecuted based upon terrorism-supporting financial transactions, given our time constraints, we chose to include those individuals who posed a more direct and immediate threat.

Nevertheless, as there have been approximately 1000 terrorist prosecution cases within the United States between September 11, 2001 and September 11, 2009 according to NYU's "2009 Terrorist Trial Report Card: September 11, 2001 – September 11, 2009," we would like to acknowledge that our time constraints and the initial uncertainty surrounding the time required to code each case precluded us from capturing all of the cases of jihadist terrorism prosecutions in the United States since September 11, 2001.

Methodology:

For the purposes of consistency and transparency, we used a uniform set of databases and websites for researching each case. The databases we used include the following: LexisNexis Academic, Lexis Nexis Legal, and Westlaw. We also used the following websites to collect

legal documents for the terrorist cases: Findlaw, NEFA Foundation, Globalsecurity.org, LawandSecurity.org (report), and defenddemocracy.org (report). Finally, we used Google with basic search terms such as “Najibullah Zazi,” “Najibullah Zazi Trial,” and “Najibullah Zazi FBI” to collect any remaining information from government and credible news sources, such as the United States Department of Justice.

After finding relevant information, we input the data into the spreadsheet and documented the source for each cell in our references section. We then crosschecked each other’s work for accuracy, consistency and completeness. Where “N/A” is listed, the data is not applicable to the case, given a previous response. For example, where an individual was not tried for material support, you will find “N/A” under columns such as “Did Individual Provide Financial Support?” Where “--” is listed, the data could not be found through our methodology. Although you will find many cells with “--”, we were pleased with how much data we were able to find for each case through our research.

We have included descriptors of each column in row 2, which are primarily used to indicate what each number represents within that column. For example, where “Gender” is listed in row 1, row 2 indicates that, in the cells below, “0 = Female; 1 = Male.” Where cases could not be clearly delineated between the numerical options, our group decided to include further information in comment boxes to provide a more accurate description of the data within that cell. If there is a comment associated with a particular cell, the cell will have a red triangle in the top right corner. Simply clicking on the cell should allow you to access these comments.

Concluding Thoughts:

We hope that this database assists in your analysis of jihadist terrorism cases in the US since September 11, 2001. We have worked diligently to provide the most comprehensive and accessible database possible. We look forward to discussing our findings with you.

Brief Guide to The Dataset

The attached dataset provides information on 152 jihadist terrorism cases in the United States since September 11, 2001. The cases included were based on the dataset of Islamic-American terrorists since September 11, 2001 that was used in another recent major study.¹ Additional cases of terrorism prosecutions were then added within the constraints of the available time period.

While other studies focus on providing individuals' biographic information or details of legal proceedings, this dataset gives a comprehensive overview of each individual's personal background, the details of the alleged plot and/or attack, and the outcome of legal proceedings. Throughout the dataset, 'N/A' indicates the question is not applicable to the specific case, whereas '--' indicates that the information could not be found. Where the numerical answer options could not accurately capture the details of a case, comments have been attached to individual cells, indicated with a red triangle in the corner. Where more than one numerical option was applicable, all were listed. For example, in Column CL "Forms of contact" with a jihadist organization, if an individual had multiple forms of contact, all were listed and separated with semi-colons.

Moving from left to right, **column C, "Status,"** indicates whether an individual is presently detained in the US legal system, killed, missing, or elsewhere (e.g., detained abroad). The details of their status are explained in the dataset, and the status often explains entries in other columns (e.g., if a person is at large, questions about their legal proceedings receive an 'N/A' entry). **Columns H-K** provide details on whether the individual plotted and/or was prosecuted individually or with others. For Column H, "**Associated with Cell,**" the researchers used a broad understanding of 'terrorist cell'—if an individual associated, trained, and/or plotted with other known terrorism suspects, this was understood as a cell. The name of the cell was based on terms used in legal documents or media reports where applicable; for groups with no name, the researchers provided details on the membership in the comments attached to the cell.

¹ David Shanzer, Charles Kurzman, and Ebrahim Moosa. *Anti-Terror Lessons of Muslim-Americans*. Duke University- University of North Carolina, Chapel Hill. 6 January 2010.

Columns L-AX provide biographic information on each individual, including details on their place of residence, family, religious views, education and profession. To be clear, **column AC**, “**Confirmed mental illness at time of judicial proceedings**” captures whether a person had a mental condition that was confirmed by medical professionals and acknowledged by courts, whereas **column AD** “**Alleged/claimed mental illness at time of judicial proceedings**” indicates whether the defendant or others made this claim. The categories are not mutually exclusive—confirmed cases were also often claimed cases, but claimed cases were not always confirmed. For **Column AV**, “**Professional?**” the researchers used the criterion of whether a person’s vocation required post-secondary education; however, some subjectivity is unavoidable. Consequently, details on their employment and education are provided in **Column AW**.

The dataset then gives details on the alleged terrorist activity in **Columns AY-DB**. Details on the investigation and initial charges are provided in **Columns BB-BM**. The dataset then provides information on the types of weapons used in the terrorist activity. To clarify, **Column BN** “**Gun owner**” indicates whether an individual already owned a gun, not specifically for the terrorist plot, whereas **Column BO** captures whether they then purchased arms for the illicit activity. Researchers sought to identify whether terrorists had a history of engaging in conflict before they sought to commit terrorism and then transferred those skills to terrorist activity, by including the questions in **Columns BX-BY**, “**Participation in armed conflict prior to plot,**” and “**if so, did he/she receive training from militants there?**” Since material support for a terrorist organization is a common charge in terrorist cases, **Columns CA-CF** indicate whether an individual was officially charged with material support, and, if so, what form was specified in the indictment. The researchers sought to remain as close to the actual legal records as possible, but were sometimes limited by lack of access. When providing details on the actual terrorist attack, the researchers distinguished between the *planned* attack and the actual outcome. **Column CW** ‘**Nature of the attack**’ describes the intended event—‘no attack’ means the individual was not planning a specific act (for instance, they may have intended to travel abroad to fight US forces, generally speaking). **Column CX** gives the actual outcome—a thwarted attack, for instance, is indicated as ‘0-nothing happened.’

Finally, **Columns DC-DS** give information on the individual’s legal proceedings. Given that many individuals accept plea bargains, questions about the details of the criminal trial are

often answered with 'N/A.' **Column DJ 'Final Charges'** indicates which of the charges upon indictment (as indicated in Column BC) the individual accepted in a plea agreement, or for which they were found guilty. Lastly, **Column DT 'Other notes'** is where the researchers provided any other relevant details on the individuals personal history, act of terrorism, or legal proceedings, that were not captured in the dataset.

As this is a 'living dataset,' many of the recent cases should be updated as legal proceedings move forward. Furthermore, new cases should be added as new prosecutions arise. Users of this dataset may also choose to expand the dataset to cover more cases, or narrow its contents based around more strictly defined criteria. The researchers also designed a dataset that provides as much detail as possible while still being useful for running data analysis or compiling summary statistics. Depending on its intended use, details within the dataset can be added or omitted.

Initial Analysis of Jihadist Terrorist Prosecutions Database

The database of 152 terrorism cases can be used to provide valuable insights into the demographic breakdown of suspects, the targets of planned attacks, and outcomes of legal proceedings. Our analysis of the findings reveals the following trends within this dataset. The charts for each analysis are included at the bottom of the Excel dataset.

Ethnicity:

As seen in Figure 1, the most represented ethnicity within the dataset is Arab, with 28% of the cases. African-Americans constituted 20% and Somalis were 12%. 11% were South Asian, 9% were Caucasian, and 20% were 'other.' Overall, our data reveals that no single ethnicity constitutes a majority of cases, contrary to popular belief. We should mention, however, that in 20 cases out of 152, the ethnicity is unknown.

Age:

The range of ages at indictment (or age when they were killed in the attack) is 15 to 63. However, as seen in Figure 2, the bulk of individuals were between ages 19 and 35. The mean age is just over 29 years, and the median age is 27. There were four cases for which the age was unknown.

Gender:

As expected, the vast majority of individuals in our dataset are men—only 3 out of 152 cases were of women. This is illustrated in Figure 3.

Countries Visited Prior to Attack:

Figure 4 lists the number of individuals in the dataset who visited certain countries prior to committing the terrorist act for which they were indicted. Overwhelmingly, the most visited countries are Pakistan and Afghanistan. Somalia, Saudi Arabia, and Egypt were also visited by a significant number of individuals. It should be noted that many individuals travelled to multiple countries; the dataset lists all countries visited by each individual.

Conversion to Islam:

Out of 152 cases, we found concrete information of whether or not 80 individuals had converted to Islam or were raised as Muslim. Of the cases for which we had clear information, 44% had converted to Islam at some point prior to committing a terrorist act, as detailed in Figure 5.

While we were unable to determine the religion from which many individuals converted, it is interesting to note that for those for whom their prior religious affiliation is known, they were all of a Christian faith. Anecdotally, we noted that many individuals converted to radical Islam while incarcerated for other crimes they had committed, or due to the influence of a person who was radicalized in prison. For individuals who were raised Muslim, our research revealed that in many cases, individuals experienced some ‘turning point’ at which they became more radical in their beliefs. We noted that this was often followed by a separation from their family and local Islamic community. These details could not be captured quantitatively; however, we noted them in Column Z, ‘Narrative on Religious Practices.’

Mental Illness:

Of the 68 cases for which an individual’s mental health status was known at the time of conviction, 88% did not have a mental illness confirmed by medical professionals, as seen in Figure 6.

Country of Birth:

Of the 129 individuals for whom country of birth is known, Figure 7.1 indicates the number of people born per country. Of those born outside of the US, Pakistan is the most represented (13), followed by Somalia (10), and Jordan (6). Of the known cases, 51% were born in the US, as seen in Figure 7.2.

Citizenship Status:

Figure 8.1 and 8.2 break down the citizenship status of the 128 cases for which this information was available. Over half—52%--are US-born citizens, and 25% were naturalized US citizens. Figure 8.1 breaks down the status of legal residents into 4 categories: legal resident (unknown documentation); student visa; work visa; or refugee. In Figure 8.2, these groups are

amalgamated. 16% were non-US citizen legal residents. Only 7% of the 128 individuals were in the US illegally at the time of indictment or death in the attack

Education:

The dataset provides information on individuals' education level, highest degree earned, and if they were a student at the time of indictment/death. Education level is broken down into: less than high school; some high school; completed high school; some college; completed college; some graduate school; and completed graduate school. The breakdown of the education level for the 76 known cases is illustrated in Figure 9. Of the individuals for whom education is known, 69% had education beyond high school: 34% had some college education; 20% had completed college; 3% had some graduate school; and 12% had completed a graduate degree.

Employment:

For each individual, the dataset provides information on whether they were employed, whether they were a professional, whether they were employed in a field related to their educational background, and details on their education and employment. Of the 95 cases for whom employment status is known, 71% were employed at the time of indictment/death, as seen in Figure 10.

Informants and Undercover Agents:

Of the 152 cases, 56--37%---had an informant involved in the investigation, and 27—18%--had an undercover agent involved. Figure 11 breaks down these figures by year of indictment, from 1999 to 2010. The years with the highest number of cases with informants or undercover agents correspond with the years with the highest number of indictments overall. For example, 2009 had the highest number of cases with informants involved, as well as the highest number of indictments. Thus, it is unclear if the use of informants and undercover agents is increasing or decreasing over time, based on this dataset.

Use of Chemical, Biological, Radiological and Nuclear (CBRN) Weapons:

The dataset breaks down the type of weapon used, or planned to be used, in the terrorist attack, into numerous types and combinations. Overall, 56 out of 152cases involved no weapons. Of the

cases for which weapons were involved, only one individual planned to use, or did use, a CBRN weapon as seen in Figure 12. This is the case of Jose Padilla, for whom the charge related to the use of CBRN weapons was dropped in 2005. Based on our dataset, CBRN weapons are rarely part of terrorist plots.

Material Support Charges:

Columns CA-CG provide details on whether or not an individual was charged with material support, and if so, what specific form of material support they provided, if known. Of the 147 cases for which this information is conclusively known, 52% were charged with material support, which is illustrated in Figure 13. As indicated in the dataset, however, if an individual was not coded for being charged with material support, they were either charged with another crime or were not indicted (for instance, if they were killed in an attack).

Alleged/Attempted Contact with Jihadist Groups:

Figure 14 indicates the total number of individuals per year of indictment who were known to have allegedly contacted or attempted to contact a jihadist group. Across all of the years, 61% of individuals had alleged or attempted contact with a known jihadist group. For the other 39%, there was no conclusive indication that such contact was attempted. It should be noted, however, that researchers considered an individual to have attempted contact if they contacted an informant or undercover agent who claimed to be a member of an organization.

Domestic vs International Targets:

In Columns CN-CT, the dataset provides details on the target of individuals' planned attack, if the case involved a specific target. Of the 117 cases involving specific targets, 46% involved a domestic target, 47% involved an international target, and 7% involved both a domestic and international target (e.g., if an individual was involved in multiple plots), as seen in Figure 15.

Training for Terrorist Attack:

The dataset provides information on whether or not an individual received training for the terrorist attack, and if so, whether training was received domestically or abroad. Figure 16.1 shows that for the 121 cases for which this information is known, 67% of individuals received

training. Figure 16.2 indicates where training occurred. Of the 67% who received training, 35% trained internationally, 28% trained domestically, and 4% trained both in the US and abroad. Details on an individual's training are included in Column DB.

Outcome of Legal Proceedings:

The dataset codes for whether an individual was convicted, acquitted, or pleaded guilty to some or all of the charges for which they were indicted. As seen in Figure 17, 35% of individuals pleaded guilty to some or all charges, 29% were convicted, 15% are still in legal proceedings, and 21% were not applicable (no trial/plea bargain, killed in attack, or at large).

Sentence Length:

Figure 18 graphically represents the sentence length for the 67 individuals who were sentenced and for whom the sentence length is known. In the other cases, individuals may not have been prosecuted (i.e., killed in attack), their sentence length is unknown, or their trials are still ongoing. As seen in Figure 16, most sentence lengths are between 5 and 26 years; 13 individuals received life sentences.

Questions for Further Analysis:

Given the current structure of the database, certain questions cannot be immediately answered. However, the database contains the necessary information to answer the following questions, if analysts re-structure the coding criteria appropriately:

- *How many converts to Islam were converted/radicalized in prison?* The current structure of the database only codes for whether an individual was converted to Islam; however, details of their religious practices, including how/when they were converted, are indicated in Column Z 'Narrative on religious practices,' where applicable. Offhand, we would estimate that 7 individuals out of the 35 for whom it is conclusively known they had converted, had converted in prison. Our references for these individuals include articles from credible news sources that specifically analyze this trend. In the future, a column can be added to code for where a person was converted, to answer this question.
- *Types of Charges:* The dataset only codes for whether an individual was charged with material support; the specific charges are written out in Column BC. In the future, the

dataset can be restructured to code for the various types of charges. With this information, it can be determined how they type of charge has changed over the years, whether certain charges are associated with the use of informants, etc.

- *Intent to fight American troops abroad:* In its present form, the dataset codes for: whether an individual's target was domestic or international; whether it was a military target, and if so, what type; and whether it was a civilian target, and if so, what type. Military targets include both US and non-US forces (e.g., Ethiopian forces in Somalia). However, in Column CT, details on the individual's target are provided, such as whether the target was US troops abroad. Therefore, to determine how many individuals intended to fight US troops abroad, this narrative information can be entered as a numerical value in an additional column.
- *Rate of joining non-Al Qaeda groups:* In its present form, the dataset codes for: whether an individual joined a known jihadist group and/or whether if they attempted to contact a known jihadist group; which group(s) the individual joined or contacted; and what forms of contact were made. In its present form, if an individual contacted multiple groups, the numbers for all groups were listed and separated by semi-colons. Consequently, it is not possible to count how many people contacted or did not contact a certain group, like Al Qaeda. To answer this question, a new code can be inserted for whether or not an individual contacted and/or joined Al Qaeda, if they contacted/joined a known group. Analysts can then determine how the rate of contact and/or membership with Al Qaeda has changed over time.
- *Rate of successful vs non-successful attacks over time:* Presently, in column CX, the dataset codes for whether an attack was successful or not by indicating if: nothing happened; or the various types of damage that resulted. However, '0-nothing happened' indicates if a person's plan was thwarted or failed, or if they never had a clear plan of attack to begin with (i.e., if they intended to fight with jihadist forces abroad). To determine whether the rate of success has changed over time, the data can be re-coded to indicate if an individual never planned an attack, or if their attack was thwarted. The dataset indicates the details of the attack, or if this was not applicable, in column CZ. It should be noted, however, that the years in the dataset are the year of indictment, not the year of the terrorist attack.
