Dr. Anderson and his colleagues at the University of Kentucky suggest that individuals trying to lower their levels of blood cholesterol should include about 5 grams of soluble fiber in their daily diet, while also restricting saturated fat and cholesterol. Thus they suggest eating more than the previously mentioned 35 grams of oatmeal or oat bran per day, which would supply 1½ to 2½ grams of soluble fiber, respectively. This should produce greater than 3% reduction in cholesterol levels.

According to this group's analysis, there are about 2 grams of soluble fiber in 1/3 cup (1 ounce or 28 grams) of dry oat bran, 1/2 cup (1.5 ounces or 43 grams) of dry oatmeal, and 1/2 cup (4 ounces or 114 grams) of cooked dried navy and pinto beans. (Note: Because of differences in methodology, the amount of soluble fiber reported for these and other products, including the foods used in the studies mentioned in this article, varies in the literature.)

Oat bran muffins have become a common way to incorporate oat bran in the diet. Oat bran can also be sprinkled in casseroles or added to baked goods and meat loaf. The goal

of 5 grams of soluble fiber per day can be met by eating a bowl of oat bran or oat meal for breakfast, one or more oat bran muffins for a snack during the day, and half a cup of cooked dried beans—or a bowl of soup made from dried beans—for lunch or dinner. Consumers should be aware that when bran is cooked as a cereal, it absorbs water and swells to a larger volume. For example, when 1/3 cup of oat bran is combined with 1 cup of water, the final product will be about 3/4 cup.

While health professionals agree that most Americans are not meeting the recommended goal of 20–35 grams of total dietary fiber per day, experts warn that people who are not accustomed to eating fiber should increase their intake gradually while also drinking more fluids. A large, sudden increase in fiber consumption may result in abdominal pain, gas, and diarrhea. However, the body seems to adapt to the regular and prolonged consumption of fiber-rich foods, and these symptoms generally subside. But too much fiber can, in rare cases, be dangerous. A diet very high in fiber recently was reported to have caused intestinal obstruction in an elderly man, requiring surgery [New England Journal of Medicine 320:1148, 1989].

In the next issue we will discuss the National Cholesterol Education Program's guidelines for blood cholesterol and the nuts and bolts of constructing a low-fat diet.

Dr. Kantor is an assistant professor and food and nutrition specialist with the University of Maryland's Cooperative Extension Service, and a regional communicator for the Institute of Food Technologists. His postdoctoral research was in cholesterol and lipoprotein metabolism.

BRIEFS

Benefit cereal challenged. Procter & Gamble has asked the FDA to stop General Mills from making cholesterol-lowering claims for its Benefit cereal. P&G's complaint stated that "General Mills has simply inserted psyllium, a recognized active ingredient in drug products like Metamucil, into a traditional food vehicle" and made claims for its "food" which the FDA will not permit for psyllium-containing drug products.

Bills would increase fat/cholesterol labeling. The Low Cholesterol Consumer Education Act of 1989 (HR 1441 and S 623) has been introduced by Representative Dan Glickman (D-KS) and Senator Tom Harkin (D-IA). This bill would require foods marketed with comparative claims about cholesterol and vegetable fats to include total fat, saturated fat, and cholesterol contents on their label. Similar bills have been introduced in several state legislatures. In California, for example, two bills would require disclosure of the amounts of fat and cholesterol and would ban "and/or" listing of fats and oils. In New York, a bill would require labels containing a "no cholesterol" claim to reveal the amount of saturated fat in the product. Consumer groups supporting these bills believe that the possibility of having different labeling requirements from state to state will help stimulate passage of a federal law.

FDA attacking illegal "Candida" supplements. The FDA Health Fraud Branch has issued instructions and a sample regulatory letter indicating that it is illegal to market vitamin concoctions intended for the treatment of yeast infections. Products of this type have been promoted by the health food industry for the treatment of "candidiasis hypersensitivity," a fad diagnosis called "speculative and unproven" by the American Academy of Allergy and Immunology [NF 3:14, 3:28, 4:84–85]. A few months ago, the FDA seized a supply of one such product, Cantrol, from its manufacturer, Nature's Way, of Springville, Utah.

Inappropriate treatments banned. The State of Washington Medical Disciplinary Board has ordered Leo J. Bolles, M.D., to stop prescribing thyroid medications and intravenous adrenal cortical steroids unless he diagnoses hypothyroidism or adrenal insufficiency using standard textbook guidelines. He was also ordered to take 150 hours of Board-approved courses in endocrinology and to maintain a file containing the names of all patients with endocrine problems so that their records could be reviewed by the Board. According to the *Townsend Letter for Doctors* (a newsletter sympathetic to unscientific methods), the Board "has been investigating a number of medical practitioners who practice unconventional medicine."

George Stickley retires. George F. Stickley, who founded the George F. Stickley Company in 1975 so he could publish authoritative books about nutrition and personal health, has sold the company to J.B. Lippincott. For more than a decade, Stickley publications provided the literary backbone for antiquackery activity throughout the United States. Lippincott plans to publish revisions of Stickley's most valuable books and to continue *Nutrition Forum* and *Nutrition Clinics* bimonthly. A catalog of Stickley/Lippincott nutritional and dietetic publications is available on request from Marylou O'Connor, J.B. Lippincott Co., East Washington Square, Philadelphia, PA 19105.

Spicy foods and the stomach. Using videoendoscopy, a research team inspected the stomach lining of 12 healthy volunteers who ate four types of meals: 1) a bland meal of unpeppered steak and French fries; 2) a bland meal plus three aspirin tablets; 3) a spicy Mexican meal (30 grams of jalapeno peppers); and 4) a pepperoni pizza. Each meal was served twice on test days for lunch and supper, and each volunteer was tested with all four types of meals with at least 24 hours between each meal type. All but one of the volunteers developed multiple gastric erosions while taking the aspirin regimen, while one or two individuals in the other groups developed single (insignificant) erosions. The researchers concluded that spicy foods do not produce demonstrable damage to the stomach lining of normal individuals [JAMA 260:3473-3475, 1988]. Reprints can be obtained from David Y. Graham, M.D., VA Medical Center, 2002 Holcombe Blvd., Bldg. 1A, Room 612 (111D), Houston, TX 77030.

Nutrition counseling recommended. On May 2, 1989, the U.S. Preventive Services Task Force issued a 294-page *Guide to Clinical Preventive Services* with recommendations about more than 100 interventions for 60 potentially preventable diseases and conditions. The task force, a 20-member nonfederal panel helped by more than 300 expert reviewers, was appointed in 1984 to determine what types of periodic physical examinations, laboratory tests, immunizations, counseling, and other measures are scientifically based and cost-effective. The panel's recommendations are intended to replace the "complete annual physical examination"—a battery of tests that is essentially the same for all patients—with interventions based on age, gender, and other risk factors. Overall, the panel recommended that physicians spend more time counseling patients on healthy living and less time doing routine screening tests. Its nutrition-related recommendations include counseling at appropriate times about: 1) dietary intakes of calories, fat (especially saturated fat), cholesterol, complex carbohydrates (starches), fiber, and sodium; 2) calcium and iron intake for women and adolescent girls; 3) nutritional guidelines during pregnancy; 4) nutritional requirements of infancy and early childhood; 5) safe use of alcohol; 6) appropriate fluoride and sugar intake; and 7) avoidance of baby bottle tooth decay (caused by propping bottles so the teeth remain bathed in milk while the infant sleeps). The report can be obtained for \$19.95 from Williams and Wilkins, P.O. Box 1496, Baltimore, MD 21298-9724 (or call 1-800-638-0672).

Antiquackery video available. Videotapes of *Vitamins and "Health" Foods: The Great American Hustle*, a 2-hour program presented last year by Dr. Stephen Barrett at the California Institute of Technology, are available for \$26 post-paid from Southern California Skeptics, P.O. Box 5523, Pasadena, CA 91107.

GNC resumes dubious advertising. About 2 years ago, faced with regulatory actions by the FDA, FTC, and Postal Service, General Nutrition Corporation sharply curtailed its practice of marketing products with false and misleading claims. However, its current catalog offers: Vitamin for the Hair ("for a thicker, fuller, shinier head of hair"); Time Stress B (for those willing to believe that "In today's hectic world, life's daily routine can rob you of important vitamins and minerals"); Octacosanol ("may speed reaction time . . . and strengthen muscles including the heart"); Memory Booster ("an aid to memory retention and mental alertness"); Coenzyme Q10 ("the energy supplement . . . popular as a cardiovascular supplement"); Cranberry Capsules ("for urinary tract infections"); Prostex ("to relieve the symptoms of benign prostatic hypertrophy"); and Spirulina Tablets ("helps cut your drive to eat").

Helsinki Hair Formula. In response to action by the Pennsylvania Department of Health, General Nutrition Corporation has agreed to stop marketing a "Helsinki formula" hair treatment. The product, which included a shampoo, a conditioner, and a vitamin tablet, had been marketed with false claims that it was a proven treatment for thinning hair and that the vitamin supplement contained "those special nutrients that have been proven helpful in an overall hair-care regimen."

Notable quote. "Regardless of state scope of practice laws, prepaid systems are likely to reject all but the most conservative [chiropractic] modes of dealing with patient problems. DCs who view themselves as holistic physicians, offer nutritional advice, use colonic therapy, and any of the other unconventional therapies will find their coverage rejected out of hand. The notion that prepaid systems should reimburse chiropractors for any services covered under the plan that they are licensed to provide simply will not fly." —from Kranz and Hendrickson: *Chiropractic and the HMO Challenge*, International Chiropractors Association, 1988.

Chiropractor's license suspended. On June 14th, the New Jersey Board of Medical Examiners temporarily suspended the license of Stanley Gutman, a Paramus chiropractor. At a preliminary hearing, Deputy Attorney-General Linda Ershow-Levenberg testified that earlier this year, Gutman had begun distributing brochures advertising himself as a family doctor and saying he would provide "confidential consultation" for cancer, multiple sclerosis, arthritis, heart disease, and other conditions beyond the scope of his license. Subsequently, Gutman offered treatment to an undercover state investigator with "ovarian cancer" and prescribed a diet of warm vegetables, skim milk, and bananas for another investigator who complained of a bleeding ulcer.

BOOK REVIEWS

Title: The 8-Week Cholesterol Cure (1987, 1988)

Author: Robert E. Kowalski

Publisher: Harper & Row, New York

Price: \$17.95

Reviewed by: Charles W. Marshall, Ph.D.

Having had a heart attack and two coronary bypass operations by age 41, medical writer Robert Kowalski began a program that reduced his total blood cholesterol level from 284 mg/dl to 169 mg/dl and increased his "good" HDL-cholesterol considerably. He says that he accomplished this within 8 weeks by: 1) eating a very low-fat (10–20% of calories), high-carbohydrate diet adapted from the American Heart Association's guidelines; 2) eating enough oat bran muffins to maintain a daily soluble fiber intake of 50 grams; and 3) taking gradually increasing doses of niacin (vitamin B₃) until he reached 3,000 mg daily. (The RDA of niacin for men is 16–18 mg.)

Before heralding his program to the world via a book, Kowalski persuaded Dr. Albert Kattus and the Santa Monica Medical Center Cardiac Rehabilitation Center to supervise 20 volunteers with high cholesterol levels for the 8-week program. The 15 who followed the rules were successful. However, nowhere in the original (1987) version of the book does Kowalski mention warning them that medical supervision would be imperative if they continued the niacin treatment.

In writing this book, Mr. Kowalski may have assumed an awesome responsibility. The book has sold over a million copies, and no doubt many of its readers have plunged into his program. Little fault can be found with his diet and oat bran proposals. However, daily intake of 3,000 mg of niacin (a *drug* at that dosage) entails risks.

In his chapter on niacin, Kowalski describes how he encountered favorable reports about niacin "buried in dozens of obscure medical journals" (hardly an apt description of JAMA!) and was puzzled that this information wasn't "widely disseminated by the medical community to patients like me and millions of others who could profit by it." The answer—which he apparently didn't grasp—is that the potential for adverse reactions limits niacin's usefulness.

Kowalski's advice about niacin appears to be based on his review of various scientific reports plus a large dose of personal enthusiasm. Unfortunately, although he lists some of the adverse reactions, he fails to place them in proper perspective. The key references¹⁻³ upon which he bases his advice indicate that only high-risk patients under the age of 60 should be given cholesterol-lowering drugs. But Kowalski encourages almost everyone with 205 mg/dl or higher to use megadose niacin to reach a level of 180–200 mg/dl.

The references also warn that daily doses of 3,000 mg of niacin should be taken only under medical supervision with testing every few months for liver dysfunction and high levels of blood sugar and uric acid. Kowalski's original edition merely suggests that if you decide to include niacin in your program to lower serum cholesterol levels, "be sure to inform your personal physician." The revised (1988) edition says "it's important to work with your physician in your efforts to lower cholesterol levels." However, this warning

may still not be forceful enough to discourage self-medication.

Although Kowalski warns that niacin should not be taken by people who have diabetes, liver abnormalities, peptic ulcer, or gout, he ignores a number of medical reports of serious side effects of megadose niacin, such as heart arrhythmias⁴ and liver damage⁵⁻⁷ that is reversible if detected in time. Rather, he states repeatedly that megadose niacin is a vitamin and is safe for long-term use.

Kowalski's 1987 edition fails to mention the importance of periodic blood tests, although they are recommended in his key references. The 1988 update advises having a single test of liver function after 2 months of niacin therapy and claims that if this is normal, no further testing will ever be needed. The update recommends slow-release niacin and claims that Harvard researcher Frank Sachs, M.D., had prescribed 1,500 mg/day to many patients and found "no side-effects whatever."

Curious about this, I telephoned Dr. Sachs, who told me that slow-release niacin does not produce the side effect of flushing that is common with ordinary niacin. However, he said that 15–20% of his patients develop abnormal elevations of liver enzymes, blood sugar, and/or uric acid levels. For this reason, he tests his patients every 3–4 months.

Kowalski's views about other vitamins reveal considerable ignorance of the scientific literature. In the 1987 edition, he claimed that "no harmful effects have ever been shown in terms of supplementation short of massive amounts." The revised edition lacks this error but still mentions that Kowalski takes a B-complex supplement which I believe contains enough vitamin B₆ to cause toxicity in some users.

Kowalski does do well in his chapters explaining the significance of the various blood lipids, the use of oat bran to help lower cholesterol levels, and how high-dose niacin probably diminishes cholesterol production by the liver. He also provides a sensible diet plan and a chapter on tempting recipes. His dietary program may be helpful, but should not be expected to produce a 40% drop in cholesterol level, as the book's jacket promises. Without niacin, only a 15–20% reduction is likely.

Responsible physicians believe that the prevention and treatment of heart disease should be approached in a comprehensive manner and that self-treatment with niacin is not sensible. A drug should not be considered unless dietary modification is unable to lower the cholesterol level sufficiently. If a drug is appropriate, the choice of the drug should depend on various factors. I believe the analysis is sufficiently complicated that professional help is advisable. I think it would be difficult to write a book that is sufficiently comprehensive for laypersons to design their own cholesterol-reduction program.

In October 1988, 74-year-old Maurice Fishman, of Beachwood, Ohio, filed a class-action suit charging that Kowalski and Harper & Row had "failed to adequately warn . . . of the serious injuries, disabilities and harmful side effects that would result from adherence to the program described in the book." The suit also charged that the program "was not safe, was not without drugs, was not a 'cure' and

was extremely dangerous." According to an article in *The Washington Post*, Fishman was hospitalized for 10 days for hepatitis after following the advice in the 1987 edition. Through its attorney, Harper and Row told the article's author that Fishman's suit is "without merit." It will be interesting to see whether the courts conclude that authors and publishers of health information can be held responsible for the quality of their advice.

Name: Cholesterol and Children (1988)

Author: Robert E. Kowalski

Publisher: Harper & Row, New York

Price: \$16.95

Reviewed by: Lisa Teresi Harris, R.D.

In this sequel to *The 8-Week Cholesterol Cure*, medical writer Robert Kowalski gives us the program that decreased his 7-year-old son's elevated cholesterol level from 181 to 141 and enabled his chubby daughter to "thin down considerably."

The book outlines the author's blueprint for "A Parent's Guide to Giving Children a Future Free of Heart Disease." Included in the work is a well-documented review of the relationship between elevated cholesterol levels in childhood and the development of heart disease later in life. Kowalski also describes the controversy surrounding cholesterol testing and treatment of children. Exercise, polyunsaturated versus monounsaturated fats, vegetarianism, and omega-3 fatty acids are also discussed.

The foundation of Kowalski's program is a low-fat, low-cholesterol diet, supplemented with 50 grams/day of oat bran. He recommends that children with elevated cholesterol levels have fat limited to 20-25% of calories and consume no more than 200 mg/day of cholesterol in their diet. He stresses gradual changes in eating habits and frankness with children regarding a heart-healthy diet. Tips on shopping with kids, modifying favorite recipes, selecting fast foods, and handling special occasions such as parties are also provided. This type of advice is the book's forte and will be welcomed by many parents.

To the author's credit, he recommends no dietary modifications for children under the age of two. Kowalski

states children should not be given large amounts of vitamins, and thus discourages niacin supplementation, a major recommendation in *The 8-Week Cholesterol Cure*. But the book still contains serious inconsistencies and inaccuracies. For example, while stressing the importance of a balanced diet, Kowalski says he sees no reason not to use vitamin supplements throughout life.

Kowalski claims that a diet of 20% fat is optimal for all children over the age of two. Yet when he discusses the recommendations of the American Heart Association (AHA), the American Academy of Pediatrics (AAP), and the U.S. Dietary Guidelines for Americans, he offers little evidence that this diet is appropriate for children. He also betrays an apparent lack of understanding of basic nutrition by stating incorrectly that "the RDA for each vitamin refers to the minimum amount needed."

When describing the cholesterol-lowering ability of soluble fiber, Kowalski fails to inform readers that the proposed mechanisms are just that—proposed and theoretical. His program for children is based on his experience with his son rather than controlled scientific studies. His dietary recommendations are more restrictive than those of the AHA, which suggests 30% of calories as fat, and the AAP, which suggests 30-40% fat. Also, studies on oat bran have not been conducted with children.

Although many of the ideas presented in *Cholesterol and Children* can help families attempting to change their eating habits, I don't recommend this book as a tool in the battle against cholesterol. I believe that the author has acted prematurely by making dietary recommendations without solid scientific evidence that they are safe and effective for children.

Ms. Harris is editor and publisher of *Current Diet Review*, a bimonthly newsletter that evaluates nutrition books and other publications.

Q. What is BST?

A. BST (bovine somatotropin) is a growth hormone produced naturally in the anterior pituitary gland of cattle. Research has shown that cows bred for increased milk production have higher BST blood levels and that injections of BST stimulate milk production in dairy cattle. (The average dairy cow produces 14,000 pounds of milk a year. BST use can add another 1,500 pounds, enough for about 700 quarts of milk.) Using recombinant DNA technology, scientists have been able to produce BST at a price low enough for commercial use. With BST injections, more milk can be produced with less feed and fewer cows. The cow's appetite increases, but the extra feed consumed is converted to milk rather than body fat. Field studies with BST-injected cows have shown milk increases of 10-15% on only 6-10% more of feed. Because BST is produced naturally by lactating cows, small amounts are found in the milk of untreated cows. BST treatment does not increase these levels. Regardless, BST is a protein that is digested like any other protein in milk and is not biologically active when ingested by humans.

NUTRITION, CHOLESTEROL AND HEART DISEASE PART V: DIETARY MODIFICATION

Mark A. Kantor, Ph.D.

In previous issues, we have discussed the risk factors for coronary heart disease (CHD), the structure and function of lipoproteins, and how dietary fats, cholesterol, and fiber affect blood cholesterol levels. This article describes the goals and guidelines of the National Cholesterol Education Program (NCEP) and how dietary modification can be accomplished.

The NCEP was initiated in November 1985 by the National Heart, Lung, and Blood Institute. It is a cooperative effort involving more than 30 health organizations and government agencies and is modeled after the highly successful National High Blood Pressure Education Program that began in 1972. Its goal is "to reduce the prevalence of elevated blood cholesterol in the United States, and thereby contribute to reducing coronary heart disease morbidity and mortality."

The NCEP is focusing on public education. It urges all adult Americans to have a blood test for cholesterol, to "know their cholesterol number," and to try to lower it if it is too high. To guide medical and nutrition professionals, the NCEP has developed flow charts for assessing cholesterol levels and recommending follow-up action.

Cholesterol Classification

First, an initial screening to determine an individual's total blood cholesterol level is performed by analyzing a nonfasting blood sample. A total cholesterol below 200 mg/dl is considered "desirable" (Table 1). About half of the adults in America fall into this category. These individuals should be given general information about how diet, exercise, and smoking relate to heart disease risk, and be rechecked within 5 years.

A cholesterol between 200 and 239 mg/dl is considered "borderline-high." About 25% of American adults fall within this range. Those who have fewer than two other risk factors for coronary heart disease or definite indication of CHD such as angina or a previous heart attack should start NCEP's Step-One Diet, which limits total fat to 30% of calories and cholesterol to 300 mg/day (Table 2). The risk factors are male gender, family history of premature CHD, cigarette smoking,

high blood pressure, HDL-cholesterol less than 35 mg/dl, diabetes, peripheral artery disease, and obesity (30% excess weight).

Those in the 200-239 range who have at least two risk factors or are known to have CHD should have a lipoprotein analysis to determine their HDL, LDL, and triglyceride levels. This test is performed on a blood sample obtained after an overnight fast of 12-14 hours. (The LDL level is not measured directly but is calculated by subtracting HDL plus one-fifth of the triglyceride level from total cholesterol. The reason for fasting is that triglycerides are influenced by eating.) A lipoprotein profile should also be obtained for those whose screening test result is considered "high"—240 mg/dl or greater. About 25% of adult Americans fall within this range. Because cholesterol values can vary from day to day in a given individual (and laboratory results can also vary), those in the borderline-high or high range should be retested within 1-8 weeks, and the average value used. However, if the two tests are more than 30 mg/dl apart, a third test should be obtained and the average of the three tests used.

TABLE 1: NCEP CLASSIFICATION OF SERUM CHOLESTEROL LEVELS (MG/DL)*

Total Cholesterol	
Under 200	Desirable
200-239	Borderline-High
240 or more	High
LDL-Cholesterol	
Under 130	Desirable
130-159	Borderline-High-Risk
160 or more	High-Risk

*Many scientific publications follow the Systeme International, which expresses cholesterol values in millimoles per liter (mmol/l). To convert mg/dl to mmol/l, multiply by .02586 and round off to the nearest 0.05. Thus, 200 mg/dl would be 5.15 mmol/l, and 130 mg/dl would be 3.35 mmol/l.

The classification for LDL is similar to that for total cholesterol: below 130 mg is considered "desirable," 130–159 is considered "borderline-high-risk," and 160 or more is considered "high-risk" (Table 1). Treatment recommendations are based primarily on LDL levels. Individuals in the desirable range should be given general information about reducing CHD risk and be retested within 5 years. If the LDL level is 130 or above, the patient usually is advised to begin a Step-One Diet. However, if the LDL is extremely high (greater than 225 mg/dl) or the patient has definite CHD, a stricter diet or drug therapy may be initiated.

The HDL level also is helpful in assessing an individual's risk for heart disease. The lower the HDL, the greater the risk. Many people can raise their HDL level by losing weight, quitting smoking, and increasing their physical activity. Unfortunately, the NCEP has not emphasized regular aerobic exercise as an adjunct to diet in improving the lipoprotein profile. Besides helping to lower serum triglycerides and raising HDL levels, exercise can help people lose weight, which, in turn, can help to decrease total cholesterol and LDL levels. For obtaining the maximum benefit, most experts recommend building up to three to four times a week for 30–45 minutes at a pace vigorous enough to produce a training effect on the heart. However, any amount of physical activity—including moderate walking and gardening—may be beneficial. Individuals who have been sedentary or who have CHD should consult a physician before starting an aerobic exercise program.

The NCEP considers dietary treatment the cornerstone of therapy to reduce elevated cholesterol levels. If a Step-One Diet does not succeed in lowering the LDL level below 130 mg/dl, the more rigorous Step-Two Diet containing fewer than 7% of calories from saturated fat and under 200 mg/day of cholesterol should be used. If all dietary attempts fail to correct elevated LDL levels within about 6 months, then drug therapy should be considered in addition to diet.

The primary goal of dietary therapy is to maintain an LDL level below 130 mg/dl. The underlying assumption is that this will help prevent heart attacks by inhibiting the growth and development of atherosclerotic plaque and may reduce the amount of plaque already present. While scientists have never proven that lowering serum cholesterol through diet will shrink plaque deposits, this has been demonstrated with the help of drugs. In the Cholesterol-Lowering Atherosclerosis Study (CLAS), a 22%-fat diet plus niacin and colestipol (a bile

acid-binding resin) were used by 80 middle-aged men who had undergone coronary bypass surgery [JAMA 257:3233–3240, 1987]. During a 2-year period, their average LDL level dropped from 171 to 97, and arteriography demonstrated that most had held their ground and some had undergone improvement in their coronary arteries. If diet alone can improve lipid levels sufficiently, plaque regression may well occur.

The cholesterol level of the average American adult is between 210 and 220 mg/dl. Using NCEP criteria and lipid levels from the 1976–1980 National Health and Nutrition Examination Survey (NHANES II), government experts have estimated that about 60 million Americans aged 20 years and older are candidates for medical advice and intervention [JAMA 262:45–52, 1989]. The cost of such intervention would be many billions of dollars.

The NCEP recommendations are based mainly on studies of middle-aged men. Comparable data are not available for women (who are less likely to develop CHD). Although major studies have shown that the incidence of heart attacks is decreased by improving blood cholesterol levels, no increase in longevity has ever been demonstrated. However, supporters of the NCEP protocols suggest that an overall benefit from lowering blood cholesterol levels will be demonstrated eventually and that there appears little risk in making the suggested dietary modifications. Many experts have advised caution in applying NCEP's guidelines too aggressively to elderly individuals until more data can demonstrate that the benefits of following the guidelines outweigh the risks, costs, and inconvenience involved. In fact, the U.S. Office of Technology Assessment has recommended that Medicare not pay for cholesterol screening [JAMA 262:464, 1989]. Expert panels in Canada, England, and some European countries are not advocating mass screening for cholesterol, but suggest treating individuals on a case-by-case basis. Their guidelines are more conservative, with higher action ranges than those of the NCEP.

General Dietary Guidelines

To assist consumers trying to lower their blood cholesterol, the NCEP suggests five general guidelines:

- Eat less high-fat food, especially foods high in saturated fat.
- Replace part of the saturated fat in the diet with

TABLE 2: DIETARY THERAPY OF HIGH BLOOD CHOLESTEROL

Nutrient	Step-One Diet	Step-Two Diet
Total fat	Less than 30% of calories	Less than 30% of calories
Saturated fatty acids	Less than 10% of calories	Less than 7% of calories
Polyunsaturated fatty acids	Up to 10% of calories	Up to 10% of calories
Monounsaturated fatty acids	10–15% of calories	10–15% of calories
Carbohydrates	50–60% of calories	50–60% of calories
Protein	10–20% of calories	10–20% of calories
Cholesterol	Less than 300 mg/day	Less than 200 mg/day
Total calories	To achieve and maintain desirable weight	

TABLE 3: DIETARY MODIFICATION GUIDEBOOKS

Title	Author(s)	Method	Food Analyses	Recipe Analysis	Sample Menus
Controlling Cholesterol	Kenneth H. Cooper, M.D., Ph.D.	Uses food exchange system to modify sample weekly diet plans	Calories, fat and cholesterol listed for over 500 food items, with fat composition specified for many	Yes	Yes
Count Out Cholesterol	Art Ulene, M.D.	Provides system for counting levels of saturated fat and dietary fiber to reach goals based on weight or activity level. Cholesterol is tabulated separately.	Ratings assigned for saturated fat, fiber and cholesterol for about 300 foods	No	No

unsaturated fat. There is no biological need for dietary saturated fat, but it is practically impossible to avoid eating some of it.

- Eat less high-cholesterol food.
- Choose foods high in complex carbohydrates (starch and fiber), such as fruits, vegetables, whole grain cereals, beans, and legumes.

- Reduce weight if overweight.

At the First National Cholesterol Conference, held in Arlington, Virginia, in November 1988, nutrition professionals agreed that the first practical step toward dietary change is to become more aware of one's diet, especially the amount of food eaten and the brands usually purchased. Toward this end, consumers should get into the habit of checking labels to determine the amount of cholesterol and the amount and type of fat. They also need to become cognizant of the "hidden" fats found in processed foods, such as cookies, crackers, and snack cakes, and the kinds of fats and oils used in their own cooking.

The next step is to make substitutions. For example, use leaner cuts of beef (select or choice rather than prime), and increase the consumption of fish, poultry, fresh fruits and vegetables, beans, and legumes. Make foods high in complex carbohydrates—such as whole grains, beans, and vegetables—the main dish, with small amounts of red meats and cheeses becoming the side dishes. Prepare more often mixed dishes such as stews, casseroles, and pasta and rice meals that

combine small amounts of meat with other foods, such as grains or vegetables.

Finally, consumers should evaluate their progress by having their blood cholesterol tested. Strive for a gradual but steady reduction in the total cholesterol and LDL-cholesterol levels.

Lowering Saturated Fat and Cholesterol

Because the major sources of saturated fat in the American diet traditionally have come from beef and dairy products, dietary advice aimed at lowering blood cholesterol often focuses on cutting back on hamburgers and fatty meats, whole milk, and cheeses—and getting into a habit of preparing foods with less fat. The following suggestions can help consumers choose and prepare foods lower in saturated fat and cholesterol.

- Trim all visible fat from beef and poultry, and remove the skin from poultry.
- Bake, broil, or roast meat dishes instead of deep-fat frying them. To prevent drying and add flavor, baste with wine, lemon juice, or low-fat broths.
- Try experimenting with herbs and spices, such as dill, tarragon, cilantro, and basil.

- Avoid fatty gravies and sauces.
- If pan- or stir-frying, use small amounts of vegetable oils such as canola or safflower oil; also increase your use of olive oil.
- One important change consumers should make is using margarine rather than butter. Many low-calorie margarines, in which water is substituted for some of the oil, are now available. Most butter-margarine combinations still contain 80% fat and should be limited.
- To cut down on whole milk products, switch to 2% or 1% milk, and perhaps eventually to skim milk. Many people find it easy to get accustomed to low-fat milk, and find that when they do so, whole milk tastes too rich. Use the low-fat or skim-milk versions of ricotta, cottage, and mozzarella cheese. Low-fat farmer or pot cheeses also are available. All these cheeses should contain no more than 2–6 grams of fat per ounce. For desserts, substitute ice milk, frozen yogurt (especially the nonfat variety), sherbet, or sorbet for ice cream. If you do eat ice cream, choose regular rather than super premium types.
- Where cholesterol and fat content are not specified on the label, it may still be possible to tell whether a product contains saturated fat or cholesterol by checking the ingredient list. Consumption should be limited of foods that contain palm, palm kernel, and coconut oils; lard; butter; shortening; egg-yolk solids; and whole-milk solids. Also, cut down on baked goods made from these ingredients or that are fried, such as doughnuts.
- Use yogurt instead of sour cream in dips and toppings.
- Use only the egg whites or discard every other yolk in recipes requiring eggs (2 whites = 1 whole egg in recipes). Or, try commercial cholesterol-free egg substitutes.
- Reduce the amount of fat in recipes by a third to a half, and use chiefly poly- and monounsaturated oils.
- In coffee, use low-fat or skim milk instead of non-dairy creamers containing saturated fats. Skim milk powder also is acceptable.
- Make your own popcorn for a low-calorie snack, but be sure to omit the melted butter. Beware of high-fat microwave popcorn products.
- Avoid nuts that are high in saturated fats, such as coconuts and macadamia nuts.
- Incorporate oat fiber into your diet, for example, in oat bran muffins or in casseroles. And to increase your total fiber intake, look for the words "whole wheat" or "whole grain" near the top of the ingredient list when buying breads and cereals.
- Use fresh fruit for dessert instead of fruit packed in syrups or high-fat desserts.
- Choose low-fat luncheon meats such as pressed turkey instead of salami and bologna. Also eat few frankfurters, other sausages, and bacon. When eating turkey, remember that light meat has less fat than dark meat.
- Shrimp, lobster, and other shellfish may be eaten occasionally because they are lower in cholesterol than previously thought, and do not contain too much saturated fat.
- Buy or make salad dressings with predominantly unsaturated oils. Olive oil is an especially good choice.
- Limit your use of organ meats that are very high in cholesterol, such as liver, kidneys, brain, and sweetbreads.
- Prepare soups and stews containing meat the day

before eating them. After refrigerating, skim off the congealed fat on the surface prior to reheating.

- Substitute rice and pasta for egg noodles.
- Steer clear of most store-bought baked products such as pies, cakes, croissants, pastries, and muffins, and try to find low-fat cookies and crackers. Better yet, eat homemade baked goods prepared with small amounts of unsaturated oils. Angel cake is a good choice because it is low in fat and cholesterol.

A key concept in successfully switching to a "heart-healthy" diet is to make the changes gradually to avoid feeling deprived. For example, instead of having bacon and eggs for breakfast every day, save that meal for weekends. Eventually, have it only once a month or on special occasions. For most people, enjoying a rich dessert or a prime rib once in a while is not going to significantly affect their cholesterol level as long as the overall cholesterol-lowering diet is followed most of the time. It is better to splurge once in a while than to cheat a little bit each day.

Many cookbooks can help make switching to a cholesterol-lowering diet simple and fun. Consumers should not consider such a diet to be a hardship. Indeed, with a little practice and experience, it is not difficult to prepare tasty meals that are low in fat, cholesterol, and calories, and high in fiber.

In any case, a diet to lower cholesterol should not be regarded as a temporary eating plan. To be effective, it must become a lifetime commitment that also is accompanied by regular aerobic exercise.

By following the above tips, consumers will automatically reduce the fat, saturated fat, and cholesterol content of their diet, and should come close to the levels recommended by the NCEP Step-One Diet. But the only way to determine how much fat and cholesterol is actually consumed is to add up the amounts contained in the daily diet. While milligrams of cholesterol can be added directly, the percentage of fat must be calculated using information on product labels or from food composition tables. The percentage of calories from fat equals:

$$\frac{\text{grams of fat consumed during the day} \times 9}{\text{total calories eaten}} \times 100$$

Nutrition Forum (ISSN 0748-8165) is published bimonthly by J.B. Lippincott Company, Downsville Pike, Route 3, Box 20-B, Hagerstown, MD 21740. POSTMASTER: Send address changes to Nutrition Forum, Downsville Pike, Route 3, Box 20-B, Hagerstown, MD 21740.

Precise self-determination of fat and cholesterol intake can be difficult because many foods do not carry complete nutrition labels and determining the fat and cholesterol content of many restaurant items is difficult or impossible (although many fast food outlets publish information about their products). Several popular books contain food composition tables to help consumers plan their diet (Table 3).

Computer programs are also available for determining fat and cholesterol intake. The ones containing large databases, including nutritional analyses of brand-name products and fast food items, generally provide the most accurate information. Computer programs are accessible to consumers at certain clinics and through nutrition professionals in private practice. Some are also marketed directly to the public.

Despite these self-help aids, most consumers wishing to design a diet that is significantly low in fat would be wise to seek professional advice from a registered dietitian or other professional nutritionist.

On the Horizon

In response to public outcry, several bills have been introduced in Congress to increase the amount of information on food labels, and the FDA is reviewing proposals to modify them.

Meanwhile, the American Heart Association is gearing up to affix a "heart-healthy" logo on certain packaged and processed foods that are low in fat and cholesterol, as well as in saturated fat and sodium. Critics of this HeartGuide Program say it is simplistic to classify individual foods as good or bad when the amount of food eaten and the overall composition of the diet are what really counts. But the Association plans to launch a massive national awareness campaign to address this concern and alert consumers and professionals to the program. In addition, it will set up a national telephone hotline to answer questions from consumers and journalists.

Experts are predicting that, as more Americans improve their diet, exercise appropriately, and stop smoking, the death rate from heart disease will continue to decline, perhaps plummeting sharply by the end of this century. For individuals who, because of genetic reasons, cannot be helped through diet and exercise alone, new and improved medications to lower cholesterol undoubtedly will become available.

Dr. Kantor is an assistant professor and food and nutrition specialist with the University of Maryland's Cooperative Extension Service, and a regional communicator for the Institute of Food Technologists. His postdoctoral research was in cholesterol and lipoprotein metabolism.

BRIEFS

"Baldness remedies" banned. On July 7th, the FDA announced that it will ban the sale of any nonprescription product claimed to grow hair or prevent baldness. This regulation, scheduled to take effect in January 1990, resulted from recommendations by a panel of experts who evaluated numerous ingredients, including lanolin, olive oil, wheat germ oil, and vitamins. In announcing the proposed ban, the agency noted that nothing done to a hair shaft once it emerges from the surface of the scalp will influence hair growth. The prescription drug Rogaine (minoxidil) is the only FDA-approved product for stimulating hair growth on the crown of the head in individuals with male pattern baldness, which is an inherited trait. Because hair loss can also result from crash dieting, iron deficiency, and various other underlying medical causes, the agency recommends that anyone experiencing a sudden, unexplained hair loss consult a doctor promptly.

Tropical oils to be used less. According to a report in the *Tufts Diet and Nutrition Letter*, 13 major food manufacturers have announced that they are reformulating many of their products without coconut, palm, or palm kernel oil. These oils generally cost less than other oils and help products stay fresh longer. However, their use has been heavily criticized because they are high in saturated fat. The 13 firms are Borden, General Foods, General Mills, Heinz U.S.A., Keebler, Kellogg, Nabisco, Pepperidge Farm, Pillsbury, Procter & Gamble, Quaker Oats, Ralston Purina, and Sunshine Biscuit. Much of the criticism came from Phil Sokolof, a Nebraska businessman who spent \$2 million on

ads headlined "The Poisoning of America!" Sokolof, who had had a heart attack and became concerned about his high cholesterol level, was enraged that companies were passing off products as "cholesterol-free" although they contained tropical oils. *Editor's note:* Although tropical oils represent a relatively small part of the saturated fat consumed in this country, their widespread use in foods did pose a serious problem for people wishing to achieve very low saturated fat intakes.

Cholesterol screening device. The FDA has approved use of the Clinicard, a device for rapidly estimating serum cholesterol levels. The device is manufactured by Chem-Elec, Inc., of North Webster, Indiana. It uses a drop of blood on a chemically treated card, with estimated levels indicated by the amount of color change. It does not give exact results but indicates whether the sample tested falls below 200 mg/dl, is between 200 and 300 mg/dl, or is over 300 mg/dl. The Clinicard is intended for screening by physicians to identify people with elevated levels who might need treatment. People with elevated readings should receive further cholesterol evaluation with conventional laboratory tests. The device is not accurate enough to diagnose an elevated cholesterol condition or to monitor the progress of cholesterol-lowering drug therapy.

Quaker buys Pritikin. Pritikin Systems, Inc., which owns all Pritikin enterprises except for the Pritikin Longevity Centers in Santa Monica, Miami Beach, and Downingtown (PA), is now a wholly owned subsidiary of the Quaker Oats

Company. The Longevity Centers will continue to operate independently under license from Pritikin Systems. Quaker plans to continue the marketing of Pritikin food products and to open new lifestyle change facilities.

Fear of obesity. Researchers who evaluated 326 high school girls have reported that 36% were underweight, 47% had normal weight, and 17% were overweight for their height [Pediatrics 83:393-397, 1989]. A majority of the girls in all three categories said they were terrified about being overweight, and 72% reported that they had attempted to diet. Dieting at the time of the survey was reported by 20% of those who were underweight, 32% of those with normal weight, and 54% of those classified as overweight. The researchers hypothesize that "fear of obesity and inappropriate eating behaviors are pervasive among adolescent girls regardless of body weight or nutrition knowledge." Reprints can be obtained from Fima Lifshitz, M.D., Department of Pediatrics, North Shore University Hospital, Manhasset, NY 11030.

Chiropractic nutrition practices. Researchers from San Jose State University's Department of Nutrition and Food Science have published the results of a survey mailed to 438 members of the San Francisco Bay Area Chiropractic Society [Journal of the American Dietetic Association 89: 939-943, 1989]. Usable responses to the five-page questionnaire were returned by 100 practicing chiropractors. Of these, 60 indicated that they routinely provide nutrition information to their patients and 38 said they provide it on request. Sixty claimed that they treat patients for nutritional deficiencies. Nineteen said they use hair analysis, and nine indicated that they use "applied kinesiology" for nutritional assessment. (Neither test is valid for this purpose.) Noting that chiropractors treat many patients and have a high level of interest in nutrition, the article recommends that dietitians provide nutrition information through chiropractic journals and seminars. *Editor's note:* It would have been interesting to know more about the quality of the chiropractors' advice. I suspect that the majority who routinely advise patients about nutrition also prescribe and sell megavitamins and other supplement concoctions. Although some chiropractors can absorb valid information from dietitians, I suspect that the majority are too delusional to do so.

Another sales device. *Delicious!*, issued eight times a year by the publisher of the trade publication *Natural Foods Merchandiser*, is a magazine given to customers by health food stores and sold by subscription. It began publication in 1985 with the intention of helping readers to "integrate the full spectrum of quality products sold in natural foods stores . . . into your life. Many of its articles make unproven claims for foods, vitamins, and other dietary supplements. In this way, claims that cannot legally be made on product labels are made in the text of the magazine, where they are protected by freedom of the press. In most issues, supplement product ads are placed next to articles boosting their ingredients. These characteristics are typical of health food publications, but *Delicious!* goes a step further. Since 1987, it has contained a "Shopping Guide" that lists products containing substances mentioned in the articles and manufacturers (including advertisers in the magazine) who market them.

Oxygen for athletes criticized. A double-blind study of 12 members of a professional soccer team found that they did not recover from exhaustive exercise significantly faster or subsequently perform better after breathing 100% oxygen than they did after breathing room air [JAMA 262:227-229, 1989]. In addition, the athletes could not tell whether they had been breathing oxygen or air. The authors conclude that although supplemental oxygen is widely used by competitive athletes, any benefit is most likely due to a placebo effect. This is not surprising because arterial blood becomes almost saturated with oxygen extracted from normal atmospheric air, so there is no reason to believe that breathing oxygen-enriched air will cause significantly more oxygen to be delivered to body tissues.

Kowalski update. A 1989 revision of Robert Kowalski's *8-Week Cholesterol Cure* was released in August. The book contains new chapters about: 1) the special needs of women, children, and the elderly; 2) the accuracy of cholesterol testing; 3) prescription drugs for lowering cholesterol; and 4) evidence that atherosclerosis may be reversible. The book also contains warnings that niacin is best taken under medical supervision and that liver function tests should be obtained periodically. Charles Marshall, Ph.D., who reviewed the 1987 and 1988 versions for *Nutrition Forum* [NF 6:31-32], considers the new edition improved, but notes that several errors which he pointed out remain in the 1989 edition.

Meat inspections will continue. The U.S. Department of Agriculture has responded to nearly 1,800 comments and withdrawn its proposal to reduce the federal inspection at meat and poultry processing plants.

"Fat Blocker" blocked. A federal court judge has issued a temporary restraining order against David Erickson (d/b/a Princeton Labs, Las Vegas), barring sales of alleged diet pills under the names Maxilite and Fat Blocker. The company had placed full-page ads in newspapers across the nation claiming that the pills could "flush calories right out of the body."

QUESTION BOX

Q. Recently I saw the term "non-tropical canola oil" on a food product label. What does this mean?

A. Canola is a special form of rapeseed that originated in Canada in the late 1970s. Rapeseed oil is usually high in glucosinolates and erucic acid (a fatty acid), both of which have nutrition and health disadvantages. Agricultural research has succeeded in breeding low-glucosinolate, low-erucic-acid rapeseed (LEAR), from which the oil is extracted. Now called "canola" (short for "Canadian oil"), it is an excellent vegetable oil that is low in saturated fat and is being used increasingly by the food industry. Since Canada is not a tropical country, it is technically correct to say that canola oil is "nontropical." But this is obviously intended to capitalize on the fact that the tropical vegetable oils (coconut, palm, and palm kernel oils), which are high in saturated fat, are under attack as "killer fats."

GARBAGE IN OUR FOOD?

Manfred Kroger, Ph.D.

On August 2, 1989, the Subcommittee on Oversight and Investigations of the U.S. House of Representatives' Committee on Public Works and Transportation held a hearing on the practice of hauling municipal solid waste in trucks that regularly carry meat, poultry, produce, and other food and consumer products. The Subcommittee's investigation suggests that this practice—called "backhauling"—is most common in the Northeast and Midwest, where trucks used to transport food from the Midwest are loaded at East Coast transfer stations with baled trash for landfills in Pennsylvania, Ohio, Kentucky, and West Virginia. The Government Accounting Office is also looking into this matter.

No current federal law or regulation specifically prohibits backhauling. The FDA probably could stop it by declaring that any food shipped in trucks used to haul trash is adulterated, but the agency may not have sufficient resources to detect violators. In June, Rep. Christopher Smith (R-NJ) introduced the Food Contamination Prevention Act, which would require the Department of Transportation to issue regulations to prohibit vehicles that haul solid or hazardous waste from being used to transport food. (Violators would be subject to criminal penalties of up to \$250,000 and 5 years in jail.) Meanwhile, the situation worries scientists and others concerned with the safety of our food supply.

Backhauling of garbage in food trucks presents a dilemma typical of densely populated areas in industrialized societies. People produce garbage, and garbage must be dealt with. One reason for the relative success of humans is that our ancestors recognized that waste products pose dangers to human health. We can ill afford to bring back the crude practices of previous ages when food-borne diseases were a major cause of debilitation and death.

Garbage hauling is reputed to be considerably more profitable than food hauling and can boost the income of truckers who might otherwise have to travel with an empty rig. But food scientists see the loading of dangerous wastes onto food trucks as a grave threat to the basic mission of our food system to produce the best possible quality and consumer satisfaction. Testimony at the hearing indicated that the Campbell Soup Company has sought assurance from trucking firms that their products would not be hauled in trucks that had carried garbage.

As far as I know, no scientific study has been done to explore whether backhauling can be done safely. But there are cogent arguments against it.

Unless extreme care is exercised to remove every trace of a previous shipment of garbage, unwanted matter will be transferred. Even without visible adulteration, tiny amounts

of contaminants can compromise food quality. For example, odors can be so persistent that spoiled silage fed to cows will make their milk taste unpleasant, and butter will assume an onion-like taste if left uncovered in a refrigerator with cut onions.

Metal trucks are easier to clean than trucks with wooden bodies. Wood retains odors more tenaciously. Even if a cleanup method were devised to make a garbage truck clean enough for food, the first illiterate, lazy, disgruntled, or careless worker would defeat what might look like a rational solution to the problem.

It is easier to rid a truck of residual chemical substances than of bacteria, viruses, molds, and yeasts. Chemicals don't multiply, but microorganisms do. Even one can turn into trillions if conditions are right. It is tough enough to clean and sanitize *food* containers. In my opinion, it's impossible (or would be prohibitively expensive) to make garbage containers compatible with foods.

One firm in Arkansas sells truck-size plastic bags for \$50 apiece and suggests that these may offer a solution. This concept is interesting and may be ripe for research, but I suspect that the plastic can be punctured by debris and that gas generated by bacterial fermentation might burst the bags.

Many truckers are said to refrigerate their garbage to keep the odor down. This raises the question of whether an air conditioner can harbor and grow bacteria and later blow them over a shipment of food. I don't know the answer, but I do recall that the fatal outbreak of Legionnaires' disease in Philadelphia in 1976 was traced to bacteria distributed through a hotel air-conditioning system. Also, it is known that buildings can become "infected" with bacteria that lodge near the intake ducts of air-conditioning systems. I believe that food trucks that back into filthy dump sites can easily pick up disease-causing bacteria that later can spread to food during loading.

There is also the psychological factor. The subject has received minimal publicity, but for most people the idea of backhauling would probably be as appealing as the thought of eating potato salad from a presumably cleaned-up cat litter box.

In the interest of fairness as well as science, I hope that enough data emerge from this hearing and subsequent investigations for a wise legislative decision to be made. Meanwhile, my gut reaction, like that of most food scientists, is that food trucks should be designated as such and not be allowed to carry materials injurious to food quality or public health.

Dr. Kroger, who testified at the subcommittee hearing, is professor of food science at The Pennsylvania State University.

BOOK REVIEWS

Title: How Superstition Won and Science Lost: Popularizing Science and Health in the United States (1987)

Author: John C. Burnham

Publisher: Rutgers University Press, 109 Church St., New Brunswick, NJ 08901

Price: \$35 hardcover, \$16 softcover

Reviewed by: James Harvey Young, Ph.D.

John Burnham, a historian of American science and medicine at Ohio State University and next president of the American Association for the History of Medicine, skillfully defends the validity of his title by tracing the decline and fall in the quality of popularization over the last hundred years.

In the late nineteenth century, the nation's best scientists considered it a social obligation to use reason and research to combat superstition and mysticism among the populace. During the present century, leaders in science and medicine have retreated from this task, which has been assumed mainly by the mass media and advertising. Broad context, rational setting, and honest candor have given way to the sensational treatment of isolated items, often aimed at serving special interests. These trends have ill served the public interest. Old superstitions have lingered because of inadequate exposure, and the most blatant kind of remystification is rampant.

The lesson in Burnham's book is that accurate and reliable publications, such as *Nutrition Forum*, are rare voices in a vast wilderness of irrationality. Those who wish to understand how this situation has come about will profit by turning to Burnham's richly textured and lucidly argued account, in which health is a central focus.

Dr. Young, who is Professor of History at Emory University, is a social historian with special interest in the development of food and drug regulation in America. His books, *The Toadstool Millionaires* and *The Medical Messiahs*, trace the history of quackery in America and efforts to control it.

Title: Controlling Cholesterol (1988)

Author: Kenneth H. Cooper, M.D., Ph.D.

Publisher: Bantam Books, New York

Price: \$23.95

Reviewed by: Lisa Teresi Harris, R.D.

Kenneth Cooper, M.D., often called the father of aerobics, has written what might be subtitled, "The Layperson's Complete Guide to Cholesterol." This work describes lifestyle modifications to help decrease the risk of heart disease by controlling (not eliminating) cholesterol. Cooper gives readers the facts in plain English, interprets them, and attempts to personalize the information so that dieters can make permanent changes.

Controlling Cholesterol is an interesting combination of anecdotes, scientific evidence, and recommendations. Cooper begins his book with a description of cholesterol and heart disease. He traces the history of cholesterol from its first reported scientific investigation (1733) through its ex-

traction, identification, and elucidation. Next, he details cholesterol metabolism, likening the major players to characters in a naval scene.

The significance of LDL, HDL, total cholesterol, triglycerides, and their interactions is explained, and a cardiovascular disease risk chart, based on age, sex, and various blood lipid levels is provided. (This book was published before the release of the NHLBI classifications for blood cholesterol; therefore, the categories are slightly different.) A discussion of the blood cholesterol test itself addresses such issues as how often the test should be taken, whether it should be taken in a fasting state, and how much it costs.

Cooper's "Controlling Cholesterol Diet" is a three-level approach to the problem. Depending on the reader's lipid profile, a basic (300 mg cholesterol per day, 20-30% fat), moderate (200 mg cholesterol, 15-20% fat), or strict (100 mg cholesterol, 10-15% fat) diet is given. Complex carbohydrates range from 50-70% of calories. Cooper provides a 1,500-calorie, 2-week diet (with recipes) for women and a corresponding 2,200-calorie diet for men. An exchange system is supplied for those who wish to develop their own plans.

The author supports aerobic exercise as a way to improve the cholesterol balancing act, and offers detailed recommendations. Other topics include the effects of alcohol, smoking, coffee, obesity, age, sex, stress, monounsaturated fats, and oat products on cholesterol metabolism and heart disease risk. Drug therapy, children and cholesterol, and the reversibility of atherosclerosis are also discussed.

This book summarizes and integrates numerous scientific studies. Cooper specifies certain studies with journal citations and provides almost 300 "selected references" at the back of the book. The information is therefore accurate and up-to-date.

Cooper has a knack for describing very technical processes in an understandable manner. Better still, he presents more than one side of an issue and attempts to explain why studies occasionally conclude with differing results. He interprets the information, summarizes it, and makes a stand, giving his recommendation for each topic in the book. He does not jump on the bandwagon when he feels further research is warranted (e.g., fish oils, oats).

Cooper's dietary recommendations are consistent with those of most medical authorities. The fiber, cholesterol, and sodium levels of the provided menus are all at appropriate levels. The recipes reflect a dietary program developed by the nutrition staff at Cooper's Aerobics Center in Dallas, Texas.

Controlling Cholesterol is accurate, comprehensive, and easy to understand (although by no means light reading). Cooper's emphasis on preventive medicine and his interest in permanent lifestyle changes shine clearly throughout this book, which is well worth the price for anyone interested in minimizing the risk of atherosclerotic heart disease.

Ms. Harris is editor and publisher of *Current Diet Review*, a bimonthly newsletter that evaluates nutrition books and other publications.

FALSE TENETS OF PARAHERBALISM

Varro E. Tyler, Ph.D.

True herbalism encompasses scientific testing, honest reporting of the results, and safe use of effective herbs by informed practitioners and the public. It also includes the production and ethical marketing of herbal products. True herbalism, which brings honor to the wonder-filled world of plants, does exist as part of the science of pharmacognosy. However, there is a dark side to herbalism which I call *paraherbalism*.

Herbalism and paraherbalism can be compared to Dr. Jekyll and his evil self, Mr. Hyde. As with these famous fictional characters, danger is ever-present that the good of herbalism will be destroyed by the evils of paraherbalism. That would be tragic because herbalism can play a useful role in the health-care arena.

Paraherbalism is a Pseudoscience

Pseudoscientists typically fail to use rigorous experimental methods, lack a coherent conceptual framework, and claim positive results not corroborated by impartial observers. The fact that paraherbalists fail to develop or accept accurate information about their recommended remedies and simply reassert untested dogma clearly identifies their field as pseudoscientific. These problems are rampant in herbal literature, both old and new. For example:

- Referring to burdock, the leading 17th century astrologer and apothecary, Nicholas Culpeper, said, "The root beaten with a little salt, and laid on the place, suddenly eases the pain thereof, and helps those that are bit by a mad dog." In 1971 in *A Modern Herbal*, Maud Grieve repeated this advice without a word of caution. In fact, there is no scientific evidence that burdock has any useful therapeutic activity against rabies—or any other disease.

- Edward Bach, who developed the Bach Flower Remedies more than 50 years ago, believed that sun-warmed dew absorbs vital healing powers from plants. Thus, if flowers are placed in pure spring water in a glass bowl in full sunlight, healing energy is transmitted to the water, which can be used in tiny doses to treat patients. Bach said his remedies did not cure disease but increased the condition of health of the user. He offered no scientific explanation, preferring to keep his reme-

dies "free from science, free from theories." Recent writers have postulated that the remedies work through a "nonphysical" energy field emanating from the plants.

- Since the early 1960s, sassafras oil and safrole, which is obtained from it, have been recognized as carcinogens in rats and mice. Their use as flavors or food additives is now forbidden by the FDA under the Delaney Clause of the Food, Drug, and Cosmetic Act. Nevertheless, sassafras is still considered an unexcelled home remedy by paraherbalists who never mention its toxicity.

- In 1974, a dubious journal article concluded that yucca is useful in the general management of the various forms of arthritis. Although the Arthritis Foundation reported that the study's design was invalid, it is still cited by paraherbalists as evidence that yucca is effective. In 1979, for example, John Heinerman wrote in *Science of Herbal Medicine* that "Yucca root contains special steroid saponins which have been successfully tested under clinical conditions to determine its effectiveness in treating acute forms of arthritis."

- One of the most common herbs marketed in the United States is comfrey, which contains pyrrolizidine alkaloids that are toxic to the liver. Paraherbalists praise its supposed virtues and fail to mention the scientific evidence of its harmful nature.

- No scientific evidence supports the use of alfalfa for arthritis, spirulina for weight loss, Mormon tea for venereal disease, damiana for sexual stimulation, eyebright for loss of vision, or borage for melancholy. Yet paraherbalists, either ignoring contrary evidence or parroting the claims of Culpeper and others, advocate such use.

False Tenets

Paraherbalism is characterized by at least ten false tenets. While not every paraherbalist embraces all of them, enough do to conclude that all are characteristic of the field.

- *Tenet #1: A conspiracy by the medical establishment discourages the use of herbs.* One forceful statement of this tenet is Heinerman's assertion that, "A large percentage of this suspicion of herbs and natural healing methods is due to the unmitigated prejudice and slanderous opposition posed by the regular medical community at large. Quite often they are joined

in this harmful conspiracy by the pharmaceutical industry." Others have suggested that herbalists (and other health food industry "pioneers") are automatically branded as quacks and charlatans by the "AMA-FDA combine."

I have never met a physician who knew enough about herbs to raise an opposing voice. Doctors who give herbal medicine any thought at all are rare. Physicians are taught nothing about the subject in medical school. If they become curious and purchase a popular book on the subject, reading that yucca roots are "mashed and boiled to make a tea for treating diabetes" might inspire them to file the volume among others devoted to superstition and witchcraft. They might even throw the book away, but they would not stop using insulin, which they know is an effective drug.

Inquisitive physicians might even look up the credentials of those whose writings on herbal remedies are most widely distributed. If so, they might find that Sybil Leek is described in *Who's Who in America* as an astrologer and wrote several books on witchcraft, including *Diary of a Witch*. They might also learn that Richard Passwater obtained his "Ph.D." from an unaccredited correspondence school not authorized to grant degrees. Such credentials are not likely to inspire scientifically trained physicians to have much confidence in the paraherbal advocates.

In the pharmaceutical industry, another attitude prevails. Here it is recognized that plants have yielded effective drugs like opium, digitalis, ergot, belladonna and rauwolfia. But there is insufficient profit potential to stimulate much research into new plant drugs. With the cost of developing a new chemical entity into a marketable drug now over \$100 million, pharmaceutical manufacturers focus on products where patent protection can be achieved rather than widely used plant remedies that probably cannot become patentable drugs. Again, there is no conspiracy but simply a lack of expected profit.

• *Tenet #2: Herbs cannot harm, only cure.* It is ancient dogma—repeated in modern herbals—that drugs of vegetable origin are automatically good, but those derived from minerals or petroleum are necessarily bad. William Smith, for example, states in *Wonders in Weeds* that: "It cannot be emphasized too highly that herbal medicine is 'safe medicine,' a claim that cannot be applied to orthodox remedies."

This thesis denies the fact that some plant constituents are among the most toxic substances known. Acutely toxic alkaloids, ranging alphabetically from aconitine to zygadenine, are abundant. Other constituents, such as the peptide amatoxins in certain fungi, can also kill. Even so, consumers are probably less likely to suffer from acute strychnine poisoning by eating *Nux vomica* seeds than they are to receive exposure to milder and less obvious toxins through repeated use of such remedies as sassafras or comfrey. And certain diterpine esters are cocarcinogens (tumor promoters).

• *Tenet #3: Whole herbs are more effective than their isolated active constituents.* Many modern paraherbalists maintain that plants are not only the safest way to administer medicine but also the most effective. They claim that, apart from their active principle, plants may contain other substances that enhance their therapeutic action by some sort of a synergistic process.

Perhaps the most persistent advocate of this doctrine has been Andrew T. Weil, M.D., who argues, "In the case of drug plants, the whole forms, being complex mixtures and therefore impure, tend to be safer than their unmixed derivatives, freed from diluents and made available in highly refined

form." Weil also argues that the lesser concentration of an active constituent present in plant tissue renders such a drug safer to use. Finally, he contends that the various active constituents in a plant work synergistically to produce a total effect greater than the mere sum of the individual component activities.

Weil's first two points can be dismissed simply by pointing out that dosage, which governs a drug's safety and efficacy, is much more readily controlled with purified constituents. Synergism occasionally occurs, but for every case where a desirable action is enhanced, there are several where undesirable actions are produced. For example, cinchona bark contains some 25 closely related alkaloids, but the only one recognized as useful in the treatment of malaria is quinine. A person who took powdered cinchona bark would also ingest the alkaloid quinidine, a cardiac depressant, and cinchotannic acid, which would induce constipation.

An even more significant example is comfrey, whose leaves and underground parts are widely recommended by modern herbalists as wound-healers. Whatever activity of this sort the plant possesses is due to its content of allantoin, an agent that apparently promotes cell proliferation. However, comfrey also contains carcinogenic pyrrolizidine alkaloids, including echimidine and symphytine. Purified allantoin, free from accompanying carcinogens, would obviously be safer to use.

• *Tenet #4: "Natural" and "organic" herbs are superior to synthetic drugs.* Paraherbalists claim that products made by the metabolic processes of plants or animals possess an innate superiority over identical products synthesized in a chemical laboratory. The falsity of this claim was demonstrated as far back as 1828 when the German chemist Friedrich Wöhler synthesized urea from inorganic materials. Wöhler's synthetic urea was identical in every respect with the urea biosynthesized and excreted by animals or biosynthesized and accumulated by many species of higher fungi. Thus, statements like "The pharmaceutical industry needs to stop fooling around with dangerous synthetic chemicals and return, once again, to the more natural substances God has placed upon this earth for our health and benefit" are derived from baseless belief rather than scientific methodology.

Nutrition Forum (ISSN 0748-8165) is published bimonthly by J.B. Lippincott Company, Downsville Pike, Route 3, Box 20-B, Hagerstown, MD 21740. Business offices are located at East Washington Square, Philadelphia, PA 19105. Printed in the U.S.A. Copyright 1989 by J.B. Lippincott Company. Annual Subscription Rates: U.S. \$30.00 individual, \$35.00 institution; all other countries except Japan, India, Nepal, Bangladesh, and Sri Lanka, \$35.00 individual, \$40.00 institution. Single copies \$7.00. Rates for airmail delivery available upon request. Subscriptions, orders, or changes of address (except Japan, India, Nepal, Bangladesh, and Sri Lanka) Journal Fulfillment Department, J.B. Lippincott, Downsville Pike, Route 3, Box 20-B, Hagerstown, MD 21740, or call 1-800-638-3030; in Maryland call collect 301-824-7300. In Japan, Woodbell Incorporated, 4-22-11, Kitakasai, Edogawaku, Tokyo 134, Japan. In India, Nepal, Bangladesh, and Sri Lanka, Universal Subscription Agency Pvt. Ltd., 101-102 Community Centre (F.F.) Saket, New Delhi-110017, India. Copies will be replaced without charge if the publisher receives a request within 60 days of the mailing date in the U.S. or within 5 months in all other countries. Editorial correspondence should be sent to Stephen Barrett, M.D., P.O. Box 1747, Allentown, PA 18105. POSTMASTER: Send address changes to Nutrition Forum, Downsville Pike, Route 3, Box 20-B, Hagerstown, MD 21740.

The term "organic" is used to describe plants grown without pesticides or synthetic fertilizers. Materials made from such plants are believed to be superior in some way to those produced by conventional agriculture. This belief is based on a complete misunderstanding of plant nutrition and physiology. Plants require inorganic nutrients such as nitrogen, phosphorus and potassium for normal growth. They obtain these elements from the soil and have no mechanism for distinguishing their original source. If adequate amounts are present, plants grow normally. If they are not, this does not occur.

Pesticides are a slightly different matter. Appropriate safety limits have been established, and some pesticides have been banned. It is possible to grow plants without using pesticides, but yields per acre are much diminished. So one either trusts scientific farmers and the regulatory process or one pays considerably more for food.

• *Tenet #5: The "Doctrine of Signatures" is meaningful.*

The three most popular aphrodisiacs sold in the Orient owe their alleged properties to the so-called Doctrine of Signatures—the ancient belief that the form and shape of a drug source determine its therapeutic virtue. Thus, rhinoceros horn, deer antlers, and ginseng root with their phallic resemblance (or in the case of bifurcated ginseng with attached rootlets, its similarity to the human body complete with phallus) are all highly esteemed as agents of virility. In Chinese pharmacies, antlers are typically displayed on velvet mats in glass showcases and sold at prices comparable to fine pearls.

Deer antler and rhinoceros horn have never been proven to contain any constituent that stimulates libido or cures impotence. Any activity should be attributed to placebo effect. Ginseng does contain triterpenoid saponins, to which various physiological activities have been attributed. However, no substantial evidence that ginseng enhances sexual experience or potency has been published in the scientific literature.

The Doctrine of Signatures is not unique to the Orient. Gerard reported in 1597 that eyebright juice applied to the eyes "taketh awaie the darknesse and dimnesse of the eies and cleareth the sight." Variations of this advice are duly repeated by most present-day paraherbalists.

Actually, no constituent of eyebright is known to be effective against any eye disease. Medieval herbalists assumed it was effective because the white to bluish corolla of its flower bears a bright yellow spot, making it resemble an eye with its pupil. Believing that this structure makes the plant effective against eye disease makes as much sense as believing that walnuts are good for mental illness because their kernels resemble the brain or that liverworts are good for jaundice because their leaves resemble the shape of the liver.

• *Tenet #6: Reducing the dose of a medicine increases its therapeutic potency.* This, like the Doctrine of Signatures, is a principle espoused by homeopaths. Founded near the end of the 18th century by Samuel Hahnemann, a German physician, homeopathy originally had three basic tenets: 1) diseases are cured by small doses of drugs which, when administered in large doses to healthy persons, produce effects similar to the symptoms of the disease; 2) the potency of a drug is inversely proportional to its concentration; and 3) chronic diseases are simply manifestations of a suppressed itch or psora, a kind of evil spirit. This last notion proved so outrageous, even to fervent homeopathic practitioners, that it was soon abandoned.

The eighth (1980) edition of the *Homeopathic Pharmacopoeia* contains some 600 pages of monographs, most of them

on drugs of plant origin. Homeopathic remedies in this book are recognized as drugs under federal laws, a fact appreciated by paraherbalists. Some of the listed substances, such as cinchona, digitalis and opium, are effective in appropriate dosage. But homeopathy advocates high dilution for maximal effect. Many homeopathic remedies are so dilute they are statistically unlikely to contain a single molecule of the original substance.

Still, there has been a resurgence of interest in homeopathy in this country in recent years. Its supposed safety and "holistic" orientation, coupled with its vast materia medica of vegetable drugs, appeal to many paraherbalists.

• *Tenet #7: Astrological influences are significant.* In his recent book, *Herbs, Health and Astrology*, Leon Petulengro comments, "Knowing as we do that planets and stars emit their own individual signals or vibrations, how can we disbelieve that ancient lore was right and that herbs and plants, and indeed humans, are ruled by these various vibrations or force fields?"

How, indeed? Just compare drugs with similar physiological effects and the different planets to which they are assigned. For example, broom, digitalis, lily-of-the-valley and black hellebore all yield drugs that can slow the heartbeat, render it more regular, or otherwise strengthen it. But they look quite different from one another and belong to different plant families. Probably for this reason, Culpeper assigned each to a different "governing" planet—a classification repeated by Sybil Leek.

Culpeper assumed that diseases caused by a certain planet are cured by herbs of the same planet or the "opposite" planet. For example, since diseases of the heart and blood vessels are caused by the sun, they should be cured by herbs dominated by the sun or ruled by Saturn. If this were true, black hellebore would be the only herb in either of the above categories that is effective against heart disease. Actually, it is probably the least effective cardiotonic drug considered by Culpeper and was dropped from the *United States Pharmacopoeia* in 1882. Broom was officially listed until 1936 (and its active principle until 1950), and lily-of-the-valley root appeared until 1950. Digitalis is still listed together with its constituent glycosides, which are extensively used. Thus, astrological reasoning classified only one out of four correctly and selected the worst example.

Looking in reverse, let's assume, as Culpeper would have us do, that herbs "dominated" by the sun do indeed strengthen the heart by sympathy. Saffron, he says, "is an herb of the Sun, and under the Lion, and therefore you need not demand a reason why it strengthens the heart so exceedingly." Juniper, he writes, "is an admirable solar shrub." Lovage, he continues, "is an herb of the Sun." Of rosemary, he notes, "The Sun claims privilege in it." None of these plants has any significant cardiac effect. In fact, of the more than 30 plants described by Culpeper and Leek as herbs of the sun, only mistletoe—which is fairly toxic—has any appreciable effect on the cardiovascular system.

• *Tenet #8: Physiological tests in animals are not applicable to human beings.* When it suits their purposes, paraherbalists typically complain that the results of animal experiments should not be applied to herbs. Heinerman has said, for example, that saffras was removed from the marketplace "because a bunch of 'puny, sickly, all-around crummy rats' just happened to get cancer when this plant was injected into them by their larger, less intelligent relatives."

It is true that great differences exist among various

animal species and between animals and humans. However, there is a high probability of significance when diverse species show similar effects. For this reason, new drugs should be evaluated in several animal species, preferably from different orders. Herbs need to be tested for safety and effectiveness. If animal testing is not acceptable to paraherbalists, the only alternative—initial screening of drugs in humans—is even less acceptable to the public.

• *Tenet #9: Anecdotal evidence is highly significant.* A century ago, glowing testimonials were widely used to sell patent medicines. Today, similar ones are used for herbal remedies. For example, *Herbal Success Stories*, published in 1980, recounts "actual case histories" of those who "either experienced the problem and cure themselves or helped a family member or friend with the ailment or cure." According to the author, readers can "use this book with assurance that successes related there are true."

Unfortunately, in individual cases, it is difficult or impossible to tell whether a reported cure resulted from the treatment, a placebo effect, or the body's ability to heal itself. It may also be difficult to tell whether an anecdote has been reported accurately or was even fabricated. Anecdotal evidence can provide leads for research, but it is not reliable for establishing therapeutic utility of an herb. That requires preliminary investigations in laboratory animals followed by randomized, double-blind clinical trials in humans.

• *Tenet #10: Herbs were created by God specifically to cure disease.* Many paraherbalists claim God has provided a remedy for every disease that might afflict us. This claim may appeal to deeply religious people, but is not testable and is not a legitimate substitute for scientific evidence.

Dr. Tyler is Executive Vice President for Academic Affairs at Purdue University. An expert in pharmacognosy (the science of medicines from natural sources), he is the author of *The New Honest Herbal*, an evaluation of popular herbs, now available from J.B. Lippincott Company.

Conclusion

Whether through incompetence, fraud, greed, or all three, it is evident that paraherbalists ignore science in favor of exaggerated claims. Rudolf F. Weiss, the grand old man of European herbal medicine, has summed up the current situation very well in the 1988 edition of his classic book *Herbal Medicine*: "Nothing has done more to prevent recognition [of herbal medicine] than the wholesale transmission of indications derived from the old herbalist tradition, often still brought before the public in articles and lectures with no scientific foundation at all. This also applies to many recent semi-scientific or popular books on herbal medicine."

Herbal advocates have cause to be alarmed. Adherents of the false tenets discussed above are creating an image of herbalism that could easily discourage and finally prevent the development of scientific herbal medicine in America. More misinformation regarding the safety and efficacy of herbs is being placed before the public currently than at any previous time, including the turn-of-the-century heyday of patent medicines. Neither pharmaceutical companies nor government agencies are providing enough money for herbal research—so university-based researchers are not being encouraged to investigate potentially useful herbs.

During the last 35 years, much has been learned about the basics of plant metabolism, analysis, and production. Our research methods have never been better, and there are still scores of thousands of readily available species awaiting investigation or reinvestigation. Herbal advocates have organized the American Botanical Council and the Herb Research Foundation to stimulate research and educate the public. If the FDA can ease its standards for evaluating new drugs, particularly from plants long used as folk remedies, research and development of such products might become practical.

BRIEFS

Preventable infant death. Last March, according to a report from CHILD, Inc., Michael David Boehmer bled to death four days after his birth at home in Lake City, Florida, because his blood did not clot properly. The clotting problem was due to insufficient vitamin K. The local medical examiner concluded that either standard prenatal care or the vitamin K shot normally given to newborns would probably have prevented the problem. (The injection supplies the vitamin until the infant's intestinal bacteria are established and begin to synthesize it.) However, the child's parents belonged to End Time Ministries, a religious group that relies on prayer and believes that medical care should be avoided. After the father testified that he would have sought medical care had he realized the boy was dying, the local judge ruled the death was not the result of a criminal act, negligence, or foul play. CHILD, Inc., founded by Rita and Douglas Swan, former Christian Scientists who lost one of their children to meningitis under Christian Science care. They believe that stringent state laws should be enacted to protect children from medical neglect in the name of religion. CHILD's address is P.O. Box 2604, Sioux City, IA 51106.

Koop urges tougher action against drunk driving. At his final press conference May 31, Surgeon General C. Everett Koop, M.D., declared drunk driving "a serious threat to public health." He recommended: 1) lowering the maximum legal blood alcohol level from the current 100 mg% to 80 mg%; 2) increasing taxes on alcoholic beverages; and 3) urging beer and liquor manufacturers to produce a health message for every alcohol ad they produce. In 1988, close to 24,000 people died in alcohol-related traffic crashes.

Food irradiation reports. The Council for Agricultural Science and Technology (CAST), 137 Lynn Ave., Ames, IA 50010, has issued the second part of its task force report, *Ionizing Energy in Food Processing and Pest Control. Part I: Wholesomeness of Food Treated with Ionizing Energy* (50 pp., 1986) is \$4, while *Part II: Applications* (98 pp., 1989) is \$10. The reports conclude that irradiated foods are safe and wholesome and that the radioactive sources used to process them pose no hazard to anyone employed at the food treatment facilities or involved in transporting the materials.

FTC consumer warning. The Federal Trade Commission has warned consumers to be aware that some television programs that look like talk shows are actually program-length commercials. Many such programs on cable and independent television stations have been promoting weight-loss plans and various health products that supposedly provide great results with little effort or risk. One tip-off, says the FTC, is that the products promoted during "commercial breaks" are related to the program's content. *Editor's note:* Most of the diet products and all of the health-related products I have seen advertised so far have been scams.

Weight-loss clinic follow-up. A study of 31 people whose photograph and testimonial had appeared in newspaper ads for a weight-loss clinic has found that 20 months later, only 8 (26%) had remained within five pounds of their target weight. The clinic, a Midwestern affiliate of a national commercial weight-loss program, offers behavioral education with a prepackaged food regimen. The researchers caution that their data must be interpreted cautiously because their findings do not reflect the experience of clients who never met their weight loss goals [Journal of the American Dietetic Association 89:547-548, 1989].

Suit fails against whiskey manufacturer. A federal jury in Seattle has cleared Jim Beam Brands Co. of negligence for not stating on its labels that alcohol consumption by pregnant women can cause birth defects in their children. Witnesses for Beam said that the plaintiff drank heavily despite repeated warnings from relatives and friends and that there was no reason to believe she would have heeded a label warning. Two similar cases are pending in Washington state courts.

Lecithin and serum cholesterol. A review of 24 studies of lecithin supplementation has concluded that most of them were poorly designed and the rest suggest that dietary lecithin does not lower serum cholesterol in humans [American Journal of Clinical Nutrition 49:266-268, 1989]. Reprints can be obtained from Martijn B. Katan, Department of Human Nutrition, Agricultural University, P.O. Box 8129, 6700 EV Wageningen, The Netherlands.

Diet and cancer. An excellent discussion of misconceptions about cancer and nutrition has been published in the American Journal of Gastroenterology [83:1346-1351, 1988]. Reprints can be obtained from Michael Mogadam, M.D., 5021 Seminary Rd., Alexandria, VA 22311.

Pharmacists' advice. American Druggist's 1989 survey of 1,500 independent and chain-based community pharmacists has found that buyers of multivitamins or calcium supplements ask for product recommendations about half the time. The most popular items in these categories were Centrum, which enjoys a 54.9% market share, and Os-Cal, which has a 44.6% market share. The magazine estimated that, if pharmacists across the nation make an average of six weekly recommendations, that could influence 450,000 weekly purchases. *Editor's note:* Imagine what would happen if pharmacists attempted to determine whether prospective buyers actually need a vitamin or mineral supplement and discouraged unnecessary purchases.

Food consumption data. In June, more than 150 food scientists and health authorities met in Helsinki, Finland, to discuss the complexities of gathering food consumption data. The symposium was sponsored by the International Life Sciences Institute. The methods used to assess the content of nutrients, additives, and drug and pesticide residues in foods include: 1) crude estimates of per capita production or disappearance rates; 2) 24-hour dietary recall; 3) dietary records, in which everything consumed is recorded; 4) market baskets, in which a typical household's food is collected; and 5) duplicate portions, in which an extra portion of food and drink is retained and subsequently analyzed. The symposium participants generally agreed that the last approach is the most accurate, but is also the most difficult to carry out. Therefore, dietary data are usually based on recall or dietary records, which can be flawed by limitations of human memory.

Anthology published. The Dushkin Publishing Group, Sluice Dock, Guilford, CT 06437, has published *Nutrition 89/90*, its third annual sourcebook of nutrition articles. Edited by Charlotte Cooke-Fuller, Ph.D., of Towson State University, with help from Dr. Stephen Barrett, it contains 66 significant articles from newspapers, magazines, newsletters and scientific journals. Single copies are available for \$10 plus \$2/order for postage from LVCAHF, Inc., P.O. Box 1747, Allentown, PA 18105.

Nutrition advice rated. The American Council on Science and Health has published the results of its fourth survey of nutrition information in popular magazines. Four judges rated articles in 25 magazines published between July 1986 and June 1988 for accuracy, timeliness and readability. *Consumer Reports* topped the list. *The Saturday Evening Post*, *Vogue*, *Reader's Digest*, *Parents*, *Good Housekeeping*, *Changing Times*, *Woman's Day*, *Modern Maturity*, *Seventeen*, *McCall's* and *Better Homes and Gardens* also received high ratings.

Egg cholesterol content revised. The U.S. Department of Agriculture's Human Nutrition Information Service has updated its nutrient composition data for eggs. The revised data are based on a 1988 study of eggs from 122 suppliers who represented more than 60% of the nation's egg production. The amount of cholesterol per egg is now 213 mg, a 22% reduction from the 274 mg figure listed since 1976.

Allergy to cottonseed oil. Researchers who tested seven people who experienced severe allergic reactions during or shortly after ingestion of products marketed by United Sciences of America, Inc., (USA, Inc.) have concluded that the reactions were caused by cottonseed protein [Journal of Allergy and Clinical Immunology 82:242-250, 1988]. Four of the seven had been hospitalized for observation. The researchers warn that increased use of cottonseed protein in food products may cause reactions in individuals with previously undetected sensitivity to this protein. Reprints are available from Fred M. Atkins, M.D., Dept. of Pediatrics, National Jewish Center for Immunology and Respiratory Medicine, 1400 Jackson St., Denver, CO 80206. USA, Inc., was a multilevel company liquidated in 1987 after law enforcement agencies stopped it from selling dietary supplements with illegal claims [see Nutrition Forum 4:25-31, 63, 86].

CHO LOW TEA: A SCAM WITH A HAPPY ENDING

James A. Lowell, Ph.D.
Alison Lowell, M.S.

With cholesterol-consciousness expanding rapidly in America, what could be more timely than a product to reduce blood cholesterol while still allowing you to eat whatever you please?

According to full-page newspaper ads appearing this spring across the country, Cho Low Tea would do exactly that. At the top of the ad were pictures of ice cream, butter, a cheeseburger, french fries, two eggs, a croissant, Swiss cheese and a very-very-deep-fried chicken leg. "Before You Cut These Out, Cut This Out," the ad said, referring to itself. "New tea from China . . . is as effective as medically prescribed drugs in reducing cholesterol." A 30-day supply cost \$29.85, while the family size—said to provide a \$10 saving—cost \$49.70.

According to the ad, "Cho Low is a rare species of tea grown in China for centuries. Traditionally, the Chinese drink it after every meal as a diet aid. [When we asked our Chinese friends about this time-honored tradition, they wondered whether we were nuts.] Recently, during extensive western medical studies, researchers were astonished to discover that besides aiding weight loss, Cho Low Tea contains natural cholesterol-reducing properties." In addition, it supposedly: 1) is 100% safe and natural; 2) can add years to your life by preventing cholesterol buildup; 3) makes you look better; 4) makes you feel better; 5) aids digestion of fatty foods; 6) reduces water retention; 7) has kept Chinese slim for centuries; and 8) has none of the possible side effects of cholesterol-lowering drugs.

The ad included a photograph of Tristan Rogers, who plays Robert Scorpio in television's "General Hospital," accompanied by a testimonial statement: "The General Hospital set is stocked with junk-food. I'm too busy to get meals anywhere else, so I eat what's on the set. But I drink a cup of delicious Cho Low Tea after every meal. Despite a history of heart disease in my family, my cholesterol is perfect—and I've noticed an improvement in my appearance. In my business, that's important."

The ad also included endorsements from seven medical sources, including Dr. Harvey L. Alpern, a cardiologist from Century City, California, who said that "Published studies indicate that the tea reduces blood cholesterol." Another endorser was Dr. John Yudkin, a British physician whose book *Sweet and Dangerous* claims that sugar causes cardiovascular disease—a conclusion not accepted by mainstream medicine. Other testimonials were attributed to sources in France, Italy, China and Israel. The ad also displayed the logo of the Better Business Bureau.

According to James Ralph, vice president of the American Newspaper Publishers Association Credit Bureau, the ad began appearing June 11, 1989, and wound up in 105 newspapers, including the *Washington Post*, *Los Angeles Times*, *Fort Worth Star Telegram*, *Newark Star Ledger* and *Pittsburgh Press*. Apparently, the advertising departments at these prestigious papers saw nothing wrong with the ad.

This was not the case, however, with health and nutrition professionals throughout the country. The National Council

Against Health Fraud and many of its local chapters were flooded with inquiries about the tea. Callers suspected the claims were bogus and were concerned the tea might be used instead of effective dietary or pharmacological methods. So did Ralph, who has been conducting seminars on how to detect fraudulent ads and is probably the industry leader in trying to persuade newspapers not to publish such ads.

After obtaining a copy of the ad and a background packet distributed by its perpetrators, Ralph concluded it was a scam and contacted the Council of Better Business Bureaus as well as state and federal law enforcement agencies. On June 15, the council notified newspapers that had carried the ad that the tea's marketer, Virginia Investments Management Inc., of Beverly Hills, was not a BBB member and lacked permission to use its logo. BBB also asked the promoters to document their claims.

Meanwhile, Dorothy Matthews, an investigator for the California State Department of Health Services, contacted Mail Pac, the fulfillment house in Sun Valley, California, that was supposed to place incoming checks in an account for Virginia Investments and then mail the tea to customers. Matthews asked that the checks be held pending further investigation. By this time, about 2,000 orders had been received. Mail Pac's attorney agreed, and no money was forwarded to Virginia Investments.

Betty Garner, an investigator for the U.S. Postal Service, acquired copies of the studies the promoters claimed were evidence that their product worked. She then had them analyzed by Ernst Drenick, M.D., a medical professor at UCLA Medical School. Drenick, an expert on obesity and weight loss, concluded the studies were either irrelevant or did not support the claims made in the ad. The U.S. Attorney's office for the District of California then took civil action to get permission to return all orders to their senders.

Six days after printing the ad, our local newspaper, the *Arizona Daily Star*, published an article stating the ad was fraudulent. In the article, Dr. Donald McNamara of the University of Arizona's Lipid Metabolism Research Laboratory said he had never heard of the tea or the researchers quoted in the ad and had never seen any published research about the product. Irene Caro, Consumer Affairs Officer for the FDA's Los Angeles District, said the ads were obviously false and that newspapers carried them "knowing full well this is a fraudulent product." She also pointed out that the claims in the ad made Cho Low Tea a drug that would be illegal to market without FDA approval.

On June 23, the FDA sent a "Talk Paper" to its field offices, stating that there was no evidence to support the claims made for Cho Low Tea and that an investigation was underway. One week later, the Los Angeles police, acting on the information provided by the Department of Health Services, raided the Beverly Hills office of Virginia Investments and arrested Peter Clarence Foster, 26, and Trevor Brine, 42. Both men were Australians who, according to Matthews, entered the United States last February. In 1988, Foster and his mother, Lugina, fled England while awaiting trial for a scheme involving the sale

of almost \$7 million worth of a "Chinese slimming tea" advertised as a weight-loss aid. The tea, called Bai Lin Tea, had been marketed through Foster's company, Slimweight, U.K., which was convicted and fined £5,000. Foster had operated a similar scam in Australia that did not result in criminal prosecution. But the Australian Department of Consumer Affairs issued an official statement in 1985 warning the public about false and misleading claims for "slimming teas."

Foster and Brine were booked on charges of conspiracy to commit grand theft and jailed in lieu of \$500,000 bail for Foster and \$250,000 for Brine. By that time—less than three weeks after their first ad appeared—thousands of orders had been received. However, none were filled because the fulfillment house had no tea to send. In fact, no Cho Low Tea existed! When asked to provide a sample to the authorities, Foster and Brine submitted Coleco tea, a brand available from a local distributor. They said they had planned to repackage this or a cheaper brand, using their own boxes and labels, but had not yet done so.

What about the testimonials? Dr. Alpern said he did not know whether the product worked. Dr. Yudkin told the authorities he had never heard of Cho Low Tea. And the agent for Tristan Rogers didn't say much except that the information about Rogers' family was not correct.

On July 7, just a week after his arrest, Foster pleaded "no contest" to two counts each of false and misleading advertising and falsely representing a drug to have medicinal properties. He was sentenced to four months in the Los Angeles county jail, after which he must donate 900 hours of community service through the California Department of Transportation, picking up trash along the freeways. In addition, he was ordered to pay \$228,000 still owed to newspapers that carried the ads. Brine pleaded no contest to one violation of each of the above

charges and earned three months in the Los Angeles county jail. Both men were also placed on three years' summary probation with a provision that they could not sell tea or any product purported to have a health benefit.

Orders for the tea continued to come in. By the end of the first week of August, over \$250,000 had been intercepted by California authorities as a result of the ad. The Postal Service is marking current mail "OUT OF BUSINESS" and returning it to its senders, while the money intercepted earlier is being returned by the state authorities—accompanied by a letter advising the senders to be more careful about answering health ads in the future.

Law enforcement agencies acted quickly to put these scam artists out of business before millions of dollars were fraudulently extracted from consumers. This case can serve as a model for other regulatory action throughout the country. According to Ralph, the total owed to newspapers—none of which received payment in advance—was close to \$600,000. (The \$228,000 figure was a hastily contrived guess based on numbers found by the authorities in Foster and Brine's computer.) Despite the court order, most if not all of the newspapers that extended credit will probably be "punished" for their willingness to serve as the vehicle for a scam. However, we believe the public would benefit greatly if publishers who repeatedly help advertisers defraud their readers could be punished by the courts as well.

Dr. Lowell is Professor of Life Sciences at Pima Community College in Tucson, Arizona, and is vice president of the National Council Against Health Fraud. His wife, Alison, an NCAHF board member, is a Ph.D. candidate in nutritional sciences at the University of Arizona in Tucson. Together they operate the Nutrition Information Center, which produces teaching aids focused on quackery.

COALITION PUBLISHES HEALTH AND SAFETY AGENDA

A coalition of 27 consumer, health and insurance groups, organized by Consumer Federation of America, has published a seven-part, 60-page *Consumer Health & Safety Agenda* intended to reduce certain health and safety hazards in the United States. In March, the coalition delivered copies to President Bush, Health and Human Services Secretary Louis Sullivan and top Congressional leaders. Copies are also being distributed to governors, state health officials, consumer groups and various insurers.

The agenda's section on food safety and nutrition was coauthored by Ellen Haas, executive director of Public Voice for Food and Health Policy. Its recommendations include: 1) more stringent standards for testing meat, poultry, fish and shellfish; 2) consumer education detailing proper storage and handling techniques to avoid illness due to bacterial contamination (including salmonella); 3) stricter standards for permissible pesticide levels in foods; 4) increased consumer education about the nature and risks of chemical additives in food; 5) increased production and sale of additive-free foods; 6) increased study of the possible risks of food irradiation; 7) development by the FDA and USDA of "meaningful standards" for use of the term "natural" on food labels; 8) increased consumer education about health-promoting food choices; 9) nutrition labeling on all food

products, with standardization of serving sizes; 10) inclusion of any adverse information when health claims are made on labels; 11) use of low-fat products in school lunches; and 12) changes in agricultural subsidies and meat grading aimed at encouraging production of low-fat products. The coalition includes the American Academy of Pediatrics, the American Association of Retired Persons, the American Lung Association, and the Center for Science in the Public Interest.

Editor's note: Although some of the above recommendations are worthwhile, others seem to spring from an alarmist viewpoint expressed in the assessment that precedes the food safety and nutrition section of the report: "Americans on the whole can take advantage of the most abundant and varied food supplies in the world, and being more health-conscious, they are beginning to modify their diets to include more low-fat and high-fiber foods. However, hidden health threats are lurking in even the most 'healthful' foods. The fish and poultry we consume may be contaminated with salmonella or other organisms, the steak we eat may contain antibiotic residues, and our fruits and vegetables may be tainted with dangerous pesticides. These contaminants, along with chemical additives in the hundreds of processed foods we eat, place Americans at risk every time they take a bite."

DIETARY GUIDELINES FOR INFANTS

Consistent with the fact that children below the age of 2 are not "little adults," Gerber Products Company has published *Dietary Guidelines for Infants*, modeled after HHS/USDA's 1985 *Dietary Guidelines for Americans*. Gerber's guidelines are based on published statements by the American Academy of Pediatrics' Committee on Nutrition and were prepared with the help of seven nutrition experts. The guidelines are:

- *Build to a variety of foods.* Unlike adults, infants do not require a variety of foods to secure nutrition during the first six months or so of life. Human milk alone provides the vitamins, minerals, carbohydrates, fats and proteins needed for normal growth and development during early infancy. With the exception of fluoride, vitamin D in the absence of adequate exposure to sunlight, and possibly vitamin K, supplements to human milk are not required during this period. Infant formula is recommended as the best alternative to human milk if breast-feeding is not used or is stopped early. Most babies are ready to start supplemental foods around 4–6 months of age. Single-grain cereal is often the first food added after breast milk or formula. Other single-ingredient foods can be added gradually until the baby is eating a variety of foods. New foods should be added one at a time, at intervals of a few days. This allows the baby to get used to the flavor of the food and enables parents to see whether a food might not agree with the baby.

- *Listen to your baby's appetite to avoid over-feeding or under-feeding.* Although healthy infants can vary considerably from one another in their caloric intake, appetite is likely to be the most efficient way to determine what an infant needs. Most infants instinctively know how much food they need to grow and develop normally and will not undereat or overeat unless pressured. Babies should be fed when they are hungry but should not be forced to finish the last few ounces of formula in a bottle or spoonfuls of food in a dish. The baby's health advisor can chart growth and development to be sure that they are progressing normally.

- *Don't restrict fat and cholesterol too much.* Although low-fat and low-cholesterol diets are widely recommended for adults, they are not appropriate for infants under the age of 2. Nutritional requirements are higher during infancy than during any other period of life. At the same time, stomach capacity is limited, so food sources must provide sufficient calories and nutrients in a small volume. Infants require fat in their diet to satisfy needs for normal growth and development.

- *Don't overdo high-fiber foods.* Infants and small toddlers eating a well-rounded diet probably get enough fiber for their needs. A diet high in fiber may be too low in calories and may interfere with absorption of iron, calcium, magnesium and zinc. Although dietary fiber may help prevent certain diseases in

older adults, there is no proven benefit from increasing the fiber intake of young children above that provided by a healthy diet.

- *Sugar is OK, but in moderation.* Sugar, which exists in several forms, is a source of calories and makes some foods taste better. Breast milk, the ideal food for infants, contains lactose, which is similar to table sugar. Other foods in a balanced diet may contain moderate amounts of sugar, but excessive amounts of such foods can crowd out more nutritious foods. Sugar has not been shown to cause hyperactivity, diabetes, obesity or heart disease. It is linked, however, to tooth decay. Dental care, proper bottle feeding, and the use of fluoride can help control and prevent tooth decay. Bottles of milk or juice should not be used as pacifiers to put a baby to sleep because prolonged contact with the natural sugars in these liquids can cause tooth decay. Artificial sweeteners are not recommended for infants.

- *Sodium is OK, but in moderation.* Although the amount of sodium in the diet is related to high blood pressure in a small percentage of adults, the amount of sodium in an infant's diet has not been shown to cause high blood pressure in later life. Even though healthy infants can tolerate a range of sodium intakes without ill effects, moderation in sodium intake is urged. Sodium intake often increases when foods prepared for the family are introduced.

- *Babies need more iron, pound for pound, than adults.* Infants are born with a stored supply of iron that lasts for the first 4–6 months of life. Iron is more likely than any other nutrient to be lacking in the infant diet. For this reason, special efforts should be made to provide infants with iron during the first two years. In addition to breast milk, the best sources are iron-fortified formula and iron-fortified infant cereal.

According to Gerber officials, their guidelines were prompted by a telephone survey showing that many parents were inappropriately responding to adult nutritional guidelines by giving their babies skim milk instead of whole milk. In addition, cases have been reported of older children who failed to grow properly because of overzealous medically unsupervised dietary treatment for high cholesterol levels [American Journal of Diseases of Children 143:537–542, 1989]. Two versions of the Gerber guidelines have been published, a 20-page booklet for consumers and a 36-page booklet for health professionals. Either can be obtained free of charge by calling Gerber's consumer information center at 1-800-4-GERBER. Although the American Academy of Pediatrics has not officially endorsed the guidelines, one section of the professional booklet was written by Laurence Finberg, M.D., the chairman of the academy's nutrition committee. The company has announced plans to distribute more than a million brochures to pediatricians on its mailing list.

ARTHRITIS: FOLK REMEDIES AND QUACKERY

William T. Jarvis, Ph.D.

The term "arthritis" encompasses more than a hundred conditions. Although the term literally means "inflammation of a joint," some types of arthritis involve pain without inflammation. People tend to lump them all together when applying folk remedies, and quacks rarely differentiate between the various types when making claims for "cures." If a relationship actually exists between nutrition and arthritis, it is unlikely that a dietary change will be effective for most types of arthritis or even for most people with the same type.

Folk medicine derives from the basic beliefs and values of a culture. It includes both self-care and the activities of folk healers. These practitioners typically specialize in "what everyone knows" (misbelieves to be true) and hold views similar to those of their clients about the causes and treatment of disease. Self-treatment, home care and friendly advice given without anticipation of financial gain can be considered folk medicine rather than quackery, even if they are erroneous. However, folk medicine has often served as the basis for the commercial promotions of quackery.

Beliefs about Arthritis

What does "everyone know" about nutritional therapies for arthritis? When investigators at the University of Toledo conducted a random telephone survey of 300 people, they found that almost half believed incorrectly that arthritis could be caused by "poor diet" or "cold, wet climate." Regarding treatment, 76% replied vitamins were useful and 57% said special diets were useful. Among college graduates, 81% believed in vitamins while 52% believed in special diets [Arthritis and Rheumatism 26:462-471, 1983].

How widespread is self-treatment for arthritis, and how much involves nutrition-related practices? At least four studies have been reported.

- Researchers at the University of Alabama found that 92 out of 98 (94%) unselected arthritis patients had tried more than one unproven remedy, with an average of four and a maximum of 13 remedies tried. Fifty-three (54%) had used "special diets or foods" [Arthritis and Rheumatism (Supplement) 23:S759-760, 1980].

- Researchers at Stanford University School of Medicine found that about one-third of rheumatoid arthritis (RA) patients reported experience with unproven therapies, with an average of three different remedies each. Diets, copper bracelets, vitamins and acupuncture (and acupressure) were most popular. Users did not differ from nonusers in demographic characteristics or severity of their disease, but were less satisfied with their physicians [Arthritis and Rheumatism (Supplement) 23:S657-658, 1980].

- In the United Kingdom, researchers who studied 199 RA patients found that 68% reported using "alternative therapies" and 42% had tried more than one. Oral treatment (including homeopathic remedies) was the most popular (41%), followed by copper bracelets (37%) and "special diet" (32%). Among the remedies were 15 different diets and 28 oral treatments [Rheumatology 3:151-152, 1983].

- In Ireland, researchers studied 100 randomized patients attending a rheumatology unit of a large hospital. Eighty-one had tried at least one remedy. Dietary modification—used by 60—was the most common unorthodox approach [Irish Medical Journal 76:464-465, 1983].

How do patients rate the nutritional remedies they have tried? Investigators in the Stanford University study concluded that up to half reported some subjective benefit. Self-devised diets were rated more effective than those of popularized arthritis diet books, and those reporting benefits had less severe disease. No objective benefit could be documented for any of the therapies used. Forty-three percent of patients reported success with special diets in the United Kingdom study and 21% reported success with "oral treatments." Only 8% reported benefit from the copper bracelets.

Placebo Effects

The Latin word placebo means "I shall please." The placebo effect is a favorable response to the act of treatment rather than the treatment itself. How much of patient satisfaction is due to the placebo effect? This question has no easy answer. Placebo responses are highly variable, as are the factors that contribute to their occurrence.

Only one feature is required for a placebo effect to occur: the patient must be aware that something has been done. Contrary to popular opinion, it is not necessary to believe in the therapy. Although faith may help elicit a placebo response, even nonbelievers may respond favorably to suggestion or operant conditioning.

The power of suggestion to alter body function is well established by research with hypnosis. Blisters have been induced and warts made to disappear through suggestion.

Operant conditioning can occur with positive reinforcement when behavior is rewarded or with negative reinforcement when behavior is "punished." Thus, a person with a history of favorable response to treatment is more apt to react well to the act of treatment. However, operant conditioning can also occur rapidly, as illustrated by a fascinating account involving a man who underwent exercise testing. At a certain workload, the man had chest pain and an abnormal electrocardiographic pattern. Immediately afterward, when working at a less strenuous pace, he reacted with pain and an abnormal ECG when told he was at the higher workload [American Journal of Cardiology 40:630-634, 1977].

The route of administration (i.e., invasive or noninvasive) is another factor that can affect placebo response. Procedures that involve touching have greater placebo potential than those that do not. The laying-on of hands often causes a person to relax and become more suggestible. The setting in which a treatment is given and the mind-set of the patient can also influence the response.

A setting in which care-givers are confident or enthusiastic about a procedure can enhance placebo response. A culturally significant setting can also produce a potent effect, as folk healers well know. Effective settings can be as divergent as the trappings of an oriental herb shop to Asians, a circle of witchcraft paraphernalia to a primitive tribesman or the atmosphere of a modern clinic to an urban American. Social expectations can also play a role, as in stoic cultures where people are taught to endure pain and suffering without complaint.

Use of placebos can have negative aspects that often are overlooked. Not only are patients deceived, but care-givers can also be deceived if they are not fully aware how placebos function. It is wrong to believe a placebo response by a patient proves the problem is only "in the mind." Such placebo responses as feeling less pain or more energy are subjective and can occur without affecting the actual course of the disease. In other words, a placebo response can obscure real disease, which can delay appropriate diagnosis or treatment. There are times when placebo use may be justified, but this should be weighed carefully each time it is considered by a practitioner.

Spontaneous Remission

Arthritic diseases commonly involve cycles of worsening followed by improvement. If improvement occurs after use of an unproven remedy, the happy patient may become convinced the remedy caused the improvement. But even lack of improvement may not be interpreted as lack of effectiveness of the remedy. Researchers have found that a person's evaluation of treatment depends not only on what takes place but also on how it compares with their expectation. With a disease that has ups and downs, a skillful quack may retain the patient's confidence

no matter what happens. If the patient feels no better after a course of treatment, this can still be interpreted as an expected response, and the dosage can be adjusted or the patient advised to continue the treatment. When the patient feels better—whether spontaneously or not—the quack, of course, claims credit.

Diet and Arthritis

Can diet or dietary supplements provide any real benefit to arthritis sufferers? In Sweden, clinical researchers compared two groups of randomly selected patients with RA. The first group contained 16 patients who fasted (with fruit and vegetable juices) for seven or ten days and then ate a lactovegetarian diet for nine weeks. The control group contained ten patients who ate a normal diet after fasting. During the fasting period, five members of the experimental group and one of the control group showed improvement, but by the end of the experiment, only members of the diet group remained improved [Scandinavian Journal of Rheumatology 8:249-255, 1979].

A research team in Florida tested the diet advocated by Colin H. Dong, M.D., with a ten-week, controlled, double-blind, randomized trial of RA patients. Eleven patients were placed on this diet, which excludes "additives," preservatives, red meat, fruit, herbs and spices, vinegar and dairy products. The diet permits fish (no sardines), six ounces of chicken per week, egg white, vegetable oil, soybean margarine, oatmeal, cream of wheat, grits, sugar, maple and corn syrup, Sweet & Low, coffee, non-herb tea and soda water. Fifteen patients were placed on a placebo diet that resembled the experimental diet but included various forbidden foods. Using objective criteria, six patients improved on the placebo diet and five improved on the experimental diet [Arthritis and Rheumatism 26:462-471, 1983].

Another research group in the United Kingdom put 53 RA patients through a "washout" period during which all medication was discontinued except two placebo capsules and two acetaminophen tablets four times daily. Twenty-five patients

were placed on six weeks of diet therapy, while 24 continued on placebo therapy. After six weeks the control group was also placed on diet therapy. The diet therapy consisted only of foods of which the patient was most likely to tolerate. Other foods were reintroduced one at a time to see whether symptoms were produced. Any foods producing symptoms were excluded. A trained clinical observer blind to each patient's current therapy made ratings of pain, stiffness, grip strength and walking time, and recorded various laboratory measurements. Researchers reported significant improvement in pain reduction, morning stiffness, grip strength and fibrinogen levels (a measure of inflammation) during periods of dietary therapy compared to placebo periods, particularly among "good responders." They noted that a portion of the improvement was due to a placebo response, but this was not sufficient to explain the whole improvement [Lancet February 1:236-238, 1986].

Researchers in New York studied the effects of fish oil supplements and an experimental diet high in polyunsaturated and low in saturated fat for 12 weeks versus a control diet with a lower polyunsaturated-to-saturated-fat ratio and a placebo supplement. Subjects were followed for one to two months after the diet and supplements were stopped. The results of this randomized, controlled, double-blind, follow-up study showed "a clear, though modest, difference between the experimental and control groups in some of the clinical manifestations of rheumatoid arthritis," favoring the experimental program.

What do these reports mean? Most arthritis sufferers treat themselves with unproven methods, and a substantial number will experiment with diets and supplements. Many will conclude these dietary manipulations helped them. Some of the subjective benefits experienced can be attributed to placebo effects, natural variations in the symptoms of their diseases or associated effects such as weight loss. However, some benefits may be due to the dietary changes themselves. (It has been speculated that dietary change helps by eliminating an obscure food allergy or modifying an immune system response to inflammation.) Since favorable results seem to be highly individual phenomena, only blinded, crossover tests can determine whether a method really works for an individual patient. Of course, even if a method works for an individual, the mechanism could still be a placebo response.

The percentage of arthritis patients who can benefit from nutritional measures is probably quite small. But health care providers should be tolerant with patients who wish to try them and help these patients avoid hazardous dietary practices.

Hazardous Remedies

Dangerous dietary remedies include any that encourage poor nutritional practices over a long period of time. The study that reported positive findings on fasting could cause someone to fast without supervision. Prolonged nutritional deprivation can have serious consequences.

More often, hazardous self-care involves the use of supplements. Overuse of fish oils puts a person at increased risk of stroke. Herbal remedies are often promoted as "nutrition products," however when gathered in the wild or from health food or herbal stores, many pose a significant hazard. Misidentification of herbs used to relieve arthritis has killed people

[Morbidity and Mortality Weekly Report 26:257-259, 1977], as have Chinese herbal pills containing uncertain amounts of potent, naturally occurring pharmaceuticals.

Where does quackery fit into the picture? Quackery can be defined as "the promotion of medical remedies known to be false, or which are unproven, for a profit." Dubious products for nutrition-related, arthritis self-care include herbal remedies, vitamin supplements and books touting special regimens. Although it has been shown above that altering dietary practices may work for some people, none of the dietary approaches found to be of modest benefit are similar enough to constitute a simple prescription for all that can be put in a bottle or presented in a popular diet book. Any benefit experienced by arthritis patients who fall for such promotions can be attributed to good luck. Fish oil supplements show some promise, but they are not hazard-free and should be used as carefully as any drug for arthritis. "Drugless practitioners," such as chiropractors and naturopaths, should be avoided if they advise patients to discontinue needed medication for dietary and/or herbal "alternatives." This has proved fatal in some cases.

Conclusion

Health professionals should be sensitive to the feelings and beliefs of arthritis patients who believe they have been helped by nutritional self-treatment. However, it would be a dereliction of duty to allow potentially harmful beliefs to persist. Health education should begin early. The Alabama study found that only 5% of patients had engaged in self-treatment before contacting a physician for their arthritis. This means physicians have a good opportunity to educate most patients about the natural course of their disease, the placebo effect and the potential harm involved in using unproven remedies.

Patients intending to use an unproven remedy would be wise to discuss it with their respective physicians. That way they can be steered away from frankly dangerous methods and can be helped to evaluate what happens with relatively harmless methods. Patients who learn to conduct their own crossover studies may experience a beneficial response. This may still be due to a placebo effect involving their own operant conditioning, beliefs or suggestibility, but it may be worth continuing if it works for them consistently. However, both patients and providers must be careful not to allow illusory improvements to steer them away from effective medical care.

Dr. Jarvis is a professor in the department of preventive medicine at Loma Linda University and president of the National Council Against Health Fraud.

INFORMATION WANTED

If you find any newsworthy items, such as a published article or news report, or have a personal experience that might be of interest to our readers, please send it to Stephen Barrett, M.D., P.O. Box 1747, Allentown, PA 18105.

A SPECTRUM OF DIET BOOKS

Lisa T. Harris, R.D.

The American public seems to have an insatiable appetite for anything that offers quick, safe, permanent weight loss. With 34 million overweight adults in this country and 30% of women between the ages of 19 and 30 dieting at least once a month, it is no surprise that diet books can be extremely popular, with several making the best-seller list each year.

Lately there has been an increase in books written by masters-level nutritionists and registered dietitians. However, as is often the case with physician-authored plans, credentials do not guarantee accuracy. This has also been a time for sequels, with Martin Katahn rotating into the T-factor and Judy Moscovitz complementing her rice diet with her *Dieter's Companion*. The "calories-don't-count" theme has been revived but with an emphasis on cutting fat intake.

Now more than ever the public is faced with books that mix legitimate research findings with pseudoscience. Laypersons will find it difficult if not impossible to sort through this ever-growing maze of misinformation.

This article presents ten noteworthy books that vary considerably in quality. All are part of the multibillion-dollar market in which the public searches for a "magic bullet" for obesity.

Recommended

The Weighting Game (1988)

Lawrence E. Lamb, M.D.

Lyle Stuart Inc., Secaucus, New Jersey

Hardcover, 266 pp, \$15.95

Dr. Lamb, a nationally syndicated columnist, wrote this book because "Gaining an understanding of what controls body weight is the best protection people can have against being ripped off." Using a question-and-answer format, he explains in detail many of the metabolic processes involved in determining body weight. He recommends a low-fat, high-carbohydrate program without excessive caloric restriction plus exercise to increase the metabolically active muscle mass. He also discusses the drawbacks of other diet programs and weight-loss aids.

The Weighting Game is a useful reference for health professionals and serious dieters interested in the whys and hows of weight loss. The dietary advice is up-to-date, well researched and accurate. The text is sometimes technical, but chapter summaries, charts and drawings help clarify important points.

The New American Diet (1986)

William E. Connor, M.D., and Sonya L. Connor, M.S., R.D.

Simon and Schuster, New York, New York

Hardcover, 410 pp, \$18.95

The Connors' program is based on a five-year NIH-sponsored study whose goal was to determine "just how many and what kind of desirable dietary changes typical Americans could comfortably make." The resulting program includes three phases of gradual change, focusing on menu modification and eventually decreasing fat intake to 20% with carbohydrate at 65%. The authors offer what they believe is "the most sensible available weight-loss approach" through weight-reduction plans of 1,000–1,200 calories for women and 1,800–2,000 for men. The book also provides helpful advice on handling special eating occasions.

The New American Diet can be a valuable reference for professionals as well as the general public. It provides a reasonable, gradual plan based on solid scientific research. It is full of charts, graphs, tables and illustrations, all of which are interesting and helpful. Information on specific food items and nutrient content, as well as menu substitutions, is also valuable.

The I-Don't-Eat (But-Can't-Lose) Weight Loss Program (1989)

Steven Jonas, M.D., M.P.H., and Virginia Aronson, M.S.,

R.D. Rawson Associates (Macmillan), New York, New York

Hardcover, 250 pp, \$18.95

This program was developed mainly for those the authors call "diet-induced low-calorie overweight" individuals who may not lose weight on a low-calorie regimen because repeated dieting has left their bodies highly efficient at saving energy. To overcome this situation, the authors present their IDEAL (I Don't Eat A Lot) exercise and eating program. The exercise component, which stresses pacewalking or brisk striding, is introduced gradually over a six-month period. Calorie counting is shunned, while fat slashing is promoted.

The book is well researched. Its diet plan is healthful, with adequate servings from the major food groups. The breakdown of 30% fat, 55–60% carbohydrate and 10–15% protein is in line with most recommendations today. In addition to exercise and diet, "mind-set strategies" are also discussed, with self-evaluative questions on many lifestyle topics. A discussion of the special nutritional needs of women is also very useful.

Marginally Recommended

The T-Factor Diet (1989)

Martin Katahn, Ph.D.

W.W. Norton & Co., Inc., New York, New York
Hardcover, 301 pp, \$18.95

The author of the best-selling *Rotation Diet* returns with this book on thermogenesis, the "T-factor." His basic premise is that dietary fat is the main factor in determining the amount of body fat because the body is most efficient at metabolizing dietary fat into fat stores. He recommends eating a low-fat diet (i.e., 20–40 g for women) rather than counting calories. He also recommends exercises involving whole-body movement for burning fat.

The idea of thermogenesis has been around for many years, so Katahn's theory is by no means a "breakthrough." It is known that fat is more efficiently metabolized than carbohydrate, but the degree to which this occurs and the significance of this finding are debatable. However, the practical recommendations in this book are sound. A computerized analysis reveals that 15% of the 1,570 calories in the recommended diet comes from fat (26 g). Thus, dieters who follow it will reap the benefits of a low-fat intake.

Elizabeth Takes Off (1987)

Elizabeth Taylor

G.P. Putnam's Sons, New York, New York
Hardcover, 256 pp, \$17.95

For those who enjoy reading about the lives of the rich and famous, this book is a must. In this work, Ms. Taylor discloses the saga of her battle of the bulge from a size 14 to size 6 and shares her "Taylor-made" program: a 14-day diet, an exercise component and lots of practical advice. She reminds women that her diet program is not a miracle and urges them to accept the body nature has provided. She encourages women to keep their sense of humor and to reward themselves.

A computerized analysis of her 1,000-calorie diet plan reveals it is relatively high in protein (37%) and low in carbohydrate (39%), while the fat content is commendable (24%). She proposes a seven-day maintenance plan of 1,200–1,500 calories, which provides dubious protection in the struggle for long-term weight control. But although the book cannot be recommended for its dietary regimen, readers may still enjoy the honest writing style. They may also benefit from Ms. Taylor's behavior advice, especially her reminder that women can look and feel good while dieting and that "diet food" can look and taste good.

The Stop-Light Diet for Children (1988)

Leonard Epstein, Ph.D., and Sally Squires, M.S.

Little, Brown and Co., Boston, Massachusetts
Hardcover, 232 pp, \$16.95

This book is designed to help children aged 6 to 12 lose weight through a program of nutrition, exercise and behavior change. The diet plan is based on ten years of research with 1,000 participants at the University of Pittsburgh School of Medicine. The plan groups foods into three categories: green (very low in calories), yellow (the mainstay of the diet) and red (high in calories). Low-fat eating with sensible portion sizes and

good food choices is emphasized. Parental involvement is imperative, but children are taught to take responsibility for their own actions.

The book is written in two sections, one for parents and another with corresponding chapters in larger print for children. The stoplight concept simplifies decision-making. No foods are "forbidden," and the emphasis on gradual, permanent change with family involvement is a plus. However, the recommended intake of 900–1,200 calories and 20% fat (derived from our computerized analysis of sample menus) may be too low for growing children. Generally, though, the book contains good advice for families interested in controlling childhood obesity.

Not Recommended

The Two-Day Diet (1988)

Tessa Cooper, M.S., and Glenn Cooper, M.D.

Random House, Inc., New York, New York
Hardcover, 227 pp, \$16.95

According to the Coopers, "Anyone can stay on a diet for two days." So they have devised a weight-loss program presumably for everyone. Their two consecutive On Days are ketotic at 700–800 calories. These are followed by an Off Day, which provides a more balanced diet with 1,200 calories. The program is said to produce maximum motivation and rapid fat-burning. After two to six weeks, dieters enter "metabolic readjustment," a phase claimed to avoid the rapid refilling of fat cells. Exercise is stressed throughout.

The authors project weight loss at 3–7 pounds a week. On Days contain 77 g of carbohydrate and are low in fiber and many vitamins and minerals. And dieters may be disappointed with the Off Days, where "the foods you love" include such "craved" items as 1 tbsp butter, 3 tbsp sour cream and ½ small donut. The authors claim lean body mass will be spared because of the high-protein nature of the diet and exercise components. Yet they offer no references to back up these claims or most others made in the book.

Maximum Metabolism (1989)

Robert M. Giller, M.D., and Kathy Matthews

G.P. Putnam's Sons, New York, New York
Hardcover, 224 pp, \$16.95

The authors of this book promise a program that paves the way to quick, permanent weight loss by eliminating hunger, cravings and stress. Touted as "the first book that tells you how to alter your metabolic rate," *Maximum Metabolism* recommends a 21-day, low-fat, high-complex-carbohydrate diet of 900 calories, proper timing and sequence of meals, and regular exercise. However, supplements such as guar gum, chromium, L-tryptophan and "antistress vitamins" are also recommended as "biochemical boosters" to correct faulty metabolism.

Maximum Metabolism is filled with unscientific claims. For example, the authors state that stress slows your metabolism, less starch equals faster weight loss, a diet low in fat will inevitably be low in calcium, and artificial sweeteners may have the same effect on insulin levels as natural sugar. Any weight loss accomplished on this program would be caused by its 900-calorie diet, which is deficient in several major nutrients.

Not Recommended (Cont.)

How to Win at Weight Loss (1987)

Stephen Langer, M.D., with James E. Scheer
Thorsons Publishers, Inc., Rochester, Vermont
Hardcover, 236 pp, \$14.95

Dr. Langer claims to have produced the definitive weight-loss book for people tired of dieting. Instead he stresses the elimination of what he calls eight "roadblocks" to weight loss: hypothyroidism, *Candida albicans*, hypoglycemia, allergies, adrenal exhaustion, heavy metal intoxication, immune system deficiency and emotional disturbances. And he claims that "An upgrading of diet through judicious selection of foods with vitamin, mineral, and, often, enzyme supplementation not only improves health but enables the overweight and obese to lose—often with amazing ease."

The book is filled with nonsense. Hypothyroidism is said to afflict 40% of the population, and yeast infection (candidiasis) is also said to be a common factor in obesity. Foods with allergens are said to be "capable of causing hypoglycemia or hyperglycemia." Odorless liquid garlic, gamma-linolenic acid and glucomannan, along with megadoses of vitamins, are recommended for various conditions. These "natural" ways to lose weight are based primarily on case histories. To help readers decide whether they suffer from hypothyroidism, candidiasis or hypoglycemia, the book lists the supposed symptoms of each. But many of the symptoms listed are so common and nonspecific they provide no basis for accurate self-diagnosis.

The Rice Diet Report (1986)

Judy Moscovitz
G.P. Putnam's Sons, New York, New York
Hardcover, 242 pp, 16.95

This book reveals the supposed diet secrets of Dr. Walter Kempner's Rice House in Durham, North Carolina, where more than 20,000 people have been treated in the last 40 years. The program consists of six diet phases, ranging from Phase I (rice, fruit and a few vegetables) to Maintenance. Salt and dairy products are generally taboo, as is snacking. During Phase I (which dieters may stay on for several months), a two-week 15- to 25-pound weight loss is predicted. Exercise is recommended and many behavior tips are provided (Moscovitz is a former psychotherapist).

The diet is bland, and although it is low in fat, cholesterol and sodium, it is also deficient in calories (approximately 700 per day), protein and many key nutrients (especially iron, calcium and vitamin B₁₂). The book contains several bizarre statements. For example, "If you don't have any cholesterol problems, you may now add plain white vinegar to your list of permissible condiments," and "A quart of milk may be more deadly to some than a quart of rotgut whiskey." Worst of all, the author suggests the plan is healthful for growing children.

Ms. Harris edits and publishes *Current Diet Review*, a bimonthly newsletter that evaluates nutrition books and other publications. Subscriptions are \$20/year from P.O. Box 1914, Rialto, CA 92377.

BRIEFS

Fitness and mortality. A large prospective study has found that "Higher levels of fitness appear to delay all-cause mortality primarily due to lowered rates of cardiovascular disease and cancer." The findings were consistent after adjustment for age, serum cholesterol level, blood pressure, smoking habits, fasting blood sugar level, family history of heart disease and length of follow-up. Fitness was determined through treadmill testing. The study, conducted by Kenneth H. Cooper, M.D., and colleagues at the Institute of Aerobics Research in Dallas, Texas, followed 10,224 men and 3,120 women for an average of eight years [JAMA 262:2395-2401, 1989].

Protein "packaging." Researchers at the USDA's Agricultural Research Service in Albany, California, are testing the ability of nearly invisible coatings of casein (milk's major protein) or plant proteins plus a small amount of vitamin C to protect sliced fruits and vegetables and other ready-to-eat foods from spoiling.

Criminal convictions. Three individuals involved in the manufacture and marketing of E-Ferol have received prison sentences. The drug, an intravenous vitamin E solution marketed without FDA approval, was responsible for the deaths of 38 premature infants in 1983 and 1984 before it was recalled from the market.

USDA research funds. During fiscal year 1988, the USDA spent \$142.3 million for educational activities and \$60.4 million for research related to human nutrition (1,031 projects).

New data on fiber and cholesterol. James Anderson, M.D., and colleagues at the University of Kentucky have reported that incorporating more fiber into the American Heart Association's recommended diet enhances the beneficial effect on cholesterol levels. The study involved 179 healthy men and women, 30-50 years of age, whose initial serum cholesterol values were between 200 and 300 mg/dl. The subjects were randomly placed into an AHA group, a high-fiber group or a control group. The AHA and high-fiber diets were identical in cholesterol content and percent of calories from carbohydrate, protein and fat, but the high-fiber diet emphasized soluble fiber (found in oats, dried beans and all fruits). Both diet groups received intensive counseling, while the control group received none. After a year, the high-fiber group averaged a 12.8% reduction of total blood cholesterol and a 17.6% reduction of LDL-cholesterol. The AHA group averaged reductions of 9.5% and 13.5%. The control group experienced reductions of 6.7% and 9.7%. The report was presented by Dr. Anderson at the Association's annual scientific session in New Orleans on November 13.

Book bargain. The softcover edition of *Popular Nutritional Practices*, by Jack Z. Yetiv, M.D., Ph.D., which lists for \$12.95, is available to *Nutrition Forum* readers for \$9.95 each or in cases of 32 for \$160, postage included. Orders, which must be prepaid, should be sent to Popular Medicine Press, P.O. Box 1212-N, San Carlos, CA 94070. The 1987 book, which received excellent reviews in major journals, covers more than 100 contemporary nutrition topics.

L-tryptophan toxicity. In mid-November, the FDA initiated a Class I recall by asking manufacturers of over-the-counter products in which L-tryptophan is the major ingredient to remove them from the market. (A Class I recall is "a situation in which there is a reasonable probability that use of, or exposure to, a violative product will cause serious, adverse health consequences or death.") Early in January, it was announced that more than 1,000 cases of a rare blood disorder called eosinophil-myalgia syndrome had occurred in users of L-tryptophan, with seven deaths and 139 hospitalizations. At least a dozen brands are implicated. The U.S. Centers for Disease Control, which is collecting case reports, has established a link between the amino acid supplement and the syndrome, which is characterized by severe muscle pain and joint pain. Some patients also exhibit weakness, swelling of the arms and legs, fever and skin rash. The investigation has not established whether L-tryptophan itself or some contaminant introduced during its manufacture is responsible for the outbreak. The health food industry has been promoting L-tryptophan to treat sleeplessness, depression, PMS and overweight. According to *Whole Foods* magazine, L-tryptophan first gained national exposure after a 1979 article in the *National Enquirer*, which touted it as a "miracle pill" for relieving stress, depression and insomnia.

Notable quote. "L-tryptophan is but one more in a long list of nutritional products that expose the public to serious harm. The marketing of all such unapproved drug products must be attributed in part to FDA's lax enforcement policy. How many more people must be exposed to harm, what level of confusion, deception and chaos must appear in the marketplace before FDA will announce that it expects the [supplement] industry to comply with the law? A lax enforcement policy serves to license crime."—Paul J. Sage, an FDA Consumer Safety Officer who has petitioned the FDA to use more criminal prosecution to clean up the illegal "supplement" market [*Nutrition Forum* 1:1-2, 1984].

Water treatment suit settled. In October 1988 the Federal Trade Commission found that Norelco had engaged in false advertising by claiming its Clean Water Machine removed possibly harmful chemicals from drinking water when its replaceable filter actually added a potentially hazardous chemical (methylene chloride). After the FTC ruling, several owners of the device filed a class action suit against North American Philips Corporation, Norelco's parent company. As part of the settlement, Norelco agreed to provide a fund of \$2.5 million for use in paying refunds to purchasers.

FTC attacks Fibre Trim. The Federal Trade Commission has charged Schering Corporation with making deceptive and unsubstantiated advertising claims that Fibre Trim can suppress

appetite or help control weight. The agency also objects to claims that the product can provide the health benefits associated with a fiber-rich diet, that it provides 2.35 g of fiber per serving and that the recommended daily dosage would contribute significantly to a person's daily dietary fiber intake.

WIC increase. The Child Nutrition and WIC Amendments Act of 1989, signed into law in November, includes a fiscal year 1990 appropriation for WIC of \$2.158 billion, \$118 million over current services plus inflation. This is the largest increase in five years, enabling WIC to serve 210,000 new participants. The WIC program provides food to help pregnant and lactating women, infants, and children aged 5 and under to improve their diets and reduce their chances of health problems due to poor nutrition [*Nutrition Forum* 5:9-11, 1988]. The new law also provides funds for promoting breast-feeding.

Unusual gift. According to an Associated Press report, a 43-year-old man from Illinois who weighed 430 pounds last August donated about four square feet of excess skin to be used for skin grafts in burn patients. After a 173-pound loss on a high-protein weight-loss regimen, 19 more pounds of pendulous skin and adjoining tissue were surgically removed to lessen the strain on his back. Donated skin serves as a temporary "living bandage" while a burn patient's skin regenerates. Then the borrowed tissue sloughs off. Most skin for transplants is obtained from dead bodies. The donor, Dennis Genz, is equipment coordinator for Sherman Hospital, Elgin, Illinois.

HeartGuide update. The American Heart Association's HeartGuide program—under which seals of approval will be issued for products low in cholesterol, total fat, saturated fat and sodium—is scheduled to begin in February 1990. One hundred products are being tested for possible endorsement. Companies in the program must pay \$10,000 to \$40,000 to enroll plus \$5,000 to \$600,000 for an education fee. According to the AHA, the fees will equal the costs of testing, national advertising, messages on product packages, brochures and other in-store materials that explain the program and stress the importance of the overall diet in the prevention of heart disease. The fees were originally higher but were reduced in response to criticism from food processors and the press. The HeartGuide logo is a bold red heart with a checkmark in its center. The program was planned to include margarines and spreads, shortenings and oils, frozen dinners and entrees, canned and frozen vegetables, and crackers. However, the USDA has ruled that food products containing meat and poultry cannot carry the AHA logo. USDA officials have expressed concern that a seal of approval on specific food items cannot convey the importance of a total diet and that foods so labeled will be perceived as "good," while other foods are perceived as "bad." AHA officials insist that the educational campaign will supply the correct perspective.

Quackery conference. The Second National Conference on Health Fraud, Quackery and Misinformation has been scheduled for September 16-18 in Kansas City, Missouri. Information about the program can be obtained by contacting John Renner, M.D., Consumer Health Information and Research Institute, 3521 Broadway, Kansas City, MO 64111, (Telephone, 816-753-8850).

Obesity newsletter changes name. The *International Obesity Newsletter* has been renamed *Obesity & Health*. An eight-page monthly, it covers nutrition research, diet frauds, weight-reduction techniques, recent books, educational materials and other topics related to weight control. *Nutrition Forum* subscribers can get a free sample issue by sending a self-addressed 4 x 9½-inch envelope to *Obesity & Health*, Route 1, Box 6A, Hettinger, ND 58639.

Alcohol popularity decreasing. The U.S. Centers for Disease Control (CDC) has reported that per capita consumption of distilled spirits (whiskey, rum, vodka and gin) in 1986 was the lowest since 1959, while per capita consumption of alcohol in all alcoholic beverages combined—2.58 gallons—was the lowest since 1977. Two out of three American adults drink, CDC reported, but 10% of drinkers (6.5% of U.S. adults) account for half of the alcohol consumed. A recent Roper poll found that 56% of Americans feel advertising of alcoholic beverages should be banned.

"Trojan horse" nutrition bill? Senator Tom Harkin has introduced the Nutrition and Health Act of 1989, a bill initiated

by the National Nutritional Foods Association, the major trade organization that represents health food industry retailers, manufacturers and distributors. The bill calls for creation of a permanent Federal Council on Nutrition and Health within the Department of Health and Human Services. The purposes of the Council will be to: 1) collect information about the relationships between nutrition and health, 2) monitor research, 3) monitor the progress of nutrition education, and 4) serve as a clearinghouse for such information. The originator of the proposal, Richard Merrium of Global Marketing Associates (a germanium distributor), believes establishment of the Council will bring "official recognition" to the health food industry by the federal government. To promote the bill, the industry has organized the National Nutrition Coalition with an office in Washington, DC. In a message to prospective supporters, the Coalition says the proposed agency will include all scientific research on nutrition and health in its database but "will not determine which scientific data are correct." This set-up, says the Coalition, should enable the natural food industry to gain credibility with consumers by presenting information "on file with the Federal Council on Nutrition and Health." The Coalition also hopes information from the database can be used to defend health claims challenged by the FDA.

CONTROVERSY LINGERS OVER "NEW" RDAS

The tenth edition of the National Research Council's *Recommended Dietary Allowances* has finally been released. But several authors of the draft upon which the report is based have asked that they be given proper credit for their work and that scientific errors in the new report be corrected.

The NRC press release of October 24, 1989, states, "The new RDAs are the product of a research review conducted by a five-member subcommittee of nutrition experts from the Food and Nutrition Board. . . . In addition, some 20 consultants assisted the subcommittee with its work. . . . An earlier RDA committee worked on the tenth edition from 1980 to 1985. It was disbanded by the National Research Council as a result of differing scientific opinions among the committee members, the Food and Nutrition Board, and independent reviewers appointed to critique the committee's draft report."

In 1985 the controversy erupted over the RDA committee's draft report, which lowered the values for vitamins A and C [Nutrition Forum 3:1-2, 1986]. The NRC refused to publish this report and discouraged outside publishers with threats of legal action. The NRC also refused to convene a meeting of the committee, the Food and Nutrition Board and anonymous reviewers of the draft to negotiate the issues involved. A suggestion to publish the 1980-1985 committee's work while retaining the 1980 values for vitamins A and C was also turned down. Six portions of the committee's draft, which were copyrighted by their authors, were published as articles in the April 1987 *American Journal of Clinical Nutrition* calling the proposed values "Recommended Dietary Intakes (RDIs)" instead of "RDAs."

In January 1987 an ad hoc committee appointed by the

National Institutes of Health (NIH) reviewed the 1985 draft and agreed it was scientifically sound. The NIH's director indicated that the NRC should either publish the report by the end of 1989 or return nearly \$600,000 it was given to prepare it. The NRC then formed a subcommittee to prepare the 1989 report.

Most of the recommendations in the 1989 edition were unchanged or modified only slightly from the ninth (1980) edition. RDAs were established for vitamin K and selenium, which were listed with estimated safe and adequate ranges in the 1980 edition. Higher values were set for calcium intake for women between the ages of 18 and 25. And lower values were set for folate, vitamin B₆, vitamin B₁₂, magnesium, zinc, iron (for adolescent and premenopausal women) and protein (for pregnant women).

Victor Herbert, M.D., who served on the 1980-1985 RDA committee, says that "Virtually all of these changes were made by our committee. The 1989 edition is mainly our work, edited by the subcommittee to retain the 1980 numbers for vitamins A and C as we suggested to resolve the impasse four years ago. But the 1989 edition recommends a higher intake for smokers for which no scientific basis exists. And the subcommittee introduced serious scientific errors as well. The extent of its plagiarism can be judged by comparing our April 1987 *AJCN* articles on iron, folate and vitamins A, B₁₂, C and K with their 1989 RDA counterparts."

The 297-page 1989 *Recommended Dietary Allowances* is available for \$19.95 prepaid from the National Academy Press, 2101 Constitution Ave. NW, Washington, DC 20418 (Telephone, 1-800-624-6242).

THE MACROBIOTIC DIET: NO CANCER CURE

Johanna Dwyer, D.Sc., R.D.

Macrobiotics is a quasi-religious philosophical system founded by George Ohsawa (1893–1966) and popularized in the United States by Mishio Kushi. The system advocates a vegetarian diet in which animal foods are used as condiments rather than as full-fledged menu items. The optimal diet is said to be achieved by balancing “yin” and “yang” foods. The yin/yang classification does not correspond to nutrient composition but rather to activity characteristics of the universe as defined by Oriental philosophy.

Kushi appears to believe that diet is the major factor in the development of cancer and should play a major role in its treatment. In *The Cancer Prevention Diet* (1983), he stated that “cancer is the body’s healthy attempt to isolate toxins ingested and accumulated through years of eating the modern unnatural diet and living in an artificial environment.” Kushi also appears antagonistic to medical treatment. In *Cancer and Diet* (1980), he stated, “Of primary importance in dealing with cancer . . . is not to disturb this natural mechanism by taking out and destroying the cancer.” And in *The Cancer Prevention Diet*, he says that “when a person with cancer has received chemotherapy, cobalt radiation, or undergone surgery . . . recovery may be somewhat more difficult” and that, “except in . . . lifesaving situations, we do not encourage patients to combine the Cancer Prevention Diet with surgery, radiation, or chemotherapy.”

The “Standard” Macrobiotic Diet

According to literature from the Kushi Institute, the “standard” macrobiotic diet for persons living in temperate climates encompasses the following:

- Whole cereal grains comprise 50–60% of each meal. Flour products, noodles, and cracked grains, such as unyeasted whole wheat breads, whole wheat and buckwheat noodles, oatmeal, bulgur wheat, cornmeal, and other cracked grains may be used to complement main servings of whole cereal grains.
- About 5–10% of the daily food intake should be soup made with vegetables, seaweed, grains, or beans. Seasonings are usually miso or tamari soy sauce.
- Vegetables comprise 20–30% of each meal. Two thirds are cooked; one third may be eaten raw, as pressed salad,

or as pickles. Those vegetables for daily use include green cabbage, kale, broccoli, Chinese cabbage, bok choy, dandelion, mustard greens, carrots, squash, scallions, and onions. Potatoes, tomatoes, eggplant, peppers, asparagus, spinach, beets, zucchini, and avocado should be avoided.

- Whole beans or soybean-based products, cooked together with sea vegetables, comprise 5–10% of the daily intake of food.
- Beverages include herbal teas, cereal grain teas, spring or well water, and small quantities of fruit juices.
- A small amount of white meat fish (flounder, carp, halibut, or trout) may be included 1–3 times a week.
- Seasonally available fruit may be eaten 2–3 times a week in small amounts.
- Snacks can include nuts and seeds (dry-roasted and seasoned with sea salt or tamari soy sauce). Popcorn, rice cakes, roasted grains, or beans can also be eaten in small amounts.
- Meat, animal fat, eggs, poultry, milk products, refined sugars, soda, coffee, “chemically treated” foods, refined grains, hot spices, and canned, frozen, or irradiated foods should be eliminated.

Vitamin/mineral supplements are usually avoided, and fluid restriction is common. Specific diets, which are variants of this general pattern, are sometimes proposed for different types of cancer.

The macrobiotic “way of life” includes chewing food at least 50 times per mouthful (or until it becomes liquid), not wearing synthetic or woolen clothing next to the skin, not taking long hot baths or showers (unless too much salt or animal foods have been consumed), having large green plants at home to enrich the oxygen content of the air, and singing a happy song every day.

Why Cancer Patients are Vulnerable

During the past few years, there has been so much publicity about diet and cancer that many people who develop cancer believe that dietary factors are the sole cause. Macrobiotic proponents claim that cancers arise from imbalances in the

body and buildups of poisons or impurities, and that detoxification can be accomplished through dietary means. This provides a seemingly straightforward dietary explanation for illness and suggests that a nontoxic, self-administered, home-based treatment using food is the answer. Patients conclude that macrobiotic diets are harmless, nontoxic, and may be beneficial, often after reading a testimonial book or encountering anecdotes about supposed cures from well-meaning friends or relatives.

Most patients are interested in self-help, especially through dietary measures. The macrobiotic diet can satisfy their desire for involvement in their own care, since a considerable amount of special food purchasing and preparation is necessary. Personalized attention is provided not only by the various advisers or counselors, but also through the activities of groups of like-minded individuals. The emphasis on spiritual dimensions may help cancer patients overcome guilt about aspects of their previous lifestyle that they feel may have caused their illness. Each of these characteristics can be attractive to patients who are frustrated by the toxic side effects of radiation or chemotherapy or who believe they are not involved enough in the treatment process, are not receiving enough emotional support from their doctors, or are not being comforted about their illness by their religious or philosophical beliefs.

Macrobiotics cloaks itself in the trappings of status and respectability. Its proponents suggest that experts and authoritative groups agree with this therapy. The macrobiotic diet is low in fat and high in fiber, which is also a characteristic of the preventive diet recommended by the American Cancer Society and other authoritative bodies, although the macrobiotic diet is much more restrictive. Because of this, many people assume that it can cure cancer as well. The fact is, however, that neither the American Cancer Society, the National Academy of Sciences, the National Cancer Institute, or any other scientific organization recommends any type of diet as a cure for cancer. The American Cancer Society lists macrobiotic diets among its "unproven methods" and warns that "if not properly planned to be nutritionally adequate, such diets could provide insufficient nutrition for cancer patients" [Ca: A Cancer Journal for Physicians 39:248-251, 1989].

Clear-Cut Dangers

What specific threats do macrobiotic diets pose? First, devotees of these regimens are often alienated from science-based medical practices. Several studies have found that the parents of macrobiotic children had more negative attitudes toward conventional pediatric guidance than did Seventh-day Adventist vegetarians or nonvegetarians of similar educational levels, and their children exhibited less satisfactory nutritional status. Advocates of macrobiotic diets for those who are already ill often oppose surgery, chemotherapy, and radiation, which they view as harmful and unnatural. Patients who follow their counsel may abandon those therapies.

Several years ago I interviewed a patient who, acting on the advice of a macrobiotic counselor, had signed herself out of the hospital on the day she was scheduled for laser surgery for a benign vocal cord tumor. During the next year, she and her family studiously adhered to a macrobiotic diet. Her increasing hoarseness was attributed by her counselors to dietary lapses. Only the intervention of a physician friend of the family finally led

her to have surgery, which was completely successful. Most patients who abandon or delay treatment of a tumor for a year are not so lucky. Their chances of cure (or lessened discomfort if only amelioration is possible) are likely to be considerably worse.

A second threat arises from the diet itself. Macrobiotic theory claims that improper diet and inadequate elimination of waste result in constitutional or metabolic contamination and cause cancer, and that cure results from righting the balance and cleansing the body with special vegetarian diets, appropriate spiritual attitudes, and other measures. These misguided notions often lead to radical dietary changes that can compromise nutrient adequacy in patients whose nutritional status is already precarious.

Among cancer patients, many of whom have great difficulty with their appetite, the dietary goal should be to maintain the best nutritional status possible. Appropriate nutritional support can maximize the chance of a positive response to cancer treatment and minimize sickness and death from secondary malnutrition. Sometimes nutritional support can help to slow or reverse weight loss, wasting of lean body mass, lack of appetite, and lack of an immune response. When this is not possible and these signs represent an unpreventable part of the disease process, dietary modification may still help the patient feel more comfortable. The macrobiotic diet does not conform to any accepted theory of nutritional support of cancer patients, nor has it been demonstrated by properly controlled experiments to be helpful in maintaining nutritional status among cancer patients.

When healthy adults who are accustomed to usual American fare go on macrobiotic diets, they usually experience weight loss, sometimes to a profound degree. Cancer patients, who have little appetite to begin with or who have complications due to a cancer located in their digestive tract, can ill afford to accelerate their weight loss. Since macrobiotic diets are formulated by adherence to a philosophy rather than nutrient need and food preferences, there is no guarantee they will be nutritionally adequate.

Nutrition Forum (ISSN 0748-8165) is published bimonthly by J.B. Lippincott Company, Downsville Pike, Route 3, Box 20-B, Hagerstown, MD 21740. POSTMASTER: Send address changes to Nutrition Forum, Downsville Pike, Route 3, Box 20-B, Hagerstown, MD 21740.

No Evidence of Benefit

The metaphysical concepts of macrobiotics are not amenable to testing, but curative claims are testable. So far, however, no study that meets accepted scientific criteria has been published. Most reports of cure are based on anecdotes and personal testimony rather than on careful comparisons of effectiveness in double-blind controlled studies of the diet versus other treatments or a placebo. Documentation is rarely furnished that the patients had cancer, and, if they did, that their survival time was improved by the diet. Reports about single patients or small groups of patients are too small to rule out chance or biased selection. Also, follow-ups are often incomplete or for too short a time to make sound conclusions. Thus it is impossible to separate out the actual positive effects (if any) of the macrobiotic diet from placebo effects or coincidence due to the natural history of the cancer itself. Finally, none of the claims

of cure have been subjected to the scrutiny of peer review in scientific journals. Rather, nonmedical channels and the popular press have been used to disseminate information.

When challenged, macrobiotic proponents respond that their philosophical or quasi-religious beliefs are not amenable to the standards of proof that apply to testing physiologic or biochemical theories. Those who object to these views are often characterized as bigots who, for economic or ideological reasons, fail to recognize the newer therapies.

Because no benefit has been demonstrated and the risks are substantial, there is no reason to recommend macrobiotic diets for cancer patients.

Dr. Dwyer is director of the Frances Stern Nutrition Center, New England Medical Center Hospitals, and Professor of Medicine (nutrition) and Community Health at Tufts University Medical School. The next issue of Nutrition Forum will describe the macrobiotic marketplace and a seminar at the Kushi Institute.

BRIEFS

Suit filed over new RDAs. Victor Herbert, M.D., J.D., is suing the National Academy of Sciences for copyright infringement. Dr. Herbert believes that the chapters on vitamin B₁₂, iron, and folate appearing in the 1989 RDA book were derived from work he produced and copyrighted while serving on the 1980-1985 RDA Committee [see NF 7:8].

Antiquackery crusader dies. Paul Sage, the FDA official who petitioned the agency to use criminal prosecutions to clean up the illegal "supplement" marketplace, died on February 18th. [Editor's note: He will be sorely missed by those of us who believe the FDA should develop policies tough enough to deter the marketing of supplements with bogus therapeutic claims.]

Bogus "Candida" product tackled by FTC. Nature's Way, of Springville, Utah, and its president, Kenneth Murdock, have signed a consent agreement to stop making unsubstantiated claims that Cantrol is helpful against yeast infections caused by *Candida albicans* and to pay \$30,000 to the National Institutes of Health to support research on yeast infections. The product is a conglomeration of capsules containing acidophilus, evening primrose oil, vitamin E, linseed oil, caprylic acid, pau d'arco, and several other substances. It is one of many products marketed by the health food industry manufacturers for the treatment of "candidiasis hypersensitivity," a fad diagnosis called "speculative and unproven" by the American Academy of Allergy and Immunology [NF 3:14, 3:28, 4:84-85]. Cantrol has been promoted with a self-test based on common symptoms the manufacturer claimed were associated with yeast problems. However, the FTC charged that the test was not valid for this purpose. FTC Commissioner Andrew J. Strenio objected to the terms of the agreement, because the penalty "looked paltry" compared to the estimated \$6 million consumers spent for the product. He also was disturbed that the agreement did not apply to the company's entire product line but just to products based on Cantrol's primary ingredients. Last year the FDA seized a supply of Cantrol from Nature's Way. [Editor's note: Public protection would have been much greater if either agency had acted in 1985 when I reported what Nature's Way was doing wrong.]

Stuart Berger attacked. CBS's "Inside Edition" has aired two programs vilifying Stuart Berger, M.D., a Park Avenue "diet doctor" who is being investigated by state licensing authorities. During the first program, a reporter described what happened when she visited Berger complaining of fatigue, as did a prominent New York allergist who probed Berger with a similar complaint. Both noted that their contact with him lasted about two minutes, included no physical examination, and culminated with a diagnosis of chronic fatigue syndrome and allergy to yeast (*Candida*). The reporter's cost was \$845 for the first visit, with an estimated total of about \$1,500 through the third visit. A former patient described a similar experience, which had cost over \$1,000. A former employee said that Berger ordered his employees to indicate on blood test reports that every patient was allergic to wheat, dairy products, eggs, and yeast. The reporter's visit had been filmed with a hidden camera. Berger obtained a court order stopping "Inside Edition" from showing the tape during the initial program. Two weeks later, however, after the U.S. Supreme Court sided with the producers, the tape was shown. During the interim, information was received from more than a hundred former patients and employees. In 1985, Dr. Berger's *Immune Power Diet* became an overnight best seller following Berger's appearance on the "Donahue Show" [NF 3:24]. In the book, claims are made that overweight and numerous other health problems are the result of an "immune hypersensitivity response" to common foods, and that "detoxification" and weight loss followed by food supplements can tune and strengthen the immune system. There is no scientific evidence to support these claims.

World Food Prize status shaky. The advisory council for the World Food Prize has announced that continuation of the award is in jeopardy. General Foods established the \$200,000 annual prize in 1986 to honor individuals who have made an outstanding contribution toward improving the quality, quantity, or availability of the global food supply. However, the company, which is now a subsidiary of Philip Morris, Inc., has announced that it will no longer support the prize. The advisory council hopes to find a new sponsor.

Anti-irradiation update. A two-year moratorium on the sale or manufacture of irradiated food (except spices) has been enacted by the New Jersey State Legislature. New York adopted a similar ban last year, and Maine has banned the sale of irradiated food indefinitely. Quaker Oats and H. J. Heinz Company have announced that they will not market irradiated foods. Irradiation, which can prolong the shelf-life of foods, has been unfairly attacked by consumer groups and segments of the health food industry.

"Misting" machine update. After tracing an outbreak of Legionnaires' disease to a Louisiana supermarket's vegetable-spraying machine, the National Centers for Disease Control have concluded that, for the most part, such machines do not appear to pose widespread risks to public health. The disease resulted from bacteria that multiplied in the reservoir of a device in which some of the water recirculated and could stagnate. More than 90% of misting machines spray water that comes directly from the tap, which poses no hazard.

Fat substitute approved. The FDA has given the NutraSweet Company permission to market imitation ice cream made with Simplese, a new fat substitute. Simplese is made by processing egg white and/or milk protein, plus water, pectin, sugar, and citric acid, into a creamy mixture that has the taste and texture of fat. NutraSweet's ice cream, called Simple Pleasures, will be available in six flavors. It will have about half the calories of regular ice cream and contain less than a gram of fat and 5-15 grams of cholesterol per 4-ounce serving. Regular ice cream (10% fat) contains 10-12 grams of fat per 4-ounce serving. The company plans to seek permission to market mayonnaise, salad dressing, sour cream, yogurt, dips, margarine, butter, and cheese spreads made with Simplese in place of fat. Additional information can be obtained by contacting the NutraSweet Company's consumer affairs center, 1-800-321-7254, 9:00 am to 3:00 pm CST.

Con man foiled again. Peter Foster, who received a 4-month jail sentence for advertising "Cho Low Tea," a nonexistent product claimed to lower blood cholesterol levels [NF 6:46-47], has been foiled in an attempt to place ads for another bogus product. Shortly after his release, he asked many newspapers for credit to place ads for Ageless Aging, a nutrient product claimed to help maintain energy, control stress, increase stamina and endurance, and counter toxins that "stimulate the production of free radicals, chemicals which contribute greatly to the aging process." Foster's request aroused the suspicion of a newspaper official, who asked the American Newspaper Publishers Association Credit Bureau Incorporated to investigate. ANPA/CBI vice president James Ralph quickly determined that the letters and product were bogus and, together with his staff, spent an entire day telephoning newspapers to warn them. Many had been processing the ad for publication. [Editor's note: James Ralph did another great job in stopping a mail-order scam whose promoter was attempting to cheat newspapers as well as consumers. However, had Foster's request been accompanied by payment, his ad would have been published by many newspapers that don't seem to care whether their subscribers are cheated.]

Tryptophan lawsuits. Many lawsuits are being filed by individuals stricken with eosinophila-myalgia syndrome linked to the taking of L-tryptophan. In February, to facilitate exchange of information among the plaintiffs, the L-Tryptophan Litigation Group was formed by the Association of Trial Lawyers, 1050 31st St., N.W., Washington, DC 20007. In March, the FDA expanded its recall to all L-tryptophan products in tablet, capsule, powder, or liquid form, as well as multi-ingredient nonprotein supplements that contain L-tryptophan. Retail sales were an estimated \$50-75 million a year.

Food allergy report. A 36-page booklet about allergies and other adverse reactions to foods is available for \$3 from the American Council on Science and Health, 1995 Broadway, New York, NY 10023. Individual membership in the Council, which includes its quarterly magazine *Priorities* and a 50% discount on all ACSH scientific reports, now costs \$25 per year. Sustaining individual membership, which includes the magazine and all new ACSH publications, is now \$50 per year.

Organic labeling bill. A 117-page bill outlining a national standard for "organic" food production was introduced on February 8, 1990, by Senator Patrick Leahy (D-VT). The bill (S. 1896), titled the Organic Foods Production Act of 1990, would establish a USDA "organically produced" label for products meeting certain production standards. Other uses of the word "organic" would be prohibited. The standards call for production without the use of synthetic pesticides, annual inspection of each farm, periodic residue testing of products, and civil penalties for violations. State programs may contain stricter guidelines if approved by the U.S. Secretary of Agriculture. The bill's sponsors believe it will: 1) help eliminate consumer confusion about unsubstantiated claims for "organic" and "natural" foods; 2) provide safer food alternatives; and 3) give farmers incentives to use fewer chemicals. The bill's critics believe it will certify nonsense, promote confusion, and increase food costs. Twenty-two states have passed statutes setting up "organic" definitions. Information about the bill can be obtained from Kathleen M. Merrigan, U.S. Senate Committee on Agriculture, Nutrition and Forestry, SD-647 Dirksen Building, Washington, DC 20510 (Telephone: 202-224-5207).

Pesticide-free certification. Scientific Certification Systems, of Oakland, CA, doing business as NutriClean, tests foods and offers a "No Detected Pesticide Residue" standard with stickers retailers can use in marketing the foods. According to an article in the July 1989 *East West Journal*, about 40 shippers of fruits and vegetables and 1,000 of the nation's 17,000 food stores are involved. NutriClean was founded in 1984 by Stan Rhodes, a chemist who had spent eight years in the natural foods business. He hopes that his testing-and-certification system will pressure growers nationwide to sharply curtail their use of pesticides. However, critics quoted in the article charged that NutriClean's program is simply a marketing gimmick that preys on consumer concerns and that there is no reason to believe that foods certified "free of residue" are safer than those that have not been certified. NutriClean also tests foods for nutrient content and certifies those found to have higher values than government-reported averages.

New newsletter. *Consumer Magazines Digest*, edited by Kristen McNutt, Ph.D., J.D., summarizes nutrition articles appearing in current issues of more than 40 popular magazines. Published monthly, it costs \$67/year. Subscriptions or a free sample copy can be ordered from Consumer Magazines Digest, P.O. Box 1985, Evanston, IL 60204.

Cholesterol booklet. The Channing L. Bete Co., 200 State Road, South Deerfield, MA 01373, has published "About Cholesterol," an excellent booklet on diet, cholesterol, and heart disease prevention. The booklet is simple enough for use in elementary schools yet comprehensive enough for adult wellness programs. A free review copy can be obtained by calling 1-800-628-7733.

HAVE YOU SEEN YOUR VITAMITICIAN LATELY?

James J. Kenney, Ph.D., R.D.

Great Earth Vitamin Stores—the nation's second largest health food store chain—is advertising a "Free Vitamin Fitting" by "highly trained Vitamiticians who tailor a nutritional support program that's a perfect fit for you." According to the ad, the program is based on a "Nutritional Fitness Profile" developed by "a noted Johns Hopkins physician."

The Profile contains 29 multiple-choice questions pertaining to diet, symptoms, illnesses, and lifestyle factors. Each question has three possible answers, with #1 indicating no problem, #2 indicating a slight problem, and #3 indicating a significant problem. To obtain my "vitamin fitting," I visited two Great Earth stores in the Los Angeles area. One displayed a large poster offering the service, while the other had posted copies of the Profile throughout the store. In both stores I completed the questionnaire.

In the first store, the "Vitamitian" referred to a document about ten pages long while reviewing my answers. My overall score was "53," which he said was "pretty good." Nevertheless, for each response #3 I'd checked, he recommended a supplement. For example, question 23 asked whether my cholesterol level was "low," "I don't know," or "high." I had checked "high." For this, he recommended *Cholesterol Counter*, a product composed of packets that cost \$19.95 for a 30-day supply. Each packet contained four pills: 500 mg of niacin, 500 mg of vegetable sterols, 400 mg of Omega-3 fish oil, and 1000 mg of oat bran and other fibers. He told me that taking a packet with each meal would help lower my cholesterol level. He also recommended a digestive enzyme supplement because I had checked "Regularly" in response to question 11, "Do you frequently suffer from gas, flatulence or heartburn?"

The second "Vitamitian" appeared more confident and did not refer to any document when giving advice. Instead of *Cholesterol Counter*, she recommended a 500 mg timed-release niacin tablet with each meal. She said I would notice flushing of my skin which would indicate that "the niacin was flushing toxins, including cholesterol, out of my system." She also recommended the enzyme supplement, but switched to an acidophilus product and a milder enzyme product when I described having had gnawing stomach sensations in the past. Both "Vitamiticians" assured me that the supplements would reduce flatulence even though I told them it had started when I began eating beans and oat bran.

Calcium supplements. The *Medical Letter*, a highly respected drug and therapeutic advisory for physicians, has reviewed the evidence regarding calcium supplements [31:101-103, 1989] and concluded: "Differences in the absorption and adverse effects of different calcium salts are generally small. Large doses of medicinal calcium may interfere with absorption of other nutrients; food sources are probably safer. Whether calcium from any source can prevent osteoporosis remains to be established." Poorly formulated products may not readily disintegrate or dissolve in the stomach. Therefore, if supplements are used, *Medical Letter* consultants recommend chewable tablets such as Tums or Os-Cal 500 Chewable or tablets labeled as meeting U.S.P. standards for dissolution.

Both "Vitamiticians" recommended a vitamin E supplement because I had checked that I live where the level of pollution is "High much of the time." (I live near smoggy Los Angeles.) The second "Vitamitian" also recommended a 500 mg vitamin C supplement to help deal with "toxins." Both recommended a high-dose multivitamin and mineral supplement even though I said I was already taking one with 100% of the Recommended Dietary Allowances. The second "Vitamitian" said "the RDAs were developed 50 or 90 years ago and were the minimum needed to prevent a deficiency."

Although my experiences do not indicate the full extent of Great Earth's newest sales gimmick, it is clear that something is wrong. The 29 questions, either separately or together, do not provide a rational basis for any type of supplement recommendation. The advice I received was completely unfounded. The scientific evidence that megadoses of vitamins C or E can protect against pollution is suggestive at best. The idea that digestive enzyme supplements can reduce flatulence due to a high-fiber diet is utter nonsense. The nutrient intake I described (even without a supplement containing 100% of the RDAs) was more than adequate to prevent deficiency. So there was no rational basis for prescribing an additional vitamin and mineral supplement.

Worse yet, the advice about niacin was potentially dangerous. Although niacin can be a valuable drug for controlling blood cholesterol levels, it should never be used outside of a comprehensive, medically supervised program that begins with attention to diet, exercise, and other factors related to heart disease risk. When niacin use is appropriate, the dosage should be built up gradually to minimize the incidence of side effects, and blood tests should be performed regularly to detect liver problems or other toxic effects (such as increased blood sugar or uric acid levels). But neither "Vitamitian" mentioned the potential dangers.

Are Great Earth's "Vitamiticians" highly trained? Or are they merely sales clerks with a new title? After returning home, I telephoned the first store and asked another Vitamitian about her training. There "really wasn't any," she replied. "All you really have to know is how to sell supplements."

Dr. Kenney, who is certified by the American Board of Nutrition, is the nutrition specialist for Pritikin Longevity Centers.

BOOK REVIEW

Title: Heart Failure: A Critical Inquiry into American Medicine and the Revolution in Heart Care

Author: Thomas J. Moore

Publisher: Random House, New York

Price: \$19.95. Hardcover, 308 pages

Reviewed by: Mark A. Kantor, Ph.D.

Thomas Moore is an award-winning journalist with a bent toward investigative reporting. If he set out to create controversy with his latest book, he most assuredly succeeded. Within days after a lengthy excerpt of *Heart Failure* appeared in the September 1989 issue of *Atlantic Monthly*, officials at the National Heart, Lung and Blood Institute (NHLBI) were scrambling to respond to Moore's allegations that the benefits of lowering elevated cholesterol levels have been grossly exaggerated, that diet has relatively little effect on heart disease risk, and that the entire National Cholesterol Education Program (NCEP), which recommends cholesterol screening for all American adults is ill-conceived at best, and dangerous at worst.

Does Thomas Moore say we do not have to worry about cholesterol any more? Does he advocate a return to bacon and eggs for breakfast, served with buttered toast? Is this book the idle musings of just another nutrition charlatan? No on all counts. Moore recognizes that a high blood cholesterol level increases the risk of heart disease. But he is very troubled about how public policy decisions are made that affect large segments of the population. And that's what this book is really about.

For starters, Moore takes dead aim at the NCEP with simple but provocative questions: "What is the nature of the process that determines that millions of Americans without symptoms are at risk (for coronary heart disease) and require expensive medical treatment? What kind of scientific evidence is required? How are adverse effects (of treatment) monitored and the benefits measured? Is the new assault on cholesterol built on as solid a scientific foundation as the campaign against hypertension?" He is especially troubled that the NHLBI never conducted a cost-benefit analysis before launching the NCEP, and that the program was never approved by Congress.

Both are legitimate gripes. But when Moore starts to dispute the evidence linking diet, cholesterol, and heart disease, he overextends his authority and his case begins to break down.

In reviewing some of the major scientific findings that gave rise to the NCEP, Moore concluded that the program is unjustified because NHLBI's own clinical trials failed to show, by and large, that lowering blood cholesterol levels reduces heart disease. However, although he cites scores of scientific references, he did not do his homework very well. Rather than considering the evidence as a whole, he focused on the negative aspects of only a few studies, such as the "MRFIT" trial. He also ignored studies in progress whose preliminary data were available at the time he wrote the book. In so doing, he failed to see the big picture.

While discussing the topic of cholesterol, which occupies nearly the first third of the book, Moore made several technical errors in his descriptions of cell membranes and lipoproteins. But his greatest mistakes were errors of omission and misleading innuendoes. For example, he is puzzled that the NCEP

dietary recommendations for reducing serum cholesterol were never tested to see whether they are safe or effective. But the NCEP advises using ordinary foods to help lower cholesterol levels. Is he suggesting there is something inherently dangerous about eating fruits, vegetables, and whole grains? He also states that laboratory tests for cholesterol are inaccurate, but doesn't mention that substantial progress has been made in improving them.

Moore complains that the much-heralded Coronary Primary Prevention Trial (CPPT), the study that sowed the seeds of the NCEP, failed to show that lowering cholesterol prolongs life. He also accused the investigators of fudging their statistics. "In scientific research, people tend to find what they are looking for, to see what they expect to see," he writes, especially when huge amounts of time and money have been invested. But the issues of marginal statistical significance and overall mortality were discussed openly in the medical literature at the time the study was published. Despite these drawbacks, experts around the world still consider the CPPT a success because so many positive trends were associated with reducing cholesterol.

Moore describes how a small circle of friends is responsible for formulating the nation's major policy decisions on cholesterol. These members of the "medical elite" chair scientific meetings, control million-dollar research grants, advise the FDA on drug safety, and interface closely with the NHLBI. Sometimes they even take jobs with drug companies. Moore doesn't doubt the integrity of these individuals or suggest that less-qualified people assume their responsibilities, but he cautions that such a group of like-minded insiders may become too attached to a single point of view. "The terrible danger of such a closed loop is that important and basic questions are neither asked nor answered," writes Moore (an "unbiased" outsider). But many dissenting opinions were heard at the NHLBI consensus conference, and continue to be voiced at meetings and in scientific publications. If there is one thing that everyone agrees upon, it is that the riddle of heart disease has yet to be solved.

Moore reserves his harshest criticisms for the giant pharmaceutical companies. He claims they have failed to demonstrate the safety of their drugs and are making enormous profits from the NCEP. In fact, he states that what started out as a campaign for the public good has become "intertwined with greed," with physicians and food companies also cashing in mightily on cholesterol. He even wonders if reducing cholesterol is such a good idea in the first place, as he points out that some cancer patients have low serum cholesterol levels. "A sea of uncertainty surrounds the territory of cholesterol levels below 200 mg/dl," he warns in a chapter entitled "The Dangers of Low Cholesterol." The American Cancer Society, however, doesn't share Moore's fear. In fact, it endorses a low-fat diet plan similar to the NCEP's to help prevent cancer.

Nowhere in his book does Moore mention the Cholesterol-Lowering Atherosclerosis Study, which provides strong evidence that reducing cholesterol levels slows the progression of plaque, or reverses deposits already formed. And he belittles or ignores other major trials and decades of epidemiologic research, animal experiments, and metabolic ward studies, all of which point to a strong link between diet, cholesterol, and heart

disease. In fact, he doesn't seem to understand that clinical trials, by their very nature, are only capable of showing modest changes in heart disease incidence and mortality. Even the longest studies are still relatively short, inasmuch as the buildup of plaque occurs gradually over the lifetime of an individual.

Despite these numerous shortcomings, *Heart Failure* is a captivating book that is more than just a story about cholesterol. In later chapters, Moore unleashes his considerable writing skills to describe the early battles against heart disease. He gives a riveting account of the major breakthroughs, including coronary bypass surgery, balloon angioplasty, thrombolytic therapy with "clot-busting" drugs, and the people behind them.

But throughout, he returns to his central theme. How much do we really know about the long-term effectiveness of these procedures? Are they worth their incredible expense? And most importantly, do they save lives? The problem, as Moore sees it, is simple: modern medicine places too much emphasis on developing high-tech treatments but invests far too little time, money, and attention in measuring their outcomes.

Moore also weaves suspense into his book, as he describes the perils of open heart surgery, during which life literally hangs by a thread. Later, he whisks the reader to a quiet neighborhood where a recent heart attack victim is locked in a deadly race against time, waiting for paramedics to arrive. And,

in several chilling chapters, he recounts what happens when the mortality rate from heart surgery starts to rise inside a prestigious medical center. It is not just human lives that are on the line, but big egos and big money as well.

Moore criticizes other aspects of American medicine, from coronary care units (do they really save lives?) to the emergency medical system (why is it not available in all communities?). In an engaging comparison, he pines that the airline industry is more accountable for the safety and well being of its passengers than hospitals are for their patients. And he is baffled by the "chaotic and uncontrolled" process that allows physicians to decide whether to try new procedures on patients, quite unlike the orderly process used by the FDA for testing and evaluating new drugs.

Heart Failure is a compelling book that has raised the blood pressure of more than a few individuals. It is intended to highlight a lack of accountability that Moore believes ails modern medicine. Moore asks questions that need to be asked. It will be unfortunate if he also leads readers to abandon dietary caution.

Dr. Kantor is an assistant professor and food and nutrition specialist with the University of Maryland's Cooperative Extension Service, and a regional communicator for the Institute of Food Technologists. His postdoctoral research was in cholesterol and lipoprotein metabolism.

FLUORIDATION ATTACKED UNFAIRLY

Newsweek magazine has published an article based on an unauthorized release of data from an experiment in which rats and mice were exposed to high dosages of fluoride. The experiment was conducted by the National Toxicology Program (NTP), a branch of the National Institute of Environmental Health Sciences. A fact sheet released by NTP indicates that more than 1000 rats and mice drank water containing 0, 11, 45, and 79 ppm of fluoride. There were 80 animals in the control and high-dose groups and 50 in the low- and medium-dose groups. No mice showed any signs of cancer, but one male rat in the 45 ppm group and four males in the 79 ppm group developed bone cancer. In addition, one male rat in the 45 ppm group, three female rats in the 79 ppm group, and one female rat in the control group developed tumors of the mouth.

NTP emphasized that the data were preliminary. Before conclusions are drawn, data normally go through an extensive peer review process by a panel of pathologists and epidemiologists at the agency. But in this case, raw data had been leaked to the press before the review took place.

The American Dental Association and public health

officials, while noting that it was too early to comment on the study's specific data, emphasized that human studies have repeatedly demonstrated fluoride's safety. Among other things, they noted that: 1) the doses given to the rodents were much higher than would be obtained by drinking water fluoridated at 1 ppm; 2) data in one or two animal strains might have nothing to do with what happens in humans; 3) while the number of people drinking fluoridated water has been rising steadily, the incidence of bone cancer (which is not common) has not changed; and 4) many studies comparing fluoridated and nonfluoridated communities have found no evidence that fluoridation affects cancer rates. Thus, while the NTP study is likely to furnish ammunition for antifluoridation propaganda, it is unlikely to be regarded as significant by the scientific community. [*Editor's note: I believe that Newsweek's article is the most irresponsible analysis of a public health topic ever published by a major national news outlet. How sad it is that a magazine which has ignored the real dangers of cigarette smoking is willing to devote two pages to attacking a nonexistent danger.*]

AIDS FRAUD RAMPANT IN HOUSTON

Nicolas Martin

Between September 20 and October 12, 1989, the Consumer Health Education Council (CHEC) surveyed 41 Houston-area health food stores to determine the extent to which bogus treatments for AIDS are recommended. CHEC volunteers telephoned the stores and asked to speak with the person who provided nutritional advice. Each volunteer caller then explained that he had a brother with AIDS who recently was hospitalized with AIDS-related pneumonia and was now at home with his family. The brother was said to not be taking AZT (the only approved AIDS drug) but was seeking a more effective alternative against the HIV virus. The caller explained that he was the family member given the responsibility for locating the "alternative" treatment and would forward information or products to his brother. The caller also informed the health food store employee that the brother's wife was still having sex with her husband and was seeking products that would reduce her risk of being infected, or make it impossible.

Despite the illegality of their actions, all 41 retailers gave what amounted to medical advice for treating or preventing AIDS. Twenty-nine did so over the phone, while twelve asked the caller to visit the store. None referred the caller to a physician, clinic, or any organization that assists people with the disease. All stated that AIDS affects the immune system of the infected person and that they sold products that could "boost," "enhance," "improve," or otherwise benefit the brother's immune system. While several expressed minor uncertainty about the wife having sex with her infected husband, none suggested that she be advised to cease such a practice or be told of her high probability of becoming infected by HIV. None advised using a condom. All said that their stores sold products that would improve the woman's immunity and protect her against possible harm from the HIV virus. Twenty-seven claimed that if the wife took certain supplements she would be protected against infection.

Our callers emphasized that they were seeking a genuine cure for AIDS, not simply a way to prolong lifespan marginally. Thirty of the employees said they sold products that would cure AIDS. When this was questioned by the caller, most stood firmly by this claim. Some expressed slight reservations, like "I'm pretty confident it will work," and some assured the caller that "people are having good luck" with whatever they recommended.

Many of the employees emphasized the influence of the mind on the susceptibility to infection or bodily reaction to HIV. Several said the products would be more effective if meditation or other ways to induce "positive thinking" were also utilized. One health food store "nutritional counselor," to whom our volunteers were referred by the AIDS Foundation and other local AIDS support groups, said by phone that "people doing drug therapy are not doing well at all" and that it would be better to turn to "natural healing." Several health food stores suggested referrals to herbalists or "nutritional" consultants in private practice. One employee, who recommended hydrogen peroxide, other products, and literature, said that her sister-in-law had died of AIDS.

The recommended products included: vitamins (41 stores); vitamin C (38 stores); immune boosters (38 stores); coenzyme Q10* (26 stores); germanium* (26 stores); lecithin (19 stores); ornithine and/or arginine (9 stores); gamma-linolenic acid* (7 stores); raw glandulars (7 stores); hydrogen peroxide (5 stores); homeopathic salts (5 stores); Bach flower remedies (4 stores); blue-green algae* (4 stores); cysteine (3 stores); and herbal baths (2 stores). [*Editor's note:* Those marked with an asterisk (*) have been subjected to federal regulatory actions but are still being marketed.]

Several subjects were pessimistic about the benefits of using AZT, and some discouraged its use. CHEC knows of cases in which infected individuals decided to take "natural" treatments instead of AZT, a decision that can shorten their life.

Unfortunately, the Houston news media have shown little interest in what we did. Only United Press International and a weekly paper in Houston's heavily homosexual district ran stories based on our survey. One television station used a hidden camera to film a health food store employee claiming to be able to cure AIDS, but the story was not aired. The media seem to view criticism of AIDS product fraud as an attack upon the victims rather than the perpetrators.

Mr. Martin is executive director of the Consumer Health Education Council, a nonprofit agency located in Houston.

QUESTION BOX

Q. What is "alternative agriculture"?

A. A recently released report by a committee of the National Academy of Sciences states that it is not a single system of farming practices. Rather, "it includes a spectrum of farming systems, ranging from organic systems that attempt to use no purchased synthetic chemical inputs to those involving the prudent use of pesticides or antibiotics to control specific pests or diseases. Alternative farming encompasses, but is not limited to, farming systems known as biological, low-input, organic, regenerative, or sustainable. It includes a range of practices such as integrated pest management; low-density animal production systems; crop rotations designed to reduce pest damage, improve crop health, decrease soil erosion, and, in the case of legumes, fix nitrogen in the soil; and tillage and planting practices that reduce soil erosion and help control weeds." In simpler terms, it appears to be a loosely defined philosophy and set of practices aimed at minimizing the use of pesticides, antibiotics, and synthetic chemical fertilizers while protecting soil quality and remaining profitable. The 464-page NAS report *Alternative Agriculture* is available for \$19.95 (softcover) or \$29.95 (hardcover) from the National Academy Press, 2101 Constitution Ave., N.W., Washington, DC 20418.

A KUSHI SEMINAR FOR PROFESSIONALS

Jack Raso, M.S., R.D.

"Laying on that stainless steel table and getting these little lines drawn on me, I felt like a piece of beef. I felt like I had no control, when they were getting ready to do radiation. And the chemo. I went . . . to see the oncologist, and seeing the other people in the waiting room, [I wondered], 'Man, is that what I'm going to be looking like?' I mean, they didn't look well. They did not look healthy. . . . If I had done chemo and radiation, I know for a fact I wouldn't be sitting here and having energy with you right now."

The speaker, whom I shall call John, was a tall, thin, youthful macrobiotic convert in his late forties who said he used to run about 4 to 5 miles a day. He was driving me to the Kushi Institute in Becket, Massachusetts, to attend the Michio Kushi Seminar for Medical Professionals, held on June 20 to 25, 1989. John said his cancer had been diagnosed in November 1988. A week later, friends gave him two books whose authors said they had recovered from cancer while following a macrobiotic regimen. Two days later, after reading the books, John flew to Massachusetts for a consultation with Michio Kushi.

I asked what Kushi had done. John responded, "Basically, Oriental diagnosis is old . . . very old. . . . I don't know how to do it. . . . But he can look at your face. He can look at your hands, your feet, the meridians of the body. . . . You'll see some material evidence of the chakras. He'll take a little thing . . . like a nail clipper dangling [from a thread] . . . and when he puts it over this area of the body where there is a chakra, that thing will start to rotate. For men, it goes clockwise; for ladies, it goes counterclockwise." (In traditional Chinese medicine, meridians are energy conduits regulating "yin" and "yang." In Hindu philosophy, the chakras are the seven occult centers of the body.)

I also asked whether Kushi had performed a physical examination. "Just looking at the face, looking at the arms . . . he can tell how far it's advanced," John replied. "Before my cancer was diagnosed, I remember looking at my hand, and this area right here was just blue and green as hell. It looked like a bruise. . . ."

"You're pretty clean; you're clean" John assured me. "But mine was really blue and greenish, and that is one of the signs of cancer. . . . This area right here [between the thumb and forefinger] is the small intestine. That was so damn sore—in

most people it is from bad eating—that I couldn't press it like that. But everything in the body corresponds. Right now, looking at my hands, which one is the redder of the two? Obviously. The tumor's on this side. It's discharging through an extremity."

When I asked whether Kushi ever referred clients to health professionals, John answered, "No, no. . . . Well, he recommends that you stay in contact with your doctor for the blood tests, which I'm doing. I've got a homeopathic doctor." He also told me that Kushi looks at and comments on his laboratory reports.

John said he had not told his former primary physician, an endocrinologist, of his decision to turn to macrobiotics. "When I was getting ready to leave his office and he told me what the verdict was, he said, 'Be careful. There's all kinds of charlatans out there that will take your money.' In retrospect, I felt like saying, 'Like you? You took my money, and you didn't fix me.'"

John also spoke about Anthony Sattilaro, M.D., whose book, *Recalled by Life* (1982), had helped steer him toward macrobiotics. "Sattilaro got off the diet 3 years ago. His cancer got worse than probably ever. . . . He was eating very wide. . . . And I think when he got well, he kind of disassociated himself with Michio. . . . He always felt like he was being used to bring people in."

Dr. Sattilaro, whose struggle with prostate cancer was widely publicized, underwent conventional therapy but credited macrobiotics for his improvement. In *Living Well Naturally* (1984), he said that his doctors had pronounced him in a state of permanent remission. But he died of his disease last year.

A Brief History

Macrobiotics was founded by Yukikazu Sakurazawa (1893–1966)—better known as George Ohsawa. His first book in English, *Zen Macrobiotics*, was published in mimeographed form in 1960. Macrobiotic insider Ronald Kotzsch, Ph.D., who wrote *Macrobiotics: Yesterday and Today*, portrays Ohsawa as a quixotic Japanese nationalist who, while preaching the "Unique Principle" of yin and yang, smoked heavily and occasionally enjoyed cheesecake, doughnuts, Coca-Cola, coffee, Guinness

Stout, and Scotch whiskey. In Kotsch's words, "Ohsawa was a man who for 40 years taught about health with a cigarette in his hand."

The earliest version of the diet, termed the "Zen macrobiotic diet," was claimed to enable individuals to overcome a wide range of illnesses that its proponents attributed to dietary excesses. This diet had ten progressively restrictive stages. The lowest stage consisted of 10% grains, 30% vegetables, 10% soup, 30% animal products, 15% fruits and salads, and 5% desserts. Each subsequent stage increased the percentage of grains by ten while reducing the percentages from other categories. The fourth stage eliminated fruits, the sixth stage eliminated all animal products, and the final stage eliminated everything but grains. In all stages, fluid intake was discouraged.

In 1967, the *Journal of the American Medical Association* presented a detailed report of a case of scurvy and malnutrition induced by fanatical adherence to a restrictive macrobiotic regimen. This article set the tone for orthodox medicine's view of macrobiotics. In 1971, the AMA Council on Foods and Nutrition said that followers of the diet, particularly the highest level, stood in "great danger" of malnutrition [JAMA 218:397, 1971].

Kotsch's book describes how a young woman in New York who had followed the highest-level diet had died in 1965—apparently of malnutrition and dehydration. That same year, Ohsawa was sued for medical malpractice and the Ohsawa Foundation in New York was closed after a raid by the FDA.

Boston then became the macrobiotic mecca. The Macrobiotic Center of New York was founded in 1984.

Macrobiotic figurehead Michio Kushi was a student of Ohsawa. Kushi was born in Japan in 1926 and studied political science and international law before coming to the United States in 1949. During the mid-1960s he settled in the Boston area and established Erewhon, a "natural" and macrobiotic foods distributor. During the 1970s, he established *East West Journal* (a monthly magazine), the East West Foundation, and the Kushi Institute. In 1982, the Kushi Foundation was established as the parent organization for the institute and magazine.

The Kushi Institute now has two locations in the United States, one in Becket (in the Berkshire mountains) and another in Brookline, Massachusetts, a suburb of Boston. In addition to holding lectures, seminars, and conferences, the institute markets more than 100 books, audiotapes, and videotapes about macrobiotics and other topics consistent with its beliefs. There are affiliated institutes in London, Amsterdam, Antwerp, Barcelona, Florence, and Lisbon, and about 600 independent macrobiotic "centers" located in many parts of the world. Institute publications state that more than 1,000 people worldwide have attended classes at Brookline and Beckett and graduated from leadership training programs.

East West Journal, which has a circulation of about 100,000, contains more than 100 pages per issue. Its news and feature articles cover health, nutrition, psychology, and environmental issues—from the macrobiotic viewpoint. Its editorial philosophy is antagonistic toward scientific medicine and certain public health measures, including fluoridation. Fringe systems, such as acupuncture, chiropractic, homeopathy, naturopathy, Christian Science, and past-life therapy, are promoted in uncritical articles. Full-page ads appear frequently for food supplements, herbs, "natural" cosmetics, subliminal tapes, and similar products. Classified ads involve such offerings as aromather-

apy, biofeedback, meditation for cancer, a solution for hypoglycemia, vitamins, herbal formulas, "spiritual numerology," natural fibers, astrology, tarot readings, "psychic counselors," "mind expansion video," "karmic life reading," and correspondence courses in natural healing, iridology, and Chinese medicine.

What is Macrobiotics?

"Macrobiotic" is derived from the Greek *macrobiotos*—long-lived. *Webster's Dictionary* defines macrobiotics as "the art of prolonging life." But descriptive definitions abound. A "short" one (five paragraphs long) appears in the December/January 1989 *Solstice*, an independent macrobiotic magazine with a circulation of about 12,000. It states: "Macrobiotics is a way of living with respect for the physical, biological, emotional, mental, ecological and spiritual order of our daily lives." But it is "not a particular form of therapy or medicine," or a religion. Kotsch says: "There is no explicit, generally accepted understanding of what it means to be 'macrobiotic.' Macrobiotics is many-faceted. It includes a diet, a system of medicine, a philosophy, a way of life, a community, and a broad social movement." Ohsawa offered a simple definition in *Macrobiotics: An Invitation to Health and Happiness*: "To live in perpetual ecstatic delight is Do-o-Raku. Those who do so are called Do-o-Raku-Mono. If you are Do-o-Raku-Mono, you are Macrobiotic, whatever you eat."

According to ancient Chinese theory, yin and yang are cosmic principles, complementary opposites. Nothing is completely yin or yang. A given object or condition is yin or yang only relative to another object or condition. Citing yin-yang theory, macrobiotics relates itself to everything in the universe, from world peace to sexual orientation.

In *Zen Macrobiotics*, Ohsawa gave cold and heat, expansion and contraction, outward and inward, up and down, purple and red, light and heavy, and water and fire as examples of yin and yang. As the "principal food," he chose whole grains, particularly brown rice, which he considered to be near the

midpoint of yin and yang. Macrobiotics classifies foods according to: climate (hot yielding yin foods, cold yielding yang foods); pH (acid or alkaline); taste (sweet or salty); color (purple or red); and water content (perishable or dry). But an orange, despite its yang color, is yin because it is cultivated in tropical and subtropical regions, and is acidic, sweet, and juicy. Orange juice is more yin because of its greater water content. Both foods are undesirable from a macrobiotic standpoint, particularly for persons living in temperate or colder regions, because they are too yin relative to whole grains.

The relationship between macrobiotics and Chinese yin-yang theory is not clear-cut. While macrobiotics distinguishes according to structure, the Chinese theory—which includes acupuncture theory—distinguishes by function. For example, macrobiotics classifies the earth (compact) as yang and the heavens (diffuse) as yin, while yin-yang theory does the opposite. Thus, as Kotsch notes, “while Ohsawa purports to present an ancient Oriental way of thinking, in practice his [system] does not correspond to the classical Chinese system.”

In the March/April 1989 *Solstice*, Kotsch suggested that a shift in emphasis toward healing started in the early 1970s: “I remember Michio saying that if macrobiotics demonstrated that it could cure cancer, it would attract attention and influence many people.” Kushi predicted recently that in 50 to 70 years, “the modern scientific orientation will be re-examined and discarded, as a new science, based on a dynamic understanding of natural order and the unifying principle of yin and yang, begins.”

Yin-yang underpinnings, quasi-religious overtones, and a Japanese culinary bias make macrobiotics complicated. Indeed, it could be considered an antiscientific, metaphysical hodgepodge. But as far as diet is concerned, it boils down to the consumption of unprocessed or minimally processed foods, primarily whole grains and vegetables, which, ideally, should be grown “organically” in the region where the consumer lives and eaten in season. *Health Foods Business* estimates that total 1988 sales of macrobiotic foods through health food stores were \$29.8 million.

The Seminar

Throughout the year, the Kushi Institute conducts residential seminars, ranging from weekend workshops to a 5-week program for leadership training. The seminar I attended cost \$450, including tuition, room, and board. However, upon registering, there was an additional charge of \$30 for membership in Kushi's nonprofit organization, One Peaceful World, which is required for participation in all Kushi Institute programs.

Nineteen people, including myself, attended the seminar. Twelve were medical doctors, including one unskempt homeopath. There were also two registered nurses, an endodontist, an osteopath, a chiropractor, and a Ph.D. involved in nutrition research. Their past experience with macrobiotics ranged from dabbling (one M.D. with cancer) to 10 years, but most of the attendees had been practicing macrobiotics for more than 6 months, and some had been practicing it for several years. They had come from as far as Michigan, Tennessee, and Ontario, Canada. Only two were visibly overweight. The diet provided during the seminar was monotonous but appeared to be nutritionally adequate except for vitamins B₁₂ and D.

The Becket facility, located on 600 acres, has three main buildings: a rambling, multistory Main House, which originally had been a hunting lodge and then a Christian monastery; a dormitory; and a house that contained a library, a kitchen, a dining room, and what appeared to be a Buddhist temple (from where I heard chanting). Orientation took place in the library after dinner. A tall, thin, self-possessed man named Charles Millman presided. Millman introduced our program host, Jimmy, who appeared to be either in his late teens or early twenties. Jimmy had completed Level III of the Leadership Studies Program after emigrating from Yugoslavia with his family. Then his parents, who ran the kitchen, were introduced. In broken English, Jimmy's father told how his wife had recovered from ovarian cancer through macrobiotics. Three years earlier, he said, doctors had predicted she would survive only 2 to 3 months.

Next, Millman introduced the codirector of the Berkshire center and plugged her recently published book-length testimonial. She told us she had grown up with a deep appreciation for health professionals, because she had always been sick. But since 1982, her only health problem had been one headache. The last staff member introduced was John, who gave an abbreviated version of the story he had told me that afternoon.

Each of us received a packet containing information about the diet, macrobiotic seminars and publications, traditional Chinese methods of diagnosis, and the Kushis' natural food store (Aveline's, named after Michio's wife) and restaurant (Ghinga). Millman informed us that Michio and Aveline want to turn the Berkshire facility into the world's leading macrobiotic educational center—a One Peaceful World Center. “By creating biological peace, by giving people health, you can create peace in various families, in various societies, nations, and throughout the world, spreading our teachings, and helping people to live healthy, happy lives,” Millman said. Later he asked us to wash our own dishes and silverware. “This is not part of slave labor,” he assured us, but “simply part of standard macrobiotic lifestyle practice, keeping everything very orderly and very neat.”

EDITORIAL BOARD

EDITOR: Stephen Barrett, M.D. **SENIOR ASSOCIATE EDITOR:** Manfred Kroger, Ph.D. **ASSOCIATE EDITORS:** Michael Botts, Esq., Darlene Forester, Ph.D., R.D.; Mary Abbott Hess, R.D., M.S.; William T. Jarvis, Ph.D.; James Lowell, Ph.D.; **CONTRIBUTING EDITORS:** John Cunningham, Ph.D.; Johanna Dwyer, Sc.D., R.D.; Mark Fuerst; Kathy King Helm, R.D.; Victor Herbert, M.D., J.D.; James J. Kenney, Ph.D., R.D.; Barbara Levine, Ph.D., R.D.; Kathleen A. Meister, M.S.; Grace Powers Monaco, Esq.; Anita Owen, R.D., M.A.; Zev Remba (Washington Correspondent); Sheldon Rovin, D.D.S., M.S.; Varro E. Tyler, Ph.D.; Eleanor N. Whitney, Ph.D., R.D.; Eleanor A. Young, Ph.D., R.D.; Jack Z. Yetiv, M.D., Ph.D.; and staff members of The Pennsylvania State University Nutrition Information and Resource Center.

The next morning, at 7:00 A.M., we commenced our daily exercise class in the library. Our instructor, Michael Joutras, said the exercises affected the flow of energy ("ki" or "Chi") through body channels ("meridians"), sharing the same system on which acupuncture and shiatsu (finger pressure at acupuncture points) are based. He instructed us to rub our palms together. "Our hands are especially charged with energy," he said. "There's a meridian going through each finger. . . . Now hold your palms slightly apart. Can you feel any electrical sensation? If you can't, pull them slightly apart, then bring them in closer again. . . . If you can't feel it, that's okay."

Joutras said that while nutritional scientists focus mainly on the physical aspects of food—vitamins, nutrients, fat, and so forth—the Eastern view was broader: "Meat has a certain kind of energy. Sugar has a certain kind of energy. Dairy food has a certain kind of energy. And when we ingest these things, then that energy is going into our body, and being released through the process of digestion, and going through the whole body, carried through the meridian system. And so the underlying basis of sickness was always that energy is imbalanced." Later he stated, "The definition of matter is . . . nothing but energy, and waves, and vibration. . . . There is nothing but condensed vibration. . . . Everything is spirit."

Our daily cooking class began at 10:00 A.M. in the Main House. It was conducted by Wendy Esko, a predictably thin, barefaced, 40-year-old woman with long hair, who stumbled onto macrobiotics 19 years ago and has been practicing it ever since. The class topic was "Medicinal Use of Food." We were warned that Cuisinart-processed vegetables caused hyperactivity.

Next came Martha Cottrell, M.D., a feminist with a Southern accent, who described Kushi as "psychic." Cottrell had contributed to the promacrobiotic collection of essays, *Doctors Look at Macrobiotics*, edited by Wendy Esko's husband, Edward Esko.

"I've been macrobiotic pretty much for about 10 years. I started when I turned 50 in 1978," Dr. Cottrell said. "Without any doubt, I feel that macrobiotics has given me at least 10 years' additional life, and maybe more. And I want to use it well, and have fun doing it, too." Before turning to macrobiotics, she said, she had suffered from arthritis, gastrointestinal problems, psoriasis, and other skin conditions. But she noted that some macrobiotic counselors have not learned how to take care of themselves very well. "Michio is so driven by what he wants to do before he dies," she said. "I was in Florida with him not long ago, and he looked extremely tired. And he's still smoking."

Dr. Cottrell's presentation was followed by dinner—which most of the participants appeared to relish. One M.D. even remarked, "If we have any more food like we've had in the last 24 hours, you'll have to roll us all down the hill."

The next speaker was Edward Esko, a tall, thin, blond man who looked anemic despite a mild facial sunburn. "There's a lot of misconception about macrobiotics," he lamented. "Especially the whole Zen macrobiotics and brown rice diet. . . . actually 25 years out of date and it's still on some people's minds." Then he told how a writer who had recently done a computerized literature search found 23 articles on macrobiotics. Twenty-one were negative. "I think what we need is 20 positive articles about the standard macrobiotic diet published in journals, medical journals, which will counteract that false impression that many people have." George Ohsawa chose the

name "Zen" because of a rough connection with Buddhist vegetarian cooking, and because Zen philosophy was popular at that time in New York. "So it was kind of a marketing strategy," Esko said. While explaining yin-yang theory, Esko nonchalantly refuted Newton's Universal Law of Gravitation, stating that gravity simply doesn't exist.

Esko introduced us to a woman from Lima, Peru, who said she had pursued macrobiotics after having been diagnosed with a brain tumor by magnetic resonance imaging (MRI). She was in her twenties and had beautiful, long hair—which had been temporarily lost as a result of therapy. One of the doctors asked whether she had had another MRI after turning to macrobiotics. She said she hadn't because her doctor had said it was expensive and needless.

Kushi's Presentation

Kushi did not appear until the afternoon of the seminar's third day, when he lectured on diagnostic principles. He is a thin, unremarkable-looking man with short, receding, salt-and-pepper hair and pronounced cheekbones. He wore a three-piece, pinstriped, navy blue suit. His broken English often made him unintelligible. Cameras flashed during his lecture.

"Modern medicine is physical, material way, analytical way," Kushi said, "therefore overlooking this universe's force coming in, and the earth force go up, coming in constantly, constantly, constantly."

To demonstrate this alleged force, Kushi produced nail clippers suspended from a dark thread. "This is no gimmick," he assured us. Then, dangling them over a supine doctor, he proceeded to give the chakra demonstration to which John had referred on our way to Becket. According to Kushi, the chakras caused the clippers to trace small circles over corresponding areas of the body. However, close observation revealed that the circling was caused by movements of Kushi's arm.

The methods espoused by Kushi do not correspond to scientific medical practice but are part of what he calls the "traditional arts of Oriental healing." They include pulse diagnosis, visual diagnosis, meridian diagnosis, voice diagnosis, astrological diagnosis, parental and ancestral diagnosis, aura and vibrational diagnosis, consciousness and thought diagnosis, and spiritual diagnosis—all of which were defined in the information packet we received.

Voice diagnosis supposedly identifies disorders of the glands, organs, and certain body systems. Kushi said, for example, that a "watery voice . . . means natural kidney-bladder is overworked. Also must be blood vessels expanded for too much water. . . . So when [you] hear a watery voice, then you should immediately know heartbeat overworked, and kidney overworked, and blood overworked."

Astrological diagnosis uses the time and place of birth and current astrological and astronomical conditions to "characterize the basic constitutional tendencies of the body and the mind as well as the potential destiny of the current and future life of the subject." After outlining nine Oriental "astrological types," Kushi summoned volunteers representing "opposite" types, compared their smiles, and commented that some were "idealistic, very romantic, uplifted" while their supposed opposites were "gentle" and "more reserved."

Behavior diagnosis supposedly reveals dietary imbalances related to psychological functions. For example, if you eat

too much fish, the next day you will make fish-like movements, Kushi said, illustrating his point by sitting in a chair and moving his knees repeatedly apart and together.

Environmental diagnosis uses atmospheric conditions, including temperature, humidity, celestial influences, tidal motions, and other data to reveal the "environmental cause" of a person's physical and psychological disorders. To illustrate, Kushi said: "Your bed, whether you sleep head north, head south, also different. Which should it be? Head should be more north if you are living in northern hemisphere. If you are living in southern, opposite."

After supper, before the lecture resumed, two doctors tried to duplicate Kushi's demonstration with the nail clippers. When I pointed out to one that her arm was moving, she invited me to try. I did, holding my arm still, and when nothing happened, she responded, "Oh, my God, when somebody wants to, they can really botch this."

The next session opened not with Michio, but with his wife, Aveline, in traditional Japanese dress, discussing her recent translation of a Japanese fortuneteller's book on nutrition. Millman then "treated" us to an 9-minute sample of the translation. Later, Michio held the nail clippers over the head of a woman seated on the floor with her eyes closed and said, "Please just remain quiet, okay? . . . Please, very quiet, please. . . . Now, start to think again. . . . Think of husband or boyfriend. Or romance. Your partner. . . . Now, let's change the content of thinking. Think about war. Many of friends is hurt. . . . Towns and cities are burned and destroyed. Many thousand, thousand people are being killed, and we are burning. . . . You can see, huh? By thought, vibration change. . . . The chakra vibration change." I noted how slight movements of Kushi's arm caused the clippers to swing—this time circling the purported crown chakra—at progressive speeds alleged to reflect the intensity of the woman's mental activity.

Unfortunately, I had to leave the seminar before it ended. When I last saw Kushi, he was exhorting the physicians to fulfill their true role as teachers of the macrobiotic way of life. I think they will.

The Bottom Line?

Lawrence Lindner, executive editor of the *Tufts Diet and Nutrition Letter*, saw Edward Esko for a private consultation at the Kushi Institute as part of an assignment for *American Health* magazine and reported his findings in the May 1988 issue. Lindner was told: 1) his heart was enlarged because he ate too much fruit; 2) his kidneys were weak; 3) he was slightly hypoglycemic; 4) deposits of fat and mucus were starting to build up in his intestines; 5) cold drinks could freeze the deposits and cause kidney stones; and 6) he should avoid chicken because it is linked with pancreatic cancer and melanoma. The consultation cost \$200. He concluded: "The macrobiotic lectures, courses, books and tapes . . . besides running into hundreds or thousands of dollars, teach a philosophy of life, not nutrient interactions." In a recent interview, he added, "Some people are attracted to macrobiotics because, like a typical cult, it seems to offer simple solutions to a variety of life's problems."

Stripped of its philosophy and bizarre notions of body function and disease, does macrobiotic eating make any sense? Over the years, many reports have noted arrested growth and

other forms of malnutrition among children eating a macrobiotic diet. Several lawsuits have claimed that cancer patients who relied upon macrobiotic methods instead of proven therapy met with disaster. (As far as I know, no such case has come to trial. They either are still pending or were settled out-of-court with an agreement not to disclose settlement terms.) Dr. Dwyer's article in the March/April *Nutrition Forum* points out how the diet poses significant risks for cancer patients who use it in addition to conventional methods.

Macrobiotic proponents respond to these criticisms in several ways. They state that deficiencies are the result of following the diet incorrectly—in an overly restrictive fashion. They claim that they do not try to lure cancer patients away from medical treatment with promises that the diet will cure them. And they point to research findings that macrobiotic adherents have lower blood pressure and very low cholesterol levels that protect them against coronary heart disease. (A study by William Castelli, M.D., for example, found that over 100 followers of the macrobiotic diet in the Boston area had an average blood cholesterol level of 125, while a control group of similar ages averaged 185.) However, they are not likely to add that other dietary approaches to disease prevention, such as the Pritikin diet or well-balanced vegetarian diets, are nutritionally superior and much more palatable.

No long-range study has been attempted to measure whether macrobiotic devotees wind up, on balance, better off than their nonmacrobiotic counterparts. Since macrobiotics has so many variables, such a study could be difficult to construct. To begin with, as Kotsch has admitted, no one can say with certainty what it means to be "macrobiotic." And if the results of such a study showed that devotees fared better, the reasons for their success might be extremely difficult to identify.

Thus, although macrobiotic eating might improve the health of many American adults—it presents significant and unnecessary risks of nutritional deficiency. Nutrient supplementation, laboratory tests, and consultations with a qualified nutrition professional could minimize this risk. But macrobiotic philosophy discourages such safeguards.

Mr. Raso is Assistant Chief Dietitian at Wyckoff Heights Medical Center in Brooklyn, New York. He has taught nutrition courses at Pratt Institute and Long Island University and has an abiding interest in "alternative" medicine, "New Age" phenomena, and metaphysics.

INFORMATION WANTED

If you find any newsworthy item, such as a published article or news report, or have a personal experience that might interest our readers, please send it to Stephen Barrett, M.D., P.O. Box 1747, Allentown, PA 18105. We are especially interested in receiving information about enforcement actions by state agencies and lawsuits by victims of nutrition quackery.

THE SAGA OF CAL-BAN 3000

Stephen Barrett, M.D.

During the past few years, many companies have marketed guar gum tablets or capsules with claims that they can cause weight loss. The most aggressive such company has been Health Care Products, Inc., of Lutz, Florida, which also does business as Anderson Pharmacals. Their product, Cal-Ban 3000, costs \$19.95 for a 3-week supply.

Guar gum is a soluble fiber used as a thickener in sauces, desserts, syrups, and various other foods. It has some medically recognized value as a bulk laxative, a cholesterol-lowering agent, and an adjunct to controlling blood sugar levels in certain diabetics. But it has not been proven effective for weight control. No long-term controlled test of guar gum as a weight-control agent has been reported in the scientific literature. Although weight loss has been reported among individuals who took guar gum during studies related to cholesterol and blood sugar control, this finding has not been consistent.

Anderson Pharmacals would like prospective customers to believe otherwise. In 1987, one of its widely circulated ads asserted that "the scientific community has at last developed a powerful, fast-acting weight loss compound that virtually eliminates dieting, eliminates strenuous exercise, and, most importantly, eliminates fat, flab, and cellulite! The powerful bioactive ingredient . . . works by 'short-circuiting' the fat-building process."

"Incredible But True!" the ad continued, "Cal-Ban 3000 bonds with the food you eat and prevents absorption of a substantial portion of the calories. . . . Your weight loss is automatic! . . . Eat all you want and still lose weight. . . . Please note: . . . Do not allow yourself to become too thin. If you start to lose weight too rapidly, reduce your tablet intake or skip a day or two."

Cal-Ban's marketers claim that guar gum causes weight loss by decreasing appetite and blocking the absorption of fat. When taken by mouth, guar gum does form a gel within the stomach, which may contribute to a feeling of fullness and may bind some nutrients so they are not absorbed. However, it has not been proven that either of these things is enough to produce weight loss consistently. For one thing, many overweight people keep eating even when their stomach signals that it is full. For another, if food absorption is decreased, the individual may eat more to compensate.

In September 1987, the U.S. Postal Service charged Anderson Pharmacals and three of its officers with engaging in a scheme to obtain money through the mail by means of false representations. At the same time, a temporary restraining order enabled the Postal Service to begin detaining mail to the company. Three months later, a hearing was held before an Administrative Law Judge who concluded that guar gum had no proven benefit for weight-reduction—and that even if it had some value, it certainly couldn't do what the ads claimed. Accordingly, he forbade further claims that Cal-Ban can prevent food from being converted into stored fat; that it will cause significant weight loss without discipline, calorie-restricted diets, or exercise; or that obese individuals who take it may reasonably expect to lose weight while continuing to eat all they want.

The hearing officer's decision has enabled the Postal Service to intercept Cal-Ban orders sent through the mail and return them to their senders. The company, however, has continued to run misleading ads in newspapers and magazines and on television. To avoid the Postal Service's clutches, orders are now solicited through a toll-free number, with payment by credit card or COD, and delivery via United Parcel Service. Cal-Ban is also being marketed through pharmacies and health food stores, which are outside of the Postal Service's jurisdiction. A few mail-order companies that include Cal-Ban in their catalog are still soliciting orders with payment through the mail—a situation that will probably trigger further regulatory action by the Postal Service.

The weight-loss claims made for Cal-Ban make it a drug subject to regulation by the FDA. So far, however, the agency has refused to take action to stop its sale. Guar gum is one of many ingredients covered by the FDA's OTC Drug Review, a process begun during the 1970s to judge the effectiveness of all nonprescription drug ingredients on a class-by-class basis. In 1979, an Advisory Review Panel concluded that guar gum had not been tested enough to determine whether it is effective for weight loss. Last year, an FDA official informed Congressman Henry A. Waxman (D-CA) that "while guar gum is under the OTC Drug Review . . . and does not present a health hazard, it may be marketed at the manufacturer's discretion." No completion date for the review process had been targeted.

The FDA's position was sharply criticized by Iowa Assistant Attorney General Ray Johnson at a recent hearing held by the U.S. House of Representatives Subcommittee on Regulation, Business Opportunity and Energy, chaired by Representative Ron Wyden (D-OR). Johnson noted that he and his colleagues have stopped many weight-loss scams from operating within Iowa but seen them continue in other states. Expressing outrage, he stated, "Perpetrators of diet fraud have nothing to fear from the FDA as long as their worthless products are not branded as unsafe. The FDA's failure . . . has given purveyors of diet fraud full reign for nearly 30 years to violate the FDC Act. Resulting consumer losses have been in the billions of dollars."

During the hearing, Wyden's subcommittee released a memo accusing the FDA of "sitting on the sidelines" in the regulation of OTC diet products. After the hearing, FDA staff members claimed the regulations had been tied up because studies involving phenylpropanolamine and benzocaine not been completed. However, on May 16, the agency announced that by the end of 1990 it would propose to ban more than a hundred unproved ingredients used in OTC diet products.

Johnson focused on Cal-Ban during his testimony. He estimated that in 1989, Iowa sales were more than \$200,000 and total U.S. sales exceeded \$20 million. In February of this year, the marketers of Cal-Ban promised to stop selling the product in Iowa and pay \$20,000 to cover the state's cost of taking action against them. Under the consent agreement, the company did not admit wrongdoing. But it will notify its 1989 customers that the Iowa Attorney General believes its ads were misleading and that a refund will be sent if requested. The company also agreed to pay restitution for 1987 and 1988, using a formula based on

the response to the refund offer. Up to \$50,000 will go to the state's Consumer Education Fund, while any excess will be given to an appropriate nonprofit organization.

Cal-Ban ads offer an "unconditional 100% money-back guarantee." However, the Better Business Bureau of New Port Richey, Florida, has given Anderson Pharmacals an "unsatisfactory" business performance record for failing to correct complaints of misrepresentation, nondelivery, and failure to refund money. Some of Cal-Ban's ads contain testimonials with "before-and-after" photographs of people who appear to have lost a great deal of weight. *American Druggist* has reported that the company offers a \$1,000 reward for such testimonials.

John M. D. Morse, M.D., a gastroenterologist in Terra Haute, Indiana, has reported esophageal blockage in two men,

ages 21 and 66 [*Gastroenterology* 98:805, 1990]. Both developed complete obstruction after swallowing four Cal-Ban tablets with water. The obstruction, described as "tenacious," required removal through an endoscope, in one case under general anesthesia. Dr. Morse noted that when a tablet is placed in water, it swells to 4 or 5 times its original size and has the consistency of putty. Cal-Ban is now marketed as capsules, which presumably will reach the stomach without swelling. Esophageal blockage has also been reported with a diet tablet containing guar gum and grapefruit fiber [*N Engl J Med* 322:702, 1990].

All things considered, I believe that Cal-Ban deserves considerably more attention from regulatory agencies than it has received so far.

BRIEFS

Kidney disease research volunteers needed. The National Institutes of Health needs more volunteers for its Modification of Diet in Renal Disease (MDRD) Study of the effect of various nutritional factors on kidney function. The study is under way at 15 university medical centers and needs people with kidney impairment who are between the ages of 18 and 70. Participants will receive—free of charge—an individually tailored nutritional program and careful management of their blood pressure. More than 400 people have enrolled so far, but the researchers would like a total of 800. Individuals who think they have decreased kidney function, or who have high blood pressure or diabetes that does not require insulin, can get more information by calling 1-800-344-2428.

Cholesterol lowered in egg experiment. Purdue University researchers have reported that feeding lovastatin to hens produced eggs averaging 168 mg of cholesterol, while hens on normal diets produced eggs averaging 200 mg. The medicated hens produced the same number of eggs as controls and their eggs contained no trace of the drug. However, the drug is too expensive to make commercial use feasible. Lovastatin is the chemical name for the cholesterol-lowering drug Mevacor.

FTC attacks "Gut Buster." The Federal Trade Commission has charged Fitness Quest, Inc., with making false and unsubstantiated claims about the effectiveness of its Gut Buster exercise device and with failing to disclose that the device may break and cause injury to the user. According to the complaint, the company falsely represented that use of the device would significantly flatten the user's stomach, improve the waistline by strengthening the stomach muscles, and reduce stomach fat. The company also claimed that using the device 5 minutes a day would achieve these benefits and that sit-ups using the device would be more effective than ordinary sit-ups.

HeartGuide terminated. The American Heart Association has canceled its HeartGuide food labeling program because of strong opposition by federal agencies. The program was designed to test and certify processed foods for total fat, saturated fat, cholesterol, and sodium and to label products that met the Association's criteria for good dietary health [*NF* 6:37, 7:7]. Just before the program's start-up date of February 1, a threat of legal action by the FDA caused several manufacturers to withdraw.

Breast-feeding hotline. The nonprofit La Leche League now offers information about breast-feeding through two hotlines, one for mothers (1-800-LA LECHE) and the other for health professionals (708-445-7730). The professional line offers fee-based access to a database with more than 5,000 articles.

Illegal "prostate products" will be banned. The FDA has announced that it will ban the sale of nonprescription drugs for the treatment of benign prostatic hypertrophy. The products, which do not have FDA approval, typically contain amino acids and plant extracts.

Health food store sales hit record high. *Health Foods Business* estimates that 37.8% of sales in health food stores last year were for vitamins and other supplements. Based on its annual survey, the magazine reported that 7,200 stores grossed \$1.579 billion for these products, up 76.5% from 1988. Total sales were \$4.034 billion (up 35%), including \$514 million for herbs and herbal teas (up 100.5%) and \$83.6 million for books (down 3.2%). Stores with under 3,000 square feet of selling space averaged \$393,265, while those over 3,000 square feet averaged \$2,587,000.

"Clinical ecology" attacked. The American College of Physicians has issued a position paper concluding that "there is no body of evidence that clinical ecology treatment measures are effective [*Ann Intern Med* 111:168-178, 1989]. An accompanying editorial in the same issue of the journal notes that its promotion has many characteristics of a cult and that its treatment approach should not be considered harmless. Clinical ecology (also called "environmental medicine" by its proponents) is based on notions that very low doses of chemicals in the environment can overload or weaken the immune system and cause hypersensitivity to common substances [*NF* 4:81-83]. Its methods, which are often quite costly, can place severe constraints on the patient's life and encourage invalidism. The position paper can be obtained from Linda Johnson White, Director, Dept. of Scientific Policy, American College of Physicians, Independence Mall West, Sixth St. at Race, Philadelphia, PA 19106. The editorial can be obtained from Ephraim Kahn, M.D., M.P.H., Hazard Evaluation Section, California Dept. of Health, 2151 Berkeley Way, Room 619, Berkeley, CA 94704.

Alcohol warnings proposed. Senator Albert Gore, Jr., (D-TN) and Representative Joseph Kennedy (D-MA) have introduced identical bills requiring warnings on all alcohol ads and displays. The bills are intended to counter the message of social acceptance conveyed by ads for alcoholic beverages. The warnings, which would rotate like those for cigarette packages and advertising, would cover addiction, drunk driving, fetal alcohol syndrome, combining alcohol and various drugs, and buying alcohol for minors. Two years ago Congress passed legislation requiring warnings on the labels of all alcoholic beverages.

Fraud with fish eggs. Top-quality caviar costs hundreds of dollars per pound. *Food Distribution Magazine* has reported that dishonest suppliers of caviar have been substituting low-grade fish roe for the luxury beluga caviar, which comes from sturgeon caught in the Caspian sea. Americans spend \$15–20 million for caviar every year.

Soy drinks inappropriate for infants. After the report of a 5-month-old child who became severely malnourished, the FDA has asked manufacturers of soy drinks to place warnings on their labels against using them as a sole source of nutrition for infants. These drinks, sometimes inaccurately called “soy milks,” may be consumed by children and adults as part of a balanced diet, but they are not nutritionally complete. Unlike soy-based infant formulas, they typically contain too little calcium, niacin, and vitamins C, D, and E. The FDA would like to be notified about any injury resulting from the use of soy drinks as well as promotion of any soy-based beverage as a replacement for infant formula.

Dubious cancer remedy attacked. The California Department of Health has ordered the Livingston-Wheeler Clinic in San Diego to stop treating cancer patients with a vaccine made from their own urine. The clinic's director, 83-year-old Virginia Livingston, M.D., postulates that cancer is caused by a bacterium she calls *Progenitor cryptocides*, which invades the body when resistance is lowered. To combat this, she claims to strengthen the body's immune system with various vaccines; a vegetarian diet that avoids chicken, eggs, and sugar; vitamin and mineral supplements; visualization; and stress reduction. She claims to have a very high recovery rate but has published no clinical data to support this. Attempts by scientists to isolate the organism she postulates have not been successful.

Food innovations. The Institute of Food Technologists (IFT) has listed the following, in order of importance, as the top innovations in the past 50 years: 1) aseptic (germ-free) packaging; 2) safe canning of vegetables; 3) the microwave oven; 4) frozen concentrated citrus juices; 5) controlled-atmospheric packaging of fresh fruits and vegetables (to retard spoilage); 6) freeze drying; 7) frozen meals; 8) improved understanding of water activity in foods; 9) food fortification; and 10) ultra-high temperature (UHT) pasteurization. IFT experts conceived the idea and published it as a staff report in connection with IFT's 50th anniversary [Food Technology 43:308, 1989]. Other important innovations that did not make the “top ten” list included polyunsaturated corn oil margarine, hydrogenation of fat, high-fructose corn syrup, aspartame, and extrusion technology, which is used to make chips, snack bits, and certain dry breakfast cereals.

FDA PLANS TO CHANGE FOOD LABELING RULES

When the FDA issued a proposal in 1987 to allow health claims on product labels, many commenters said the proposal was too broad and would allow claims not justified by scientific research. So the agency has replaced the 1987 proposal with a new one [Federal Register 55:5176–5192, 1990]. If adopted, the plan would allow companies to present specific messages on their products regarding: 1) calcium and osteoporosis; 2) sodium and high blood pressure; 3) dietary fats and heart disease; 4) dietary fats and cancer; 5) dietary fiber and cancer; and 6) fiber and cardiovascular diseases.

Under current laws, any claim that a food is effective in the prevention, cure, mitigation, or treatment of any disease or symptom would subject the product to regulatory action as a “drug.” The new proposal would permit claims about the association between diet and the above-mentioned conditions if the label statements are: 1) truthful and not misleading, 2) limited to describing the relationship between a particular food component and a chronic disease; and 3) consistent with sound total diet.

Under the proposal, a committee of government nutrition experts would help develop scientific summaries, consumer health message summaries, model label statements, and a consumer guide to food labeling. Label claims will be required to be consistent with information in the summary and must indicate the availability of the summary. When judging

claims, the FDA will consider what is left out as well as what is included.

Part of the impetus for the new proposal was a court case in which the FDA had attempted to stop a manufacturer from marketing a supplement product (Exachol) with claims that it could help lower blood cholesterol levels. The FDA charged that the product was both a misbranded food and an unapproved new drug. The manufacturer argued that the FDA had neither formally adopted nor uniformly enforced its 1987 health claims proposal, and that the claims made for Exachol were similar to those made for breakfast cereals and cooking oils. The court sided with the manufacturer, ruling that the agency could not restrict a small supplement-maker while ignoring similar claims made by major food companies.

The FDA has also announced plans for changing the rules for other aspects of food labeling. Current regulations require nutrition labeling only on nutrient-fortified foods or foods about which the company makes a nutritional claim. During the next 2 years, the agency expects to propose that all foods that are a meaningful source of nutrition must have nutrition labeling. Saturated fat, cholesterol, fiber, and calories from fat will have to be disclosed. Uniform definitions of health-related terms such as “low-fat” and “high-fiber” will be developed and required. And the format of nutrition labels will be revised.

NUTRITION QUACKERY: RECENT TRENDS AND TIDBITS

Stephen Barrett, M.D.

Not much is known about the epidemiology of quackery. Few large studies have been performed to determine how many people are victimized, why they are vulnerable, and how they can be protected. Nor has much been published about the numbers of people and companies involved in the promotion of quackery. I find these issues fascinating and have been devoting increasing amounts of time to exploring them.

Vitamin Advertising

The leading nutrition scam is "nutrition insurance," the concept that everyone should take supplements to be sure they get enough vitamins and minerals. Drug companies making this pitch tend to say it is difficult to get enough from food, while health food industry communications suggest that it is impossible.

"Stress vitamins" are a related scam promoted with claims that stress "robs" the body of nutrients. Lederle Laboratories, the makers of *Stresstabs*, began using this theme in 1975 and continued it in various forms for about 10 years.

During the same period, Hoffmann-La Roche also used misleading ads to promote vitamins. Most of these ads suggested that to be sure of getting enough vitamins, a daily supplement was advisable. But some suggested that "the stress of illness" would lower vitamin C plasma levels or that "as part of everyday living you do things that may be lowering the level of vitamins in your body and robbing you of these vital nutrients." Another ad contained a headline and statement, "Up tight or up in smoke . . . With both acute stress and heavy cigarette smoking, the plasma levels of vitamin C in your blood may be lowered."

Several other drug companies and more than a hundred health food industry manufacturers joined the fray, some using similar advertising and some merely relying on "stress" in their product's name to do the selling for them. Although I have not seen any overall estimate, I suspect that sales topped \$100 million a year at the peak of the "stress vitamins" market.

According to Leon Ellenbogen, Lederle's chief of nutritional science, the concept of high-dosage stress vitamins was based on a 1952 National Academy of Sciences report that

recommended extra vitamins for people suffering from stresses such as general surgery, serious burns, and major fractures. However, the report actually stated that "in minor illnesses or injury where the expected duration of the disease is less than 10 days and when the patient is essentially ambulatory and is eating his diet . . . a good diet will supply the recommended dietary allowances of all nutrients."

In 1986, to settle action taken by New York State Attorney General Robert Abrams, Lederle paid \$25,000 to the state and agreed not to make unsupportable claims that emotional stress causes depletion of water-soluble vitamins, that *Stresstabs* will reduce the effects of psychological stress, or that consumers undergoing ordinary physical stress cannot obtain all necessary nutrients by eating a well-balanced diet or by taking an ordinary potency (about 100% of the U.S. recommended daily allowance [RDA]) multiple vitamin supplement. In 1985 E. R. Squibb & Sons signed a similar consent agreement that included a \$15,000 penalty.

Since these cases were settled, I have seen no ads for "stress" supplements placed by drug companies, but several health food industry manufacturers still use false claims to market these supplements. Ads for "nutrition insurance" have become less frequent and more subtle. For example, Hoffmann-La Roche, which makes most of the raw ingredients used by other vitamin manufacturers, is spending millions of dollars advertising that foods containing beta-carotene may help prevent cancer, that beta-carotene is being studied as a cancer preventive, and that it is a good idea to include foods containing beta-carotene in your diet. (You can decide for yourself whether this information is provided as a public service or to stimulate the sale of beta-carotene supplements.)

Pharmacists

Pharmacies typically carry hundreds of irrationally formulated supplements, some of which are completely useless. Many pharmacies display posters or flyers that tell what vitamins do in the body. (These obviously are intended to promote sales by inducing customers to think that if a little is good, more is better.) Pharmacy schools appear to teach the facts needed to

advise people that "nutrition insurance" is rarely needed, that "stress" supplements are a scam, and that doses above the RDAs are rarely appropriate. Yet pharmacists throughout America seem content to sell supplements to people who do not need them. Their professional journals rarely contain articles criticizing the fraud involved.

Dubious "Supplement" Products

Under federal law, any product "intended for use in the cure, mitigation, treatment, or prevention of disease" is a drug. Drugs that are not generally recognized as safe and effective by experts are considered "new drugs" that cannot be legally marketed without FDA approval. If a product is marketed with illegal therapeutic claims, the manufacturer can be ordered to stop making the claims. The FDA can also initiate seizure of the product, obtain an injunction, and/or seek criminal penalties.

Despite the law, the health food industry markets a steady stream of products intended for the prevention and treatment of virtually every health problem. Hardly a month goes by without a new item added to its endless list. The amount of literature containing illegal claims varies considerably from manufacturer to manufacturer. Some distribute materials marked "for professional use" or "confidential," which retailers can use covertly to advise their customers. Sometimes these are distributed at health expos or at seminars sponsored by the company or a distributor. Some companies distribute literature intended to be displayed or given to customers. Health food stores can obtain these sales aids by contacting the companies or using the reader service card of a trade publication in which the company advertises.

Manufacturers wishing to minimize the risk of triggering regulatory action provide no printed information and assume that customers will be educated through other channels of communication. Magazines catering to the health food industry publish a steady stream of articles encouraging supplement use and supporting the products of their advertisers. These magazines are available by subscription or given free to health food store customers. A few mail-order companies publish newspaper-like catalogs containing articles as well as product information.

Enforcement actions taken by the FDA during the past 2 years have crimped the sales of a few product categories and stopped a few manufacturers from making blatant therapeutic claims about a large number of their products. However, illegal marketing is still common.

Since AIDS became a household word, dozens of products have been claimed to help "strengthen" the immune system. The FDA has taken action against some of these, but many are still marketed.

"Ergogenic aids"—supplement concoctions claimed to increase stamina, endurance, muscle bulk, and/or athletic performance—are probably the health food industry's hottest current product line. About a hundred companies are marketing them. Most if not all products of this type are fakes, but government agencies have shown little interest in curbing their sale.

Food Advertising

Public focus on the relationship between diet and heart disease has spawned a large number of related advertising

claims for food products. Since the public is much more familiar with "cholesterol" than with "saturated fat," many manufacturers have been making "no cholesterol" claims even for foods that are high in fat. Thus, unsuspecting consumers interested in trying to adopt healthier eating habits might actually make things worse by eating these foods. A similar situation exists for some products containing oat bran. Although oat bran can play a valuable role in lowering cholesterol as part of a low-fat diet, some "oat bran" products contain insignificant amounts of oat bran or contain undesirable amounts of fat as well. New rules proposed by the FDA within the past few months should correct these problems.

Mail Frauds

In 1977 I headed a study of ads for products sold by mail through magazine ads. After the Pennsylvania Medical Society obtained 500 nationally circulated magazines, I sorted and evaluated the ads. About one fourth of the magazines carried such ads, with a total of about 155 products from 50 companies. Not one product could live up to its advertised claims. The study touched off a chain of events leading to passage of the Mail Order Consumer Protection Amendments of 1983, which gave the Postal Service the ability to investigate faster and to recommend penalties of up to \$10,000 a day for repeat offenders. It appears that the number of fraudulent magazine advertisements for mail-order products has dropped sharply as a result.

In 1987 I screened five of the tabloid newspapers over a 3-month period and found many misleading ads. I plan to survey both magazines and tabloids again within the next few months. Bad ads for "food supplements" appear regularly in publications allied with the "health food industry." Most invite prospects to obtain the products through retail outlets, but some sell by direct mail. About a dozen companies, which stock and sell hundreds or thousands of supplement products, issue monthly catalogs that contain ads with false or misleading claims. Overall, I suspect that the number of individuals and companies

Nutrition Forum (ISSN 0748-8165) is published bimonthly by J.B. Lippincott Company, Downsville Pike, Route 3, Box 20-B, Hagerstown, MD 21740. Business offices are located at East Washington Square, Philadelphia, PA 19105. Printed in the U.S.A. Copyright 1990 by J.B. Lippincott Company. Annual Subscription Rates: U.S. \$30.00 individual, \$35.00 institution; all other countries except Japan, India, Nepal, Bangladesh, and Sri Lanka, \$35.00 individual, \$40.00 institution. POSTMASTER: Send address changes to Nutrition Forum, Downsville Pike, Route 3, Box 20-B, Hagerstown, MD 21740.

engaged in "nutrition-based" mail frauds is now small enough that, once the marketplace has been mapped, the Postal Service will be able to clean it up.

Two areas that are difficult to measure are direct mail solicitations and telemarketing scams. I have seen many direct mail solicitations for weight-reduction schemes and "anti-aging" products. Some of these look like reproductions of newspaper ads (although they may not have actually been published) with a handwritten note in the margin or on a Post-it. The Iowa Attorney General has seen evidence that people who buy one bogus diet product often receive ads for others. Curious to see whether the names of presumably gullible subscribers to the tabloids would wind up on "sucker lists," I used code names to subscribe during my 1987 study. To my surprise, I received no unsolicited mailings under these names.

Telemarketing schemes remain a serious problem. Typically, they involve notification that the recipient has won a "valuable" prize. To collect, the recipient must order a large supply of vitamins, a water purifier, or something else that costs hundreds of dollars. If delivery is made, the prize is invariably worthless, the product order overpriced, and the "money-back guarantee" is not honored. When the product has been ordered by credit card, the buyer can usually prevent loss by asking the credit card company to reverse the payment. But many buyers don't realize this or waste so much time trying to get a refund that the deadline for action through the credit card issuer expires.

Dubious Practitioners

Several hundred physicians practice "clinical ecology" (also called "environmental medicine"), a pseudoscience based on the notion that hypersensitivity to tiny amounts of common foods and chemicals can trigger a wide range of symptoms. Similar numbers practice "orthomolecular therapy" (sometimes referred to as "megavitamin therapy"), which is based on the idea that most ailments will respond to the "correct" doses of nutrients. Some physicians who prescribe supplements for the gamut of ailments call their approach "nutritional medicine." Many of these practitioners diagnose hypoglycemia, hypothyroidism, candidiasis hypersensitivity, and chronic fatigue syndrome in large numbers of their patients.

Some dentists espouse the idea that the mercury in silver-mercury fillings is toxic and can cause a wide range of illnesses. They recommend that such fillings be replaced with other materials, which can cost thousands of dollars. The leading advocate of "mercury-amalgam toxicity," a Colorado dentist, recommends an elaborate program of supplements to minimize negative effects he claims can occur when the mercury-containing fillings are removed.

Significant percentages of chiropractors are involved in unscientific nutrition practices. Many companies market supplements to chiropractors with claims that they are suitable for treating almost anything. The claims, which would not be legal on product labels, do not appear on the labels. Rather, they are made in literature distributed by mail or provided at seminars in which use of the products is described.

State boards have taken a few actions against licensed practitioners who are engaged in unscientific practices, but much more action is needed to protect the public.

Cancer Quackery

During the past decade, there has been a trend away from dubious "drug" products, such as laetrile, into regimens that include diets, enemas, vitamins, minerals, glandulars, enzymes, and various nostrums that are not legally marketable in the United States. Practitioners of "metabolic therapy" claim to diagnose abnormalities at the cellular level and correct them by normalizing the patient's metabolism. They claim that cancer (as well as other diseases) is the result of metabolic imbalance caused by a buildup of toxic substances in the body. They also claim that scientific practitioners merely treat the symptoms of the disease, while they treat the cause by removing "toxins" and strengthening the immune system so the body can heal itself. These ideas have no scientific basis but have popular appeal because the treatment approaches include diet and lifestyle changes that encourage patients to feel they are in control.

Proponents of dubious methods of cancer treatment have been very active politically. They have lobbied, staged demonstrations, and produced considerable literature advocating their case. A few years ago, as a result of Congressional pressure, the Office of Technology Assessment (OTA) began a lengthy investigation of "unconventional" methods of cancer therapy. The first draft of the OTA report, which was circulated for comment this year to advocates as well as critics, looked quite good to me. It was hoped that the final report would be published soon, but the wheels of government turn slowly. Meanwhile, two other important reports are nearing publication, a book I am editing for the Florida Cancer Society and a computerized database developed by attorney Grace Monaco.

Multilevel Marketing

During the past 5 years, I have collected information on more than 30 companies engaged in person-to-person sales of food supplements, homeopathic remedies, herbal remedies,

Young, Ph.D., R.D.; Jack Z. Yetiv, M.D., Ph.D.; and staff members of The Pennsylvania State University Nutrition Information and Resource Center.

and other health products. Virtually anyone can become a distributor by filling out a one-page application and buying a distributor kit for \$20 to \$35. Kits typically contain a sales manual, product literature, order forms, and a 1-year subscription to a magazine published by the company. Once on board, the distributor can buy products "wholesale," resell them at "retail" prices, and recruit other distributors. When enough distributors have been recruited, the recruiter is eligible to collect a percentage of their sales. Companies suggest that this process provides a great money-making opportunity. However, it is unlikely that people who do not join a company during its first few months of operation or are among the early distributors in their community can build enough of a sales pyramid to do well.

Most multilevel companies promote their products with claims that they can prevent or cure a wide range of diseases. A few companies merely suggest that people will feel better, look better, or have more energy if they use supplements.

When illegal therapeutic claims are made in product literature, the company is an easy target for government enforcement action. Some companies run this risk, hoping that the government will not take action until their customer base is well established. Other companies make no claims in their literature but rely on testimonials, encouraging people to try their products and taking credit for any improvement that occurs. Testimonials may be published in company magazines, audiotapes, or videotapes. Many companies hold meetings at which people are encouraged to tell their story to the others in attendance. Testimonial claims can trigger enforcement action, but since it is time-consuming to collect evidence of their use, few government agencies bother to do so.

Government enforcement action against multilevel companies has not been vigorous. Typically, the companies are left alone unless their promotions become so conspicuous and their sales volume so great that an agency feels compelled to intervene. Even then, few interventions have substantial impact once a company is well established. The most effective intervention I have seen was against United Sciences of America, which had been marketing supplements claimed to prevent heart disease and many other health problems. An FDA regulatory letter and an embargo by Texas authorities stopped sales dead in their tracks [NF 4:25-30, 1987]. The company, which had been having financial problems, was unable to recover and was liquidated a few months later. On the other hand, Herbalife and Sunrider International have thrived despite both FDA and state enforcement actions.

The Media

Overall, during the past decade, the media have become a bit more aggressive regarding quackery. *Reader's Digest*, *Family Circle*, *Hippocrates* (now *In Health*) and *Redbook* have published excellent articles. The *Family Circle* article, which told how readers could report problems or send questions to the National Council Against Health Fraud, generated more than 150 queries.

Many well written health and nutrition newsletters have achieved large circulations. My favorites are the *Mayo Clinic Health Letter*, *Mayo Clinic Nutrition Letter*, *Tufts University Diet and Nutrition Letter*, *Harvard Medical School Health Letter*, and *Consumer Reports Health Letter*.

The number of "health food" magazines has increased, but *Prevention*, whose circulation is larger than those of all the others combined, has swung away from nutrition nonsense and now is very careful about its nutrition articles. Although it still tends to emphasize news about nutrients (which may stimulate readers to take them unnecessarily), its nutrition articles undergo expert prepublication review and generally are timely and accurate. The magazine's advertising content has also changed dramatically. Years ago, there were dozens of pages of supplement ads in every issue. Today there are very few.

Rodale Press's book division and its Prevention Book Club still market many titles that are not worth the paper they are printed on, but there is hope that this situation will improve. No clear trend is apparent among other book publishers. Most appear willing to publish anything they think will sell. Nonsensical books involving nutrition are published frequently, but books containing valuable advice about health and nutrition also are published frequently. The antiquackery exposes produced by the George F. Stickley Company during the early 1980s are either out of print or nearly so. I plan to remedy this situation with at least one book per year, starting with *Health Schemes, Scams, and Hoaxes*, which will be published by Consumer Reports Books in December.

Television remains a mixed bag. While the Donahue and Sally Jessy Raphael shows remain meccas for quacks, *Inside Edition*, shown on CBS, has a special interest in exposing quackery. Measuring how radio talk shows fit into the national picture would be a massive undertaking because there are so many of them. But it is clear that in many communities such programs are a major source of misinformation. Several leading promoters of quackery are talk show hosts who provide a forum for a steady parade of irresponsible guests. Programs boosting nutrition nonsense have considerable popular appeal and advertiser support, which encourages stations to keep them on the air.

Antiquackery Activities

Overall, I am optimistic about antiquackery. The American Dietetic Association is working steadily to achieve state laws to outlaw the practice of nutrition by individuals who lack adequate training. The National Council Against Health Fraud has established a growing network of activists who are accomplishing much in their own states and local communities. The council publishes a bimonthly newsletter and maintains many task forces that produce position papers. It helps quackery victims file lawsuits and gives awards to journalists who attack quackery. (Membership information can be obtained by writing to the council at P.O. Box 1276, Loma Linda, CA 92354.)

Last year, John Renner, M.D. began operating the Consumer Health Information and Research Institute (CHIRI) in Kansas City, Missouri. Its purpose is to promote consumer and patient education activities, including studies of misinformation, fraud, and quackery. CHIRI has scheduled a National Health Fraud Conference from September 14 to 16 in Kansas City. (For information call 816-753-8850.)

Drs. Renner and Victor Herbert are still pursuing libel suits against the National Health Federation (NHF) and various other defendants. It is too soon to predict the outcome, but the suits appear to have caused considerable friction among NHF's

present and former leaders. According to a special NHF report distributed in July, its long-time lobbyist was fired for setting up an unauthorized bank account, and its former longtime attorney is suing NHF for \$64,633.17 for allegedly unpaid fees in the Herbert and Renner cases. NHF has generated many mass letter-writing campaigns that were effective in lobbying against government regulation of questionable health methods. But financial difficulties and infighting appear to have weakened NHF greatly.

In July 1990 I retired from my job at a hospital clinic so I could spend more time investigating and writing about the health

marketplace. I still see private patients, but most of my time is spent doing research. Information sent by *Nutrition Forum* readers is very helpful to me.

Dr. Barrett, who practices psychiatry in Allentown, Pennsylvania, edits *Nutrition Forum Newsletter* and is a board member of the National Council Against Health Fraud. In 1984 he received the FDA Commissioner's Special Citation Award for Public Service in fighting Nutrition Quackery. In 1986 he was awarded honorary membership in the American Dietetic Association.

BRIEFS

Toxicity of sustained-release niacin. Near-fatal hepatitis has been reported in a previously healthy 32-year-old man who had taken one 500-mg timed-release niacin tablet daily for 2 months, purchased at a health food store [JAMA 264:181, 1990]. Niacin is an effective and relatively safe drug for cholesterol control but is not suitable for self-medication. Crystalline ("regular") niacin has a greater incidence of minor side effects (flushing and burning of the skin) but is considerably less troublesome to the liver. Several observers have expressed concern that sustained-release niacin is too readily accessible without a prescription [JAMA 264:241-243, 1990].

"B₁₅" sellers convicted. Michigan Pharmacal, Inc., of Ferndale, Michigan, was fined \$10,000 plus \$90,000 in costs after pleading guilty to knowingly and willfully (through its employees) making false statements to the FDA in 1983 about the amount of calcium pangamate it had in stock. Company vice president William Farber was fined \$1,000 after pleading guilty to conspiring to mislead the FDA and continuing to distribute the product, which contained N,N-dimethylglycine, which the agency considers a nonconforming food additive [FDA Consumer 24(3):40, 1990]. The criminal charges were filed in 1987. *Editor's note:* Various compounds called "B₁₅," "vitamin B₁₅" or "pangamic acid," have been claimed to enhance athletic performance and to be effective against cancer and many other diseases. The FDA greatly reduced its sale in the early 1980s by securing civil court orders against three manufacturers attempting to market "B₁₅" as a dietary supplement. This case is significant because the agency rarely uses criminal prosecution in cases involving "supplements."

Irradiation of poultry approved. The FDA has approved the use of irradiation to control *Salmonella* and other illness-causing bacteria in chicken, turkey, and other fresh or frozen uncooked poultry. Agency scientists described irradiation as the first approved process to "pasteurize" solid foods. As with the heat-pasteurization of milk, irradiation reduces but does not eliminate all bacteria. Thus processed poultry, like pasteurized milk, would be safer but would still require refrigeration. The FDA has also decided that irradiated foods should continue to carry a representative logo and be labeled "treated with radiation" or "treated by radiation." Poultry industry officials have expressed disinterest in irradiation out of fear that consumers would disapprove.

FDA clips "Body Toddy." Rockland Corporation has signed a consent agreement to stop selling Body Toddy with health claims that lack FDA approval. The company had claimed it is effective against aging, cancer, diabetes, cataracts, high blood pressure, thyroid deficiencies, stroke, heart attack, high cholesterol, depression, loss of memory, and many other problems. The product—touted to "supercharge your immune system"—was claimed to be a liquid concentrate of pure natural minerals that come from a "natural deposit phenomenon of prehistoric vegetable and plant matter."

Quackery report. An excellent article on nutrition fads has been published in the *American Journal of Gastroenterology* [85:510-515, 1990]. Reprints are available from Michael Mogadam, M.D., 5021 Seminary Road, Suite 124, Alexandria, VA 22311.

Book bargains. Firms that sell remaindered books by mail can be a good source of quacky diet and nutrition books that are no longer stocked in bookstores—often at 20-40% of their original list price. One of the best is Edward R. Hamilton, Falls Village, CT 06031.

New Jersey curbs dubious methods. The New Jersey State Attorney General has secured consent agreements barring Linda Choi, M.D., and Pruyakant Doshi, M.D., from: 1) using chelation therapy to treat cardiovascular diseases; 2) using hair analysis as a tool for nutritional assessment; and 3) diagnosing and treating "*Candida albicans* overgrowth syndrome." Both were assessed \$3,000 for investigative costs and had their medical license placed on probation for 1 year. Investigation by the state medical board had concluded that: 1) chelation therapy has not been accepted as safe and effective for the purposes used by the doctors; 2) hair analysis has no medically valid purpose except as a diagnostic screening device for lead poisoning in at-risk populations (not the purpose for which Choi and Doshi were using it); and 3) "*Candida albicans* overgrowth" is not generally recognized as a clinical entity and has not been established as the cause of the conditions they treated.

WIC program endangered? Senator Howard Metzenbaum (D-OH) has charged that infant formula prices are so high that thousands of women and children are being denied much-needed food. At a public hearing held by the Senate Subcommittee on Antitrust, Monopolies and Business Rights, he accused three leading manufacturers of "follow-the-leader" price-fixing that he said might violate federal antitrust laws. The manufacturers denied this and stated that price hikes are legitimately due to rising costs of research and development, capital expenditures, personnel, and other related expenses. Approximately 30% of all infant formula is purchased by the WIC program, which is designed to provide help to low-income women and children considered to be nutritionally at risk. At the end of June, Congress voted to allow states to borrow 3% against next year's appropriation, but it still appears that some states will have to eliminate participants.

FDA law available. Copies of the Federal Food, Drug, and Cosmetic Act, including all amendments, can be obtained for \$7.50 from the U.S. Government Printing Office, Superintendent of Documents, Washington, DC 20402. (Ask for publication #017-012-00347-8.) FDA publication No. 2 (order #107-012-00343-5), which summarizes the laws in lay terms, costs \$2.75.

Lactation suppressants seldom appropriate. The FDA has asked the manufacturer of Parlodel (bromocriptine) to stop labeling the drug for use in drying up milk production and preventing breast engorgement in mothers who do not breast-feed. The agency has also asked manufacturers of products containing estrogens and androgens to stop labeling these as lactation suppressants. Research has shown that the traditional treatment of pain-relievers, ice packs, and a well-fitting bra or specially made breast binder is sufficient. Breast engorgement is short-lived; and although perhaps 10% of women may benefit from drug treatment, the risk of side effects exceeds the likelihood of benefit [FDA Consumer 23(10):3, 1989 and 24(3):25-27, 1990].

Notable quote. "Consumers with misinformation about nutrition typically fall into two categories: the deceived and the deluded. The deceived can respond to education, but the deluded are adamant—even fanatical—about their beliefs, and will refuse to consider good scientific data or a logical presentation."—Victor Herbert, M.D., J.D.

Magazine sued. Martin Katahn, Ph.D., author of *The Rotation Diet*, has filed a \$5.75 million dollar libel suit against *Good Housekeeping*, charging that an article in its March 1990 issue caused "great injury" to his reputation and impugned his veracity. Katahn's diet is based on the premise that rotating daily intakes of 600, 900, and 1,200 calories facilitates weight loss by preventing the metabolic slowdown caused by constant low-calorie dieting. The 172-word article referred to a controlled study reported in the *American Journal of Nutrition* and concluded that rotation does not work. The suit charges that the article misrepresented the results of the study whose rotating diet program was similar but not identical to the Rotation Diet. According to the suit papers, *The Rotation Diet* appeared on the *New York Times* best-seller list for 49 weeks and has more than 1 million hardcover copies and 1.5 million paperback copies in print.

Vitamin store cited. Acting on a complaint by Dr. Stephen Barrett, the Pennsylvania Department of Health has cited the Vitamin Healthcenter in Whitehall, Pennsylvania, for offering to sell misbranded and unapproved new drugs and for being an unregistered distributor of drugs. The citation concerned *Amino Hair*, a high-potency formula claimed to reverse male pattern baldness, and *Immuno-C*, which was promoted as helpful against arthritis, AIDS, flu, atherosclerosis, and cancer. The store—which agreed to correct the violations—is part of a chain located in shopping malls throughout Connecticut, Florida, Maryland, New Jersey, New York, and Pennsylvania.

Great Earth penalized. Great Earth International, the nation's second largest health food store chain, has agreed to pay \$100,000 in penalties plus \$9,520 in costs to settle charges brought by the Orange County District Attorney. The case involved advertising claims made for vitamin E ("helps dissolve existing clots . . . making the heart a more efficient pump"), *Yeasterol* ("to control . . . *Candida albicans*, a troublesome yeast"), *Lowestrol* ("may not only counter the build-up of cholesterol deposits, but may also appear to reduce the blood's tendency to clot"), *Elavita Formula DP* ("gives the body and brain the special nutrients it needs" for alertness, memory, motivation, learning, sex drive, and positive emotions), *Nutrimune* ("shown to boost the body's defense system"), *Thymosin* ("boosts the body's resistance to disease!"), *Rejuva-cell* ("anti-aging . . . retards hair loss . . . lowers blood pressure, improves sexual function . . . reduces cholesterol"), and *PMS Formula*. Without admitting wrongdoing, the company signed a consent agreement pledging to refrain from marketing products that are misbranded or are unapproved new drugs.

"Organic" bill advances. A national organic food certification program funded by tax dollars was included in the 1990 Farm Bill package approved on April 27 by the U.S. Senate Agriculture Committee but is not yet included in the Farm Bill in the House of Representatives. The legislation calls for a USDA "organically produced" label for agricultural products that meet federal standards set with the help of a 13-member advisory board. States could set stricter standards but could not restrict sales of USDA-certified products from other states. The Agriculture Department, which opposes the "organic" legislation, has proposed forming a national commission to study the most effective means to establish a national certification program. Daniel D. Haley, administrator of the Agriculture Department's Marketing Service, has expressed concern that consumers may be led to believe that "organic" foods are significantly safer, more nutritious, or of higher quality. In an article in *USA Today*, he said his department supports national minimum standards supported by industry user fees, but the current legislation "is impractical, unwieldy, costly, and would require excessive government surveillance at both the national and state levels."

Impact of cholesterol education. Cholesterol-consciousness is increasing. National surveys conducted by the FDA and the National Heart, Lung, and Blood Institute have found that the proportion of persons who reported ever having had their blood cholesterol checked rose from 35% in 1983 to 58% in 1988, and the proportion knowing their cholesterol level rose from 3% to 17%. State health departments have observed slightly smaller numbers in surveys conducted during 1988 [JAMA 263:3133-3135].

Sokolof strikes again! Early this Spring, Phil Sokolof attacked McDonald's in a series of ads headlined "The Poisoning of America." The ads said that the company's hamburgers should have their fat content reduced by 10%. Although McDonald's termed Sokolof's ads "reckless and misleading," it subsequently reduced the fat content of its shakes, began phasing out the use of beef tallow for cooking french fries, and said it will post complete nutritional information about its products at all outlets. Sokolof is a Nebraska businessman who became concerned about diet and cholesterol after he had a heart attack. In 1988 he launched a \$2 million campaign attacking tropical oils—a move that probably helped persuade major food companies to stop using them in many of their products [NF 6:37]. McDonald's, which has 11,000 franchised outlets in the United States and 52 other countries, is celebrating the 35th anniversary of its founding.

Calories and aging. According to researchers who spoke at a recent international conference, evidence continues to accumulate that diet and caloric restriction may lengthen life span and retard the susceptibility of animals to cancer and other age-associated diseases and physiological processes. It was also noted that some animals studied this way had decreased fertility and problems with bone development. Human studies to explore the significance of these findings have not been performed. The conference, held in March in Washington, D.C., was sponsored by the International Life Sciences Institute.

Fiber cookie crunched. In response to an FDA regulatory letter, Phoenix International Marketing Corporation of Sparks, Nevada, has agreed to halt distribution of its Phoenix Fiber Cookie, Phoenix Fizzie, Phoenix Nutritious Beverage, and Phoenix Vitamin and Mineral Capsules. The FDA notified the company that promotional material distributed with the "Phoenix for Life" Weight Control System made unsubstantiated medical claims that the products were useful for weight control, cardiovascular disease, colon cancer, diabetes, and diverticulitis. In addition, government tests had shown that the cookies contain twice the claimed 120 calories.

Novel weight-control device. A New Jersey man has offered a \$25,000 reward to anyone who catches him in the act of eating at a restaurant. (The money would be given to a charity selected by the recipient.) So far, according to CBS TV's *Inside Edition* the man has lost 67 pounds.

Tryptophan update. As of mid-May, 1,500 cases of eosinophilia-myalgia syndrome, including 23 deaths, have been reported among L-tryptophan users in the United States, and 10 cases have been reported in Canada. Most cases appear to be linked to products from one Japanese manufacturer [JAMA 264:213-217, 1990], which health food industry trade publications have identified as Showa Denka.

VITAMIN A CASES SETTLED FOR RECORD SUM

Two victims of vitamin A toxicity have obtained out-of-court settlements totalling nearly \$900,000. Their problem arose in 1979 after chiropractor Vernon P. Mannon of Peoria, Illinois, prescribed massive doses of vitamin A for Judith Cramton and her children, Lynne and Dale II. Mrs. Cramton had sought help for her children's ichthosis, a congenital disorder in which the skin is scaly and resembles that of a fish. For 9-year-old Lynne, Mannon prescribed 750,000 international units (IU) daily for several weeks to be followed by 370,000 IU daily for 2 months. For 4-year-old Dale, he prescribed 675,000 IU daily for 2 months and then half that amount. Mannon also advised Mrs. Cramton to take 1,250,000 IU plus scores of other supplements because he said her diet had been inadequate.

Within a few months, all three Cramtons developed symptoms of vitamin A poisoning. Mrs. Cramton developed swelling of the brain, manifested by blurred vision and headaches. Lynne experienced similar symptoms plus musculoskeletal pain and tenderness, hair loss for 2 months, and damage to the growth centers of several of her bones. Dale developed bone pain and enlargement of his liver and spleen.

Although their acute symptoms subsided after the vitamin A was stopped, both children were permanently damaged. One of Lynne's legs is several inches shorter than the other, which has caused her to develop scoliosis. Dale has permanent damage to his liver and spleen.

The vitamin A products Mannon prescribed—and sold—were manufactured by Nutri-Dyn, Inc., and Biotics Research Corporation, both of which market primarily through chiropractors. In 1984, Mrs. Cramton and her husband began a series of suits against Mannon and the manufacturers, charging negli-

gence in failing to warn that high doses of vitamin A were dangerous. The suits also claimed that the products had been marketed illegally because vitamin A is not generally recognized as safe and effective for the treatment of ichthosis. In fact, several weeks before Mrs. Cramton consulted Mannon, the FDA had proposed a rule to ban OTC marketing of vitamin A for ichthosis [Federal Register 44:16126-16164, 1979]. Ironically, Nutri-Dyn's product, a liquid emulsion containing 12,500 IU per drop, was labeled, "Keep out of reach of children."

In 1986, Dale's case against Mannon was settled out-of-court for the \$100,000 limit of Mannon's insurance. Nutri-Dyn paid \$245,000 to settle the children's cases in 1987, and Biotics settled for \$450,000 in 1988. In 1989, Lynne's case against Mannon was settled for the \$100,000 policy limit. Their lawyer was Thomas H. Tate of Coale, Kananack & Murgatroyd, Washington, D.C., who specializes in product liability and birth defect litigation. Mr. Tate believes that vitamin A products should carry warnings on their label, particularly about use by children.

Vitamin A toxicity can result from ingesting excessive doses of vitamin A on a regular basis for weeks or years. The signs and symptoms that develop as body stores build up include dry and itchy skin, headache, hair loss, bone malformations, bleeding tendencies, bone fractures, muscle and joint pain, visual problems, and liver toxicity. Most adverse effects disappear after excessive intake is stopped, but permanent damage to the liver, bones, and eyes can occur. The settlement in this case is the highest payout ever reported in a lawsuit involving vitamin A toxicity.

BOGUS DEGREES IN THE NEWS

Raymond J. Salani operates Nutri-Care Health Center in Shrewsbury, New Jersey. Since the early 1980s, he has represented himself as a nutritionist and health consultant with a Ph.D. degree. According to his ads, Nutri-Care is "a preventive health care facility that helps you fight disease, resist stress, and reach your best level of health—nutritionally—without drugs." A Nutri-Care brochure asked whether you would like to "strengthen yourself" against 96 "common health problems" ranging from bad breath and dandruff to cancer, heart disease, and stroke.

In some ways, Salani conducted himself like a medical doctor. He saw clients by appointment, took their medical history, ordered laboratory tests, and prescribed products. He even provided statements for insurance companies. But his activities were neither legal nor medically sound.

In February 1989, the New Jersey attorney general and the state board of medical examiners charged Salani with practicing medicine without a license, violating the state's clinical laboratory act, and committing insurance and consumer fraud. The complaint stated that Salani misused the term "doctor," prescribed "excessive quantities" of food supplements that were ineffective or potentially toxic, and issued fraudulent reports to insurance companies.

The complaint was supported by affidavits from six former patients and four undercover investigators who had consulted "Dr." Salani for leg cramps, stomach cramps, migraine headaches, obesity, epileptic seizures, hypoglycemia, allergies, and attacks of shortness of breath. In most cases, he had ordered urine and blood tests and outlined a program of vitamins, minerals, and other dietary supplements that would cost hundreds of dollars. Nutri-Care performed the urine tests although it was not licensed to operate a bioanalytic laboratory. The blood tests were ordered from a licensed laboratory using preprinted request slips with "Nutri-Care Health Center" stamped on the line that said "Physician's Signature." Several patients complained that Salani's charges exceeded his original estimates, that the amounts reported to insurance companies were less than what they had paid, and that he had billed for tests that had not been performed.

Salani led many of his patients to believe that his work was done under medical supervision. His receipts and reports to insurance companies were made using "Physician's Statements" preprinted with the words "Mill Run Associates, J. Willard Cook, M.D., Medical Director," at Nutri-Care's address. Dr. Cook—a family practitioner in Shrewsbury—occasionally referred patients to Salani and sometimes saw some of Salani's patients for consultations. But Salani did most of his work independently. Although Cook knew that Salani billed insurance company reimbursement for services performed by Salani under Cook's name, he continued to maintain his relationship and perform medical screenings for Nutri-Care. Cook was also aware that medical laboratory work was being done under his name even though he had not seen the patients and the results went to Salani.

In November 1989, New Jersey's medical licensing board reprimanded Cook for permitting his name to be used in connection with Salani's operation of Nutri-Care Health Center. The board also fined Cook \$2,500 for aiding and abetting Salani's unlicensed practice of medicine.

Salani's "Ph.D. degree" is from Donsbach University, an unaccredited correspondence school operated by Kurt Donsbach, a chiropractor who has been a major figure in the food supplement industry. In 1971, Donsbach pleaded guilty to practicing medicine without a license after agents of the Fraud Division of the California Bureau of Food and Drug observed him representing to customers at his health food store that vitamins, minerals, and/or herbal tea were effective against cancer, heart disease, and other ailments. He was assessed \$2,750 and served 2 years' summary probation.

Accredited nutrition degrees require several years of study based on current scientific knowledge. Degrees from Donsbach University—which taught that virtually all ailments have nutritional solutions—could be obtained in less than a year. In December 1989, a New Jersey superior court judge permanently enjoined Salani from representing to the public that he has a doctoral degree unless he acquires one from an accredited school. "He's not entitled to give people the impression he is super extra," the judge commented. "He did not get a Ph.D. from an accredited university. . . . If the public was aware that there were mail-order courses, they would say it's a Mickey Mouse degree."

In March 1990, the judge approved a consent agreement barring Salani from representing himself as a doctor, recommending supplements for the prevention or treatment of any specific medical condition or complaint (except under medical supervision), diagnosing medical conditions or symptoms, or filling out insurance forms in a misleading manner. Salani is also required to inform his clients that the FDA does not recognize any need or usefulness for the products he typically recommends. To settle the case, Salani paid the state \$11,000, part of which was used for restitution to insurance companies and former patients.

Donsbach himself is involved in a scandal involving "naturopathic" degrees. In June 1988, the Arizona Naturopathic Physicians Board of Examiners revoked the naturopathic license of Jess Franklin Lee after determining that he had used a counterfeit credential to obtain his license. In 1983, when Lee applied for his license, he submitted a diploma dated "17th June 1961" from the "Hollywood College School of Naturopathy" in Los Angeles, California. Subsequently, however, Arizona authorities concluded that no such school had existed and that the "diploma" had been created by making altered photocopies of a 1961 diploma from the Hollywood College School of Chiropractic. A few months ago, the Oregon Office of Educational Policy and Planning concluded that Donsbach and four others had done the same thing to become licensed as naturopaths in Oregon. The Oregon Board of Naturopathic Examiners is expected to revoke their licenses.

Donsbach now operates a Mexican hospital that "specializes in the treatment of chronic, degenerative diseases including cancer and multiple sclerosis." In 1989, he resigned as board chairman of the National Health Federation (an aggressive health food industry lobbying group) and founded the Confederation of Health Organizations "to unite the major elements of the alternative holistic health movement." He has also launched another unaccredited school to issue "Ph.D." degrees. A lengthy account of his activities was published in the October 1987 issue of *Nutrition Forum*.

NATURAL HYGIENE: STILL ALIVE AND DANGEROUS

Jack Raso, M.S., R.D.

Natural Hygiene is a comprehensive philosophy of health and "natural living" that advocates a raw food diet of vegetables, fruits, and nuts, denounces virtually all medical treatments, and promotes fasting as desirable during health and beneficial against disease. According to its philosophy:

Health is the result of natural living. When people live in harmony with their physiological needs, health is the inevitable result. By supplying the organism with its basic requirements (natural, unadulterated food; sunshine; clean, fresh air; pure water; appropriate physical, mental and emotional activities; and a productive lifestyle) while simultaneously eliminating all harmful factors and influences, the self-constructing, self-regulating, self-repairing qualities of the body are given full rein.

Background History

Health Science, the magazine of the American Natural Hygiene Society, states that the Natural Hygiene movement was founded during the 1830s by Sylvester Graham, "America's first crusader for healthful living in diet, exercise, sleep, bathing, clothing, and sexual, emotional and mental expression." The movement enjoyed considerable popularity, but declined until "resuscitated" from "almost dead" by Herbert M. Shelton (1895-1985).

In a 1978 interview in *Natural Living*, Shelton described his educational background: "I postgraduated from the University of Hard Knocks and left before I got my diploma. I went through the usual brainwashing process of the school system in Greenville, Texas and revolted against the whole political, religious, medical and social system at the age of sixteen." During the next several years, he obtained a "Doctor of Physiological Therapeutics" degree from the International College of Drugless Physicians, a school established by Bernarr Macfadden, and took a postgraduate course at the Lindlahr College of Natural Therapeutics in Chicago. Then he went to New York where, "after nine months of brainwashing," he acquired degrees in chiropractic and naturopathy.

In 1920, after further study and apprenticeship at various institutions, Shelton published the first of his 40 books, *Fundamentals of Nature Cure*. In 1928, he founded Dr. Shelton's Health School in San Antonio, which operated at seven different locations until 1981. From 1934 through 1941, he produced a 7-volume series under the title *The Hygienic System*. In 1939, he launched *Dr. Shelton's Hygienic Review*, a monthly magazine that was published for about 40 years.

Organized Activity

The fountainhead of today's Natural Hygiene activity is the American Natural Hygiene Society (ANHS), founded in 1948 by Shelton and several associates and now headquartered in Tampa, Florida. Regular ANHS membership costs \$25 and includes a subscription to *Health Science*, a 32-page bimonthly magazine. In 1989, ANHS had about 6,000 members and an income of about \$500,000. ANHS has been active in promoting certification of "organic foods" and opposing compulsory immunization, fluoridation, and food irradiation.

Each issue of *Health Science* contains a Professional Referral List. Most of those listed are chiropractors, but a few hold medical, osteopathic, or naturopathic degrees. The list includes 13 "certified members" and 7 "associate members" in the United States, and 15 more members in other countries. Certified members include ANHS founders and subsequent members who have "successfully completed an internship (or its equivalent) in Natural Hygienic care with an emphasis on Fasting Supervision and are certified by the International Association of Professional Natural Hygienists as Specialists in the Application of Fasting Supervision and Natural Hygienic Care."

Therapeutic Philosophy

According to an ANHS brochure:

A thoroughgoing rest, which includes fasting, is the most favorable condition under which an ailing body can purify and repair itself. Fasting is the total absti-

nence from all liquid or solid foods except distilled water. During a fast the body's recuperative forces are marshalled and all of its energies are directed toward the recharging of the nervous system, the elimination of toxic accumulations, and the repair and rejuvenation of tissue. Stored within each organism's tissues are nutrient reserves which it will use to carry on metabolism and repair work. Until these reserves are depleted, no destruction of healthy tissue or "starvation" can occur.

ANHS publications promote fasting for children as well as for adults.

The brochure also states:

Natural Hygiene rejects the use of medications, blood transfusions, radiation, dietary supplements, and any other means employed to treat or "cure" various ailments. These therapies interfere with or destroy vital processes and tissue. Recovery from disease takes place in spite of, and not because of, the drugging and "curing" practices.

In 1982, a federal court jury awarded over \$800,000 to the survivors of William Carlton, a 49-year-old man who died after undergoing a distilled water fast for 30 days at Shelton's Health School. An article in the *Los Angeles Times* stated that Carlton had died of bronchial pneumonia resulting from a weakened condition in which he lost 50 pounds during his last month of life. The article also noted that he was the sixth person in 5 years who had died while undergoing treatment at the school. Shelton and his chiropractic associate, Vivian V. Vetrano, claimed in their appeal that Carlton had persisted in fasting after Dr. Vetrano had advised him to stop. However, the verdict was upheld by the Fifth Circuit Court of Appeals and the U.S. Supreme Court declined further review.

"Food Combining"

Another conspicuous component of Natural Hygiene is its system of "food combining." In *Food Combining Made Easy* (a "nutrition classic," according to its cover), Shelton wrote: "To a single article of food that is a starch-protein combination, the body can easily adjust its juices . . . to the digestive requirements of the food. But when two foods are eaten with different . . . digestive needs, this precise adjustment of juices to requirements becomes impossible." Natural Hygienists believe, for example, that consuming a high-protein food and a high-carbohydrate food at the same meal will, at the least, tax the body's enzymatic capacity.

Such pronouncements were debunked more than 50 years ago in both scientific and popular literature, but the Hygienic faithful still hold them dear. In a review of studies of human gastric digestion of proteins and carbohydrates in health and disease, published in 1934 in the *Journal of the American Medical Association*, researcher Martin E. Refhuss, M.D., presented detailed evidence that "clearly proves that any presumed incompatibility between protein and carbohydrate food . . . is certainly not sustained." Of the likes of Shelton, Dr. Refhuss wrote: "One searches in vain through the literature revealing several thousand contributions by research workers on diet and nutrition to find any real scientific work by these reformers."

In *Food Combining*, Shelton grouped foods into seven categories "according to their composition and sources of origin": 1) proteins such as nuts, peanuts, and avocados; 2) starches, including sweet fruits, such as peanuts (again), chestnuts, pumpkins, bananas, and mangos; 3) fats such as most nuts (again) and avocados (again); 4) acid fruits such as citrus fruit and tomatoes; 5) "sub-acid" fruits such as pears and apricots; 6) non-starchy and green vegetables such as lettuce, broccoli, and watercress; and 7) melons such as watermelon, honeydew, and cantaloupe. Hygienic classification schemes differ somewhat, but certain listed foods, such as garlic (an "irritant"), and all animal-source foods, are not recommended under any circumstances.

Shelton taught that the following combinations are indigestible: "acids" and starches; proteins and starches; acids and proteins; fats and proteins; sugars and proteins; sugars and starches (note that Shelton classified sweet fruits as starches); melons and anything other than fresh fruit; and even two different proteins.

Despite a plethora of absurdities, Natural Hygiene has enjoyed a renaissance of late, thanks to Harvey and Marilyn Diamond and their books *Fit for Life* (1985) and *Living Health* (1987). Harvey received his "Ph.D. in nutritional science" from T. C. Fry's unaccredited American College of Health Science in Texas—now called the Life Science Institute—which offers a voluminous correspondence course detailing Fry's views. Natural Hygiene advocates have written two other popular books: *The Beverly Hills Medical Diet* (1982), by Judy Mazel, and *Unlimited Power* (1986), by Anthony Robbins.

The 1990 Conference

Both Harvey Diamond and T. C. Fry were present at the American Natural Hygiene Society's 42nd Annual International Natural Living Conference, held at Hofstra University in New York from July 27 to August 1, 1990. I attended the morning and afternoon sessions on July 28 and found a revivalistic atmosphere with about 250 people present. One person sitting near

Nutrition Forum (ISSN 0748-8165) is published bimonthly by J.B. Lippincott Company, Downsville Pike, Route 3, Box 20-B, Hagerstown, MD 21740. Business offices are located at East Washington Square, Philadelphia, PA 19105. Printed in the U.S.A. Copyright 1990 by J.B. Lippincott Company. Annual Subscription Rates: U.S. \$40.00 individual, \$50.00 institution; all other countries except Japan, India, Nepal, Bangladesh, and Sri Lanka, \$45.00 individual, \$55.00 institution. Single copies \$9.00. Rates for airmail delivery available upon request. Subscriptions, orders, or changes of address (except Japan, India, Nepal, Bangladesh, and Sri Lanka) Journal Fulfillment Department, J.B. Copies will be replaced without charge if the publisher receives a request within 60 days of the mailing date in the U.S. or within 5 months in all other countries. Editorial correspondence should be sent to Stephen Barrett, M.D., P.O. Box 1747, Allentown, PA 18105. POSTMASTER: Send address changes to Nutrition Forum, Downsville Pike, Route 3, Box 20-B, Hagerstown, MD 21740.

me in the first row insisted, mysteriously, that Hygiene "changes you." I didn't pursue the subject.

Ronald G. Cridland, M.D., Director of the Fundamental Health Center in Toronto, Canada, was the first speaker of the day. His topic was "Natural Hygiene: The Science of Health." Cridland referred to Greek mythology and great medical reformers such as Ignaz Semmelweis and Louis Pasteur in an effort to lend credence and historical depth to the work of Shelton, Sylvester Graham, and other Hygienic pioneers. Cridland eulogized Semmelweis as a man who "did everything he could to try and raise the education of his peers. He gave lectures, and he wrote papers . . . and he was always put down. In fact, eventually he died insane . . . a couple of hundred years before his time." Cridland then trivialized the practice of immunization.

Cridland summed up Hygienic philosophy: "Disease is a result of a susceptible organism, because you are not living within your capacity. . . . The idea is to identify and remove factors that interfere with the healing process in our diet, in our environment, in our activity, and in our psychology." Regarding diet, he said that "raw vegetables probably should provide the majority of your diet" and also that "At one time we may have been designed to subsist largely on fruits, because fruits were more like vegetables than they are today. They had less sugar content, more fiber content."

When Cridland was finished, the moderator instructed us to turn to the people next to us and hug them twice.

The next speaker was Alec Burton, M.Sc., D.O., D.C., Director of the Hygeia Health Institute in Sydney, Australia. His lecture was titled "Diet and Nutrition from the Natural Hygiene Perspective."

Burton likened extracted oils to sugar, stated that "no fat or oil should be added to food in any way at all," and described processed fats as "highly dangerous." He claimed (incorrectly) that the National Research Council "recommends one percent of calories from fat . . . about thirty calories or . . . the equivalent of half a teaspoon of oil. And that's what they recommend as probably the ideal."

Taking aim at what he considered the follies of nutritional science, Burton opined that "the history of nutrition . . . often reads like the work of a mentally defective person on a bad day." He cited the mistaking of beri beri for an infection and a commission's conclusion that pellagra was caused by the bite of a horsefly. "I want to go on," he said. "There are endless stories associated with very, very serious errors and serious mistakes."

Burton suggested that the need for protein is about 20 grams a day, and warned against eating polar bear liver (which is extremely high in vitamin A). Unlike macrobiotic adherents, he boasted, Natural Hygienists do not develop scurvy. But later he advised not to eat too much fruit. Burton ended his talk saying that "Really good science is also good common sense."

He was followed by Ralph Cinque, D.C., Director of the Hygeia Health Retreat in Yorktown, Texas, whose topic was: "Setting Your Goals as a Natural Hygienist."

"More than anything else," said Cinque, "hygiene should free you from therapeutic dependencies, both physically and psychologically. I want to remind people of something: that there is a veritable army of therapists out there waiting like sharks to justify giving you treatments. And I believe that the best attitude that you can have is to be skeptical of all of it. . . .

And I believe that the extent to which you can be free of therapeutic dependencies should be the measure of your success as a Hygienist."

At lunchtime I asked a gentleman for directions to the dining room. He engaged me in conversation and introduced me to his daughter. They had come to the conference from the Midwest. His daughter had been diagnosed with chronic fatigue syndrome due to Epstein-Barr virus. I interviewed both of them and obtained a diet history from the daughter.

She was 22 years old, was about 5' 5" tall, and weighed between 98 and 100 pounds—at least 11% below a desirable weight of 113 pounds based on an assumed small body frame type. Her total energy need for weight maintenance is at least 1,675 kilocalories per day. Her typical food intake consisted of melons for breakfast; two bananas and three peaches at lunch; a salad of Romaine lettuce, carrots, zucchini, avocado, and tomato—sans dressing—at dinner; and water between meals. She had recently undergone a medically supervised 18-day fast, during which she had consumed only distilled water.

Her father explained: "We went all over the country looking for a cure, and there is no cure for it." Many drugs were considered, he said, "but drugs have such a significant adverse effect."

Despite some improvement in her condition over a month she spent in the care of an orthodox physician in California, he said, they went to Denver to meet with an uncredentialed "natural healer" who had worked with rock stars, using diet, "mental control," exercise, and relaxation to maintain their "high energy level." At that point, his daughter "was really feeling bad. She could hardly get up in the morning. . . . She couldn't go to college. [She was] very depressed." The "healer," using *Fit for Life* as a guide, worked with her five days a week for six weeks—about two years ago. But for about a year and a half, she had been following a stricter Hygienic regimen. Now she was on the verge of emaciation. "We went on blind faith," her father admitted.

Lunch consisted of raw, fresh, non-starchy vegetables, fresh fruit (no melons), and raw almonds. As we neared the end of a long buffet table, I expressed my concern that no dressing would be available. But in fact there were two dressings of a sort—one a thick, bland avocado dip, the other like watered-down, unsweetened punch. I did not enjoy lunch.

Nor did I enjoy the next lecturer, Jim Lennon, Executive Director of the American Natural Hygiene Society and a former musician. Jim offered "faith-keeping" tactics to ward off inquiries by well-meaning but "misguided" significant others into the safety and wherefores of Hygienic eating, and then gave a pep talk.

"What is the famous question?" he asked. "Right: 'Where do you get the protein?' The answer is, 'It's in everything! Thanks for asking; how are the kids?' Because you don't want to talk about that, do you? . . . You can change the subject. You are not working for the other people that you run into in your life. You don't have to answer every question. You don't have to be a physiologist."

He told the attendees they were leaders, celebrities, because they "don't go along with the crowd. You're different. You have the courage to go your own way. How unique that is!"

"Who bothers you?" he asked. "The answer is, the people who know they should be doing it. . . . As soon as someone starts bothering you, that's a victory. . . . They're

trying to figure out a way to make it okay that they don't [follow the diet]." Later Lennon stated that grandparents "can only inspire" dietarily recalcitrant grandchildren.

The last afternoon speaker, D. J. Scott, D.C., restated Lennon's sentiments toward doubters of Natural Hygiene: "You start out with the realization that people challenge you because . . . somehow or other they feel a wee bit threatened."

"Hygienists don't need those surgical procedures," Scott declared, referring to hysterectomies and prostate surgery. "I've seen massive tumors of the pelvic organs, women with thyroid tumors as large as a 7-month pregnancy, ovarian cysts that completely fill up an abdomen. And those things, even though they have had them for lengthy periods of time and have been recommended to have immediate surgery, do diminish. They do gradually diminish, not in one week of fasting, not in a month of fasting, but over months of Hygienic living."

Throughout the program, there was considerable talk about "vitality." Yet, in just the vicinity of my seat, I counted 13 people, young and old, who were napping.

Overview

In *Science and Unreason* (1982), Daisie and Michael Radner explain the "marks of pseudoscience," among them anachronistic thinking, a grab-bag approach to evidence, argument from spurious similarity, research by exegesis (regarding science as all statements by scientists, open to interpretation), and refusal to revise in the light of criticism. The authors suggest that just one of these characteristics is sufficient to render a theory or practice pseudoscientific. Natural Hygiene encompasses all five of them.

Any philosophy, pseudoscientific or other, is dangerous to the extent that it promotes practices likely to produce illness or unnecessary hardship and discourages those likely to prevent or relieve health problems. The degree of danger also depends on the extent to which unhealthful recommendations are followed.

Natural Hygiene is dangerous because it trivializes nutrient needs, encourages prolonged fasting, and discourages medical interventions almost across the board. While its recommended diet has two admirable characteristics (low fat content and high fiber content), its proscription of both dairy products and supplements in its primarily raw food diet is an invitation to osteoporosis.

Although Natural Hygiene's dietary rules are rigid and restrictive, its adherents vary considerably in the extent to which they follow them. Acknowledging this in a *Health Science* interview, Ralph Cinque has conceded: "I don't think it is right to tell a person that bad things are happening inside them because of a certain [food] combination. . . . I don't think . . . that they should suffer mental distress over their food combinations." The Diamonds, too, in *Fit for Life*, give reluctant consent to the consumption of milk (preferably unpasteurized) and plain yogurt; and their dinner menus include seafood and fowl.

No scientific study has ever compared the disease and death rates of Hygienists with those of other people. But it appears to me that the hazards far outweigh the possible benefits.

Mr. Raso is Assistant Chief Dietitian at Wyckoff Heights Medical Center in Brooklyn, New York.

BRIEFS

Pork producers squealing. Some of Pennsylvania's pig farmers have objected to the use of pigs in ads for a statewide anti-litter campaign. The \$400,000 campaign, announced in July, identifies people who litter as pigs. One television ad, for example, shows a young man gradually transforming into a pig as he admits littering. According to an Associated Press report, the farmers complained that the ads created an unfair image of pigs, which are intelligent and clean.

Perrier relabeled. Perrier mineral water bottled for U.S. distribution may no longer be labeled "natural sparkling" mineral water. The FDA says that this is a false claim because the water is not carbonated when it emerges from the spring in Vergese, France, but is added when carbon dioxide is added to the mineral water. Last February, Perrier's manufacturer conducted a worldwide recall after benzene (a carcinogen) was discovered in samples of its products. It turned out that minuscule amounts of benzene and other impurities are naturally present in the carbon dioxide gas, which is mixed into the water to give Perrier its fizz. The problem was traced to negligence in changing filters that remove chemicals in the gas before it is mixed with the mineral water. The manufacturer has agreed to relabel bottles as containing "natural mineral water" and to provide the FDA with the results of daily laboratory tests for possible benzene contamination.

Free booklet. The American Dietetic Association and the International Food Information Council have developed "10 Tips to Health Eating," which can be obtained by sending a stamped, self-addressed, 4" x 9 1/2" envelope to 10 Tips, P.O. Box 1144, Rockville, MD 20850.

Sugar information. "About Sugar: A User's Guide," a booklet that explains sugar's role in food technology and provides illustrative recipes, is available free of charge from the Sugar Association, 1101 15th Street, N.W., Suite 600, Washington, DC 20005. The Association also is distributing a brochure called "A Chef's Guide to Low Fat, High Pleasure Eating," which contains recipes and cooking tips useful for reducing dietary fat.

Court protects diet book publisher. A Pennsylvania Superior Court has upheld a lower court summary judgment dismissing a suit against the publisher of *The Last Chance Diet*, by Robert Linn, D.O. The suit had been brought by the administrator of the estate of a woman who died in 1977 of complications allegedly caused by a liquid protein diet recommended by the book. The appeals court reasoned that publishers are protected by the First Amendment right to freedom of speech and that a book cannot be considered a defective product under tort law [Smith v. Linn, 563 A. 2d 123 (Pa. Superior Ct., Aug. 7, 1989)].

Phony steroid ring smashed. A lengthy investigation by the FDA, Internal Revenue Service, and Justice Department has led to the breakup of one of the largest counterfeit steroid rings in the United States. The ringleader, Don L. Tirado, of San Jose, California, was sentenced to 4 years in prison after pleading guilty to three felony counts of counterfeiting, money laundering, and conspiracy. According to a report in the July/August *FDA Consumer*, Tirado and two associates marketed 14 fake anabolic steroid products during 1986 and 1987. Their tablets were low-dose vitamins that had been obtained from legitimate manufacturers in unlabeled bottles and packaged to mimic brand-name steroids. Their injectables were composed of sesame oil, water with artificial sweetener, or diluted milk of magnesia. Anabolic steroids, which can cause serious harm, are widely abused by athletes, especially bodybuilders and weightlifters.

Another "anti-Candida" product snuffed. During 1988, the FDA initiated a seizure of *Yeastop*, a vitamin concoction claimed to be effective against yeast micro-organisms that have become "overgrown" or "out of control." The manufacturer, Nature's Herbs, of Orem, Utah, claimed that the product was a "dietary supplement." But the FDA charged that the therapeutic claims on its label made it an illegal drug. In January 1990, a federal judge ruled that *Yeastop* was a drug and ordered Nature's Herbs to pay for its destruction and for other court costs and fees.

Opposition to BST. Two of the nation's leading milk-producing states have passed laws temporarily banning the use of bovine somatotropin (BST), a hormone that increases milk production. Minnesota has enacted a 1-year ban, while Wisconsin has banned BST until July 1, 1991, or 6 months after the FDA approves its use, whichever comes later. The main reason for the ban is political: fear that BST use will drive small farmers out of business. However, small farms are failing anyway. An editorial in the *Journal of the American Medical Association* notes that, since 1980, more than 10,000 dairy farms have stopped operating in Wisconsin alone, indicating an intrinsic trend toward larger, more efficient farms [JAMA 264:1028, 1990]. The editorial also notes that BST's opponents tend to use groundless safety and health issues as a red herring to strengthen their economic concerns. Although milk produced by BST-treated cows is no different from milk produced by untreated cows, five large supermarket chains have agreed not to use it for their house brands of dairy products. FDA scientists have concluded that BST presents no health risk to consumers [Science 249: 875-883, 1990]. A reprint of their report can be obtained by writing to C. Greg Guyer, Ph.D., FDA Center for Veterinary Medicine, 5600 Fishers Lane, Room 8-81, Rockville, MD 20857.

Dubious clinic operator dies. Virginia Livingston-Wheeler, M.D., who claimed to cure cancer by strengthening the immune system with various vaccines and dietary measures [NF 7:24], died in June at the age of 84.

More alcohol warnings. Representative Joseph Kennedy (D-MA) and Senator Albert Gore, Jr. (R-TN) have introduced bills to require warnings in all broadcast and print ads for alcoholic beverages. Print ads would also have to include a toll-free number readers could call for more information about the risks of drinking. Proponents of these bills note that the alcoholic beverage industry spends some \$2 billion per year for ads and other promotions. "For years, the American public has been receiving a lopsided message from the industry," Kennedy said at a recent hearing. "It is time we wake up and say 'enough is enough.'" The National Institute on Alcohol Abuse and Alcoholism estimates: 1) more than 18 million Americans age 18 and older abuse alcohol; 2) each year, more than 40,000 infants are born with alcohol-related birth defects; and 3) each year, about 24,000 people die and 500,000 are injured in alcohol-related motor vehicle accidents. However, ads portray alcohol use as fun and relaxing with no adverse consequences. A law requiring label warnings went into effect in November 1989. Like the tobacco industry, the alcohol industry maintains that its ads are not directed at children, do not cause increased consumption, and are intended to promote brand loyalty and brand switching by competitors' customers.

Libel suit dismissed. On August 7, a federal judge dismissed the suit filed against *Good Housekeeping* by Martin Katahn, Ph.D., author of *The Rotation Diet*. Katahn [NF 7:30]. The judge ruled that the article was not libelous.

USDA hotline busy. During fiscal year 1989, a record 64,000 consumers called the Agriculture Department's Meat and Poultry Hotline (800-535-4555) for advice on food safety. Most inquiries concerned basic safe food handling and storage. The service operates weekdays from 10 AM to 4 PM, EST.

AIDS videotape. The FDA, Centers for Disease Control, and Whitman-Walker Clinic have produced a videotape to show how people with AIDS can reduce their risk of acquiring food-borne infections through careful food selection and preparation. Copies are available for \$8.95 from the National AIDS Information Clearinghouse, P.O. Box 6003, Rockville, MD 20850. The clearinghouse maintains a toll-free number (800-458-5231) for answering questions. A CDC official has stressed that AIDS infections are not acquired by eating food or drinking liquids.

Jarvis, Ph.D.; James Lowell, Ph.D.; **CONTRIBUTING EDITORS:** John Cunningham, Ph.D.; Johanna Dwyer, Sc.D., R.D.; Mark Fuerst; Kathy King Helm, R.D.; Victor Herbert, M.D., J.D.; James J. Kenney, Ph.D., R.D.; Barbara Levine, Ph.D., R.D.; Kathleen A. Meister, M.S.; Grace Powers Monaco, Esq.; Anita Owen, R.D., M.A.; Zev Remba (Washington Correspondent); Sheldon Rovin, D.D.S., M.S.; Varro E. Tyler, Ph.D.; Eleanor N. Whitney, Ph.D., R.D.; Eleanor A. Young, Ph.D., R.D.; Jack Z. Yetiv, M.D., Ph.D.; and staff members of The Pennsylvania State University Nutrition Information and Resource Center.

Parents sentenced for child's death. A Toronto couple, Sonia and Khachadour Atikian, have been sentenced to 2 years in prison for "failing to provide the necessities of life" for their daughter, Lorie, who died in 1987 at the age of 17 months. Testimony at the trial indicated that the child died of pneumonia and malnutrition after being kept on a Spartan diet. Mrs. Atikian maintained that she was following the advice of herbalist Gerhard Hanswille, who claimed his system could help make Lorie a "superbaby." Hanswille admitted that, on the day before Lorie died, he had treated her with an "electromagnetic machine" and advised that she be wrapped in cabbage leaves. But he denied influencing Mrs. Atikian against conventional treatment and said he had told her to seek medical advice. Hanswille, who was unlicensed, also told the court that in 1972 he had obtained a "doctor of naturopathy" degree from Bernadean University (an unaccredited correspondence school in Nevada that was never licensed to operate or issue degrees). The judge and jury apparently believed that the Atikians should have realized that Lorie was desperately ill and needed medical care.

Smoking impairs ability to smell. A study of 638 individuals for whom detailed smoking histories were available has shown that smoking decreases the sense of smell in a dose-related manner in both current and previous smokers [JAMA 263:1233-1236, 1990]. Although improvement usually occurs when smoking is stopped, restoration of olfactory function to the level observed in nonsmokers requires about as long as the number of years smoked. Previous studies have been contradictory, but the researchers believe this happened because former smokers were included in the "nonsmoking" groups. Reprints are available from Richard L. Doty, Ph.D., Smell and Taste Center, Hospital of the University of Pennsylvania, 3400 Spruce St., Philadelphia, PA 19104.

"Right-to-die" verdict. The U.S. Supreme Court has affirmed that competent people have a right to refuse life-sustaining treatment, including artificially given food and fluids. But when patients are incompetent, the court said, they are unable to make informed and voluntary choices. States are therefore justified in requiring "clear and convincing evidence" of the patient's wishes before allowing withdrawal of such support measures. The ruling was applied to the case of 32-year-old Nancy Cruzan, who has been in a coma due to irreversible brain damage since a 1983 car accident. By a 5-4 vote, the Supreme Court upheld a Missouri Supreme Court ruling that Ms. Cruzan's guardian could not terminate her treatment because there was not sufficient evidence of her wishes. The verdict has stimulated many hospitals to become more aggressive about having patients sign living wills or other "advance directives" to be used if they become irreversibly ill and are unable to speak for themselves. Groups promoting the concept of living wills have been flooded with requests for forms. U.S. Senator John Danforth (R-MO) has introduced the Patient Self-Determination Act, which would require hospitals and nursing homes to inquire about advance directives. The American Medical Association (AMA) has asked that the bill be modified to ensure that patients are not unduly pressured during the admission process. Similar legislation pending in the House of Representatives was modified to conform with the AMA's wishes.

Death associated with "tanning" pill. Canthaxanthin is a fat-soluble carotenoid that the human body cannot convert to vitamin A. It is legally used in tiny amounts as a food coloring agent. Despite a warning by the FDA, it is illegally sold in tanning parlors and by mail as a tablet for skin tanning, under such names as *Orobronze*, *Darker Tan*, and *BronzGlo*. Ads for *Darker Tan* promise "a rich dark bronze glowing tan without risking skin cancer." A case has been reported of a 20-year-old woman who took high doses and developed aplastic anemia, a serious condition in which the production of blood cells is impaired [JAMA 264:1141-1142, 1990]. The authors note that although a single case cannot establish a cause-and-effect relationship, no other cause was apparent. Previous reports have linked canthaxanthin use to hepatitis, generalized itching, hives, and eye problems.

Weight loss and gallstones. Several researchers have reported increased gallstone formation and gallbladder sludge (probably a precursor of stones) among patients who lost weight rapidly with gastric bypass surgery or very-low-calorie weight-loss programs. According to the July 1990 Medical World News, Nutri/Systems is facing many lawsuits.

Cholesterol and colon cancer. A study has found that 69 patients with colon cancer had significantly lower blood cholesterol levels than matched control subjects who were followed over a 10-year period [JAMA 263:2083-2085, 1990]. The data were obtained from the population of a large outpatient medical clinic that performed periodic examinations with emphasis on early detection of cancer. Each of the cancer patients was matched with a control patient of the same sex and within 1 year of age in whom cancer did not develop. The researchers concluded: 1) individuals who develop colorectal cancer share the same serum cholesterol level as the general population initially; 2) during the 10 years preceding the cancer, they demonstrate a gradual decline opposite to the rising level generally seen with age; 3) cholesterol levels of the cancer patients did not become lower as their cancers advanced; 4) the data support the hypothesis that the decline is associated with the genesis of the cancer rather than a consequence of the cancer; 5) it is possible that genes on one particular chromosome are responsible for both decreased cholesterol synthesis and development of the cancer; and 6) further research must be done to elucidate the significance of the study's findings. Reprints can be obtained from Sidney J. Winawer, M.D., Gastroenterology Service, Memorial Sloan-Kettering Cancer Center, 1275 York Ave., New York, NY 10021.

Cholesterol-lowering drug use soaring. U.S. retail pharmacies filled nearly 13 million prescriptions for cholesterol-lowering drugs during 1988, a five-fold increase over 1983 [JAMA 263:2185-2188, 1990]. Niacin sold over-the-counter is not included in these figures.

Selenium and breast cancer. A prospective study of registered nurses has found no relationship between selenium intake during adult life and the risk of developing breast cancer [JAMA 264:1128-1131, 1990]. The study was performed by comparing the selenium content of toenail clippings from 434 nurses who developed breast cancer with those of 434 who did not.

Fluoridation census. The U.S. Centers for Disease Control estimates that as of December 31, 1988, 132 million Americans (53% of the population) were served by fluoridated water.

Chiropractic group opposes fluoridation. In May, the International Chiropractors Association (the nation's second-largest chiropractic group) adopted a policy opposing fluoridation of public water supplies. The group considers fluoridation "possibly harmful and a deprivation of the rights of citizens to be free from unwelcome mass medication." They are also opposed to compulsory immunization.

Hair analysis for drug detection. FDA Compliance Policy Guide 7124.06, issued on May 31, 1990, states that analysis of hair by radioimmunoassay (RIA) for the presence of abused drugs is "an unproven procedure unsupported by the scientific literature or well controlled studies or clinical trials."

BOOK REVIEW

Title: Treating Arthritis: Medicine, Myth and Magic (1989)

Author: Felix Fernandez-Madrid, M.D., Ph.D.

Publisher: Plenum Press, New York

Price: \$22.95, hardcover

Reviewed by: William T. Jarvis, Ph.D.

This much-needed treatise lives up to its billing as the "alternative to quackery." It explains the diseases we know collectively as "arthritis," provides tools to protect against quackery, and explains the principles of modern scientific treatment. Most important, it does a superlative job of explaining why early treatment is important to keep inflammation from doing irreversible damage to the joints.

The author believes that the roots of diet-related arthritis quackery can be traced back 5,000 years to the Egyptian belief that all diseases are attributable to food intake. The book begins with a fascinating imaginary journey through time by an arthritic patient who is treated by the ancient Mesopotamians, East Indians (Ayurvedic medicine), Chinese, Egyptians, primitive shamans, and many other types of healers. Some of what these people did was useful, but most was not. It also demonstrates that there is nothing new under the sun when it comes to self-treatment and quackery. It exposes the faulty rationales for "glandulars," adrenal extracts, Liefcort, DMSO, bee stings, snake venom, and other dubious remedies. And it discredits the notion that rheumatoid arthritis is caused by an infectious organism.

In the remainder of the book, the author describes the symptoms and treatment of a wide range of arthritic disorders. He includes information on nutrition and skeletal health and describes the role of rest and exercise as well as proper medical management.

For a look at arthritis past and present, and how sufferers can face the future, this book is excellent.

Dr. Jarvis is professor of preventive medicine at Loma Linda University and president of the National Council Against Health Fraud, Inc.

Notable quote. "Every newspaper in America has a daily astrology column, with one or two exceptions. Virtually no newspaper in America, as far as I know, has a daily science column. . . . Newspapers continue to publish astrology and sleight science in order to sell more newspapers. If making money is the only object, the situation will continue. But if the health of the country or the satisfaction of the citizens—their ability to understand the world they live in—is what we're after, then we've got a lot more serious science to report in all media; especially daily newspapers."—*Carl Sagan.*

New food safety newsletter. Lilian Langseth, publisher of *Nutrition Research Newsletter*, has launched the *Food Safety Notebook*, a monthly newsletter covering scientific and political news about foods, food chemicals, and food safety. Introductory subscriptions are \$45/year. For further information or a free sample contact her at P.O. Box 700, Palisades, NY 10964.

COSTS OF FOODBORNE DISEASE

Manfred Kroger, Ph.D.

While some people express alarm about hypothetical health problems related to food technology and agricultural practices, the food industry and public health officials are struggling to stem the tide of *real* hazards confronting consumers. Although it is clear that foodborne diseases have caused more fatalities and misery to humans than all the wars ever waged, it is difficult to assess the full health and economic impact of these diseases throughout the world. However, a recent analysis by E. C. D. Todd, an official of Canada's Department of Health and Welfare, delineates in broad strokes the costs in the United States. He estimates that there are 12.6 million cases costing \$8.4 billion annually [Journal of Food Protection 52:595-601, 1989].

Microbiologic diseases represent 84% of these costs, led by salmonellosis (\$4 billion for 2.9 million cases per year) and staphylococcal intoxications (\$1.5 billion). Other costly outbreaks are toxoplasmosis (\$445 million), listeriosis (\$313 million), campylobacteriosis (\$156 million), trichinosis (\$144 million), *Clostridium perfringens* enteritis (\$123 million), and *E. coli* infections including hemorrhagic colitis (\$223 million). Botulism costs \$87 million; but with an average of only 270 cases per year, it is the costliest (\$322,200) per case. These estimates include both medical costs and lost earnings. They would be much worse if the food processing and food service industries were not of such high quality in this country.

These data on foodborne diseases should come in handy for setting priorities for research and regulatory efforts. Despite the concerns they may engender, anyone familiar with foreign travel or the state of food hygiene elsewhere, should realize that things are really quite good at home. Further improvement can come about through technological improvements and better education of food handlers.

Dr. Kroger is professor of food science at The Pennsylvania State University and associate editor of the *Journal of Food Science*.

DUBIOUS TEST DEBUNKED

Researchers at the University of California have demonstrated that provocation and neutralization—the principal diagnostic tests used by “clinical ecologists”—are not valid. The determination was made with a double-blind study of 18 patients, each of whom received three injections of suspected food extracts and nine of normal saline (dilute salt water) over a 3-hour period [New England Journal of Medicine 323:429–433, 1990].

The tests were performed in the offices of seven proponents who had been treating the patients. In unblinded tests, these patients had consistently reported symptoms when exposed to food extracts and no symptoms when given saline injections. But during the experiment, the patients reported as many symptoms after salt water injections as they did after food extract injections, indicating that their symptoms were nothing more than placebo reactions.

“Clinical ecology” is based on the dubious premise that multiple symptoms can be triggered by hypersensitivity to tiny doses of foods and environmental chemicals. The symptoms reported during the experiment included itching of the nose, watery or burning eyes, plugged ears, a feeling of fullness in the ears, ringing ears, dry mouth, scratchy throat, an odd taste in the mouth, tiredness, headache, nausea, dizziness, abdominal discomfort, tingling of the face or scalp, tightness or pressure in the head, disorientation, difficulty breathing, depression, chills, coughing, nervousness, intestinal gas or rumbling, and aching legs.

“Clinical ecologists” also claim that “neutralizing” doses of offending allergens can relieve the patient’s symptoms. However, seven patients who were treated during the experiment had equivalent responses to extracts and saline.

The experimental protocol was developed in consultation with proponents and critics who agreed that it was a fair and appropriate test. Proponent organizations also provided financial support. Despite this, one prominent proponent claimed in an Associated Press interview that incorrect dosages were used. Reprints of the *New England Journal of Medicine* article are available from Don L. Jewett, M.D., Special Studies Unit, Department of Orthopedic Surgery, University of California, San Francisco, CA 94143.

QUESTION BOX

Q. Was Chiquita Banana correct in warning that bananas should “never-never” be refrigerated?

A. Yes! Sustained cold temperatures interfere with certain physiological functions that are vital during post-harvest storage. When kept at room temperature, bananas continue to ripen and eventually will spoil. But spoilage occurs more rapidly if they are refrigerated. In the refrigerator, banana peels become dull and later turn gray (“dead”), then brown/black. Refrigerated bananas remain edible for only a few days before their flesh loses its flavor and texture and turns dark. Also, they are easily damaged by handling or by pressure from packaging materials and may burst along their ridges. Other cold-sensitive foods include green beans and certain types of apples.

CAL-BAN SCUTTLED

State and federal agencies have permanently stopped the sale of *Cal-Ban 3000*. The ingredient in this product is guar gum, which swells to several times its size when exposed to water. *Cal-Ban*’s marketers claimed that their product expanded in the stomach and produced a feeling of fullness that caused people to eat less. However, there is little scientific evidence that guar gum is effective for weight reduction [NF 7:22-23]. In addition, many *Cal-Ban* users have been seriously harmed.

On July 5, postal authorities obtained a temporary injunction prohibiting sales through the mail and by telephone and directing telephone companies to disconnect the company’s toll-free lines.

On July 6, the Hillsborough County Sheriff filed charges of fraud against three company officials. On July 18, the Florida Department of Health and Rehabilitative Services issued an emergency order requiring Florida retailers to remove *Cal-Ban* from their shelves and to stop selling the product immediately. The department said it took this action after reviewing complaints from more than 100 individuals, at least 50 of whom needed some type of medical intervention. The complaints included esophageal obstruction, gastric obstruction, upper and lower intestinal obstruction, nausea, vomiting, headache, and dizziness.

On July 25, the FDA issued a regulatory letter notifying the company that the product was an unapproved new drug and was misbranded and asked that it be recalled immediately. At the same time the agency announced that it had collected reports of at least 17 cases of esophageal obstruction. Hospital stays were required by 10 of these people, one of whom had died.

On July 26, the California Department of Health Services warned consumers not to use *Cal-Ban 3000* and warned retailers not to sell it. California authorities also embargoed shipment and sale of more than 20 million tablets and capsules at a warehouse and manufacturing plant in Anaheim, California.

In August, the Florida civil case was settled with payment of \$1.3 million, and the criminal case was settled with a plea bargain in which the company pled guilty to one count of organized scheme to defraud, paid a \$5,000 fine, and pledged never to sell guar gum or *Cal-Ban* again in the United States. The Postal Service case was settled with a similar consent agreement plus a penalty of \$25,000. In addition, if the three company officials ever promote another weight-loss aid, the promotional material must make it clear that any weight loss will result from increasing exercise and/or consuming fewer calories.

The FDA has indicated that by the end of 1990 it will ban the use of guar gum and more than 100 other ingredients in nonprescription diet aids. Guar gum will remain approved as a food additive for thickening or stabilizing cheeses, salad dressings, and ice cream. When used in a food formulation, it poses no health hazard and is superior to starch or gelatin.

Cal-Ban 3000 had been marketed since 1986. Sale through the mail has been prohibited since 1987, but the company continued to secure orders by telephone, with payment by credit card or COD and delivery by United Parcel Service. Action by Florida authorities or the FDA could have stopped its sale several years ago.

DEVIOUS CLAIMS THE ANATOMY OF A MARKETING SCHEME

Ira Milner, R.D.

Enzymatic Therapy, Inc., of Green Bay, Wisconsin, markets "nutritional supplements," "herbal extracts," and "sports nutrition formulas" sold through health food stores. On March 25, 1990, I joined more than 100 retailers and a few chiropractors at a seminar in New Jersey to learn about the company and its products. Before the program began, we were asked to sign a "guarantee" that we were not agents of the FDA, the Better Business Bureau, or any other consumer protection agency and would not tape the seminar for any government agency to use against Enzymatic Therapy. The statement also acknowledged that the sole purpose for attending was to obtain "educational information."

The seminar, which was held at the Radisson Newark Airport Hotel, lasted from 9:00 AM to 6:00 PM, with a break for lunch. Enzymatic Therapy products were displayed and could be ordered at a special 15% discount. Three speakers made presentations:

- Terence J. Lemerond, president of Enzymatic Therapy and three other companies: Biotherapeutics/PhytoPharmica (which markets supplements and botanical extracts to professionals), Bay Natural Foods (a health food store), and the Naturalean Wellness Center (next door to the store). Company publications state that Lemerond has "studied nutrition for 20 years" and was a "nutrition consultant" for 9 years. From 1977 to 1983 he served on the board of governors of the National Health Federation, which lobbies aggressively against government regulation of the health marketplace. His other activities have included a radio talk show and a newspaper column. In the local Yellow Pages, his name is followed by the initials "N.D., B.S., C.N.C."

- Kenneth R. Daub, D.C., a chiropractor from Rockford, Illinois, who was described as "specializing in circulatory and metabolic diseases."

- Michael T. Murray, N.D., who practices naturopathy in Bellevue, Washington, and teaches "therapeutic nutrition" and "botanical medicine" at Bastyr College, a naturopathic school in Seattle.

This report is based on my experience at the seminar plus information from government reports and company documents.

Background History

According to an article distributed by Enzymatic Therapy, Terry Lemerond was inspired to enter the health food business after solving a weight problem with the help of a friend who operated a health food store. In 1969, he acquired his own store (later renamed Bay Natural Foods) and engaged in "nutritional consultation." During the seminar, he described how the company was started in the back room of the store after he concluded it was much better to combine many nutrients into single products for specific conditions. He and his wife incorporated Enzymatic Therapy in January 1981. Later that year, in advertisements in *Natural Foods Merchandiser*, the company announced a "money-back guarantee on an extraordinary new system of nutritional health care!"

"The success of our case histories would astound you," the ads continued, "Enzymatic Therapy is a dynamic new concept in nutritional supplement formulas. They are directed straight at the ailments of our modern age. Created by a nutritional counselor from his highly successful practice, these formulas are the results of experience—not conjecture."

The advertisements listed 11 products: *Acne-Zyme* (to support healthy skin tissue and improve complexion), *Acid-A-Cal* (to improve joint function), *Liv-A-Tox* (to support liver function and detoxification), *Vira-Plex* (strengthens against colds, flu, and infection), *Pro-Gest-Ade* (for digesting protein), *Liga-Plex* (supports weak ligaments, tennis elbow), *Nucleo-Pro F* (for female problems), *Nucleo-Pro M* (for male problems), *Arthro-Flex* ("joint pain, etc., etc."), *Relax-O-Zyme* ("muscle and nerve relaxant"), and *Hypo-Plex* (weight loss, appetite depressant, and control of high or low blood sugar). Each product had a formula number on its label.

A brochure subsequently mailed to retailers stated that "in one and a half years of testing our products through a few selected health food stores, sales exceeded \$10,000 per month per store." The accompanying price list contained more specific claims. *Nucleo-Pro M*, for example, was said to be for "prostatitis, impotence, male hormonal problems, fatigue, and lack of stamina," while *Nucleo-Pro F*, was for "female hormonal problems, impotency, irregular menses, fatigue, menstrual

cramps." The mailing also included "Research Bulletin #105: ACNE," a two-page flyer that listed and discussed the ingredients in *Acne-Zyme No. 105*. The flyer did not mention the product by name but said there was a formula available to meet criteria described in the article. The second page contained disclaimer: "This material is for educational purposes only and is not meant to diagnose or prescribe. Researched by Siri Khalsa, *Nutrition News*, Pomona, CA. . . . Permission to reprint granted to Enzymatic Therapy, Inc."

In 1982, Ms. Khalsa published a book *You Can Do Something About Common Ailments*. Enzymatic Therapy is not identified in the book, but most chapters are almost identical to the "Research Bulletins." The appendix lists the formula numbers and ingredients of Enzymatic Therapy's products, and a footnote states, "If the health food store in your neighborhood cannot accommodate you, please write us and we'll tell you where you can locate the formulas."

At the end of 1984, the company boasted that "No other line of supplements can offer you the service, support, and the profitability that comes from working with Enzymatic Therapy formulas" and promised to supply "unlimited quantities of bag stuffers and promotional material." By that time, it offered about 50 numbered formulas with corresponding "Research Bulletins." Some of these were still attributed to Ms. Khalsa, but most were "researched by the American Society of Nutritional Research" in Phoenix, Arizona.

These flyers, which had four pages, were intended for distribution to customers. The first page of each contained a box in which retailers could print their store's name and address under the message: "For professional health care, shop at. . . ." Retailers also received Enzymatic Therapy's "Professional Price List," which listed "suspected symptoms" for which each of the products were supposedly useful, plus a four-page flyer entitled "Restricted for Professional Use Only" in which detailed therapeutic claims were made for each product.

Nutrition News, edited and published by Ms. Khalsa, appears to be an independent publication that was launched in 1976. Each issue contains four pages and discusses the supposed relationships between nutrients and various health problems. No products are named, but the substances involved are common ingredients in health food store products. The newsletter is available by individual subscription and is sold in bulk to health food stores for free distribution to customers. ("Your customers want to know what your products can do for them," said a recent solicitation, "Each month we publish an attractive, topical newsletter geared specifically to inform them and motivate them to buy those products. . . . Put *Nutrition News* in your store and you put the finest sales money builder money can buy right into your customers' hands.")

A Minor Setback

Under federal law, any product "intended for use in the cure, mitigation, treatment, or prevention of disease" is a drug. If a product is marketed with drug claims that lack FDA approval, the agency can issue a regulatory letter, initiate a seizure, obtain an injunction, and/or seek criminal penalties. The claim need not be on the product label itself. Any claim traceable to the manufacturer is considered part of the label. Thus, the literature distributed by Enzymatic Therapy made its products misbranded and unapproved new drugs.

In May 1985, after an extensive undercover investigation, *Consumer Reports* magazine listed Enzymatic Therapy among more than 40 companies that were violating federal law by making unapproved drug claims for "supplement" products. About 1 year later, the FDA issued a regulatory letter ordering Lemerond to stop using the "Research Bulletins" to make "false and misleading" representations for *Renatone*, *Liv-A-Tox*, *Vira-Plex*, and other Enzymatic Therapy products. The FTC also communicated with the company but took no formal action.

In 1986, Enzymatic Therapy launched *Nicorest*, an alleged "smoking deterrent tablet," composed of vitamins and herbs, whose name was similar to Merrill Dow's *Nicorette* (a nicotine chewing gum). After Merrill Dow learned of the similarity, *Nicorest* was changed to *Nico-Tabs*.

But the Beat Goes On

After receiving the regulatory letter, Enzymatic Therapy stopped using the Research Bulletins but continued to make illegal claims for its products through seminars and various publications.

The heart of its communication system to customers is a series of 45 brightly colored "Health Guides." These, according to a company flyer, "explain how our specific nutritional and herbal formulas support and enhance a full range of body functions. . . . Once your patrons realize the many health benefits of proper nutrition, you will have loyal customers for life." Most of the guides describe the ingredients in various formulas, the products that contain them, and the body organs or functions they can "support." For example, Guide No. 12, "A Comprehensive Guide to Healthy Kidneys," touts *Renatone No. 184* ("to aid the kidney in its vital roles") and *Arbutin Complex No. 802A* ("diuretic and urinary tract antiseptic"), and *K Com No. 808* ("a general tonic for the urinary system").

Health Guides can be obtained from Lem's Contract Printing in Green Bay by mail or by calling a toll-free number. Retailers can order up to 1,200 per month per store and have been encouraged to display them in a special 48-pocket rack that, until recently, was sold by Enzymatic Therapy. At the seminar, Lemerond said that 500,000 to 750,000 of the guides

Nutrition Forum (ISSN 0748-8165) is published bimonthly by J.B. Lippincott Company, Downsville Pike, Route 3, Box 20-B, Hagerstown, MD 21740. Editorial correspondence should be sent to Stephen Barrett, M.D., P.O. Box 1747, Allentown, PA 18105. POSTMASTER: Send address changes to Nutrition Forum, Downsville Pike, Route 3, Box 20-B, Hagerstown, MD 21740.

have been distributed each month and that they were used in his Green Bay store. In November 1990, John H. Renner, M.D., a board member of the National Council Against Health Fraud, visited the store and observed a clerk giving inappropriate advice to two customers.

In 1986, Enzymatic Therapy began publishing *Formula for Health*, an 8-page newsletter for retailers, which now is issued monthly. Recently, to boost its monthly specials, the newsletter has been accompanied by reproducible 1-page inserts that contain a box for the retailer's business card. The first three specials have been products "for a healthy immune system," "for healthy digestion," and "to help you breathe easy." Enzymatic Therapy guarantees that if a customer returns a product for any reason, it will replace it free of charge or credit the retailers account. It also offers retailers a full refund on any product returned within 1 year in resalable condition.

In January 1989, Enzymatic Therapy began publishing *Health Counselor*, a magazine "designed to help educate your customers on the value of health, and ways to support the body by using nutritional and herbal formulas." Single copies are distributed free-of-charge, but retailers are encouraged to buy multiple copies for distribution or sale to their customers. The magazine contains articles boosting herbal remedies and ads for Enzymatic Therapy products. Many ads contain illegal therapeutic claims. In the first issue, for example, on a page marked "advertisement," several formulas were claimed to "support the heart and entire cardiovascular system" and to be "particularly useful for individuals with atherosclerosis (hardening of the arteries)." In the May/June 1990 issue, an advertisement states that "Liv-A-Tox No. 125 is a unique combination of nutrients, herbs, and glandular concentrates to support liver functions for a healthy flow of fats and bile."

Lemerond also operates Biotherapeutics/Phyto-Pharmica, which markets nutritional supplements and herbal extracts through chiropractors and other health professionals. Its 1990 catalog lists about 80 products, including *Hepatox* ("to support the liver"), *Cardioplex* ("support for the heart and cardiovascular system"), *Glucoril* ("to deeply revitalize the pancreas"), and *Vision Tone* ("to support eye function").

In addition to expanding its product lines, Enzymatic Therapy has been expanding its operating space. It moved to larger quarters in 1987 and has just built a 30,000-square-foot facility.

The Seminar

For several years, Enzymatic Therapy has invited retailers to attend free "nutritional seminar and sales training" sessions. About 20 were scheduled during 1990.

During the seminars, Lemerond shows slides of the products and describes how to use them for specific health

problems. "Our products are specifically designed to nutritionally aid and support the various systems and the functions of the body," he said at the seminar I attended. "The goal of Enzymatic Therapy is to provide you and your customers with the finest nutritional formulas of the highest quality, backed by sound scientific research."

"I think we provide some of the best literature in the industry," Lemerond continued, "it is a tremendous sales tool. It's like having another person in the store selling for you without having to pay that person." He then described how one retailer who bought between \$600 and \$1,000 of product a month told him he had "never sold" an Enzymatic Therapy product—he just puts the rack in the center of the store and lets people take the literature and sell themselves.

Samples of the guides were distributed at the seminar. According to Lemerond, seminar participants have experienced an 80% increase in their sales of Enzymatic Therapy products.

As he talked about the products, Lemerond related many anecdotes. The most memorable was about a California woman who took *Hair and Nutrition #180*, which provides "nutritional support for healthy skin and hair" and "definitely affects the growth of hair." Lemerond said that the woman "could never grow long hair," but soon after taking the product, she grew "somewhere around 6 inches of hair." Several seminar participants sitting near me wondered aloud whether Lemerond—who is balding—had ever used it.

The Murray Connection

Michael Murray, N.D., a 1985 graduate of Bastyr College, is a consultant to Enzymatic Therapy and has been closely allied with Lemerond for several years. At the seminar, Lemerond described Murray as "one of the finest scientists in the United States in the nutritional field" and said he had formulated or reformulated many Enzymatic Therapy products. Enzymatic Therapy, which undoubtedly views naturopathy as a marketing channel for its products, has donated at least \$15,000 to Bastyr College.

Murray is a prolific writer. He wrote *The 21st Century Herbal* ("a layman's guide to botanical extracts") and is co-author of the *Encyclopedia of Natural Medicine* (a reference guide for patients) and *A Textbook of Natural Medicine* (a massive collection of information about naturopathic methods). He also edits *Phyto-Pharmica Review* (a newsletter related to the herbal products marketed by Lemerond's professional division), and *The Health Series* (booklets about herbs and common ailments written for laypersons).

Murray also is doing business as president of Vital Communications, of Bellevue, Washington. Near the end of 1989, Vital Communications took over as "sponsor" of the seminars and publisher of both *Health Counselor* and *Phyto-*

EDITORIAL BOARD

EDITOR: Stephen Barrett, M.D. **SENIOR ASSOCIATE EDITOR:** Manfred Kroger, Ph.D. **ASSOCIATE EDITORS:** Michael Botts, Esq., Darlene Forester, Ph.D., R.D.; Mary Abbott Hess, R.D., M.S.; William T. Jarvis, Ph.D.; James Lowell, Ph.D.; **CONTRIBUTING EDITORS:** John Cunningham, Ph.D.; Johanna Dwyer, Sc.D., R.D.; Mark Fuerst; Kathy King Helm, R.D.; Victor Herbert, M.D., J.D.; James J. Kenney, Ph.D., R.D.; Barbara Levine, Ph.D., R.D.; Kathleen A. Meister, M.S.; Grace Powers Monaco, Esq.; Anita Owen, R.D., M.A.; Zev Remba (Washington Correspondent); Sheldon Rovin, D.D.S., M.S.; Varro E. Tyler, Ph.D.; Eleanor N. Whitney, Ph.D., R.D.; Eleanor A. Young, Ph.D., R.D.; Jack Z. Yetiv, M.D., Ph.D.; and staff members of The Pennsylvania State University Nutrition Information and Resource Center.

Pharmica Review. In a letter to retailers early in 1990, Murray stated, "Your customers need help in selecting natural products they use to treat themselves, which is their constitutional right. Can you realize how little time you have to help each and every customer who comes into your store, as well as the legal implications involved with trying to be too helpful? *Health Counselor* magazine will solve those problems for you. . . . With just six issues of this bimonthly magazine in publication, *Health Counselor* already has a circulation of 105,000 per issue."

Enzymatic Therapy appears to be using Murray as a "front"—to create an illusion of distance between the company and many of its claims. Bulk orders for *Health Counselor* are still placed through Lem's Contract Printing (which also ships the Health Guides), with order forms variously addressed to Lem's or Vital Communications Post Office Box 1332 in Green Bay.

The Health Series also is being used to promote Enzymatic Therapy products. A recent mailing to health food stores contained Murray's booklet on irritable bowel syndrome (IBS), an Enzymatic Therapy flyer for products whose ingredients are discussed in the booklet, and a cover letter in which Murray tells how he prescribes one of the products to patients and suggests that the booklet can help customers "understand how to handle IBS naturally." The mailing was sent from Post Office Box 1332 under bulk mailing permit #436, which Enzymatic Therapy has used for years to mail its catalogs and other publications.

At the seminar I attended, Murray discussed herbs and various symptoms and conditions for which he said specific Enzymatic Therapy products should be recommended. Participants also were given *The Professional Guide to Nutritional and Herbal Formulas*, a 158-page looseleaf manual "published and distributed by Vital Communications, Dr. Michael Murray, N.D." which describes Enzymatic Therapy products and more than 80 diseases and conditions they supposedly can help. In addition, the manual contains "protocols" for using various products against AIDS, multiple sclerosis, cancer, arthritis, and other serious health problems.

The Daub Connection

The third speaker at the seminar was Kenneth Daub, D.C., clinic director of Vascular Associates International Corp., in Rockville, Illinois. His topic, "The Management of Arterial Disease," was a rambling account of his views on atherosclerosis and some of the patients he has treated.

Daub is the developer of *MVP*, a supplement program he says was adapted from the work of Hans Neiper, a German physician. At the seminar, Daub distributed a booklet entitled "Owners Manual for a Healthy Circulatory System," which claims that *MVP* can "help the body nutritionally cleanse itself of the life-threatening plaque in the arteries." Daub also encouraged attendees to request his videotape, which makes similar claims and contains testimonials from people who say his product was effective against high blood pressure, obesity, numbness of the hand and leg, chest pain, fatigue, and lack of energy. The tape, which he sells for \$20, appears intended to interest people in marketing the product as well as using it. At one point, the narrator even refers to "a lifetime of financial freedom," words multilevel companies typically use to attract distributors.

A note accompanying the videotape states that it was made in 1985 when Daub's program was called *VMP*, which stood for Vascular Maintenance and Prevention. "Our friends in the FDA didn't like that name so they made us change it," the note said. "It would have been too costly to re-make the videotape, therefore when *VMP* is mentioned. . . . you'll know why it has been changed to *MVP*."

Actually, the FDA objected to a bit more than the product's name. The regulatory letter Daub received in June 1987 ordered him to stop stating or suggesting that *VMP* was useful against occlusive vascular disease, strokes, heart attacks, elevated cholesterol levels, high blood pressure, arthritis, and other forms of inflammation, eczema, hyperactivity in children, and "problems from alcoholism to obesity to cancer."

At that time, Daub was marketing his program through a company called Total Concept in Health Corporation. Currently, the exclusive distributor is Enzymatic Therapy. The slogan "Don't be bypassed, use *MVP*," appears in both the company's brochure and on refrigerator magnets distributed at the meeting.

The PR Connection

Enzymatic Therapy also uses S & S Public Relations, Inc., of Northbrook, Illinois, a public relations firm that issues news releases and arranges interviews with Lemerond. Like the Health Guides, the releases make claims for the products that would be illegal on product labels.

In January 1990, when Lemerond opened his Naturelean Wellness Center, S & S announced that it was directed by a medical doctor and offered "diet counseling, exercise, toning, EKGs nutritional analysis, massage therapy, rolfing, lean body analysis and other programs."

The Bottom Line

According to federal law, drugs must be proven safe and effective for their intended purpose before they are marketed, and their labels must contain adequate directions for use. When this information is not printed on the label or a package insert, the intended purpose can be determined by examining other evidence. Enzymatic Therapy's products are obviously being marketed for the treatment of disease.

Rather than seek FDA approval, Lemerond and his associates have been using subterfuge to "distance" illegal claims from their product labels. The fact that this effort has prospered is not the result of its cleverness but of FDA sluggishness. As should be obvious from this report, evidence of wrongdoing is not difficult to obtain.

At the National Health Fraud Conference held a few months ago in Kansas City, a high-ranking FDA enforcement official announced plans for greater use of criminal prosecution in health fraud cases. Lemerond has been flaunting the law for years and deserves nothing less.

BRIEFS

Postal Service attacks mail-order company. On November 7, United States Postal officials filed a false representation complaint against Nature's Bounty, Inc., of Bohemia, New York (doing business as Puritan's Pride). The complaint charges that at least 19 of the company's nutritional products were falsely advertised in Puritan Pride mail-order catalogs. The products include *Cholesto-Flush*, *Fatbuster Diet Tea*, *Kidney Flush*, *Memory Booster Prostex*, and *Stress B with 500 mg Vitamin C*. In 1985, General Nutrition Corporation signed consent agreements with the Postal Service to stop making unsubstantiated claims for 14 products sold through the mail. In 1989, Nature's Bounty purchased GNC's mail-order division for approximately \$7 million. The transaction included the right to use the Puritan's Pride trademark.

Adverse food reaction protocols. Free reprints of "Workshop on Experimental Methodology for Clinical Studies of Adverse Reactions to Foods and Food Additives" are available from Karen A. Taylor, International Life Sciences Institute, 1126 16th St., N.W., Washington, DC 20036.

New diet brochure. The FTC has issued an excellent 2-page flyer to help consumers evaluate weight-loss programs. Free copies of "Diet Programs" can be obtained from the Public Reference Branch, Room 130, Federal Trade Commission, 6th and Pennsylvania Ave., N.W., Washington, DC 20580.

Newsletter expands. *Obesity and Health*, which covers news and research related to weight control, has expanded into a bimonthly journal format. The introductory rates are \$49 for one year and \$89 for two years from Healthy Living Institute, 402 S. 14th St., Hettinger, ND 58639.

FDA pesticide report. The FDA's annual pesticide residue study again has found that 65% of domestically grown foods showed no pesticide residue and 34% had residues well within the limits set by the Environmental Protection Agency (EPA). The agency's annual Total Diet Study found that dietary intakes of pesticides for all population groups were well within international and EPA standards. Copies of the report, "Residues in Food—1989" are available from Norma Yess, FDA, HFF-420, 200 C St., S.W., Washington, DC 20204.

Silver fillings under attack. Irresponsible press reports suggesting that mercury-amalgam fillings are toxic have been increasing as a result of experiments conducted on sheep by researchers at the University of Calgary, Canada. On October 15, *Newsweek* reported the study and said that "no one has really looked" for evidence tying any disease to mercury from silver fillings. The article was coauthored by Sharon Begley, who wrote the scurrilous anti-fluoridation article *Newsweek* published in February [NF 7:15, 1990]. An FDA dental official has termed the sheep studies "very, very flawed" and irrelevant to what happens in humans. The American Dental Association states that adverse reactions to amalgam fillings are extremely rare. Although billions of fillings have been used successfully, fewer than 50 cases of allergy have been reported.

Report on unconventional cancer treatment. The United States Office of Technology Assessment has issued *Unconventional Cancer Treatments*, a thoroughly researched 312-page book containing a wealth of previously unpublished information. Copies (GPO stock #052-003-01207-3) are \$14 each from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. A 32-page summary report (#052-003-01208-1) costs \$1.75.

Homeopath stopped. The North Carolina Supreme Court has reversed two lower court decisions and ruled that the state board of medical examiners may ban physicians from using homeopathy. In 1985, the board voted to suspend the license of George Guess, M.D., because he refused to stop practicing homeopathy. Dr. Guess has announced plans for a federal court appeal.

In case you didn't know. Life Chiropractic College is offering a bachelor of science program in nutrition, which includes courses in basic sciences, food preparation, and clinical nutrition from a chiropractic viewpoint [Today's Chiropractic, October 1990]. The program also includes special projects in which the students "come to grips with the real world and the role nutrition plays in people's lives." Some students work in a soup kitchen to "appreciate the nutritional problems of the poor and homeless." Others work in an organic garden to gain "firsthand experience at growing pesticide-free, natural foods." According to a faculty member, "Chiropractic, through the specific [spinal] adjustment, can release nerve interference to help make the transportation of nutrients easier and improve the body's ability to absorb them. . . . Proper eating also affects the way patients think, how they feel, and the body's ability to hold an adjustment." The program is accredited by the Commission on Colleges of the Southern Association of Colleges and Schools, but is not approved by the American Dietetic Association to prepare students to become registered dietitians.

CANAH may fold. The Coalition for Alternatives in Nutrition and Healthcare (CANAH) may cease operations for lack of funding. According to an article in *Health Foods Business*, Catherine Frompovich, CANAH's founder and president, announced this together with her resignation at a regional health food industry convention. The group (mostly Frompovich herself) lobbied aggressively against fluoridation, food irradiation, and nutritionist licensing.

Oreo boycott. STAT (Stop Teenage Addiction to Tobacco) is mounting a boycott of Oreo cookies, Ritz crackers and other products marketed by RJR Nabisco. STAT believes that the company "is conducting a massive advertising and promotion campaign to encourage children and adolescents to become addicted to cigarettes. Many of RJR Nabisco's advertisements that target young people violate even the tobacco industry's own code of advertising ethics." Product lists and other information are available from STAT, 212 Lyman Street, Suite 210, Springfield, MA 01103. [Editor's note: I urge all food service personnel to join STAT's worthwhile effort!]

Raw milk verdict upheld. The California Court of Appeals has reinstated a verdict against the country's largest raw milk producer/distributor. In 1987, a jury awarded \$40,000 to the family of Paul B. Telford, finding that his death resulted from drinking Alta-Dena Certified Raw Milk. But the trial judge overturned the jury's verdict on grounds of "insufficient evidence." Although raw milk cannot be marketed across state lines, it is still produced and sold within California under the name "Stueve's Natural." The Alta-Dena name and pasteurized product line were sold by the Stueve family to a French company, so all "Alta-Dena" products are now pasteurized.

Depression and weight change. Albert J. Stunkard, M.D., and colleagues at the University of Pennsylvania have found that the direction of weight change tends to remain stable from one episode of severe depression to another. Among 53 patients undergoing two such episodes, 23 lost weight during both, 17 gained weight during both, and 5 showed no change. No relationship was found between the severity of the depression and the amount of weight gained or lost [Archives of General Psychiatry 47:857-860, 1990].

Dale Alexander dies. Dale Alexander, author of *Arthritis and Common Sense* and four similarly titled books about good health,

the common cold, healthy hair, and dry skin, died in June at the age of 70. His arthritis book advocated taking cod liver oil, mixed with orange juice, to "lubricate the tissues surrounding the joints." The first edition was published in 1951 and sold more than a million copies. A second edition was published in 1984.

FDA attacks food claims. The FDA has sent regulatory letters to six food companies, warning them to stop making health claims that are not backed by scientific evidence. Ralston Purina was ordered to stop claiming that eating *Oat Chex*, "may help reduce cholesterol levels." The letter to Ralston said that even if scientific evidence eventually supports a link between eating oat bran and reducing coronary heart disease risk, *Oat Chex* contains insufficient fiber to support its health claim. The other letters concerned *Toasted Oat Bran Shake* (J&J Snack Foods Corp.), *Rice Bran Oil* (Select Origins, Inc.), *Oatmeal Goodness Bread Wheat Oatmeal* (Continental Baking Co.), *Vita Fiber Rice Bran* (Pacific Rice Products, Inc.), and *Oat Bran Fruit Jumbo Cookies* (Health Valley Foods, Inc.).

Defunct magazines. Three magazines that promoted dubious health concepts have stopped publication: *Bestways*, *Medical Self-Care*, and Jeffrey Bland's *Medical Nutrition* (originally *Complementary Medicine*).

BOOK REVIEW

Title: Health Schemes, Scams, and Frauds (1990)

Authors: Stephen Barrett, M.D., and the editors of Consumer Reports Books

Publisher: Consumer Reports Books, New York

Price: \$13.95 softcover

Reviewed by: James Harvey Young, Ph.D.

Quackery has been a concern of Consumers Union for the more than the half century of its existence. In 1980 it compiled articles from *Consumer Reports* plus additional information on health deceptions into a most useful book. But, sadly, pseudoscience does not stand still. A decade later, the book required updating.

To manage this task, CU selected *Nutrition Forum's* editor, Stephen Barrett, M.D. *Forum* readers are well aware of his dedication to exposing falsehood and fraud and of his imaginative methods of undercover investigation. His information bank has contributed greatly to the crisply written pages of CU's revamped classic.

The book's 14 chapters flow from a historical overview through present problems and what our society should do about them. The allure and hazards of quackery are fully described, as are a wide range of dubious therapies for cancer, arthritis, and AIDS. The tactics used to sell unnecessary vitamins and worthless (usually illegally marketed) nutrient concoctions are revealed in detail. Fringe medical practices, including fanciful diagnoses of "hypoglycemia," "candidiasis hypersensitivity," and "total allergy syndrome," get their critical due. Orthomolecular therapy, chelation therapy and homeopathy are keenly analyzed. The scam is described in which dentists persuade patients to have their mercury-amalgam fillings replaced to ward off "mercury poisoning." Chiropractic, in its current setting, is

carefully examined, leading to the same judgment as in the book's first edition: "not recommended." A glossary of questionable methods and a detailed index round out the book.

The new edition urges regulatory agencies to increase the vigor and rigor of their enforcement endeavors with respect to deceitful and dangerous wares. In particular, the Food and Drug Administration is besought to resume an almost abandoned weapon: criminal prosecution of the quacks. CU believes, as do I, that the ripple effect of heavy fines and imprisonment could have significant deterrent impact.

The Dread Disease, James Patterson's study of popular American attitudes toward cancer, describes a century-long entrenched cancer counterculture which remains skeptical of scientific medicine. Its constituents include not only the ill-informed and the poor but members of the middle and upper classes whose decision-making abilities have become clouded with fear. In other fields as well as cancer, this counterculture provides fertile soil for the clever proselytizing of the quack.

Quackery has deep roots. Centuries ago, Phaedrus said: "Vulgus vult decipi" (the average person wants to be deceived). Centuries from now, observers may still echo this sentiment. Quackery may not be conquerable, but it deserves to be constantly attacked. *Health Schemes, Scams, and Frauds* is an important weapon for this purpose.

Dr. Young, who is emeritus professor of history at Emory University, is a social historian with special interest in the development of food and drug regulation in America. His books, *The Toadstool Millionaires* and *The Medical Messiahs*, trace the history of quackery in America and efforts to control it. *Health Schemes, Scams, and Frauds* is available for \$13.95 postpaid from LVCAHF, Inc., P.O. Box 1747, Allentown, PA 18105.

A VISIT TO NATURAL FOODS EXPO

Norra Tannenhaus

Practitioners of "alternative" health methods love to announce breakthroughs and miracle cures. However, if my visit to the March 1990 Natural Foods Expo West in Anaheim, California, was any indication, their products and interests have not changed very much during the past few years. Hypoglycemia, organic foods, enemas, mercury in dental fillings, alleged immune system hazards and boosters, and the dastardly deeds of "allopathic" physicians continue to preoccupy the industry. Many of the exhibitors served a turgid stew of half-truths, doctor-bashing, and back-to-nature fantasies.

"Them-versus-Us"

Natural Foods Expos are held twice a year, once on each coast, sponsored by New Hope Communications, publisher of *Natural Foods Merchandiser* (a trade magazine) and *Delicious!* (a consumer magazine) and *Organic Times*. In May, *Natural Foods Merchandiser* described the meeting as "a winning show," with about 12,000 visitors, 826 exhibit booths filled by 657 manufacturers, and 65 educational seminars. To me, however, the meeting's most striking feature was pervasive criticism of the medical profession. This approach was most apparent in the literature distributed, but I encountered it at exhibits and in seminars as well.

The most dangerous provider of advice was probably the Cancer Control Society, which distributed information in envelopes marked "ALTERNATIVE CANCER THERAPIES—NUTRITIONAL APPROACH—ALSO HELP FOR ARTHRITIS, DIABETES, MS, AND HEART DISEASE" in bright red letters. These packets included lists of "nutrition-minded doctors in the Los Angeles area," clinics providing "non-toxic therapies," and people offering testimonials for laetrile, Hoxsey therapy, natural foods, and other "alternative" methods. The society also sponsors \$75 bus tours of Tijuana clinics that offer treatment for cancer, arthritis, multiple sclerosis, and other "degenerative" diseases. A flyer states that for \$10 extra, nurses taking the tour earn 10 hours of continuing education credit recognized by the California Board of Registered Nursing.

Marketing Techniques

Another striking feature was the sophistication of the marketing techniques employed. Most of the stores and manufacturers avoided illegal claims themselves on their product labels, but almost invariably, literature extolling a product's virtues was available nearby. Twinlab, for example, displayed *Twinfast*, an 80-calorie meal offered in a large, inviting exhibit, as a "very-low-calorie weight-loss formula." Next to it were stacks of a book called *Prevent Cancer Now: Your Guide to Self-Protection*, by Michael Colgan. Two of its chapters were entitled "Low Calories Prevent Cancer" and "Overweight Causes Cancer."

Another company that has developed some savvy marketing techniques—probably because of past run-ins with the law—is Michael's Naturopathic Programs. According to a representative at the booth, retailers can suggest that their customers try what has worked for others in the past, but "We don't want to get into prescribing." Nevertheless, the company offers in-store teaching by a "Wholistic Lifestyle Consultant whose training includes Iridology and Reflexology," to coach retailers in topics such as "How each of Michael's programs work in the body" and "How to insure health improvement and create loyal customers." The brochure for a product called "Instant Energy" contained this message:

"For some consumers the desired effects may require a little additional time before being completely felt. This obviously is due either to slower metabolic rates in their bodies, to some kind of dietary hindrance, to a particular medicine they may be on, to a specific physiological dysfunction, or even to the time in which such product was consumed. The ages, sexual genders, and weights of consumers for whom the product does not work well also needs to be considered." In other words, it's your fault if it doesn't work.

Other manufacturers were less polished. PC Teas Co. promoted a vile-tasting tea called Lin Chi Toucha, a combination of ginseng and two other herbs. Said marketing manager Sunny Wong, "Eat anything you like, drink this tea after each meal, and it will lower your cholesterol by 20% after 1 month."

At Least the Food was Good

The exhibits promoted everything from blood builders to maple sugar candy. In fact, the industry seems to have made its greatest strides in food. Amidst the tofu and organic vegetables, I found a delicious candy bar called the President's Lunch because Ronald Reagan had once sampled it. The ingredients: oats, sunflower seeds, bee pollen, kelp, lecithin, honey, raisins, and peanut butter. There was also a First Lady's Lunch, with almonds and dates replacing the raisins and peanut butter. Tofu burgers also seem to have come a long way, if the ones I tried were representative. More than a hundred food companies had exhibits.

Seminars

Herbs and their properties are among the most enduring preoccupations of natural foods proponents. In a seminar on reducing stress, a panel of herbalists suggested that audience members do something "natural," like watching a sunset or hugging a tree. "To be whole against stress, you have to be whole in your life," one speaker warned. According to another, herbs function as "nervines" and "adaptogens." In the right combinations, these substances supposedly relax body and mind. Ginseng, a perennial favorite, seems to be maintaining its popularity. At yet another seminar, echinacea and astragalus

were described as "superstars" for strengthening the immune system.

Other advice was less innocuous, however. One speaker, Ed Alstat, N.D., R.P.H. (introduced as "Dr." Ed Alstat) instructed his listeners—many of whom appeared to be owners or employees of health food stores—on how to make differential diagnoses and tailor remedies to each customer. While noting that patients/customers (he used the terms interchangeably) should sometimes go to a physician or an emergency room, Alstat explained how to check hair for signs of thyroid deficiency and nails for possible "mineral imbalance." He also suggested examining customers' eyes and teeth for signs of "neural breakdown" and offering toothpaste, dental floss, and B₁₂ supplements as remedies. Members of the audience asked many questions and seemed genuinely interested in trying to help customers with a wide variety of health problems.

Shoddy treatment by doctors and the press were the subjects of another seminar entitled "Natural Foods and the Media." Gardiner Harris, editor of Jeffrey Bland's now-defunct magazine *Medical Nutrition*, declared that the use of supplements to prevent birth defects was a discovery more important than the Salk polio vaccine. He characterized the objections of "traditional" scientists as "silly," but didn't elaborate. [*Editor's note*: High levels of vitamin A supplementation during pregnancy can cause birth defects. RDA-level supplementation begun prior to conception is probably harmless. However, it has not been proven that, in women who are eating a nutritious diet, it is likely to benefit the developing fetus.] After expressing admiration for Bland and Adelle Davis, Harris alleged that one outspoken critic of the health food industry had been shown, on at least three occasions, to have falsified data to support his contention that supplements were harmful.

At the "Annual Industry Trends Update," a GNC executive said that during the next 5 years, his company planned to open 100 new stores per year and focus on such categories as weight loss, sports nutrition, fitness equipment, and workout apparel. The bulk of its advertising dollars will be used to

sponsor such events as marathons, nationally televised "Ms. Fitness America" competitions, and bodybuilding exhibitions, fashion shows, and bench press competitions in shopping malls. Other panelists suggested that increased public concern about the environment could be used by the health food industry to persuade people to improve their "internal environment."

Dubious Literature

Pamphlets, newspapers, brochures, and magazines reflected the general tone of the exposition. For example, the October/November issue of *Body and Soul*, a newspaper intended for distribution through health food stores, carried an article about colon-rectal cancer that recommended colonics because ordinary enemas are not enough. The author suggested that readers who could not find someone to administer the colonic should go to a health food store and read about colon cleansing (presumably to do it themselves). The procedure is necessary, the article said, because "it is important to keep your colon free of 'crusting, gooey, gluey material.'" Other articles in this and other issues touted chelation therapy for atherosclerosis and called *Ginkgo byloba* the "biggest buzzword in herbal products today."

Overall: Out of Step

Although the health food industry has become very sophisticated about marketing, it promotes many theories and practices that were discredited long ago. Thus, while medical science is advancing steadily, the "alternative health industry" seems to be standing still.

Ms. Tannenhaus, a freelance writer based in Los Angeles, is author of *Preconceptions: What You Can Do to Help Yourself Have A Healthy Baby* [Contemporary Books, 1988].

FTC BLASTS "STRESS VITAMIN" ADS

The Federal Trade Commission has secured a consent agreement forbidding Miles Inc., of Elkhart, Indiana, from making unsubstantiated claims for its One-A-Day brand multiple vitamins. According to the FTC Complaint, Miles' ads on radio and television had stated:

- "Strenuous exercise can actually knock essential minerals right out of your system. But One-A-Day vitamins are uniquely formulated to help put back what your world takes away."

- "The stress of daily living can take a lot out of you. . . . Your B vitamins, for example, are being chipped away by everyday problems and pressures. But One-A-Day puts them back. One-A-Day vitamins are uniquely formulated to put back what your stressful world takes away."

- Defending your lungs against air pollution requires vitamins A, E, and C. Daily stress can chip away at your B vitamins. And rigorous physical training can actually knock essential minerals right out of your system. That's why One-

A-Day vitamins are uniquely formulated to help put back what your world takes away. So eat a balanced diet and take One-A-Day, every day."

- The consent agreement forbids Miles to represent, directly or by implication, that any vitamin or mineral supplement:

- Affords any protection or benefit to human lungs.
- Is necessary or beneficial in replacing any vitamin and/or mineral lost through physical exercise.
- Is necessary or beneficial in replacing any vitamins and/or minerals lost as a result of, or provides any benefit with regard to, the stress of daily living.

Miles also is barred from making any other unsubstantiated claim for any of its products. After the Commission issues a final order, any violation can trigger a civil penalty of up to \$10,000 per day. This case is highly significant because it involves a large corporation and is the first federal case to strike at the heart of fraudulent "stress vitamin" claims.

THE LEGACIES OF EDGAR CAYCE

Jack Raso, M.S., R.D.

Edgar Cayce (1877–1945), dubbed the “Sleeping Prophet” by biographer Jess Stearn, was born in Christian County, Kentucky. He was a precursor of “New Age” trance channeling, giving well over 14,000 “psychic readings” between 1910 and his death. A poorly educated photographer and Sunday school teacher with no medical training whatsoever, Cayce gained nationwide renown for diagnosing illnesses and prescribing dietary remedies while in a self-induced hypnotic state. His current promoters claim:

He could see into the future and the past . . . describe present far-off events as they were happening; and . . . astound doctors with his x-ray vision of the human body. His readings—his words while in this state—were carefully transcribed while they were spoken. He is undoubtedly the most documented psychic who ever lived. And the accuracy of his predictions has been put at well over 90%! At his death, he left a legacy of thousands of case histories that science is still at a loss to explain completely.

Cayce reportedly preferred the appellation “psychic diagnostician” to “healer.” His “revelations” were allegedly derived from our “collective consciousness” rather than from particular spirits.

The *New Age Encyclopedia* states that Cayce’s career as a clairvoyant was launched at age 23 after a hypnotic session in which he diagnosed and prescribed a cure for his own persistent case of laryngitis. As news of the healing spread, people sought his help. Cayce would enter a trance and offer guidance to someone present or who had mailed a request for service. His “readings” answered questions about health conditions, astrology, and supposed previous incarnations. In *The Outer Limits of Edgar Cayce’s Power* (1971), Cayce’s sons stated that the readings comprise over 50,000 single-spaced typewritten pages and more than 10 million words. The Edgar Cayce Foundation was formed to preserve them.

In *Edgar Cayce on Diet and Health* (1969), Hugh Lynn Cayce (1907–1982) wrote of his father:

At the age of six or seven he told his parents that he was able to see and talk to “visions,” sometimes of relatives who had recently died. His parents attrib-

uted this to the overactive imagination of a lonely child who had been influenced by the dramatic language of the revival meetings which were popular in that section of the country.

Cayce’s health-related pronouncements also may have reflected his early association with Wesley Ketchum, a homeopathic physician. As for his predictions, the failure of Atlantis to resurface in the late 1960s is but one of a score of not-so-near misses. In 1941, Cayce predicted that land would appear in both the Atlantic and the Pacific within a few years, that most of New York City would disappear within another generation, and that the southern portions of Carolina and Georgia would disappear even sooner.

A.R.E.’s Enterprises

In 1931, Hugh Lynn Cayce helped found the Association for Research and Enlightenment (A.R.E.). In 1976, he became board chairman while its presidency was assumed by his son Charles Thomas Cayce, Ph.D., whose degree is in child psychology.

A.R.E. functions as an eclectic “New Age” nerve center, from which emanates a steady flow of seminars and publications. Its headquarters, a modern three-story building in Virginia Beach, Virginia, contains a visitor/conference center, a library, and the A.R.E. Bookstore. Its 1988 gross income was \$7.8 million, including \$2.2 million for membership dues and \$2.4 million for educational materials.

A.R.E. membership costs \$30 per year, but 9-month “introductory memberships” cost \$15 or \$20. Members receive the bimonthly magazine *Venture Inward*; may borrow books from the A.R.E. Library, join a study group, and attend or send their children to A.R.E.’s summer camp in the Appalachian foothills; and are entitled to discounts on A.R.E. conferences and referrals to over 400 practitioners who use the Cayce approach. Members also are invited to participate in “home research projects,” in which they carry out some psychic activity and report the results. The study groups concern themselves with such things as diet, the laws of reincarnation (“karma”), metaphysical dream interpretation, and the spiritual legacies of ancient Egypt and Atlantis.

A.R.E. mailings to prospective members state: "There is no human problem for which the Cayce predictions do not offer hope." A.R.E. "research reports" based on Cayce readings are available on 15 health-related topics ranging from scarremoval, moles, and warts to arthritis, diabetes, and multiple sclerosis.

Many of Cayce's remedies are sold through the mail by Home Health Products, Inc., which specializes in "natural products for a holistic approach to health care." Its own products include skin conditioners, laxatives, and a few supplements, but its catalog also includes supplements made by other companies. These include *Cata-Rx* ("a safe nonprescription formula that counteracts nutritional deficiencies associated with age-related cataracts"); *Prostate Plus* (suggested as an alternative to surgery); *Livcleanse* ("help for toxic overload"); *Kidney Flush* (to "help flush away urinary infections"); *Thyro-Vital* (to improve thyroid function); and *His Ease* (to increase sexual virility). According to the company's brochure, "In addition to changes in diet, Edgar Cayce frequently recommended specific remedies and treatments. Many of these had to be custom-formulated from herbs, oils, and other naturally occurring substances."

The A.R.E. Bookstore, which also sells by mail, features many books by or about Cayce, including the 24-volume "library series" of excerpts from his readings (usual price \$395). It also carries a large selection of books and tapes on psychic and metaphysical topics, including dream interpretation, reincarnation, tarot, I Ching, and pyramid power. Its health-related books deal mainly with dubious nutritional methods and other unscientific approaches. One book—*Third Opinion*, by John Fink—is a directory of "alternative" cancer centers.

Another item sold by the bookstore is the *Physician's Reference Notebook*, by William A. McGarey, M.D., and several colleagues, which contains commentaries on over 50 ailments. Several years ago, an A.R.E. mailing to chiropractors stated:

This book is a "magic tool" to be used in conjunction with your professional skill and knowledge in healing some of your more difficult cases. One of our colleagues, using the information in our commentaries, has cured dozens of psoriasis cases. . . . Even some of the neurological degenerative conditions, such as M.S., A.L.S., or even . . . (foot drop), have responded exceptionally well to these recommendations.

The A. R. E. Clinic

In 1970, William McGarey and his physician-wife Gladys founded the A.R.E. Clinic in Phoenix, Arizona. According to an article in *Medical World News*, they opened this facility to offer "comprehensive care to patients seeking holistic medical alternatives." In an interview in *Health Talks* (1989), McGarey said that the clinic had a staff of 45 or 50 persons, including five physicians (one an osteopath), a chiropractor, and a psychologist with a doctoral degree.

In the book, he denies any conflict or contradiction between his Cayce-based practices and his medical education. "The philosophy behind the A.R.E. clinic," he says, "is that everyone is a whole human being . . . created in the image of God." According to McGarey, the clinic consists of a general practice, a "brain injury center," and an "energy medicine

center that looks at the biomagnetic energies of the body." Among other things, the clinic offers "electromagnetic field therapy," "relaxation training," and "the laying on of hands." The clinic also offers the Temple Beautiful Program, a 11-day "rejuvenation program" that includes dream analysis, stress reduction, visualization, biofeedback, exercise, nutrition, and supplementation. During the previous 10 years, McGarey reported, 160 to 170 such programs were conducted with 10 to 18 attendees at most of them. It now costs \$4,100.

McGarey lamented that "When doctors fail to recognize the spiritual aspect of the human being, they miss the most important part." When one recognizes our destiny as "getting back to our spiritual origin," he said, "there is a different kind of emphasis on healing; you do not get tied up with modalities. Healing is more of a spiritual event." McGarey also noted, "When you treat someone, we cannot consider ourselves as the healer. We are only the . . . channel of the Great Healer."

"Most any kind of condition," McGarey stated, "is not as significant as the cause and what we can do to direct the body back to normal." He further stated that "Any time you are disturbing what is normal, you are creating disease." In the *Edgar Cayce Remedies* (1983), he advocated potato poultices to the eyes (for cataracts), monthly "high-colonic" enemas for angina pectoris, and castor oil packs for epilepsy and cat bites.

A Recent Conference

Each year, A.R.E. holds dozens of conferences in Virginia Beach and various other cities. Many deal with "awakening" psychic powers, but some deal with astrology ("the key to self-discovery") and such mundane topics as weight control and "managing your financial resources holistically."

On September 8, 1990 I attended an A.R.E. "Special Event" entitled "Wellness: The Cayce Approach to Health and Healing," held in the cafeteria of the Baptist-denomination Riverside Church in Manhattan, near Columbia University. "Tuition" at the door was \$89. I estimate that 300 people attended, most of them white and apparently over 30. Books for sale covered two tables near the cafeteria entrance. I was

accompanied by a social worker from India with a master's degree in theology, who likened the situation to a retreat.

The opening remarks were made by Charles Thomas Cayce, who asked us to rate the applicability of 25 items on a "health inventory" included in a scanty information packet. The items included: "I have a sense of well being," "I do not depend on medicines, including prescription drugs, to maintain my health," "Silence is enjoyable," and "I have a personal definition of God which has meaning to me." He told us to take a few minutes to discuss one negative response with someone nearby.

Dr. Cayce said the conference would take "a closer look at alternative explanations for illness [and] alternative approaches to wellness." He stated that over two thirds of the "readings" given by his grandfather concerned illnesses and their cure, and that another large portion dealt with general aspects of healing such as "emotional imbalance" and "at-tunement of the body and the mind to the spiritual aspect of ourselves." He said that in the Cayce readings, the term "spirit" is used interchangeably with the terms "God," "creative forces," and "life force," and that one force, God, can be used in "good ways or bad ways that we label evil." He then spoke of the "universal Christ-consciousness . . . an awareness within each soul imprinting its pattern on the mind, waiting to be awakened by the will, of our oneness with God."

"The premise here," he explained, "is that the mind is more than brain, cortex, blood, cells." He defined healing as "the process of awakening that God-pattern within," and quoted a phrase common in the Cayce readings: "Spirit is the life, mind is the builder, the physical is the result." He stated that with every thought we have, we are building patterns, or "thought-forms," that "create a mental body, an energy body . . . a nonphysical body manifesting as colors and images depending on how it's perceived by people with various sorts of sensitivities."

Dr. Cayce introduced the first speaker, Eric Mein, M.D., a former "Fellow-in-Residence" at the Edgar Cayce Foundation who was finishing his medical residency at the University of Washington in Seattle. Dr. Mein led us in breathing and stretching exercises while the slide projector and screen were being readied. Then he wondered aloud why it is "un-heard-of" for the "spirit-body connection" to be discussed in conventional medical circles. Later he referred to the many temples of Aesculapius, the ancient Greek god of healing, as "holistic centers." He suggested that everything affects the immune system but dismissed the details of a pivotal slide on the subject as "gibberish."

The next speaker was Gladys McGarey, M.D., who, in addition to her role of co-director of the A.R.E. Clinic, has been president of the American Holistic Medical Association. Her topic was "The Healing Energy of Pain." After describing her dog as "a real pain," but still her friend, she stated that pain is "our friend" also. This is so, she explained, because pain awakens within us "the awareness that we're alive. If you don't feel pain . . . you're dead." Her idea of pain, she said, comprises not only physical pain, but "mental pain" such as the pain of confusion, "the pain of forgetting," as in Alzheimer's disease, and the "pain that comes from remembering."

Dr. McGarey recounted the story of a mother whose baby was hospitalized and near death from a large cyst on her right lung. "It didn't look like the baby was going to make it through the night. We called our study group and had the . . . group begin to pray for [them]." The mother "got up to go to the

hospital. but as she walked past her bed, she laid on the bed and she fell asleep. About a half an hour later she woke up just throwing up this huge amount of mucus . . . but again she fell back asleep and she didn't wake up until morning," at which time she called the hospital and was told her baby was "doing much better." The next morning an x-ray revealed that the lung was clear. "You see," said McGarey, "what had happened was that the mother took on her baby's condition and she threw up a whole lot of mucus that cleared the situation for the baby."

Of another patient, who had "severe" lung cancer and was understandably very angry and miserable, she said, "It was his anger, actually, that had probably precipitated the cancer." He died two months later, but McGarey judged that massage and other "alternative" therapies had been successful because the patient had "died in a completely connected state." McGarey also expressed belief in reincarnation, "past-life regression," and "the chakra system," which she equated with the endocrine system.

Drs. Mein and McGarey were joined by Roger Jahnke, C.A., O.M.D., for a panel discussion and question-and-answer session moderated by Dr. Cayce. Jahnke said that as a premed student he had worked in various hospital departments, including dietary, but had "never found in the hospital what I felt . . . true healing was all about. So I dropped out basically . . . and I became an English major and started writing poetry." In the literature of aboriginal cultures, he found that "the spiritual tradition and the medicine are one." Now he teaches at the unaccredited Santa Barbara College of Oriental Medicine. The initials after his name stand for "Certified Acupuncturist" and "Doctor of Oriental Medicine."

In response to a question, Dr. Mein stated that chronic fatigue syndrome is often the result of "impaired eliminations" or "toxic buildup" and suggested "the apple diet or mono [single food] diet." Dr. Jahnke recommended tai chi, a Chinese martial art comprising ballet-like exercises.

Near the discussion's end, Cayce asked the panelists: "When you consider causes for a physical problem, do you include past-life influences?" Dr. Mein replied "sometimes" and Dr. McGarey said yes.

Before breaking for lunch, we were referred to brochures describing local A.R.E. activities and to the catalog of Atlantic University, an unaccredited institution in Virginia Beach that offers a master's degree in "Transpersonal Studies," the philosophies of the Edgar Cayce tradition.

After lunch, Jahnke instructed us in acupressure, "personal reflexology" and "freestyle" tai chi. "After you get into this . . . new health care revolution," he said, "if you get confused about what to do . . . go to the Chinese literature, or go to the Ayurvedic Hindu-Buddhist literature, or go to the Native American literature, or go to the Polynesian literature. Go to any . . . health literature of any [aboriginal] culture."

Jahnke emphasized that his "self-applied health-enhancement methods" could be learned in a few minutes and "can't be forgotten because [they] are so deep within . . . your cellular nature. . . . These ideas are in you, and they've been covered over with . . . an unfortunate misunderstanding." He then took about 45 minutes to give us a sketchy idea of the methods.

"We've paid too much for health care," Jahnke lamented. "Somebody was complaining earlier: All the good stuff Medicare doesn't pay for."

After teaching "alternate nostril breathing," he mar-

velled aloud that Edgar Cayce—who had traveled very little—had known about it: “It just really was one of the first things that blew my mind. I mean, there he was in Hopkinsville, Kentucky, and maybe the circus came to town, and maybe there was a Buddhist monk in the side show but maybe not.”

A woman in the audience asked what it meant to have “very extra-long ear lobes.” Jahnke replied that if she had such ear lobes, she “may be a relative of the Buddha.” In response to the laughter, he assured us he wasn’t joking. With regard to herbal tonics, he said, “Be sure you know what you’re taking—and then go ahead because the herbs are good.” Although “we love all this esoteric stuff,” he said, the salient message of the day is that healing takes an investment of time and that we should not interfere with healing by taking too many medicines.

Later Jahnke told us to pinch our fingers to discover tenderness at acupuncture points. A woman reported some in her pinky, which Jahnke said was the channel for the heart and the small intestine. “Eat good,” he advised her. “Don’t forget to love yourself . . . [and] get a little exercise.” When he informed us that acupuncture points lie throughout the palm of the hand and told us to “find a sore spot,” my companion aptly noted, “When you push it real hard, you get sore all over.”

A question from the audience prompted Jahnke’s return to the subject of herbs, which he described as “super-nutrients because our food is kind of in trouble,” even in health food stores. Vitamin supplements, he said, “are a little difficult because they’re nutrients that are extracted from their source. . . . n herbal medicine . . . you’re deriving the full nutritional benefit, especially if the herbs are concentrated in a very special way.” But he was evasive when asked to give an example of a tonic herb, calling the question “inappropriate” and repeating his recommendation that interested persons sign a sheet at the information table.

During the last break, a woman hurriedly handed me a business card advertising a Reverend Jean’s channeling classes.

The final presentation covered Cayce home remedies, a collection of 16 methods detailed in a videotape covered by the cost of admission. They include: castor oil packs (“to help with arthritis, colds, gallstones, ulcers and more”); peanut oil massages (“to prevent arthritis”); potato poultices (“to relieve tired or strained eyes”); castor oil liniments (“to remove warts”); and coffee ground foot baths (“to soothe sore feet and improve circulation in the legs”).

Diet Basics

“New Age” popularizer Hans Holzer, Ph.D., has called Cayce the “greatest of all dietetic healers.” In *Beyond Medicine* (1987), Holzer writes: “Edgar Cayce abundantly made clear in his writings [that] certain combinations of foodstuffs are chemically incompatible in the human system [and] can create damage or at the very least ill health.” For example, coffee should be taken black or with hot milk, but not with cold milk. And tea with sugar, especially white sugar, is hepatotoxic; tea with honey is not.

According to an A.R.E. chart: (1) 80% of one’s daily food intake should consist of fruits and fruit juices, vegetables, water, and herbal teas; (2) 20% should consist of dairy products including whole milk and butter, whole-grain breads, high-fiber cereals including granola, honey, soups, fowl, lamb, and fish; (3) desserts such as ice cream, beef, brown rice, oils, potatoes with skin, spices, gelatin products, cheese, and eggs should be

consumed about three times weekly; and (4) fried foods, alcohol, pasta, white bread, pork (except crisp bacon occasionally), and “processed foods” are to be avoided.

The “readings” in *Edgar Cayce on Diet and Health* include the following tidbits:

Canned tomatoes are usually preferable to fresh.

Gelatin facilitates glandular activity.

Certified raw milk is to be preferred, except from cows that eat certain types of weeds or grass growing in January.

Raw green peppers should not be eaten alone.

Citrus fruits and cereals should not be eaten together. Have a percentage of 80% alkaline-producing to 20% acid-producing foods in the diet.

Don’t combine white bread, potatoes, spaghetti, or any two foods of such natures, in the same meal.

Ice cream is far preferable to pie, which combines starches and sweets.

Orange juice and milk should be consumed separately at opposite ends of the day.

It is preferable to consume meats with sweets than with starches.

Citrus juice or tomato juice should not be consumed with any starch other than whole wheat bread.

Lime juice should ideally be added to orange juice, and lemon juice to grapefruit juice (an idea, the authors admitted, “probably new to those working in the science of modern dietetics and food research”).

It is “normal” to consume above-ground and below-ground vegetables in a ratio of three to one.

Squirrel should be stewed or well cooked.

Cheese and cream are good for the system.

Beet and “raw” cane sugars are the best for everyone.

The book’s foreword stresses that all the readings it contains pertain to “normal” healthy people who are not overweight.

Critical Comments

In *Health and Healing: Understanding Conventional and Alternative Medicine* (1983), ethnopharmacologist Andrew Weil, M.D., a “natural medicine” sympathizer, says of the Cayce readings:

Much of this material sounds like hogwash. I, for one, do not expect California to fall into the sea by 1998, creating a new coast near Phoenix, Arizona. I find many of Cayce’s metabolic and hormonal explanations of specific diseases to be garbled and fanciful, such as his assertion that multiple sclerosis is an imbalance of the endocrine glands due to deficiency of gold.

I certainly agree. As far as I know, no study has determined the extent to which Cayce advocates follow his advice or what impact it has on their lives. Nor has it been determined whether they seek appropriate medical help when it is needed. If such studies could be done, what do you think they would find?

Mr. Raso is Assistant Chief Dietitian at Wyckoff Heights Medical Center in Brooklyn, New York.

DIETARY GUIDELINES REVISED

The third (1990) edition of *Nutrition and Your Health: Dietary Guidelines for Americans* has been published. The document presents dietary advice for healthy Americans and constitutes the central statement of federal nutrition policy. Issued jointly by the U.S. Departments of Agriculture and Health and Human Services, the guidelines were released originally in 1980 and updated in 1985. The two Departments distributed more than five million copies of the 1985 edition, and millions more were printed and distributed by others.

The new edition is based on recommendations of a nine-member advisory committee: Malden C. Nesheim, Ph.D. (chairman); Lewis A. Barnes, M.D.; Peggy R. Borum, Ph.D.; C. Wayne Callaway, M.D.; John C. LaRosa, M.D.; Charles S. Lieber, M.D.; John A. Milner, Ph.D.; Rebecca M. Mullis, Ph.D.; and Barbara O. Schneeman, Ph.D. This committee and departmental reviewers concluded that the central messages of the 1985 guidelines remain sound and of major importance in choosing food for a healthful diet. The new edition is more specific and quantitative than previous versions, and is written in a more positive tone. The changes reflect new scientific evidence on the relationships between diet and health, information on the usefulness of the earlier editions, and formal comments from individuals and groups outside the government.

Seven Guidelines

The new report states that food alone cannot make people healthy. Smoking, alcohol abuse, other lifestyle factors, and heredity are also important. The American food supply is varied, plentiful, and safe to eat. But many Americans eat diets with too many calories, too much fat (especially saturated fat), cholesterol and sodium, and low in complex carbohydrates and fiber. The revised guidelines are:

- *Eat a variety of foods.* To assure variety and a well-balanced diet, choose foods each day from five major food groups: vegetables (3–5 servings); fruits (2–4 servings); breads, cereals, rice, and pasta (6–11 servings); milk, yogurt, and cheese (2–3 servings); and meats, poultry, fish, eggs, and

dry beans and peas (2–3 servings). Vitamin or mineral supplements at or below the RDAs are safe, but are rarely needed except by women who are menstruating, pregnant, or breast-feeding. Many women and adolescent girls need to eat more calcium, and children, teenage girls, and women of childbearing age should take care to consume enough iron-rich foods.

- *Maintain healthy weight.* Obesity is associated with many serious illnesses. Being too thin is linked to osteoporosis in women and early death in both men and women. The guidelines recommend ranges of weights for adults ages 19 to 34 and higher ranges for those 35 and over. Waist measure should be smaller than hip measure. For those who are overweight, the recommended loss of 1/2 to 1 pound a week should be accomplished by increasing physical activity and eating less fat and fatty foods, more fruits, vegetables, and cereals, less sugar and other sweets, and little or no alcohol.

- *Choose a diet low in fat, saturated fat, and cholesterol.* This advice is tied to the goal of maintaining blood cholesterol level below 200 mg/dl. It recommends a fat intake of 30% or less of calories, with less than 10% of calories as saturated fat. Have your blood cholesterol level checked. If it is within a desirable range, help keep it that way with a diet low in saturated fat and cholesterol. If it is high, follow the doctor's advice about diet and medication.

- *Choose a diet with plenty of vegetables, fruits, and grain products.* This guideline recommends that adults eat at least three servings of vegetables and two servings of fruit daily. It also recommends at least six servings of grain products, with an emphasis on whole grains. Because foods differ in the kinds of fiber they contain, it is best to include a variety of fiber-rich foods. Fiber should be obtained from foods, not supplements.

- *Use sugars only in moderation.* The major health concern with excess sugar consumption is tooth decay. The risk does not depend simply on the amount of sugar consumed but on the frequency of consumption of sugars and starches and how long they remain in contact with the teeth. Eating such foods as frequent between-meal snacks may be more harmful to teeth than having them at meals. Teeth should be brushed (with a fluoride toothpaste) and flossed regularly. Fluoridated water or

COMPARISON OF 1985 AND 1990 DIETARY GUIDELINES

1985	1990	Reason for Change
Eat a variety of foods	Eat a variety of foods	(No change)
Maintain desirable weight	Maintain healthy weight	Focus on total diet in more positive way
Avoid too much fat, saturated fat, and cholesterol	Choose a diet low in fat, saturated fat, and cholesterol	New interim health-based weight criteria
Eat foods with adequate starch and fiber	Choose a diet with plenty of vegetables, fruits, and grain products	Focus on foods, rather than food component, in total diet
Avoid too much sugar	Use sugars only in moderation	Focus on targeted food in a more positive way
Avoid too much sodium	Use salt and sodium in moderation	Focus on both in more positive way
If you drink alcoholic beverages, do so in moderation	If you drink alcoholic beverages, do so in moderation	(No change)

another fluoride source is especially important for children while their teeth are forming.

- *Use salt and sodium in moderation.* Noting that high sodium intake can be a factor in high blood pressure, the guidelines suggest that sodium intake be moderated. This can be accomplished by learning to enjoy the flavors of unsalted foods; adding little or no salt during cooking or at the table; flavoring foods with herbs, spices, or lemon juice; and limiting intake of foods that are obviously salty or contain significant amounts of hidden salt. A blood pressure check is also recommended.

- *If you drink alcoholic beverages, do so in moderation.* Alcoholic beverages supply calories but few or no nutrients. Drinking them has no proven health benefit and is linked with many health problems, is the cause of many accidents, and can lead to addiction. Since birth defects have been attributed to drinking during pregnancy, women who are pregnant or trying to conceive are advised to abstain completely from alcohol. People planning to drive a car or engage in another activity that requires attention or skill are also advised to abstain.

In October 1990, Congress enacted the National Nutritional Monitoring and Related Research Act of 1990 (Public Law 101-445), a bill intended to ensure more complete information while reducing duplication of efforts among government agencies studying the eating habits of Americans. The bill calls for

the establishment of a National Nutrition Monitoring Advisory Council and an Interagency Board for Nutrition Monitoring and Related Research. It also states that *Dietary Guidelines for Americans* will be updated and published every five years.

Copies Available

Single copies of *Nutrition and Your Health: Dietary Guidelines for Americans* (HG 232) are available free from the Consumer Information Center, Department 514-X, Pueblo, CO 81009; at county extension offices; or through DHHS, ODPHP, National Health Information Center, P.O. Box 1133, Washington, D.C. 20013.

The report of the Dietary Guidelines Advisory Committee was published in May 1990. It contains the committee's recommendations, the rationale for proposed changes, and an overview of public comments to the committee. Free copies are available from the Human Nutrition Information Service, USDA, Room 325A, Federal Building, Hyattsville, MD 20782.

Detailed suggestions for implementing the guidelines are included in *Dietary Guidelines and Your Diet*, publication 001-000-04467-2 (1986), available for \$4.50 from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

BOOK REVIEW

Title: Dubious Cancer Treatment—A Report on "Alternative" Methods and the Practitioners and Patients Who Use Them (1991)

Editors: Stephen Barrett, M.D., and Barrie R. Cassileth, Ph.D.
Publisher: American Cancer Society, Florida Division, Inc., Tampa, Florida

Price: \$10.00 (softcover)

Reviewed by: Manfred Kroger, Ph.D.

Scientifically based cancer treatment is visible and measurable. Its methods are sanctioned and supported by the public as well as by medical institutions. But dubious methods (those lacking a scientific basis) operate in the shadows. Their promoters rarely, if ever, collect meaningful data on their results. Investigations by outsiders are sparse and done mainly by a handful of devoted "quackbusters." The national office of the American Cancer Society collects data and issues position papers on "unproven methods," but it has shied away from publishing them as a unit.

Dubious Cancer Treatment is the first book of its kind to bring together prominent experts on cancer quackery. It evolved from a seminar sponsored by the society's Florida division, with all material updated under the editors' guidance. Each participant has particular insights into the subject.

Gary K. Lyman, M.D., an oncologist in Florida, compares proven and dubious treatments. William T. Jarvis, Ph.D., president of the National Council Against Health Fraud, provides useful definitions, delineates how quackery is promoted, and spells out how it can harm. Victor Herbert, M.D., J.D., a prolific nutrition researcher and lawyer, briefly deals with

ethical considerations. Co-editor Barrie R. Cassileth, Ph.D., a researcher on social aspects of cancer, has a chapter on historical trends and patient characteristics. Psychiatrist Jimmie C. Holland, M.D., a leading scholar on cancer and emotions, analyzes why patients choose dubious treatment. Benjamin R. Wilson, M.D., an Oregon surgeon, spotlights dubious degrees and spurious science on a quack-by-quack basis. James A. Lowell, Ph.D., who has visited the notorious Mexican cancer clinics many times, describes his unique findings. Surgeon Joseph J. Zaveritnik, M.D., analyzes "immuno-augmentative therapy," while pathologist Edward R. Friedlander, M.D., critiques mental imagery. Edward T. Creagan, M.D., a leading Mayo Clinic researcher, reports on three Mayo studies of vitamin C and cancer. Grace P. Monaco, J.D., a specialist in health law, deals with legal and insurance issues. James Randi, widely known as a "magician" and investigator of occult and supernatural claims, appeals for more antiquackery action. And Helen G. Brown, a community educator from the University of California, Los Angeles, challenges patients to approach cancer rationally.

This slender monograph is terribly important for professionals as well as for patients. The Florida Division of the American Cancer Society deserves congratulations for its courage and persistence in coordinating this project.

Dr. Kroger is professor of food science at The Pennsylvania State University and associate editor of the *Journal of Food Science*. The book is not available through bookstores but can be ordered for \$10 postpaid from LVCAHF Inc., P.O. Box 1747, Allentown, PA 18105.

MY QUICK TOUR OF WHOLE LIFE EXPO

Stephen Barrett, M.D.

Ads for Whole Life Expo describe it as "the world's largest exposition for health, fitness and awareness of the body, mind and spirit." The ads promised over 200 speakers and 300 exhibits at locations in New York City (October 26-28, 1990) and Los Angeles (February 15-18, 1991). At the New York event, some 120 exhibitors promoted a wide array of products, procedures and philosophies for dealing with life's problems. The products included self-help books and videos, subliminal tapes, crystals and other "new age" jewelry, special lights, supplement products, herbal remedies, and all sorts of gadgets to relieve stress. Hands-on treatment was offered by many types of "holistic" and occult practitioners. Animal rights and environmental groups were also represented. During my 3-hour tour of the exhibits, I acquired an armful of brochures and observed the following:

- An exhibitor for a blue-green alga (spirulina) product said it was "the best source of B₁₂ on the planet," was effective against cancer, Alzheimer's disease, and worked by "sucking out the toxins from the body."

- A gentleman hawking a red "phototherapy" light said that the aorta was so close to the surface that holding the light near the body for 20 minutes would enable it to benefit all of the body's blood cells.

- A company selling aloe products displayed a sign that said "Aloe is to an AIDS patient as insulin is to a diabetic." Other signs suggested that aloe "settles nerves," "stimulates cell growth," and is useful against arthritis, AIDS, yeast infections, ulcers, intestinal disorders, high blood pressure, skin problems, and chemotherapy.

- Occult modalities included "psychic astrology" (\$20 for 15 minutes), "aura" photographs and readings (\$10), "past-life regression" pyramidal gadgets, and "energy balancers."

- At one exhibit, reflexologists claimed that foot massage can reduce stress, cleanse the body of toxins, increase

circulation, assist in weight loss, and improve the health of organs throughout the body. Six practitioners, whose services were available for modest fees, were kept busy massaging people's feet throughout the time I toured the exhibit hall.

- A chiropractor who examined my spine expressed amazement that I didn't suffer from back pain and urged me to visit his office for preventive treatment.

- After completing a brief questionnaire to determine my "body type," I was informed by a Maharishi Ayur-Veda exhibitor that my "doshas" were imbalanced and offered to sell me a tea to correct this. When I indicated that my health was good, he replied that achieving balance through Ayurvedic measures would prevent future trouble.

- Several companies offered juice made from "green foods." One salesman said that the B-vitamins in his product would provide a "burst of energy." I tried one, which tasted like grass.

- More than a dozen exhibitors represented multilevel companies that market nutritional or herbal products. The most noteworthy were Omnitrition International, which was formed to market products formulated by Durk Pearson and Sandy Shaw (authors of *Life Extension*), and Showcase International, a Rexall subsidiary. Showcase plans to market homeopathic remedies, a "health tonic, high in natural nutrients," and guar gum/nutrient drinks and high-fiber brownies claimed to help control weight and cholesterol levels. I also had the opportunity to sample *Km*, an herbal product claimed by various distributors to do just about everything. I have never tasted anything worse.

Dr. Barrett, a practicing psychiatrist and consumer advocate, is a board member of the National Council Against Health Fraud. In 1984 he received the FDA Commissioner's Special Citation Award for Public Service in fighting Nutrition Quackery.

BRIEFS

CANAH dissolved. The Coalition for Alternatives in Nutrition and Healthcare ceased operations on October 31, 1990, due to lack of funding. It was launched in 1984 with the primary goal of seeking a "healthcare rights amendment" that would forbid Congress from restricting "any individual's right to choose and to practice the type of healthcare they shall elect for themselves or their children." Shortly before its dissolution, it presented a petition with nearly 100,000 signatures to an official of the U.S. Department of Health and Human Services.

French Parliament limits alcohol and tobacco ads. In 1993, tobacco advertising will be banned in France and alcohol advertising will be limited to late-night radio. The U.S. Leadership Council on Advertising has estimated that similar bans in this country would eliminate as many as 249 magazines that depend on the revenue from such ads.

Report criticizes "organically grown foods." The Institute of Food Technologists has issued an excellent report debunking the mythology of "organic" foods. Copies are available for \$1.00 from the Institute of Food Technologists, 221 N. LaSalle St., Chicago, IL 60601.

More One-A-Day enforcement actions. Miles Laboratories has signed a 3-year "assurance of discontinuance" order with the attorneys general of New York, California, and Texas and agreed to pay \$10,000 to each of these three states. Without admitting wrongdoing, Miles pledged not to claim that: 1) the average consumer needs a supplement to prevent mineral and vitamin loss; 2) vitamins can prevent or reverse lung damage caused by pollution; 3) routine daily stress depletes vitamins; or 4) routine physical exercise such as the aerobics shown in Miles' television ad depletes essential minerals.

New MR FIT findings. The Multiple Risk Factor Intervention Trial, funded by the National Institutes of Health, was designed to see whether an intensive educational program could lower the death rate for heart disease. The study involved more than 12,000 middle-aged men whose levels of cigarette smoking, blood cholesterol, blood pressure, or a combination of these factors, placed them at high risk for heart disease. After careful evaluation, the men were randomly assigned either to a special intervention (SI) program or to their usual sources of health care (UC). The program ended after participants had been followed for more than 6 years. At that time, the researchers were surprised to find no overall difference in death rates between the two groups [JAMA 248:1465-1477, 1982]. However, after 4 additional years, the SI group had experienced fewer heart attacks and had a lower overall death rate [JAMA 263:1795-1801, 1990]. Both groups were smoking less and had lower blood cholesterol levels, but the improvement was greater in the SI group:

	Baseline		10-year follow-up	
	SI	UC	SI	UC
Cigarette smoking	63%	63%	48%	34%
Blood cholesterol	240	240	233	228

Reprints can be obtained from Marcus O. Kjelsberg, Ph.D., Coordinating Centers for Biometric Research, School of Public Health, University of Minnesota, Room 200, 2221 University Avenue, S.E., Minneapolis, MN 55414.

BST booklet. The American Council on Science and Health has published a position paper strongly supporting the use of bovine somatotropin (BST) to increase the amount of milk cows can produce. Copies are available for \$3.85 from ACSH, 1995 Broadway, 16th Floor, New York, NY 10023.

Fluoridation booklet. The American Council on Science and Health has published a position paper supporting fluoridation of public water supplies. Copies are available for \$3.85 from ACSH, 1995 Broadway, 16th Floor, New York, NY 10023.

Suit filed over Alar scare. Apple growers are seeking damages from CBS-TV's *60 Minutes* and the Natural Resources Defense Fund for sales lost during a scare over the growth chemical Alar. The industry estimates that growers lost more than \$100 million after the program, "Intolerable Risk: Pesti-

cides in Our Children's Food," was broadcast in February 1989. A few months later, Alar's manufacturer stopped selling it.

Notable quote. "We live in a society exquisitely dependent on science, and most of the people know nothing about science. That is a prescription for disaster . . . Science is a way of thinking much more than it is a body of knowledge."—Carl Sagan, Ph.D. [JAMA 261:2169, 1989].

Mercury-amalgam scam boosted. On December 23, 1990, CBS-TV's *60 Minutes* aired a vicious attack on the safety of "silver" fillings. Segments of the broadcast claimed that they emit toxic amounts of mercury that cause serious disease. Although removal temporarily raises body mercury load, a woman was permitted to state that her symptoms of multiple sclerosis disappeared overnight after her fillings were taken out. The program triggered an avalanche of queries to dentists and induced many viewers seek replacement of their fillings with other materials. "Silver" fillings are actually an alloy of silver, tin, copper, zinc, and mercury. Although liquid mercury is toxic, there is overwhelming evidence that mercury in the alloy is stable and safe. The American Dental Association, which criticized the program, considers it unethical for dentists to represent that removing amalgam fillings can cure disease. In a letter to Executive Producer Don Hewitt, Dr. Stephen Barrett characterized the program as "the most irresponsible report on a health topic ever broadcast."

Water testing scams. The Federal Trade Commission has warned that offers for free home-testing of tap water are almost always part of a sales promotion. Nor can home-testing provide the in-depth analysis required to determine whether water actually needs treatment or what type of system would be best. Although contaminants have been reported in some water supplies, most households have no cause to worry. But fraudulent sellers who offer "free home water testing" suggest otherwise. Some add tablets or drops to tap water, claiming that particle formation or a color change signifies contamination. When the change occurs (due to normal chemical reactions), they claim the water is polluted and may cause cancer. Some sellers say that our government recommends widespread use of purification systems, has approved their testing method, or has approved or licensed their equipment. These claims are false. The government does not endorse water tests or water treatment products, and an Environmental Protection Agency (EPA) registration number does not signify agency "approval." The FTC advises people worried about their water supply to call EPA's Safe Drinking Water Hotline (800-426-4791) or to consult their local or state health department or a state-certified laboratory. A free brochure, "Water Testing Scams," can be obtained from the FTC Public Reference Branch, 6th & Pennsylvania Ave., N.W., Washington, DC 20580.

HOW QUACKERY SELLS

William T. Jarvis, Ph.D.
Stephen Barrett, M.D.

Modern health quacks are supersalesmen. They play on fear. They cater to hope. And once they have you, they'll keep you coming back for more . . . and more . . . and more. Seldom do their victims realize how often or how skillfully they are cheated. Does the mother who feels good as she hands her child a vitamin think to ask herself whether he really needs it? Do subscribers to "health food" publications realize that articles are slanted to stimulate business for their advertisers? Not usually.

Most people think that quackery is easy to spot, but it is not. Its promoters wear the cloak of science. They use scientific terms and quote (or misquote) scientific references. On talk shows, they may be introduced as "scientists ahead of their time." The very word "quack" helps their camouflage by making us think of an outlandish character selling snake oil from the back of a covered wagon—and, of course, no intelligent people would buy snake oil nowadays, would they?

Well, maybe snake oil isn't selling so well, lately. But acupuncture? "Organic" foods? Mouthwash? Hair analysis? The latest diet book? Megavitamins? "Stress" formulas? Cholesterol-lowering teas? Homeopathic remedies? Nutritional "cures" for AIDS? Or shots to pep you up? Business is booming for health quacks. Their annual take is in the *billions!* Spot reducers, "immune boosters," water purifiers, "ergogenic aids," systems to "balance body chemistry," special diets for arthritis. Their product list is endless.

What sells is not the quality of their products but their ability to influence their audience. To those in pain, they promise relief. To the incurable, they offer hope. To the nutrition-conscious, they say, "Make sure you have enough." To a public worried about pollution, they say, "Buy natural." To one and all, they promise better health and a longer life. Modern quacks can reach people emotionally, on the level that counts the most. This article shows how they do it.

Appeals To Vanity

An attractive young airline stewardess once told a physician that she was taking more than 20 vitamin pills a day. "I used to feel run-down all the time," she said, "but now I feel really great!"

"Yes," the doctor replied, "but there is no scientific evidence that extra vitamins can do that. Why not take the pills one month on, one month off, to see whether they really help you or whether it's just a coincidence. After all, \$300 a year is a lot of money to be wasting."

"Look, doctor," she said. "I don't care what you say. I KNOW the pills are helping me."

How was this bright young woman converted into a true believer? First, an appeal to her curiosity persuaded her to try and see. Then an appeal to her vanity convinced her to disregard scientific evidence in favor of personal experience—to *think for herself*. Supplementation is encouraged by a distorted concept of *biochemical individuality*—that everyone is unique enough to disregard the Recommended Dietary Allowances (RDAs). Quacks will not tell you that scientists deliberately set the RDAs high enough to allow for individual differences. A more dangerous appeal of this type is the suggestion that although a remedy for a serious disease has not been shown to work for other people, *it still might work for you. (You are extraordinary!)*

A more subtle appeal to your vanity underlies the message of the TV ad quack: *Do it yourself—be your own doctor.* "Anyone out there have 'tired blood'?" he used to wonder. (Don't bother to find out what's wrong with you, however. Just try my tonic.) "Troubled with irregularity?" he asks. (Pay no attention to the doctors who say you don't need a daily movement. Just use my laxative.) "Want to kill germs on contact?" (Never mind that mouthwash doesn't prevent colds.) "Trouble sleeping?" (Don't bother to solve the underlying problem. Just try my sedative.)

Turning Customers Into Salespeople

Most people who think they have been helped by an unorthodox method enjoy sharing their success stories with their friends. People who give such *testimonials* are usually motivated by a sincere wish to *help their fellow humans*. Rarely do they realize how difficult it is to evaluate a "health" product on the basis of personal experience. Like the airline stewardess, the average person who feels better after taking a product will

not be able to rule out coincidence—or the placebo effect (feeling better because he thinks he has taken a positive step). Since we tend to believe what others tell us of personal experiences, testimonials can be powerful persuaders. Despite their unreliability, they are the cornerstone of the quack's success.

Multilevel companies that sell nutritional products systematically turn their customers into salespeople. "When you share our products," says the sales manual of one such company, "you're not just selling. You're passing on news about products you believe in to people you care about. Make a list of people you know; you'll be surprised how long it will be. This list is your first source of potential customers." A sales leader from another company suggests, "Answer all objections with *testimonials*. That's the secret to *motivating* people!"

Don't be surprised if one of your friends or neighbors tries to sell you vitamins. More than a million Americans have signed up as multilevel distributors. Like many drug addicts, they become suppliers to support their habit. A typical sales pitch goes like this: "How would you like to look better, feel better and have more energy? Try my vitamins for a few weeks." People normally have ups and downs, and a friend's interest or suggestion, or the thought of taking a positive step, may actually make a person feel better. Many who try the vitamins will mistakenly think they have been helped—and continue to buy them, usually at inflated prices.

Faked endorsements are being used to promote anti-aging products and other nostrums sold by mail. The literature, which resembles a newspaper page with an ad on one side and news on the other, contains what appears to be a handwritten note from a friend (identified by first initial). "Dear Anne," it might say, "This really works. Try it! B." Although both the product and the "newspaper page" are fakes, many recipients wonder who among their acquaintances might have signed the note.

The Use of Fear

The sale of vitamins has become so profitable that some otherwise reputable manufacturers are promoting them with misleading claims. For example, for many years, Lederle Laboratories (makers of *Stresstabs*) and Hoffmann-La Roche advertised in major magazines that stress "robs" the body of vitamins and creates significant danger of vitamin deficiencies. Another slick way for quackery to attract customers is the *invented disease*. Virtually everyone has symptoms of one sort or another—minor aches or pains, reactions to stress or hormone variations, effects of aging, etc. Labeling these ups and downs of life as symptoms of disease enables the quack to provide "treatment."

"Reactive hypoglycemia" is one such diagnosis. For decades, talk show "experts" and misguided physicians have preached that anxiety, headaches, weakness, dizziness, stomach upset, and other common reactions are often caused by "low blood sugar." But the facts are otherwise. Hypoglycemia is rare. Proper administration of blood sugar tests is required to make the diagnosis. A study of people who thought they had hypoglycemia showed that half of them had symptoms during a glucose tolerance test even though their blood sugar levels remained normal.

"Yeast allergy" is another favorite quack diagnosis. Here the symptoms are blamed on a "hidden" infection that is treated with antifungal drugs, special diets, and vitamin concoctions.

Food safety and environmental protection are important issues in our society. But rather than approach them logically, the food quacks exaggerate and oversimplify. To promote "organic" foods, they lump all additives into one class and attack them as "poisonous." They never mention that natural toxicants are prevented or destroyed by modern food technology. Nor do they let on that many additives are naturally occurring substances.

Sugar has been subject to particularly vicious attacks, being (falsely) blamed for most of the world's ailments. But quacks do more than warn about imaginary ailments. They sell "antidotes" for real ones. Care for some vitamin C to reduce the danger of smoking? Or some vitamin E to combat air pollutants? See your local supersalesman.

Quackery's most serious form of fear-mongering has been its attack on water fluoridation. Although fluoridation's safety is established beyond scientific doubt, well-planned scare campaigns have persuaded thousands of communities not to adjust the fluoride content of their water to prevent cavities. Millions of innocent children have suffered as a result.

Hope for Sale

Since ancient times, people have sought at least four different magic potions: the love potion, the fountain of youth, the cure-all, and the athletic superpill. Quackery always has been willing to cater to these desires. It used to offer unicorn horn, special elixirs, amulets, and magical brews. Today's products are vitamins, bee pollen, ginseng, *Gerovital*, "glandular extracts," and many more. Even reputable products are promoted as though they are potions. Toothpastes and colognes will improve our love life. Hair preparations and skin products will make us look "younger than our years." And Olympic athletes tell us that breakfast cereals will make us champions.

Nutrition Forum (ISSN 0748-8165) is published bimonthly by J.B. Lippincott Company, Downsville Pike, Route 3, Box 20-B, Hagerstown, MD 21740. Business offices are located at East Washington Square, Philadelphia, PA 19105. Printed in the U.S.A. Copyright 1991 by J.B. Lippincott Company. False hope for the seriously ill is the cruelest form of quackery because it can lure victims away from effective treatment. Even when death is inevitable, however, false hope can do great damage. Experts who study the dying process tell us that while the initial reaction is shock and disbelief, most terminally ill patients will adjust very well as long as they do not feel abandoned. People who accept the reality of their fate not only die psychologically prepared, but also can put their affairs in order. On the other hand, those who buy false hope can get stuck in an attitude of denial. They waste financial resources and, worse yet, their remaining time.

The choice offered by the quack is not between hope and despair but between false hope and a chance to adjust to reality. Yet hope springs eternal. The late Jerry Walsh was a severe arthritic who crusaded coast-to-coast debunking arthritis quackery on behalf of the Arthritis Foundation. After a television appearance early in his career, he received 5,700 letters. One hundred congratulated him for blasting the quacks, but 4,500 were from arthritis victims who asked where they could obtain the very fakes he was exposing!

Clinical Tricks

The most important characteristic to which the success of quacks can be attributed is probably their ability to exude confidence. Even when they admit that a method is unproven, they can attempt to minimize this by mentioning how difficult and expensive it is to get something proven to the satisfaction of the FDA these days. If they exude *self-confidence* and enthusiasm, it is likely to be contagious and spread to patients and their loved ones.

Because people like the idea of making choices, quacks often refer to their methods as "*alternatives*." Correctly used, it can refer to aspirin and Tylenol as alternatives for the treatment of minor aches and pains. Both are proven safe and effective for the same purpose. Lumpectomy can be an alternative to radical mastectomy for breast cancer. Both have verifiable records of safety and effectiveness from which judgments can be drawn. Can a method that is unsafe, ineffective or unproven be a genuine alternative to one that is proven? Obviously not.

Quacks don't always limit themselves to phony treatment. Sometimes they offer legitimate treatment as well—the quackery is promoted as *something extra*. One example is the "orthomolecular" treatment of mental disorders with high dosages of vitamins in addition to orthodox forms of treatment. Patients who receive the "extra" treatment often become convinced that they need to take vitamins for the rest of their life. Such an outcome is inconsistent with the goal of good medical care, which should be to discourage unnecessary treatment.

The *one-sided coin* is a related ploy. When patients on combined (orthodox and quack) treatment improve, the quack remedy (e.g., laetrile) gets the credit. If things go badly, the patient is told that he arrived too late, and conventional treatment gets the blame. Some quacks who mix proven and unproven treatment call their approach *complementary therapy*.

Quacks also capitalize on the natural healing powers of the body by *taking credit* whenever possible for improvement in a patient's condition. One multilevel company—anxious to avoid legal difficulty in marketing its herbal concoction—makes no health claims whatsoever. "You take the product," a spokesperson suggests on the company's introductory videotape, "and tell me what it does for you." An opposite tack—*shifting blame*—is used by many cancer quacks. If their treatment doesn't work, it's because radiation and/or chemotherapy have "knocked out the immune system."

To promote their ideas, quacks often use a trick where they bypass an all-important basic question and *ask a second question* which, by itself, is not valid. An example of a "second question" is "Why don't the people of Hunza get cancer?" The quack's answer is "because they eat apricot pits" (or some other claim). The first question should have been "Do the people of Hunza get cancer?" The answer is "Yes!" Every group of people on earth gets cancer. So do all animals (vegetarians and meat-eaters alike) and plants. Another common gambit is the question, "Do you believe in vitamins?" The real question should be, "Does the average person eating a well balanced diet need to take supplements?" The answer is no.

Another selling trick is the use of *weasel words*. Quacks often use this technique in suggesting that one or more items on a list is reason to suspect that you *may* have a vitamin deficiency, a yeast infection, or whatever else they are offering to fix.

The *money-back guarantee* is a favorite trick of mail-order quacks. Most have no intention of returning any money—but even those who are willing know that few people will bother to return the product.

Another powerful persuader—*something for nothing*—is standard in advertisements promising effortless weight loss. It is also the hook of the telemarketer who promises a "valuable free prize" as a bonus for buying a water purifier, a 6-month supply of vitamins, or some other health or nutrition product. Those who bite receive either nothing or items worth far less than their cost. Credit card customers may also find unauthorized charges to their account.

The willingness to believe that a stranger can supply unique and valuable "inside" information—such as a tip on a horse race or the stock market—seems to be a universal human quirk. Quacks take full advantage of this trait in their promotion of *secret cures*. True scientists don't keep their breakthroughs secret. They share them with all mankind. If this were not so,

Yetiv, M.D., Ph.D.; and staff members of The Pennsylvania State University Nutrition Information and Resource Center.

we would still be going to private clinics for the vaccines and other medications used to conquer smallpox, polio, tuberculosis, and many other serious diseases.

Seductive Tactics

The practice of healing involves both art and science. The art includes all that is done for the patient psychologically. The science involves what is done about the disease itself. If a disease is psychosomatic, art may be all that is needed. The old-time doctor did not have much science in his little black bag, so he relied more upon the art (called his "bedside manner") and everyone loved him. Today, there is a great deal of science in the bag, but the art has been relatively neglected.

In a contest for patient satisfaction, art will beat science nearly every time. Quacks are masters at the art of delivering health care. The secret to this art is to make the patient believe that he is cared about as a person. To do this, quacks *rather love lavishly*. One way this is done is by having receptionists make notes on the patients' interests and concerns in order to recall them during future visits. This makes each patient feel special in a very personal sort of way. Some quacks even send birthday cards to every patient. Although seductive tactics may give patients a powerful psychological lift, they may also encourage over-reliance on an inappropriate therapy.

Handling the Opposition

Quacks are involved in a constant struggle with legitimate health care providers, mainstream scientists, government regulatory agencies, and consumer protection groups. Despite the strength of this orthodox opposition, quackery manages to flourish. To maintain their credibility, quacks use a variety of clever propaganda ploys. Here are some favorites:

"*They persecuted Galileo!*" The history of science is laced with instances where great pioneers and their discoveries were met with resistance. Harvey (nature of blood circulation), Lister (antiseptic technique), and Pasteur (germ theory) are notable examples. Today's quack boldly asserts that he is another example of someone ahead of his time. Close examination, however, will show how unlikely this is. First of all, the early pioneers who were persecuted lived during times that were much less scientific. In some cases, opposition to their ideas stemmed from religious forces. Second, it is a basic principle of the scientific method that the burden of proof belongs to the proponent of a claim. The ideas of Galileo, Harvey, Lister, and Pasteur overcame their opposition because their soundness could be demonstrated.

A related ploy, which is a favorite with cancer quacks, is the charge of "*conspiracy*." How can we be sure that the AMA, the FDA, the American Cancer Society, and others are not involved in some monstrous plot to withhold a cancer cure from the public? To begin with, history reveals no such practice in the past. The elimination of serious diseases is not a threat to the medical profession—doctors prosper by curing diseases, not by keeping people sick. It should also be apparent that modern medical technology has not altered the zeal of scientists to eliminate disease. When polio was conquered, iron lungs became virtually obsolete, but nobody resisted this advancement

because it would force hospitals to change. Neither will medical scientists mourn the eventual defeat of cancer.

Moreover, how could a conspiracy to withhold a cancer cure hope to be successful? Many physicians die of cancer each year. Do you believe that the vast majority of doctors would conspire to withhold a cure for a disease that affects them, their colleagues, and their loved ones? To be effective, a conspiracy would have to be worldwide. If laetrile, for example, really worked, many other nations' scientists would soon realize it.

Organized quackery poses its opposition to medical science as a philosophical conflict rather than a conflict about proven versus unproven or fraudulent methods. This creates the illusion of a "holy war" rather than a conflict that could be resolved by examining the facts.

Quacks like to charge that "*Science doesn't have all the answers*." That's true, but it doesn't claim to have them. Rather, it is a rational and responsible process that can answer many questions—including whether procedures are safe and effective for their intended purpose. It is quackery that constantly claims to have answers for incurable diseases. The idea that people should turn to quack remedies when frustrated by science's inability to control a disease is irrational. Science may not have all the answers, but quackery has no answers at all! It will take your money and break your heart.

Many treatments advanced by the scientific community are later shown to be unsafe or worthless. Such failures become grist for organized quackery's public relations mill in its ongoing attack on science. Actually, "failures" reflect a key element of science: its willingness to test its methods and beliefs and abandon those shown to be invalid. True medical scientists have no philosophical commitment to particular treatment approaches, only a commitment to develop and use methods that are safe and effective for an intended purpose.

When a quack remedy flunks a scientific test, its proponents merely reject the test. Science writer John J. Fried provides a classic description of this in his book, *Vitamin Politics*:

Because vitamin enthusiasts believe in publicity more than they believe in accurate scientific investigation, they use the media to perpetuate their faulty ideas without ever having to face up to the fallacies of their nonsensical theories. They announce to the world that horse manure, liberally rubbed into the scalp, will cure, oh, brain tumors. Researchers from the establishment side, under pressure to verify the claims, will run experiments and find that the claim is wrong. The enthusiasts will not retire to their laboratories to rethink their position. Not at all. They will announce to the world that the establishment wasn't using enough horse manure, or that it didn't use the horse manure long enough, or that it used horse manure from the wrong kind of horses. The process is never-ending. . . . The public is the ultimate loser in this charade.

Promoters of laetrile were notorious for shifting their claims. First they claimed that laetrile could cure cancer. Then they said it could not cure but could prevent or control cancer. Then they claimed laetrile was a vitamin and that cancer was a disease caused by a vitamin deficiency. Today they say that laetrile alone is not enough—it is part of "metabolic therapy," which includes special diet, supplement concoctions, and other modalities that vary from practitioner to practitioner.

The *disclaimer* is a related tactic. Instead of promising to cure your specific disease, some quacks will offer to "cleanse" or "detoxify" your body, balance its chemistry, release its "nerve energy," bring it in harmony with nature, or do other things to "help the body to heal itself." This type of disclaimer serves two purposes. Since it is impossible to measure the processes the quack describes, it is difficult to prove him wrong. In addition, if the quack is not a physician, the use of nonmedical terminology may help to avoid prosecution for practicing medicine without a license.

Books espousing unscientific practices typically suggest that the reader consult a doctor before following their advice. This disclaimer is intended to protect the author and publisher from legal responsibility for any dangerous ideas contained in the book. Both author and publisher know full well, however, that most people will not ask their doctor. If they wanted their doctor's advice, they probably would not be reading the book in the first place. Sometimes the quack will say, "You may have come to me too late, but I will try my best to help you." That way, if the treatment fails, you have only yourself to blame. Patients who see the light and abandon quack treatment may also be blamed for stopping too soon.

"Health Freedom"

If quacks cannot win by playing according to the rules, they try to change the rules by switching from the scientific to the political arena. In science, a medical claim is treated as false until proven beyond a reasonable doubt. But in politics, a medical claim may be accepted until proven false or harmful beyond a reasonable doubt. This is why proponents of laetrile, chiropractic, orthomolecular psychiatry, chelation therapy, and the like, take their case to legislators rather than to scientific groups.

Quacks use the concept of "*health freedom*" to divert attention away from themselves and toward victims of disease with whom we are naturally sympathetic. "These poor folks should have the freedom to choose whatever treatments they want," cry the quacks—with crocodile tears. They want us to overlook two things. First, no one wants to be cheated, especially in matters of life and health. Victims of disease do not demand quack treatments because they want to exercise their "rights," but because they have been deceived into thinking that they offer hope. Second, the laws against worthless nostrums are not directed against the victims of disease but at the promoters who attempt to exploit them.

Any threat to freedom strikes deeply into American cultural values. But we must also realize that complete freedom is appropriate only in a society in which everyone is perfectly trustworthy—and no such society exists. Experience has taught us that quackery can even lead people to poison themselves, their children, and their friends.

It is because of the vulnerability of the desperately ill that consumer protection laws have been passed. These laws simply require that products offered in the health marketplace be both safe and effective. If only safety were required, any substance that would not kill you on the spot could be hawked to the gullible.

Some people claim we have too much government regulation. But the issue should be one of quality, not quantity. We can always use good regulatory laws. Our opposition should

be toward bad regulations that stifle our economy or cramp our lifestyles unnecessarily. Consumer protection laws need to be preserved.

Unfortunately, some politicians seem oblivious to these basic principles and expound the "health freedom" concept as though they are doing their constituents a favor. In reality, "health freedom" constitutes a hunting license for quackery, with open season declared on the sick, the frightened, the alienated, and the desperate. It represents a return to the law of the jungle in which the strong feed upon the weak.

How to Avoid Being Tricked

The best way to avoid being tricked is to stay away from tricksters. Unfortunately, in health matters, this is no simple task. Quackery is not sold with a warning label. Moreover, the dividing line between what is quackery and what is not is by no means sharp. A product that is effective in one situation may be part of a quack scheme in another. (Quackery lies in the promise, not the product.) Practitioners who use effective methods may also use ineffective ones. For example, they may mix valuable advice to stop smoking with unsound advice to take vitamins. Even outright quacks may relieve some psychosomatic ailments with their reassuring manner.

This article illustrates how adept quacks are at selling themselves. Sad to say, in most contests between quacks and ordinary people, the quacks still are likely to win.

Dr. Jarvis is a professor in the Department of Preventive Medicine at Loma Linda University and president of the National Council Against Health Fraud.

Dr. Barrett, who practices psychiatry in Allentown, Pennsylvania, is a board member of the National Council Against Health Fraud. In 1984 he received the FDA Commissioner's Special Citation Award for Public Service in fighting nutrition quackery.

QUESTION BOX

Q. Some candy makers advertise that their candy bars provide "quick energy." Does sugar do this?

A. The sugar in candy is digested into glucose and fructose and absorbed quickly into the blood stream. This raises the blood glucose level, which provides some energy for a short time. However, the body responds by releasing insulin into the blood, which temporarily drops the glucose level below what it was before eating the high-sugar food. Thus, eating a sugary food or beverage right before a long workout can cause faster exhaustion, since the body has to use its energy reserves (glycogen) earlier than normally. There also is a lessened release of fat stores. These events can impair performance. The better food choice before a workout would be foods like bread, pasta, and starchy vegetables. These contain complex carbohydrates, which are slowly absorbed by the body and therefore have a steadier effect on blood sugar.

There is some evidence that consuming sugar during exercise helps people, such as marathon runners, who are exercising so strenuously and for so long that they risk running out of glycogen. In a workout lasting longer than 2 hours, consuming a sugary food or beverage during the workout may help postpone exhaustion.

THE NABISCO/KRAFT BOYCOTT: A CAMPAIGN FOR BETTER PUBLIC HEALTH

Joe B. Tye

Do you approve of cigarette companies using cartoon characters to encourage children to smoke? If you do, indulge yourself with a box of RJR Nabisco's Oreo cookies.

Should cigarette companies use professional athletes and sports imagery to promote smoking? If your answer is yes, buy Kraft cheese from Philip Morris.

Does it please you that cigarette companies influence children through movies? If so, stop reading. Kraft and Nabisco food products are for you.

But if you object to such unethical sales tactics, read on. There is something you can do about them.

Functions of Cigarette Advertising

For more than 60 years, cigarette advertising has served two main purposes: to attract new customers (mostly young ones) and to reassure worried adult smokers that they can be reasonably safe by choosing the right brand. From 1930 to the early 1950s, every major tobacco company used deceptive health claims in its advertising.

R.J. Reynolds (now part of RJR Nabisco) stated, "More Doctors Smoke Camels Than Any Other Brand." Other Reynolds' advertisements claimed positive health benefits like improved digestion, steady nerves, and enhanced athletic performance. Philip Morris scared millions of smokers into switching to its brand with headlines that screamed "Play Safe! An Ounce of Prevention is Worth a Pound of Cure" and "Eminent Medical Authorities Recommend Philip Morris." Other advertisements featured Lucille Ball and Desi Arnaz claiming that smoking Philip Morris prevented "cigarette hangover." (Ironically, both succumbed to the ultimate cigarette hangover: cancer.)

Today's themes are less blatant, but the message is still the same. R.J. Reynolds' message that "Now is Lowest" is intended to suggest safety. In reality, Now is no safer than any other brand.

"Low Smoke" Virginia Slims are an attempt by Philip Morris to reassure pregnant women and young mothers that smoke from their cigarettes will not harm their children. Unfortunately, some will be persuaded that "low-smoke" cigarettes are a reasonable alternative to quitting.

Children and teenagers have always been prime targets of cigarette advertising. R.J. Reynolds and other cigarette companies used to hire famous celebrities like John Wayne and Joe DiMaggio to push their cigarettes. Advertisements like the one calling Lucky Strike "The One to Start With" make it clear that the target was America's youth.

During the latter half of the 1980s, as adult smokers quit at an accelerating rate, tobacco companies began targeting potential "replacement smokers" with increased intensity. Between 1987 and 1988, the tobacco industry increased its promotional expenses by more than 25%. Most of the increase was devoted to campaigns targeting youth. In direct response, since 1987 teenage smoking has increased more than 10%.

The U.S. Congress has not merely refused to curb this deluge of deceptive advertising and public relations. It has actually worked to defend the tobacco industry against conscientious regulators. It is no coincidence that the tobacco lobby and its allies in the advertising business are among the largest contributors to political campaign funds and are generous in handing out "speaking fees" to politicians willing to vote their way.

The Nabisco/Kraft Boycott

When faced with government inaction, concerned citizens must take matters into their own hands. For this reason, STAT is organizing a nationwide boycott of Kraft and Nabisco products to force their parent corporations, Philip Morris and RJR Nabisco, to stop encouraging young people to use their deadly products. The boycott has five demands:

Demand #1: Stop Using Cartoon Characters to Promote Smoking

During the early sixties, RJR sponsored the Flintstones cartoon show. Ads featured Fred Flintstone and Barney Rubble sneaking out behind the house for a smoke when they were supposed to be doing housework. The appeal to rebellious adolescents was unmistakable.

Today, RJR Nabisco uses cartoon characters to push Camel and Magna cigarettes. These cartoons promote a self-indulgent and drug-using lifestyle that is attractive to many adolescents. It is no coincidence that a substantial proportion of increased sales of Camel cigarettes last year was among young people. Indeed, Camel's "smooth character" cartoon has enabled it to challenge Marlboro for supremacy on junior high and high school campuses.

Demand #2: Stop Using Athletic Imagery to Promote Smoking

The tobacco industry's own code of advertising ethics prohibits the display of athletes or others engaged in strenuous athletic activities. Yet RJR Nabisco and Philip Morris both routinely violate this provision, knowing that athletic imagery is a potent way to attract teenagers.

RJR Nabisco cigarette advertisements feature professional athletes engaged in daredevil stunts and other feats requiring great strength and stamina. Among them are skiers, windsurfers, aerobic dancers, stunt motorcycle riders, and mountain climbers. Philip Morris not only uses athletes to promote smoking but denies doing this. In a recent letter in the *Wall Street Journal*, a senior executive stated, "We don't have celebrities or athletes endorse cigarettes in our advertising." Meanwhile, 8-page Marlboro ads in *Sports Illustrated* and other magazines popular with teens featured two prominent racecar drivers who had won the Indianapolis 500.

The tobacco industry's own research has determined that a key reason that many young people refrain from smoking is fear of impairing their athletic performance. The prevalence of sports imagery in cigarette ads is an attempt to offset this and increase the number of adolescents who smoke.

This is also an important reason that tobacco companies spend so much money to sponsor athletic events. It not only associates smoking with athletic excellence, but also allows them to circumvent the ban on televised cigarette advertising.

Demand #3: Stop Subliminal Cigarette Advertising in Movies

Years ago, many people began smoking because they liked the "cool" image portrayed by Humphrey Bogart or other Hollywood stars. Today, cigarette companies are attempting to replicate this success by paying movie producers to feature their cigarettes in feature films, including many made for children.

Philip Morris paid the makers of *Superman II* more than \$40,000 to feature the Marlboro logo some two dozen times. Lois Lane, a nonsmoker in the comics, becomes a Marlboro chain-smoker in the movie. In one scene she tells a silently acquiescing Clark Kent that she will never get sick because she drinks orange juice, while a lighted Marlboro dangles from her lips. American Brands provided \$20,000 worth of Lucky Strike and Pall Mall cigarettes to the makers of *Beverly Hills Cop*. In one scene, star Eddie Murphy holds up a pack of Luckies and says, "These are very popular cigarettes with the children."

Other youth-oriented movies in which cigarette-makers engineered subtle pro-smoking messages are: *Who Framed Roger Rabbit* and *Honey, I Shrunk the Kids*, both from Walt Disney; *Supergirl*; *Days of Thunder*; *The Heavenly Kid*; and *Two of a Kind*.

Cigarette-makers get more for their money than just a brief glimpse of their brand. In most cases, movies with paid cigarette advertising also include one or more instances in which smoking is glamorized.

Demand #4: Stop Targeting Young Women

Cigarette-makers prey upon the psychological vulnerability of adolescent girls with ads that associate smoking with independence, popularity, and, above all, with being thin and attractive.

Hundreds of studies—including some funded by the tobacco industry—have proven that smoking by pregnant women is harmful to the fetus, and that smoking by young mothers can cause serious health problems in their children. Yet to this day, RJR Nabisco and Philip Morris claim that there is no reason for pregnant women and young mothers to stop smoking. As noted above, Philip Morris advertisements even suggest that young women can continue to smoke without harming their children.

Demand #5: Exported Cigarettes Should be Labeled with Health Warnings and have their Advertising Restricted

A major reason why cigarette advertisements were booted from U.S. television in 1971 was the vulnerability of children. In Japan and other countries, where broadcast cigarette advertising is still permitted, RJR Nabisco and Philip Morris target young teenagers with advertising that encourages them to smoke. Likewise, a major reason behind the toughening of health warnings was to discourage children from starting to smoke. But in many countries, children are not getting specific health warnings. In Japan, for example, the warning says only "For the sake of your health, please do not smoke too much."

Children in other countries should be no more exploitable than children in America. They deserve the same protection from the efforts of Philip Morris and RJR Nabisco to encourage smoking.

How You Can Help

There are four things you can do to oppose the effort to turn children into nicotine addicts:

- Stop buying products with the easy-to-recognize Nabisco and Kraft logos. If you have children, use this as a lesson in ethics. In the Tye family, our children, ages 7 and 10, tell all their schoolmates to shun Oreo cookies in the lunch line so they don't support the bad people who push cigarettes.
- Write to the chief executives of Nabisco and Kraft (with copies to STAT) informing them of your decision and asking for a response:

H. John Greeniaus
President and CEO
Nabisco Brands
100 DeForest Avenue
East Hanover, NJ 07936

Michael A. Miles
Chief Executive Officer
Kraft General Foods
120 Park Avenue
New York, NY 10017

- Ask organizations such as your hospital, school board, business and professional organizations, and religious institutions, to support the boycott effort. Groups concerned with the health, education, and welfare of our youth should certainly support this effort to eliminate the slick advertising that encourages young people to smoke. STAT is mounting a campaign to persuade hospitals to remove Nabisco and Kraft from their approved vendor lists. We can provide you with more detailed information about the unethical methods used by Philip Morris and RJR Nabisco to promote smoking.

• Join STAT (Stop Teenage Addiction to Tobacco), the nonprofit organization dedicated to protecting children from the tobacco industry. Members receive the *Tobacco and Youth Reporter*, the world's most widely read tobacco control publication, plus the satisfaction of belonging to a network that will save many lives.

Mr. Tye is President of STAT and chief operating officer of Baystate Medical Center, a large teaching hospital in Springfield, Massachusetts. For more information, contact: STAT, 121 Lyman Street, Suite 210, Springfield, MA, 01103 or telephone 413-732-7828. A free brochure, "Smoking: Guidelines for Teens," can be obtained by sending a stamped, self-addressed 4" x 9 1/4" envelope to Teen Smoking, Dept. C, American Academy of Pediatrics, P. O. Box 927, Elk Grove, IL 60009. Readers offended by cigarette ads in magazines can use subscription reply cards to protest.

BRIEFS

"Yeast" treatment debunked. In a double-blind trial, the antifungal drug nystatin did no better than a placebo in relieving systemic or psychological symptoms of "candidiasis hypersensitivity syndrome," a diagnosis considered "speculative and unproven" by the American Academy of Allergy and Immunology. Reprints of the report [N Engl J Med 1991;323:1717-1723] can be obtained from William E. Dismukes, M.D., Division of Infectious Diseases, Department of Medicine, University of Alabama Medical Center, Birmingham, AL 35294.

Suit filed to undercut FDA enforcement. The Dietary Supplement Coalition is seeking a court order to declare coenzyme Q10 a food, not a food additive. The purpose of the suit is to stop the FDA from banning the sale of "food supplements" as unsafe food additives. The coalition was formed in 1989 in response to FDA seizures of mineral orotates, evening primrose oil, germanium, superoxide dismutase, coenzyme Q10, and several other substances marketed as "supplements" but widely promoted with illegal therapeutic claims [NF 6:16]. *Editor's note: DSC hopes to enable manufacturers to market a wide variety of substances as "foods" as long as no illegal claims are traceable to them. Of course, such claims still will be made "independently" through books, magazine articles, talk shows, and retail outlets, so that potential customers can learn the products' intended uses.*

Health food retailers uneasy? *Health Foods Business* reports that health food store owners have developed "increased fear—even paranoia" about their right to provide advice to their customers. Retailers interviewed by the magazine's editor said they still give nutritional advice but are more careful about how they present information and how they present themselves.

Infant formula price-fixing? The Federal Trade Commission is investigating charges by maternal and child health advocates and WIC program directors that formula manufacturers have illegally fixed infant formula prices. The WIC program, which helps low-income and postpartum women, infants, and children younger than age 5 with clinical evidence of nutritional needs, is the nation's largest purchaser of infant formula—spending an estimated \$660 million in 1990 on bottle-feeding. According to an article in *Medical World News*, WIC program leaders have complained since the early 1980s that high formula costs siphon off funds that would otherwise provide specially chosen foods to larger numbers of malnourished women and children. USDA officials estimate that cost-containment mechanisms legislated 3 years ago enabled the states to negotiate price cuts that saved taxpayers \$293 million in fiscal 1989 and \$500 million in fiscal 1990. The American Academy of Pediatrics (AAP) opposes direct formula advertising to consumers as part of its efforts to promote breast-feeding. Since the FTC believes that high prices and lack of advertising often go hand in hand, the agency is investigating whether this policy represents a conflict of interest because some of AAP's members who profit from selling infant formula products to their patients. *Editor's note: The FTC can't seem to grasp the idea that health professional groups that oppose various types of advertising are motivated by a desire to protect consumers from being misled.*

Major report endorses fluoridation. The U.S. Department of Health and Human Services has released *Review of Fluoride Benefits and Risks*, a comprehensive evaluation of the public health benefits and risks of fluorides from drinking water and other dietary and dental product sources. The report—more than 200 pages long—was drafted by a Public Health Service subcommittee chaired by former FDA Commissioner Frank W. Young, M.D., Ph.D. The review was prompted by an experiment that found bone cancer among certain rodents that were fed high doses of fluorides [NF 7:15]. The review concluded that the study and another long-range animal study "fail to establish an association between fluoride and cancer." Copies (limited quantities) are available from Dental Disease Prevention Activity, Center for Preventive Services, Centers for Disease Control, Atlanta, GA 30333 (Telephone: 404-639-1830).

Bizarre lawsuit withdrawn. In September 1990, 40 dentists filed a class action suit in an Ohio federal court, charging the American Dental Association (ADA) with "breach of contract" and "fraudulent misrepresentation." According to the suit papers, the Association had acted improperly by insisting that fluoridation and mercury-amalgam ("silver") fillings are safe. The ADA replied that the plaintiffs had failed to state a legitimate cause of action and that, since the ADA is based in Chicago, the Ohio court lacked jurisdiction. In December the suit was withdrawn, but it may be filed again in Chicago. One of the plaintiffs was Hal Huggins, D.D.S., the leading anti-amalgamist. John Yiamouyiannis, Ph.D., the leading antifluoridationist, helped finance the suit and acted as the group's spokesperson.

Warning labels ordered for raw milk. The California Department of Health Services has issued emergency regulations requiring all raw milk products to carry the warning: "Raw (unpasteurized) dairy products may contain disease-producing bacteria and other micro-organisms. Persons at highest risk of disease from these organisms include newborns and infants; the elderly; pregnant women; those taking corticosteroids, antibiotics, or antacids; and those having chronic illnesses or other conditions that impair their immunity." In October 1990, the producing herds were quarantined after showing signs of infection with brucellosis, salmonellosis, and listeriosis.

Elderly volunteers wanted for cholesterol study. Four hundred men and women are being sought for the Cholesterol Reduction Program in Seniors (CRISP), sponsored by the the National Heart, Lung, and Blood Institute. The study is intended to produce scientifically based recommendations for assessing and dealing with elevated cholesterol levels in the elderly. Participants must be 65 years of age or older, have a cholesterol level above 239, have no history of heart disease or stroke within the previous 3 months, and be able to visit one of the five university-based participating clinics regularly. Volunteers should contact: John R. Crouse, M.D., Winston-Salem (919-748-6703); Donald B. Hunninghake, M.D., Minneapolis (612-625-4447); William B. Applegate, M.D., Memphis (901-577-8400); Robert H. Knopp, M.D., Seattle (206-223-3376); or John C. LaRosa, M.D., Washington, D.C. (202-676-5150).

THE FAIM SYMPOSIUM A "COMPLEMENTARY MEDICINE" SMORGASBORD

Jack Raso, M.S., R.D.

The Foundation for the Advancement of Innovative Medicine (FAIM) defines innovative medicine as "a treatment or therapy of empirical benefit that is yet outside the mainstream of conventional medicine." Headquartered in Kinderhook, New York, the group was formed in 1986 and incorporated in 1987. A separate FAIM Educational Fund (FAIM ED) was incorporated this year. According to a recent brochure:

FAIM's mission is to secure free choice in health care. Our first goal is the development of a membership to serve as both a forum for exchange and a constituency for change. The second goal is to secure the freedom of physicians to offer innovative therapies. The third goal is guaranteed reimbursement for the patients. . . .

The mission of FAIM ED is to educate both those within the field and the general public as to the benefits and issues of innovative medicine. This activity includes the collection of statistical data and research of value to practitioners and patients alike.

During the past year, articles in FAIM's quarterly newsletter (*Innovation*) have promoted "alternative" cancer therapies, chelation therapy, homeopathy, shark cartilage (for arthritis and protection against tumor growth), and an oral bacterial preparation for chronic fatigue syndrome. One article provides strategies for suing in small claims court when insurance companies fail to cover "complementary" treatment. Other articles blast fluoridation, mercury-amalgam fillings, and sugar (for supposedly causing digestive troubles). A recent flyer urges members to ask their state legislators to support a bill to ensure that "unconventional" practitioners participate in the judging of practitioners accused of professional misconduct.

FAIM's board of trustees is composed of eight medical doctors and one dentist, all of whom practice within New York State. The board's president (and a FAIM co-founder) is Robert C. Atkins, M.D., author of *Dr. Atkins' Diet Revolution* (1971), *Dr. Atkins' Superenergy Diet* (1977), *Dr. Atkins' Nutrition Breakthrough* (1981), and *Dr. Atkins' Health Revolution* (1988).

Atkins appears to favor empiricism and clinical experience over reason and scientific analysis. In the news release promoting the latest of these books, he states that "there is only one disease which is called imbalance, and it is combated by the restoration of balance, which is another word for health." He claims that "nutrition has been useful in just about every condition I have treated. . . . And there are probably herbal answers for every condition for which there is a pharmacological answer." He also claims it is difficult or impossible to conduct double-blind tests of the "alternative" methods he espouses.

Atkins founded and directs The Atkins Centers for Complementary Medicine in New York City. He also publishes *The Atkins Health Letter* and hosts "Design for Living," a nightly radio talk show on WOR. (The former host of the program was the late Carlton Fredericks, who performed "nutritional consultations" costing \$200 at Atkins' offices.) In an interview in the March 1991 *Swanson's Health Shopper*, Atkins defined complementary medicine as a synthesis of orthodox and "alternative" medicine "put together . . . to integrate the best of both." The services under his auspices include acupuncture, chiropractic, homeopathy, bioenergetics, clinical ecology, chelations, ozone therapy, neurolinguistic programming, ultraviolet blood irradiation, and "an assortment of unclassified techniques."

Each year, FAIM sponsors several symposia featuring prominent practitioners of "innovative medicine." On January 26 and 27 I attended the first of this year's series at the New York Penta Hotel, across the street from Madison Square Garden. About 500 people attended the two Saturday sessions and about 400 attended the single Sunday session. Virtually all were white and appeared older than 40.

The Exhibitors

As I entered the 18th-floor hall, I noted a coffee urn containing an herbal tea marketed by Sunrider International, one of about 17 companies with booths in the back of the hall. At the Sunrider booth, I paid \$2 for a *SunBar*, a 1½-ounce "herb

food" candy bar containing water lily bulb, Chinese asparagus root, and several other exotic ingredients. The product tasted medicinal and was so hard and adhesive that I feared it might loosen my mercury-amalgam fillings. As I chewed apprehensively, the Sunrider salesman introduced me to another distributor—said to be a registered dietitian with a master's degree in nutrition—who expressed antipathy toward double-blind studies.

Other exhibitors at the symposium included:

- *The Atkins Centers for Complementary Medicine*, which markets "Dr. Atkins' Targeted Nutrition Program." This is a supplement program in which "building blocks" are added to a "basic formula" to "help the body to create its own cures." The 17 "building blocks" include *Cardiovascular Formula*, *Heart Rhythm Formula*, *Hypoglycemia Formula*, *Anti-Arthritic Formula*, and *Urinary Frequency Formula*. A brochure states that the formulas have evolved from 25 years of Dr. Atkins' experience in using nutrition to treat more than 40,000 patients.

- *Boericke & Tafel, Inc.*, Santa Rosa, CA, said to be "America's oldest homeopathic pharmaceutical firm." Its *Alfalfa Tonic* was promoted at the meeting "for symptomatic relief of insomnia and nervous stress."

- *Great Smokies Diagnostic Laboratory*, Asheville, NC, a laboratory that performs a variety of nonstandard tests. Its flyer invites patients to ask their doctor about the laboratory's Comprehensive Digestive Stool Analysis. "Discover How Much Valuable Information Lies Hidden in Your Stool Sample!" the flyer states. "The CDSA now detects levels of Short Chain Fatty Acids. Low levels of some of these may be associated with increased risk of colon cancer and ulcerative colitis."

- *Health from the Sun*, Newton Upper Falls, MA, which markets Sanhelios herb products, including *Circu Caps*, *Prosta Caps*, *Circu Balm*, *Kalm Caps*, and *The 3-Day Diet* ("a 'near fast' diet for losing 7 to 10 pounds in 3 days").

- *Huggins Diagnostic Center*, Colorado Springs, CO, "the leader in diagnosing and treating patients who suffer from mercury toxicity due to dental amalgam," according to a brochure. The brochure recommends hair analysis (to detect supposed mercury toxicity) and sequential removal of mercury-amalgam fillings, and advertises electrolyte replacement beverages including "Jungle Juice" and "Jogger Colada." A flyer available at the booth states in bold red letters: "You wouldn't take your child's temperature with a leaky thermometer."

- *Klabin Marketing*, New York City, NY. Pushing *Aloe-Ace*, aloe vera juice from organically grown aloe vera leaves, complete with sap and rind.

- *Natren, Inc.*, North Hollywood, CA. Featuring *Bulgareicum I.B.*, a *Lactobacillus bulgaricus* culture that allegedly "aids in the production of white blood cells" and "activates the immune system."

- *Ocean Health Products*, which distributed flyers suggesting that shark cartilage is effective against cancer, diabetic retinopathy, osteoarthritis, psoriasis, and various other conditions. A flyer written by FAIM board member Ronald Hoffman, M.D., states: "Although there have been no clinical test performed, several doctors and chiropractors have noticed that when used regularly, shark cartilage seems to reduce the incidence of muscle pulls, inflamed joints, and stiffness due to injury."

- *Tachyon International*, Fort Lee, NJ, which markets *Tachyon Cells* and *Tachyon Water*—"Phenomena of the 90's

New From Japan!!" According to its flyer, the tachyon is a newly discovered form of energy that "possesses a nature which goes beyond the conventional terms of physics" and is equivalent to "chi" or "ki" in the Orient. The flyer also states that the Tachyon Research Association has succeeded in extracting the tachyon, charging various substances with it, and turning them to practical use. *Tachyon Cells* are used by taping them to the skin. The flyer quotes testimonials asserting that the cells are effective for wrenched, frozen, or painful shoulders, swollen knees, and "abnormal coldness."

The Speakers

Before the "festivities" began, I took a front seat. To my left sat a pathologically obese man whose name badge indicated he was a dentist and whose behavior suggested narcolepsy. On my right an elderly woman eyed my note-taking suspiciously while she gabbed about root canals, Atkins' radio program, and a turkey sandwich she had bought at a GNC store that morning.

On both days, the symposium program kicked off with a brief welcome from Atkins, whom FAIM's executive director and lobbyist Monica Miller introduced as "our guiding light." Atkins, who looks overweight, opined that "freedom of choice" in matters of health should be a major political issue. "When we get our potentially terminal illness, or when we get an illness which is going to be able to debilitate us," he said, "this is where we need to be able to make that intelligent choice. Now, the reason that we don't have freedom of choice is that there are too many people in our country that don't even perceive that there are other choices." He ascribed this "lack of awareness" to the media's and politicians' reliance on physicians "connected with some trade organization such as the American Medical Association."

FAIM, he said, "may be growing at a rate so rapidly that it will become the predominant organization in the country for the principle of freedom of choice." He then complained about pressure placed on the nutritional supplement industry and about FDA "Gestapo raids" to enforce labeling laws.

Nutrition Forum (ISSN 0748-8165) is published bimonthly by J.B. Lippincott Company, 100 Insurance Way, Suite 114, Hagerstown, MD 21740. Business offices are located at East Washington Square, Philadelphia, PA 19105. Printed in the U.S.A. Copyright 1991 by J.B. Lippincott Company. Annual Subscription Rates: U.S. \$40.00 individual, \$50.00 institution; all other countries except Japan, India, Nepal, Bangladesh, and Sri Lanka, \$45.00 individual, \$55.00 institution. Single copies \$9.00. Rates for airmail delivery available upon request. Lippincott, 100 Insurance Way, Suite 114, Hagerstown, MD 21740, or call 1-800-638-3030; in Maryland call collect 301-714-2300. In Japan, USACO Corporation, 13-12, Shimbashi 1-chome, Minato-Ku, Tokyo, 105 Japan. In India, Nepal, Bangladesh, and Sri Lanka, Universal Subscription Agency Pvt. Ltd., 101-102 Community Centre (F.F.) Saket, New Delhi-110017, India. Subscription rates in Japan: 10,500 yen individual, 12,700 yen institution (includes airmail postage). Copies will be replaced without charge if the publisher receives a request within 60 days of the mailing date in the U.S. or within 5 months in all other countries.

Editorial correspondence should be sent to Stephen Barrett, M.D., P.O. Box 1747, Allentown, PA 18105.

POSTMASTER: Send address changes to Nutrition Forum, P.O. Box 1550, Hagerstown, MD 21740.

Atkins related the story of a 53-year-old man with lung cancer who had recently gone to Memorial Sloan-Kettering Hospital, where he had been offered only one mode of therapy: radiation. Subsequently, said Atkins, he had offered the man at least 20 treatment options, "all from the field of complementary medicine, all of them using a different model." The next day, Atkins said, the man "looked like he was cured."

Atkins did not say whether he had treated the patient, but he implied that the patient's improved appearance had resulted from introducing hope and a consequent change in attitude. The aim of cancer therapy, Atkins suggested, should be to "just treat the underlying condition—the terrain." He then said that perhaps a "new medical science called 'terrainology' . . . should be our new banner."

Atkins then exhorted the attendees to scout and recruit new members, estimating FAIM's current membership at 1,600. "I'm looking for 10,000 by the end of 1991. I want to show that growth pattern to the politicians. I want . . . people [to] recognize that here is a political force . . . to be reckoned with." He solicited volunteers for a membership expansion committee.

The first talk, on "Women's Health," was delivered by macrobiotics aficionado turned eclecticist Christiane Northrup, M.D., a clinical assistant professor of obstetrics and gynecology at the University of Vermont, immediate past-president of the American Holistic Medical Association, and co-founder and director of "Women to Women," a women's health care center in Yarmouth, Maine.

Northrup alluded to studies "now showing that mind is the result of consciousness" and that "consciousness creates the body." She described the immune system as "a liquid mind . . . affected by everything colors, light, vitamins, brown rice." She advised us to think of ourselves as holograms.

Health is "not just about food," she emphasized. "I tell people if they're going to have a prime rib, get a massage; maybe it'll cancel it out." Later she said: "When you have emotions that remain locked in your body, which you do not feel, your need for vitamins is increased."

"Men's and women's physical energy is completely different," she asserted, likening male energy to "heaven's force" and female energy to "earth's energy coming upward . . . into the vagina." She also said that the "chakras" correspond to the major endocrine organs. (In yoga philosophy, the chakras are the seven centers of spiritual energy in the human body.) "The uterus is in the second chakra," she told us, which is "symbolic of relationships, creativity, and security."

Northrup attributed the high incidence of breast cancer in Maine to insufficient sunlight, and fibroid uterus and endometriosis partly to "blocked energy in the pelvis." She stated that "therapeutic touch" accompanies the endometrial biopsies she performs. PMS often recurs, she asserted, if women don't "get in touch with what their mission is here on the planet."

Atkins introduced the next speaker, Harvey Bigelsen, M.D., as "the first professor of terrainology . . . politically, a most important figure to us . . . the man who single-handedly got the first significant bill enabling M.D.'s who had another approach to have the protection of homeopathic boards [in] Arizona, the most conservative state in the country." Bigelsen is the director of the Center for Progressive Medicine in Phoenix, Arizona.

Bigelsen, thin and ponytailed, described himself as a "trained ophthalmologist" who has been in the field of "holistic" medicine for 15 years. "Traditional medicine made no sense to me whatsoever. . . . There was no known reason for disease. . . . There's no rhyme or reason whatsoever to disease. . . . The treatment for the cause and the cure of chronic disease is a 100% failure. . . . That frustrates me. I'm a scientist."

Bigelsen said that thanks to the above-mentioned bill, he has been "allowed . . . to do things that other places couldn't do. . . . My work can be done in the open completely. For the past 10 years, I've been on television out in Arizona, and the establishment cannot do anything about it."

Among other things, he claimed that the length of time an unstained drop of blood can "live" on a microscope slide is an indication of the health of the patient from whom it was drawn. He said his basic philosophy is that "there is a harmony in this universe."

Bigelsen stated that we all harbor the "spore form" of cancer in 20% of our cells. "Twenty percent is fine." But cancer, he said, is on the increase "because of the tremendous pollution of the . . . internal terrain of the body." He expressed beliefs that cancer is contagious and "transferable." Cancer is a mold, he said, and is not spread via the bloodstream or lymphatic system. "I am treating approximately 40 to 60% of my patients for cancer now that don't even know it. They will have it in 5 to 10 years if I don't fix them now." He also stated that HIV is not "necessarily" the cause of AIDS but is an "inhabitant" of the disease.

Next, Atkins introduced Mark Anderson, coauthor of *Empty Harvest*, as "the authority on the subject of what has gone wrong with our planet." Anderson's lecture was titled "How Agricultural Practices Rob You of Health."

"What we have in today's world," he lamented, "is a health-disease paradigm built upon a pharmaceutical-chemical approach [from] which nutritional concepts can't get out. Nutritional insights and understanding find a difficulty in being expressed."

Anderson likened white bread to money without precious metal backing. "This discussion on nutrition gives one the impression that the whole issue can be settled by making the right choices in the supermarket. And it ain't so. I don't care how informed you are. . . . The laws of the universe say you can't make something out of nothing."

He produced a soil sample. "Soil is what makes human

EDITORIAL BOARD

EDITOR: Stephen Barrett, M.D. **SENIOR ASSOCIATE EDITOR:** Manfred Kroger, Ph.D. **ASSOCIATE EDITORS:** Michael Botts, Esq., Darlene Forester, Ph.D., R.D.; Mary Abbott Hess, R.D., M.S.; William T. Jarvis, Ph.D.; James Lowell, Ph.D.; **CONTRIBUTING EDITORS:** John Cunningham, Ph.D.; Johanna Dwyer, Sc.D., R.D.; Kathy King Heim, R.D.; Victor Herbert, M.D., J.D.; James J. Kenney, Ph.D., R.D.; Barbara Levine, Ph.D., R.D.; Kathleen A. Meister, M.S.; Grace Powers Monaco, Esq.; Anita Owen, R.D., M.A.; Jack Raso, M.S., R.D.; Sheldon Rovin, D.D.S., M.S.; Varro E. Tyler, Ph.D.; Eleanor N. Whitney, Ph.D., R.D.; Eleanor A. Young, Ph.D., R.D.; Jack Z. Yetiv, M.D., Ph.D.; and staff members of The Pennsylvania State University Nutrition Information and Resource Center.

beings healthy, because soil is what makes plants healthy. Plants don't grow in supermarkets." He called modern farming "the art of killing."

"If the food was organically grown, it's not the fact that it lacks pesticides that's so important. It's the fact that the food survived without pesticides. That means the farmer had to invest his skills, time, and money into regenerating, revitalizing, the basis of plant growth—soil, not oil."

"Whatever happens anywhere," he said, "happens everywhere, eventually. . . . This is the global consciousness of personal health, that my health is inexorably linked to what is happening as the forests of Tibet are cut down." He pronounced vitamins "the greatest health discovery of the 20th century," because they "finally proved that there was a cause of health."

Having referred earlier to Bigelsen's description of cancer as a mold, Anderson stated that fungi living in the human body yield "nature's verdict upon the quality of health of our tissue. If it is hungry, starved, and diseased, it deserves to be attacked."

"Bacteria and fungus are not the enemy. They are just showing us that we are deficient. Consequently, they are cleaning us out, removing the dying, weak, necrotic tissue. This is the great failure of the germ theory of medicine."

"Artificial chemical fertilizers," Anderson concluded, "are the great seduction of the 20th century that have led to the ruination of the human species."

Hal Huggins, D.D.S., lectured on "Amalgams and Root Canals." He stated that if "negative-current" fillings are removed first, the patient gets better, but if "positive-current" fillings are removed first, the patient gets worse, "and the reason for that is so obvious, I'm not going to bother to go into it with you."

Huggins said that dental diseases include "the incurables and the unexplained" such as chest pains, depression, and suicidal thoughts. For "calcium imbalances," he said he prescribes not calcium supplementation but massage therapy.

He stated he has two psychologists on his staff who are very important because "when you take out the fillings, you start releasing people's emotional problems." Suicide, he declared, "is such a big part of the amalgam issue." He also said that root canals are dangerous and that he has seen dramatic changes in people whose teeth containing root canals had been removed. He said he couldn't explain their improvement but that acupuncture meridians might be involved.

Atkins stated that he had chosen the next speaker—Michael Weiner, Ph.D., author of 15 books, including *Weiner's Herbal* (1982)—because "herbal medicine is every bit as important as nutritional medicine as one of the cornerstones of complementary medicine." He said Weiner's doctorate was in "Nutritional Ethnomedicine." The University of California at Berkeley awarded it, he added. "And when they found out what he did with it, they decided they were never going to issue another one. Because what he did with it was create an herbal revolution." Like Atkins, Weiner hosts a radio talk show ("Dr. Weiner's Herb and Nutrition Hour") on WOR. He also is "director of scientific affairs" for Nature's Herbs, of Orem, Utah, which sponsors the program.

Weiner told us: "Much of what you have learned to incorporate in your life is already in the scientific literature. It is just not promulgated by your healer, in general."

"Trial and error," he said, "is an incredible system,

because if [a substance] works, it tends to be used over and over again. If it kills the patient, it's not used any more. . . . I wish some of the people using chemotherapeutic agents used trial and error." The audience applauded.

Later he stated: "I've been using vitamins since I got converted to vitaminology 20 years ago by many leaders in the field, most of whom are in this room, and of course my granddaddy Linus Pauling. And I've always taken megadoses of many nutrients, particularly vitamin C. But about 3 weeks ago, I—Father Earth himself—got sick. Isn't that terrible." He said that when vitamin therapy had proved ineffective, he had panicked slightly. But taking one capsule of a particular herb had made his flu disappear instantly.

Let's Live columnist Jonathan Wright, M.D., then shared his "Pearls from a Complementary Physician's Notebook" and recommended *The National Enquirer* as a source of medical information. He appeared short of breath throughout his talk.

"One of the things that we like to know about if we happen to have a cancer and we're undergoing any sort of a treatment is, how am I doing. Of course, those of us who are in deep touch with our bodies might be able to tell that without any sort of a test" and might be "in touch enough not to get cancer in the first place."

"There's an old principle in nutritional and orthomolecular medicine," he said, "namely: if you think a nutrient ought to work . . . and it isn't working . . . before you give it up, inject the stuff."

After Wright finished, Atkins praised him for being open-minded, dedicated, and original.

The Saturday afternoon session concluded with a panel discussion, moderated by Michael Schachter, M.D., a FAIM trustee who is a laetrile enthusiast. When a woman asked Dr. Weiner if one can overdose on herbs, he replied that trial and error is "the only common sense approach because we are going into areas that do not have . . . extensive documentation."

Schachter asked Bigelsen what kinds of "therapeutic maneuvers" he uses in treating his patients. Bigelsen responded (quite unholistically): "I treat the blood, not necessarily the patient." His offerings include the introduction of "debrising germs" into the blood stream, injections of lactic acid to stimulate metabolism, "fetal cell therapy," and "scar therapy," which includes injections into circumcision scars. "You gotta get the pollution out of the body," he explained.

A question regarding the diagnosis of "mercury toxicity" was put to Dr. Huggins. "If the urinary excretion of mercury is very low," Huggins replied, "then we figure the patient has 'retention toxicity.' That is, they're retaining the mercury. If the hair [analysis] shows very low levels of mercury, then this also [indicates] retention toxicity. . . . The low levels of mercury are the ones that scare me a lot more than the high levels." Later he said: "The only time we really recommend removing of amalgams is for people who are interested in their health."

"Once you have gotten the satisfaction of seeing your patients get well," Atkins said in his welcoming address at the Sunday session, "you can't go back to an inferior brand of medicine, which is my name for conventional medicine. I hate to say it, but conventional medicine just doesn't measure up."

Pat McGrady, Jr. was the first lecturer on Sunday. His talk was titled "The Cancer Patient's Right to Live." Atkins said that McGrady "has the broadest fund of knowledge about alternatives which are available to the cancer patient . . . than

any person I've ever encountered." He described McGrady as a best-selling author and operator of a "referral service" for cancer patients.

"If you've played any role in [a] personal war against cancer," McGrady said, "you know that the cancer patient has two enemies: the disease itself and those who exploit this war for their own gain. And the latter may be a more formidable enemy than the former." The cancer patient's enemies, he said, include "do-good" societies, the FDA, the National Cancer Institute, and the American Medical Association. "There is no substitute for freedom of medical choice. It's as important as religion or speech," McGrady declared. "We *should* try to eliminate quackery, but most of it is government-sponsored." He even claimed that new and experimental methods within orthodox medicine have no track record and are unlikely to develop any.

McGrady said he is employed by clients to find therapies that "offer them a chance of extending their survival and improving their quality of life." He stated he talks to 2,000 cancer patients annually. He advised: "Stay away from the quacks in general, but if your kid has a brain cancer, send him to one." With respect to cancer surgery, he pronounced: "The ultimate twitches of the scalpel often produce a grotesque mutilation making a human being almost unrecognizable as such. Many doctors never learn."

Next, during a time slot designated "New Health Products," several exhibitors came forward and hawked wares promoted in the lectures. Kunio Yanagida, a Japanese man representing Tachyon International, said that tachyon energy can be extracted from the atmosphere with a "special device" and used to: power cars, motorcycles, and electric shavers; recharge batteries; turn regular cigarettes into "light" versions; and improve athletic performance.

William Philpott, M.D., a proponent of "magnetic field therapy," was the symposium's last speaker. Atkins introduced

him as "a physician with a nationwide constituency." Philpott said he had practiced medicine for 40 years before retiring in May 1989. He stated he had had a fundamentalist Christian upbringing, had majored in theology, and apparently had been destined to be a preacher.

Philpott said that 70% of people's energy comes from food and that most of the rest comes from the earth's magnetic field. He added that "tachyon energy," which he defined as "gravitational energy," is a "very important" source of energy. He then said that we can "accentuate" the magnetic field through which our blood flows, and thus have "more energy," by following a practice he maintains daily: keeping a magnet in a pocket over the heart. He also recommended sleeping with magnets at the top of the head.

Innovation or Nonsense?

Drs. Petr Skrabanek and James McCormick write in *Follies and Fallacies in Medicine* [Prometheus Books, 1990]:

The claims of systems of alternative medicine all have two things in common. They have no detectable or coherent *raison d'être* other than the enthusiasm of their advocates and, almost without exception, they claim to cure or alleviate a very large number of ill-defined and quite disparate ills.

True scientists regard innovation as a potential springboard for studies that can lead to proof, disproof, or alternate hypotheses. FAIM is using it as a political catchword.

Mr. Raso is Assistant Chief Dietitian at Wyckoff Heights Medical Center in Brooklyn, New York. [Editor's note: The Foundation for Innovative Medicine, an unrelated group with a similar name, is discussed in the question box on page 22.]

BRIEFS

Correction: MR FIT findings. The 10-year follow-up figures comparing the special intervention (SI) and usual care (UC) groups in the Multiple Risk Factor Intervention Trial were reversed in our table on page 8 of the January 1991 issue. The table should have shown that the special intervention group achieved lower blood cholesterol levels and had fewer smokers:

	Baseline		10-year follow-up	
	SI	UC	SI	UC
Cigarette smoking	64%	63%	32%	45%
Blood cholesterol	240	240	228	233

"Overweight rights" verdict overturned. The U.S. Supreme Court has overturned a \$44,000 award to a Sharon L. Russell, who in 1985 was dismissed in from a Rhode Island college nursing program for being too fat. The ruling did not address the merits of the case but returned it on technical grounds to a federal appeals court for further consideration.

Anthology updated. The Dushkin Publishing Group, Sluice Dock, Guilford, CT 06437, has published *Nutrition 91/92*, its fourth annual sourcebook of nutrition articles. Edited by Charlotte Cooke-Fuller, Ph.D., of Towson State University, with help from Dr. Stephen Barrett, the book contains 66 significant articles from newspapers, magazines, newsletters and scientific journals. Single copies are available for \$10.95 plus \$2/order for postage from LVCAHF, Inc., P.O. Box 1747, Allentown, PA 18105.

Dental health confusion. A survey of 1,000 adults has found widespread public ignorance about fluoridation and amalgam safety. When asked, "Do you want your drinking water fluoridated, the responses were: yes, 52%; no, 28%; and don't know, 20%. When asked "Do you think people should have any concerns at all that they might develop any health problems from silver fillings in their teeth, the responses were yes, 48%; no, 37%; and don't know, 15%. The survey, conducted in March 1991, was commissioned by the American Dental Association.

Cholesterol-lowering factor in oats identified. A controlled experiment suggests that the water-soluble fiber *β*-glucan is responsible for the cholesterol-lowering effect of oat products [JAMA 265:1833-1839, 1991]. Six groups of about 20 volunteers following a NCEP Step 1 diet (30% or fewer calories from fat) were given either oat bran or oat cereal at daily doses of 1, 2, or 3 ounces (dry weight) for 6 weeks, while a seventh group received 1 ounce/day of farina, which contains no *β*-glucan. (A cup of dry oatmeal contains 3 ounces.) The groups eating 2 or 3 ounces of oat bran or 3 ounces of oatmeal had the best results. Reprints of the study are available from Michael H. Davidson, 800 S. Wells St., Suite M-25, Chicago, IL 60607. Another study obtained significant results in adults consuming 2 ounces of dry oats during an 8-week period [Am J Public Health 81:183-188, 1991].

Inositol used by drug abusers? Some health food store retailers say they have stopped selling inositol powder because most of it is used to cut cocaine and methamphetamines.

QUESTION BOX

Q. What is a "nutraceutical"?

A. Stephen Felice, M.D., board chairman of the Foundation for Innovative Medicine, coined the term to encompass "nutritional products with disease-related benefits—from diets, dietary supplements and isolated natural substances to genetically engineered designer foods." During the past year, the Foundation's programs have included scientists, attorneys, and health food industry representatives.

Federal laws require proof of safety and effectiveness before products can be marketed with health claims. The FDA's recently proposed regulations for general food labeling will disallow health claims except for a few situations where they are well supported by scientific evidence. According to Dr. Felice, these regulations are "ignoring the importance of nutritional supplements and the potential for significant medical and scientific advances." Current laws provide little or no incentive for industry-sponsored research on foods or food supplements that cannot be patented. He would like the approval process changed so that it is less expensive and permits companies to gain exclusive rights to market products when their research demonstrates health benefits. He also would like a commission to be established to "bring nutraceuticals into the mainstream of the food and research-based pharmaceutical industries."

Felice established the Foundation in 1976. From 1986 through 1989, Dr. Felice wrote a column called "Nature and Medicine" for the trade magazine *Health Foods Business*. He also serves as a consultant to the pharmaceutical and health food industries. [Editor's note: It is not clear to me whether Dr. Felice's proposed changes would benefit the public or weaken consumer protection against claims for supplements based on flimsy evidence.]

Health food store sales. *Health Foods Business* estimates that 41% of sales in health food stores last year were for vitamins and other supplements. Based on its annual survey, the magazine estimated that 7,300 stores grossed \$1.545 billion for these products, down 2% from 1989. Total sales were \$3.776 billion (down 7%), including \$487 million for herbs and herbal teas (down 9%) and \$94.2 million for books (up 13%). Stores with under 3,000 square feet of selling space averaged \$305,457, while those over 3,000 square feet averaged \$1,855,246. Homeopathic remedies accounted for \$86.5 million (5.6%) of the "vitamins/supplements" category.

Health information for travelers. Immunization, prevention of food- and water-borne diseases, and many other practical topics are covered thoroughly in *Health Information for Travelers*, a 164-page booklet updated yearly by the U.S. Centers for Disease Control. Copies are \$5 from the Supt. of Documents, U.S. Govt. Printing Office, Washington, DC 20402.

Gulf war casualties. According to an article in *American Medical News*, "the biggest threat to U.S. forces during Operation Desert Storm was not enemy fire, but food poisoning." More than 600 members of one tactical air wing were stricken with botulism, and other units had serious salmonella outbreaks. Throughout history, more soldiers have succumbed to the effects of food poisoning and water-borne illness than to the ravages of weaponry.

Backhauling attacked. The Sanitary Food Transportation Act has been passed to curb the dangers of "backhauling," where refrigerated trucks or other vehicles are used to haul chemicals or garbage on one trip and food products on the return trip [NF 6:39, 1989]. The U.S. Department of Transportation is now required to issue regulations that establish cleaning and decontamination procedures and restrict the hauling of dangerous products in vehicles used to haul food.

Weight-loss guidelines. A task force working through the Michigan Health Council has developed weight-loss program guidelines that have been endorsed by 45 health-care organizations in the state. Their published report, *Toward Safe Weight Loss: Recommendations for Adult Weight Loss Programs*, can be obtained free from the Center for Health Promotion, Michigan Dept. of Public Health, Box 30195, Lansing, MI 48909.

Food additives booklet. The FDA, in cooperation with the International Food Information Council, has published a booklet describing the role of additives and the federal regulations governing their use. Professionals can obtain copies by writing to "Food Additives," P.O. Box 1144, Rockville, MD 20850.

Notable quote: "... Consumer fraud experts issue this warning: Watch out for dentists who urge you to put up more green to get rid of your silver. ... If you already have silver fillings and are concerned about a medical disorder, by all means see a physician, not a dentist. So get your symptoms checked out—rather than your fillings yanked out."—*Prevention*, April 1991 (an article triggered by *60 Minutes'* unconscionable attack on mercury-amalgam fillings). *Consumer Reports* published a similarly supportive article in its May issue.

Mercury-amalgam news. The FDA has issued a Talk Paper stating that patients should not ask dentists to remove their amalgam fillings. The statement was issued after a panel of

medical and dental experts concluded that no hazard has been demonstrated. In March, a bill to ban the use of mercury in fillings in New Mexico was defeated in committee.

GINKGO EXTRACT: MIRACLE OR ?

Varro E. Tyler, Ph.D.

Ginkgo has been valued in China for its medicinal properties since 2800 B.C., but it is only in the last 20 years that the leaves of this living fossil have been extensively used in Western medicine. The ginkgo tree (*Ginkgo biloba* L.) is truly a relic of the past. Having survived unchanged in China for some 200 million years, it was brought to Europe in 1730 and is now a popular ornamental in parks and gardens everywhere. Because of its toughness, it even thrives along the busy streets in some of our major cities.

Unlike many of the herbs in use today, ginkgo leaves are not used so much in their crude state as in the form of a concentrated standardized extract. In fact, in the past few years physicians in Germany have written more prescriptions for ginkgo extract than for any other drug. During 1988 they wrote 5.24 million prescriptions for just two ginkgo products, Tebonin, manufactured by the Willmar Schwabe Company in Karlsruhe, and rökän, made by Intersan, a subsidiary in Ettlingen.

These preparations are produced from green-picked leaves that are dried, milled, and extracted with an acetone-water mixture under partial vacuum. After the organic solvent is eliminated, the extract is processed, dried in a microwave oven, and standardized. The final product is adjusted to a potency of 24% flavonoids (mostly flavonoid glycosides and quercetin) and 6% terpenes (principally a unique group of diterpenes known as ginkgolides). Marketed in both solid and liquid form, the tablets or capsules contain 40 mg of the extract each. Similar products are sold over the counter in health food stores in the United States under the trade names *Ginkgold* (Nature's Way, Springville, UT), *Ginkgo-Power* (Nature's Herbs, Orem, UT), *Ginkgo Biloba* (Indiana Botanic Gardens, Hammond, IN), and several others. *Ginkgold* is the American name of the standardized Schwabe product, which has been subjected to extensive pharmacologic and clinical testing in Europe.

Although ginkgo extract is reputed to have a number of beneficial effects on the circulatory system and as an antiasthmatic, the ailment that is probably responsible for most of its widespread popularity is that of decreased cerebral blood flow, particularly in geriatric patients. The various conditions associated with such vascular insufficiency, ranging from short-term memory loss, headache, tinnitus, and depression to outright senility, are purported to be amenable to ginkgo therapy. An impressively bulky body of literature—including two volumes totalling 1,715 pages containing 167 papers by hundreds of scientists—has been published on the various chemical and biologic aspects of the ginkgolides. In addition, some 300 clinical and pharmacologic studies attest to the extract's ability to cause vasodilation and improved blood flow both in the arteries and capillary vessels. Indications also exist that ginkgo extract has useful properties as a free-radical scavenger. Large doses of the extract are required, especially in serious cases, which explains why a concentrate is used rather than the herb itself.

Despite the apparent success of ginkgo as a treatment for peripheral vascular and organic brain syndromes in elderly people, the drug has not been without its detractors. Under German law, the efficacy of drugs is based on a doctrine of "reasonable certainty" rather than one of "absolute proof," as required in the United States. In 1989, a critique of 48 preclinical and clinical studies of the effectiveness of ginkgo extract was published by pharmacologist Peter S. Schönhofer and three colleagues at the Bremen Central Hospital. They concluded that all of the studies were deficient in one or more important aspects and failed to substantiate efficacy of the drug.

This created enormous controversy, and many of the investigators whose work had been criticized wrote letters of rebuttal to the publisher of the journal *Internistische Praxis*. A single such letter was eventually published about a year later,

Dubious Claims Made by Ginkgo Promoters in the United States

Claims	Facts
According to records dating back to 2,800 B.C., the Chinese were the first people to explore ginkgo's extraordinary medicinal properties. The Chinese made preparations of dried ginkgo leaves to treat many of the symptoms of advancing years such as poor circulation, memory loss, and general mental deterioration.	There is little evidence to support this claim. The seed of the ginkgo plant was, and still is, used by the Chinese primarily in the treatment of tuberculosis, asthma, and coughs. Substantiation of any significant internal use of leaf preparations by the ancients for circulatory disturbances is lacking. Such use apparently dates from about 1970. It has not been proven that ginkgo can do this.
Ginkgo extract may offer significant protection against the development of Alzheimer's disease and strokes.	
Ginkgo extract will reverse the aging process.	There is no valid scientific or clinical evidence that this drug can reverse the aging process.
When you purchase this hard-to-find product, you can look forward to a healthier—and possibly even longer—life.	Ginkgo products are not hard to find and are sold in most health food stores in the United States. Ginkgo extract is the most prescribed drug in Germany today. The claim that it increases longevity is false and irresponsible.

but even then, the editors allowed Schönhöfer the final word in which he repeated his allegations of ineffectiveness. Additional rebuttals of his criticism were, however, published in *Der Kassenarzt* in 1990. At least two court actions also took place. In deciding one in favor of Schönhöfer on the grounds of freedom of scientific expression, the court in Hamburg was quick to note that it was not passing judgment on the utility of the product.

My detailed reading of many of the papers involved and study of the various claims and counterclaims has led me to conclude that the allegations of Schönhöfer and colleagues are not well substantiated. Probably every scientific or clinical study ever conducted has certain deficiencies, but it is highly unlikely that 48 of them carried out by qualified and reputable investigators on a single drug would be so deficient as to render their results totally invalid. The more likely reason for such a judgment is that the evaluators used unreasonable standards.

My conclusions on ginkgo extract will probably not bring great joy to either party in this controversy. I believe that the opinionated conclusions of Schönhöfer et al. should never have been published without far more careful peer review than they apparently received. An enormous volume of research appears to substantiate some efficacy for ginkgo extract as a treatment for various circulatory conditions. Assuming this to be true, I

also believe the Schwabe organization should have made greater efforts to market their product as an approved drug in the United States, instead of allowing health food stores to sell it as a food supplement with no labeled claims. Since the product is extremely profitable, the manufacturer would have been well advised to undertake the expense of proving its safety and effectiveness to the Food and Drug Administration. Otherwise, in this country, it falls in the present never-never land of unproven herbal remedies, a category in which it probably does not belong.

Presumably, Schwabe failed to take such a step because of patent difficulties and cost considerations. If so, this is a telling argument for modification of the food and drug laws to allow the marketing of such phytomedicines with proof of safety and traditional claims of utility but without absolute proof of efficacy. The latter procedure is simply too costly unless patent protection can be assured, a difficult-to-impossible process for ancient plant remedies.

Dr. Tyler is a professor of pharmacognosy (the science of medicines from natural sources) at Purdue University and author of *The New Honest Herbal*, an evaluation of popular herbs.

BOOK REVIEW

Title: The Cancer Industry: Unraveling the Politics (1989)

Author: Ralph W. Moss

Publisher: Paragon House, New York

Price: \$21.95

Reviewed by: Saul Green, Ph.D.

Mr. Moss would like you to believe that research institutions, hospitals, medical associations, government agencies, foundations and large corporations—which he calls “the cancer industry”—suppress innovation to maximize profits. Many of the book’s allegations are repeated from a 1980 edition titled *The Cancer Syndrome*. Both versions have been carefully contrived to promote distrust and fear of scientifically based cancer treatment.

The first part of *The Cancer Industry*, entitled “Proven Methods (That Often Don’t Work)” —is intended to undermine confidence in scientific methods. The second part, which occupies half the book, promotes the gamut of “unproven therapies.” The final two parts expound Mr. Moss’s opinion that “the direction of cancer management appears to be shaped by those forces financially interested in the outcome of the problem.” He even claims that big business is so powerful and so determined to make money that it has blocked scientists and government agencies from paying more attention to cancer prevention.

Readers unacquainted with the facts may find Moss’s arguments disquieting, if not persuasive. My reaction was quite different. Having personal knowledge of many of the events he described, I found reading his versions very painful. Although the book is loaded with carefully selected facts, it is also loaded with distortions and misrepresentations. For example:

- Insinuating that an executive-level position made him privy to the inner workings at Sloan-Kettering Institute, Moss

represents that he was assistant director of public affairs at Memorial Sloan-Kettering Cancer Center during the mid-1970s. However, documents I have from Sloan-Kettering officials indicate that his only title was “science writer.”

- Moss suggests that a Sloan-Kettering researcher, Kanematsu Sugiura, found that laetrile was effective against cancer in mice and that his work was never repeated or refuted. The book fails to mention that at least six major cancer research institutions did repeat Sugiura’s experiments and had negative results.

- Moss endorses the work of the late Dr. Virginia Livingston-Wheeler, who claimed that cancer is caused by a bacterium she named *Progenitor cryptocides*. He neglected to mention that scientists do not believe her hypothesis because there is no proof that the organism exists. Neither Dr. Wheeler nor anyone else has been able to produce a cancer by injecting her alleged organisms into experimental animals. Independent researchers have found numerous cases where cancer tissues did not contain the organism. In addition, cultures of “*Progenitor cryptocides*” from Dr. Wheeler’s own laboratory, which were grown in other laboratories, turned out to be common forms of *Staphylococci* that inhabit the skin.

Mr. Moss appears to feel no need to question any assertions or possible motives of those whose work he extols. He is apparently content to regurgitate the tales they tell about themselves, their experiences with patients, and their scientific ability. The book is dangerous because it may induce desperate cancer patients to abandon sound, scientifically based medical care for a worthless “alternative.”

Dr. Green is a biochemist who did cancer research at Memorial Sloan-Kettering Cancer Center for 23 years.

ORGANIC FOODS GET GOVERNMENT "BLESSING" DESPITE CLAIMS THAT AREN'T KOSHER

Marilynn Larkin

My infatuation with the organic foods movement ended shortly after it began—during the late '60s—and the foods I've been eating since are doing all they should to keep me alive and well. Yet through all these years, "true believers" have not only kept the folklore alive but have mesmerized a new generation of activists. The result: last year an organic certification provision wormed its way into federal law. By passing the provision, Congress appears to have legitimized what science has debunked.

The U.S. Organic Foods Production Act of 1990—Title 21 of the 1990 Farm Bill—calls for: certification standards set by the U.S. Secretary of Agriculture; a 15-member National Organic Standards Board to suggest guidelines; a National List of substances permitted or prohibited for organic use; certification of organic farmers, processors, manufacturers and wholesalers; labeling and record-keeping requirements; collection of fees from producers, certifiers, and handlers; and civil penalties of up to \$10,000 for violations.

The danger of all this to consumer confidence and pocketbook was apparent when I attended the Third National Conference on Organic & Sustainable Agriculture Policies, held on February 15-16, 1991, at the Ramada Renaissance Hotel in Washington, D.C. Co-sponsored by the Center for Science in the Public Interest (CSPI), the Institute for Alternative Agriculture, and the Texas Department of Agriculture, the meeting was rife with criticism of the way our food is grown, processed, and inspected.

Diverse Bedfellows

A more appropriate title for the gathering would have been Sustainable/Alternative/Organic Agriculture, since "organic" certification is only a small part of a much larger agricultural reform picture. But after years of operating in their own little spheres of influence, the organic folks have acquired new allies, a loose coalition of agricultural and business interests that don't necessarily subscribe to organic mythology, but

want Congress to allocate money for research into more cost-effective ways to produce certain foods. The alliance includes farmers and agricultural conglomerates seeking to use smaller amounts of pesticides and fertilizers to produce the same crop yields; biotech companies that stand to profit from the development of herbicide-tolerant and engineered plants; and environmental and consumer groups, including Consumer Federation of America, that are concerned with possible adverse effects of pesticide residues on human health and the environment. Another major player was CSPI, which lobbied and urged readers of its publications to ask their legislators to support the bill.

Two baby food companies have announced plans to market lines of processed organic foods, and supermarkets are willing to cater to an organic food market segment—if this is profitable. But most large food companies seem to have a wait-and-see attitude. "We invited them to participate," said conference manager Beth Zimmerman, "but they weren't interested."

Terms Ill-Defined

The supporters of "organic & sustainable agriculture" actually are so diverse they barely speak the same language. Definitions of key terms appear to be up for grabs.

"Sustainable agriculture" is probably the easiest to define. It is said to mean growing food in ways that are economically viable and preserve the environment (i.e., soil must in some way be replenished and protected from erosion, so it can sustain crops in coming years). How this differs from what sensible farmers have always done is not exactly clear.

"Alternative agriculture," according to a 1989 report by a committee of the National Academy of Sciences, represents "a spectrum of farming systems, ranging from organic systems...to the prudent use of pesticides or antibiotics...to integrated pest management, crop rotations...and tillage and planting practices that reduce soil erosion and help control

weeds." Proponents often use the terms "sustainable" and "alternative" interchangeably, despite the fact that "sustainability" is a goal and "alternative agriculture" an alleged way of achieving it.

Figuring out what is meant by "sustainable" and "alternative" is simple compared with getting a handle on the term "organic." Does it refer to the food itself or food production techniques? Does it mean no chemicals are used? Or fewer chemicals than are used now? Does it embrace old-style farming methods, such as crop rotation? Or new-style (e.g., herbicide-tolerant) plants?

The lay understanding is that no synthetic fertilizers or pesticides are used in growing or handling "organic" foods. The scientific viewpoint is that since "organic" means "carbon-containing," the term itself is superfluous because all foods contain carbon atoms. Scientists have also pointed out that the fertilizer source makes no significant difference because the vitamin content of fruits and vegetables is determined primarily by their genes. (True, the mineral content can vary a bit with that of the soil, but this has no significance in the overall American diet.) Studies also have found that the pesticide levels in foods labeled organic are similar to those that are not—and are insignificant anyway. Moreover, it is clear that many producers calling themselves "organic" use all sorts of chemicals when the spirit (or economic necessity) moves them to do so. The situation is no less murky when it comes to defining "organic" meat and poultry products.

The new legislation attempts to offer the best (or worst, according to purists) of both worlds. A few chemicals can be used here but not there. Chemicals on the National List will be okay—but wait, the list is being revised. It's all right to use "botanical" pesticides—meaning natural pesticides derived from plants—but tests should be done to be sure the resulting organic products "don't contain any pesticide residues or natural toxicants." But don't produce and meat contain natural toxicants? Of course—although the amounts usually are too small to cause detectable harm. Mother Nature makes them that way. Indeed, according to biochemist Bruce Ames, Ph.D., herbs, spices and other plants contain naturally occurring toxicants thousands of times in excess of the occasional traces of synthetic toxic pest control agents used in agriculture.

Things get even murkier when it comes to processed foods. If these items "contain at least 50% organically produced ingredients by weight, excluding water and salt," the word "organic" will be permitted on the principal display panel, the new law says, but only "for the purpose of describing the organically produced ingredients." If they "contain less than 50% organically produced ingredients by weight, excluding water and salt," then the word "organic" can be used on the ingredient listing panel. *Et cetera.*

At the conference, all sorts of definitions were bandied about for organic foods. Varying percentages of organic ingredients were quoted as necessary before a processed food could be called "organic," and there was little agreement on the techniques to be incorporated into alternative/organic agriculture. The advocacy magazine *Organic Farmer* has even

devoted most of its Winter 1990 issue to the topic, highlighting no less than four lengthy definitions for use "as a basis for discussion." If the proponents can't figure it out, what's the consumer to make of it all?

How Congress Got Involved

How did Congress get involved in this nonsense? In 1985, when proponents began lobbying for sustainable agriculture, the "organic" people were shunned as a "fringe" element by mainstream agricultural interests. But after the 1989 Alar scare—which shook consumer confidence in our food supply—the "gung ho organics" people gained political clout. Patrick Leahy, senator from Vermont, chairman of the Senate Agriculture Committee and ardent environmentalist, started pushing for the certification provision's passage.

"Leahy got democratic senators to support the organic provision from an environmental perspective, since it meant using fewer pesticides," said Sandra Schlicker of McMahon and Associates, Washington lobbyist and consultant to the Rodale Institute, in a preconference interview. "The other key point was that certification is supposed to be self-supporting." Bolstered by mail and phone calls stimulated by proponent organizations and the "health food" press, the provision passed handily in the Senate.

In the House, opposition on economic grounds was countered with the argument that "farmers will pay for the organic seal like producers pay for the kosher seal." Once the issue of cost was downplayed, lobbyists "appealed to House members' commitment to the free enterprise system," Schlicker said. "We figured, it's just one more choice for consumers, so why not put it in?" Not everyone was persuaded—so organic devotees added a crowning touch. "On the morning the provision was due to come up for a floor vote, a six-pack of organic juice and a box of blueberries were delivered to each member of the House," Schlicker said. The U.S. Department of Agriculture had expressed strong opposition to the provision. But, according to a blow-by-blow account in *Organic Farmer*, passage was secured by a "massive" telephone campaign

Nutrition Forum (ISSN 0748-8165) is published bimonthly by J.B. Lippincott Company, Downsville Pike, Route 3, Box 20-B, Hagerstown, MD 21740. generated by a coalition of 24 environmental, consumer, and farm groups.

The Real Costs

It's highly unlikely that certification costs will be 100% or even 75% "user-borne," as proponents would have us believe. The USDA was supposed to appoint the standards board by May 28, 1991, but the agency's 1991 budget was appropriated before the new law was enacted. If and when directives are issued, the states would then have to decide how to comply. Rather than magically gearing up to implement a national program's requirements, most states will have to bear the expense of startup costs, transitional costs (for programs already in place), and ongoing costs of monitoring the program.

Even consumers who never bite into an "organic" apple are likely to foot part of the bill. Currently, about half the states use some system of organic certification. Those that run their own program have administrative costs. Those that hire private organizations (such as the National Organic Farmers Association) to "certify" the products pay the organization and bill the farmers. However, there are upwards of 30 such organizations, each with different certification criteria and fee structures. Who will pay to get everyone in sync?

The best estimate I could get from panelists concerning current certification costs to the farmer is 2% of gross sales. Yet proponents agree that once national standards are in place, costs will be higher. Ironically, small farmers—who are among those pushing hardest for national certification—are the ones most likely to be driven out of business if the program actually comes to pass!

Is All This Really Necessary?

The endorsement of an organic certification program is something far worse than pinching pocketbooks. By passing this provision the government has, in effect, given its "blessing" to organic food. Unlike the kosher food blessing, however, this legislative sanction casts aspersion on the food we've been happily and healthfully eating up to now. The mere existence of the provision in the Farm Bill implies that it's something necessary and desirable. If organic foods are strictly regulated, won't that mean they're better than conventionally grown foods, which don't require a special label? A logical thought—and apparently what the conference organizers want us to believe.

Brave New World?

"Am I being hopelessly romantic if I envision a day when farmers will be held in the same esteem as the medical

profession?" enthused Katherine Clancy, professor of human nutrition at Syracuse University, in the first day's keynote address. Biotechnology is turning agriculture into an industry that will soon yield only "biomass, not crops," she continued. The "reductionist efforts" of the food processing industry are giving us "imitation food," she claimed, composed of "ingredients that never resided on a farm," that are "genetically engineered" and "factory-made." The audience ate it up.

One brave soul stepped up to the microphone, albeit apologetically, and admitted to Clancy that he's lactose-intolerant. It seems the food industry actually did something good by figuring out a way for him to enjoy the nutritional benefits of dairy products. Was the organic movement going to take that away from him?

"We're not talking about LactAid," Clancy replied quickly. "We're talking about saccharin and other imitation products that don't have an agricultural base." (Oh. So sometimes "factory-made" is okay. Curiouser and curiouser.)

Safety and Nutritional Claims

Many of the 400 or so attendees looked like fresh-faced kids and former '60s activists—foot soldiers of the organic faction—who were there to celebrate their provision's passage. In the hallways between sessions, I heard many of them extol the supposed virtues of "organic" food. But in a private interview, conference coordinator Roger Blobaum, director of CSPI's Americans for Safe Food (ASF), was more guarded in his assertions. "No one is making any nutritional claims for organic food and very little is being said in terms of food safety," Blobaum said. Two groups of people support organic certification, "those concerned with safe food and the environmental people," he added. People who view it as an environmental issue aren't that concerned about pesticide residues, "they're more concerned with how food is produced and its impact on the environment."

And the safe-food faction? "There isn't any safe level for a carcinogen. It depends on how much risk you want to take," he said with a look that implied only an idiot would want to take this risk. "After all, FDA tests only pick up 40% of pesticides. And there are no standards or testing for neurotoxins, which kill by affecting the nervous system." The nervous system of insects, you mean? "Yes, that's how they kill. And they can have the same effects in the body." Seeing my skeptical look, he became conciliatory. "We're not saying that everybody should quit using pesticides or get all the residues out. Just move away from chemical use," he said. "We don't contend organic food is residue-free. It's a production claim that says food was grown in this way, with these inputs."

EDITORIAL BOARD

EDITOR: Stephen Barrett, M.D.; SENIOR ASSOCIATE EDITOR: Manfred Kroger, Ph.D.; ASSOCIATE EDITORS: Michael Botts, Esq.; Darlene Forester, Ph.D., R.D.; Mary Abbott Hess, R.D., M.S.; William T. Jarvis, Ph.D.; James Lowell, Ph.D.; CONTRIBUTING EDITORS: John Cunningham, Ph.D.; Johanna Dwyer, Sc.D., R.D.; Kathy King Helm, R.D.; Victor Herbert, M.D., J.D.; James J. Kenney, Ph.D., R.D.; Barbara Levine, Ph.D., R.D.; Kathleen A. Meister, M.S.; Grace Powers Monaco, Esq.; Anita Owen, R.D., M.A.; Jack Raso, M.S., R.D.; Sheldon Rovin, D.D.S., M.S.; Varro E. Tyler, Ph.D.; Eleanor N. Whitney, Ph.D., R.D.; Eleanor A. Young, Ph.D., R.D.; Jack Z. Yetiv, M.D., Ph.D.; and staff members of The Pennsylvania State University Nutrition Information and Resource Center.

Although Blobaum sounded moderate with respect to pesticide use, a flyer in ASF's information packet did not. Entitled "Truth in Produce: Maine's Successful Effort To Keep Consumers Informed," it begins:

Wouldn't it be nice if you could read a label and find out which pesticides were used on that tomato or carrot you're thinking of buying? In fact, some pesticides *are* listed on a label. By federal law, pesticides applied to produce "post-harvest" have to be listed on the *shipping container*. Post-harvest pesticides, typically fungicides used to preserve fruits and vegetables shipped long distances, are worth worrying about. Some are carcinogenic. Some are mixed or sealed in by waxes applied to fruits and vegetables. That means they can't be washed off. By reading the label, you could choose between fruits and vegetables that have had pesticides applied after harvest and those that have not—like locally grown produce, which isn't shipped long distances. Or certified organic produce, which can't be treated with any synthetic pesticides.

Not quite. For one thing, the risk from postharvest pesticides is minor. For another, some synthetic pesticides may make the National List. Do you think ASF or the organic food movement itself could survive without fearmongering?

Rampant Ignorance

"The EPA says two people in my neighborhood will die from pesticides in food," said Mary Blehm, of Mothers and Others for Safe Food—one of the groups that orchestrated the Alar scare—as she begged me to read their book called *Pesticide Alert*. "At least I'm feeding my children food they'll grow from instead of food they won't grow from," she added.

I asked an EPA toxicologist to explain to another "safe food" advocate how EPA tolerance levels are determined. The young woman's eyes glazed over during the explanation. "I

don't really understand any of that," she said with an ingratiating smile. "But it's nice to have other opinions."

If the foot soldiers are ignorant about science, their leaders help keep them in the dark. During one panel, a young woman stood at the microphone and stated she "hadn't heard enough during the conference about the nutritional benefits of organically grown foods." This statement generated applause from the audience, but no comment from the podium. Why were the panelists silent? Most were aware no nutritional claims could legitimately be made. I assume they also knew that the National Research Council of the National Academy of Sciences recently recommended that Americans increase their consumption of fresh fruit and vegetables, noting that the potential benefits of eating more produce greatly outweigh any risk from exposure to pesticide residues. Perhaps the panelists didn't want to risk cooling the troops' fervor with a dose of reality.

Expensive Food

In her keynote address, Clancy acknowledged that "agriculture can't be sustainable without addressing [the issue of] hunger." Yet organic proponents, who never seem to miss an opportunity to flaunt their social conscience, don't flinch at the extra cost of organically grown foods. While advocates claim the premium runs only 5 to 30% above that of conventionally grown items, marketplace studies suggest otherwise. *Organic Market News*, for example, reported that on September 22, 1990, organic wholesale prices and Los Angeles terminal market prices for selected vegetables were as much as 183% higher for organic produce (in this case, eggplant). And carrots, cauliflower, corn, kale, russet potatoes, yellow squash, and zucchini all cost more than twice as much as their conventionally grown counterparts. Clearly, organic foods are not destined to feed the masses.

Hillary Hinds Kitasei, a panelist whose listed credential was her membership in the League of Women Voters in Croton-on-Hudson, NY, admitted that groups such as the organic co-op she belongs to "discriminate" against people who can't afford the time to do their share in the co-op or the expense of

PUBLIC ATTITUDES TOWARD "ORGANICALLY GROWN" FOODS*

Question	Yes	No	Not Sure
Have the reports in the last year regarding the use of pesticides and other chemicals made you change your eating habits?	30.7%	69.1%	0.2%
Have the reports caused you to seek out organically grown produce or produce grown with limited use of chemicals?	28.3%	71.0%	0.7%
On the whole, would you say the federal government does a good job of protecting consumers from pesticides and other chemicals in fruits and vegetables that may be potentially harmful?	46.5%	48.2%	5.2%
Have you ever eaten organically grown fruits and vegetables, that is, fruits and vegetables grown without pesticides or synthetic chemical fertilizers?	57.6%	38.2%	4.0%
Would you buy organically grown fruits and vegetables if they cost the same as other fruits and vegetables?	84.1%	13.2%	2.7%
Would you still buy them if they cost more, or not? (Asked of those who answered yes to the above question)	52.1%	29.7%	18.2%

*Adapted from The 2nd Annual Organic Index, a Louis Harris Poll conducted for Organic Gardening (a Rodale Press publication). Data based on 1,250 telephone interviews conducted between November 6 and December 13, 1989. Of those who had eaten organic foods, 64.7% said the most important reason was long-term health effects. However, 60.7% said they believed they were more nutritious.

a baby-sitter. That didn't stop her from exhorting the attendees to keep fighting for their cause, and to remember "the latent force of feminism in middle-class women and its power to move this country."

Although Ms. Kitasei can afford to revel in her self-proclaimed "political and spiritual revolution," most people can't. Will organic foods become the elitist fare of a chosen few destined to live a long, healthy life? More likely, the chosen few will enjoy only the dubious honor of spending more for their meals. Or, suggests Dr. Manfred Kroger, "if America's poor are scared away from conventionally grown agricultural products, organic foods might even go down in history as one of the cruelest hoaxes ever perpetrated on the poor."

What Should Be Done?

It would be foolhardy, however, to dismiss organic enthusiasts as naive but benign. At the conference, Eileen van Ravenswaay, Ph.D., a professor in Michigan State University's Department of Agricultural Economics, released preliminary results of her survey of consumer attitudes toward food purchasing. She and a colleague conducted the survey by mailing questionnaires to 2,200 households throughout the U.S. Of 906 primary shoppers who responded, nearly 60% said that fresh fruits and vegetables are likely to contain pesticide residues and

about one fourth said residues pose an extremely high health risk over a lifetime. The survey also found that many shoppers would be willing to pay more for foods with labels stating the items had been tested and met some kind of standard. It wouldn't matter much whether the labels stated "pesticide-free," "no detectable levels of pesticide," or "no residues above federal limits." Most produce already meets federal standards, but the survey suggests that the public either doesn't know about government food safety programs or doesn't trust them. Similar public concerns were expressed during a Louis Harris Poll conducted during 1989.

"Organic certification" isn't the answer. It will merely create more confusion and distrust in the marketplace. Foods certified as "organic" will neither be safer nor more nutritious than "regular" foods. They will just cost more. Instead of spending money to legitimize nutrition nonsense, our government should do more to attack its spread.

Ms. Larkin, a former contributing editor of *Health* magazine, is a freelance writer in New York City. In 1985 she received a first-place award for consumer journalism from the National Press Club.

"Organic Foods—A Scientific Status Summary" is available for \$1 from the Institute of Food Technologists, 221 North LaSalle St., Chicago, IL 60601. "The Guide to the U.S. Organic Foods Production Act of 1990," a 23-page booklet prepared for the Organic Foods Production Association of North America, is available for \$10 from its author, Stuart Fishman, 5628 S.W. Miles Court, Portland, OR 97219.

BRIEFS

Anorexia nervosa lowers bone density. A study of 27 anorexic women has found that their bone density had been decreased by malnutrition and did not reverse rapidly when they recovered. The researchers fear that anorexia during youth may adversely affect bone strength throughout adulthood and constitutes a risk factor for the premature development of fractures due to osteoporosis [*JAMA* 1991;265:1133-1138].

FDA may toughen enforcement. It has been FDA policy since 1969 that the use of the term "fresh" with any food that has been heated or chemically processed is false and misleading. When the agency asked Procter & Gamble to stop representing that its juice made from frozen concentrate is "fresh," the company said it would not remove the words "Fresh Choice" from its Citrus Hill orange juice label without a guarantee that other manufacturers would have to take similar action. But the company relented after U.S. marshals impounded 24,000 half-gallon cartons of the juice at a Minneapolis warehouse. Ragu Foods, which also has been warned by the FDA, then agreed to stop calling its heat-processed pasta sauces "fresh." Referring to the Citrus Hill impoundment in an interview in *American Druggist*, the new FDA Commissioner, David A. Kessler, M.D., J.D., said he intends to end the FDA's reputation as a "paper tiger" that sends letters but is slow to enforce regulations. The National Consumers League helped stimulate the agency's action.

Guar gum warning proposed. In response to reports of esophageal obstruction following ingestion of guar gum tablets, the FDA has proposed a warning label on all OTC drugs containing guar gum, karaya gum, psyllium, or other gums as active ingredients. The proposed warning reads: "Take (or mix) this product with at least 8 ounces (a full glass) of water or other fluid. Taking this product without adequate fluid may cause it to swell and block your throat or esophagus and may cause choking. Do not take this product if you have ever had difficulty in swallowing or have any throat problem. If you experience chest pain, vomiting, or difficulty in swallowing or breathing after taking this product, seek immediate medical attention."

Dubious cancer treatment results. Researchers at the University of Pennsylvania Cancer Center have compared 78 patients with advanced cancer treated at the center with 78 similar patients given various vaccines, a vegetarian diet, and coffee enemas at the Livingston-Wheeler Clinic. The study found no difference between average survival time of the two groups. However, the quality-of-life measurements were better for the conventionally treated group [*N Engl J Med* 1991;324:1180-1185]. The clinic's founder, Virginia Livingston-Wheeler, M.D., died last year. An ad seeking a new medical director offers a "six-figure net income guarantee to qualified candidates."

Food irradiation may increase. The nation's first food irradiation plant is under construction in Mulberry, Florida. The facility's owner, Vindicators of Florida, Inc., hopes to process 300 million pounds of fruits, vegetables, and poultry this year. More than 30 countries have approved the use of food irradiation technologies to help ensure food safety. However, in the United States, opposition by consumer groups aligned with the health food industry has made many food companies and retailers wary of marketing irradiated foods. Several dozen irradiation facilities exist here but are used mainly to sterilize surgical supplies.

Libel protection for fruits and vegetables? In March, the Colorado Senate passed a bill extending libel protection to fruits, vegetables, and other produce. The legislation is called the Act Concerning the Creation of a Cause of Action for the Disparagement of Perishable Agricultural Food Products. The *Washington Post* states that the senator who introduced it is an apple grower alarmed at the attack on the use of Alar in apples. The bill would expose those who cast needless doubt on the safety of various perishable agricultural products to lawsuits for up to three times the cost of lost sales traceable to such disparagement.

Alcoholism and the elderly. The American Association of Retired Persons warns that some elderly individuals who appear headed for senility are actually problem drinkers. The warning signs—which often mimic those of other disorders—are: mood swings; short-term memory loss; loss of appetite; untidy appearance; apparent immunity to prescribed medications; repeated falls, cuts, and bruises or burns from smoking; and loss of interest in hobbies, activities, or contact with family.

Wine slated for safer packaging. The manufacturer of *Cisco*, a high-alcohol, fruit-flavored wine, has agreed to repackage its product so it no longer resembles wine coolers that are 5% alcohol. Wine usually contains 10% alcohol, but *Cisco* has twice that amount. A 12-ounce bottle contains the same amount as five shots of 80-proof vodka. Alcohol poisoning has been reported among teenage users who underestimated its potency, which is four times that of the average cooler.

Indictments for telemarketing fraud. Federal grand juries in Tampa, Florida, have indicted 26 individuals for conspiracy, mail fraud, wire fraud, bank fraud, credit fraud, and money laundering. Each of the defendants is accused of making false representations in the sale of vitamins and/or water purifiers through telemarketing companies.

DONSBACH'S CANADIAN CONNECTION

Paul Benedetti

Kurt Donsbach could be considered "chairman of the board" when it comes to questionable nutrition in the United States. Armed with a string of dubious credentials, he has established correspondence schools, produced books, magazines, and pamphlets, founded a "nutritional consultants" organization, and operated myriad supplement companies. He also has been board chairman of the National Health Federation, the health food industry's militant lobbying arm.

At one time it was estimated that Donsbach University, his unaccredited correspondence school in Huntington Beach, California, was awarding more Ph.D.s in nutrition than all the accredited universities in the United States combined. "Donsbach University" no longer exists, but its legacy lives on through its graduates.

One such individual is David Rowland, who received a "Ph.D. in nutrition" in 1980. Rowland is one of the leading figures in the "alternative health" scene in Canada. He is a popular lecturer and appears often on radio and television shows and at alternative health fairs and supplement trade shows. Rowland also calls himself a registered nutritional consultant (R.N.C.) and says he has a Doctor of Nutritional Medicine (N.M.D.) degree from the John F. Kennedy College of Nutraceutical Arts & Sciences (American Nutraceutical Univer-

sity), an affiliate of the American Nutraceutical Association. Rowland says that degree "is an honorary one awarded me by a professional association...for my contribution to the field." However, the group's literature suggests that the primary requirement has been payment of a fee. Curiously, Rowland rarely mentions his two reputable credentials: a bachelor of arts degree and a master of business administration from the University of Toronto.

Rowland's Network

In a pattern strikingly similar to that of Donsbach, Rowland has established an elaborate network of Canadian organizations designed to promote "holistic nutrition." Four of them were founded in 1983: The Nutritional Consultants Organization of Canada (NCOC), the Canadian Nutrition Institute, *Nutrition News*, and Creative Nutrition Canada Corp.

• The Nutritional Consultants Organization of Canada (NCOC) is a nonprofit association designed to "help inform the public about nutritional consulting and to provide standards of practice for Nutritional Consultants." In a recent letter to my managing editor, Rowland stated that he had served as "elected president" from 1983 to 1988 and as one

of ten directors since that time. NCOC's seven-person "advisory board" includes: Linus Pauling, Ph.D.; Abram Hoffer, M.D., Ph.D. (a proponent of megavitamin therapy for schizophrenia); Morton Walker, D.P.M. (a prolific writer); Lendon Smith, M.D. (who surrendered his medical license rather than face charges of insurance fraud); Maureen Salaman (president of the National Health Federation); and Jeffrey Bland, Ph.D. (the leading interpreter of scientific information for the health food industry). All six have the letters "R.N.C." after their name on NCOC's letterhead.

- The Canadian Nutrition Institute is a correspondence school whose principal course is a "certificate program in holistic nutrition" that cost \$795 (Canadian dollars) in 1990. The application form notes that credit may be given for equivalent studies or related work experience such as owning or operating a health food store or selling supplements.

The brochure states that the course, which can take from 6 months to 2 years or longer to complete, will "enable a self-motivated person to acquire knowledge beyond that presently available in traditional approaches to nutritional training." The textbooks listed in the brochure include: *Superhealth* by Kurt Donsbach; *Psycho-Nutrition* by Carlton Fredericks (once convicted of practicing medicine without a license); *Nutrition From Tots to Teens* by Emory Thurston (once convicted of offering laetrile to treat cancer); and the *Vitamin Bible* by Earl Mindell, whose Ph.D. is from the unaccredited University of Beverly Hills. According to government education officials, the Canadian Nutrition Institute is not a recognized degree-granting body and has no standing whatever in Canada's academic community. Nor are its courses and certificates accepted by any accredited college or university in the country.

The brochure also states that successful completion of the course is "one of the ways of meeting the professional requirements for the professional designation Registered Nutritional Consultant," which allows the recipient to "legally use" the letters "R.N.C." The credential is obtained by applying through NCOC.

Pertinent literature stresses that the R.N.C. designation is "registered" or "certified" by the Canadian Council of Professional Certification. However, like Rowland's school, this council has no academic standing. Government records indicate it was incorporated in 1975 for the express purpose of giving certification to unrecognized professions. It does not regulate anybody; their own organizations do that, director Russell Pickering told me during a telephone interview. "The onus is on the association that's offering it. The Canadian Council is just the certifying body," he said. When I asked what the certification actually means, he replied that it gives "the recognition of being certified."

- *Nutrition News* is a quarterly newsletter for R.N.C.s. Rowland publishes it and writes many of its articles.

- Creative Nutrition Canada Corp. is an importer and distributor of vitamin supplements.

Like Donsbach, Rowland pursues many interests in the field of alternative health. He is the author of several books on holistic health, a practicing nutritional consultant, and a

former associate editor of *The Vitamin Supplement*, a magazine circulated internationally in health food stores. He is also a senior partner in Nutripower, a California company that manufactures and distributes nutritional supplements.

Rowland is a frequent and outspoken critic of mainstream medicine. "If quackery is the promotion of a procedure that doesn't work, then much of medicine is quackery," he said in an interview. His writings and speeches often call for freedom of choice in the health marketplace. "A self-regulating market takes care of the quacks," he said.

Rowland also has published booklets on health topics, such as *Who Needs Supplements?* and *Vascular Cleansing—New Hope For Heart Disease*, a 33-page work widely advertised in health food magazines with the promise: "This Book Could Save Your Life." In it he suggests a daily regimen of 30 vitamins, minerals, and glandular substances to reverse or prevent atherosclerosis—a regimen sometimes referred to as "oral chelation." Part of the evidence he offers to justify this approach is an uncontrolled study attributed to the Preventive Medicine and Nutrition Care Center in Huntington Beach, California, a now-defunct facility that was owned and operated by Donsbach. The booklet doesn't mention that the U.S. Food and Drug Administration has banned the sale of "oral chelation" products.

Dr. Jack Hirsh, chairman of the department of medicine at McMaster University Medical Centre in Hamilton and a specialist in atherosclerosis, examined Rowland's suggested regimen and said he knew of no evidence that the program was beneficial. When questioned about this, Rowland answered "I'm reporting on the evidence I have available to me.... It's responsible because I am reporting the truth."

Rowland's booklet provides testimonials from eight users of his vascular cleansing program, one of whom is identified as "V. Head, Willowdale, Ont." The booklet neglects to mention that Vickers Head is the vice president of the Nutritional Consultants Organization of Canada, one of the original directors of the corporation, and a personal friend of Rowland's. When asked about this, Rowland replied, "I know the man. Does that mean because I know him, he's lying?"

Rowland has gone to considerable lengths to protect the rights of nutritional consultants to practice in Canada. He has written numerous editorials in *Nutrition News* and elsewhere about health freedom, and has even written a 75-page booklet, *Legal Aspects of Nutritional Consulting*, which offers advice how to avoid difficulty while plying the trade.

One suggestion is a religious angle: "Belonging to a particular religious organization will not permit you to practice medicine without a license; however, there might be some ways in which it could help protect your freedom to exchange health information with your friends, associates, and/or clients." To explore this approach, Rowland suggests contacting the Alpha Holistic Freedom Alliance, a recently incorporated, non-denominational religious organization. Not surprisingly, it has the same address as his Nutritional Consultants Organization of Canada.

BOOK REVIEW

Title: Natural Healing with Herbs (1990)

Author: Humbart Santillo, B.S., M.H.

Publisher: Hohm Press, Prescott, Arizona

Price: \$14.95

Reviewed by: Varro E. Tyler, Ph.D.

In a previous issue [NF 6:41-44], I listed ten signs that identify irrational recommendations for the use of herbs. These signs—which I call false tenets—can be used to distinguish between rational use (true herbalism or pharmacognosy) and irrational use (the pseudoscience which I call *paraherbalism*). Humbart Santillo has assembled the almost perfect *paraherbal*—a single volume which espouses nine of the ten false tenets:

1. The foreword by the late Robert S. Mendelsohn, M.D., restates the fictitious medical-conspiracy-against-herbs theory by noting that belief in modern medicine's credo prevented people from even mentioning herbs.

2. Omission of facts about the toxicity of such herbs as comfrey (p. 107) implies that there are no harmful ones.

3. The introduction by macrobiotic guru Michio Kushi restates the erroneous belief that whole herbs offer more than just an active chemical constituent by claiming that they contain "energies" in addition to active chemical principles. He states that the real contribution of herbs to therapy is largely in this energy aspect.

4. Page 350 advises us to use "a pure 100% organic vegetarian diet" and to "avoid all inorganic foods."

5. Page 17 recommends eyebright as an eyewash. This is an example of the "Doctrine of Signatures," the ancient belief that the form and shape of a drug source determine its therapeutic virtue.

6. Pages 5 through 11 espouse yin-yang theory and four-humor diagnoses— notions as nonscientific as those of astrology.

7. Chapter 12 is devoted to homeopathy. Located therein is the enlightening statement that "Medicinal activity is a distinct property of all drugs."

8. The book either ignores or passes over lightly the toxicity information gathered from animal tests on coltsfoot (p. 106), comfrey (p. 107), and sassafras (pp. 173-174). Santillo calls poke "an excellent herb, it should be used with caution."

9. Anecdotal information is used liberally throughout the book.

10. The only false tenet missing from Santillo's book is the assertion that God created herbs for the specific purpose of curing disease.

I might be willing to overlook Santillo's lapses in syntax—"Potent herbs can produce toxic effects in large amounts," (p. 46)—or spelling—"Principle Therapy," (p. 296). But I don't think kindly about his recommendation of cabbage leaf poultices or castor oil packs for internal tumors or, if pain is present, the consumption of wild lettuce and valerian tincture (p. 351) to alleviate it.

Santillo's knowledge of the herbs themselves is superficial. Mormon tea (p. 116) is obtained from *Ephedra nevadensis*

Wats. not, as he maintains, *E. vulgaris*. Chaparral (p. 103) is not "one of nature's best antibiotics." The garlic-in-olive-oil preparation (p. 123) he recommends for infections would be ineffective because the antibiotic allicin is rapidly destroyed under such conditions. Valerian is not a stimulant, even initially, in human beings (p. 117). That effect is reserved for cats. Further, a 1988 study indicates that the volatile oil is not the sedative principle in the drug.

The chapter on "hydrotherapy" repeats much of the information and uses many of the classifications developed by Father Sebastian Kneipp, who originated the specifics of the procedure. However, Father Kneipp's name is not mentioned. Many of Santillo's recommendations seem to be little more than paraphrases of the same information found in J.K. Kloss's 50-year-old work *Back to Eden*. Kloss is included as one of the 12 references in Santillo's book. The average age of the 11 references for which publication dates are noted is now 24 years. Despite all this, the book jacket describes the book as "The First American System of Herbology."

Santillo's biographical sketch lists a B.S. degree from Edinboro State Teacher's College and four other "degrees": Doctor of Naturopathy, Health Practitioner, Iridology Certificate of Merit, and Master Herbalist. The sketch also describes his study of Oriental medicine, myopractic therapy, medical botany, and concept therapy.

Dr. Tyler is professor of pharmacognosy (the science of medicines from natural sources) at Purdue University. A world-renowned authority, he wrote *The New Honest Herbal*, an evaluation of popular herbs, and is coauthor of the textbook *Pharmacognosy*.

QUESTION BOX

Q. Does eating sugar make you feel hungrier?

A. It takes less time for the body to break down the chemical bonds in sugar (a simple carbohydrate) than it does to break down the bonds in starch and fiber (complex carbohydrates). Because of this, sugar-sweetened foods may provide a more immediate energy source, while foods with starch or fiber tend to provide a slower and more sustained energy source. Therefore, while sugar itself may not make you feel hungry, it can leave your appetite less satisfied when consumed alone in the form of a soft drink or a candy bar. If you eat sugar at the same time as complex carbohydrates, protein, or fat, your appetite will probably be satisfied for a longer period.

Q. How long can canned food be stored at home?

A. Food that has been properly canned is safe to eat as long as the container remains intact (After several years, most metal containers will show signs of corrosion, usually starting from the outside). After a long period of storage, however, changes may occur that affect the food's color, quality, and nutrient value. Within a year, canned fruit juice will lose about 25% of its vitamin C, and canned asparagus will lose some vitamins along with its green color. Canned foods last longer when stored at cooler temperatures. Foods stored at 67° F retain their peak of quality twice as long as they would stored at 85° F. At 67° F, most foods retain their quality for 1 year. However, some foods retain their quality for only 6 months. Foods that should be stored no longer than 6 months include asparagus, beets, citrus fruits, green beans, fruit juices, pickles, peppers, sauerkraut, mixed fruits, fruit juices, and all tomato products.

BOTTLED HYPE: THE STORY OF *Km*

Jack Raso, M.S., R.D.

Km is a potassium/herbal formula produced by Matol Botanical International Ltd. of Montreal, Canada, and sold person-to-person through distributors in many countries. I became curious about it when a local distributor informed me that one of her many satisfied customers was a kidney patient whose blood potassium level was chronically high. A few months later she invited me to a large public meeting and sponsored me as a distributor. Matol's mission, according to its August 1991 *Journal*, is:

To impact World Health and the environment positively through products, services, education and programs that promote quality of life and healthy living; to impact the vision of humanity and the world we live in.

Matol's "governing values," listed below the mission statement, are integrity, quality, leadership, independence, family, respect, financial security, loyalty, and personal growth. Independence, the statement suggests, can be achieved "by promoting and encouraging everyday health, wealth, self-esteem and freedom from unnecessary obligations, servitude and oppression."

The Matol Story

Km's history is vividly described in company brochures and videotapes, which provide the following details:

Km was formulated in the 1920s by Karl Jurak, a student of agrobiolgy (plant chemistry) at the University of Vienna. During his youth, Karl was interested in flowers and plants and displayed an "unquenchable thirst for knowledge." One day while climbing a mountain he suddenly became weak and "dangerously short of breath." To improve his physical condition, he became "driven to establish a state of optimum health." He reasoned that "if he could find a way to focus his natural body energies, he would then find the key to relieving his problems. He decided to apply his knowledge of science and use the plants he loved...to prepare a health formula for himself."

Karl was "sure that nature had anticipated man's needs." After eight months of work, during which he analyzed his own blood samples daily, he arrived at a formula. But although he noted many benefits, the "key" to the formula was missing—"a factor that would perfectly merge all of the virtues of each plant." Finally, in 1922, the "key" was revealed to him in a dream. He completed the formula and found that taking it led to "remarkable improvement." He based his doctoral thesis on this work and, at the age of 19, received a doctorate with honors in agrobiolgy. In 1925 he was awarded a second doctoral degree, in biochemistry.

In 1932, the story continues, the Canadian government commissioned Jurak to do research and he emigrated to Canada. For 30 years he went on preparing the formula himself. He didn't sell it, but gave it to friends and relatives until—in 1962—he was no longer able to satisfy the demand and "destiny intervened." In that year Jurak entrusted the formula to his son, Anthony, who had earned his own doctorate in biochemistry. "But with the inheritance came the injunction not to change the formula."

Among the many persons using the privately prepared formula was a long-time friend of Jurak's son—J. F. Robert Bolduc. In 1984 Bolduc was manager of a market research firm in Montreal. Later that year he became aware of the rapid growth of the natural products industry and the value of networking and, with Anthony Jurak, launched Matol Botanical International. For Matol's introduction to the United States they were joined in 1986 by network marketing expert Sam Kalenuik.

An article by writer Kevin Krajick in the August 1989 issue of *Longevity* fills a few gaps in the above story. Initially, Matol Botanical International had a single product—*Matol*—which was marketed as a treatment for diseases ranging from rheumatism of the spine to prostate cancer. But Canada's Health Protection Branch enjoined the company from making therapeutic claims for the product. Matol's attempt in 1985 to export its product to the U.S. was stymied by the FDA, which had it seized on grounds that extravagant claims had rendered it an unapproved new drug. In April 1986 the FDA issued an Import Alert, directing that shipments of Matol be detained. However, Matol circumvented the FDA by adding cascara sagrada (a laxative) to its product and renaming it *Km*.

Matol's Products

Km retails for \$36 a quart. It is packaged in a white plastic container bearing the words:

...a potassium mineral supplement preparation, in a non medicinal base prepared by a special process from extracts of flowers, foliage, roots and barks of certain botanical plants. *Km* contains 585 mg of Potassium per serving of 2 tablespoons. Drink 1 tablespoon (15 ml) twice a day, morning and night, which can be mixed in milk or water.

The amount of potassium in each serving is not much more than would be furnished by 8 ounces of orange juice, 1 broccoli stalk, or 1 medium-sized banana. The first 3 of the 27 ingredients listed on the container are purified water, caramel color, and glycerin. Other ingredients include 14 herbs, 5 minerals, and artificial flavors (unnamed except for vanillin, which was not in the original formula). Matol suggests that one ounce daily is appropriate for most people but that dosage should be determined by how the user feels.

During the past 2 years, Matol has added other items to its product line: *FibreSonic*, a powdered supplement, said to contain vitamins, minerals, and 27 kinds of dietary fiber; and the "Pathway Program," a weight-management program that includes two flavors of powdered meal replacement shake and two types of high-fiber bar.

The Pathway oat and peanut bars, about 2 ounces each, sell for \$21 per box of 8 (\$1.31 per ounce). These are similar to peanut butter-flavored *Slim-Fast* bars, although they are lower in nutrients and three times as expensive. But they are preferable, according to their package, because "Matol's Pathway Program fosters self-esteem, eliminates roadblocks and strengthens personal intuition." My sponsor represented them as fat-free, which they are not. The Pathway *Matola* bar, a low-fat granola bar, is advertised as cholesterol-free, sweetened with honey/fruit juices, and containing "chelated minerals" and "certified organic ingredients." Available in 2 flavors, it costs \$21 per box of 8.

I Become a Distributor

Multilevel marketing (also called network marketing) is a form of direct sales in which independent distributors sell products to their friends, acquaintances, and other contacts. Distributors can buy products wholesale, sell them at retail, and recruit others to do the same. Recruiters who enroll enough distributors become entitled to a percentage of their sales. Matol's sales pitch emphasizes financial opportunity as well as product integrity.

I obtained my Matol distributor's kit by completing a simple application and paying \$90 to the woman who sponsored me. The kit included a quart of *Km*, two 10-ounce packets of *FibreSonic*, a translucent measuring flask, a 1-ounce measuring cup, a 1990 audiotape of a talk by Sam Kalenuik, two slick videotapes, and a handsome looseleaf binder. The binder contained product brochures, a sales receipt book, order forms, a *Prospecting & Sponsoring Handbook*, a *Distributor Manual*, a *Business Guide*, a catalog proffering Matol "designs" including clothing and accessories, an issue of Matol's *Journal*, a

question-and-answer booklet, record-keeping materials, a brochure requesting a donation to the nonprofit Dr. Karl Jurak Foundation (concerned with child abuse), and other paraphernalia. The box containing the kit bore the message: "I Am Staying Young. Ask Me How."

Matol's *Handbook* suggests using the following advertisement to attract new distributors:

"Dissatisfied?" We are currently seeking 3 individuals with sales, management, or teaching backgrounds who have owned their own business. Must be capable of handling exceptionally large incomes....Call for an appointment....

In the audiotape, Kalenuik states that Matol had a quarter of a million distributors. In the videotape entitled "An Idea Whose Time Has Come," the narrator says, "No important news flashes heralded the discovery [of *Km*], no documentation in prestigious journals—just an unpretentious sharing of human insight." One scene shows a boy denying his dog additional *Km*, unflinchingly downing an unmeasured amount and, as an afterthought, stuffing a second bottle of *Km* into his school bag. Another depicts a young girl about to "share" *Km* at school during "show-and-tell." Toward the end of the video, the elderly Karl Jurak tells us we "are the carriers of this important legacy."

The second videotape has three segments. In the first, "Building on Destiny," Karl Jurak indicates that although he doesn't understand how *Km* works, it may "have something to do with purification and oxygenation of blood."

The second segment consists mainly of testimonials from distributors about how enthusiastic they are and/or how much money they have made. Several stated they had earned \$30,000 per month, and Matol's top distributors, a married couple, were said to have made \$82,579 in a single month. (The improbability of such earnings accruing to new distributors is not mentioned. My sponsor, who certainly marketed aggressively, told me she was making about \$700 per month.)

The third segment assures us that "Matol's phenomenal success is based on *Km* alone—no fancy packaging, no Madison Avenue hype. Just one single product that works." But the company also intends to "continue Dr. Jurak's dream in addressing the most pressing health problems facing mankind today...obesity, environmental impurity, widespread dietary deficiency in both young and old. To meet these challenges, Matol introduces World Health Quest products. The first of these

[*FibreSonic*] already promises to make a major contribution to international health."

Yet another video (not part of the kit), "Why Herbs?," asks us to "imagine a world sometime in the near future...where disease and other physical ailments have been virtually eradicated, where heart disease, high blood pressure, even cancer are no longer a threat." Such a situation will remain unlikely, says the narrator, until people take responsibility for their own health and stop relying on modern medicine—which "has failed miserably" and whose "cut-and-burn methods" are "deadly." What is the "simple and time-tested" answer to the "dilemma" of nutritionally inadequate food? Herbs, without which "good health is nearly impossible." And what is "the primary obstacle preventing herbs from reaching every home in America?" Fear. "What is there to be afraid of?" asks the narrator. Better health? A longer life? Reduction of medical bills? The death of modern medicine? Simply beware, he says, of fraudulent products and disreputable manufacturers.

Another new sales aid, the *Pathway Research Manual*, gives elaborate instructions for combining foods to achieve what Matol considers the ideal balance of "alkaline-forming" and "acid-forming" foods. The average cost of Pathway products is said to be \$19 to \$50 per week (plus the cost of *Km*).

***Km*'s Promotion**

It is illegal for distributors to claim that *Km* is effective against any health problem. Matol's 1990 "Question & Answer" booklet states:

We market our product as a food supplement and we do not make any therapeutic claims, but we do believe that most people can benefit from our product; this is why we are confident enough to offer a 30-day guarantee on the product.

And Matol's *Journal* warns:

An independent Matol Botanical International Ltd. Distributor is not permitted to diagnose or prescribe the products as a specific treatment for *any* disease or condition. To do so is likely in contravention of the law and is not condoned by Matol Botanical International Ltd.

Matol Botanical International Ltd. does not make any claims whatsoever about its products and does not sanction or permit any of its Distributors to make any claims.

Although company literature makes no *direct* therapeutic claims for *Km*, one brochure provides pictures of its 14 herbs and attributes beliefs about their use to various peoples in the past. For example, it says that Indians of Virginia believed that passion flower could "quiet and soothe the body" and that native Indians along the Pacific coast of North America believed that tea made from saw palmetto berries "soothed and quieted the mind." Another brochure quotes Karl Jurak stating, "In 60 years, given time, I have never seen this product fail once in helping to do some good for the people using it."

It is clear that some distributors make therapeutic claims. Some, for example, are circulating typed reports associating *Km*'s herbal ingredients with organs and health problems that each herb supposedly can help. One report, for example, states that alfalfa "is used as a blood thinner, and a kidney cleanser. Athletes use this herb for indurance [sic] and energy." Another claims that *Km* is a "blood purifier."

Have these or similar claims been scientifically tested? The question- and-answer booklet acknowledges:

Other than those done by Dr. Karl Jurak way back in the beginning, no tests of any kind have been done. We do not believe that we will enter into any such programs since trying to prove what this product seems to have done for some people would be next to impossible. However, Matol's *Km* formula has been tested in the finest laboratory in the world for over 60 years—the human body.

The booklet also states that "if there were any contra-indications when using our products, the FDA would have instructed us to indicate that on our label. As you can see, the label does not carry any contra-indications....If there are any secondary effects, they will appear briefly and will not be severe. These possible secondary effects could be manifested by diarrhea, constipation, lightheadedness, headache, itchy sensations, or nausea."

Originally, my sponsor said that the cost of *Km* is refundable. But later she added that the product had to be consumed regularly for 30 days—even if the buyer finds *Km* nauseating (as I did).

My First "Opening of America" Meeting

On February 13, 1991, I attended a 2-hour Matol corporate meeting in the Grand Ballroom of the Holiday Inn near LaGuardia Airport in New York City. A banner above the podium advised in French and in English: "GIVE AND RECEIVE." The banner also showed a chart with a crooked line slanting upward at about 45 degrees. Below it stood two displays of Matol products.

Opening remarks were made by "executive advisor" Jacobus Jeffrey, who wore a green "2 FOR FREEDOM" button on his lapel. (The slogan refers to the strategy of "two in-home meetings a week for financial freedom.") My sponsor—who referred to him as "Brother Jeffrey"—claimed that he was on the board of directors of a medical center in Brooklyn where Matol meetings were held regularly in a conference room. However, the center's chief executive officer denied that he knew anyone by that name.

Mr. Jeffrey is a trim-bearded, middle-aged, black man who speaks in measured tones. He welcomed an above-capacity, ethnically mixed crowd of well over 750 men, women, and children from New York and nearby states. He said he was "so excited" about this long-awaited first New York corporate meeting. He asked all the nondistributors to raise their hands and then to stand up. Their rising was met with applause. "You are our guests," he told them, and promised the audience—twice—that we would not walk out as we walked in, but would leave the meeting with a "different feeling." The meeting's

purpose, Jeffrey stated, was to build leaders in the tri-state area and in "the Matol family." "New York," he declared, "needs to be penetrated." Applause followed. At his request, the audience chanted one of Matol's mottos: "Helping people to help people."

The next speaker was David Gordon, a chiropractor from Bloomington, Indiana, whom Jeffrey introduced as a "field advisor" and a "special, special person" who had made more than \$100,000 in his first year with Matol. Before inviting Gordon onto the podium, Jeffrey displayed a copy of Matol's *Journal*, whose cover pictured Gordon and his wife.

Gordon, who is short, assured us he was standing. He asked us how we were tonight ("Great!") and how our day had been (the same). He told us his suits were at the airport in Chicago, spoke of his prior depression, and reminisced about his boyhood summers in Buffalo, New York. Then he recounted the circumstances leading to his embrace of *Km*. "All you need to do," he advised, "is share the product with people and get them drinking it, and it'll do the work for you. Have you noticed that?" The applause suggested that the audience agreed.

Then he asked how many of those present had been drinking *Km*. The response seemed to disappoint him. "That's all?" he asked. "You've never had the joy of tasting it?...You're in for a treat." He demonstrated the translucent measuring flask included in the distributor's kit, and advocated drinking *Km* from the flask in public to attract attention to the product.

Gordon said that "things started to happen" when he'd begun using *Km* in August 1989. Never a "morning person," for example, he had begun waking up 2 hours earlier than usual. After relating his wife's negative opinion of the product's odor, he described *Km* as a potential "disaster" from a marketing standpoint. "So I tell people: it looks bad, it smells bad, it tastes bad, and it works." To which my sponsor responded, "Amen." (So did I—to myself. *Km* looks like an extract of mud and tastes vile!)

Gordon said his father had been a practicing physician, his wife is a nurse, and he himself had planned in high school to become a surgeon. He was, thus, he said, a skeptic, and as such had approached the matter of *Km*.

What if *Km* doesn't work? "It takes time," he said. One third of *Km* users allegedly recognize benefits (unspecified) within a few minutes to a few days; another third within a week to a month; and another third within 1 to 3 months. According to a flyer: "The benefits of *Km* are immediate. But, the *Km* experience depends on a person's body awareness." The flyer identifies at least one alleged benefit: *Km* "facilitates...purification." In addition to being a "universal product," said Gordon, *Km* has the features of being both consumable and one of a kind. "We just happen to have a monopoly." When he announced that an East Coast warehouse would soon be established, the audience roared.

He then talked about soil depletion. "We have stripped from our food supply 70% of the nutrients that should be available to us. We're trying to run...on 30%." Cells, he said, "get pooped" running on 30%. "Maybe you noticed how tired Americans are?" He gave assorted statistics to support his sentiment that Americans are in bad shape.

Gordon said that about 3 years earlier, *Km* had been temporarily unavailable and sold for \$100 a bottle. "When you find out what's in that bottle," he explained, "you realize there isn't any price too high—if it's for someone you love." He described *Km* as a "universal product" from which anyone can

benefit, and implied that it "would actually enhance oxygen efficiency to all 60 trillion cells of your body." The remarkable and varied responses to *Km*, he added, are attributable to its "working at the cellular level."

Gordon summed up the Matol sales technique: "The bottom line that we're sharing with people is results. That's it. The product works....When you share stories of benefits with other people—not features of the product, [but] benefits—they will want to have it. When the perceived value of the product exceeds the cost, people will buy it....Our job [is] to tell stories." He stated that "FDA has approved [*Km*] for use by everybody...men, women, children, [the] elderly, pregnant women, infants...heart patients....It is a food supplement...a liquid salad." [Editor's note: This statement appears to be false. New drugs and food additives are subject to FDA approval, but herbs and supplement products marketed without therapeutic claims are not.]

Km, he said, "changes people physically, emotionally, psychologically, financially." He suggested that it can rehabilitate one's sense of humor. Later he described the new Pathway products, noting that "the carbohydrate is in a time-release form, so you get a constant energy curve all day."

Gordon also claimed that the Pathway "weight management program" brings about loss of "just nonstructural fat" and, furthermore, "actually sculpture[s] your body....The weight comes off in the right places." But the Pathway program, he counseled, won't work without *Km*, because "*Km* enhances the efficiency at the cellular level of utilization of all the nutrients." Moreover, he said, continued use of *Km* leads to better food choices: "You will desire better foods."

Gordon reported that sales hit \$1.5 million dollars one day around the time of a recent convention in Anaheim, California. He said February 1991 sales were projected to be nearly \$20 million, and that 1990 sales had been nearly \$200 million. Later he solicited testimonials from Pathway product users who had lost more than 10 pounds. The four respondents reportedly had lost an average of one pound daily.

When Gordon was through, Jacobus Jeffrey, joined by 18 "achievers" on the podium, presided over a prolonged series of bilingual mutual and self-congratulations. Then he introduced Matol's vice president of personal development, Dr. Clifford Baird (the "2 FOR FREEDOM" strategist), as a gentleman with "an educational background second to none." Dr. Baird, he said, had four traditional degrees plus three others—in "life," mountaineering, and "streetology."

Baird, nearly 6 feet, 7 inches tall, told us how wonderful we were and identified his four degrees: a Bachelor's in math, an M.A. in industrial psychology, an M.B.A. in banking and marketing, and a Ph.D. in psychology. Then he declared: "Wisdom is not the byproduct of education." Baird's talk was filled with clichés. He struck me as a pop psychologist-preacher, but the audience responded to him with much laughter and applause.

My Second Meeting

On April 10th I attended another "Opening of America" meeting, which drew some 2,000 persons to the Radisson Hotel in Hauppauge, New York. A banner proclaimed 1991 "The Year of Freedom," and "New Age" music filled the hall before

commencement. I had come by chartered bus with Mr. Jeffrey's group of 30.

The opening speaker was John Paul Dadufalza, a 24-year-old of Philippine descent whose picture appears on the cover of Matol's July 1991 *Journal*. A former flight attendant, he reportedly earned \$20,265 during his fourth month as a distributor. My sponsor likened him to Michael Jackson. His exotic good looks and polished appearance in a tailored suit had made him the most conspicuous award recipient at the previous meeting.

John Paul exuberantly recounted his embrace of *Km* and Matol, which he attributed to his mother's nagging. Unspecified "health challenges" finally prompted him to try *Km* 6 months after his mother had given him a bottle. However, he did not specify any benefit of *Km* other than financial. He asked people who had lost weight on the Pathway program to stand and called on the "big losers" to deliver testimonials.

I was disappointed to learn that the legendary Karl Jurak would not appear. Nor would Robert Bolduc. (My sponsor informed me he was busy pursuing a doctorate in network marketing.) But Anthony Jurak and Sam Kalenuik took turns on the podium.

Anthony Jurak told us it was his 53rd birthday; he looks about 10 years younger. He intimated a belief in destiny, and explained Matol's motto, "Give and receive: We know for sure today that if you give, eventually you receive." Later he added: "If the dream is big enough, the facts don't count" and "Freedom is going on a holiday and not having a return ticket."

Kalenuik is 40 years old, short, and silver-haired. He claimed he could tell us in 25 minutes or less how to get our

lives in order. He reiterated Anthony's saying about dreams and facts, and expressed a strong desire "to have the biggest impact in 2,000 years on world peace." He also expressed belief in "synchronicity": "Meaningful coincidences will occur in your life when you're headed in a right direction." Becoming increasingly metaphysical, he insisted: "Thoughts change matter. Thoughts *are* things." Babies, he continued, have no limitations at all. He asked how many of us believed in God. About half the attendees raised a hand, but my sponsor assured me that the majority believed. Kalenuik told us we were all essentially equal, and that inequality results from wrong thinking.

The Bottom Line

Km epitomizes the "New Age" quest for a nutritional quick fix. It has never been proven safe or effective for any purpose except making money for some of its distributors. The identity and amounts of its herbal ingredients are not public information. It is promoted with glittering generalities by the company and "unauthorized" therapeutic claims by its distributors. Those who feel better after using *Km* are encouraged to attribute any improvement to the product's potency. These simple tactics—plus the lure of easy money—have enabled Matol to pull wool over the eyes of a multitude of people from all walks of life.

Mr Raso, a registered dietician, lives in New York City and is preparing a book on "paranormal" nutrition.

"HEALTHY CELLS" OR UNHEALTHY SALES?

William M. London, Ed.D.

A few months ago a poster on the bulletin board of my local public library announced seminars in Cleveland and Akron by Albert Earl Carter, author of *The Cancer Answer*. The seminars were sponsored by three Matol distributors from the North Canton area. They also had advertised in the *Akron Beacon Journal* and sent flyers to chiropractors and massage therapists.

I attended the seminar in Cleveland. The advertised cost was \$20 in advance or \$25 at the door, which covered two people and an autographed copy of *The Cancer Answer*. However, I came alone and was charged only \$10. The seminar lasted 2 hours and was attended by about 50 people. According to one of the promoters, Al had received a standing ovation the previous night at a seminar in Canton attended by 150 people.

Two weeks later my book arrived in a package containing a blank billing slip from the American Institute of Reboundology in Cypress, California, the address given in *The Cancer Answer* for Al Carter. According to the book's cover, "We are not being told the truth about cancer," "Cancer is not a disease," and "The answer to cancer has been staring medical science in the face for at least a decade."

Al doesn't claim to be a scientist or a medical doctor. ("What I am is an investigative scientific reporter, so I can't qualify for the title of "quack" he claimed in the book.) His answer to "cancer and other old-age diseases" is his "Healthy Cell Concept," which he depicts as a rectangle with four

quadrants that he calls cell exercise, cell food, cell environment, and cell communication. The center of the rectangle contains a cartoon character of a healthy cell named Larry Lymphocyte who converses with Al throughout much of the book.

"Rebound exercise" is part of Al's answer. According to Al, rebounding on a minitrampoline "can increase the activity of the Lymphatic System by as much as thirty-fold and increase the number of garbage-eating white blood cells as much as three times! Now, all you have to do is feed those cells good cell food so that they are healthy, and let them go." At the seminar, Al called himself "the world's foremost authority on the most efficient and effective form of exercise yet devised by man" for "every cell of the body." He also boasted that rebounding is the top form of exercise recommended in literature for Matol's Pathway Weight Management Program and by the National Aeronautics and Space Administration (NASA).

About 6 weeks after the seminar I received issues #2 and #3 of *On the Rebound*, a newsletter published by Fit for You International of Whittier, California. Its masthead identifies Sylvia Ortiz (an aerobics instructor) as president & editor-in-chief; Jose Ortiz, M.D. (Natural Mr. America 1986) as medical advisor; and Albert Earl Carter as "rebound consultant." One issue of the newsletter displayed the "Healthy Cell" concept with a product mentioned in each quadrant:

•The "Cell Exercise" product is the PROBOUNDER 2000, a minitrampoline that Fit for You markets with a suggested retail

price of \$195 and a dealer's cost as low as \$100. An accompanying ad promises that distributors will be shown how to sell it as a single product and "in conjunction with any other health care products you currently market." Sylvia Ortiz claims that the PROBOUNDER 2000 is "the perfect adjunct to chiropractic due to its unique ability to help the body remove lactic acid and other toxins." When the device is prescribed by a chiropractor, she noted, insurance companies often pay up to 80% of the unit's cost. "Using typical sales of 20 per month...you could also expect an additional \$22,800 in annual profit to you!" In a sidebar, one of the seminar's sponsors was congratulated for selling 100 units by promoting "healthy cell" seminars in Ohio and Pennsylvania. For \$390, Fit for You even offers 4-day seminars for certification in "reboundology."

•The "Cell Food" product is *Km*. In his lecture and in the newsletter, Al said, "I have studied *Km* and personally feel it is a perfect cell food." He also identified inositol, choline, aminobenzoic acid, B₁₅, and B₁₇ (laetrile) as "cell foods" and said (incorrectly) they are water-soluble vitamins. Newsletter #3 contains a full-page ad for *Km*, which lists 12 *Km* distributors who serve 37 states. When I called one listed for eight northwestern states, I was greeted by a taped message promoting both *Km* and the "Healthy Cell" concept.

•The "Cell Environment." product is a water purifier made by Trinisol Water Systems, and sold by Fit for You. Al emphasizes that pure water is important to "healthy cells" and says that chlorination and fluoridation of community water supplies are hazardous to health. *On the Rebound* supports this view with an article on water purification by Trinisol's president, Fred Van Liew, who is described as host of a radio talk show on which he interviews "this country's leading natural health care experts."

•The "Cell Communication" product is "Subliminal Audio Tapes,"—which Fit for You advertises for appetite control, building a strong immune system, and freedom from stress.

•*The Cancer Answer* suggests that most cancers are under control until doctors tell patients the diagnosis. According to the book, when their cells receive this message, "they simply prepare the body for death. They give up and quit fighting. The immune system slows down and becomes inefficient, giving the cancer an opportunity to take over." A positive attitude—aided by the tapes, of course—conveys "psycho-immunity" to cells.

Fit for You also sells Al's first book (current retail price \$12.95) *The Miracles of Rebound Exercise*, which Al claims has sold 1.3 million copies—a remarkable achievement considering that it is not listed in *Books in Print*.

In *The Cancer Answer*, Al recommends various brands of "food supplements" and other products available from New Dimensions Distributors, in Fountain Hill, Arizona. Two days after calling its toll-free number (1-800-624-7114) I received the *Healthy Cell Catalog* and an issue of *Healthy Cell News* (featuring, on page 1, the four quadrants and Larry Lymphocyte's picture). The catalog's many nostrums included "antiaging nutrient" coenzyme Q₁₀, *Berry Trim* (a bogus weight-reduction product), and *Dr. Rinse Formula* (for "aiding in the fight against cardiovascular and circulatory problems" and easing the pain of arthritis). The "newspaper" included articles and ads promoting homeopathic tinctures (for lost libido and various other health problems) and many other dubious products.

"Professor Carter" (as Al likes to call himself) claims to have put "all the pieces of the puzzle together" for answering not only cancer, but arthritis and other afflictions. He is networked with chiropractors, *Km* distributors, and other assorted zealots whose claims are fanciful and sometimes illegal. Their real product is not "healthy cells" but self-delusion.

Dr. London is assistant professor of health education at Kent State University and president of the Ohio Council Against Health Fraud.

NEW REPORT ON THE WEIGHT-LOSS MARKET

Surveys have estimated that the percentage of overweight adults in the United States is between 25% and 64%, depending on the criteria and methods used to collect the data. The "weight-loss industry" is high in salesmanship but low in accountability of both dollar volume and success percentages. Certain statistics, known only to operators of privately held companies, may not be reliable and may be inflated to make programs seem more popular.

Despite these difficulties, Marketdata Enterprises, an independent market research and consulting firm, has issued a 252-page report filled with tidbits and tabulations to characterize and forecast the weight-loss marketplace during the next 5 years. The July 1991 report estimates total 1990 sales of \$30.2 billion in 1990, including: over-the counter (OTC) appetite suppressants (\$1.47 billion); low-calorie prepared foods (\$1.97 billion); diet soft drinks (\$13.3 billion); artificial sweeteners (\$1.19 billion); commercial weight-loss centers (\$2.0 billion); hospital- and MD-based weight-loss programs (\$1.6 billion); nonresidential fitness and exercise clubs/spas (\$6.4 billion); residential health spas (\$1.55 billion); and diet books and cassette tapes (\$0.67 billion).

The Marketdata study, called *The U.S. Weight Loss & Diet Control Market*, was compiled from trade association

surveys, government and company reports, and extensive telephone surveys by Marketdata's staff. The report also notes:

•Seventy percent of teenage girls are dieting. The explosion of eating disorder cases is partly exacerbated by misuse of OTC diet products, most notably phenylpropanolamine.

•Most dieters with money to spend are "cosmetically obese" (20 to 30 pounds to lose) rather than medically at risk.

•Recent government investigations have pressured many commercial operators to promise to institute methods for collecting and reporting data on their customers' experiences—including their ability to keep weight off once it has been lost.

•The use of relatively low-cost meal-replacement products has increased while medically monitored very-low-calorie diet programs have suffered declining enrollment.

Marketdata's report, although intended primarily for commercial parties, might be useful for individuals interested in probing further into the economics and organization of the weight-loss marketplace. The price is \$995, with a 20% discount to *Nutrition Forum* subscribers. Individual sections of the report can be purchased separately. For a free brochure and table of contents, write Marketdata Enterprises, Inc., P.O. Box 436, Lynbrook, NY 11563 or telephone 516-791-6579.

BRIEFS

L-tryptophan damage award. A panel of arbitrators has awarded nearly \$2.2 million to 3 people from Oregon who developed eosinophilia-myalgia syndrome after taking tainted L-tryptophan supplements. One died and the other two have been hospitalized repeatedly for severe pain and fatigue. The illness has been traced to an impurity introduced during a new process used by Showa Denko, a large Japanese supplier. About 800 suits have been filed against the company.

Libel suit settled. In an out-of-court settlement, three defendants have agreed to pay a total of \$60,000 to John Renner, M.D., a Kansas City physician who has been actively engaged in fighting quackery. Dr. Renner's suit, filed in 1988, charged that Kurt Donsbach, Maureen Salaman, Clinton Miller, Joseph Lisa, the National Health Federation, and a publishing company operated by Donsbach had disseminated false and defamatory statements about his professional activities, mainly through sale of a book written by Lisa and promoted by the others. When the suit was filed, Donsbach was NHF's board chairman, Salaman its president, and Miller its legislative representative. The settlement pledges payment of \$29,000 by Donsbach, \$25,000 by Miller, and \$6,000 by Salaman over a 3-year period. NHF is noted for its aggressive lobbying and letter-writing campaigns in support of "alternative" methods of health care. Donsbach and Miller resigned from the group during 1989.

Mexican clinic operator convicted. James Gordon Keller, who operated St. Jude's Clinic in Tijuana, Mexico, has been convicted by a jury in McAllen, Texas, of 11 counts of using interstate communications to defraud patients. Prosecutors claimed that he told would-be patients that they could be cured of cancer through the use of crystals, herbal teas, vitamins, massage, and injections of an unapproved drug called "tumorax." In March, Mexican authorities delivered Keller to U.S. officials so prosecution could take place.

New "credentials" for health food retailers. The National Nutritional Foods Association (the primary trade organization for health food retailers, manufacturers, and distributors) and Bastyr College (a naturopathy school) are jointly sponsoring a 3-step course on retailing, introductory nutrition, and "advanced study" of such topics as herbs, homeopathy, sports nutrition, and skin care. In an interview reported in *Natural Foods Merchandiser*, NNFA's executive director said that the knowledge imparted to store managers and employees "can only lead to greater public confidence and a more professional industry." *Natural Foods Merchandiser* also reported that NNFA and its regional chapters contribute \$100,000 to the program.

More evidence against "clinical ecology." A study of 26 "environmental illness" patients found that their prevalence of major psychiatric disorders was more than twice as high as that of a control group [JAMA 264:3166-3170, 1990]. Reprints are available from Donald W. Black, M.D., Dept. of Psychiatry, University of Iowa College of Medicine, 500 Newton Road, Iowa City, IA 52242.

USDA hotline. The U.S. Department of Agriculture's Meat and Poultry Hotline (800-535-4555 from 10 a.m. to 4 p.m. EST) deals with proper handling of meat and poultry. Last year its 14 home economists fielded 80,000 questions from consumers.

AIDS food safety advice. The FDA, in cooperation with the U.S. Centers for Disease Control, has produced a 15-minute videotape, entitled *Eating Defensively: Food Safety for Persons with AIDS*. It covers foods to avoid, risks of contracting foodborne diseases, correct methods of food preparation and handling, and food safety advice to follow in kitchens, grocery stores, restaurants, and foreign countries. Copies are available for \$8.95 from the National AIDS Information Clearinghouse, P.O. Box 6003, Rockville, MD 20850. Once purchased, the tape may be reproduced without charge. Free brochures on the same subject are available on request.

In-case-you-missed-it department. According to an ad in *Horoscope* magazine, "your astrological sign can predetermine health and well-being!" Fortunately, *Astrological Vitamins* "specifically formulated" to be "compatible with your own individual astrological sign" are now available so you can "protect yourself from your own health weaknesses!" The ad explains that "many astrologers believe Aries may have poor eyesight and vitamin A helps maintain normal vision" and that "Taurus is prone to throat problems and vitamin C may help increase resistance to colds." The cost is \$22.95 for a 30-day supply (or \$39.90 for a 2-month supply) plus a free crystal pendant for "luck, health, and long life."

"No cholesterol" labeling attacked. The FDA has ordered three manufacturers of vegetable oil products to stop making "no cholesterol" claims on their labels. The cited products had displayed such a claim together with a picture of a heart or electrocardiogram. The FDA stated that this is misleading because it suggests that the product by itself can benefit general health but fails to reveal that (1) other dietary factors and overall weight control are necessary to achieve a healthy heart, and (2) the product is high in fat and that excess fat in the diet is a general health risk.

"Fast food" guidebook. Dietitians at Riverside Methodist Hospitals have developed *Food Facts Fast Foods Pocket Edition*, a 50-page guide to informed choices involving 480 lunch and dinner items at 16 leading fast-food chains. For each item the booklet charts total calories; calories from fat; grams of fat, carbohydrate, and protein; grams of saturated fat; milligrams of cholesterol; milligrams of sodium, and exchange values. A brief introduction explains how to make choices compatible with the 1990 U.S. Dietary Guidelines. Single copies are \$3.75 each; bulk orders (6 or more copies) are \$3.25 each from Gail Crosser, Nutrition Services, Riverside Methodist Hospitals, 3535 Olentangy River Road, Columbus, OH 43214.

New group hopes to protect nonstandard practitioners. A dentist opposed to the use of mercury-amalgam fillings has formed what he calls a "minority trade association" called the International Association of Dentists and Physicians. The purpose of the group, which is open to all types of licensed or "certified" health care providers, is to set standards for unorthodox methods that will be recognized by insurance companies, regulatory agencies, and the courts.

Notable quote. "Instead of putting their energy into coming up with a repeatable experiment as free as possible of methodological flaws, fringe scientists usually expend it in creating a blast of hot air and ad hominem attacks on their critics....Much of fringe research is the dilemma of a man in a boat who rows from one side: No matter how long or how hard he works, he never succeeds in doing anything except going in circles, never realizing that it isn't his dedication of his strength but his method that is flawed. Until fringe research puts both oars in the water, it is doomed to remain where it has always been: spinning aimlessly on the shores of science.—*Stephen Peterson, Skeptical Inquirer, Summer 1989.*

Vitamin politics. *American Druggist* has reported that the National Association of Retail Druggists' chief lobbyist is upset with Inner Circle, a Republican group whose members contribute at least \$1,000 per year to help elect a Republican majority in the Senate. In May 1991, Inner Circle members were informed of new member services, including discounts on drugs through a J. C. Penny Co. Inc. mail-order subsidiary and cut-rate vitamins and other health products from Bronson Pharmaceuticals. According to the article, NARD's lobbyist is irate about the glowing terms with which these benefits were described. NARD has also expressed concern that the FDA has advised consumers to seek lower prices through a discount mail-order pharmacy, such as the one operated by the American Association of Retired Persons.

Nutri/System sued again. *Newsday* has reported that 18 New York State residents have sued Nutri/System, claiming that its weight-loss regimen was responsible for damaging their gallbladder, which had to be removed. The suits charge that the company failed to warn people that rapid weight-loss can cause cholesterol-saturated bile to accumulate as gallstones. Nutri-System has denied any wrongdoing in more than 500 similar lawsuits filed throughout the country.

Unsafe recipe recalled. *Gourmet* magazine has notified its subscribers that a cookie recipe in its July 1991 issue contained an unsafe ingredient. Instead of 1/4 teaspoon of wintergreen extract, the recipe called for 1/4 teaspoon of wintergreen oil, a substance that can cause allergic reactions.

Nutrition education for medical students. The H. J. Heinz Company Foundation has given \$243,130 to the preventive medicine department of Rush Medical College (Chicago) to develop a computerized nutrition curriculum for medical students. The program will focus on how nutrition relates to disease and how physicians can guide patients to healthful diets.

Vitamins may cause facial eruption. A 53-year-old woman who began taking dietary supplements on advice of a health food store developed acne rosacea resistant to standard medical treatment. The supplements included 100 mg of vitamin B₆ and 100 µg of vitamin B₁₂ daily. Her symptoms cleared up within 3 weeks after stopping supplementation, returned after taking half the previous dose, and promptly cleared up when she stopped the vitamins again [*Cutis* 48:119-120, August 1991].

Fish inspection increased. The FDA has launched a special inspection of the nation's 4,100 seafood processing plants and other seafood establishments. It plans to complete the process within a year to evaluate the quality of seafood handling. The agency also announced that it is increasing its efforts against "shellfish bootleggers," who harvest and sell shellfish illegally from contaminated waters. Annual consumption of seafood reached nearly 16 pounds per person in 1989, an increase of nearly 60% over the past decade. The National Academy of Sciences said that despite increased consumption, reported cases of seafood-borne illnesses have not increased.

AMA modifies its cholesterol campaign. The AMA Campaign Against Cholesterol has a new name and logo. The campaign, which began in 1988, is cosponsored by a pharmaceutical firm and several food companies. Its new name is the AMA Cholesterol Education Program. Its logo no longer includes the AMA seal, and its messages state that the AMA endorses no products. These changes were made in response to FDA concerns that the campaign might constitute an endorsement or an implied health claim for the products.

Pediatricians blast food ads. The American Academy of Pediatrics wants television food advertising aimed at children stopped. In an updated policy statement, the Academy charged that the primary goal of children's television is to sell products to children. According to the Academy, young children cannot distinguish between programs and commercials and don't understand that commercials are designed to sell products. The policy statement also noted: "Television shows promote toys. The same toys are used to promote cereals and other foods. Commercials for the cereals, named after the toys, indirectly promote the toy and the toy-based program as well as the cereal and other related products."

QUACKERY AND THE FDA: A COMPLICATED STORY

Stephen Barrett, M.D.

The U.S. Food and Drug Administration (FDA) tries to ensure that all products marketed for the prevention or treatment of disease are safe and effective. How much can it protect us from quackery?

In 1979, at the request of an FDA official, I obtained evidence that a vitamin concoction was being illegally marketed as a remedy for high blood pressure, stroke, arthritis, atherosclerosis, glaucoma, angina, high cholesterol, and poor blood circulation. A few weeks later, an FDA inspector came to my office, filled out papers for me to sign, took the evidence, and reimbursed me for expenses. To my great surprise, however, no prosecution took place. In fact, the product is still sold today. This experience provided my first clue that something was wrong with the FDA's enforcement policy toward health frauds. Over the years, Congressional oversight committees and FDA advisory panels have reached the same conclusion. Americans have far less protection from quackery than they realize.

Organized Quackery: Drugs in "Disguise"

Ineffective products marketed for the treatment of disease can harm or even kill people by diverting them from effective treatment. For this reason, the Federal Food, Drug, and Cosmetic Act prohibits the marketing of health products that have not been proven effective as well as safe for their intended purpose. This law—which is primarily enforced by the FDA—applies not only to prescription drugs but also to vitamins, minerals, amino acids, and any other nutrients that are claimed to be effective against any disease.

Despite this fact, manufacturers aligned with the health food industry are marketing hundreds of unproven "dietary supplements" intended to be used against disease. The intended uses—such as "for strengthening the immune system" or "for preventing cataracts"—are almost never printed on

product labels, which would make the products easy targets for regulatory action. Instead, the claims are spread separately through books, magazine articles, and radio and television talk shows, all of which are protected by the doctrines of free speech and freedom of the press.

Cautious manufacturers rely on these media outlets to inform prospective customers what the ingredients in their products are for. However, many manufacturers provide health-food retailers with literature and other information to be distributed in the relative privacy of their stores. In May 1985, following an extensive undercover investigation, *Consumer Reports* listed 42 companies whose literature contained illegal claims that various products were effective against cancer, atherosclerosis, prostate trouble, sexual dysfunction, high blood pressure, and many other ailments. The article also chided the FDA for not doing enough to police the marketplace.

Instead of acknowledging the seriousness of the problem, FDA officials attempted to downplay its significance. In a prepared statement, they claimed that "many of the products mentioned in the article were known to the FDA and were under investigation, covered by the OTC drug review, or already acted upon Those new to the agency will be scheduled for coverage in the future."

This statement was deliberately deceptive. It was true that many of the products were "known to the FDA." However, an FDA press officer told me that 25 of the 42 companies were not "known to the FDA"—despite the fact that I had mailed information about eight of them to the FDA's Health Fraud Branch as well as to its Commissioner and chief enforcement officer six months before the article was published. Only ten of the rest had been subjected to enforcement action—in one case 23 years previously—and several of these had continued to break the law despite what the FDA had done. Four other companies were said to be "under investigation." The FDA never asked for the evidence collected by *Consumer Reports* and stopped only a few of the violations the article had revealed.

Further Evidence of Weakness

The FDA's impact on the marketplace can be judged by observing the number of illegal supplement products sold, how long they remain on the market, and how long the FDA takes to act after it becomes aware of violations.

The most efficient FDA enforcement action I have ever seen was taken in 1986 against United Sciences of America, a multilevel company which claimed that its nutritional products would help prevent cancer and heart disease. Using videotaped endorsements from prominent scientists (some of whom later charged that the endorsements were used without their permission), the company quickly built sales to several million dollars per month. However, within six months after learning of the illegal claims, the FDA sent a single letter ordering the company to stop making them. The resultant scandal plus action by several state attorneys-general quickly drove the company out of business.

Unfortunately, this degree of regulatory success is not common. The following examples are more typical.

- In 1983, a manufacturer of fish oil capsules distributed a booklet stating that fish oils were effective in preventing heart disease. Although this claim was based on a well designed scientific experiment, the evidence was far from sufficient to justify self-medication by the general public. Acting on a tip from me, the FDA ordered the company to recall the booklet, which it did. However, the FDA took five years to stop other companies from making similar claims in ads. By that time total fish oil sales were close to \$100 million a year and their intended use was firmly established in the public's mind.

- During the 1980s the amino acid L-tryptophan was marketed as an aid for insomnia, weight reduction, premenstrual syndrome, and several other problems. These claims were illegal. In 1989 L-tryptophan was implicated in an outbreak of eosinophilia-myalgia syndrome, a rare disorder characterized by muscle and joint pain, weakness, swelling of the arms and legs, fever and skin rash. More than 1500 cases were reported, including at least 28 deaths and many cases of severe disability. Although the problem was caused by a contaminant in the manufacturing process, the FDA might have prevented the outbreak by stopping the illegal claims before L-tryptophan became established in the marketplace.

- Since AIDS became a household word, many companies have marketed nutritional products said to "strengthen the immune system." All of these products are fakes. More than two years after the product category had established its market niche, the FDA stopped some companies from marketing them. But others continue to do so.

- Marketing of *Cal-Ban 3000*, a guar gum product claimed falsely to produce automatic weight loss, began in 1986 and continued despite action by the Postal Service and the Iowa Attorney General. The FDA, which could have ordered the marketing stopped, said it would not do so because guar gum was still under review as an ingredient in over-the-counter (OTC) diet products. The FDA stated that as long as guar gum did not present a health hazard, it could be marketed at the

manufacturer's discretion. The OTC review process had begun in the early 1970s and had no completion date targeted. Early last year, at a Congressional hearing, an Iowa Assistant Attorney General accused the FDA of giving purveyors of diet fraud "full reign" to violate the law for almost 30 years, with "resulting consumer losses . . . in the billions of dollars." Pressed by Congressional staff members, the FDA announced that guar gum would be banned along with more than 100 unproved ingredients used in OTC diet products. (The ban will be scheduled to take effect in February 1992.) Meanwhile, it turned out that *Cal-Ban* was not safe because when placed in water, guar gum tablets swell to several times their original size and have the consistency of putty. In 1989, the FDA was notified that two *Cal-Ban* users had suffered serious esophageal obstruction. However, it did not order the marketing stopped until a year later. By that time at least 17 cases of esophageal obstruction, including one death, had been reported.

- More than 100 companies are marketing vitamin and amino acid concoctions said to increase stamina and endurance and help build big muscles. All of these products are fakes. Lack of FDA action has enabled these so-called "ergogenic aids" to grow to a \$100 million a year rip-off. An FDA official has told me that since the products appear to be physically harmless, they are likely to remain "low-priority" for regulation.

- In 1986, while working on an article about homeopathy for *Consumer Reports*, I spent more than two hours with the FDA's top enforcement official, Joseph Hile, Associate Commissioner of Regulatory Affairs. During the interview I asked him to examine a homeopathic home remedy kit and tell me whether its labeling was legal. The kit included products called *Hepatic Dysfunction* and *Glandular for Men*. After examining the kit, he began pacing the floor and said he couldn't answer my question because the situation with homeopathic products was extremely complicated—and if he said the labeling was illegal, he would be obliged to take action. After the interview ended, I showed the kit to a member of the FDA's Health Fraud Branch who said, "Sure it's illegal. Product labels must be written entirely in English. These are not." No enforcement action was taken. Hundreds of homeopathic remedies still are marketed for the treatment of health problems for which they have no proven effectiveness.

Nutrition Forum (ISSN 0748-8165), © 1991, is published by Stephen Barrett, M.D. All articles and advertising inserts are fully endorsed by Dr. Barrett.

Individual subscriptions in the United States and Canada are \$35 for 1 year (six issues), \$65 for 2 years, and \$95 for 3 years, payable to Nutrition Forum, P.O. Box 1747, Allentown, PA 18105. Institutional (multireader) subscriptions are \$45 for 1 year, \$80 for two years, and \$115 for 3 years. Overseas subscriptions (via airmail) are \$45 for 1 year, \$85 for 2 years, and \$125 for 3 years. Back issues are \$6 each.

Many Pressing Issues

Ask any FDA official why the agency has not been more effective against health frauds and you will get essentially the same answer: "We'd like to devote more attention to health frauds but the FDA's limited resources are not sufficient to do everything that needs to be done." I believe this statement is true but incomplete.

The FDA is responsible for ensuring that our food is safe and wholesome; that cosmetics are safe; that drugs and therapeutic devices are safe and effective; and that all of these products are honestly and informatively labeled. These tasks are enormous. About 25¢ out of every consumer dollar in the United States is spent on FDA-regulated products—produced or distributed by close to 90,000 companies. The problem of health frauds has had to compete for attention with the AIDS epidemic, the high cost of pharmaceutical research and development, criminal tampering with foods and drugs, concerns about the safety and efficacy of generic drugs, questions about food safety, and many other pressing issues.

In 1983, as part of an extensive 4-year investigation of frauds against the elderly, the late Congressman Claude Pepper asked federal agencies what they were doing about quackery. The FDA replied that \$1.8 million (0.5%) of its \$362.7 million budget had been allocated for 1983, but this included educational activities and publications in addition to enforcement actions.

In May 1991, a prominent FDA advisory committee concluded that, despite a \$682 million budget and approximately 8400 full-time employees, the FDA was no longer capable of fulfilling its statutory obligations. Although public health had not yet been significantly threatened, the committee noted, "In the past decade . . . Congress has relentlessly added new responsibilities without providing the resources to carry them out. Many sources, the report also noted, "depicted an agency that is overextended, underfunded, and shackled by bureaucratic constraints."

In 1990 the FDA's enforcement staff included nearly 1000 investigators, compliance officers, laboratory personnel, and attorneys. During a typical year, the investigators visit about 20,000 companies within the United States and 400 abroad, review about 1½ million imported goods, and conduct 100,000 examinations at the wharves. In addition, agency scientists analyze 75,000 product samples each year. These activities typically result in 25,000 import detentions and 17,000 other regulatory actions ranging from simple warnings to product

recalls and court actions [FDA Consumer 25(1):7, 1991]. The vast majority involve safety violations rather than quack claims.

Uncertain Priority

In 1984, Frank A. Young, M.D., Ph.D., became FDA Commissioner and announced that fighting health fraud would have a high priority. Under his administration, the FDA established its Health Fraud Branch, cosponsored national and regional health fraud conferences, and distributed information packets to almost 20,000 newspapers, magazines, and radio and television stations, urging them to reject fraudulent ads. Although educational activities like these are important, they have little or no deterrent effect on lawbreakers.

When the FDA detects illegal marketing, it can issue a warning letter, initiate a seizure, seek an injunction, or initiate criminal prosecution. During my interview with Joseph Hile I asked why criminal prosecutions—with their potential threat of a prison sentence—were not used more often in food supplement cases. He replied that the Justice Department would not process them, so there was no point aiming in that direction. When I asked why he didn't make this problem public so that criticism focused on the FDA (by the *Consumer Reports* article, for example) could be redirected toward the responsible party, he said that it wasn't his place to do this.

A few months after my meeting with Mr. Hile, he retired and was replaced by John A. Taylor, who attacked the problem of health frauds much more aggressively. He initiated many important seizures that stopped manufacturers from making illegal therapeutic claims for their products. Mr. Taylor, who retired in 1989, is now a consultant to a prominent law firm in Washington, D.C. He credits the aggressiveness of his enforcement policy to "a change of philosophy from the top" initiated by Commissioner Young. In a candid interview, Mr. Taylor agreed that more criminal prosecutions are needed because companies may regard lesser enforcement actions as part of "business as usual." But he noted that criminal actions are time-consuming and require more levels of review as well as action by the Justice Department.

Mr. Taylor admitted that "during the early 1980s, there was a widespread perception that the Justice Department would not take our cases—and we didn't keep testing the Department by bringing new cases." Cases were presented during his administration, "but in busy jurisdictions—where drug trafficking is a problem, for example—those involving dietary supplements would go to the bottom of the pile."

A Complicated Situation

During the past decade I have spent countless hours studying the illegal marketing of supplement products and talking with FDA regulatory officials in an attempt to understand what is wrong and what can be done to remedy it. Here are my conclusions:

- Health food industry manufacturers are well funded, well organized, and well informed. They will continue to make illegal claims for their products as long as they can get away with making them.

- Regulatory actions during the past decade have had little deterrent effect on the health food industry because they rarely have interfered with profitability.

- The only way to reduce profitability is to combine rapid detection, rapid enforcement action, severe penalties, and increased public education.

- The FDA does not appear to have a systematic program of detecting violations by health food industry manufacturers. I believe this can be done with existing agency resources.

- The time between detection of an illegal promotion and regulatory action typically is not short enough to prevent violators from making substantial profits. One reason for this has been excessive bureaucracy within the FDA. Commissioner David A. Kessler, M.D., J.D., who assumed office this year, has already streamlined enforcement processes by reducing the levels of review needed to take action.

- The FDA classifies worthless yet harmless articles promoted to improve health, athletic ability or appearance as "economic frauds." This category of products is considered low priority and is virtually unregulated. This is unconscionable.

- Warning letters and injunctions inflict no financial penalty except what a violator pays its lawyers. Seizures are rarely large enough to drive a violator out of business. Many companies regard defending against these actions as part of the cost of doing business. This situation can be corrected by passage of a law enabling the FDA to initiate or assess large financial penalties against violators.

- Criminal prosecutions, which can result in financial penalties and/or prison sentences, could exert a deterrent effect on the health food industry if enough of them were carried out. However, there have been very few of them. (I know of only two between 1963 and 1990.)

- The reason for the small number of criminal prosecutions is not clear. FDA officials are at least partly responsible. So is the Justice Department. As far as I can tell, negotiations between the two agencies are considered delicate by the FDA and have never been publicly revealed. However, Congressional oversight committees are now aware of this problem.

- It is not clear whether the Justice Department and the criminal court system can handle enough health-fraud cases to make a difference. The general level of lawlessness in this country is so great that the criminal courts may not be able to handle more cases. Moreover, Justice Department priorities are strongly influenced by the Administration—which, under

Presidents Reagan and Bush, has tended to minimize government regulation. The food and drug industries—which are huge—are certainly not interested in seeing the FDA get more power. Sorting out the issues involved requires a Congressional investigation.

- The FDA does not have an efficient or systematic method of informing the public about its regulatory actions. Although the FDA Press Office issues news releases, most regulatory actions are not reported, and details of these actions are often difficult for reporters to obtain. I believe this problem can be corrected with existing FDA resources.

- The FDA maintains statistics on the number of regulatory actions (such as seizures) it has approved. However, it does not maintain statistics on the number of violations detected, the percentage of these against which action actually is carried out, and whether the action is effective. Thus neither the agency nor anyone else is unable to quantitate its degree of effectiveness in the marketplace.

- Many people within the FDA care a great deal about health frauds and feel frustrated that they cannot do more about this problem.

The Bottom Line

The only way to clean up the health food industry is a policy that *deters* violations. The Internal Revenue Service has made it clear that cheating on income tax can cost people dearly and land them in jail. The FDA should make it clear that cheating on product labels or accompanying literature can cost just as dearly. Cheating by supplement manufacturers is easy to detect because public disclosure is needed to attract customers. I believe there are many ways the FDA could achieve greater efficiency in its regulation of health frauds.

Commissioner Kessler has voiced great interest in attacking this problem. Congressmen Henry Waxman and John Dingell have introduced legislation (H.R. 2597, later modified to become H.R. 3642) to give the FDA more clout. The current version enables the Secretary of Health and Human Services, following an opportunity for an informal hearing, to stop the marketing of any food, drug or cosmetic considered to have reasonable probability of causing serious adverse health consequences or death. The bill would also enable the FDA Commissioner assess penalties (subject to court review) of up to \$250,000 for individuals and \$1,000,000 for companies for each violation of the Food, Drug, and Cosmetic Act. (Multiple violations would have a \$5,000,000 limit.) If these provisions are enacted, consumer protection will get a much-needed boost. The health food industry knows this and has generated many letters and petitions opposing this legislation.

Dr. Barrett, a practicing psychiatrist and consumer advocate, edits Nutrition Forum Newsletter and is co-author/editor of 27 books including *Health, Schemes, and Scams* [Consumer Reports Books, 1990]. In 1984 he received the FDA Commissioner's Special Citation Award for Public Service in fighting nutrition quackery.

BENEFITS AND RISKS OF VEGETARIAN DIETS

Susan Dingott, M.S., R.D.
Johanna Dwyer, Sc.D., R.D.

The eating patterns and health practices of vegetarians are as diverse as those of nonvegetarians (omnivores). Table 1 shows how vegetarians differ in the types of animal foods they eat. Vegetarians also vary in their attitudes towards supplementation, conventional medicine, and many other matters that may affect their health. Thus there are hundreds if not thousands of ways to be vegetarian.

To be safe from a nutritional standpoint, any eating pattern, vegetarian or otherwise, must provide balance, variety, and moderation. It must meet special nutrient needs that arise during infancy, adolescence, pregnancy, lactation, and other stages of life. It must accommodate special therapeutic considerations that individuals with certain health problems may require. It should also reduce risks of diet-related diseases.

Considerable agreement exists among experts about the dietary patterns that lower chronic disease risks. The American Heart Association, American Cancer Society, National Cholesterol Education Program, and Committee on Diet and Health of the National Research Council all recommend that adults reduce fat consumption to 30% of calories, with no more than 10% of calories as saturated fat. Some vegetarians—especially those who eat no animal foods at all—achieve these recommended intakes better than most omnivores [Am J Clin Nutr 48:712-738, 1988]. However, vegan diets may fall short in certain nutrients unless they are carefully planned.

Table 2 summarizes some of the positive aspects of vegetarian eating. But ill-planned vegetarian diets pose substantial risks (see Table 3). Problems most commonly occur with vegan diets because vegans eliminate all animal foods and may also avoid foods that are processed or not "organically grown." Vegans often refuse to use supplements and may eschew conventional medical care as well [Am J Clin Nutr 48:811-818, 1988].

One danger of vegan diets is insufficient energy intake (calories), especially during infancy and early childhood. If

energy needs are not met, body proteins will be broken down for energy, and this creates additional problems [Ann Rev Nut 11:61-92, 1991]. Therefore, adequate energy intake should be the foremost consideration in vegan dietary planning.

Low protein digestibility and quality are other potential risks. Protein quality depends on both digestibility and amino acid composition. The digestibility of protein in the usual American mixed diet is good, probably 95% to 96%. But plant protein foods high in fiber or other inhibitors may have digestibilities as low as 80% [World Health Organization Technical Report 724, 1985]. The digestibility of one vegetable protein in one child's vegan diet was found to be only 86% [Am J Clin Nutr 48:868-874, 1988]. Low protein quality is rarely seen in American vegetarian diets, except among vegans or fruitarians who eat small amounts of a single plant food (such as rice or fruit) as a staple. Single plant protein foods usually are lower in protein quality than most animal proteins because they lack significant amounts of various essential amino acids. Table 4 indicates the limiting amino acids (the essential amino acids present in shortest supply) in foods commonly consumed by vegetarians.

Plant foods low in particular amino acids can be combined with plant or animal foods containing them to provide a mixture containing all the essential amino acids. These combinations of "complementary" proteins compensate for the limited amounts of amino acids in the proteins of individual plants. Table 4 shows, for example, how legumes (which are low in two essential amino acids) can be combined with grains (which contain ample amounts of these two but are low in three others) to supply a mixture adequate to meet body needs.

It is not necessary to eat complementary proteins at every meal; it suffices to eat them over the course of a day. Both body protein breakdown and amino acids from recently ingested proteins provide a general body pool of amino acids that can temporarily fill any gaps.

TABLE 1. TYPES OF VEGETARIAN DIETS

Type	Prohibited Foods	Typical Health Practices
Vegan	Meat, fish, poultry, eggs, dairy products	Vegans tend to be physically active, avoid drugs and tobacco products, and rely on unconventional rather than conventional health care. Exceptions include macrobiotics who often smoke cigarettes and Rastafarians who smoke marijuana.
Lactovegetarian Lacto-ovo-vegetarian Semivegetarian	Meat, fish, poultry, eggs Meat, fish, poultry Meat, but may include small amounts of fish and poultry in the diet	Varies from group to group. Some use vitamin and mineral products; others do not. More likely than omnivores to be physically active and not smoke or use alcohol. Links to conventional health care system tend to be stronger than those of vegans.

Practical Tips

To assure adequacy with respect to energy and other nutrients, vegetarians should follow these simple principles:

- *Include foods that are calorically and nutrient dense.* Cooked legumes, whole-grain breads, enriched cereals, nuts, and nut spreads (such as peanut, cashew or tahini butter) are concentrated sources of calories, protein, vitamins, and minerals.

- *Choose foods that provide enough iron, calcium, and zinc.* Since their diets contain no animal foods, which are particularly rich in these minerals, this should be a special

concern for vegans. Small amounts of animal foods, such as milk and eggs, increase the bioavailability of iron from plant foods eaten at the meal. Plant sources of iron include dried figs, prunes and raisins, pumpkin seeds, sesame seeds, and soybean nuts. Iron-fortified cereals also are excellent sources of iron. To ensure that iron intake is satisfactory, eat good sources of vitamin C, such as tomato, broccoli, melon, or orange or other citrus juice at each meal. These foods enhance absorption of the iron in legumes and grains by making it more soluble.

Low-fat or skim milk, or milk products, such as yogurt and cheese are excellent sources of calcium for lacto-(ovo)vegetarians. Vegans can get calcium from foods such as

TABLE 2. POSSIBLE BENEFITS OF VEGETARIAN EATING

Characteristic	Comments/Possible Mechanisms
Leanness	Vegetarians tend to be more physically active than nonvegetarians [Am J Public Health 79:1283-1288, 1989]. Higher intakes of dietary fiber may decrease absorption of food by 2-3 % and contribute to a feeling of fullness.
Lower blood pressure	Vegans, who consume a diet very low in fat, tend to have blood pressures 10-15 mm Hg lower than nonvegetarians of similar age and gender. Much of this effect appears to be related to body weight rather than other dietary variables [Am J Clin Nutr 48:795-800, 1989].
Lower serum cholesterol	Total blood cholesterol levels are lower in vegans than in lactovegetarians or nonvegetarians. Whole-fat milk products and eggs tend to raise serum blood lipids due to their saturated fat and cholesterol content. Vegetarians often use non-fat or lowfat milk, and vegans use no milk or eggs at all [Am J Clin Nutr 48:712-738, 1988].
Less colon cancer?	Diets high in animal foods may increase the incidence of colon cancer by increasing the fecal concentration of various carcinogens [Nature 294:453-456, 1981, Br J Cancer 28:94, 1973]. A high intake of animal fat may increase the risk of colon cancer [N Engl J Med 323:1664-1672, 1990]. It also is possible that carcinogens are produced by cooking meat at very high temperatures.

TABLE 3. POSSIBLE RISKS OF VEGETARIAN EATING

Risk	Comments
Osteoporosis	There is little evidence that a vegetarian diet causes or cures osteoporosis. One recent study of 290 postmenopausal women found no differences in the measurements of bone mineralization between nonvegetarians and lacto-ovo-vegetarians [Am J Clin Nutr 50:517-523, 1989].
Rickets	Vegan children who have limited sun exposure may be at risk of developing rickets secondary to vitamin D deficiency. One study found very low intakes of calcium and vitamin D among macrobiotic infants. Only one received a daily supplement of vitamin D, and 15 (28%) were found to have rickets [Am J Clin Nutr 47:89-92, 1988]. Another study found low serum concentrations of vitamin D among lactating macrobiotic women in Boston [Obstet Gynecol 70:870-874, 1987].
Iron-deficiency anemia	In one recent study, low serum ferritin levels (a sensitive measure of iron storage status) were found in 5% of male and 27% of female lacto-ovo-vegetarians, and mean ferritin levels of omnivores were significantly higher than those of vegetarians [Am J Clin Nutr 45:785-789, 1987].
Macrocytic anemia	Signs of vitamin B-12 deficiency have been observed in some breast-fed infants of women who are strict vegetarians [Am J Clin Nutr 47:89-92 1988].
Emaciation or slowed growth	Excessive leanness and/or slow growth have been noted among vegan and vegetarian infants and young children after weaning [Am J Clin Nutr 47:89-92 1988].

TABLE 4. PROTEIN COMPLEMENTATION
 Proteins low in certain amino acids can be combined with others containing them to form complete amino acid mixtures.

Food Group	Limiting Amino Acids	Combine With	Examples
Legumes (beans, peas, lentils)	Tryptophan, methionine	Grains Nuts/seeds	Lentil soup with cornbread Peanut-sesame seed mix
Grains (wheat, rice, oats, barley, corn, rye)	Lysine, isoleucine, threonine	Legumes Dairy	Kidney beans and rice Whole-grain cereal with milk
Nuts/seeds (almond, cashew, filbert, pumpkin, sesame, sunflower, walnut)	Lysine, isoleucine	Legumes	Kidney bean soup with sesame seeds
Animal foods	Not as limited	Any of above	Vegetables with yogurt dressing

tofu, kale, broccoli, sunflower seeds, dried figs, tortillas, calcium-fortified *Total* breakfast cereal (48 mg/1 oz serving), or *Citrus Hill Plus Calcium* orange juice (160 mg/6 oz serving). Vitamin D is also needed to increase the efficiency of calcium absorption. Fortified milk, and milk products can provide vitamin D, but vegans who lack adequate exposure to sunlight (or who use sunscreens) may need to take a vitamin D supplement.

Lacto-ovo-vegetarians can get zinc from egg products.

Dried beans, peas, lentils, nuts and seeds are good plant sources of zinc. However, the zinc in fruits and vegetables is less bioavailable than the zinc from animal sources. Vegans and lacto-vegetarians may prefer to use yeast-leavened whole-grain products to increase the bioavailability of the zinc in whole grains by inactivating zinc inhibitors.

• Limit foods that are high in phytates (whole grains, bran, and soy products) and oxalates (spinach, rhubarb, and chocolate), since phytates can inhibit the absorption of iron, calcium, and zinc.

Vegetarians with special health problems may need expert help. The *Diet Manual, Including a Vegetarian Meal Plan* recently published by the Seventh-day Adventist Dietetic Association, P.O. Box 75, Loma Linda, CA 92354, is an excellent reference for health professionals.

Vegetarianism based on sound nutrition principles can be a healthful choice, but neither vegetarians nor omnivores have a monopoly on healthful eating. Vegetarians are just as diverse in their health status as are nonvegetarians. Similar health benefits can be gained from both well-selected omnivorous and vegetarian diets.

Ms. Dingott is a staff nutritionist at New England Memorial Hospital, Stoneham, Massachusetts. Dr. Dwyer is director of the Frances Stern Nutrition Center, New England Medical Center Hospitals, and professor of medicine (nutrition) and community health at Tufts University Medical School. This article was prepared with partial support from grants MCJ8241 and MCJ9120 from the MCH Service, U.S. Dept. of Health and Human Services.

BE WARY OF MAIL-ORDER HEALTH PRODUCTS!

A study of magazines, tabloid newspapers, direct-mail catalogs, television infomercials, multilevel companies, and other channels through which health-related mail-order products are marketed has concluded that almost none of them work as advertised. The study was conducted by Dr. Stephen Barrett with partial support from the Dick Goldensohn Fund, a New York City-based foundation interested in economic justice.

The study included a survey of one issue each of 463 magazines in national circulation during the summer of 1990. Dubious ads appeared in 56 out of 423 (13%) general audience magazines and 23 out of 40 (58%) health and fitness magazines. In the general magazines, about 50 companies advertised about 70 dubious products. In health-food publications, 15 companies advertised 24 dubious products. In fitness and bodybuilding magazines, 26 companies advertised more than 60 products. All but one product (a sweat-reducing device) were misrepre-

sented. Tabloid newspapers (*Globe*, *National Examiner*, *Sun*, *National Enquirer*, and *Weekly World News*), which Dr. Barrett surveyed for several months, contained several misleading ads per issue.

A booklet describing Dr. Barrett's study is available for \$3.85 from the American Council on Science and Health, 1995 Broadway, 16th Floor, New York, NY 10023. The booklet advises that no mail-order product can cause effortless weight loss; erase scars, wrinkles or "cellulite"; selectively reduce one part of the body; increase bust or penis size; prevent or cure hair loss; increase stamina, endurance, strength, or muscle mass; prevent aging; prolong life; prevent senility; increase memory; or increase sexual stimulation or pleasure. Nor can musical tapes with "subliminal" messages do anything more for physical or mental well-being than listening to ordinary music.

BRIEFS

Nutrition Forum changes publisher. Dr. Stephen Barrett, who has edited *Nutrition Forum* since its inception, is now also its publisher. The newsletter was published by the George F. Stickley Co. from October 1984 through December 1988 and by the B.J. Lippincott Co. from January 1989 through October 1991. Publication will continue bimonthly for at least three more years. A list of back issues can be obtained by sending a stamped self-addressed envelope to P.O. Box 1747, Allentown, PA 18105.

Court knocks chelation therapy. A federal court judge in Georgia has dismissed a bizarre claim asserted by a woman who suffered a stroke following surgery in 1989 for partial blockage of her left carotid artery. The woman had charged that her neurosurgeon had committed malpractice by failing to inform her that chelation therapy was a possible alternative. Georgia's informed consent law requires physicians, before performing surgery, to inform their patients of the risks and of "practical alternatives . . . generally recognized and accepted by reasonably prudent physicians." The judge ruled that the plaintiff had failed to prove that this standard had been violated. (The case was not dismissed because other allegations of malpractice are still pending.) Chelation therapy is a series of intravenous infusions containing an artificial amino acid (EDTA) and various other substances. Proponents claim chelation is an alternative to surgery because it can remove atherosclerotic plaque from the body's arteries. In 1985, an American Heart Association task force concluded that there is no scientific evidence to demonstrate any benefit.

Laetrile follow-up study. Three naturopaths from Oregon have published the results of their study of cancer patients they interviewed in 1983-84 at the clinic operated by Ernesto Contreras, Sr., in Tijuana, Mexico. According to their letter in the December 1991 *Townsend Letter for Doctors*, they were able to follow 22 late-stage cancer patients with a history of conventional treatment. All died of their cancer within two years, and no patient appeared to substantially outlive expected norms.

Garlic promotion recalled. Lichtwer Pharma U.S., which had publicized scientific findings that garlic tablets can lower blood cholesterol levels, has notified health-food retailers to return its previously distributed information. The notice, dated August 1991, states: "In response to numerous requests for specific information about KWAI, we have in the past sent you material discussing garlic and research concerning it. We would like to clarify that such research is still ongoing, and there is no scientific consensus in the U.S. at this time as to garlic's effect on human functions. . . . In view of the unresolved research status of the information conveyed in materials previously sent to you, and in light of legal questions raised by the FDA, it is critical that these materials not be distributed or displayed, or discussed with your customers. We request that you return immediately to us any previous materials we have sent you which could be considered to convey specific claims for KWAI."

Bill seeks to tighten health claims on food labels. H.R. 1662, the Nutrition Advertising Coordination Act of 1991, would amend the Federal Trade Commission Act to require food advertising to meet the requirements applicable to nutritional labeling of food. In addition, advertising that characterizes the level of fat, saturated fat, cholesterol, and/or fiber in a food product would also have to disclose relevant level(s) of total fat, saturated fat, and/or cholesterol. (Ads for "high-fiber" products, for example, would have to say how much fat the products contain.) The purpose of this bill is to require the FTC to abide by the regulations the FDA is developing for health claims on food labels.

Consumer attitudes. A poll of 1,000 adults age 25 or older suggests that Americans can be placed into three groups. The "I'm Already Doing It" group (26%) considers nutrition and dietetics important and tends to cook from scratch, purchase lowfat or fat-free products, and read nutrition information on food labels. However, individuals in this group are more likely to have misconceptions about diet, including the belief that there are "good" and "bad" foods. The "Don't Bother Me" group (36%) feels that diet and nutrition are "not much of an issue." In this group, 83% realize they aren't doing all they can to eat healthfully but show no interest in changing eating habits. The "I Know I Should But..." group (38%) thinks nutrition is fairly important, but fewer than half feel they are doing as much as they should to maintain a balanced diet. When asked which foods consumers should choose to improve their diet, 40% said vegetables and 27% said fruits. The survey's cosponsors were the National Center for Nutrition and Dietetics, Kraft Foods, and *Good Housekeeping* magazine.

Nutrition hotline. The National Center for Nutrition and Dietetics (NCND), with a \$450,000 supporting grant from Kraft General Foods, has begun operating a consumer hotline (800-366-1655). Callers can speak with a registered dietitian, listen to three recorded nutrition messages, or leave their name and address for a free brochure. Dietitians will be available 9 a.m. to 4 p.m. CST, Mondays through Fridays. The recorded messages will be available 24 hours a day. NCND is the public education initiative of the American Dietetic Association and the ADA Foundation.

Notable quote: "Why did a large vitamin manufacturer recently buy 80,000 copies of *Nutrition News*? Why? Because *Nutrition News* sells product. It can help you sell more product too. Your customers want to know what your products can do for them. Each month we publish an attractive, topical newsletter geared specifically to inform them and motivate them to buy those products."—Ad for *Nutrition News*, a 4-page newsletter that health food stores can purchase and distribute free to customers. The newsletter makes claims for the ingredients in supplement products that would be illegal to state on the product labels.

LIFE AFTER BYPASS: MY PERSONAL WAR AGAINST CHOLESTEROL

Stephen Barrett, M.D.

When the AMA announced its War on Cholesterol, I planned merely to write about it. But today I am fighting in the front lines. Here's what happened...

A few years ago, I began gathering information about diet, cholesterol and heart disease. I read a myriad of journal articles, attended seminars conducted by experts, and talked extensively with professional friends, several of whom had been battling their own cholesterol levels for many years. My goal at the time was to learn enough to edit articles on the subject for *Nutrition Forum*. Never did it cross my mind that cholesterol control would become a life-and-death issue for me.

But it did. One morning in February 1989 I experienced a mild burning sensation in the upper part of my chest. It lasted only a minute but returned several more times during the next few days. At first it didn't appear related to exertion; it seemed to come and go by itself. But by the third day, I began to worry that it might be angina pectoris—a signal that my heart muscle was not getting enough oxygen to meet its needs.

On the other hand, I also began to worry that I was being ridiculous. How could somebody like me develop blockage in his coronary arteries? There was no history of premature heart disease in my family. I have never smoked. I didn't have high blood pressure or diabetes. I was not overweight. I exercised regularly for fitness. And my general health was so good that I hadn't missed a day's work for illness in more than 30 years. True, my blood cholesterol level was close to 240, but with no other risk factor in the picture, I was not a likely candidate for heart disease.

After discussion with my wife (a family practitioner) and a brief telephone consultation with a local cardiologist, we scheduled an appointment for a stress test that afternoon. By the middle of the test, the verdict was clear. I did have angina and—since its frequency kept increasing—my risk of a sudden heart attack was very high.

Within minutes, I went by wheelchair to the emergency room at the Lehigh Valley Hospital Center, where I was

hooked to a continuous cardiac monitor and given an anticoagulant by slow intravenous drip. About two hours later, I entered the intensive care unit where the monitoring and medication were continued. On the following day I underwent coronary angiography, a procedure in which a catheter was inserted into an artery in my arm and threaded into the area where the coronary arteries enter the heart. Then a special dye visible by x-ray was injected so that blood flow through my coronary arteries could be seen and evaluated. Minutes later, the verdict again was clear. I had 95% blockage of one artery and 50% blockage of two others. The recommended treatment: bypass surgery.

Successful Operation

Bypass surgery is an amazing technological feat. The heart normally receives its blood supply from the coronary arteries, which connect from the aorta (the main artery emerging from the heart) to the heart muscle. If these become clogged near their origin but are open beyond that point, normal blood flow can be restored through grafts that run from the aorta to the unblocked portions of the coronary arteries.

The grafts are obtained from the patient's mammary artery (which supplies a portion of the chest wall but is not vital to the area) and/or saphenous veins, which serve the lower part of each leg. During the operation, the patient's heart is stopped so that the grafts can be sewn in place while circulation is maintained through a heart-lung machine. In my case, the surgeons used the mammary artery and a portion of vein from one leg.

My operation went well. I awoke six hours later with pain at the operative site that required narcotics to control, but by the next day, this discomfort was easily controlled by a non-narcotic pain-reliever. My recovery continued smoothly, and I was discharged in one week.

During the next few weeks, I had to walk slowly

because anemia due to blood loss caused my heart to beat fast and hard with even minimal exertion. This problem resolved as my body replaced the lost red blood cells. For about a month, I had some soreness of the chest, which was aggravated by movements that stretched the chest muscles. I was able to work part-time in my home-office two weeks after leaving the hospital and resumed full-time work after ten weeks. I had no anginal pain, and a treadmill test showed that the operation had restored normal blood supply to my heart. Of course, the key question was—and still is—how to minimize the odds that my coronary blood vessels will again become blocked.

Risk Factors

The material that clogs coronary arteries is a fatty, fibrous, cholesterol-laden deposit called plaque. Over long periods of time, plaque build-up gradually thickens the artery walls and narrows the channel inside, a condition called atherosclerosis. If enough plaque accumulates to impede the flow of blood through the coronary arteries, inadequate blood supply to the heart can cause chest pain (angina) or a heart attack.

Medical scientists have identified ten "risk factors" for coronary heart disease: cigarette smoking, high blood pressure, high blood cholesterol level, obesity, diabetes, lack of exercise, stress, a family history of coronary heart disease, being male, and increasing age. Risk factors are cumulative: the more an individual has, the greater the danger of having a heart attack. In my case, the culprit appears to have been a high blood cholesterol level.

Cholesterol Regulation

Within the bloodstream, cholesterol travels in fat/protein packages called lipoproteins. Low-density lipoproteins (LDL) tend to cause atherosclerosis, while high-density lipoproteins (HDL) tend to protect against it by helping to remove cholesterol from the artery walls. Thus the lower the level of LDL and the higher the level of HDL, the smaller the risk of coronary heart disease.

Blood cholesterol levels are determined partly by heredity and partly by diet. Cholesterol regulation is accomplished mainly through the action of the liver. When the diet is high in fat—particularly saturated fat—the liver becomes less able to remove cholesterol from the blood. Conversely, when the diet is low in fat, removal of cholesterol from the blood is facilitated. Soluble dietary fiber also plays a role in cholesterol regulation by absorbing bile acids secreted by the liver into the intestine. When the diet is high in fiber, these compounds (which the liver makes from cholesterol) are transported down the intestinal tract and excreted. When the diet is low in fiber, they are reabsorbed and add to the body's cholesterol pool. Obesity and exercise level also play a role in cholesterol regulation. The presence of excessive body fat tends to raise the level of LDL, and strenuous exercise may raise HDL.

Dietary Modification

The cornerstone of blood cholesterol control for people at risk is dietary therapy. The primary goal is to maintain LDL below 130 milligrams per 100 milliliters of blood. This usually occurs when total cholesterol stays below 200, but even 200 can be a problem for individuals whose HDL is less than 40. During the 20 years before my surgery, my total cholesterol values averaged just below 240 and my LDL was close to 160. Today these values are considered "borderline high," but at the time most of my cholesterol determinations were made, my levels were not considered high enough to require vigorous action, such as drug therapy. I was concerned enough to maintain a diet that was lower in fat than that of the average American, but this turned out to be insufficient to protect me.

Most experts recommend limiting dietary fat to 30% of calories, and if that is not effective, cutting it to 20% of calories. They also recommend limiting saturated fat and dietary cholesterol. Since my diet had probably been close to 25% fat, my advisors suspected that lowering it to 20% would not have much effect. Moreover, data from recent experiments suggested that a 10%-fat diet may stop or even reverse the progression of coronary atherosclerosis.

After much deliberation, I decided to aim for a dietary level of 10% fat, with as little saturated fat and cholesterol as possible, and to increase my intake of soluble fiber. Weighing each portion of food and calculating its contents is very tedious and cannot be done with certain foods. So one of my advisors suggested a simple method: count the grams of fat consumed and limit the number to 20 per day. Moderately active people typically burn off about 15 calories per pound per day. So at a weight of 150, I would require about 2,250 calories. Fat contains 9 calories per gram. So a 20-gram-per-day diet would be about 9% fat. Counting fat calories with the help of food composition tables is fairly simple.

The foods highest in saturated fat include red meats, butter, and whole-milk products. The food highest in cholesterol is egg yolks. Since my operation I have eaten only a few small servings of lean red meat and have not had an egg yolk or a single portion of any whole milk product. To reduce my saturated fat intake, I gave up a few of my favorite foods—most notably pizza, ice cream, cream cheese, and pastries. Instead of

Nutrition Forum (ISSN 0748-8165), © 1992, is published by Stephen Barrett, M.D. All articles and advertising inserts are fully endorsed by Dr. Barrett.

Individual subscriptions in the United States and Canada are \$35 for 1 year (six issues), \$65 for 2 years, and \$95 for 3 years, payable to Nutrition Forum, P.O. Box 1747, Allentown, PA 18105. Institutional and other multireader subscriptions are \$45 for 1 year, \$80 for 2 years, and \$115 for 3 years. Overseas subscriptions (via airmail) are \$45 for 1 year, \$85 for 2 years, and \$125 for 3 years. Back issues are \$6 each.

All correspondence should be sent to Stephen Barrett, M.D., P.O. Box 1747, Allentown, PA 18105. Telephone 215-437-1795.

high-fat pastries, I eat Entenmann's nonfat baked goods or home-baked low-fat cakes. Instead of ice cream, I consume nonfat frozen yogurt. To further reduce my total fat intake, I stopped using margarine and salad dressings that contain fat and reduced my portion sizes of chicken, fish and peanut butter.

The foods highest in soluble fiber include oat bran, oat meal, many varieties of beans, and several fruits. My dietary program includes several portions of fiber-rich foods each day. I begin each day with a large bowl of oatmeal (made from a cup of dry oats) and include a bran muffin either for lunch or for a mid-morning snack. On most days I also eat a banana and at least one other piece of fruit.

My lunch menu includes such items as nonfat yogurt, a sardine sandwich (one sardine and some low-fat cottage cheese on a bagel). My typical afternoon snack is an apple or a handful of nonfat pretzels. Most of my dinners include a large bowl of salad with ten or more ingredients, topped with a nonfat dressing—usually Mother's Creamy Italian. Other dinner items include chicken or turkey (once a week), fish (once or twice a week), a bean soup or other bean dish, grains such as couscous, bulgur or quinoa, and several vegetables. Fortunately, my wife is an excellent and inventive cook and has developed some very tasty low-fat dishes. My favorite is spaghetti with a sauce made from tomato sauce, cauliflower, sauteed onions, water-packed tuna fish, and mashed chick peas.

Many people have asked me whether I miss the foods I gave up. The answer is no. I think of them as poisons and have completely detached myself from them. In addition, I have found enough tasty low-fat and nonfat foods to satisfy me.

Exercise Program

Since exercise can help lower total cholesterol and raise HDL, I decided to increase the amount and intensity of what I did. I have never been sedentary, and had exercised regularly, swimming twice a week for many years. Two months after the operation, I bought a treadmill and began my program at home. A few weeks later, I entered the formal cardiac rehabilitation program at the hospital where my operation had taken place. There, three times a week, I engaged in a series of exercises while wearing a device that transmitted my electrocardiogram to a screen that was observed by a specially trained nurse. That way, if an exercise provokes an abnormal heart rhythm or any sign of strain, it can be stopped before damage occurs. Over a 3-month period, my exercises were increased in duration and intensity to maintain a pulse rate high enough to strengthen my heart and make it beat more efficiently.

After the program ended, I continued to exercise on my treadmill, three times a week at 3.4 miles per hour at an elevation of about 8 degrees, which gave me a pulse of 144 beats per minute. To be sure my pulse didn't get too high, I wear a device that transmits to a watch on the handbar which gives a continuous readout of my pulse. Over the following year, as my heart became better trained, it became necessary to raise the elevation to 16 degrees and my speed to five miles an hour to maintain my target pulse. At that point a sports medicine specialist advised that carrying hand weights would enable me to achieve the same effect while walking more slowly. Using 3-pound weights, I now walk 3.5 miles an hour with 16 degrees elevation. To give my legs an occasional break, I use a stationary bicycle and a rowing machine for part of each 45-minute session. My resting pulse—62 before the operation—is now in the low 50s. While exercising, I watch television or play a movie or a quackery-related tape on my VCR.

Increasing exercise and lowering dietary fat content often results in weight loss. My weight dropped from 157 to 140 during the first six months after surgery and has remained close to 140 since that time.

Cholesterol Levels Improve Dramatically

Within a month after changing my diet, my total cholesterol level dropped below 200, and my LDL dropped below 130. Unfortunately, my HDL level became undesirably low. When it remained low for several months, I decided to see whether niacin might raise it. When a small dose showed promise, I gradually increased the dosage to about 2 grams a day. The results were startling: my HDL more than doubled and my LDL fell well below 100, a level at which atherosclerosis may be reversed. Meanwhile, researchers have been accumulating more data which suggests that a 10%-fat diet plus niacin can not only stop the progression of atherosclerosis but may reverse it. I don't know if it is necessary to stay on a diet as strict as mine to achieve good results. But I see no harm in continuing it.

Caution Needed!

A program like mine should *never* be attempted without close medical supervision. Any restrictive diet should be checked by a professional to be sure it is nutritionally adequate. Moreover, large amounts of fiber can decrease the absorption of minerals. In my case, blood tests showed that my iron storage levels were slowly decreasing. Since I couldn't increase the

Jarvis, Ph.D.; Grace Powers Monaco, Esq.; Jacob Nevyas, Ph.D. **CONTRIBUTING EDITORS:** Johanna Dwyer, Sc.D., R.D.; Mary Abbott Hess, R.D., M.S.; James J. Kenney, Ph.D., R.D.; Marilyn Larkin; James A. Lowell, Ph.D.; Jack Raso, M.S., R.D.; Varro E. Tyler, Ph.D.; and staff members of the Pennsylvania State University Nutrition Information and Resource Center. **SCIENTIFIC CONSULTANTS:** John A. Dodes, D.D.S.; Victor Herbert, M.D., J.D.; Gabe Mirkin, M.D. **PUBLICATIONS CONSULTANT:** George F. Stickley.

mineral content of my diet without substantially increasing its fat content, I decided to take a broad-spectrum mineral supplement.

High-fiber diets pose another possible problem. If the fiber content of the diet is raised too quickly, cramps, bloating and diarrhea can result. Thus any increase should be done slowly over a period of weeks.

Niacin also poses hazards. Large amounts can produce burning and flushing of the skin and can irritate and even damage the liver. For these reasons, niacin should never be taken without close medical supervision. The dosage should be increased gradually to minimize side effects, and tests should be done periodically (monthly at first) to be sure the liver is not being injured. Regular niacin is much safer than the sustained-release variety. I have occasional periods of flushing and itching of the skin, but don't consider them a problem. Taking the niacin after meals tends to minimize their occurrence.

Several studies have found that small doses of aspirin may reduce the likelihood of heart attacks. I found, however, that even as little as a baby aspirin (80 mg) every three days sharply reduced the ability of my blood to clot. A lower dose might work, but since my cholesterol levels are so well controlled, I see no reason to run any risk of uncontrolled bleeding

from an accidental injury. So I am not using aspirin.

Benefits Apparent

As my exercise progressed, my endurance increased tremendously. About a year after the operation, I entered the "Channel Swim" at my local community center, a contest that required 20 miles of swimming, which I did in twenty 72-lap segments. I not only won the over-55 bracket but broke the pool record for this age group by more than two hours.

A few months later, I had a thallium stress test. This procedure is like an ordinary treadmill test but ends with an injection of radioactive thallium into a vein in the arm. Then a computerized x-ray machine maps the distribution of the thallium in the patient's heart muscle so its blood supply can be evaluated. I am pleased to report that I passed the test with flying colors. Sometimes I feel like I can jump over tall buildings in a single bound.

Dr. Barrett, who practices psychiatry in Allentown, Pennsylvania, is co-author/editor of 28 books, including *Health Schemes, Scams, and Frauds* [Consumer Reports Books, 1990] and the college textbook *Consumer Health—A Guide to Intelligent Decisions* [Times Mirror/Mosby, 1989].

PROGRESS REPORT

*Periodic testing enables me to evaluate my program and guard against liver toxicity. In November 1989, blood tests indicated that sustained-release (SR) niacin might be irritating my liver, so I switched to ordinary niacin.

FALSE CLAIMS BARRED FOR DIET PROGRAM

The Federal Trade Commission (FTC) has charged Nu-Day Enterprises, Inc., of Gig Harbor, Washington, and its owner, Jeffrey S. Bland, Ph.D., with falsely claiming that their diet program could cause weight loss by changing the user's metabolism.

The Nu-Day Diet Program, which cost \$59.95 for a 2-week supply, contains a meal-replacement formula; *Nu-Day Herbulk* (said to be a "natural appetite suppressant" that provides fiber and "cleanses the digestive system"); an instructional booklet; and an audiocassette answering questions about the program. It has been promoted with a 30-minute television program entitled "The Perfect Diet," which offered "amazing true stories of people like yourself losing 20, 30, 50 pounds or more, safely, quickly and naturally." The FTC charged that the following statements, included in the television ad, could not be substantiated:

- "The Nu-Day program allows us to . . . tune up that heat-producing machinery so that the fat is not stored for a rainy day that never comes. Rather, it's lost as body heat—and that is what we call efficient metabolism. So really, we're inducing efficient metabolism."

- "A revolutionary new concept in weight loss. A diet that actually raises your metabolism, causing your body to burn off excess fat, quickly, safely and naturally."

- "In the cell we have different little organelles, these are these little things like the nucleus of the cell in the center, which is like the brain of the cell. These little pink units are called mitochondria—and they're like the lungs or spark plugs of the cell. They burn up the energy. . . . As a person tends to age . . . these mitochondria take a siesta, they go to sleep and they don't effectively convert food to energy anymore. We tend to store that energy as fat for a rainy day that never comes. So really what the Nu-Day program [does] is to try to help activate those mitochondria Get them back to the point where they will convert efficiently food and energy and burn off that fat."

- "Well in excess of 100,000 clinical trials have been evaluated with people that have been on this diet, and the responses that we are getting here are remarkable."

On May 22, 1991, without admitting wrongdoing, Dr. Bland signed a consent agreement to pay \$30,000 for redress and to refrain from making unsubstantiated claims that the Nu-Day program, or any similar program or product, can:

- Alter human metabolism so that the body will burn more calories . . . following the program or eating the food products

- Alter human metabolism so that weight lost while following the program or eating the food products will not return when caloric intake increases

- Alter mitochondria so the body's cells convert more food into energy

- Prevent the body's metabolism from slowing down to the level that it would reach on any other diet involving similar caloric intake.

The FTC also charged that format of the television commercial containing these claims was deceptive. Although it appeared to be an independent consumer news program that used interviews to report on its discovery of the Nu-Day Diet, it actually was a paid ad. The consent order requires future programs of 15 minutes or longer to display messages identifying them as paid ads for products they are selling.

Dr. Bland, identified during the program as "one of the nation's leading nutritional biochemists," is the health food industry's most prolific interpreter of nutrition-related scientific developments [NF 3:33-37]. His interpretations consistently favor the use of supplements. A former biochemistry professor, he appears frequently at trade shows, writes and edits books, produces audio and video tapes, and conducts seminars for health professionals. He also has been a research associate at the Linus Pauling Institute of Medicine and has directed its nutrient analysis laboratory.

BOGUS "NUTRITIONIST" SUED

Illinois Attorney General Roland W. Burrish has charged a Decatur, Illinois, woman with practicing medicine without a license and making claims that lack a legitimate medical basis. According to the complaint, Ina June Organ sold herbs, vitamins and homeopathic remedies through her shop and offered diagnostic services with a device called an INTERRO. The suit alleges that she represented to customers that the device could pinpoint many medical problems. She was also purported to use iridology (reading the iris of the eye) to identify "weaknesses" in body systems. Illinois authorities became concerned because Ms. Organ had been treating foster children with elixirs that have a high alcohol content. The children, said to be hyperactive, were claimed by her to be suffering from food allergies that could be diagnosed with the INTERRO. The Attorney General is seeking civil penalties and an injunction

barring Ms. Organ from engaging in practices that seek to treat, cure, or mitigate human ailments.

Editor's note: The INTERRO is galvanometer connected to a computer. One wire from the computer goes to a brass cylinder covered by moist gauze that the patient holds in one hand. A second wire is connected to a probe that the practitioner touches to the patient's other hand or foot. To use the device, the practitioner probes points on the patient's hands and feet and interprets numbers on the computer's screen. (The less the electrical resistance, the higher the score.) This completes a low-voltage circuit and causes a band to rise on a scale on the computer screen. Several years ago I examined an INTERRO and found that the main factor influencing the reading on the screen is how hard the probe is pressed against the patient's body.

HEALTH FOOD STORE PROBE YIELDS POOR ADVICE PLUS DOUBLETALK

Julia M. Haidet

It is illegal for health-food retailers to diagnose health problems and prescribe products to treat them. But several studies have shown that they do so anyway.

• In 1983, investigators from the American Council on Science and Health made 105 inquiries at stores in New York, New Jersey, and Connecticut. Asked about eye symptoms characteristic of glaucoma, 17 out of 24 suggested a wide variety of products for a person not seen; none recognized that urgent medical care was needed. Asked over the telephone about sudden, unexplained 15-pound weight loss in one month's time, 9 out of 17 recommended products sold in their store; only 7 suggested medical evaluation. Seven out of 10 stores carried "starch blockers" despite an FDA ban. Nine out of 10 recommended bone meal and dolomite, products considered hazardous because of contamination with lead. Nine stores contacted made false claims of effectiveness for bee pollen, and 10 stores

did so for RNA. The investigators concluded that most health food store clerks give advice that is irrational, unsafe, and illegal.

• In 1987, a registered dietitian posed five similar questions to 10 health food store proprietors in eastern Pennsylvania and concluded that fewer than half the answers were correct (NF 5:1-3, 1988).

• In 1989, volunteers of the Consumer Health Education Council (CHEC) telephoned 41 health-food stores in the Houston area and asked to speak with the person who provided nutritional advice. The callers explained that they had a brother with AIDS who was seeking something that was effective against the HIV virus. All 41 retailers offered products they said could benefit the brother's immune system, improve the woman's immunity and protect her against harm from the HIV virus. Thirty said they carried products that would cure AIDS [NF 7:16, 1990].

Store	"Frequent headaches"	"Kidney Stone"	"Thirsty/tired/dizzy"
A	Could be a sugar imbalance; stay away from sugar and eat more complex foods like vegetables and fruits. Should also see a doctor to find exact cause and then call back.	Lack of potassium is likely to be the cause. Grind up skins of boiled potatoes, mix with water and drink; this can help prevent kidney stones.	Should see a physician. If you know what the problem is, you may be able to take some herbs that may help prevent the symptoms.
B	Could be tension, allergies, diet. Should see a doctor.	Should make an appointment to see the store's wellness counselor. Diet, fluid intake and social habits need to be evaluated.	Could be due to stress, change in weather, or low iron levels. Iron supplement, folic acids and B-12 could help you feel better in 3-4 days. These supplements can also help with forgetfulness. Don't drink coffee with the iron supplements or they won't work.
C	Should try massage therapy which works for stress headaches. Should try to find out cause.	Should read an herb book from the library. There are different causes for different people. Some herbs can help dissolve stones.	Cannot make any recommendations over the phone. Must come in by appointment to fill out questionnaire about health. Also mentioned that they cannot prescribe or diagnose.
D	Many different possible reasons. Should try herbs and homeopathic remedies; taken over time, some herbs could prevent headaches. Feverfew and wood bettany are two herbs that could help.	Drink fresh-squeezed lemon juice in water. Stay away from large amounts of calcium supplements, especially inorganic ones (dolomite and calcium carbonate). Stay away from meat and dairy products. Get a water purifier if you have hard water. Larger countertop models are better.	Could be related to changes in the diet. Could be an overgrowth of yeast in the system. Should get a book on the subject and see the whole picture. Certain nutrients can help with the lack of energy. Should see a homeopathic doctor for an analysis.
E	Try feverfew herb. Allergies to chocolate, Coca-Cola could be cause. Also could be stress, lack of exercise, liver malfunction, or constipation.	Diet causes them. Should drink a mixture of apple juice, lemon juice and olive oil. Too little sodium can precipitate stones. Should avoid the amino acid L-cystine. Gingko should be taken to help prevent stones. Limit calcium and dairy products, antacids, salt, animal protein, and foods containing oxalic acid. Could be a B-6 deficiency. Existing stones can be dissolved by eating more citrus foods and potatoes. Vitamin A should be decreased. Should also take magnesium, B-6 and calcium together.	Might be a sugar problem. Should come in and see the iridologist who would probably suggest taking certain herbs and making changes in my diet.

Last year, as part of a project for a college course in consumer health, I telephoned ten health food stores in Northeast Ohio and described three problems:

1. "I suffer from frequent headaches, sometimes migraines. Do you have anything that could help prevent these? Could it be a nutritional deficiency?"

2. "I recently had a kidney stone and was told I have an 80% chance of getting another one in the future. Is there anything I can do to help prevent this from happening?"

3. "I'm thirsty all the time and lack energy—except right after I eat—and sometimes feel dizzy. What do you recommend?"

Everyone I contacted offered advice, most of which was related to products carried in their store. None of the advice was appropriate. Even the few who recommended seeing a doctor suggested that dietary change or a nutrition-related product would be appropriate.

Five of those questioned about headaches suggested herbal remedies. Three suggested that an allergy might be involved, two suggested that a vitamin or mineral deficiency might be involved, and two thought a dietary imbalance might be the cause. Three, in addition to giving their nutrition-related

advice, suggested seeing a physician. Only one gave no advice related to health food stores or their products; that person advised trying massage therapy for headaches.

To prevent kidney stones, five salespeople boosted herbs, three said diet was involved, two recommended vitamin or mineral supplementation, one advised seeing the store's "wellness counselor," and one expressed confidence that something could be done to prevent them. None suggested discussing the matter with a physician.

For "thirst, fatigue and dizziness" (which could be symptoms of a serious health problem), four thought dietary changes might help, three suggested herbs, and three suggested vitamin or mineral supplements. Six recommended consultations with a medical doctor (2), homeopathic doctor (1), nutritionist (2), or iridologist (1). Two suggested coming to the store to complete a written questionnaire so they could give further advice.

Ms. Haidet, a 1991 graduate of Kent State University, is a program associate for the American School Health Association. Her investigation was supervised by William M. London, Ed.D., assistant professor of health education at Kent State and president of the Ohio Council Against Health Fraud.

Store	"Frequent Headaches"	"Kidney Stone"	"Thirsty/Tired/Dizzy "
F	Could be an allergy to certain foods. Try feverfew capsules or yerbamate herb; these could help prevent the headaches.	Hard to tell what cause is. A lot of vitamin C can cause kidney stones. Quite sure there are some things that can be done to prevent them.	Not a doctor, so couldn't recommend. But I should look at my diet. Sometimes too much sugar and not enough sleep can produce a hypoglycemic reaction. I should come in and take a written test that would take about an hour and a half and then see a nutrition consultant for an hour. Symptoms could be a gland problem (thyroid, adrenal). It could be related to low blood pressure or a problem with the pancreas.
G	Could be a niacin or B-vitamin deficiency.	Magnesium supplements can help to prevent kidney stones.	Probably should see a doctor. May not be getting enough vitamins and minerals. Should take a multivitamin which could help with the energy problem. A "Woman's Formula" with extra iron is recommended.
H	Niacin (200 mg, 3 times per day) can provide relief by dilating the blood vessels. Lecithin may help, as well as feverfew, Migrelief, and a calcium-magnesium combination. A combination of rosemary, peppermint, and wormwood may also help. Taking any of these over time could also help prevent headaches.	"Stone-free" herbal mixture with gravel root can help prevent stones.	Said he doesn't have a "piece of paper" so he couldn't say what the problem is, but B vitamins can give energy and ginseng can help with energy. Should check a book like the "Nutritional Outline for the Professional" which suggests herbs for treatment. It would also be good to see a nutritionist.
I	Herbal formulas can help prevent, such as feverfew and white willow.	Avoid dairy products, drink extra water, decrease salt. Take "Stone-free" (made of cleansing herbs) on a regular basis to help prevent stones.	Should get a physical from a doctor and then call the health food store back and work from there.
J	Should see an osteopath or chiropractor to make sure it is not a musculoskeletal problem. Could be a lack of calcium or B-vitamin.	Diet is the main cause of stones. Coffee and tea aggravate them. Drink cranberry juice, which helps flush the kidneys and can help to dissolve stones if they are not too bad already. There are also some herbal remedies which should be taken with a lot of water.	Diet is probably the cause. I should visit the store so I can find out for sure whether it is a deficiency or toxicity.

BRIEFS

Nutritionist licensing update. As of November 1991, dietitians have gained passage of laws to regulate nutritionists in 27 states, Puerto Rico and the District of Columbia. Some make it illegal for unqualified persons to call themselves dietitians or nutritionists, while others define nutrition practice and who is eligible to do it.

Anti-herbicide bill introduced. U.S. Senator Patrick Leahy (D-VT), who spearheaded the U.S. Organic Foods Production Act of 1990 [NF 8:25-29], has introduced legislation to ban the federal government from funding research into herbicide-resistant plants and transfer those funds to research into "sustainable" methods of weed control.

FDA electronic bulletin board. The FDA's Electronic Bulletin Board Service can now be accessed free-of-charge through a toll-free number, using a modem and a computer. Its information includes news releases, enforcement reports, *FDA Consumer* magazine, *FDA Federal Register* summaries, congressional testimony, and speeches. A user guide for the system can be obtained by calling the agency's Parklawn Computer Center at 301-443-7318

New food safety guide. *A Quick Consumer Guide to Safe Food Handling*, produced by the USDA Food Safety and Inspection Service, covers shopping, storage, meal preparation, cooking, microwaving, serving, and handling leftovers, with emphasis on meat and poultry products. For a free copy, write to the Consumer Information Center, 574-X, Pueblo, CO 81009.

FDA ad complaint line. The FDA has set up a toll-free number (800-238-7332) for physicians, pharmacists, nurses, veterinarians, and other health professionals to use when they have concerns about the advertising, marketing or promoting of FDA-regulated medical products. The line will be answered by staff in the FDA Office of Health Affairs during normal business hours.

FDA labeling proposal. On November 27, 1991, as required by the Nutrition Labeling and Education Act of 1990, the FDA announced its proposed rules for food labeling and nutrient content [Federal Register 56:60365-60878, 1991]. The lengthy report includes the scientific data supporting the proposed rules. The next issue of *Nutrition Forum* will cover them in detail.

Recycling claims withdrawn. *Advertising Week* has reported that Tetra Pak, Inc., and Combiblock, Inc., the nation's two largest producers of juice drink containers, have agreed to stop advertising that their packages are "as easy to recycle as newspapers." The containers have six layers of paperboard, plastic and aluminum. The ads were challenged by ten state attorneys general who noted that the layers must be separated and that few recycling facilities can recycle aseptic packaging.

Tobacco promotion in retail stores. A 1987 survey of 61 supermarkets, grocery stores, convenience stores and pharmacies in Buffalo, N.Y., found that 41 (67%) displayed tobacco posters and 53 (87%) displayed other promotional items. Forty owners or managers said they had received monetary incentives to display tobacco ads. Only 14 said that they had displayed antitobacco information, but 31 said they would be willing to do so [Public Health Reports 9:570-575, 1991].

New health magazine. The American Medical Association and *Good Housekeeping* have announced plans to collaborate on a magazine called *Living Well*. The new magazine will preview as a section in the March 1992 issue of *Good Housekeeping* and will appear as a stand-alone magazine on newsstands in mid-March.

Surplus food distribution. The U.S. General Services Administration (GSA) plans to release more than 100 million pounds of food left over from the Persian Gulf War. According to a report in *Vegetarian Times* magazine, most of the food will be channeled through Second Harvest, a Chicago-based agency that provides food to 180 food banks serving 42,000 agencies nationwide. The food—worth more than \$200 million—includes fresh and frozen items, canned goods, packaged foods, and military rations.

Poppy seeds cause positive drug test. A researcher at the University of Michigan has reported that eating poppy seeds can produce positive urine tests for opiate drugs. After encountering a woman who tested positive after eating a lemon poppy seed muffin, he ate one himself and found morphine in his urine an hour later [JAMA 266: 3130-3131, 1991].

Nutri/System suit update. Nutri/System has settled lawsuits filed by 199 former south Florida customers who had charged that the weight-loss program caused them to develop gallbladder problems. The terms of the settlement were not publicly disclosed. Nationwide, about 700 suits have been filed.

What Harvard doctors do. The *Harvard Heart Letter* has reported on the health and nutrition habits of 672 Harvard Medical School clinical faculty members who responded to a survey conducted by the newsletter. The responses included: trying to control weight (74%); would like to lose ten pounds or more (39%); eat red meat less than once a week egg intake less than one a week (55%); intentionally maintain a high intake of soluble fiber (59%); take aspirin regularly to protect against cardiovascular disease (25%); and take beta-carotene supplement or maintain high dietary intake (80%). The percentages reporting other supplement use were: vitamin C (13%); calcium (10%); fish oil (2%); and vitamin or mineral other than calcium or beta-carotene (23%). The editor called the 23% figure "surprisingly high . . . given the evidence that these items provide little or no benefit for healthy people consuming a balanced diet."

PROPOSED LABELING RULES STIR CONTROVERSY

Stephen Barrett, M.D.

While most consumers and nutrition professionals are looking forward to more informative food labels, the supplement industry is fighting to prevent reform.

In the mid 1980s, controversy erupted about whether food labels should be permitted to make health claims, such as "helps prevent cancer" or "helps lower cholesterol." As consumers became more attentive to food choices, there also was considerable public pressure for clearer and more complete nutrition information. During 1990, the FDA began issuing regulations that addressed these problems. Soon afterward, passage of the Nutrition Labeling and Education Act [NLEA] strengthened FDA's authority and required new rules, currently scheduled to take effect on May 8, 1993.

Proposed Rules

The U.S. Department of Agriculture regulates the labeling of most meat products, poultry products, and eggs. The FDA regulates the labeling of almost all other foods. In November 1991 the two agencies proposed regulations that included the following [Federal Register 56:60302-60878, 1991]:

- Labeling would be extended to almost all packaged foods.
- Retailers were urged to voluntarily inform customers about the nutrient content of commonly purchased raw fruits, vegetables, and fish (20 foods in each category). By May 1993, if fewer than 60% of stores are displaying the information, regulations will be written to make the display mandatory.
- The U.S. Recommended Daily Allowances (U.S. RDAs), would be replaced with U.S. Reference Daily Intakes (RDIs) that would enable consumers to compare the nutrient content of many foods. RDIs would be established for protein, 13 vitamins and 13 minerals, based mainly on the 1989 Recommended Dietary Allowances published by the National Academy of Sciences. Most RDI values are lower than their corresponding U.S. RDA values, which means that the percentages of vitamins and minerals on most food labels will generally be higher than they are now. This is a good idea because the RDIs

are closer than the U.S. RDAs to most people's actual requirements [J Am Dietetic Assoc 92:361, 1992].

- Daily Reference Values (DRVs) would be set up to provide a similar basis to compare total fat, saturated and unsaturated fat, cholesterol, carbohydrates, dietary fiber, sodium and potassium. These food components are important to health but were not addressed by the RDA report. Labels would indicate the percentages of RDIs and DRVs in each serving of the food.

- Labels must declare the total number of calories, the number derived from fat; the total amount of fat, saturated fat, and cholesterol; total carbohydrates, complex carbohydrates, and sugars; dietary fiber; protein; sodium; vitamins A and C; calcium; and iron.

- Labeling of dietary supplements of vitamins and minerals that are not in the form of ordinary food would have to identify the quantity and the percentage of RDI for all vitamins, minerals, and other food components present in significant amounts.

- Serving and portion sizes for 131 food categories, 23 meat categories, and 22 poultry categories would have to be based on the amount of food customarily consumed per eating occasion by an average person over the age of 4. The units of measurement must appear in common household and metric measurements, such as 1 cup (240 milliliters).

- Health claims would be permitted only if supported by valid and substantial scientific information. Claims would be permitted regarding (a) sodium and high blood pressure, (b) calcium and osteoporosis, (c) dietary fats and cancer, or (4) dietary fats and heart disease. Claims would not be permitted regarding (a) zinc and immune functions, (b) antioxidant vitamins and cancer, (c) fish oils and heart disease, or (d) folic acid and neural tube defects. The FDA is still studying possibility of permitting claims relating fiber to cardiovascular disease and cancer. The attorneys general of 33 states have asked the FDA to permit health-related claims only through the use of FDA-approved model claims.

- Many descriptive terms would have to conform to new definitions (see table on next page).

PROPOSED DEFINITIONS FOR FOOD LABELS

Term	Definition Proposed in Federal Register, November 26, 1991
Free	An amount that is nutritionally trivial and unlikely to have a physiological consequence.
Caloric free	Fewer than 5 calories per serving
Sugar free	Less than 0.5 grams per serving
Sodium free or salt free	Less than 5 mg per serving. A claim made for a food normally free of or low in a nutrient must indicate that the situation exists for all similar foods. For example: "spinach: a low-sodium food."
Low	Low enough to allow frequent consumption without exceeding the dietary guidelines
Low sodium	Less than 140 mg per serving and per 100 grams of food (a little less than half a cup)
Very low sodium	Less than 35 mg per serving and per 100 grams of food
Low calorie	Less than 40 mg per serving and per 100 grams of food
Reduced sodium*	Contains no more than half the sodium of the comparison food
Reduced calories*	Contains 1/3 fewer calories than the referenced food
Light (or lite)	Contains 1/3 fewer calories than the referenced food, with a minimum reduction of more than 40 calories per reference amount and serving size. Products deriving more than half their calories from fat must have their fat content reduced by 50% or more with a minimum reduction of more than 3 grams per serving. Other use of "light" must specify if it refers to look, taste or odor. For example, "Light in color."
Less*	Contains at least 25% less of a nutrient than the referenced food
More	Contains at least 10% more of a desirable nutrient than does a comparable food
High	Contains 20% or more of the RDA or DRV
Source of	Contains 10–19% of the RDI or DRV
Fat free	Less than 0.5 grams of fat per reference amount and serving size, and no added ingredient that is a fat or oil
Low fat	3 grams or less of fat per reference amount, per serving size and per 100 grams of product
(Percent) fat free	Only for foods that meet the FDA definition of low fat
Reduced fat*	Reduced fat content by 50% or more, with a minimum reduction of more than 3 grams per reference amount and per serving size
Low in saturated fat	1 gram or less per serving, with not more than 15% of calories from saturated fat.
Reduced saturated fat*	No more than 50% of the saturated fat of the reference food. Foods with at least 25% reduction may use the term "less." When these terms are used, the label must indicate the percentage reduction and the amount of saturated fat in the reference food. The reduction must be at least 1 gram.
Cholesterol free	Less than 2 mg of cholesterol and 2 grams or less of saturated fat per serving
Low in cholesterol	20 mg or less per serving and per 100 grams of food, and 2 grams or less of saturated fat per serving
Reduced cholesterol*	50% or less of cholesterol per serving than its comparison food. The label of a food containing more than 11.5 grams of total fat per serving or per 100 grams of the food must disclose that fact.
Less fat*	At least 25% less fat, with a minimum reduction of more than 3 grams per reference amount and per serving size
Fresh	Can only be linked to raw food, food that has not been frozen, processed, or preserved
Freshly	May be used with a verb such as "prepared," "baked" or "roasted" if the food is recently made and has not been frozen or heat-processed or preserved
Lean	Meat or poultry product with less than 10.5 grams of fat, less than 3.5 grams of saturated fat, and less than 94.5 milligrams cholesterol per 100 grams
Extra lean	Meat or poultry product with less than 4.9 grams of fat, less than 1.8 grams of saturated fat and less than 94.5 milligrams cholesterol per 100 grams

*An alternative proposal for the terms "reduced," "less," or "fewer" has been drafted but not yet published. Under this proposal, the terms would be equivalent and permissible provided they indicate the identity of the comparison food and the percentage by which the nutrient has been reduced. Foods claimed to contain fewer calories must contain at least 40 fewer calories per serving than the referenced food.

Special Rules for Supplements

Shortly before the Nutrition Labeling and Education Act was passed, the health food industry succeeded in exempting "dietary supplements of vitamins, minerals, herbs or other similar nutrients" from certain provisions applicable to foods. Instead, the law said, there should be separate standards established by the Secretary of Health and Human Services. The industry, which attributed its success to the efforts of Senator Orrin Hatch (R-UT), hoped that the standards for supplements would be more lenient than those for foods.

In response to the law, FDA Commissioner David Kessler, M.D., J.D., set up a 12-person FDA Dietary Supplement Task Force chaired by Gary Dykstra, FDA Deputy Associate Commissioner for Regulatory Affairs. On August 29, 1991, the task force held a hearing to explore how dietary supplements should be defined, what goals the FDA should have in regulating the marketplace, whether supplements should be regulated differently from foods and drugs, and whether additional laws are needed for the FDA to do the job.

Mr. Dykstra opened the hearing with a statement from Commissioner Kessler. Although supplements can add to the nutrient content of the diet or provide substances not found in the foods normally consumed, the statement noted, "dietary supplements do not look like foods. They are capsules and tablets. Moreover, the desire to take the products often arises from a belief that dietary supplements can have drug-like effects." Noting that attempts by the FDA to regulate supplement products have had only limited success, Dr. Kessler suggested that "a completely new look at how supplements should be regulated is necessary." He asked the task force to consider the best way for the agency to protect the public and to recommend whatever legislative changes may be necessary to accomplish this.

The 35 people who testified at the hearing included prominent nutrition scientists, supplement industry representatives, consumer advocates, opponents of FDA regulation, writers aligned with the health food industry, and victims of supplement toxicity. Each was given up to 10 minutes, but questions from task force members were permitted after the 5-minute mark.

• Irwin H. Rosenberg, M.D., professor of medicine at Tufts University, was the first person to testify. Dr. Rosenberg is chairman of the Food and Nutrition Board of the National Academy of Sciences and president of the American Institute of Nutrition, the most prominent professional organization of nutrition scientists. More than a decade ago, the FDA Vitamin and Mineral OTC Panel, which he chaired, had anticipated many of the issues the FTC task force is now examining. The panel's report [Federal Register, March 16, 1973], said Dr. Rosenberg, "was the first, and as far as I know, only substantive study of its kind . . . and is still perhaps the most comprehensive statement on safety, effectiveness, and fair labeling of vitamins and minerals . . . even though excessive timidity at that time in FDA leadership caused that report to be withdrawn without further public comment or hearing."

In line with the 1979 report, Dr. Rosenberg said that the FDA should establish a category of nonprescription dietary supplements that are neither foods nor drugs. "Issues of safety and effectiveness remove [these] products from the category of foods. They are not apples or oranges or bouillon cubes. People die from inappropriate use of vitamins and minerals. So a special category is needed," he stated. "We consider title statements such as 'high' or 'super potency' to be label claims . . . which require substantiation," he added. "More potent for what? A higher dose is not necessarily effective. We questioned the accuracy, also, of the designation 'natural,' since that designation implies an advantage which . . . has not been proved."

• William R. Pendergast, an attorney representing the American Herbal Products Association, said:

Dietary supplements should be given their common-sense definition, namely anything that is marketed to supplement the diet. This would include products containing vitamins and minerals, herbal products, and any other ingredient in tablet, capsule, or powder form, or any form other than that of a conventional food, marketed for the purpose of supplementing the diet in one fashion or another.

When a panelist noted that the law defines a drug as anything intended to prevent, mitigate, cure, or treat disease, Mr. Pendergast replied that application of the law should depend upon the language used in a particular claim. "If you said that 'if you take this product it will prevent cancer,' then that properly would be a drug. However, 'if you take this product, the likelihood of cancer may be decreased because of its antioxidant properties,' for example, that would not be a drug."

• Anthony Iannarone, representing Hoffmann-La Roche, said that the issue of vitamin safety has been exaggerated. "Frequent generalities that vitamins can be toxic are not helpful and are actually misleading in the absence of specifics," he stated. "Safety of vitamins and minerals basically involves the purity of the materials and levels of constituent ingredients. However, neither government agencies nor industry, including the supplement industry, should be protecting people from their own stupidity."

• Michael Culbert, board chairman of the Committee for Freedom of Choice in Medicine, characterized the FDA's refusal to permit resumption of the sale of L-tryptophan as:

Power-mad bureaucratic satrapy running wild in an orgy of probably civil rights violations through what we can only describe as thug-like, Nazi-like police tactics which seem clearly aimed at eliminating the health food, dietary supplements, and related industries. We do not need protection from L-tryptophan. We need protection from the government in general, and the FDA in particular.

Culbert's organization, which began during the 1970s as the Committee for Freedom of Choice in Cancer Therapy, is the political arm of several interlocking corporations that are promoting and/or marketing questionable remedies for cancer and other serious diseases.

• Saul Kent, president of the Life Extension Foundation, suggested that the FDA is so biased against supplements that a law should be passed to transfer its power to regulate them to the U.S. Department of Agriculture.

The Life Extension Foundation sells supplement products and memberships. Regular membership, which costs \$50 per year, provides product discounts, a directory of "life extension" doctors, a directory of "innovative medical clinics," a copy of *The Physician's Guide to Life Extension Drugs*, and two monthly newsletters, *Life Extension Report* and *Life Extension News*. A few months ago the Foundation announced the formation of Health Issues Cooperative Association, which will lobby for "health freedom" issues. Among other things, it plans to introduce legislation to reduce the FDA's authority, to file lawsuits challenging the agency's control over health care, and to introduce a health-care rights amendment to the U.S. Constitution.

The FDA has been aware of the Foundation's activities for several years. In 1987, FDA officials and U.S. marshals seized large quantities of products marketed by the Foundation, including *BHT* (promoted for herpes and AIDS), *DMSO* (for arthritis and bursitis), *Coenzyme Q10* (for cardiovascular disorders and longevity), and *Cognitex* (to enhance mental function). In November 1991, a 28-count indictment was filed in the Southern District Court of Florida charging Kent and the company's vice president with importing and selling unapproved new drugs and misbranded prescription drugs. According to an FDA report, the products, which were imported from Europe and labeled as nutritional supplements, were promoted for cancer, AIDS, herpes, senility, heart and lung disease, and other illnesses.

• Bonnie Liebman, representing the Center for Science in the Public Interest (CSPI), began her presentation by handing bottles of *Runner's Edge*, *Exercise Edge*, *Cell Guard*, *Ageless Beauty*, *Jet Stress*, and *Energy Extra Enzymes* to the task force chairman.

"It is time for the FDA to start take supplements seriously," she said. "There is no question but that many supplements are frauds. But in its fervor to squelch the irresponsible use of supplements, the FDA has failed to recognize that some segments of the population may need supplements, and many consumers may reasonably wish to take supplements. . . . Given this reality, consumers need the FDA to help separate the good from the bad supplements rather than the blanket advice to avoid them all." Ms. Liebman proposed that the FDA ensure that supplements are safe (or inform consumers that the safety has not been determined) and can be absorbed as their label suggests. She also said that labels should inform consumers of possible hazards and benefits and should not mislead consumers. She took particular issue with claims that are implied in product names:

Name claims range from the familiar *Stress-tabs*, to the less familiar products such as *Diarrhea Be Gone*, *Clear Thinking*, . . . *Livatox Tab*, *Vision Aid*, *Lung Care Tab*, *Masculine Drive Tab*. . . and *Mental Wisdom Tab*, which

I would have brought for this panel but I didn't want to pay the money. It is ludicrous for the FDA to crack down on unsubstantiated health claims while ignoring these products. Curbing name claims would also reduce the number of deceptive products on the market.

• Dr. Thomas W. Richey, testifying for Lederle (which markets *Stresstabs*), ignored Ms. Liebman's attack. He urged that supplement manufacturers be given wide latitude in choosing their ingredients. "It is clear from the congressional record on the Proxmire Amendment that dietary supplements are foods . . . should be defined as broadly as possible, and should include vitamins, minerals and other similar nutritional substances," Dr. Richey stated. When asked by a panelist how the FDA could decide what substances can be included in the "similar nutritional substances" category, he replied, "I don't have any guidance there other than for what the intent of Congress was . . . that if it was to be used to supplement the diet in a nutritional fashion, that it would include things other than vitamins and minerals." When asked whether anything could be excluded by that definition, Dr. Richey replied "Drugs," which generated laughter from the audience.

• Norma Hart, Ph.D., a former school psychologist for New York City public schools, described how her health had been destroyed by a single dose of L-tryptophan, from which she developed eosinophilia-myalgia syndrome. "If I had my way," she said, it would be in large windows of health food stores . . . and on the label something equivalent to 'Take at your own risk, We don't know yet,' or these substances would be . . . prescription drugs so that there could be medical consideration of the need in a given person and of the contraindications."

• Abbey Meyers, executive director of the National Organization for Rare Disorders (NORD), urged that the FDA "eliminate the very real public health risk caused by the unregulated and unsupervised manufacturing, marketing, and sale of dietary supplements and other health food products making unproven medical claims." She was particularly concerned that carnitine promoted by the health food industry is not effective against carnitine-deficiency diseases. She noted:

People do not take dietary supplements because they taste good. Their only value is their perceived medical use. The question is why it takes dead bodies before the

Nutrition Forum (ISSN 0748-8165), © 1992, is published by Stephen Barrett, M.D. All articles and advertising inserts are fully endorsed by Dr. Barrett.

Individual subscriptions in the United States and Canada are \$35 for 1 year (six issues), \$65 for 2 years, and \$95 for 3 years, payable to Nutrition Forum, P.O. Box 1747, Allentown, PA 18105. Institutional and other multireader subscriptions are \$45 for 1 year, \$80 for 2 years, and \$115 for 3 years. Overseas subscriptions (via airmail) are \$45 for 1 year, \$85 for 2 years, and \$125 for 3 years. Back issues are \$6 each.

All correspondence should be sent to Stephen Barrett, M.D., P.O. Box 1747, Allentown, PA 18105. Telephone 215-437-1795.

FDA takes enforcement action against them. Will it take people dying from liver damage because of sustained-release niacin before the agency acts to protect people from seeking to reduce their cholesterol level? Will it take chronic fatigue syndrome patients dying from acute renal failure before you ban germanium? . . . Will it take more dead bodies or merely seriously ill carnitine-deficient infants who nearly die before they are taken off health-food versions of L-carnitine and put on *Carnitor*, the prescription product?

She also noted that although supplement products might be found useful for the treatment of rare disorders, no legitimate drug maker will undertake the necessary research to gain FDA approval unless health food manufacturers are prevented from undercutting their market with unregulated products.

- Eva Taming, an attorney from Chicago, described how she had formed a parent support group called Assistance for Babies and Children with Carnitine Deficiency (ABCD) to help parents and the medical community become aware of the rare but serious problem of carnitine deficiency. She noted that although the prescription drug *Carnitor* is effective against this problem, the health food product L-carnitine is not and can result in unnecessary suffering and even death.

- J.B. Cordaro, president of the Council for Responsible Nutrition (CRN) used his opportunity to repeat CRN's claim that few people obtain 100% of the RDAs of every nutrient from diet alone. (CRN is a 64-member trade association representing major supplement manufacturers and distributors. CRN misinterprets survey findings to suggest that vitamin shortages are widespread and should be remedied by using supplements.)

- Robert E. Olson, M.D., Ph.D., professor of medicine at State University of New York at Stony Brook, refuted Mr. Cordaro's testimony by pointing out that not meeting the RDAs is not the same thing as nutritional deficiency because the RDAs are deliberately set much higher than the average person needs. Dr. Olson said that supplements may be needed by infants, women who are pregnant or breast-feeding, and certain people with unusual lifestyles or diets (such as vegetarians), but that healthy adult men and nonpregnant, nonlactating women do not need vitamin supplements. Dr. Olson chaired an American Medical Association panel which recommended that the ingredients supplements be limited to 50-150% of RDA amounts [JAMA 257:1929-1936, 1987]. He said that supplements intended for the treatment of dietary deficiency diseases and a few

other responsive diseases are therapeutic agents, many of which exceed 10 times the RDA and constitute a hazard for consumers. He recommended that the Proxmire Amendment be repealed so that the FDA could "consider limiting the distribution of therapeutic preparations, which are drugs, to the prescription route only."

- John H. Renner, M.D., of Kansas City, Missouri, testified on behalf of the National Council Against Health Fraud as well as his own Consumer Health Information Research Institute. He recommended that dietary supplements be divided into three groups:

1. Supplements of essential nutrients. These should include vitamins and essential minerals but not free amino acids.
2. Food supplements and herbal products with known pharmacological activity. These should be required to have full, dosage-specific label information, including a warning about excessive dosage.
3. Food supplements and herbals with no known pharmacological activity. These should be labeled with a disclaimer that they are not effective for any health purpose, including purposes described in literature in health food stores or catalogs used to market the products.

I submitted a similar proposal in a letter to the FDA. I believe that use of the term "dietary supplements" should be restricted to products composed of one or more essential nutrients that may be usefully added to the diet. Under such a rule, vitamins and minerals would qualify as ingredients of dietary supplements. Single amino acids, even the essential ones, would not be dietary supplements because isolated amino acid deficiencies do not occur. My proposal also would bar use of the word "dietary supplement" for herbal products and the large number of nutrient concoctions whose real purpose is intended to be therapeutic. The health food industry appears worried that the FDA Supplement Task Force will recommend a policy of this type.

Organizing for Protest

On February 21-23, 1992, about 30 supplement industry leaders attended an "emergency meeting" in San Ynez, California, to discuss events threatening the industry. The meeting was sponsored by the Dietary Supplement Coalition (DSC), a group formed three years ago to defend the health food industry and individual companies against product sei-

Kenney, Ph.D., R.D.; Marilyn Larkin; James A. Lowell, Ph.D.; Jack Raso, M.S., R.D.; Varro E. Tyler, Ph.D.; and staff members of the Pennsylvania State University Nutrition Information and Resource Center. **SCIENTIFIC CONSULTANTS:** John A. Dodes, D.D.S.; Victor Herbert, M.D., J.D.; Gabe Mirkin, M.D. **PUBLICATIONS CONSULTANT:** George F. Stickley.

zures [NF 6:16, 1989]. The participants included manufacturers, retailers, trade association leaders, lobbyists, industry advisors, and editors of "health-food" industry trade and consumer publications. The agenda included: 1) the FDA's pending rules for food labeling; 2) proposed legislation to strengthen the FDA; 3) unfavorable recommendations expected from the FDA Task Force on Dietary Supplements; and 4) forthcoming Congressional hearings on various aspects of health frauds and quackery.

"What we heard was that it was do or dietime," said the March editorial in *Health Foods Business*, "The enormity of the situation shocked those present into creating a New World Order for our industry. . . . The issues facing the industry in the next few months are a result of converging movements in Congress and in the Food and Drug Administration that by coincidence or design are gathering momentum, much like a tornado about to strike." The outcome of the meeting was formation of the Nutritional Health Alliance to enable manufacturers, suppliers, distributors, retailers, consumers, and other supplement industry allies to coordinate their efforts.

The Council for Responsible Nutrition also plans to appeal to Congress and call public attention to its viewpoint that the FDA wants to go too far in regulating the supplement industry. For this purpose, CRN has formed the Coalition for Sound Nutrition Policy and raised over \$500,000 to fund its efforts.

Two pending bills worry the health food industry. One is H.R. 2597/S. 2135, which would increase the FDA's enforcement powers as well as penalties for violating the Food, Drug, and Cosmetic Act. The other is H.R. 1662, which would amend the Federal Trade Commission Act to make it illegal to advertise nutritional or therapeutic claims that would not be permissible on product labels. Supplement companies fear that the FDA will ban or greatly restrict sales of individual amino acids, herbal concentrates, and vitamin and mineral supplements whose potency is much above the amount found in regular foods. The industry also fears that the RDI system will decrease supplement sales by increasing people's perception that the foods they consume contain adequate amounts of nutrients.

Another "Vitamin War"?

The health food industry is already generating protests. *Whole Foods* has published a 1-page "Consumer Bulletin" for retailers to reproduce and distribute to their customers. The bulletin urges customers to complain to Congress that the FDA proposals on dietary supplements are too restrictive. *Natural Foods Merchandiser* has said that "if 5,000 stores across the country each submitted 200 letters, Congress would receive one million letters from their voting constituents. Think they would listen? I'd bet on it." Enzymatic Therapy, which has marketed many products with illegal therapeutic claims [NF 7:41-44, 1990], has mailed flyers containing form letters to thousands of independent health food stores for distribution to customers. *Health Store News* has published a special issue containing 24 form letters addressed to "strategic senators and representatives." The issue, available to retailers for \$15/100,

claims that the proposed FDA regulations would result in one million lost jobs, cause health food stores to close, and make vitamins available only by prescription.

The health food industry knows how to generate huge amounts of communication to government officials. A similar campaign begun 20 years ago led to passage of the Proxmire Amendment. The situation arose after the FDA proposed that food products be labeled so that ingredients, nutrient content and other information would be displayed in a standard format. These provisions became regulations with little controversy and are still used today. But the FDA proposal also said that labeling could neither state nor imply that a balanced diet of ordinary foods cannot supply adequate amounts of nutrients [FDA Consumer 7(7):10-16, 1973].

Because this struck at the heart of health food industry mythology about "nutrition insurance," the industry responded with lawsuits and a massive letter-writing campaign asking Congress to completely remove FDA jurisdiction over food supplements. This activity was orchestrated by the National Health Federation (NHF), a militant lobbying group, many of whose leaders had been in legal difficulty for questionable health promotions. Crying, "Fight for your freedom to take vitamins!" NHF organized its members and allies into unprecedented political activity. Article after article urging support of the anti-FDA bill appeared in health food industry publications and chiropractic journals, and retailers urged their customers to join the fray. The issue also triggered the formation of the Council for Responsible Nutrition to represent the political interests of major supplement manufacturers. At a Congressional hearing, several representatives reported that they had received more mail about vitamins than about Watergate.

In 1976, as a result of this pressure, Congress passed the Proxmire Amendment to the Federal Food, Drug, and Cosmetic Act. Though not as restrictive as NHF's original proposal, this law prevents the FDA from regulating food supplements unless they are inherently dangerous or are marketed with illegal therapeutic claims. One FDA Commissioner called the amendment "a charlatan's dream." But the impact on the FDA was greater than the wording of the law itself. The apparent political power of the health food industry made many FDA officials wonder how far the agency could go in regulating supplement promotions that remained illegal. Commissioner Kessler appears to have no such fears. Under his leadership, the FDA has greatly increased the scope and vigor of its enforcement activities.

During the current controversy, the Proxmire Amendment has been mentioned repeatedly by both sides. Consumer protection advocates want it repealed. The health food industry wants it used (and strengthened, if necessary) to oppose greater FDA regulation. It remains to be seen whether Congress can ignore the industry's campaign and do what is needed to protect the public.

Dr. Barrett, a practicing psychiatrist and consumer advocate, edits Nutrition Forum Newsletter and is co-author/editor of 28 books including *Health Schemes, Scams, and Frauds* [Consumer Reports Books, 1990]. In 1984 he received the FDA Commissioner's Special Citation Award for Public Service in fighting nutrition quackery.

BRIEFS

"Quackbusters" settle libel claims. In an out-of-court settlement, *Vegetarian Times* has paid a total of \$11,000 to Stephen Barrett, M.D., William T. Jarvis, Ph.D., and John Renner, Ph.D., and the National Council Against Health Fraud. The situation arose after the August issue of the magazine published "The Health Fraud Cops," a lengthy cover story that asked whether "quackbusters" are consumer advocates or "medical McCarthyites." The article contained many statements that were false, misleading and/or defamatory and attempted to portray the trio as closed-minded individuals who are unwilling to consider promising "nutritional" methods. The settlement agreement included publication of a detailed rebuttal, written by Dr. Barrett, in the March 1992 issue. Dr. Victor Herbert, who also was improperly criticized in the article, appears likely to file suit against the magazine and several people quoted in the article.

Health food store sales. *Health Foods Business* estimates that 37.8% of sales in health food stores last year were for vitamins and other supplements. Based on its annual survey, the magazine estimated that 7,300 stores grossed \$1.46 billion for these products, down 5.4% from 1990. Total sales for all products were \$3.88 billion (up 3.2%), including \$653 million for herbs and herbal teas (up 39.8%) and \$109 million for books (up 14.7%). Stores with under 3,000 square feet of selling space (87% of total stores) averaged \$310,000, while those over 3,000 square feet averaged \$2.43 million. Homeopathic remedies accounted for 6.8% of the "vitamins/supplements" category.

Organic certification" inches closer. U.S. Secretary of Agriculture Edward Madigan has announced the appointment of 14 members of the Organic Standards Certification Board, mandated by the U.S. Organic Foods Production Act of 1990 to establish standards for the processing of foods to be marketed as "organic."

Data on weight-loss programs. *The Consumer Guide to Weight-Loss Programs* provides detailed descriptions of many weight-loss products and programs. The 90-page book is available for \$23.45 from Marketdata Enterprises, P.O. Box 36-N, Lynbrook, NY 11563.

Increased HDL screening advocated. In February a National Institutes of Health consensus development panel concluded that all healthy Americans having their total cholesterol checked also should be screened for HDL cholesterol. The panel also recommended HDL and triglyceride screening for individuals with desirable (under-200) levels of total cholesterol who are known to have coronary heart disease or who have two or more risk factors for it. To increase precision when treatment decisions are involved, at least two (and preferably three) samples should be taken at least one week apart. Individuals with HDL below 35 mg/dl should attempt to raise their levels by losing weight, stopping smoking, exercising, and eating a lowfat diet.

Dubious weight-control ingredients banned. An FDA ban on 111 over-the-counter (OTC) diet pill ingredients became effective on February 10, 1992. The ingredients include arginine, caffeine, kelp, guar gum, lecithin, papaya enzymes, phenylalanine, tryptophan, and vitamin B₆. These substances can still be marketed as "nutritional supplements" without claims for weight control. Although an 1979 FDA advisory committee report concluded that the banned products had not been proven effective, the agency failed to propose a ban until prodded by a Congressional hearing conducted in 1990 by Congressman Ron Wyden [NF 7:22-23, 1990].

Fibre Trim blasted. In 1989 the FTC charged that Schering Corporation had marketed *Fibre Trim* with unsubstantiated claims that it is effective for weight loss, weight control and weight maintenance. In September 1991 an FTC administrative law judge ruled that there was no scientific evidence to substantiate such claims. *Fibre Trim* is composed of natural fiber from citrus and grain compressed into tablets. The recommended daily dosage contains about 4 grams of fiber. Ads said the product could provide a feeling of fullness and could "take the edge off hunger." A company document estimated that 70% of *Fibre Trim*'s 1986 sales were to consumers "looking for the magic pill" and who "want a product that will do the work." The judge ordered Schering to refrain from making unsubstantiated claims that *Fibre Trim* (a) is a rich source of fiber, (b) could provide any health benefit associated with the intake of fiber, or (c) could provide any appetite-suppressant, weight-loss, or weight-control benefit.

Walter Hudson dies. Walter Hudson, once listed in the *Guinness Book of World Records* as the world's heaviest man, died of heart failure at the age of 46. His reported weight at the time of death was 1,125 pounds. In 1987 he made headlines when started on a meal-replacement program supervised by comedian-turned-weight-loss-guru Dick Gregory. Although Hudson lost weight rapidly for a few months, he regained it after he resumed eating food.

Passive exercise claims attacked. The FTC has charged Slender You, Inc., with making false and unsubstantiated weight-loss claims for the continuous passive motion exercise tables it manufactures and sells to health and fitness centers. Under a consent agreement, the company is prohibited from making such claims in the future.

New book about fermented milk products. The *Encyclopedia of Fermented Fresh Milk Products* provides a wealth of information about traditional and nontraditional fermented milk, cream, buttermilk and whey products, including yogurt, acidophilus and bifidus products, fermented baby foods, "sweet" milk, acidified milk, and many other products. Nutrition Forum's senior associate editor Manfred Kroger, Ph.D., is one of the three coauthors. The 400-page book is available for \$94.95 from Van Nostrand Reinhold, P.O. Box 688, Florence, KY 41042.

Diet and arthritis. A Norwegian research team has reported that a small group of rheumatoid arthritis patients treated with dietary methods for 13 months had fewer symptoms than a control group of people who ate normally. During the first 7-10 days, the treatment group consumed a low-calorie liquid diet with new foods added individually in an attempt to identify foods that might cause arthritis symptoms to worsen. Then these patients followed a vegetarian diet that eliminated dairy products, eggs, refined sugar, citrus fruits, and gluten-containing foods. (Gluten is a protein found in wheat, oats, rye and barley.) The control group ate in their usual way. Patients who appeared helped by the diet relapsed when they resumed their normal eating habits [The Lancet 338:899-902, 1991]. *Tufts University Diet & Nutrition Letter* has cautioned that (1) the experimental diet can lead to nutritional shortfalls that require professional monitoring, (2) the results were based on the experience of only 17 individuals, and (3) a much larger sample would be required for confirmation.

Notable quote. Vitamins actually play a minor role in our overall health. Together with most minerals they make up the *micronutrients* of the diet, while fats, proteins and carbohydrates are the primary *macronutrients*. As the names imply, macronutrients have a far greater influence on health than do micronutrients—both for better and for worse.—*Lahey Clinic Newsletter, December 1991.*

DECEPTION FOUND AT COMMERCIAL WEIGHT-LOSS CLINICS

On April 30, 1991, a sales representative from a diet center in New York City told a 5'8" woman who weighed 130 pounds that she was 5 pounds overweight and could afford to lose 7 pounds. This ran counter to the advice of the woman's personal physician who confirmed that she already had an ideal weight and did not need to lose more. Moreover, the 7-pound loss would have put her several pounds beneath the ideal target weight listed on the sales representative's own chart. The program would cost \$710 with maintenance, which amounted to \$100 per pound. When the woman failed to sign up, the sales representative pressed her repeatedly and offered her reduced payments as an incentive.

On May 8, 1991, a 5'8" man who weighed 178 pounds was told at another center that he should lose 18 pounds. No measurements other than weight were taken. The man worked out regularly and was very muscular. He had a low body fat content and did not need to lose weight. On the same day, at another center, another man who was 5'9" and weighed 142 pounds was urged to sign up for a program to lose 8 pounds in 2 weeks.

These experiences were reported by agents of the New York City Department of Consumer Affairs who called or visited 14 weight-loss centers last year. The study concluded:

- Few of the centers gave advance warning or openly discussed the safety risks of their program, or of rapid weight

Candy cigarettes seductive? Two studies have explored the influence of candy and bubble gum cigarettes on the attitude and behavior of children toward smoking [Pediatrics 89:27-32, 1992]. One study found that young children in focus groups played with candy cigarettes and imitated adult smoking behavior. The other study found that children who repeatedly buy candy cigarettes are more likely than nonbuyers to experiment with smoking. Noting that "parents and public health professionals would not sanction toy marijuana joints or crack cocaine," the researchers recommended that candy cigarette products be eliminated as part of our society's efforts to prevent children from starting to smoke.

Raw milk creamed again. The California Court of Appeal has upheld a 1989 lower court verdict ordering Steuve's Natural and Alta-Dena Certified Dairy products to place a warning label on their raw milk products. The appeals court concluded that, contrary to the claims made in Alta-Dena's advertisements, raw certified milk: (1) can contain highly dangerous organisms, (2) is less safe than pasteurized milk, (3) does not possess superior health and nutritional benefits, and (4) is not produced under the strictest health standards in the industry. The appeal court also upheld the trial court's assessment of civil penalties (\$23,000), restitution (\$100,000), and payment of more than \$1.5 million in fees to the attorneys representing Consumers Union, which had initiated the lawsuit.

loss in general, even when directly asked about possible problems. One representative said her center's program was "absolutely safe" even though the health history form prospective clients had to sign contained a warning about health risks.

- Some centers attempted to sell their services to people who didn't need them, including the underweight.
- Some centers were engaged more in quackery than medicine. One clinic representative advised that filling the stomach with certain foods would speed up metabolism. Another said her clinic's maintenance program would "close up the body's fat cells."
- Some centers engaged in high-pressure sales tactics.

The Department has proposed regulations that would require weight-loss centers to (a) display a large sign stating that rapid weight loss (more than 1 1/2 to 2 pounds a week) may cause serious health problems, (b) advise consultation with a physician, (3) indicate that only permanent lifestyle changes can promote long-term weight loss, and (4) inform customers that information on dropout rates and staff qualifications is available on request.

The report, *Weighty Issues: Dangers and Deceptions of the Weight Loss Industry*, is available for \$5.00 from the Communications Division, New York City Dept. of Consumer Affairs, 42 Broadway, New York, NY 10004.

THE SHADY BUSINESS OF NATURE'S SUNSHINE

Jack Raso, M.S. R.D.

Nature's Sunshine distributors are using dubious diagnostic tests and prescribing herbs and other products for a large variety of health problems. Many of these people appear to be committing theft by deception and practicing medicine without a license.

Multilevel marketing (also called network marketing) is a form of direct sales in which "independent" distributors sell products, typically to their friends and acquaintances. Distributors can buy products "wholesale," sell them "retail," and recruit other distributors who can do the same. When enough distributors have been enrolled into a recruiter's "downline," the recruiter is eligible to collect a percentage of their sales.

Nature's Sunshine Products, Inc. (NSP), of Spanish Fork, Utah, has been training its distributors to use iridology, "muscle-testing," and "body typing" to market hundreds of the company's products. According to its literature, NSP has grown from a "kitchen table enterprise" in 1972 into an international business with annual sales exceeding \$60 million and distributors in all 50 states, Canada, England, Australia, and New Zealand. The business began with herbs but has expanded into vitamins and other nutritional supplements, homeopathic remedies, skin-care products, hair-care products, water treatment systems, cooking utensils, and a weight-loss plan. Over the years, more than 250,000 people have signed on as "independent" distributors.

The Distributor Kit

Becoming an NSP distributor is simple and requires no prior training in either health or nutrition. All it takes is submission of a 1-page application with a \$35 fee.

NSP's distributor kit consists of a looseleaf binder labeled "The People-To-People Health Business" and a wire-bound book called *A Systems Guide to Natural Health*. The looseleaf binder contains a congratulatory form letter, a product catalog, a manual of policies and procedures, four different price lists, distributor applications, order forms, a receipt book, and

flyers concerning products, payment plans, discounts for new distributors, and group insurance. The policies and procedures manual contains a 15-point "Code of Ethics," which includes: "I will not make any false or therapeutic claims concerning any NSP product" and "I will service a minimum of ten retail customers each month." Distributors also receive a 1-year subscription to NSP's monthly magazine, *Sunshine Horizons*.

The *Systems Guide*, published in 1988, contains about 80 pages. About half of the book describes various body systems and the products NSP relates to them. For each system, there are "key," "primary," and "complementary" products. Key products combine ingredients to "provide comprehensive nutritional support" for the body system. Primary products are combinations "designed to provide more specialized support for the particular system." Complementary products are single-ingredient items "for individuals who want to round out the systems approach to holistic health."

The circulatory system's "key" product is *Mega-Chel*, which contains 12 vitamins, 9 chelated minerals, choline, inositol, PABA, bioflavonoids, fish oils, adrenal substance, thymus substance, and spleen substance. The "primary" circulatory products include *CoQ-10 Plus*; *Bugleweed Liquid Herb*; *Capsicum*, *Garlic & Parsley*; and herbal mixtures (*BP-X*, *GC-X*, *GCC*, *ATC*, *HS-II* and *I-X*) that contain from 3 to 14 ingredients. The "complementary" products include butchers' broom root, capsaicin, garlic, hawthorn berries, liquid chlorophyll, magnesium, omega-3 fatty acids, and yellow dock root. Each of these products is said to provide "nutritional support" for the circulatory system. Products for other body systems are listed in the table on page 19.

Body Hype

Since 1989, NSP has been marketing *GlanDiet*, a meal-replacement program based mainly on the the book, *Dr. Abravanel's Body Type and Lifetime Nutrition Plan*, by Elliot B. Abravanel, M.D., and his wife Elizabeth King. The book maintains that there is a "dominant gland" at the root of every weight

problem and that weight can be controlled by soothing the errant gland and moderating its cravings. The book advises that the corrective plan be tailored to the individual's "body type," which is determined by examining the person's shape, body fat distribution, food cravings, sleep patterns, and various other characteristics. Women can be classified as "thyroid," "pituitary," "adrenal," and "gonadal" type, while men can be classified as "thyroid," "pituitary," or "adrenal." The personality traits described for each type resemble those of a typical horoscope.

According to NSP literature, the object of the *GlanDiet* Program is "to bring balance to out-of-balance systems." Two types of meal-replacement powders are available for this purpose. One, formulated for thyroid and pituitary types, "contains a higher concentration of protein than carbohydrates because carbohydrates tend to stimulate the pituitary and thyroid glands, while protein tends to stimulate the adrenals and gonads." The other powder, said to have a higher ratio of carbohydrate to protein, is formulated for adrenal and gonadal types. To help distributors design the correct program, NSP provides "a convenient body type questionnaire... based solely upon shape and build." For each type there also are "foods to eat or avoid" and various herbal teas and supplement products. All dieters are advised to begin with a "two-to-three day cleanse," engage in aerobic exercise, and aim for an overall calorie count of 1,200/day for women or 1,400/day for men. Obviously, most people who exercise and restrict calories to such levels will lose weight whether or not they use NSP products.

A-Type (Adrenal)

P-Type (Pituitary)

T-Type (Thyroid)

G-Type (Gonadal)

What is your Body-Type?

Each of us is biochemically unique. Therefore, no single diet program will meet every individual's needs.

Recent research now shows there are 4 distinct body types — 4 types of metabolism. Your body shape is determined by which of the major glands (thyroid, adrenal, pituitary, gonadal) is most dominant in your system. This dominant gland determines which foods you crave and where fat appears on your body.

Nature's Sunshine Products now offers a fascinating new weight control program that works with your body to achieve maximum results. The **GlanDiet** Program features meal replacement beverages and vitamin/herb formulas specially designed for your body type.

"Homeopathic" Products

Homeopathy is based on the idea that greatly diluted substances can exert powerful therapeutic effects on the body. This idea is utter nonsense, but the FDA permits homeopathic products to be marketed without proof that they work as claimed [NF 4:1-6, 1987].

NSP markets about 50 homeopathic products, most of which are named after a disease or symptom. The product *Candida*, for example, is said to be a "natural homeopathic medicine for the relief of the itching, burning and other symptoms associated with Candida yeast infections." The product *Parasites* is for "minor intestinal symptoms associated with parasites such as bloating, abdominal pain, flatulence and diarrhea." *Gout* is for "minor pain, heat, redness, and swelling associated with gouty inflammation of the joints." *Incontinence* is for "occasional minor bladder incontinence (involuntary urination) in adults." *Depressaquel* is "to assist in the reduction of minor feelings of melancholy, apathy and listlessness by lifting the mood and mental outlook." And so on. Each product contains very small amounts of about ten ingredients.

An NSP manual depicts the label of each homeopathic product on a separate page, followed by long lists of symptoms said to be associated with each ingredient. For example, *Gout* contains a 1:100,000 dilution of poison ivy, which is "associated" with "rheumatic and gouty conditions which worsen in cold, wet weather, improve with movement." The manual also lists "nutritional support companion products" for many of the homeopathic products. This setup enables NSP to suggest therapeutic uses for herbal products and supplements without making explicit claims for them.

FDA regulatory guidelines state that "nonprescription homeopathics may be sold only for self-limiting conditions recognizable by consumers" and that their labeling "must adequately instruct consumers in the product's safe use." Candidiasis, parasites, depression, gout, incontinence, and several other conditions for which NSP markets products do not appear to meet these criteria.

Distributor Training

NSP sponsors many meetings and courses at which distributors can receive training.

- Distributor School is a two-day program given at various locations throughout the U.S. and open to all distributors and managers. In 1988 NSP launched the program and announced:

Distributor School will be built around the new catalog, "A Systems Guide to Natural Health." Students will learn [NSP's] philosophy of natural health, plus they will be taken on a tour of the body, system by system. For each system they learn the basics of what that body does and what happens when it starts to break down. Attendees will come away actually knowing the key products to use for each of these systems.

Thus they will have a working knowledge of which nutritional supplements to choose to feed the various systems of the body.

In addition, there will be a carefully constructed business and motivation session that will teach distributors how they can support their own good health habits by sharing their new-found knowledge with others.

NSP's Distributor School kit provides specific guidelines for staying within the law and proposes "legal" ways to promote NSP supplements, such as discussing the "historical uses" of herbs and how herbs, "as foods," contribute to health.

According to the kit, the company will pay up to \$2,000 per calendar year to help defray the expense of any lawsuits filed against an active distributor or manager on grounds of prescribing or diagnosing.

• Manager School was a 5-day program given several times a year at the company's home office. Its purpose was to train people "to really be Natural Health Counselors." The program included "in-depth training in iridology, muscle-testing and nutritional supplements." However, "business and legal information will be woven into the fabric of how to actually practice natural health consulting properly." The program also included role-playing of counseling sessions. The course materials included iridology and muscle-testing charts. Managers

NSP's "SYSTEMS APPROACH" TO NATURAL PRODUCTS

Body System	Key Products	Claims for Key Product	Primary Products	Complementary Products
Circulatory	Mega-Chel	Improves vascular and heart muscle tone, improves circulation throughout the body; lowers LDL	Co-Q10 Plus, herbal combinations	Butcher's broom root, garlic, capsicum, hawthorne berries
Digestive	Food enzyme digestive aid Protein digestive aid (HCl)	Enhances utilization of food, supports weakened pancreas For people who need help digesting protein or are on a high-protein diet	Herbal combinations	Fennel, ginger, safflowers
Intestinal	Bowel Build	Nutritionally enhances digestion and provides dietary fiber, promotes cleansing of toxic intestinal buildup	Psyllium hulls, herbal combinations	Acidophilus, aloe vera, cascara, single herbs, liquid chlorophyll
Nervous	Nutri-Calm	Provides the nutrition the body needs to cope with a busy modern world	Herbal combinations; some contain valerian	Blackcurrant oil, evening primrose oil, lecithin, single herbs
Glandular	Master Gland Formula	Strengthens the thyroid, adrenals, and pancreas	Herbal combinations	Chromium, vitamin C, kelp, single herbs
Immune	Immune Maintenance Formula	Counters the effects of poor foods, pollution, and other things harmful to us	Target Immune Formula, germanium, herbal combinations	Barley juice, pau d'arco, vitamins, single herbs
Respiratory	ALJ Formula	Removes trapped toxins from mucous linings of respiratory system	Herbal combinations	Single herbs
Structural	SKL Formula Target Endurance Formula	Maintains strong and healthy bones Nutritionally feeds the body's muscles	Herbal combinations, trace mineral product, massage lotion	Aloe vera, comfrey, other single herbs
Urinary	URY	Nutritionally supports the urinary system ; helps cleanse blood and resist infection	Multivitamin/mineral product, potassium, herbal combinations,	Vitamins, single herbs
Skin and Hair	External: Herbal Trim Internal: HSN-W	Works from the outside in to break up and rid the body of toxins and impurities Nutritionally supports the structure and function of the skin from within	Herbal salve, ointment, and skin conditioner Chlorofresh	Tea tree oil, pau d'arco lotion, horsetail, aloe vera gel, vitamin C, sage

were encouraged to hold regular meetings to explain the body systems and key products to new distributors. Late last year, Manager School was converted into a 2-day affair called Natural Health and Business School.

- A Professionalism Symposium is offered following the company's national convention each year. This meeting features speakers on health and business topics and workshops on muscle-testing, advanced iridology, Chinese herbology, and new NSP products.

- Other educational opportunities are offered through area herb conferences, lectures at the national convention, conferences for leading distributors, and regional conferences for distributors who wish to focus on selling NSP's water treatment system.

Dubious Diagnostic Tests

Iridology and muscle-testing are used as the basis for prescribing NSP products. Iridology is based on the notion that the body's health status can be determined by examining the iris (the colored portion of the eye surrounding the pupil). Iridologists claim to diagnose "imbalances" that can be treated with vitamins, minerals, herbs, and similar products. In *Iridology Simplified* (1980), which is on NSP's suggested reading list, chiropractor Bernard Jensen wrote: "By knowing in advance one's weak tissues and organs, as can be revealed by iridology, it is possible to supply needed nutrients and thereby prevent unnecessary illness and disease from occurring."

NSP's muscle-testing is a variation of "applied kinesiology (AK)," an elaborate pseudoscience concocted during the 1960s by a chiropractor. AK is based on the notion that every organ dysfunction is accompanied by a specific muscle weakness, which enables health problems to be diagnosed through muscle-testing procedures. AK practitioners—most of whom are chiropractors—also claim that nutritional deficiencies, allergies, and other adverse reactions to food substances can be detected by placing substances in the mouth so that the patient salivates. "Good" substances supposedly make specific muscles test stronger, whereas "bad" substances cause specific weaknesses. The recommended "treatment" includes dietary measures and food supplements. Controlled studies have found no difference in response to test substances and placebos.

During my investigation of Nature's Sunshine, I was unable to find out the precise manner in which its distributors use iridology and muscle-testing to market their wares. Regardless of the details, under state laws, a commercial interaction in which a person attempts to discover a health problem and recommend a product to solve it constitutes the practice of medicine.

NSP is well aware of this fact. Its literature and training sessions warn distributors not to "diagnose" or "prescribe." The distributor application form requires an acknowledgement that NSP's products "are not intended for and are not to be sold as a cure, ameliorant or palliative for any disease or ailment, and that such products are sold solely and only for nutritional purposes." An article in the February 1989 *Sunshine Horizons*

advises distributors:

Teach, don't prescribe and diagnose. . . .

Instead of diagnosing, ask questions. Be particularly careful when using iridology and muscle-testing. For instance, don't say "You have a sinus problem." Rather, ask them, "Do you have sinus problems?" Let them diagnose themselves. You can also teach by talking to them in the third person. For example, you might say, "People with lymphatic rosaries typically have trouble with their sinuses." Or you can cite authorities: "Dr. Bernard Jensen says that this particular eye sign is associated with sinus congestion."

Always make clear that the information you are providing is only educational in nature and that the decision as to what they will do must be left up to them.

... Practice saying things correctly with family and friends so that the correct things to say and do are so ingrained in you that you never have to worry about getting "trapped" into practicing medicine without a license, even when dealing with strangers.

Despite the doubletalk, this approach appears illegal. Courts have long ruled that one cannot escape responsibility for practicing medicine without a license or marketing unapproved drug products by calling them something else. In addition, the use of false statements to sell products constitutes theft by deception.

Distributor School

In the spring of this year, I contacted NSP's Manager Service Department and expressed an interest in becoming a distributor. I was referred to a potential sponsor who lived in my neighborhood. When I telephoned, his son explained that his father had to see a "patient," whereupon I asked whether father was a doctor. The son replied that he was an iridologist.

On April 4, 1992, I attended NSP's Distributor School at a hotel in Uniondale, New York. The tuition was \$35. Fifty-eight people were registered for the program. The *Distributor School Preparatory Workbook*, which each of us received, states the school's goal: "To provide an active understanding of Natu-

Nutrition Forum (ISSN 0748-8165), © 1992, is published by Stephen Barrett, M.D. All articles and advertising inserts are fully endorsed by Dr. Barrett.

Individual subscriptions in the United States and Canada are \$35 for 1 year (six issues), \$65 for 2 years, and \$95 for 3 years, payable to Nutrition Forum, P.O. Box 1747, Allentown, PA 18105. Institutional and other multireader subscriptions are \$45 for 1 year, \$80 for 2 years, and \$115 for 3 years. Overseas subscriptions (via airmail) are \$45 for 1 year, \$85 for 2 years, and \$125 for 3 years. Back issues are \$6 each.

All correspondence should be sent to Stephen Barrett, M.D., P.O. Box 1747, Allentown, PA 18105. Telephone 215-437-1795.

ral Health which can be used to improve health and can be shared with family and friends."

The program began with the presentation of "Why Herbs?" a video promoting herbal supplementation in general. Shortly afterward, Molly Wright, our "trainer," said she wanted "to talk about where health begins." She asked where it begins, and told us to feel free to answer her questions. A distributor responded: "On the cellular level."

"The millions and millions and billions of cells" of which the body is composed, said Molly, have five basic needs: oxygen, water, nutrients, proper elimination, and even temperature. We can control "a certain amount" of these needs, she said, and "what we can control, it's our business to try to control." She described herbs and vitamins as "a great nutritional source," particularly "when we eat foods that don't have all the nutritional value." Then she referred to Alexis Carrel (1873-1944), a French-American surgeon who received the 1912 Nobel Prize for Medicine. Carrel developed methods for keeping tissues and organs alive in vitro for long periods. The *Workbook* also cites his work and states: "Under proper conditions, cells can live forever."

"If you've ever been to a nutrition class in the medical university," Molly said, "the nutrition specialist will say that you really don't need vitamins and herbs because if you eat the right foods... you'll get the right nutrients you need. But we can't trust all the foods we're eating... We can't always rely on the quality... The quality of the nutrients... is certainly important." This "lack of nutrients," according to Molly, causes a "weakening condition" of the body. "Another way that the body gets sick," she said, is "toxic buildup." This, she claimed, is caused by "a stressful environment and improper elimination."

"When the body is trying to accumulate its nutrients," Molly elucidated, "if it's clogged with toxins, then... even if you're giving it all the right things, it's not going to be able to use them as it should because of this toxic condition." If the body isn't able to "eliminate properly," she added, "those toxins are going to build, and so we need to assist it in cleaning." She also referred to Chinese yin-yang philosophy.

"Nature's Spring"

Next, Molly discussed tap water. "Most of the water that is supplied to your home is not used for drinking," she said. "The solution then would be to clean just the water that you're going to drink. And since the city can't do that for us at this time, we need to be aware of how we can best do that."

Molly then informed us that the solution to tap water safety is *Nature's Spring II*, an NSP water treatment system retailing for \$520. In a video presentation that followed, the narrator described it as "an easy-to-use countertop unit designed to help ensure that the water you drink is the way nature intended it to be." A distributor in my row informed Molly that she'd had her tap water tested and that "the results were really shocking." She said the sample had contained fecal matter and had been "very toxic, very high in metals, very high in lead." I later observed this distributor washing down some pills with

what she said was "Nature's Spring" water. She had brought a gallon container of it with her.

"The difference in the taste—that's kind of interesting," said Molly. "It does to me taste a lot better because I'm used to it now. But when we first bought our *Nature's Spring* unit, I put the regular tap water and then the *Nature's Spring* clean water in two different cups, and I had my husband taste it to see which one he liked better; and he picked the one that was regular tap water." Later Molly said:

You're always washing things for your body. What about washing the water for the inside of your body? That's the important place to start. . . .

Whatever's put into that water, whatever's in the environment can be absorbed in that water, from the rainfall, whatever's in the sky. . . . Insecticides, pesticides. . . even the things that are used to treat the water are harmful for you.

NSP's brochure for its water-treatment devices states that distributors are independent of the company and "not authorized to make any representations on behalf of Nature's Sunshine." The brochure also states:

Nothing in this material or in any statement concerning Nature's Sunshine, or in any statement attributed to Nature's Sunshine, is intended to make any of the following representations, claims, or statements: (1) That your water supply contains, or may contain, any contaminant or contamination (or any health-related physical, chemical, biological, or radiological substance or matter); (2) That scientific certainty exists regarding the relationship between acute or chronic illness and water supply.

Prescribing vs. Recommending

After a break, Molly conducted a discussion of NSP's herbal supplements. She referred to chemist Mark Pedersen, whom she identified as NSP's director of research and development. Two paperbacks written and published by Pedersen sold for about \$12 each at the school: *Nutritional Herbology* (1991) and *Nutritional Herbology, Volume II: Herbal Combinations* (1990).

The back cover of the first volume states that *Nutritional Herbology* "provides the nutritional profile or 'label' for 106 commonly used herbs and natural foods. It is ironic that avid 'label readers' are only provided nutritional profiles of processed foods, while the most desirable foods, natural herbs, foods and food supplements are never sold with nutritional information, until now." Moreover, the book "combines a detailed history and use of each herb with the nutritional profile to explain and interpret many historical uses of herbs as foods and medicines." Actually, Pedersen goes further in his book, listing: herb constituents of little or no nutritional import, the "definite actions" and "probable actions" of each herb, and instructions on preparation and dosage.

Volume II categorizes herbal combinations according to the physiological system—circulatory, digestive, glandular, etc.—for which they are purported to be therapeutic. They are further classified according to whether they are recommended for “excess conditions” or for “deficient conditions.” The book includes a “Medical Index” of diseases and symptoms.

Molly cited Pedersen as responsible for many of NSP’s herbal combination products. She expounded:

He has written books to give... information on Nature’s Sunshine Products. And Nature’s Sunshine cannot sell these books, even though they’re perfect for our use, because we’re a manufacturing company and realize the conflict between a manufacturing company and a publishing company. The FDA recognizes that as conflict of interest, [and so] we can’t publish the information that you really want to know about the products.... We can’t look like we’re prescribing actual products that we’re manufacturing. So that’s why we have such a healthy education program, and everyone is into self-learning.

Molly thereupon announced that the books could be bought from her and briefly described the first volume. “When you put these herbs together in certain combinations,” she claimed, “they actually go in and target and help with whatever’s going on.”

Based on Pedersen’s empirical classification system, the Distributor School literature lists four categories of herbs: 1) aromatic (“stimulate action, speed things up”); 2) mucilaginous (“soothe, lubricate, absorb water/toxins, slow things down”); 3) bitter (“loosen, soften, relax, dissolve, liquefy”); and 4) astringent (“contract, tighten, tense, tonify, solidify tissue”). Molly cited several herbs, including aloe vera and slippery elm, as mucilaginous. “A mucilage herb has a cooling down effect,” she told us. “It has a soothing effect.” She claimed that aloe vera “has cooling properties in it” and would have a cooling effect on “the inflammation in the body or whatever needs to be cooled down in the body.” “If you have anything hot before [ingesting] slippery elm,” she stated, “then you will feel that cooling down going on.” She said that saponins, present in bitter herbs, may be thought of as soap, since they “clean out the dirty.”

Bowel Build, one of NSP’s “key products,” is a combination of vitamins, minerals, herbs, and digestive enzymes. NSP’s catalog describes it as “food for the gastrointestinal tract itself.” Molly said it was a good example of a synergistic product, having both “laxative-type herbs in it to help cleanse” and “building-type herbs in it to help strengthen the... system.” She asked if they would “cancel each other out,” and then explained that “the herbs work not like a chemical or a drug that’s going to actually change something. They’re just going to either... support or cleanse the system somehow so that it gives you the right benefit.” The herbs will do “what’s needed,” she claimed, but won’t have any bad effect on the rest of the system.

The “systems approach” was Molly’s next topic. She began with the digestive system. “This,” she said, “is where you should start when you’re thinking about health.... Cleansing is

very important because... if you want to give yourself nutrients that your body needs and there are toxins blocking the way for those nutrients to be used, then you need to clean those toxins out of the way first so that you can use those nutrients.”

“Nothing Illegal or Weird”

“If you are working with your medical doctor on something that you have a specific problem with,” she told a questioner, “I’m not advocating that you stop doing that. But you can use your judgment and your education.... The drugs are going to probably cause the herbs to not work like they should.” Later, she stated: “Some drugs will wipe out the effects of your herbs.” Although Molly advised distributors who were not licensed health professionals against prescribing or diagnosing, she did suggest an alternative:

If somebody comes to you... or if you know somebody who has friends with, like, a diabetic problem... use your knowledge about the product that would support somebody with a diabetic condition. And you recommend to them that that’s what you would do if you had that type of condition in the body....

You’re giving a referral, basically, just like you would recommend a movie that you saw, or a play that you saw and that you enjoyed. You’re telling them... about the experience that you had with this product, and that’s why it would work. And if you don’t know of [any] experience, you can do some research into the historical uses, and they need to rely on the historical uses.

The “Herbal Hour”—a home meeting designed to generate sales—is described in printed material I obtained at the school. It includes a “script” and defines herbs as “little units of concentrated energy that nourish and energize the body and provide missing nutrients that supply the raw materials that we so desperately need to allow the body to do its job.” The Herbal Hour instructions advise:

Tell your group that you are not there to prescribe or diagnose, that you are not a doctor so it is not legal for you to go beyond sharing information with your friends and neighbors. We like to explain, however, that it is their legal right to prescribe for themselves, so if they choose to use the information for themselves, they may do so.

When a distributor asked the difference between prescribing and recommending, Molly replied: “Prescribing is actually saying: ‘If you have a cold... you need to take this common cold product that Nature’s Sunshine sells.’” But saying “If I had a cold, I would take this because I know it helps clean the mucus out of my system, and that will make the cold go away” would merely be recommending, she said. “It’s just a matter of semantics,” she added. Then she proposed a similar alternative to diagnosis:

Somebody comes in, they're sneezing and running at the nose. If you say—"Oh, you have a cold. Here's a product for you."—that's diagnosing. You're telling them they have a cold, and you're not a doctor to tell them that. [But you could] say: From what it looks like . . . you know . . . you're having some respiratory troubles, and these are good respiratory disease products . . . probably the ones that you're thinking of."

Nevertheless, one distributor raised the question of lawsuits. She conceded that there had been cases involving distributors who "would not watch how they're recommending products." But she added: "It's not something you need to be concerned with. . . if you're just recommending the product and selling them. . . We're not doing anything illegal or really weird."

The Name Game

Next, Molly discussed NSP's "key products." She asked if anyone had had good results using any of the products for gastric ulcers. One distributor stated she advises people against drinking water with meals because it interferes with the action of hydrochloric acid and digestive enzymes. She said that drinking water with meals had been described to her as "the work of the devil." Another distributor concurred. "But," she added, "there are medical-nutritional doctors who say that's nonsense."

"It just shows you," Molly rejoined, "the different type of training that they have." The distributor countered that the doctor to whom she had alluded was a "natural doctor"—a "nutritional" doctor. Molly responded that in nutrition schools, "nutritional philosophy is taught right along with the medical philosophy." Such schools, she claimed, teach that "if you do certain things in a certain way, then you don't need to be aware of any of these other things."

"A lot of these products you'll just take the rest of your life," said Molly, "because [of] the imbalance of your body, or you may have an inherently weakened state that you have to work with always." She indicated that the names of the herbal combination products refer to the conditions or organs they are designed to treat. For example, "U" stands for "ulcer"; "UC3-J," for "ulcers, colitis, Crohn's disease, and celiac disease"; AG-C and AG-X, for "anti-gas"; and BLG-X for "bile, liver, and gallbladder." The letter "C," if it follows the hyphen, designates that the product is based on a traditional Chinese formula. Other letters following the hyphen refer to

the designers of the formulas. For example, "A" refers to Paavo Airola (a naturopath) and "X" to Dr. John Christopher (an herbalist).

"Herbal Cleansing"

Molly claimed that, ideally, people should have three bowel movements daily, and she declared that "everyone has a certain degree of parasites." She asked us how "optimal and proper elimination" can be supported. One distributor suggested "LBS II," a "lower bowel stimulant" composed of nine herbs including cascara sagrada (a laxative). Another revealed that she'd neglected to tell one of her clients to ingest ample fluids with the herbal supplements he had been taking to "cleanse" himself. "Totally unbeknownst to me," she explained, "he was not drinking any water. He prided himself on being able to get by with only two glasses of fluid a day. . . . And so he had horrendous stomach pains, and it wasn't until we went through everything [that we realized what the problem was]—and then he just went: 'Oh, you mean you have to drink water?'" The audience laughed. "Horrible stomach pains," she emphasized. "I mean horrible. . . I was just amazed that he didn't put that together at all. . . and I didn't even ask."

Another distributor acknowledged that she hadn't felt well during an herbal "cleanse." Molly attributed this feeling to the excretion of toxins. "A lot of times when toxins are coming out of the body," she explained, "you experience the symptoms. That's the body's way of healing itself. So if you get a flu-like symptom with that cleanse, don't be alarmed." Molly referred to this reaction as a "healing crisis."

The Bottom Line

Nature's Sunshine is marketing hundreds of dubious products intended for the treatment of health problems. Its distributors are using unscientific methods as a basis for recommending products. The company also provides an extensive framework of false, misleading, and unproven statements with which to promote the products. I believe that, despite its elaborate system of disclaimers, NSP is breaking the law and encouraging its distributors to do likewise.

Mr. Raso, a registered dietitian, lives in New York City and is preparing a book on "paranormal" nutrition.

BRIEFS

Anthology updated. The Dushkin Publishing Group, Sluice Dock, Guilford, CT 06437, has published *Nutrition 92/93*, its fifth annual sourcebook of nutrition articles. Edited by Charlotte Cooke-Fuller, Ph.D., of Towson State University, with help from Dr. Stephen Barrett, the book contains 67 significant articles from magazines, newsletters and scientific journals. Single copies are available for \$10.95 plus \$2/order for postage from LVCAHF, Inc., P.O. Box 1747, Allentown, PA 18105.

EMS associated with lysine. Eosinophilia-myalgia syndrome has been reported in a 33-year-old woman who took an array of products that included lysine and homeopathic remedies, but did not include L-tryptophan [NJ Med 89:285-286, 1992]. Lysine use is suspected in at least three other cases. Reprints of the report are available from Michael Patmas, M.D., 1749 Hooper Ave., Toms River, NJ 08753.

High-tech AIDS ripoff. The New York City Department of Consumer Affairs has concluded that many private home-care suppliers have been engaging in "bedside robbery." The biggest problem is the provision of total parenteral nutrition (TPN), a liquid protein and fat supplement fed intravenously through a surgically implanted catheter to AIDS patients whose digestive system no longer functions normally. The Department's report, "Making a Killing on AIDS," cites instances where insurance companies and government agencies have been billed more than \$15,000 a month for treatment that costs much less to deliver. Only three out of twelve companies responded to the Department's questionnaire about prices for their services. Several patients reported that buying supplies through a pharmacy and administering TPN themselves could more than halve their home-care costs. The report is available for \$5.00 from the Communications Division, New York City Dept. of Consumer Affairs, 42 Broadway, New York, NY 10004.

Diet and behavior. Information presented at a 1991 symposium on diet and behavior has been published in a 92-page book. The symposium was sponsored by the National Center for Nutrition and Dietetics with funding from The Sugar Association. The topics include: (1) consumers' food habits and safety concerns, (2) nutrition and cognitive performance, (3) food additives and behavior, (4) nutritive sweeteners and behavior, and (5) high-intensity sweeteners and behavior. Copies of the book can be purchased for \$2.00 from The Sugar Association, 1101 15th St., N.W., Suite 600, Washington, DC 20005.

Information on new food labels. The Food Label Education Project (FLEP), a consortium of industry, government, and professional and consumer groups, is developing educational materials to explain the labels resulting from the FDA's proposed food labeling rules [NF 9(1):1-5]. For information about FLEP and its forthcoming materials, write to: Regina Hildwine, Industry Analyst, National Food Processors Association, 1401 New York Ave., N.W., Washington, DC 20005.

Genetically-engineered produce approved. The Bush administration has agreed to permit genetically-engineered fruits, vegetables, and grains to be sold without government testing if their new properties can be found in plants people already eat. The new policy is intended to treat foods developed through biotechnology the same way as all other foods: the degree of oversight will depend on the characteristics of the food rather than the method by which it is produced. The first product anticipated is a tomato that has been altered to remove the enzyme that makes vine-ripened tomatoes spoil. Currently, tomatoes are picked green, sprayed with a gas to ripen them, and then shipped. Calgene's new Flavr Savr tomatoes, which can be picked when red and juicy and shipped thousands of miles without spoiling, are expected to reach supermarkets in late 1993. About 30 companies are developing dozens of crops, including tomatoes, melons, potatoes, celery, carrots, and cucumbers. Other products being researched include a low-cholesterol pig, cholesterol-free canola oil, and a cotton plant that packs its own weed-killer. Biotechnology opponents have threatened that unless the FDA conducts a formal rulemaking procedure, they will initiate legal action to prevent genetically engineered products from being sold.

Vitamin A and liver damage. Researchers who reviewed 41 cases of vitamin A toxicity have concluded that total cumulative intake was a critical factor. One person took six years to develop cirrhosis on a daily dosage of 25,000 IU, but those on higher doses developed cirrhosis sooner [Gastroenterology 100:1701-1709, 1991].

Primrose oil seizure upheld. A U.S. Court of Appeals has upheld a lower court summary judgment against Efamol, Ltd., a company headquartered in Nova Scotia, Canada. Efamol, Ltd., is the leading marketer of evening primrose oil (EPO) products sold throughout the United States. In 1979 the FDA had notified Efamol representatives that EPO could not be imported into the United States unless the company sought and obtained approval by filing an appropriate food additive petition or new drug application. Although Efamol said that it would not export the oil to the U.S., it continued to ship it in bulk to California for encapsulation. The capsules would then be shipped to distributors who would market them as dietary supplements through health food stores or by mail-order. In 1989, at the FDA's request, a U.S. marshal seized 45 drums of EPO en route to the company in California. The FDA had evidence that Efamol, Ltd., was spreading therapeutic claims through press conferences, news releases, news bulletins to distributors, and many other channels of communication. One piece of evidence was a videotape of Efamol's president telling a gathering of health food retailers exactly how to prescribe EPO for premenstrual syndrome. Although Efamol, Inc., could have been charged with marketing an unapproved new drug, the FDA felt that treating it as a "food additive" would make the court case simpler.

CHIROPRACTORS AND NUTRITION: THE "SUPPLEMENT UNDERGROUND"

Stephen Barrett, M.D.

Many companies market supplement concoctions to chiropractors with claims that would be illegal on product labels. Although this marketing channel poses considerable danger to consumers, government enforcement agencies have been reluctant to explore it.

About 50 companies market supplements through chiropractic offices, where they typically are sold for at least twice their wholesale cost. Many of these products are intended for the treatment of disease even though they are unproven and lack FDA approval for this use. Since it is illegal to place an unproven therapeutic claim on a product label, claims of this type are conveyed separately through product literature distributed at chiropractic meetings, company-sponsored seminars, and by mail.

The percentage of chiropractors engaging in unscientific nutrition practices is unknown, but several reports suggest that it is substantial. In 1988, 74% of about 2400 chiropractors who responded in a survey by the leading chiropractic newspaper reported using nutritional supplements in their practices. Not long afterward, researchers from San Jose State University's Department of Nutrition and Food Science mailed a survey to 438 members of the San Francisco Bay Area Chiropractic Society. Of the 100 who responded, 60% said that they routinely provide nutrition information to their patients, 38% said they provide it on request, 60% claimed that they treat patients for nutritional deficiencies, 19% said they use hair analysis, and 9% indicated that they use "applied kinesiology" for nutritional assessment [Journal of the American Dietetic Association 89:939-943, 1989]. Neither hair analysis nor applied kinesiology are valid for nutritional assessment of patients.

In 1989, a spokesperson for Douglas Laboratories (a company that sells nutritional products only to chiropractors) stated that "roughly 65% of all chiropractors are dispensing nutritional products, and more of them are doing it every day."

Typical Chiropractic Beliefs

Chiropractic is based upon the belief that most ailments are the result of spinal problems. The "discovery" of chiropractic was announced in 1895 by Daniel David Palmer, a grocer and "magnetic healer" who practiced in Davenport, Iowa. Palmer believed that he had restored the hearing of a partially deaf janitor by "adjusting" a bump on his spine. Not long afterward he decided that the basic cause of disease is "nerve interference" caused by misaligned spinal bones which could be adjusted back into place by hand.

Today's 45,000+ chiropractors can be divided into two main types: "straights" and "mixers." Straights tend to cling strictly to Palmer's basic doctrine that most disease is caused by misaligned vertebrae ("subluxations") that can be corrected by spinal adjustment. Mixers acknowledge that germs, hormones, and other factors play a role in disease, but they tend to regard mechanical disturbances of the nervous system as the underlying cause (through lowered resistance). In addition to spinal manipulation, mixers may use nutritional methods and various types of physiotherapy (heat, cold, traction, exercise, massage, and ultrasound). About 300 chiropractors belong to the National Association for Chiropractic Medicine, a reformist group that has renounced Palmer's basic theories. Its members limit their practice to musculoskeletal problems and have denounced the unscientific methods used by other chiropractors.

Although some aspects of scientific nutrition are taught in chiropractic schools, many ideas that chiropractors absorb—in school and afterwards—are as unscientific as their basic theory of disease. Chiropractors who give nutritional advice typically recommend vitamin supplements that are unnecessary or are not appropriate for treatment of the patient's health problem. Some chiropractors have charged thousands of dollars for treatment programs involving diagnostic evaluations, vitamins, adjustments, and massage over a period of several months.

ACA Council on Nutrition

The American Chiropractic Association's Council on Nutrition, which was founded in 1974, holds symposiums and seminars and publishes a quarterly journal (*Nutritional Perspectives*) and a monthly newsletter. The journal states that the council is "dedicated to the health of mankind on the premise that proper nutrition is a major factor in promoting and maintaining good health and preventing disease." During the past year, the journal has contained editorials, letters to the editor, abstracts of scientific reports, and reprints from *FDA Consumer* and other publications. Recent issues have contained 28 to 32 pages, of which about 35% are ads by supplement manufacturers. The title page states that ads "are initially screened" by a committee of the council, but that neither the council or its personnel are responsible for the advertising and that publication of the ads does not imply approval or endorsement by the journal or the council.

Recent issues of the council's newsletter have supported the (bogus) idea that mercury-amalgam fillings are dangerous and opposed pending legislation to strengthen the FDA. One issue was accompanied by a form letter asking the FDA to lift its ban on L-tryptophan supplements.

The Council on Nutrition also appoints the American Chiropractic Board of Nutrition, which sets standards and administers a certifying examination for chiropractors. To become certified, chiropractors must take 300 hours of approved courses and pass an examination in basic and clinical nutrition. According to the council's correspondence secretary, 42 of the council's 300 members are certified. To maintain certification status, the chiropractor must submit evidence each year of active involvement in chiropractic education at an approved college or must submit detailed case histories or a paper on nutrition for publication. However, the past four issues of *Nutritional Perspectives* contain no reports of cases or research studies involving chiropractic nutrition.

In 1991, the American Chiropractic Association passed the following resolution, which was co-authored by the executive director of the ACA Council on Nutrition:

The ACA's Council holds the position that it is appropriate for a doctor of chiropractic to recommend the use of vitamins, minerals, and food supplements to the extent that this is not in conflict with state statutes and regulations. A nutritional assessment should be made of the patient prior to the use of nutritional supplements. The recommendation of nutritional supplements should include a nutritional assessment of the patient. The practitioner shall record the rationale for the supplements in the patient's charts. The doctor should attempt to determine that the products being recommended are not experimental.

A similar resolution was passed regarding weight-control programs. Commenting on these resolutions, the newsletter's editor said:

Save and memorize these resolutions! Their importance cannot be overstated. Before these resolutions were passed, there was no official "opinion" or direction by the ACA regarding this area. With these resolutions, we have, for the first time, something in writing; a part of the American Chiropractic Association that says YES WE CAN use nutrition. . . . Now we have the clout and the backing of the American Chiropractic Association behind us.

Marketing Strategies

Under federal law, "drugs" are defined as any articles (except devices) "intended for use in the diagnosis, cure, mitigation, treatment, or prevention of disease" and "articles (other than food) intended to affect the structure or function of the body." All drugs must be labeled with adequate directions for their intended uses. Drugs not generally recognized as safe and effective by experts are "new" drugs. It is a federal crime to market a "new" drug in interstate commerce without FDA approval or without adequate directions for use. To gain FDA approval substantial evidence must be presented to the FDA that the product is safe and effective for its intended use.

Chiropractic suppliers are marketing thousands of unapproved nutritional products intended for the treatment of disease. The manufacturers seldom advertise openly what the products are for. Some companies make therapeutic claims through seminars, exhibits at chiropractic conventions, and material provided by "independent" regional distributors. Some companies provide their own product literature, which may or may not provide complete directions for use. Some companies provide copies of articles from the popular press or health food magazines that mention or promote substances contained in their products. A few companies distribute elaborate manuals listing the diseases their products can supposedly treat. Other companies stress quality or price advantage and let the chiropractors figure out for themselves what the products are for. Many products are simply named after an organ (e.g., *Ora-Brain*), bodily function (*Anabolic MegaPak*, *Gluco-Stabil*), or health problem (*ArthEase*, *Candidaforte Pack*). Other products are given code names or numbers that the company explains elsewhere.

Regional distributors, who may handle the products of one company or several, may mail information or visit chiropractic offices in much the same way that drug "detailers" attempt to educate physicians. However the information delivered by legitimate drug company representatives is strictly regulated by the FDA and must be complete and based on well designed scientific tests. The information delivered to chiropractors has neither of these characteristics and is transmitted through channels that are intended to be hidden from the FDA.

Several chiropractors and naturopaths have written manuals suggesting specific products for large numbers of diseases. Those that I have collected within the past few years contain a disclaimer that nothing should be construed as a claim or representation that any of the products mentioned consti-

tutes or is intended for use as a cure, palliative or ameliorative for any of the conditions noted. One of the books, *The Unauthorized Guide to Nutritional Products & Their Uses*, by David Williams, D.C., states that its information was "compiled from specific recommendations made by various manufacturers." Although it advises readers to use the book as a guide, with the help of a physician, it also tells how to order the products from a mail-order discount house.

In December 1991 *The Chiropractic Journal* (a newspaper distributed free-of-charge to chiropractors) published an ad from Physiologics, of Boulder, Colorado, which said:

Are you ignoring a major income source? Spend 5 seconds per patient and increase your gross profits \$53,000 or more per year. According to national studies, over 50% of the population could benefit from some type of nutritional support therapy. Of those individuals who use supplements, the average purchase is 1.5 supplements per visit. That means if you see an average of 30 patients per day, you will have the opportunity to provide 15 of them with nutritional supplements. Our studies show your average profit margin per patient equals \$13.75 . . . = \$53,625 gross profit per year.

During the past two years I have collected catalogs and/or other product literature from about 50 companies that

market supplement products through chiropractors. The table below illustrates some of the claims that I believe are false, misleading, or otherwise illegal.

The Bottom Line

It is clear that the entire communication system between supplement manufacturers and their chiropractic clients is set up with the hope of "distancing" illegal claims from their product labels. Although some chiropractors may give rational nutrition advice to their patients, their journals contain little or no discussion of how such advice is given, or should be given. Although I am aware of several cases in which patients were seriously harmed by vitamin megadoses prescribed by chiropractors, I have seen no case reports in chiropractic journals or warnings that high doses can be toxic. Worst of all, however, despite the many problems described in this article, no prominent chiropractor or chiropractic organization has openly suggested that there is anything wrong with the way chiropractors "practice nutrition."

Stephen Barrett, M.D., a practicing psychiatrist and consumer advocate, edits Nutrition Forum Newsletter and is co-author/editor of 31 books, including *Health Schemes, Scams, and Frauds* (Consumer Reports Books, 1990). He has been investigating the chiropractic marketplace for more than 20 years.

DUBIOUS PROMOTIONS TO CHIROPRACTORS

Company	Products	Claims in Catalogs or Product Literature
Body Gold La Jolla, CA	Super Fat Burner Formula	Accelerates fat loss and enhances muscle definition
Esscolloid Co. Cedarburg, WI	Immune Life	Promotes thymosin, trophic hormones, natural killer cells, interferon, and T-cells
Futurebiotics Brattleboro, VT	Hypoglycil PressureLo	The perfect product for people who feel tired and unwell Brings together the minerals, vitamins, herbs, and other key factors that address a major health concern
Health Concerns Alameda, CA	Astra Essence	Promotes longevity useful in our society where many show signs of premature aging or kidney deficiency from fast-paced lifestyles
Metagenics Laguna Hilks, CA	Parasidal	Destroys parasites
Nova Nutritional Products Inglewood, CA	Stress Buster	Contains . . . vital nutrients that will help you fight the "burn-out" of stress
Rainbow Light Nutritional Systems Santa Cruz, CA	Adrenogen The Mind System	For glandular systems overtaxed by stress or stimulants Specifically formulated to help fuel the brain's production of mental energy
Standard Vitamins Company La Canada, CA	Cardio-Care	Nutrition for a healthy heart - supplies all the nutrients known to benefit the heart and circulatory system
Universal Laboratories New Brunswick, NJ	Orchic Test Infusion	Increases testosterone production to promote muscle mass and strength gains in both men and women

CHIROPRACTIC NUTRITION: AN INSIDER'S VIEW

Ira Milner, R.D., obtained the following information during two telephone interviews with Donald Huml, D.C., president of the American Chiropractic Association's Council on Nutrition:

How do you feel about chiropractors who sell supplements out of their office?

That's up to the discretion of the practitioner. I don't have an ethical problem with that. Again, anything in the hands of the wrong person can be misused. We sell some supplements out of our office. It makes it convenient for the patient. We try to compete with whatever is fair and equitable prices.

What is considered legitimate and what is considered illegitimate by the council. For example, the use of such things as . . . bee pollen and dietary supplements. What are your feelings about those?

The official stance is this: That a person needs a proper and complete nutritional workup. Upon the findings of that nutritional analysis, supplementation can be utilized that has been shown to be effective for their particular situation. There are things that have reams and reams of information published in the scientific literature. Evening primrose oil (EPO)—there are thousands of citations. . . . Bee pollen . . . may be very effective for certain things, and the scientific validation may be much less. And they talk about some other supplements that might have even less. So, it's up to the doctor's discretion, but experimental nutrition is not encouraged. If you know what I mean.

You mean use of substances that have not been shown to be effective?

Yes, but you know that's a gray area.

How do you determine effectiveness?

Again, speaking for the Council, all we can state is just try to keep everything above-board. . . . Don't go too far out on a limb, and use what is effective. Now, there are things that have shown their effectiveness that haven't been tested in clinical trials just because they're new, if you know what I'm saying.

How have they been shown to be effective if their effectiveness has not been shown in clinical trials?

Let me see what can I think of that we use in our practice. . . . We tell people to drink ginger tea for colds and flus and stuff like that because I know it's very helpful and it helps clear up your sinuses. . . . The Council wants to promote proper nutritional therapies that have some backbone . . . that have some clinical trials, but I don't know any nutritionist that doesn't use things like the ginger, that don't have a few of these items in their armamentarium that haven't had massive clinical trials.

Are you aware of any chiropractors doing anything that you or the council feel is unscientific or unproven?

There are all sorts of people out there both in the chiropractic profession, in health food stores, and in the medical profession, that use dubious diagnostic techniques. . . . I have had patients come . . . who have been put on a vitamin regimen just

from a hair analysis. And that's not enough information gathered to put someone on a program unless they are on a vitamin, like vitamin C to specifically chelate out one of the heavy metals that might show up on a hair analysis. There are also people who will put people on nutritional programs based on muscle-testing alone, which, at best, is educated guesswork. That information . . . should always be backed up with some sort of other standardized testing protocol. Unfortunately, what is taught in seminars sometimes is bastardized. You know once people [return] to their office, they can do anything they want. What is taught in seminars is not always what comes out of a practitioner's office.

Do chiropractors as a whole prescribe a lot of supplements?

Not necessarily. It depends on how your practice leans. I personally have a strong background in nutrition, and my practice is geared that way so we make recommendations. Some chiropractors never make recommendations for nutrients; they will deal strictly with the spine and nothing else. And some will recommend only one or two specific types of supplements for disk problems. . . . So it varies, it goes the whole gamut from nothing . . . to putting people on a whole program.

Where do chiropractors learn about or how to prescribe supplements?

In school and in postgraduate work. The Council on Nutrition and American Chiropractic Board of Nutrition put on a 300-hour postgraduate education seminar Except when you're in school, everything else is done on a seminar type of basis.

About fifty or so mail-order companies supply a whole range of products to chiropractors. . . . Where do they learn how to use these products?

All those companies offer support because sometimes they have unique formulations. However, all of the usage should be based on physiology. What is the supplement doing, how is it doing it, does this patient need this. . . . So you always fall back onto basic physiology and biochemistry as to how this works . . . and is it the appropriate supplement for this person.

So a chiropractor may call one of these companies and speak to someone there that can give advice about how much to use of a certain supplement or whether it's indicated in a particular situation or not?

Right, just like a medical doctor does with drugs. You rely on the information you are getting from the drug company to be correct and reliable, then using your knowledge of physiology and basic biochemistry you hope to apply that to the person. [Editor's note: Medical doctors rarely need to contact drug companies to find out what their products are used for. That information is readily available in product literature, medical journals, textbooks, and other scientific publications.]

Do these companies ever offer seminars to chiropractors to help use their products?

You know I don't believe that is legal. You cannot make a medical claim for a supplement.

BOOK REVIEWS

Title: Straight Talk About Weight Control (1991)

Authors: Lynn J. Bennion, M.D., Edwin L. Bierman, M.D., and James M. Ferguson, M.D.

Publisher: Consumers Union, Mt. Vernon, N.Y.

Price: \$15.95 softcover

Reviewed by: Lisa T. Harris, R.D.

Three prominent physicians and the editors of *Consumer Reports* have produced a comprehensive work about the current state of knowledge on weight control. The book is not a diet plan but presents essential information for those who hope to succeed in long-term weight management. Its information is accurate and highly readable. It provides detailed explanations of the definition, measurement, causes and treatment of obesity.

The authors, all experts in the field of weight control, also discuss the prevalence of obesity in this country, health problems related to the condition (social costs as well as physical and psychological), and the benefits of weight loss. A short food program, dubbed "healthy, low-calorie menus," is included (approximately 1,600 calories per day). In addition, the book is full of sobering statistics, touching anecdotes, and pertinent research findings, both historical and recent.

Straight Talk About Weight Control gives readers the facts needed to make informed choices. The section on pros and cons of various weight-control methods should be especially useful to dieters. The discussion includes everything from exercise to behavior change, from jaw wiring to gastric bypass, and from commercial weight-loss programs to conventional dietary counseling. Readers can use this information to evaluate strategies according to their particular weight-loss profile and needs. The overriding emphasis, however, is on reducing caloric intake, increasing energy output, and maintaining positive eating habits.

People looking for a new miracle diet plan may be disappointed, but those who take their weight control seriously should find the book a valuable reference. It may be especially helpful to dieters who are "successful" with many diets but invariably regain the lost weight. The book gives readers frank information to prepare them for the permanent changes needed to maintain weight loss. It is also an excellent reference for those who counsel patients with regards to weight control.

Straight Talk About Weight Control may not become a best seller. But for consumers who are ready to take control of their eating and exercise habits, it may help save time, money, and frustration.

Lisa Harris, R.D., is a nutritionist and freelance writer in San Bernardino, California. For several years, she edited and published of *Current Diet Review*.

Title: Your Guide to Good Nutrition (1991)

Authors: Fredrick J. Stare, M.D., Virginia Aronson, M.S., R.D., and Stephen Barrett, M.D.

Publisher: Prometheus Books, Buffalo, N.Y.

Price: \$13.95, softcover

Reviewed by: Manfred Kroger, Ph.D.

Among the many books offering nutrition advice, a large number are unsound, some even dangerously so, and many are far too technical for the average reader. This practical and easy-to-read 213-page paperback is just right for the average person who doesn't have a doctor's degree and is intelligent enough to stay away from all those tracts devoid of merit.

The book is essentially a question-and-answer display of more than 300 subjects arranged in 13 chapters. These include nutrition basics and a balanced diet; how to evaluate nutrition information; vitamin and mineral supplements; "health foods" and related products; "junk foods" and "fast foods"; additives; practical weight control; balanced vegetarian diets; the truth about sugar, "fluid facts"; tips for teenagers; and diet in relation to heart disease and cancer. There is also a very useful 11-page glossary of terms and concepts. One figure and 13 tables provide condensed overviews; and, as is customary with books of this genre, the Recommended Dietary Allowances (of 1989) are found in an appendix.

The authors of this guide together have authored more than two dozen books on various subjects all related to this one. Dr. Stare, a respected Harvard University nutrition professor, is known worldwide for his research and writing. Ms. Aronson, a registered dietitian, is co-author of *The White House Family Cookbook*. Dr. Barrett is a nationally renowned author on health subjects as well as a consumer advocate who, in 1984, received an FDA award for his public service in fighting nutrition quackery.

The book is indeed easy to understand and can be used, via its 12-page index, as a reference as much as an enlightening, educational textbook. As a matter of fact, it would be an excellent choice as a school or university classroom text. All topics covered reflect the mainstream thinking of current health professionals. The data presented are from conventionally accepted and reliable sources. And the recommendations, wherever made, are in harmony with the major nutrition guidelines and scientific health advice presented to the public in recent years.

“ERGOGENIC AIDS” CHALLENGED

About 100 companies are marketing “supplements” of vitamins, minerals, amino acids, and various other ingredients with false claims that they can help build muscles and improve athletic performance. In May, the New York City Department of Consumer Affairs issued “Notices of Violation” to six such companies and challenged the FDA to clean up the marketplace nationwide.

Investigators from the Department found that manufacturers they contacted for information about their products were unable to provide a single published report from a scientific journal to back the claims that their products did any of these things. Calling the bodybuilding supplement industry “an economic hoax with unhealthy consequences,” the department warned consumers to beware of terms like “fat burner,” “fat fighter,” “fat metabolizer,” “energy enhancer,” “performance booster,” “strength booster,” “anabolic optimizer,” and “genetic

optimizer.” The Department calculated that a supplement program recommended in the leading bodybuilding magazine (*Muscle & Fitness*) would cost more than \$11 per day.

The companies cited for “deceiving or misleading consumers by falsely representing and/or exaggerating the benefits, qualities or effects” of their products were: Metabolic Nutrition, Inc., Miami, Fla. (*Opti-Genetics*); Cybernetics, Lakewood N.J. (*Cyberblast, Cybertrim, Cybergain, Vortex*); Universal Nutritional Systems, New Brunswick, N.J. (*Hot Sauce*); Champion Nutrition, Concord, Calif. (*Metabolol*); ROM Research, Baltimore (*Ultra Pro*); and Mega-Pro International, St. George, Utah (*Anabolic Muscle Stuff, Meg-amino 1500, Smilax Spray*).

A 32-page report, *Magic Muscle Pills!!: Health and Fitness Quackery in Nutritional Supplements*, is available for \$5 from the NYC Dept. of Consumer Affairs, 42 Broadway, New York, NY 10004.

HEALTH FOOD INDUSTRY STEPS UP ANTI-FDA CAMPAIGN

The campaign to weaken the FDA envisioned by the Nutritional Health Alliance [NF 9:1-5, 1992] has gone into full swing. At a trade show in April, alliance leaders pledged to generate one million letters to Congress within six months and raised \$500,000 to launch the campaign. “Health Freedom Kits” containing form letters, sample press releases, and other campaign materials have been distributed to many health food stores throughout the United States. Most trade and consumer “health-food” publications have published ads urging their readers to “fight for your family’s right to choose safe and beneficial nutritional supplements.” The ads claim that if current FDA and Congressional actions are passed and enforced, 50% of all nutritional supplements will no longer be available within the next 12 to 18 months and the FDA will become “empowered with police powers and the ability to levy heavy civil penalties that will be used indiscriminately against dietary supplements and force most health food stores out of business.”

The health food industry fears that the FDA intends to promulgate labeling regulations that will sharply curtail its freedom to market products. The industry also fears that Congress will enact new laws giving the FDA greater efficiency and power to enforce its regulations. NHA’s campaign is intended to block both of these possibilities and to weaken the agency’s current enforcement power.

In line with these goals, Senator Orrin Hatch [R-UT] has introduced the Health Freedom Act of 1992. The bill would amend the Food, Drug, and Cosmetic Act to define the term dietary supplement as “an article that includes, and is intended to supplement the diet with: (A) a vitamin; (B) a mineral, (C) an herb; or (D) another similar nutritional substance, including a concentrate or extract of . . . (A), (B), or (C).” The bill would prevent the FDA from regulating the dosage of any substance

for which no therapeutic claims are made, but would permit therapeutic claims based on “scientific evidence, whether published or unpublished, that provides a reasonable basis.” The FDA would be prevented from regulating claims before they are made, and manufacturers would be permitted to seek immediate court review of FDA warning letters. According to an article in *Whole Foods*, an industry group called the Utah Natural Products Alliance (UNPA)—which includes several manufacturers of herbal products—worked with Senator Hatch to develop S. 2835.

Under current laws, it is illegal for manufacturers to make therapeutic claims that are not recognized by the scientific community, and the FDA can quickly squelch claims that violate this standard. Senator Hatch’s proposal would enable manufacturers to call anything they please a “supplement,” make false claims based on a poorly designed study, and tie up the FDA in court while continuing their dubious promotions. For practical purposes, consumer protection against health food industry deception would end.

Nutrition Forum (ISSN 0748-8165), © 1992, is published by Stephen Barrett, M.D. All articles and advertising inserts are fully endorsed by Dr. Barrett.

BRIEFS

Offbeat literature available. The Lehigh Valley Committee Against Health Fraud wishes to dispose of more than 100 duplicate copies of health-food magazines, chiropractic journals, and other sources of nutrition misinformation. *Nutrition Forum* readers can obtain five assorted items for \$7 or ten assorted items for \$13 from LVCAHF, Inc., P.O. Box 1747, Allentown, PA 18105. (Satisfaction not guaranteed.)

Food safety booklet. The U.S. Department of Agriculture has published *How to Keep Your Food Safe*, a 20-page booklet designed to teach people with lower-level reading skills how to safely care for food. The booklet will be distributed through the WIC Program, the agency's supplementary food distribution program for low-income women and children. A free copy can be obtained by writing to USDA/FSIS, Public Awareness Office, Room 1165 South Bldg., Washington, DC 20250.

Food slogans attacked. The National Consumers League (NCL), a Washington-based consumer protection organization, has urged the FDA and USDA to ban the term "healthy" from food labels. A recent NCL-sponsored survey of 1,000 consumers found that 59% said that they would be inclined to choose one product over another simply because the word "healthy" appears on the label. Two out of three also said that when they see the word "healthy" on a label, they expect the product to be low in sodium, fat, saturated fat, and cholesterol. At a recent press conference, NCI president Linda Golodner called use of the word a "shameless manipulation" and "a marketing tool, not a guide for the health-conscious consumer." NCI would also like "wholesome" and "nutritious" prohibited on food labels.

Misleading infomercial stopped. The Postal Service has obtained a cease-and-desist order barring the promoters of *Oncor* from falsely representing that it, or any other product, is safe and effective for treating male impotence or lack of sexual desire. The product, said to be a homeopathic medication containing *Avena sativa*, had been promoted with a 28-minute television program set up like a regularly scheduled talk show with commercial breaks. The program failed to disclose that participants introduced as "impartial health professionals independent from the distributor of the product" actually were closely tied to *Oncor's* promoters. In addition, one of the supposedly satisfied consumers who appeared as a "guest" on the program was closely related to a promoter.

Salt and high blood pressure. A comprehensive review has concluded that the relationship between sodium chloride and high blood pressure is too complex and has not been studied enough to justify population-wide recommendations. The reviewers believe that although lower NaCl intake may improve blood pressure in some persons, there is no evidence that this will decrease the occurrence of cardiovascular disease in the general population. The reviewers also noted that lowering NaCl intake may have long-term metabolic risks that have not been fully identified [*American Journal of Hypertension* 5(Suppl):1-44, 1992].

Iron poisoning in infants. An analysis of 3.8 million cases of poisoning among children has concluded that iron was the single most common cause of accidental death by ingestion [*Pediatrics* 89:999-1006, 1992]. Iron supplements, either as iron tablets or as an ingredient in prenatal vitamins, were responsible for 30% of accidental poisoning deaths reported between 1983 and 1990. In 1991, eleven children died following iron supplement ingestion.

Conrad LeBeau enjoined. On March 10, 1992, a U.S. District Judge ordered Vital Health Products, Ltd., and its president, Conrad Le Beau, to stop selling hydrogen peroxide products, licorice root tea, mineral water, or any other product claimed to prevent, cure, mitigate or treat human disease, unless the product has been granted FDA approval. Calling LeBeau a "self-styled authority" on the products he promoted, the judge concluded that a permanent injunction was necessary because LeBeau had continued to market his products despite previous regulatory actions by the FDA. In 1988 the agency had warned LeBeau to stop marketing *Aloe Vera Oxygel* with claims that it was effective against arthritis, cancer and AIDS. When he persisted, the FDA initiated a seizure of a number of vials and negotiated an agreement under which they were confiscated. Although LeBeau subsequently shipped his products and literature from separate locations, the judge ruled that the literature was still part of the products' labeling. LeBeau acted as his own attorney during most of the proceedings. He claimed that the FDA was violating his 9th Amendment rights, but the judge dismissed this claim. During 1990 LeBeau marketed a "9th Amendment Legal Defense Kit," which he said could help sellers and "alternative" practitioners "legally use testimonials and make truthful claims about your products and services without government interference, approval or censorship."

Jarvis, Ph.D.; Grace Powers Monaco, Esq.; **CONTRIBUTING EDITORS:** Johanna Dwyer, Sc.D., R.D.; Mary Abbott Hess, R.D., M.S.; James J. Kenney, Ph.D., R.D.; Marilyn Larkin; James A. Lowell, Ph.D.; Jack Raso, M.S., R.D.; Varro E. Tyler, Ph.D.; and staff members of the Pennsylvania State University Nutrition Information and Resource Center. **SCIENTIFIC CONSULTANTS:** John A. Dodes, D.D.S.; Victor Herbert, M.D., J.D.; Gabe Mirkin, M.D. **PUBLICATIONS CONSULTANT:** George F. Stickley.

"Boiler room" vitamin scam stopped. Three people who operated a telemarketing scheme in Tampa, Florida, during a six-month period in 1988 have been sentenced to prison for mail fraud and related activities. Their company, American Health Systems, used post cards to solicit telephone calls and then used a high-pressure sales pitch and deceptive tactics to attempt to sell vitamins to the respondents. Over 3,000 individuals and banks were reported to have lost \$1 million in this scheme. Sandor Weiss received a 135-month sentence after a 2-week trial, while two other defendants, Dawn Dodson and Dave H. Zion, received 10-month sentences after pleading guilty.

What vitamins do pharmacists recommend? Each year, *American Druggist* magazine asks pharmacists which nonprescription (OTC) products they recommend most often. This year, responses were received from 283 chain pharmacists (a 20.2% reply rate) and 297 independent pharmacists (an 18% reply rate). Both groups reported that about half the customers who buy vitamin products ask for advice. For multivitamins, chain pharmacists said they recommend *Centrum* (55%), generic/private label (31.3%), or *Theragran M* (8.8%), while independents recommended generic/private label (35.8%), *Centrum* (29.2%), *Theragran M* (14.6%), or *Super Plenamins* (5.8%). Among children's vitamins, *Poly-Vi-Sol* led with 35.2% of chain pharmacists and 47% of independents recommending them.

New newsletter. *The Diet Business Bulletin*, a quarterly newsletter will track marketing and business aspects of the diet industry. Subscription information can be obtained from Marketdata Enterprises, 181 S. Franklin Ave., Suite 608, Valley Stream, NY 11581.

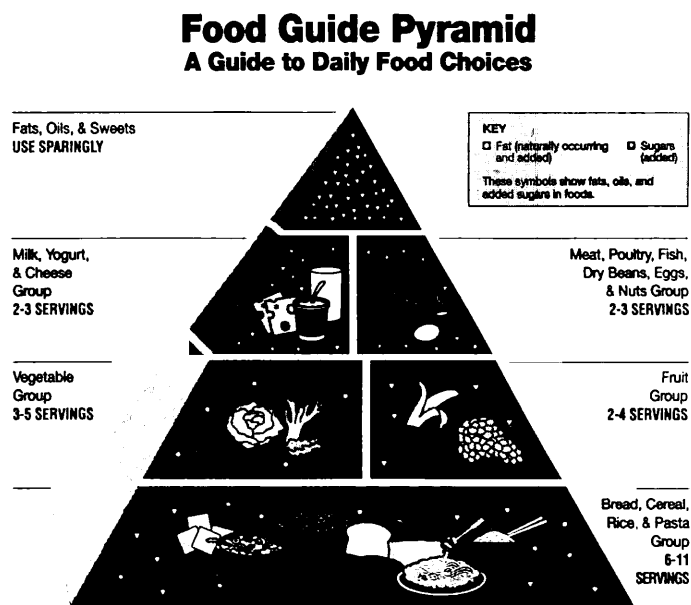

Dental delicensure upheld. A state appellate court has upheld the New York State Board of Regents' decision to revoke the dental license of Joel Berger, D.D.S., on nine counts of professional misconduct. The board's action followed a complaint that Dr. Berger had removed mercury-amalgam fillings from a woman's teeth after telling her the mercury was poisoning her. An appeal to a higher court is expected.

Notable quote. "Historically, the field of nutrition has focused on manifestations of specific deficiency diseases. . . . More recently, there has been increasing recognition of the potential role of nutrition in preventing many important illnesses. Such illnesses include heart disease and stroke, several forms of cancer, diabetes, osteoporosis, and renal disease. It may be more realistic, however, to think of nutrition as a useful adjunct in delaying or mitigating these disorders rather than preventing them entirely. Furthermore, proper nutrition is of little value if the individual continues to smoke, drink excessively, or engage in an immoderate or unsafe lifestyle." —*Richard S. Rivlin, M.D.* [JAMA 268:382-383, 1992]

Unconventional research? A recently passed law directs the National Institutes of Health (NIH) to establish an office to "fully investigate and validate" unconventional medical practices. The law, which provides funding of \$2 million, also directs NIH to establish an advisory panel to recommend research to test the "most promising" of such practices. The 16-member panel contains a few prominent research scientists but is composed mainly of unscientific practitioners and promoters. The panel met on June 17 and 18 to discuss research methodology and hear testimony from "alternative" practitioners.

USDA PYRAMID RELEASED

The U.S. Department of Agriculture has issued a pyramid to replace the familiar pie chart used since 1946 to promote the concept of a balanced diet. The pyramid, which cost almost \$1 million to develop, is intended to implement the U.S. Dietary Guidelines. Whereas the pie chart gave equal space to all food groups, the pyramid gives more space to the groups (grains, vegetables and fruits) for which the largest numbers of portions are recommended. Except for the milk group, the number of recommended servings depends on the individual's estimated caloric intake, with the lower numbers for people consuming 1,600 calories daily and the higher ones for those consuming 2,800 calories. *USDA's Food Guide Pyramid*, a 32-page booklet, provides detailed dietary instructions; information on the fat, salt, and "added sugar" content of common foods; and tables for rating one's diet. Copies of the booklet [HG 249] are \$1 each from the Consumer Information Center, Pueblo, CO 81009. *Editor's note:* The emphasis on "added sugar" appears unwarranted. Most people who meet the guidelines for number of servings and overall fat content do not have to worry about how much sugar they consume.

CAN MEGADOSES OF VITAMIN C HELP AGAINST COLDS?

Charles W. Marshall, Ph.D..

Few things have stirred the imagination and hopes of the public in matters of nutrition or vexed nutrition scientists as much as Linus Pauling's 1970 book, *Vitamin C and the Common Cold*. The book's main claim is that taking 1 gram (1,000 mg) of vitamin C daily will reduce the incidence of colds by 45% for most people, but that some persons might need much larger amounts. It recommends that if symptoms of a cold do start, you should take 500 or 1,000 mg every hour for several hours—or 4 to 10 grams daily if symptoms don't disappear with smaller amounts. Without question, publication of this book, combined with Pauling's reputation as a Nobel Prize-winning scientist, has made vitamin C a best seller. When his theory was announced, millions of Americans rushed to try it for themselves. The second edition of the book, issued in 1976 as *Vitamin C, the Common Cold and the Flu*, suggests even higher dosages.

Pauling has also suggested that most people need a daily vitamin C intake of 2,300 mg or more for "optimum" health and to meet stresses, including infections. In *How to Live Longer and Feel Better* (1986) he states that individual biochemical variability is so great that optimum intake may be as high as 250 mg to 20 grams or more per day.

Many concerned persons have wondered whether Pauling's advice is prudent, and millions have experimented upon themselves to see if they can tell. Pauling himself reportedly takes 12,000 mg daily and raises it to 40,000 mg when symptoms of a cold appear! Pauling presumably has adapted to such dosage, but most people would suffer chronic diarrhea and the risk of kidney stones.

How Scientific Facts Are Determined

The "scientific community" consists of thousands of scientists throughout the world, most of whom operate under a strict set of rules known as the scientific method. Simply stated, this is a system of logical steps designed to separate cause-and-effect from coincidence. This method is used to answer such questions as: "If you do a particular thing, will something else take place?" and "If two things follow one

another, are they related?"

A scientific "fact" is determined by analyzing the results of all the experiments that bear on that particular fact. In the case of vitamin C, there are two key questions. First, does vitamin C prevent colds? And second, does it reduce their severity? Before discussing experiments on these questions, however, we should note that not all experiments are created equal. *To be valid, an experiment must be well designed, and its data must be honestly collected and interpreted with good techniques of statistical analysis.* One hallmark of a good experiment is that others can repeat it and get the same results.

Experimental studies of the possible value of vitamin C in the prevention of infections have been conducted by medical investigators ever since preparations of the pure crystalline vitamin became commercially available during the 1930s. By 1982, about thirty of these were reported and the majority of medical scientists had concluded that supplementation with vitamin C does not prevent colds and, at best, may slightly reduce the symptoms of a cold. Two subsequent reports have not altered these conclusions.

Linus Pauling remains steadfast in his belief that the scientific community is wrong—basing his ideas on the same experiments but interpreting their results differently. Moreover, he suggests the following way to determine one's correct vitamin C dosage: "If you are taking 1 gram per day, and find that you have developed two or three colds during the winter season, it would be wise to try taking a larger daily quantity." Presumably, if you have fewer colds than expected, you should believe that vitamin C has been responsible for the decrease.

Unfortunately, in the real world, scientific facts cannot be determined that simply. Consider the following questions:

1. Is it possible that you actually had a different number of colds than you recall? This would be faulty data collection.

2. Is it possible that you would have had only one cold this year anyway? If so, what happened to you would be a mere coincidence.

3. Is it possible that you had a very mild cold but wish so strongly for a favorable result that you didn't count it? If so, this would be an effect of bias.

Scientific experiments must be designed to overcome these possible sources of error. The problem of faulty memory can be overcome by keeping close track of the individuals involved in an experiment. The problem of coincidence can be overcome by using large numbers of people and following them for significant lengths of time. The problem of bias, however, is far more complicated. Use of the double-blind method is critical, but as you will see, experiments with vitamin C have encountered some very curious results when subjects were able to figure out whether they were getting the vitamin or the placebo during experiments intended to be double-blind.

So far, at least 30 experiments have tested the ability of vitamin C to protect against colds in large groups of people. Five review articles by biomedical scientists have found Pauling's claims unsupported, except for slight reduction in severity, in most of those trials that were scientifically properly designed and executed. Now let's examine the evidence.

Inoculation Trials

One way to test whether high-dosage vitamin C prevents colds is to inoculate the throats of volunteers with cold viruses. Two studies of this type found that everyone got colds whether they took vitamin C or not. Dr. Walker and co-workers in 1967 and Drs. Schwartz, Hornick and associates in 1972-73 gave half of their volunteers a placebo and the rest 3,000 mg of vitamin C daily for several days before inserting live cold viruses directly into their noses; and then continued 3,000 mg of vitamin C (or placebo) for seven more days. All of the volunteers got colds, which were of equal severity.

Pretreatment with Vitamin C Trials

Another way to test vitamin C is to see what happens to matched groups over a period of time. Two teams of investigators have done this more than once, one team led by Dr. John L. Coulehan and the other by Dr. Terence Anderson.

Dr. Coulehan's first study was done on 641 Navajo Indian children, half of whom received a placebo while the rest received 1,000 mg of vitamin C daily. A complicated system of judging the severity of head, throat and chest symptoms was used. The Coulehan team reported in 1974 that the vitamin C group had less severe colds, but other scientists who reviewed the study criticized the method of judging the severity of symptoms.

So in 1976 the Coulehan team repeated their study with 868 Navajo children but used a better system of scoring severity. The children receiving vitamin C averaged 0.38 colds per person while the placebo group averaged 0.37. The average duration of the colds was 5.5 days in the vitamin group and 5.8 in the placebo group. Thus, in this test, vitamin C neither prevented colds nor shortened their duration. In 1979, Dr. Coulehan published his analysis of vitamin C versus the common cold and concluded that extra vitamin C is not worth taking.

The Anderson Trials

In 1972, Dr. Terence Anderson and colleagues at the University of Toronto published the results of a 3-month double-blind study of 818 volunteers aged 10 to 65. Half received 1,000 mg of vitamin C daily before colds and 4,000 mg per day during the first 3 days of a cold, while the other half received "equivalent" placebos. This study was designed to test Pauling's claims that ingestion of 1,000 mg of vitamin C daily would reduce the frequency of colds by 45% and the total days of illness by 60%. These claims were certainly not supported by the study's outcome. In the vitamin group, 74% had one or more colds during the study period, while 82% of the placebo group had one or more colds. The difference, which amounted to "one-tenth of a cold per person," was judged by Dr. Anderson to be "of no practical importance." The severity, as measured by days confined indoors, averaged 1.36 days for the vitamin group and 1.87 days for the placebo group—a 30% difference that Anderson decided to explore further. At the end of this trial, before the double-blind code was opened, all volunteers were asked whether they had experienced any unusual feelings of well-being [euphoria] during the trial. Nineteen percent of both groups said yes—an interesting example of the placebo effect.

In 1974, the Anderson team reported on a larger trial to see what results would be obtained with different amounts of vitamin C. Some 3,500 volunteers were divided into eight groups, six of which received various daily dosages of vitamin C while the others received placebos for three months. No difference in the incidence of colds was found among the groups taking no vitamin C, 250 mg, 1,000 mg or 2,000 mg daily. A possible slight reduction in severity of symptoms was found in the vitamin C groups, but volunteers taking dosages of 4,000 or 8,000 per day when a cold began did no better than those taking only 250 mg per day.

The third Anderson trial, reported in 1975, covered 16 weeks and used 488 volunteers (ages 14 to 67), with one-third receiving a pill of vitamin C as its sodium and calcium salts, and one-third given vitamin C in slow-release capsules, and one-third getting a placebo. The vitamin C dosage was 500 mg once a week (equivalent to about 70 mg daily) before colds, but 1,500 mg the first day of a cold followed by 1,000 mg on the second and third days. No reduction in the incidence of colds was observed,

but those taking vitamin C averaged less time at home (1.62 vs. 1.12 days indoors). Do you think that a half-day's less confinement is of practical significance?

Taken together, the Anderson studies suggest that extra vitamin C may slightly reduce the severity of colds, but that it is not necessary to take the high dosages suggested by Pauling to achieve this result. Nor is there anything to be gained by taking vitamin supplements year-round in the hope of preventing colds.

Other Studies

In 1975, Carson and co-workers told of treating company employees with 1,000 mg of vitamin C or a placebo daily during colds. The number of colds per person, the duration of colds and their severity were the same in both vitamin and placebo groups.

In 1975, Karlowski and associates at the National Institutes of Health reported treating volunteers as follows: 25% received placebos; 25% took 3,000 mg of vitamin C daily before colds but placebos during colds; 25% were given placebos daily before colds and 3,000 mg of vitamin C daily during colds; and 25% got 3,000 mg daily before colds and 6,000 mg daily during colds.

The experiment was supposed to be double-blind, but the doctors had failed to make the placebo taste the same as the vitamin C pills as is done in most trials. As a result, half of the volunteers correctly guessed which pill they were getting and therefore became unblinded. When the results were tabulated with all volunteers lumped together, the average number of colds per person was 1.27 colds for the vitamin group and 1.41 for the placebo group. But among those who remained blinded, no differences in the incidence or severity were found. This fascinating result shows how many people who think they are taking a positive step (such as taking a vitamin) may report a favorable result even when none really exists!

Two Trials with Identical Twins

In 1977, Miller and colleagues treated 44 pairs of identical twins for 5 months as follows. One twin in each pair received a vitamin C capsule while the other got a placebo. The daily vitamin C dosages before and during colds ranged from 500 for younger children to 1,500 mg for older ones. The investigators noted "no significant overall benefit on cold symptoms" as reported by the children's mothers, but the responses varied among the subgroups when the children were divided according to sex and age. After the data were analyzed, four

mothers admitted tasting the capsules in an attempt to figure out which twin was getting the vitamin C! Thus it is possible that the ratings of these mothers and possibly others were influenced by guessing which twin was getting the vitamin C.

A double-blind Australian trial with 95 pairs of identical twins was reported in 1981. One of each pair took 1,000 mg of vitamin C for 100 days while the other received a placebo. The vitamin C group had slightly more colds but a shorter duration of colds (5 days instead of 6).

In 1977, Tyrell and co-workers reported treating 743 men and 758 women for 5 months as follows. Half received placebo pills daily. The others took vitamin C but only during colds at dosages of 4,000 mg on the first and second days of a cold and 200 mg on the third day. There was no benefit from taking vitamin C. The incidence and duration of colds were the same for both men and women in the vitamin and placebo groups. Men in both groups missed an average of half a day's work while women missed about a day.

An 8-week trial with 764 U.S. Marine recruits carried out by Pitt and Costrini was reported in 1979. Half of the recruits received 2,000 mg of vitamin C daily, while the others took placebo pills on the same schedule. No benefit from vitamin C was found. Ninety percent of both groups got colds, and no difference in severity or duration of colds was found.

In a 1984 study Dr. M. H. Briggs gave half of 528 volunteers 1,000 mg vitamin C daily and the other half a daily placebo for three months. In the vitamin C group 47% got colds, and 46% of the placebo group. Severity of symptoms lasted an average of 3.1 days for the vitamin C group and 3.3 days for those getting placebos. Briggs concluded: No prevention and no benefit.

In 1990 Dr. Elliot Dick and coworkers summarized the methods and results of their three double-blind controlled trials to test methods of transmission of viruses, by contaminated fingers or inhaling viruses in the air, and to test the protective effect of vitamin C. They used 24 volunteers (8 donors and 16 recipients). The recipients were non-smoking men who tested negative for antibodies to the RV16 type cold virus. Half of these were pretreated for 3.5 weeks with 2,000 mg of vitamin C daily (4 x 500 mg), and the other eight were given four placebos daily. The eight donors were infected with RV16 cold virus by direct inoculation into the nose and then were housed with the recipients 24 hours a day for a 7-day interaction period. All donors developed colds first and then all 16 of the recipients. The vitamin C or placebo pills were continued during the week of interaction and for the following two weeks. During the 7-day interaction period the men were supervised and slept, ate and

played cards in the same room. All got colds, but the authors claim that the vitamin C group suffered significantly less "symptoms and signs" such as coughs and mucus production.

Do Added Bioflavonoids Help?

In 1979, Dr. I.M. Baird and co-workers reported a 10-week experiment with 350 volunteers (ages 17 to 25) who were divided into three groups. One-third of them, as the placebo group, received a daily "supplement" of a synthetic orange drink containing no vitamin C. A second group got a synthetic orange drink containing 80 mg of synthetic vitamin C. The third group was given enough pure orange juice daily to provide 80 mg of natural vitamin C plus bioflavonoids. The incidence of colds was the same for all three groups. Both vitamin C groups had slightly less severe colds than the placebo group. Thus the synthetic vitamin C was as effective as the natural vitamin C and the presence of bioflavonoids had no apparent effect.

Antihistamine Effect of Vitamin C

Histamine in varying amounts is almost always released in the tissues of the respiratory tract by an allergic-like response to the stress of common cold infections. Perhaps the first clue that animals and humans might use vitamin C to combat stress that involves histamine release came in 1940 from the research team led by the co-discoverer of vitamin C, Dr. Charles Glen King of Columbia University.

Dr. King's group showed that stressing rats with certain drugs stimulated their bodies to synthesize extra vitamin C. Later, evidence was presented to support the belief that animals, such as the rat, who can make their own supply of vitamin C, react to histamine by producing extra vitamin C.

In 1974, two other research teams found that rats given vitamin C along with histamine-releasing drugs had a reduction in stress symptoms and reduced histamine in the urine. They concluded that vitamin C can act like an anti-histamine drug. However many physicians believe that reducing infection-caused inflammation (nature's defense reaction) slows recovery.

Two Recent Reviews

Two comprehensive reviews covering just about all of the published reports about testing vitamin C against colds in humans are those of Dr. A. Stewart Truswell of the University of Sydney, Australia, and Dr. Harri Hemila, Institute of Biotechnology, University of Helsinki. In 1986 Dr. Truswell concisely summarized the results of 27 trials conducted since 1970. Of these, five were treatment trials with vitamin C or a placebo given only at the onset of a cold and for only several days—all of which found no benefit. The other 22 were double-blind controlled trials giving daily vitamin C or placebo before and during colds. Of these twelve trials showed no prevention and

no reduction in duration or severity, five trials showed no prevention and only slight, statistically non-significant lessening of severity, and the other five trials reported no prevention and a small but significant reduction of duration of the colds. Dr. Truswell concluded: "It is now fairly clear that for preventing colds, vitamin C has no worthwhile effect," but there is "a little more evidence for a small therapeutic effect." However, as Dr. T.W. Anderson's second trial in 1974 revealed, 250 mg of vitamin per day reduced severity as much as did 1,000 mg or 4,000 mg.

In his 1992 review entitled, "Vitamin C and the Common Cold," Dr. Harri Hemila concluded: "Vitamin C has consistently decreased the duration of cold episodes and severity of symptoms." Yet Dr. Truswell found no reduction in severity in 17 of 27 trial reports he analyzed.

And finally, let us note that Dr. Richard Cutler at the National Institute on Aging and Dr. R. S. Sohal claim there is evidence that an excess supply of antioxidants like vitamins C and E from outside the body (exogenous) suppresses the body's own unique endogenous (from within) antioxidants such as catalase and superoxide dismutase.

Overview

Does it make sense to supplement with vitamin C? If so, should it be done daily or only at the first sign of a cold or other infection? And what dosage should be used?

The many studies done in the last thirty years clearly prove that daily vitamin C supplements, whether 100 mg or 5,000 mg, do not prevent colds and provide, but only for some people, only a slight reduction in duration and severity of colds. Dr. Thomas Chalmers, a prominent medical educator and researcher, concluded in 1975: "I, who have colds as often and as severe as those of any man, do not consider the very minor potential benefit that might result from taking vitamin C three times a day for life worth either the effort or the risk, no matter how slight the latter might be."

If you choose to supplement when a cold strikes, there is no reason to take more than 250 mg per day, as shown in the 1974 Anderson study. This amount is easily obtained from the age-old "remedy," fruit juices. Supplementation with larger amounts of vitamin C has not been shown to be more effective, and it may cause diarrhea or have other adverse effects.

What about other infections? It is known that the body's pool of vitamin C in the blood plasma and white cells declines rapidly the first day or two in the presence of stresses such as severe infections, burns or surgery. Some doctors believe that under these circumstances, a supplement of 250 mg, but never more than 500 mg, per day for a few days may aid in recovery.

Dr. Marshall, a retired biochemist, is author of *Vitamins and Minerals: Help or Harm?*, which won the American Medical Writers Association award for the best book of 1983 for the general public. The book can be obtained for \$14 postpaid from LVACHF, Inc., P.O. Box 1747, Allentown, PA 18105.

THE FDA VERSUS JONATHAN WRIGHT

On May 6, 1992, FDA and local enforcement officials raided the Tahoma Clinic in Kent, Washington, a few miles southeast of Seattle. The clinic's proprietor, Jonathan V. Wright M.D., claims he is being picked on unfairly. Government documents, however, suggest otherwise.

Dr. Wright, a graduate of Harvard University and the University of Michigan Medical School, began practicing in Kent in 1973. In *Dr. Wright's Book of Nutritional Therapy* [Rodale Press, 1979], he labels his approach "nutritional biochemistry" and describes how he treats a wide range of health problems with vitamins, minerals, other "natural" substances, and/or dietary measures. He and Alan Gaby, M.D., of Baltimore, give seminars on "Nutrition as Therapy," which present their theories in detail. In 1985, Dr. Wright co-founded and became president of the American Quack Association (a support network for "holistic" practitioners), which no longer appears to be active.

Dr. Wright's dispute with the FDA surfaced in July 1991 when law enforcement officers seized 103 bottles of L-tryptophan from the For Your Health Pharmacy, located near the Tahoma clinic. The FDA had banned the marketing of L-tryptophan following an outbreak of eosinophilia-myalgia syndrome, the tally for which is now 1511 serious cases, with 38 deaths [JAMA 268:1826, 1992]. In August 1991, Wright filed suit, asserting that the outbreak was due to a contaminant and that his tryptophan was safe and therefore legal to dispense. The suit also asked the court to return the product and bar the FDA from "unreasonably interfering" with his ability to exercise clinical judgment in treating patients.

On May 4, 1992, a U.S. Magistrate issued warrants authorizing criminal searches at the Tahoma Clinic and the adjacent pharmacy. The warrants were based on affidavits from an FDA investigator who concluded that the clinic had been "receiving, using, and dispensing several unapproved and misbranded foreign-manufactured injectable drug products" and that the pharmacy had been dispensing them. The affidavits also state:

- In August 1991, FDA investigators observed mold in some glass vials at the pharmacy and were informed that the products had been made at a laboratory adjacent to Dr. Wright's clinic. Further investigation indicated that Dr. Wright and the pharmacy proprietor were co-owners of the laboratory and clinic and that a clandestine manufacturing facility was being constructed in a vacant business next to the pharmacy. When FDA investigators went to the laboratory, Dr. Wright would not permit them to conduct a full inspection.

- During the next few months, illegally marketed products were identified by inspecting trash from the clinic and pharmacy.

- In December 1991, an FDA inspector posed as a patient and was diagnosed with an Interro device. The woman who operated the device probed one of the inspector's fingers while selecting items on the screen that were said to repre-

sent substances to which he might be allergic. The woman explained that the height of a vertical bar that appeared on the Interro's screen when she probed his finger would indicate whether or not he was sensitive to the item being tested. After the test was completed, a printer produced a list of foods, chemicals, and other substances, with numerical values corresponding to readings on the screen. Then he was given homeopathic medicines, instructions for using them, and an article saying that they would dramatically relieve his allergic symptoms. [The Interro is a computerized galvanometer that measures changes in the skin's electrical resistance and depicts them on its monitor. The harder the probe is pressed against the patient's finger, the less the skin resistance and the higher the reading on the screen. The FDA Center for Devices and Radiologic Health has said the Interro is "adulterated and misbranded" and can have no legal medical use.]

- In February 1992, the Tahoma Clinic posted a notice claiming that state-licensed physicians are "exempt from the restrictions and regulations of the federal Food and Drug Administration as a matter of federal law." The notice also stated that "no employee, agent or inspector of the FDA shall be permitted on these premises."

On May 6th, FDA agents accompanied local police officers, who broke down the front door of the Tahoma clinic. Dr. Wright and his supporters claim that the search party entered with guns drawn and terrorized the clinic staff. Federal officials state that the police broke down the door because the clinic staff had refused to open it when they knocked, a gun was drawn because the officers suspected that those inside might be hostile, but the gun was never pointed at anyone and was reholstered as soon as the area was deemed safe. The authorities seized products, patient files, computer records, and Interro devices from the clinic and additional materials from the pharmacy. Two weeks later, the state pharmacy board summarily suspended the pharmacy's license, an action taken only when the board feels that public health may be endangered.

The health food industry is attempting to arouse public sympathy and fire up its own troops by claiming that the authorities used excessive force—that Dr. Wright "had committed no crime but was only providing his patients with nutritional supplements and non-toxic, natural therapeutics." Dr. Wright's supporters have generated extensive press coverage of their version of the controversy and have started a legal defense fund. The Nutritional Health Alliance, a group campaigning to weaken FDA jurisdiction over vitamins [NF 9:9-14, 1992], has given \$50,000 to the fund.

In August 1992, Dr. Wright consented to the destruction of the L-tryptophan that had been seized and agreed to pay at least \$850 to cover court costs and fees associated with the action. But he filed another suit seeking to bar the FDA from regulating what he does. For Your Health is now operating as a health food store.

BRIEFS

"Fountain of youth" ring indicted. On March 16, federal authorities announced criminal charges against David Halpern, of Pebble Beach, California, and his mother, sister, and brother-in-law with illegally importing more than 15 tons of products promoted for the treatment of more than 100 diseases and conditions. The products, whose market value exceeded \$5 million, included procaine derivatives such as *Gerovital H3*, "sexual tonics" containing yohimbine and methyltestosterone, and injectable animal tissues used for "cell therapy." The products had been imported for sale to wholesalers, health food stores, gymnasiums, chiropractors, and individual consumers.

Fluoridation update. The U.S. Centers for Disease Control estimates that more than 135 million Americans have access to public water supplies that are fluoridated either naturally (9.3 million) or artificially (125.9 million).

Bodybuilding supplement survey. A survey of 12 popular health and bodybuilding magazines (one issue each) has found ads for 89 brands and 311 products with a total of 235 unique ingredients [JAMA 268:1008-1011, 1992]. The most frequent ingredients were amino acids and herbs. Among the 221 products for which an effect was claimed, 59 were said to produce muscle growth, 27 were said to increase testosterone levels, 17 were said to enhance energy, 15 were said to reduce fat, and 12 were said to reduce fat. The researchers advise doctors to routinely ask patients whether they are taking supplements and to report possible adverse or side effects to public health authorities. Reprints of the report can be obtained from Rosanne M. Philen, M.D., Division of Environmental Hazards and Health Effects (F28), National Center for Environmental Health and Injury Control, Centers for Disease Control, 1600 Clinton Road, N.E., Atlanta, GA 30333.

Military weight standards. The Institute of Medicine (IOM), an affiliate of the National Academy of Sciences, has issued a report suggesting that the U.S. Army change its current weight and physical performance standards for recruitment and retention. Current standards base the permitted amount of weight on an individual's height without taking muscularity into account. Thus, some extremely muscular individuals might not meet the standards even though they are fit and healthy. The report noted that the standards are based on norms for white males and may discriminate against women and certain racial and ethnic groups. The report also suggested that performance tests be revised to reflect the load-carrying work of combat soldiers rather than the ability to run and do push-ups and sit-ups.

Exercise and breast milk. A study of infants who given samples of breast milk collected before and after exercise has found that the milk produced after exercise contained more lactic acid and was less accepted [Pediatrics 89:1245-1247, 1992]. The authors suggest that mothers consider nursing before they exercise rather than soon afterward.

Mother jailed for baby food tampering. A South Carolina woman who put more than 460 pieces of glass in a jar of baby food and then fed several spoonfuls to her 13-month-old son has been sentenced to 33 months in jail followed by three years of supervised probation. The woman had brought the child to an emergency room, claiming that she had discovered glass in two jars of baby food and in her son's mouth. However, federal investigators found that the jars had come from lots produced six months apart and thus could not have had the glass enter them during the manufacturing process. When the investigators indicated they were "pretty sure this was a case of tampering," the woman confessed that she had hoped to get money from both the manufacturer and the grocery store. Prosecution was brought under the federal Anti-Tampering Act.

Notable quote: "Unfortunately, some members of the chiropractic profession have been engaging in what amounts to 'crime and wicked conduct' in their practices by jumping on the bandwagon of getting all they can from the insurance industry while the 'getting' is good. They have been playing a numbers game of getting as many patient visits and as many dollars per visit by whatever means they (and often their practice consultants) can devise.... Some members of our profession have been engaging in outright fraud with too many examinations and inflated office fees—which include inappropriate and worthless therapies and x-ray procedures—that sometimes amount to \$1,000 for the first visit before they've done anything at all for the patient!" [Today's Chiropractic Jan/Feb 1992, 7-9]

Tryptophan suit settled. A suit by a man from Kansas who became quadriplegic after taking L-tryptophan has been settled out of court. The settlement amount was not disclosed, but probably is several million dollars.

FDA stops illegal claims. Swanson Health Products, of Fargo, North Dakota, has agreed to stop selling four products it had been marketing with unsubstantiated claims for the prevention or treatment of serious diseases [FDA Consumer 26(1):41-42, 1992]. The products are *Heart Food* and *Cardiolife* (claimed to prevent heart attacks), *Cata Rx* (promoted as a cure for cataracts), and *Gymnema Sylvestre* (claimed to block absorption of sugar into the body). Swanson's also agreed to stop making therapeutic claims for *Willard's Water* (promoted as an infection fighter) and *Co-Enzyme Q10* and *Acidophilus* (promoted as digestive aids). Swanson is one of the country's largest mail-order discounters of products sold through health food stores. Its monthly newspaper-style catalog (*Health Shopper*) typically ranges from 76 to 96 pages per issue. It consists mainly of articles about products made by other manufacturers. Most articles are accompanied by display ads. Some articles appear to be written by an official of the manufacturing company, some are reprints of articles from other sources, and others are in the format of an "interview" conducted by Swanson. Most articles contain claims that would be illegal on product labels.

Growth of breast-fed infants. A study comparing 46 breast-fed and 41 formula-fed infants has found that both groups grew similarly in height but the breast-fed infants tended to weigh less at the end of 18 months, indicating that they were leaner [Pediatrics 89:1035-1041, 1992]. The researchers noted that when the growth of breast-fed infants was plotted on standard growth charts, they appeared to be "faltering" after a few months even though they actually were healthy and thriving. To avoid causing unnecessary worry among parents, the researchers recommended that their data be used to update growth charts for breast-fed infants.

Weight-loss brochure. The FDA, FTC, and National Association of Attorneys General have produced a brochure describing how to spot phony weight-loss promotions. A free copy of "The Facts About Weight Loss Products and Programs" can be obtained by writing to FDA Consumer Affairs and Information, 5600 Fishers Lane, HFC-110, Rockville, MD 20857.

Weight-loss guidelines. The Michigan Health Council has published the conclusions of a task force appointed in 1987 to establish guidelines for weight-loss programs in Michigan. The 48-page report covers risk-assessment, program staffing, full disclosure to prospective clients, selection of weight-loss goals, nutrition recommendations, exercise, and psychological approaches. The task force recommended against the use of appetite-suppressant drugs and, in most cases, the use of formula products. A free copy of *Toward Safe Weight Loss* can be obtained by writing to Della Jones, Center for Health Promotion, Michigan Dept. of Health, 3423 N. Logan/Martin Luther King, Jr., Blvd., Lansing, MI 48909.

Quackery calendar. The American Medical Association has published a 12 x 18-inch calendar featuring pictures of ads and product labels from the AMA's historical collection. The post-paid price is \$13.45 for AMA members and \$16.45 for nonmembers, plus sales tax in some states. Copies can be ordered by calling 1-800-621-8335. [Order #OP310892]

Delaney Clause criticized. The Council for Agricultural Technology (CAST) has issued a 24-page report stating that the Delaney Clause is "hopelessly obsolete" and should be abandoned. The controversial clause, part of the 1958 Amendment to the Food, Drug, and Cosmetic Act, states that "no additive shall be deemed to be safe if found to induce cancer . . . in man or animals." When the law was passed, about 50 carcinogens were known and could be easily regulated. Since that time, thousands more were identified and advances in analytical methods have enabled detection of amounts that have little or no biological or toxicological significance. CAST and other prominent scientific groups believe that the FDA should be able to utilize a "de minimis" policy. (The term comes from a judicial doctrine, *de minimis non curat lex*, which means "the law does not concern itself with trifles.") The report, *Food Safety: Interpretation of Risk*, can be obtained for \$8.00 from CAST, 137 Lynn St., Ames, IA 50010.

FDA pesticide report. The FDA's annual pesticide residue study has found that 66.8% of 18,214 fruits, vegetables, and other domestic or imported foods, had no detectable pesticide residues, 31.6% had residues below the maximum federal limits, and only 1.5% contained violative levels. The agency's annual Total Diet Study found that dietary intakes of pesticides for all population groups were well within international and EPA standards. Copies of the report, "Residue Monitoring - 1991" are available from Norma Yess, FDA, HFF-420, 200 C St., S.W., Washington, DC 20204.

Dental quackery report. *Dubious Dental Care*, a 12-page report published by the American Council on Science and Health, is now available for \$2.00 from LVCAHF, Inc., P.O. Box 1747, Allentown, PA 18105. The report covers a wide variety of controversial and quack procedures.

Vitamin hype. The National Nutritional Foods Association (NNFA), is using *Time* magazine's April 6, 1992, cover story, "The New Scoop on Vitamins," as the centerpiece for a public relations campaign. The cover is headlined "The Real Power of Vitamins - New research shows they may help fight cancer, heart disease, and the ravages of aging." The article itself provides a confusing look at research tidbits and speculations about vitamins, garnished by hedged statements by its author. NNFA sent a copy to all members of Congress as part of its campaign to prevent implementation of proposed FDA food labeling regulations. Multiple copies were also distributed to health food stores for distribution to their customers. (NNFA is the major trade organization of health food manufacturers, retailers, and distributors.)

QUESTION BOX

Q. I've received several elaborate mailing pieces for a newsletter called *Health and Healing*, edited by Julian Whitaker, M.D. Can you shed any light on this publication?

A. The newsletter is marketed by Phillips Publishing Co., of Potomac, Maryland, which also publishes a reputable health-related newsletter and several others on financial matters. One promotional piece is a 20-page "special supplement" called "Wellness Today," which claims that Dr. Whitaker "is quickly becoming America's #1 advocate of a more intelligent approach to health care." Dr. Whitaker espouses many questionable methods and appears antagonistic to many types of conventional medical treatment. The newsletter's associate editor is Jane Heimlich, M.D., author of *What Your Doctor Won't Tell You*, a book advocating the gamut of unproven and unscientific approaches to health care. The newsletter has recommended a very-low-fat diet for combatting heart disease, nutritional supplements for a wide variety of unproven purposes, and chelation therapy. Several articles have attacked "FDA tyranny and criticized the medical establishment's negative views toward "alternative medicine." Recent ads state that the circulation is 300,000.

BOOK REVIEW

Title: Earl Mindell's Herb Bible (1992).

Author: Earl Mindell, R.Ph.

Publisher: Fireside Books/Simon & Schuster, New York.

Price: \$13.00

Reviewed by: Varro E. Tyler, Ph.D.

Earl Mindell, co-founder of Great Earth Vitamin Stores, has added another biblical work to his collection (*Earl Mindell's Vitamin Bible*, *Earl Mindell's Vitamin Bible for Kids*, and *Earl Mindell's Pill Bible*). This new volume bears the same relationship to authentic herbal information that tales of the Old and New Testaments simplified for children have to the *Revised Standard Version*. Yet even that analogy does not apply perfectly, because biblical stories retold for juveniles are usually faithful to the original. This herbal is characterized by numerous sins of commission and omission, as well as by a large number of weasel words like "possible benefits," "may help," "often used," "long used," "have relied on," "touted as," "is believed." Such constant equivocation should cause a careful reader to question the validity of any of the information. Pharmacist Mindell states that he owes his lifelong interest in herbs to a college course called Pharmacognosy 101. Pharmacognosy is the science of medicines from natural sources. As a professor in that discipline, I must say it is unfortunate that he did not go on to Pharmacognosy 102.

Following an introductory chapter, the author presents brief monographs on herbs and their uses, which he classified into different chapters on the basis of their popularity, traditional use, geographic origin, recommended availability, female and male specialties, preventive application, cosmetic employment, and fragrance.

Contrary to Mindell's assertions, no substantial evidence supports the use of alfalfa tablets to relieve rheumatoid arthritis; dandelion (part unspecified) does not help rid the body of excess salt; the effectiveness of echinacea as an immune enhancer is not tied to its ability to cause a tingling sensation on the tongue; no proof exists that ginseng increases estrogen levels in human beings; silymarin is not "a flavonoid" but a mixture of flavolignans; two average-sized capsules of white willow bark will not contain a therapeutically effective dose of salicin; there is no reason to believe that yucca will relieve joint pain due to arthritis and rheumatism. His frequent failure to identify the part of the plant introduces many more errors. For example, in the "Ginkgo Tree" monograph he refers to ginkgo as an "ancient remedy." While this is true for the *fruit* of that plant, it does not accurately describe the *leaf extract* that has come into such wide usage recently.

Errors of omission are nearly as frequent. An authoritative work would have noted the effect of capsaicin on substance P and the fact that it alleviates pain only after long usage. The toxicity of nordihydroguaiaretic acid in chaparral is not mentioned; nor is the irritant effect of juniper oil on the kidneys. The effectiveness of nettle root in the treatment of benign

prostatic hypertrophy is not discussed. Recent findings concerning the potential toxicity of skullcap are overlooked. Nothing is said about the need to maintain an alkaline urine if *urva ursi* is to be an effective treatment for bladder and kidney ailments. Borage is recommended without reservation, in spite of its content of hepatotoxic pyrrolizidine alkaloids.

Proper nomenclature is especially important in an herbal guide to identify with certainty the source of the therapeutic agent under discussion. But he errs still further by misidentifying cascara sagrada as California buckthorn and citing obsolete botanical origins, such as *Caryophyllum aromaticum* for clove, *Armoracia lapathifolia* for horseradish, and *Cardus [sic] marianus* for milk thistle. The relatively unimportant *Smilax officinalis* is the only source listed for sarsaparilla. *Ephedra sinica* is not a source of Mormon tea, nor does the latter contain ephedrine and pseudoephedrine. Chaste tree is said to derive from *Verbenaceae [sic]* species, a family composed of about 750 different species in some 70 genera. In fact, it is obtained from only a single species, *Vitex agnus-castus* L. Hawthorn is not spelled with a final "e."

Some of Mindell's comments would be amusing if they were not so woefully inaccurate. The claim that goldenseal, a native of North America, was discovered by the aborigines of northern Australia denies credit to the American Indians who utilized it extensively before transmitting their knowledge of it to the early-day settlers. After noting that guarana seeds contain up to 5 percent caffeine, he states that the plant is "reputed" to increase mental alertness and fight fatigue. This is an instance where the ever-present qualifier could have been omitted. The author's statement that many herbs support the so-called Doctrine of Signatures (plant parts resembling a particular organ cure diseases of that organ) is without foundation. For every herb that appears to support this venerable myth, there are many that do not.

This elementary synopsis of herbal medicine is flawed still further by the inclusion of many unproven and inaccurate assertions regarding the usefulness of the plants discussed. As a sales tool for health food stores, it undoubtedly will do well. As "bible," it fails miserably. Why do you suppose a major publisher is willing to put its imprint on such a book?

Dr. Tyler is professor of pharmacognosy at Purdue University and author of *The Honest Herbal* [Haworth, 1992], an evaluation of popular herbs.

INFORMATION WANTED

If you find any newsworthy item, such as a published article or news report, or have a personal experience that might interest our readers, please send it to Stephen Barrett, M.D., P.O. Box 1747, Allentown, PA 18105. We are especially interested in receiving information about enforcement actions by state agencies and lawsuits by victims of quackery.

SHOULD HERBAL REMEDIES REMAIN IN FDA REGULATORY LIMBO?

Varro E. Tyler Ph.D.

Phytomedicines are broadly defined as crude vegetable drugs (herbs) and the extracts and tinctures made from them. They generally are prepared from one of some 13,000 species that have been used for at least a century as traditional medicines by people in various cultures around the world. Several hundred of these are not obscure plants with ambiguous uses whose existence is known only to ethnobotanists. Rather, they are well-known or classic drugs, once commonly used, some of which have already re-entered the *materia medica* as the result of modern investigations. It is the group that is certainly the most likely to yield additional significant drugs if subjected to further scrutiny.

Over the years, more than 600 botanical items have received official recognition in the various editions of *The United States Pharmacopeia*. Most have now been deleted from that volume. It should be emphasized, however, that most did not lose their official status because tests proved them unsafe or ineffective. They were dropped because newer drugs appeared safer, more potent, or, in some cases, more profitable to market. The vast majority of the abandoned botanicals were not thoroughly examined using modern standards. If they had been, I believe that some might still have a practical niche in modern medical practice.

This article discusses ten phytomedicines that have been researched in Western Europe in recent years but are available in the United States only as crude herbs for making teas or as finished products sold as "foods" or "nutritional supplements." I believe that these herbs have utility or potential utility as drugs and that some are eminently worthy of further investigation.

U.S. Regulatory Limbo

The laws and regulations governing the sale of phytomedicines in Western Europe and the United States are complex and vary considerably from country to country. In some countries, many phytomedicines are prescription-only

drugs. In others, they are over-the-counter drugs sold only in pharmacies; in still others, they are sold in so-called drug stores (not pharmacies) or health food stores. Worldwide, they are recommended by herbologists, chiropractors, naturopaths, acupuncturists, and various other "alternative" practitioners and "healers," many of whom are not appropriately trained to diagnose and treat the gamut of disease.

In Germany, approval of herbal drugs is based on the results of clinical and pharmacological studies; in other European countries, such as France and the United Kingdom, the traditional use of herbal drugs is generally considered as sufficient proof of the product's efficacy and safety. Even in Germany, however, where significant evidence is required for approval of a new phytomedicine, the required amount needed is much less than it would be in the United States. The German standard has been characterized as providing "reasonable certainty" rather than "absolute proof" of safety and efficacy.

Much of the research on phytomedicinals in Germany is conducted in-house by pharmaceutical companies, but much is also carried out under grants and contracts by institutes (departments) of the universities. There is considerable concern at these academic institutions that, as the date for European economic unity approaches, this sort of support will be lost. Bureaucrats tend to reduce things to the lowest common denominator, and Germans fear that lax regulations in Britain and France, which allow the sale of phytomedicinals without substantial testing, will prevail throughout all of the countries involved. If phytomedicinals can be sold without the need for evaluation, research funds devoted to this purpose are sure to dry up, and progress in the field will be severely limited.

In this country, no deviation from the most rigid criteria for determining drug safety and efficacy is permitted, even for phytomedicines long in use. It was clearly the intent of the United States Congress to "grandfather" from such requirements all drugs marketed prior to 1962. Because the vast majority of herbs now in use here were at one time official in *The United States Pharmacopeia* or *The National Formulary* and therefore fall into that category, it may seem unusual that they

are not presently viewed in this way by the Food and Drug Administration (FDA). However, that agency, by a clever interpretation of administrative law, simply ruled that pre-1962 drugs could continue to be sold but would be considered misbranded if any therapeutic claims, not proven by post-1962 standards, were made on the label.

This placed phytomedicines in the United States in regulatory limbo between drugs and foods. Although most are basically drugs by almost any definition applied to them, they could not legally be sold as such unless many millions of dollars were spent to prove them safe and effective. Since exclusivity of sales rights could not be assured through the patent mechanism for drugs already used for centuries or even millennia, no manufacturer was willing to hazard such an investment. Phytomedicines continued to be marketed under the guise of foods or nutritional supplements, without therapeutic claims on their labels. No legal standards of quality exist or are now enforced, and, with some herbal products (particularly those with raw expensive ingredients), consumers have less than a 50% chance that the contents and potency are accurately disclosed on the label.

But the most serious effect of the FDA regulations on pre-1962 drugs has been to discourage research in this country, particularly in the pharmacologic and therapeutic areas but also in the area of chemistry, on the classic phytomedicines. Among the most recent drugs of plant origin marketed in this country are the catharanthus alkaloids vinblastine and vincristine, which were discovered about 30 years ago and are now approved for use as chemotherapeutic agents for treating cancer. There is some hope that taxol, now derived from scarce yew trees, may eventually be marketed as an anticancer agent, but first a reliable synthetic or cell-culture production method must be developed so it can be mass-produced. Still, a 30-year gap between new natural plant drugs is much too long.

Consequently, research in the field has shifted to other countries, especially Germany, where phytomedicinals are popular. In 1989, the estimated market for phytomedicinals in Western Europe was 2.2 billion U.S. dollars, with 70% of this figure in Germany alone. These estimates, compiled by the European Scientific Cooperative for Phytotherapy, are viewed by many people as quite conservative.

The second reason why Germany leads the world in phytomedicinal research is that once a product has been proven safe, only reasonable certainty of its efficacy is required to market it there. In 1978, Germany's Federal Health Agency established Commission E to evaluate some 1,400 herbal drugs corresponding to 600–700 different plant species. Evaluations are based on data from the published literature, information supplied by practicing physicians, reports from patients, pharmacological investigations, and limited clinical studies. This process has resulted in a series of monographs that assess the safety and utility of each drug and summarize what is probably the best information available today on the composition and use of many phytomedicinals. This has encouraged even small pharmaceutical manufacturers—and there are many in Germany—to sponsor appropriate research in the hope that the

data obtained will facilitate a favorable evaluation by Commission E.

Ginkgo

Without question, a concentrated extract of the leaves of *Ginkgo biloba L.*, an ornamental tree that is truly a living fossil, is the most important phytomedicinal agent to be marketed in the last decade. Its popularity may be judged by the 5.4 million prescriptions written for it in Germany in 1988, more than for any other pharmaceutical. In addition, it is available in Western Europe as an over-the-counter drug. Ginkgo biloba extract (GBE) is prepared by extracting the dried green leaves with an acetone-water mixture under partial vacuum; the solvent is then removed and the extract adjusted to the desired potency.

GBE appears to be effective against ailments associated with decreased cerebral blood flow, particularly in geriatric patients. Such conditions, including memory loss, headache, tinnitus, and depression, respond to the vasodilation and improved blood flow induced by GBE in both the arteries and capillaries. There is also evidence that the extract is an effective free-radical scavenger. Side effects are usually minimal but may include restlessness, diarrhea, nausea, and vomiting.

In the United States, GBE is marketed as a "food supplement" with no therapeutic claims on product labels. As is customary with phytomedicinals here, catalogues and books make therapeutic claims for GBE that are mostly pure hyperbole [see NF 8:23–24]. Assertions that GBE offers significant protection against strokes or the development of Alzheimer's disease or that it will reverse the aging process, produce increased longevity, or enhance intelligence are, for example, quite unproven.

Echinacea

Echinacea (also called cone flower) was introduced into medicine in 1871 by a patent medicine vendor in Nebraska who learned of its value as a "blood purifier" from the Indians. Originally, the rhizome and root of two varieties were extensively employed here, usually as a tincture (hydroalcoholic solution), as anti-infective agents. In 1920, it was the largest-selling of the 239 plant-derived preparations marketed to physicians by the firm of Lloyd Brothers in Cincinnati. However, with the development of sulfa drugs and other antimicrobial agents, the use of echinacea declined rapidly, and the drug was dropped from official status in *The National Formulary* in 1950. Meanwhile, Dr. Gerhard Madaus had introduced the plant into Germany.

As early as 1939, it was observed that various infectious diseases responded favorably to echinacea therapy despite the fact that the phytomedicinal did not act directly on the disease-producing pathogen. The search for the identity of the active principles of echinacea has led to the publication of more than 200 papers since 1940, with most of the chemical research

conducted in Germany. Although it was postulated in 1941 that constituents in the plant seemed to stimulate the body's own healing powers, serious research on echinacea's nonspecific immunostimulant properties did not begin until 1971. Intensive research, particularly during the last decade, has found that echinacea stimulates the activity of various types of phagocytes, inhibits hyaluronidase, increases fibroblasts and properdin levels, and may cause increased production of interferon. All these activities could result in enhanced resistance to disease.

About 150 conventional (non-homeopathic) phyto-medicinals containing echinacea are currently marketed in Germany. Preparations intended for external use (ointments, lotions, creams) are employed for the treatment of wounds, burns, and various inflammatory conditions. Oral preparations (tinctures, extracts) are used to increase immunity and appear to be most useful in preventing or moderating the symptoms of colds or flu. Injectable preparations are also available. Commission E has approved use of the drug in its various forms. No side effects with local or oral administration have been reported.

Chamomile

Chamomile, particularly the German variety, consists of the dried flower heads of *Matricaria recutita* L. In 1987, it was designated as the medicinal plant of the year in Europe, where it is used in scores of phytomedicinals marketed for treating everything from gastrointestinal spasms to skin irritations. In the U.S., it is known primarily as a pleasant-tasting tea. Chamomile is perhaps the best example of the wide chasm separating medicinal practice in Western Europe and the United States.

Europeans utilize chamomile internally and externally for its anti-inflammatory, antispasmodic, antibacterial, and mild sedative properties. Commission E has declared it effective for all of these actions except as a sedative. Many varieties of chamomile extracts, tinctures, ointments, and teas are sold in Europe. The drug is an ancient one, and the literature dealing with it is extensive. A 1986 review of the literature on chamomile and its near relative, Roman chamomile, listed 220 references.

Contraindications to the use of chamomile are not known. Side effects may include allergic reactions, and some authors place great emphasis on this potential hazard. However, only five such cases were reported in the literature between 1887 and 1982. Considering that an estimated 1 million cups of chamomile tea are consumed daily worldwide, this is a very low incidence.

Feverfew

Feverfew, the leaves of *Tanacetum parthenium* (L.) Schultz Bip., has been used as a folk remedy for the treatment of headache and related conditions for some 2,000 years. During the 1980s, it gained popularity as the result of British studies which found that doses of about 60 mg of freeze-dried powdered leaves could significantly decrease the frequency

and severity of migraine headaches and the nausea and vomiting that may accompany them.

The active principles of feverfew are sesquiterpene lactones, of which parthenolide is the predominant one. Regulatory agencies in various countries have proposed standards ranging from not less than 0.1 to not less than 0.2% of parthenolides in whole, dried feverfew leaf. Where standardized dried leaf preparations are not available, many people consume the fresh leaves, chewing them before swallowing. This can cause ulceration and, more commonly, inflammation of the mouth and tongue, often with swelling of the lips. These conditions subside when administration is stopped. No chronic toxicity tests have been carried out with feverfew, but no serious side effects have been observed, even in long-term users.

In the United States, feverfew is marketed as a "food supplement" in compressed tablets or capsules containing 300 to 380 mg of the herb. The recommended dosage is up to six per day. This is many times the effective daily dose of high-quality preparations, but perhaps this large excess is used as a "safety factor" to assure some activity with low-quality products. A recent study in Canada showed that no commercial feverfew product in North America contained even half of the minimum parthenolide concentration (0.2%) required for effectiveness.

Valerian

Who could imagine that a plant with mild but effective tranquilizing and sedative properties could have been widely used in medicine for a millennium; further, that today in Germany alone more than 100 phytomedicinals containing it are marketed; and, most amazing of all, that the active principles responsible for its therapeutic effects remain unidentified! The existence of such a plant epitomizes the failure of modern-day scientists to coordinate the chemical and pharmacological testing of classical plant drugs. The drug is valerian, the root and rhizome of *Valeriana officinalis* L. Other species possess similar activity and are similarly used.

Over the years, valerian's depressant effects on the central nervous system (CNS) have been attributed to its volatile oil and especially to two components, valerenic acid and valeranone. More recently, it was believed that a mixture of compounds known as the valepotriates was responsible. But in 1988, investigators published the results of an extensive study in rats which indicated that, while the crude drug was effective, these principles were not. Here the matter stands. All that is certain at this time is that rhizomes and roots that are fresh or have been recently dried at a temperature below 40°C exhibit the most effective CNS-depressant activity.

Commission E considers valerian an effective treatment for restlessness and sleep disturbances resulting from nervous conditions. In the United States, the drug is available as a coarse powder for making tea, an encapsulated powder, and a tincture, all of which are marketed as "food supplements." There have been no reports of side effects or toxicity in either animals or humans.

Milk Thistle

About 20 years ago, scientists succeeded in isolating from the milk thistle, *Silybum marianum* (L.) Gaertn., a crude mixture designated silymarin, whose components were later identified. Studies on small animals have shown that silymarin protects the liver against a variety of toxins including those of the deadly amanita. Human trials have also been encouraging with respect to hepatitis and cirrhosis of various origins. Both types of studies suggest that silymarin shields intact liver cells or cells not yet irreversibly damaged by acting on cell membranes to prevent entry of toxic substances. Protein synthesis is also stimulated, thereby accelerating the regeneration process and the production of liver cells. As a result of these findings, Commission E has endorsed the use of milk thistle fruits as a supportive treatment for inflammatory liver conditions and cirrhosis.

Silymarin is very poorly soluble in water, so aqueous preparations (teas) of the fruit are ineffective. Silymarin is also poorly absorbed (20–50%) from the gastrointestinal tract, so the drug is best administered parenterally. Oral use requires a concentrated product. Milk thistle is currently marketed in this country as a "food supplement" in capsules containing 200 mg each of a concentrated extract representing 140 mg of silymarin. Toxic effects have not been reported.

St. John's Wort

Only a portion of the potential of even well-known drug plants has been examined. A case in point is St. John's wort, *Hypericum perforatum* L., the leaves and tops of which have long been used internally as a diuretic and treatment for menstrual disorders and externally, usually in an oil base, for wound healing. More recently, the plant has gained considerable reputation in Europe as an effective treatment for nervousness, sleep disturbances, and, particularly, depression. At first, such activity was attributed to hypericin, a naphthodianthrone pigment, but it is now believed that various flavonoids and xanthenes play a significant role in its antidepressant action. These compounds function as monoamine oxidase inhibitors. Tests on small animals and preliminary tests in humans have confirmed the activity, and Commission E has approved the use of St. John's wort for the treatment of psychotic disturbances, depression, anxiety, and nervous unrest.

The most important property of this ancient plant is perhaps still to be realized. In 1988, investigators showed that hypericin and pseudohypericin showed dramatic antiretroviral activity and low toxicity at effective doses. Phase I clinical trials of hypericin are now underway at New York University Medical Center, and it appears that St. John's wort may eventually yield a useful treatment for retroviral-induced diseases such as AIDS.

Hypericin is known to induce photosensitivity in livestock. While this is not ordinarily a problem in humans taking normal doses of the herb, fair-skinned consumers are cautioned

against excessive exposure to sunlight. St. John's wort is available in this country both in capsules and as a fluid extract. Naturally, these are sold only as "food supplements," not as drugs.

Saw Palmetto

Commission E has approved several plants that can help people with benign prostatic hypertrophy (BPH). Perhaps the most popular of these is saw palmetto (also called sabal), the fruit of *Serenoa repens* (Bartr.) Small. Extracts of the fruits have anti-androgenic properties. The beneficial effects include increased urinary flow, reduced residual urine, increased ease in commencing urination, and decreased frequency of urination. The chemical constituents responsible for this activity have not been identified, but they occur in the fraction extracted by nonpolar solvents.

A number of phytomedicinals containing saw palmetto extract are marketed in Europe. In this country, only the crude drug is available in cut or powdered form for use as a tea because all OTC drug preparations used to treat BPH were banned by the FDA in 1990. Since the active constituents of saw palmetto are not water-soluble, little or no benefit can result from the use of any water-based preparation.

Hawthorn

The leaves and flowers or fruits of the hawthorn, *Crataegus laevigata* (Poir.) DC. and related species, constitute one of the most widely used heart remedies in Germany today. Hawthorn apparently brings about its beneficial effects in two ways. First, it dilates (widens) blood vessels, particularly the coronary arteries, thus improving circulation. In addition, it exerts a positive inotropic (strengthening) effect directly on the heart muscle.

These beneficial effects develop slowly over a period of days or even weeks. Toxic effects are uncommon, even at large doses. The drug thus provides a useful treatment for certain milder forms of heart disease. Such usage has been approved by the Commission E, and scores of phytomedicinals containing hawthorn are marketed in Western Europe. The principal active constituents in hawthorn are simple flavonoids and oligomeric procyanidins. To assure potency, product standardization is based on oligomeric procyanidin content.

Hawthorn was selected as the 1990 medicinal plant of the year by the Union of German Druggists. (In Germany, druggists sell herbal teas and various proprietary products, but they are not pharmacists.) Although hawthorn is available in this country as a "food supplement," both in tablet form and as a powdered herb, I believe it is unsuitable for self-treatment. It might, however, find a useful role in medical practice if competent physicians were permitted to prescribe it. Physicians in Germany recommend use of standardized hawthorn prepara-

tions in mild cases of coronary artery disease and angina pectoris, particularly in the elderly, where a gentle, long-lasting action without side effects is desired.

Melissa

Melissa (also called lemon balm) is a drug derived from the leaves of *Melissa officinalis* L., a volatile-oil-containing herb that was selected medicinal plant of the year in Europe in 1988. The plant is familiar to beekeepers all over the world because the odor of its essential oil resembles that of the pheromone (sex-attractor hormone) produced by bees which consequently find the plant very attractive.

Melissa is little known in this country, but its volatile oil is widely used throughout Western Europe as a sedative, a spasmolytic, and an antibacterial agent. The sedative action is attributed largely to citronellal, with other terpenes such as citronellol, geraniol, caryophyllene, linalool, citral, limonene, and eugenol contributing to the effect. Some of these constituents are responsible for the plant's antispasmodic and antibacterial properties.

Commission E has approved melissa only as a calmative and a carminative, but a cream containing the plant extract is widely marketed as a local treatment for cold sores and related conditions caused by the herpes simplex virus. Here the activity is attributed to a complex mixture of tannins that is contained in the plant to the extent of about 5%. Tests indicate that the ointment can not only reduce the time required to heal herpes lesions, but can also extend the interval between recurrent episodes.

What's the Bottom Line?

Western Europe's experience with useful phytomedicines seems to have had relatively little impact on herbal medicine in the U.S. In Germany, at least, phytomedicine seems to become ever more scientific with proven product safety and efficacy a desired goal. Here, herbal medicine is not only stifled by regulatory disinterest but is debased, even by some knowledgeable people, to the status of unconventional medicine, along with homeopathy, crystal power, Qigong, and numerous other examples of the power of the placebo effect.

Rational herbal therapy is as conventional as the use of plantago seed (psyllium) for constipation. This plant product is an official drug in the current edition of *The United States Pharmacopeia*. Yet a combination of adverse educational, regulatory, and financial circumstances conspires to keep useful phytomedicines out of the American health-care system. If this continues unchanged, herbalism in this country will also remain unchanged—a medieval system in which drugs, not even called drugs, are separated by the Atlantic Ocean from their modern, scientific counterparts in Western Europe.

I believe that the FDA should regulate herbs and

phytomedicines as drugs, not foods or food supplements. However, in evaluating their safety and efficacy, special consideration should be given to their long history of use and the voluminous scientific and clinical literature that has accumulated about them in recent years in developed European nations. Perhaps the simplest procedure would be to adopt the published standards of Commission E herbal monographs. This would not only result in the rapid establishment of appropriate standards; it would also result in considerable saving of time and money that would otherwise be required to duplicate the Commission's findings.

Such an action would benefit consumers in two ways. First, herbal products could be labeled with accurate information about their benefits and risks—information that is unavailable under current FDA policy. Second, requiring product literature to conform to the monographs would undercut the exaggerated claims now made by herbal marketers.

I once thought that public opinion would force our government to change its outlook on phytomedicinals in a relatively short period of time. This prediction now seems faulty, probably, in large measure, because outrageous claims by many herbal advocates have caused the government to view all things associated with herbs as nonscientific and therefore unworthy of consideration. Considering most of the herbal literature available in this country, it is not difficult to see how this impression would be gained. I also thought that the best way to differentiate between rational herbalism and faulty herbalism was to label the latter "paraherbalism" [see NF 6:41-44, 1989]. I now believe it is more appropriate to refer to rationally used herbs or their extracts as phytomedicines and the practice of using such products as phytomedicine. This terminology might remove or lessen the stigma now associated with herbalism.

Research on well-known natural products is not carried out extensively in this country in pharmaceutical industry because of the difficulty in obtaining patent protection and subsequent lack of profitability. But many academic scientists are little concerned about these factors. Some of the plant drugs just discussed present intriguing problems that could be resolved by academic scientists, if funding could be obtained from appropriate granting agencies, such as the National Institutes of Health. Aside from its cancer and AIDS programs, the NIH has been loathe to support phytomedical research, but perhaps the taxol breakthrough will change this picture, too.

I believe that phytomedicines can prove to be a significant source of new drugs and drug products. That is already the case in Western Europe. Scientists themselves need to be aware of this so they, in turn, can create public awareness. This will not only change the regulatory philosophy that now exists, but should also lead to increased funding for natural product research as well.

Dr. Tyler is professor of pharmacognosy at Purdue University and author of *The Honest Herbal*, an evaluation of more than 100 popular herbs and related products. The third (1993) edition is available for \$20 postpaid from LVCAHF, Inc., P.O. Box 1747, Allentown, PA 18105.

BRIEFS

Correction. The last issue of *Nutrition Forum* described a study of advertising for nutritional supplements in health and bodybuilding magazines. The note said that among the 221 products for which an effect was claimed, 12 were said to reduce fat. It should have said that these products were said to increase strength.

Dangerous message. Health-food industry publications have expressed optimism that Bill Clinton will support weakening of the FDA after he takes office. In October he issued a letter stating that, "Dietary supplements like vitamins, minerals, herbs and other nutritional substances have an important role in preventive health. We must protect the rights of consumers to choose dietary supplements and insure they are safe and of high quality and that health information about the supplements is truthful and non-misleading. . . . However, the FDA must not be allowed to infringe on the rights of the millions of Americans who enhance their daily diet with vitamins or other dietary supplements. The Health Choices Freedom Act of 1992 was introduced by Congressman Bill Richardson of New Mexico . . . one of the strongest congressional supporters of my campaign for President, and I look forward to working closely with him and the nutritional supplement community on this important issue." *Editor's note: Congressman Richardson's bill, like Senator Hatch's Health Freedom Act [NF 9:30, 1992], would make it virtually impossible for the FDA to regulate claims made for vitamins, minerals, herbs, and anything else the industry calls a "supplement."*

Popular supplements. *Health Foods Business* has asked 15 leading manufacturers to identify their top-selling supplements. The "top ten," listed in the magazine's August 1992 issues, were: multivitamins, vitamin C, vitamin E, calcium, B-complex, Beta-carotene, zinc, calcium/magnesium, multiminerals, potassium, and iron. One company official said that multivitamin/multimineral products "obviously drive the industry." Another manufacturer, referring to vitamin C, Vitamin E, and beta-carotene, said that "the field of antioxidants is on the threshold of exploding."

Critical vitamin report. The New York City Department of Consumer Affairs has published a 57-page report advising vitamin-takers how to avoid overpriced and worthless vitamins. The Department also charged four companies with violating city law by making "preposterous claims" for products. One company had claimed that its vitamin C product could inhibit the AIDS virus. Three others were attacked because their names (*Memory, Supreme Vital Hair, and Manpower*) could mislead consumers into believing that the products could enhance memory, hair growth, or male strength or virility. Copies of the report, *Hype and Hope: The Cost of Vitamins*, are available for \$3 from the Department of Consumer Affairs (Attn: Publications), 42 Broadway, New York, NY 10004.

Much trouble for "clinical ecologist." In April 1991, a jury in New York City awarded \$900,000 to the survivors of Glen Gerston, a commercial artist who committed suicide at the age of 29 after several years of treatment by Warren M. Levin, M.D., a clinical ecologist. The amount included \$411,000 for punitive damages, \$250,000 for wrongful death, \$150,000 for lost earnings, \$85,000 for medical expenses, and \$4,000 for funeral expenses [The New York Jury Verdict Reporter 9(23):1-3, 1991]. Testimony at the trial indicated that although the patient was a paranoid schizophrenic who thought "foods were out to get him," Dr. Levin had diagnosed him as a "universal reactor" and advised that, to remain alive, he must live in a "pure" environment, follow a restrictive diet, and take supplements. Dr. Levin admitted that since 1974, when he began practicing clinical ecology, he had diagnosed every patient he saw as suffering from environmental illness. In September 1992, after a lengthy investigation involving the care of 13 patients, the New York State Department of Health Board for Professional Medical Conduct stated that Dr. Levin "has a litany of unproven and medically unnecessary tests that he runs on virtually all patients. He uses these tests—whatever their results may be—to convince his patients that his unconventional kinds of treatment are necessary." The Board found him guilty of "gross negligence," "fraudulent practice," and "moral unfitness" and recommended that his license be revoked. "Clinical ecology is a pseudoscience based on claims that "overloading" the immune system causes multiple common symptoms.

"Natural" poultry? Several producers have launched a petition campaign to persuade the U.S. Department of Agriculture to define more narrowly the term "natural" when used in labeling fresh meat and poultry products. Their goal is to restrict the term to animals that have been raised since birth without antibiotics or growth-producing hormones. According to a report in *Natural Foods Merchandiser*, current regulations permit use of the term for any fresh meat or poultry product that contains no artificial ingredients and has undergone only minimal processing. The issue may also be addressed when "organic" standards are proposed as required by a federal law passed two years ago [NF 8:25-29, 1991].

Nutrition Forum (ISSN 0748-8165), © 1992, is published by Stephen Barrett, M.D. All articles and advertising inserts are fully endorsed by Dr. Barrett.

Subscriptions must be for a full calendar year. Individual subscriptions in the United States and Canada are \$35 for 1 year (six issues), payable to Nutrition Forum, P.O. Box 1747, Allentown, PA 18105. Institutional and other multireader subscriptions are \$50 for 1 year. Overseas subscriptions (via airmail) are \$50 for 1 year. Back issues are \$6 each.

Supplement labeling rules blocked. On December 2, Health and Human Services Secretary Louis Sullivan proposed final regulations that provide for consistent, scientifically based labeling for all processed foods. However, the proposed regulations did not cover the labeling of dietary supplements. An amendment passed during the closing days of the 1992 Congressional session prevents the FDA from proposing new regulations for dietary supplements until the end of 1993. The amendment, engineered by Senator Orrin Hatch (R-UT), also delays possible implementation of new standards (RDIs) for vitamin and mineral contents.

Antiquackery blockbuster. The American Medical Association has published a 370-page guide to contemporary literature on "alternative" health methods, which it defines as "methods that are not based on established scientific knowledge." The book, *Reader's Guide to "Alternative" Health Methods*, summarizes the contents of more than 1000 books, journal articles, and other reports published mainly between 1980 and 1992. It also lists organizations that promote "alternative" methods and organizations and publications that are skeptical of these methods. The book's introduction notes that the word "alternative" has two possible meanings: "Correctly employed, it refers to methods that have equal value for a particular purpose. (An example would be two antibiotics capable of killing a particular organism.) When applied to unproven methods, however, the term can be misleading because methods that are unsafe or ineffective are not reasonable alternatives to proven treatment." The introduction also states: "Our handling of information contrasts starkly with that of the general media. During the past few years, many articles and broadcasts addressed to the public have given what we believe is a very distorted view of 'alternative' health-care methods. Most of these reports are marked by a complete absence of critical thinking and merely echo the views of proponents and their satisfied clients." The book, which lists for \$34.95, is available for \$32 postpaid from LVCAHF/NF, P.O. Box 1747-N, Allentown, PA 18105.

Poultry irradiation approved. The U.S. Department of Agriculture has approved the irradiation of poultry, which can greatly reduce the danger of *Salmonella* contamination. However, large poultry producers have expressed no interest in irradiating their products. Part of their reluctance is due to protests from individuals opposed to irradiation, but some of it stems from reluctance to admit that there is anything now wrong with their products. The December 1992 issue of *American Health* contains an outstanding article exploding the propaganda of irradiation opponents.

Fluoridation and hip fractures. A study of patients in Utah who were 65 years of age or older has found that those who lived in a fluoridated community had a slightly higher incidence of hip fractures [JAMA 268:746-748, 1992]. An accompanying editorial, titled "Please 'pass the roach poison again,'" noted that other studies have shown the opposite and that many other factors are involved in the development of hip fractures and that the study does not provide reason to curtail fluoridation programs. [JAMA 268:781-782, 1992].

Modern alchemy? Termites, ruminants, and/or the microorganisms they harbor produce enzymes that turn cellulose, the woody fraction of plant materials, into glucose. Researchers at USDA's Northern Regional Research Center in Peoria, Illinois, are studying the role of three relevant enzymes (xylanase, xylosidase, and arabinosidase) and the bacterium (*Bacteroides ovatus*) that produces them in the human large intestine. The researchers hope to find a way to turn dietary fiber into a calorie-producing substance.

Caffeine withdrawal symptoms. A study of 62 normal adults whose mean daily intake of caffeine was 235 mg (the amount in 2.5 cups of coffee) found that 52% of them had moderate or severe headaches and 8 to 11% had symptoms of depression or anxiety when they abruptly switched to a caffeine-free diet [New England Journal of Medicine 327:1109-1114, 1992]. A copy of the report can be obtained from Roland R. Griffiths, Ph.D., Dept. of Psychiatry, Johns Hopkins University School of Medicine, 5500 Nathan Shock Drive, Suite 3000, Baltimore, MD 21224.

Report on amino acid safety. The Federation of American Societies for Experimental Biology (FASEB) has issued a 324-page report on the safety of amino acids used as dietary supplements. The FDA commissioned the report because of the epidemic of eosinophilia-myalgia syndrome epidemic among people who took L-tryptophan. The report concludes that: (1) single- or multiple-ingredient capsules, tablets, and liquid products are used primarily for pharmacological purposes or enhancement of physiological functions rather than for nutritional purposes; (2) little scientific literature exists on most amino acids ingested for these purposes; (3) no scientific rationale has been presented to justify the taking of amino acid supplements by healthy individuals, (4) safety levels for amino acid supplement use cannot be established at this time, and (5) a systematic approach to safety testing is needed. Copies of the report are available for \$40 from FASEB, 9650 Rockville Pike, Bethesda, MD 20814.

HEARING EXAMINES L-TRYPTOPHAN REGULATION

On July 18, 1991, the Human Resources and Intergovernmental Relations Subcommittee of the House of Representatives' Committee on Government Operations held a hearing on the regulatory history of L-tryptophan. The testifiers included scientific experts, regulatory officials, and victims of eosinophilia-myalgia syndrome (EMS), a previously rare disease that erupted among L-tryptophan users in 1989. L-tryptophan, an essential amino acid, was marketed as a "dietary supplement" for many years before the FDA banned it in response to the EMS outbreak.

One of the experts was Richard J. Wurtman, M.D., professor of neuroscience at M.I.T. and Harvard Medical School, the leading researcher on amino acid metabolism. He testified that, 20 years ago, his laboratory discovered that tryptophan levels normally control the production of serotonin, a brain chemical involved in sleep, mood, and appetite. He said that, at the time, he thought that tryptophan might become a legitimate drug that could help people sleep, diminish pain, and control mood and appetite.

"Nobody argues about whether tryptophan works," Dr. Wurtman continued. "The reason 15 million people took it is that when presented in pure form—which it wasn't in EMS patients—it is an effective compound. . . . I had assumed that pharmaceutical companies might take this discovery and invest the \$10 or \$20 million, whatever it took then, to do appropriate safety and efficacy studies." Noting that tryptophan might eventually have been approved as a drug, he lamented that "it didn't work out that way. . . . because tryptophan was allowed to be sold as a nutritional supplement."

"But tryptophan in a bottle is not a nutritional supplement, Dr. Wurtman said. "In protein, it comes with 21 other amino acids, and you need all of them in order to utilize them and make protein. Pure tryptophan in pills or in a bottle is not natural. . . . The body cannot use it to make its own protein. There is not a single person in America who is tryptophan-deficient. Isolated amino acid deficiencies do not occur. People who have low blood tryptophan levels also have low blood levels of other essential amino acids as well, because these people are protein-deficient. Giving one amino acid to a protein-deficient person can make matters worse."

Dr. Wurtman noted that since manufacturers did not want to invite FDA regulatory action by openly marketing tryptophan as a drug, they did not list appropriate use, dosage, or contraindications on their labels. "Tryptophan was, in every sense, an accident waiting to happen," he added. He also described hazards associated with other amino acids that are still marketed in health food stores. He believes that isolated amino acids should not be marketable unless they can meet regulatory standards for prescription drugs.

FDA officials presented the following account of tryptophan's regulatory history. Until 1973, it was included on a list of food substances that were generally regarded as safe (GRAS) for use as dietary supplements. In 1973, the FDA revoked this GRAS status and stated that L-tryptophan could not

be marketed without approval as a food additive. Since approval had not been sought, the agency initiated seizure actions against two manufacturers. The first case was dismissed because L-tryptophan was accidentally included on a GRAS list published in 1977. The second case was withdrawn before a verdict was rendered, because the FDA believed that the judge was inclined to favor the manufacturer. The FDA also felt constrained by the Proxmire Amendment (1976), which curbed its ability to regulate vitamin dosage. Although amino acids were not included under this law, the agency took its passage as a signal that Congress did not want supplement products regulated without serious indications of danger to health. Thus, although the marketing of amino acid supplements was illegal, the FDA did nothing further until the EMS outbreak occurred.

After the outbreak occurred, an anonymous person sent the FDA a package of ads and product literature that contained therapeutic (drug) claims for L-tryptophan. FDA attorney Mary Pendergast, who compiled a 21-page analysis of this material, concluded that at least 26 companies had made illegal claims and that many "amino acids" were still sold as dietary supplements in violation of FDA food additive and drug regulations. She also concluded that the occurrence of EMS in children might be related to the marketing of the products advertised for use in sedating children.

Rep. Patsy T. Mink [D-HI], who presided over the hearing, asked what the FDA was doing about the illegal promotions described in the analysis and whether criminal charges would be filed. She was informed that the agency had initiated several investigations, but details could not be revealed. Mrs. Mink then said, "I don't know why an agency in the first place has to sit and wait for anonymous information; it should be out there investigating. But the fact is you had some information to base some corrective action on and I'm just a little amazed that nothing has been done." Following a few minutes of additional testimony, she summed up her view of the proceedings:

I think the hearings. . . make it clear that the L-tryptophan tragedy was indeed an accident waiting to happen. . . . Throughout the 1980s, the FDA permitted all amino acids to be marketed illegally as dietary supplements. Many of these products made illegal drug claims that were also ignored by the agency. What is perhaps most alarming is that all of the amino acids that remain on the market today in supplement form are illegal. We fail to understand how FDA can allow the supplement industry to flaunt federal law.

The U.S. Government Printing Office has published a transcript of the hearing and the documents submitted to the subcommittee. A limited supply is available from the subcommittee staff (202-225-2548). Copies may also be purchased from the Superintendent of Documents, Washington, DC 20402. "ALTERNATIVE" THERAPY BUZZWORD FOR THE '90s

Stephen Barrett, M.D.

The *American Heritage Dictionary* defines "buzzword" as "a usually important-sounding word or phrase connected with a specialized field that is used primarily to impress laymen." Promoters of quackery are very adept at using slogans and buzzwords. During the 1970s, they popularized the word "natural" as a magic sales slogan. "Natural" foods are claimed to be safer and/or more nutritious than other foods. Despite the falsity of this claim, "natural" products typically command higher prices than their "unnatural" counterparts.

During the '80s, the word "holistic" gained widespread use. "Holistic" practitioners imply that their approach is special because it treats the "whole patient" and not just the disease. However, good physicians have always paid attention to patients' social and emotional concerns as well as their physical problems. Most practitioners who call themselves "holistic" are engaged in unscientific methods. For this reason, scientific practitioners should not embrace it.

Today's leading buzzword is "alternative." Correctly employed, the word refers to methods that have equal value for a particular purpose. (An example would be two antibiotics capable of killing a particular organism.) When applied to unproven methods, however, the term can be misleading because methods that are unsafe or ineffective are not reasonable alternatives to proven treatment. For this reason, I place the word "alternative" in quotation marks when it refers to methods that are not based on established scientific knowledge.

Many "alternative" approaches are rooted in vitalism, the concept that bodily functions are due to a vital principle or "life force" distinct from the physical forces explainable by the laws of physics and chemistry. Nonscientific health systems based on this philosophy maintain that diseases should be treated by "stimulating the body's ability to heal itself" rather than by "treating symptoms." Homeopaths, for example, claim that illness is due to a disturbance of the body's "vital force," which they can correct with special remedies, while acupuncturists claim that disease is due to imbalance in the flow of "life energy" (*Ch'i* or *Qi*), which they can balance by twirling needles in the skin. Many chiropractors claim to assist the body's

"Innate Intelligence" by adjusting the patient's spine. Naturopaths speak of "Vis Medicatrix Naturae." Ayurvedic physicians refer to "prana." And so on.

Although vitalists often pretend to be scientific, they really reject the scientific method with its basic assumptions of material reality, mechanisms of cause and effect, and provability. Their proponents regard personal experience, subjective judgment and emotional satisfaction as preferable to objectivity and hard evidence.

Misleading Publicity

During the past year the news media have publicized "alternative" methods in ways that will cause great public confusion. Most of these reports have contained little critical thinking and have featured the views of proponents and their satisfied clients. *Time*, *Newsweek*, and *U.S. News & World Report* have published feature articles stating that "alternative" methods have become increasingly popular. "Good Morning America" and "CBS This Morning" have aired snippets for a week, and CBS's "48 Hours" has aired a 1-hour show. And Cable News Network and the Associated Press have propagated the conclusions of a *New England Journal of Medicine* article (discussed below) without any indication that the study was flawed.

Many of these reports exaggerated the significance of the newly opened National Institutes of Health Office for the Study of Unconventional Medical Practices (now called the Office of Alternative Medicine). *Time*, for example, stated that "the NIH program is supported by an odd alliance of New Age believers and old-school quackbusters. Both sides want to sort out once and for all what works." The article was titled, "New Age Meets Hippocrates: Medicine gets serious about unconventional therapy."

Taken together, these reports have suggested that "alternative" methods have become increasingly accepted by the public, even though (as I had pointed out to several reporters) no valid data exist to enable comparison of past and present utilization of most "alternative" practices. Many of these reports

have lumped approaches (such as biofeedback and a low-fat diet) that probably have real value with nonsensical methods (such as homeopathy) and concluded (incorrectly) that "alternatives" are moving into the scientific mainstream. Some reports decry the high cost of medical care and suggest that "alternatives" may prove to be less expensive.

Behind the Scenes

During the past few months, the Fetzer Institute has emerged as a major player in the unfolding mess. The Institute, located in Kalamazoo, Michigan, is described in its brochure as "a nonprofit educational organization that promotes research into health care methods that utilize the principles of mind-body phenomena." Since 1991, the Institute has published *Advances* ("The Journal of Mind-Body Health"), which was originally published by the Institute for the Advancement of Health. This latter group, which ceased operations on January 1, 1991, was heavily promoted by the late Norman Cousins, a prominent editor who claimed to have healed his spine and his heart with unconventional methods.

In January 1993, the *New England Journal of Medicine* published "Unconventional Medicine in the United States," an article by David Eisenberg, M.D., and five collaborators [NEJM 328:246-252, 1993]. The article, supported by a contract with the Fetzer Institute, was based on a telephone survey concerning the use of 16 types of "unconventional therapy" among 1,539 individuals. The authors concluded:

One in three respondents (34%) reported using at least one unconventional therapy in the past year, and a third of these saw providers for unconventional therapy . . . In 1990 Americans made an estimated 425 million visits to providers of unconventional therapy. This number exceeds the number of visits to all U.S. primary care physicians (388 million). Expenditures . . . amounted to approximately \$13.7 billion.

Although the report was widely cited in the media as evidence of increasing public interest in "alternative methods," the study's design was extremely poor. The authors define "unconventional therapies" as "medical intervention not taught widely at U.S. medical schools or generally available at U.S. hospitals." However, the categories they selected included some approaches that are medically appropriate (self-help groups, for example) and some that may or may not be appropriate, depending on the circumstances (relaxation therapy, biofeedback, hypnosis, massage, and commercial weight-loss clinics). About 30% of the visits were for "relaxation techniques," 11% for commercial weight-loss clinics, and 5% for self-help groups. In light of these facts, the estimated expense total is meaningless.

The February issue of *Consumer Reports* contains a 9-page article titled, "Can Your Mind Heal Your Body," said to be "largely adapted from the book *Mind/Body Medicine*, just published by Consumer Reports Books." The article concludes that enough is known about "mind/body medicine" to make it

applicable in a number of situations and that mind/body techniques pose virtually no physical or emotional risks—as long as they are not used in place of conventional medicine. This advice strikes me as simplistic. Although some activities, such as self-help groups, can offer valuable emotional support, other mind/body techniques are the bailiwick of charlatans. The book thanks the Fetzer Institute for cooperating and supporting its planning and development, but no mention of this role accompanies the *Consumer Reports* article.

From February 22 through February 24, the Public Broadcasting System will air a 5-part series called "Healing and the Mind," narrated by Bill Moyers. The topics include Chinese medicine (featuring Dr. Eisenberg), "the relationship between the immune system and our emotions," group therapy and meditation, "the art of healing," and treatment at Commonweal, a "retreat center for people with cancer." The series was funded by the Fetzer Institute and four other sources. An article in *USA Today* has noted that Eisenberg, an instructor at Harvard Medical School, was the principal consultant for the series and is a Fellow of the Fetzer Institute. The article states that he hopes to create a teaching center "dedicated to the rigid assessment of unconventional therapies" with "a lot of political support and a lot of money to fund and implement." When asked how our already overburdened health-care system can afford to study unconventional methods, he replied, "How can we not spend millions of dollars to understand which are safe, effective and could save money?"

David Zimmerman, editor/publisher of *Probe*, has prepared 2-part report on the Fetzer Institute. In a recent conversation, he said, "It isn't often that the *New England Journal*, Consumers Union, and PBS can get snookered by the

FOR ADDITIONAL INFORMATION

Reader's Guide to "Alternative" Health Methods (\$30.00), written by two AMA Library officials, Stephen Barrett, M.D., and NCAHF president William Jarvis, Ph.D., cites and analyzes more than 1,000 reports on "unproven, disproven, controversial, fraudulent, quack, and/or otherwise questionable approaches to solving health problems." Each major topic includes an overview by the authors.

A Consumer's Guide to "Alternative Medicine" (\$18.00), written by Kurt Butler and edited by Stephen Barrett, M.D., is a treasure-trove of information on dubious products and practices. Two chapters confront leading "diet gurus" and "experts to be wary of." Another deals with chiropractic, which the author calls a "cancer of the health-care system." Another blasts acupuncture, naturopathy, ayurveda, multilevel marketers, and other "wannabes." Another attacks scores of modern "snake-oil" products. A chapter on "tabloid journalism" summarizes the author's 2-year study of TV talk shows, in which he recorded or obtained a transcript of almost every one that promoted dubious health ideas. The final chapter provides novel ideas for antiquackery activities. Orders should be sent to LVCAHF-NF, P.O. Box 1747, Allentown, PA 18105, adding \$2.00 for the first book and 50¢ for each additional book for postage.

same folks." (His reports can be obtained for \$5 from Probe, Box 1321, Cathedral Station, New York, NY 10025.)

The NIH Deback

In 1991, at the urging of former Congressman Berkley Bedell, Senator Tom Harkin (D-IA) secured passage of a law ordering NIH to foster research into unconventional practices and allocating \$2 million per year for two years. In various interviews, Bedell acknowledged that he had undergone unconventional treatment "to replenish nitrogen" for a suspected recurrence of prostate cancer.

Early in 1992, NIH appointed a 20-person ad hoc advisory panel that included him, Dr. Eisenberg, and leading advocates of acupuncture, energy medicine, homeopathy, Ayurvedic medicine, and several types of "alternative" cancer therapies. A few qualified researchers were placed on the panel, but they had little influence over subsequent events. In June, the panel met for two days to discuss research principles and to hear testimony from more than fifty assorted practitioners.

In addition to promoting their own approach to health care, many panelists and testifiers praised NIH for its "openness" and commented to the press that the event "legitimized" unconventional medicine itself. Panel members were considered "professional service contractors" and did not have to file conflict-of-interest statements or promise to refrain from using their advisory status in advertising their products and services. Although several "quackbusters," including me, were interviewed for possible appointment to the panel, we were neither selected nor notified about the meeting. When a list of panelists was faxed to me by a reporter, I predicted that many would trumpet their appointment as evidence that whatever they promote is valid. That is precisely what happened.

Panelists were assigned to committees, which made recommendations at a meeting in September. These included: (1) collecting and disseminating research literature on unconventional practices; (2) making the NIH office a permanent entity with authority to issue grants and peer-review committees that include experts in the therapies under consideration; (3) introducing medical and nursing students to alternative therapies while in school; and (4) a moratorium on legal actions and other sanctions against physicians who practice aspects of alternative medicine under consideration at NIH. Press reports indicate that the NIH office is considering proposals to fund studies of several methods. It remains to be seen whether such studies will be funded and will yield useful results. Even if useful research is conducted, however, its benefit is unlikely to outweigh the publicity bonanza given to quack methods.

Quackery vs. Science

"Alternative" practitioners typically use anecdotes and testimonials to promote their practices. When someone feels better after having used a product or procedure, it is natural to credit whatever was done. This can be misleading, however, because most ailments resolve themselves and those that

persist can have variable symptoms. Even serious conditions can have sufficient day-to-day variation to enable quack methods to gain large followings. In addition, taking action often produces temporary relief of symptoms (a placebo effect). People who are not aware of these facts tend to give undeserved credit to "alternative" methods.

When challenged about the lack of scientific evidence supporting whatever they espouse, promoters of quackery offer various responses. They may claim that scientific reports (whose meaning they distort) do back them up. They may claim that research isn't necessary because they have seen with their own eyes that their methods are effective. They may claim that funds are not available for them to perform research. Sometimes they claim that the scientific establishment is unwilling to test their methods or even to look at their data. They may claim that scientific journals are unwilling to consider their research because it poses a threat to the establishment. Each of these claims involves deception. Preliminary research does not require funding or even take much effort. The principal ingredients are careful clinical observations, detailed record-keeping, and long-term follow-up "to keep score." Proponents of "alternative" methods almost never do any of these things.

Under the rules of science and consumer protection, no procedure is presumed safe or effective until reasonably demonstrated to be so. National Council Against Health Fraud president William T. Jarvis, Ph.D., has noted that proponents should carry the burden of proof because "no agency could test all of the theories that people dream up." Actually, most proponents who clamor for research do so as a ploy to arouse public sympathy—the last thing they want is a scientific test that could prove them wrong. Should scientific studies be performed and come out negative, proponents invariably claim that the studies were conducted improperly or that the evaluators were biased.

It is often suggested that people seek "alternatives" because doctors are brusque, and that if doctors were more attentive, their patients would not turn to quacks. Doctors sometimes pay insufficient attention to the emotional needs of their patients. But blaming the medical profession for quackery's success would be like blaming astronomers for the popularity of astrology. Some people's needs exceed what ethical, scientific health care can provide. And many types of quackery have nothing to do with doctor-patient relationships. The main reason for quackery's success is its ability to seduce people who are unsuspecting or desperate. The massive publicity given to "alternatives" will do exactly that.

In December, I expressed several of these points in a lively debate with a naturopath, a homeopath, and a "nutritional doctor" on a "Donahue" show entitled "Can Alternative Medicine Replace Doctors?" Transcripts are available for \$3 from Journal Graphics, 1535 Grant St., Denver, CO 80203. Video-tapes (\$28.90) can be ordered by calling 1-800-367-84336.

Stephen Barrett, M.D., a practicing psychiatrist and consumer advocate, edits *Nutrition Forum Newsletter* and is co-author/editor of 32 books on health topics. He is a board member of the National Council Against Health Fraud and has been investigating the health marketplace for more than 20 years.

MINI-GLOSSARY OF "ALTERNATIVE" METHODS

Except for biofeedback, none of the items in this list has a rationale or underlying theory that is consistent with accepted scientific beliefs. Biofeedback has proven efficacy but is also promoted with dubious claims.

Acupressure (shiatsu): A technique that uses finger pressure instead of needles at "acupuncture points."

Acupuncture: A system of treatment purported to balance the body's "life force" by inserting needles (or using other forms of stimulation) at various points where imaginary horizontal and vertical lines ("meridians") meet on the surface of the body. These points are said to represent various internal organs (some of which are nonexistent). Although acupuncture can sometimes relieve pain, there is no evidence that it can influence the course of any organic disease.

Anthroposophical medicine: A set of practices based on the occult philosophy of Rudolph Steiner (1861-1925) and said to relate humankind to the natural environment, with emphasis on color, rhythm, and spirituality. Its practitioners frequently prescribe homeopathic remedies, herbs, study of musical instruments, social service projects, prayer, and meditation. The remedies are claimed to restore balance either by strengthening the therapeutic "etheric body" or by moderating the animalistic "astral body."

Applied kinesiology: A pseudoscience based on the belief that every organ dysfunction is accompanied by a specific muscle weakness that can be diagnosed by various tests. (Note: kinesiology, which is the study of the mechanics and anatomy of motion, is a legitimate science.)

Ayurvedic medicine: A set of practices promoted by transcendental meditation (TM) organizations. Ayurveda (meaning "life knowledge") is said to be based on a traditional Indian approach that includes meditation, purification procedures, rejuvenation therapies, herbal and mineral preparations, exercises and dietary advice based on "Ayurvedic body type."

Biofeedback: A technique that can help people learn to control certain body functions. The patient is connected to a device that continuously signals the heart beat, skin temperature, degree of muscle contraction, or other mechanism. In scientific hands, biofeedback has achieved a measure of respectability for helping patients control pain, anxiety, phobias, high blood pressure, sleep disorders, and some stomach and intestinal disorders. Some specialized techniques have been used to treat abnormal heart rhythms, epilepsy, Tourette's syndrome, fecal incontinence, and Parkinson's disease. However, claims that biofeedback fosters "personal growth," "self-understanding," "stabilization of the autonomic system," or the like are simplistic and unproven.

Cellular therapy: Injections of animal cells into the human body, claimed by various proponents to cure disease, rejuvenate or "revitalize" the body, and prolong life. The cells are commonly obtained from freshly slaughtered sheep fetuses, but other animals can be used. The method is also called "cell therapy" and "live-cell therapy."

Chelation therapy: A series of intravenous administrations of a synthetic amino acid (EDTA) plus various other substances. Proponents claim that chelation can reverse atherosclerosis and is effective against many other diseases. However, there is no scientific evidence that this is so.

Chinese medicine: A collection of practices that includes acupuncture, the use of herbs and dietary procedures, pulse diagnosis, and other procedures. (Pulse diagnosis supposedly involves six pulses at each wrist that correspond to twelve internal spheres of bodily function.)

Chiropractic: A broad spectrum of practices related to the false premise that spinal misalignments ("subluxations") are the cause, or underlying cause, of most ailments. Many chiropractors prescribe and sell supplement concoctions in their offices [NF 9:25-28, 1992]. Chiropractic has received considerable favorable publicity since a RAND Corporation study concluded that spinal manipulation may be appropriate for certain cases of low-back pain. However, most of the research upon which this conclusion was based was done under medical supervision and does not reflect what takes place in a typical chiropractic office.

Clinical ecology: A pseudoscience based on the premise that multiple common symptoms are triggered by hypersensitivity to common foods and chemicals. Also called "environmental medicine" by its proponents.

Colonic irrigation: A "high colonic" enema performed by passing a rubber tube into the rectum for a distance of up to 20 or 30 inches. Warm water is pumped in and out through the tube, a few pints at a time, typically using 20 or more gallons. Some practitioners add herbs, coffee, or other substances to the water. The procedure is said to "detoxify" the body, though no "toxins" have ever been specified or scientifically demonstrated.

Nutrition Forum (ISSN 0748-8165), © 1993, is published by Stephen Barrett, M.D. All articles and advertising inserts are fully endorsed by Dr. Barrett.

Individual subscriptions in the United States and Canada are \$35 for one year (six issues), payable to Nutrition Forum, P.O. Box 1747, Allentown, PA 18105. Institutional and other multireader subscriptions are \$50 for one year. Overseas subscriptions (via airmail) are \$50 for 1 year. Back issues are \$6 each.

All correspondence should be sent to Stephen Barrett, M.D., P.O. Box 1747, Allentown, PA 18105. Telephone 215-437-1795.

Complementary medicine: A term used by unscientific practitioners who claim to integrate both "alternative" and conventional methods into their practice.

Energy medicine: An umbrella term for various practices said to be based on the practitioner's ability to view or sense an individual's "energy field" or "etheric body." Some practitioners claim to rely on psychic ability, while others use "electro-diagnostic" devices.

"Holistic" approach: A slogan used to suggest that a practitioner treats the "whole person," with due attention to emotional factors as well as the person's lifestyle. Most practitioners who call themselves "holistic" use unscientific methods for diagnosis and treatment.

Homeopathy: A pseudoscience based on the idea that symptoms can be cured by taking infinitesimal amounts of substances that, in larger amounts, can produce similar symptoms in healthy people. Homeopathic theory states that the more dilute the remedy, the more powerful it is. (Some are said to be so dilute that no molecule of the original substance remains.)

Iridology: A pseudoscience based on the idea that each area of the body is represented by a corresponding area in the iris (pupil) of the eye. Practitioners claim to diagnose nutritional imbalances that can be treated with vitamins, minerals, herbs, and similar products.

Macrobiotic diet: A semi-vegetarian diet claimed by its proponents to improve health and prolong life. Proponents suggest that the diet is effective in preventing and treating cancer, AIDS, and other serious diseases. There is no evidence to support these claims. Some versions of the macrobiotic diet contain adequate amounts of nutrients, but others do not.

Mental imagery: A procedure in which detailed mental images are used in an attempt to control a situation. For example, cancer patients may imagine that their white blood cells are little knights in white armor attacking their tumors, which they picture as black dragons. New Age devotees may imagine that they have spirit guides and work to put as much detail as possible into the fantasized image.

Metabolic therapy: A loosely defined treatment program based on the idea that cancer, arthritis, and other chronic illnesses result from a disturbance of the body's ability to protect itself. The program is claimed to detoxify the body and strengthen

the immune system. Its components, which vary from practitioner to practitioner, may include megadoses of vitamins, oral enzymes, pangamic acid, coffee enemas, a low-protein diet, and laetrile (for cancer).

Natural hygiene: A form of naturopathy that emphasizes fasting, strict vegetarianism, and food-combining, a dietary practice based on the incorrect notion that certain food combinations can cause or correct ill health. Natural hygienists oppose immunization and food irradiation and eschew most forms of medical treatment.

Naturopathy: A system of treatment based on the belief that the cause of disease is violation of nature's laws. Naturopaths believe that diseases are the body's effort to purify itself, and that cures result from enhancing the body's ability to heal itself. Naturopathic treatments can include "natural food" diets, vitamins, herbs, tissue minerals, cell salts, manipulation, massage, exercise, diathermy, colonic enemas, acupuncture, and homeopathy. Like some chiropractors, many naturopaths believe that virtually all diseases are within the scope of their practice.

Nutripathy: A pseudoscience in which treatment with supplements and other measures is related to a formula devised by Cary Reams. Proponents claim that the formula, derived from the results of nonstandard urine and saliva tests, reveals energy input and energy use within the body. Reams, a self-professed biophysicist, was prosecuted for practicing medicine without a license during the 1970s.

Orthomolecular therapy: A treatment approach that supposedly provides the correct amounts of nutritionally "right" molecules normally found in the body. Its practitioners prescribe large doses of vitamins, minerals, and various other substances. It is sometimes referred to as megavitamin or meganutrient therapy.

Reflexology: Pseudoscience based on beliefs that each body part is represented on the hands and feet and that pressing on the hands and feet can have therapeutic effects in other parts of the body. Also called "zone therapy."

Therapeutic touch: A system in which the hands are used to "direct human energies to help or heal someone who is ill." Proponents claim that healers can detect and correct "energy imbalances" by stroking the body or placing their hands above the afflicted part. Healing supposedly can result from a transfer of "excess energy" from healer to patient.

NUTRITION MISINFORMATION IN THE DENTAL OFFICE

John E. Dodes, D.D.S.

Dental problems are among the most common ailments in the United States, accounting for over \$34 billion in dental bills in 1990. Most dentists work in solo or very small group practices where they are not exposed to the professional review and criticism of their colleagues. This situation, plus economic pressures and the poor education in scientific methodology and clinical nutrition afforded to most dentists, has led to the dissemination of dubious, erroneous, and fad nutrition information in many dental offices.

Dentistry has a long history of dentists promoting nutrition faddism. Weston Price, D.D.S., was the primary purveyor of pseudonutrition in dentistry. His book *Nutrition and Physical Degeneration* alleged that tooth decay was a tragic expression of our "modern degeneration," which he referred to as "race decay." Price blamed soil depletion, white flour, sugar, and pasteurized milk.

Royal Lee, a nonpracticing dentist who marketed vitamin products, opposed fluoridation, and promoted nutrition misinformation. In 1962, Lee and his company were convicted of misbranding 115 special dietary products by making false claims for the treatment of more than 500 diseases and conditions. Lee received a one-year suspended prison term and was fined \$7,000. In 1963, a prominent FDA official said Lee was "probably the largest publisher of unreliable and false nutritional information in the world." Although Lee died in 1967, many of the products are still marketed and prescribed inappropriately by dentists (and chiropractors).

Melvin Page, D.D.S., is the father of the phrase "balancing body chemistry." Page stated that dental caries is an "outstanding example of systemic chemical imbalances." His book, *Degeneration-Regeneration*, claims that there "is but one disease: inefficient body chemistry." Page's discredited ideas have been followed by many dentists, including Hal Huggins, D.D.S., of Colorado Springs, Colorado. In his videotaped "tour" of the Huggins Diagnostic Center, Huggins recommends using hair analysis as the basis for prescribing supplements to "balance body chemistry." However, hair analysis is not a valid basis for determining the body's nutritional state.

Huggins is also the leading advocate of the disproven allegations that the mercury in "silver" fillings causes a host of diseases, from arthritis to multiple sclerosis. This allegation is false because this mercury is strongly bound to the other materials in the amalgam and is not released in significant amounts.

Huggins prescribes special diets and "detoxifying" supplements before and following the removal of a patient's silver fillings. Replacement with gold or other materials is not only costly to the patient but can also cause great harm. In order to replace a filling it is necessary to enlarge the cavity in which it is placed, which may weaken the tooth or injure the nerve, causing the tooth to be lost. In 1985, a \$100,000 settlement was awarded to a 55-year-old California woman whose dentist had

removed her silver fillings after claiming that the fillings were a "liability" to her large intestine. In removing the fillings from five teeth, the dentist caused severe nerve damage requiring root canal therapy for two teeth and extraction of two others.

Another major figure in promoting dubious nutrition information is Emanuel Cheraskin, M.D., D.D.S. A former dental school professor, Cheraskin exaggerates the value of nutrition in health and disease and, in fact, argues that most, if not all diseases can be prevented and/or treated with diet alone. For example, Cheraskin is an advocate of "orthomolecular psychiatry," the disproven theory that emotional problems are caused by dietary deficiencies. The American Psychiatric Association has disclaimed this theory. In their books *New Hope for Incurable Diseases* and *Psychodietetics*, Cheraskin and co-author William Ringsdorf, D.D.S., make many scientifically unsupported claims concerning the value of nutrition in treating and preventing diseases, especially incurable ones. They claim, for example, that a diet low in sugar and processed carbohydrates will demonstrably tighten periodontally loose teeth in ten days. Cheraskin and Ringsdorf lecture widely, and both once taught at the University of Alabama's dental school.

A 1985 article in a dental trade journal was titled "Nutrition counseling boosted our practice." The article stated "Are you interested in doubling your net practice income? We almost did it last year . . . we used nutritional counseling as the vehicle." Usually "counseling" is not the only service such dentists provide. They also sell unnecessary and overpriced nutrition supplements, often through the use of discredited diagnostic methods such as hair analysis, lingual ascorbic acid testing, applied kinesiology, testing for food allergies, pendulum divining, and other occult practices. Some dentists sell supplements and herbal preparations as distributors for multi-level "health food" companies.

In 1985 many dentists, myself included, were contacted by Neil Brahe, D.D.S., a well known practice management "expert." Dr. Brahe was promoting United Sciences of America (USA) Inc., a multilevel vitamin and food supplement company. He stated, "You can make the products available to your patients . . . and they can purchase from the company with profit dollars coming to you." The claims for these supplements were roundly criticized as being unscientific and inaccurate, especially by Dr. Fredrick J. Stare, M.D., Ph.D., professor emeritus of the Harvard School of Public Health. In 1987 the company was successfully prosecuted by the Attorney Generals of New York, Texas, and California and driven out of business. But not before many unsuspecting dental patients were sold its expensive and useless products.

In 1979 a dentist who was a food faddist, told his 40-year-old diabetic patient, Carl Stevens, to stop taking insulin and substitute a "holistic" diet. Within three weeks Carl was dead, but his dentist persuaded Carl's widow that Carl could be brought back from the dead through special rituals and psychic

communication. Eight years later Carl Stevens' mummified remains were discovered in his Illinois home. The dentist, whose dental license had been revoked for failure to renew, was sentenced to 30 months' probation.

Patients with temporomandibular joint (TMJ) disorders, characterized by chronic facial pain and difficulty opening the mouth, are often treated with a host of unscientific methods usually including food supplements and vitamins. One author recommended "raw veal bone" for this condition.

A number of dentists are giving patients with periodontal disease vitamin preparations, especially vitamin C, even though studies have shown no benefit. And it is not unusual to hear of patients being sold expensive food supplements and vitamins as part of implant treatment or even routine dental therapy. One reason this occurs is because dentists are poorly trained in the principles of scientific reasoning and are barraged by quack courses given at dental conventions and seminars.

Dental meetings, conventions, and many dental journals do not screen lecturers and writers for scientific validity. In December 1989, for example, the *New York State Dental Journal* published an article by a dentist on "Health, Nutrition and Aging," which included the false claim that soil depletion and food processing produce nutritionally impoverished food. This, of course, is untrue. Our soils are not nutrient-deficient. Even if they were, however, the result would not be vitamin-deficient plants, but smaller yields. And food processing often increases the nutritional value of the food. This article cited many discredited and unscientific vitamin promoters as references and should never have been published in a state dental journal.

The 1989 Greater New York Dental Meeting (the

largest dental convention in the world) offered a course by a physician who is a proponent of clinical ecology, a discredited form of "allergy" treatment. During his lecture he advocated a number of fad nutrition practices. When a reputable professional association offers a course eligible for continuing education credit, it is easy to assume that the course is scientifically valid. The American Dental Association has expressed concern about dubious seminars but fears that aggressive actions (such as "blacklisting" speakers) could trigger expensive lawsuits. Another factor is that these dubious courses can generate large profits for the sponsors.

The media often promote food faddism with inaccurate and misleading stories. Articles in *Newsweek* and *Chemical & Engineering News* have greatly distorted the facts on fluoridation, and "60 Minutes" on CBS TV has aired a horrendous program attacking the use of silver-fillings. Media that prime the pump of quackery in this manner help greedy and/or gullible dentists to pander to patients' health fears.

Concerned dentists and dental educators are seeking stricter standards for lecturers and authors in major dental meetings and journals. They are also urging that dental education be improved by including courses on scientific method, statistics, and the recognition of quackery. Meanwhile the public should be wary of dentists who preach faddist nonsense and sell dietary supplements under the guise of "nutrition counseling."

Dr. Dodes, who practices in Woodhaven, N.Y., is president of the New York State chapter of the National Council Against Health Fraud.

BRIEFS

Diet and cancer surprise. An 8-year study of 89,494 nurses who were between ages 34 and 59 when the study began has found no evidence that a high intake of dietary fat increases the incidence of breast cancer or that a high intake of dietary fiber protects against it [JAMA 268:2037-2044, 1992]. The authors note, however, that recommendations to reduce the intake of animal fat (saturated fat) still are justified to reduce the incidence of cardiovascular disease and possibly colon cancer.

Opposition to genetically engineered foods. Leaders of the Pure Food Campaign (PFC), a project of biotechnology critic Jeremy Rifkin's Foundation on Economic Trends, claim that decals with their boycott logo are appearing in restaurants and retail stores and that 1,500 chefs have pledged to refuse to purchase, prepare, or serve genetically engineered foods. PFC's warning statements and tactics resemble those of food irradiation opponents and are just as ill-founded. PFC has announced its intention to launch an international boycott of the Campbell Soup Company, which financed the development of the Flavr Savr tomato [see NF 9:24, 1992], unless the company halts research and marketing of genetically engineered tomatoes.

Fewer food stamp vendors. Federal laws require that at least half of a store's food stamp sales be in staple items for home consumption, such as bread, milk, meat, and cereals. The Pennsylvania Food Advocate has reported that about 650 convenience stores were being dropped from participation in the Food Stamp program because they sell more snacks than staple food. Many of these stores are in inner-city neighborhoods that no longer have large supermarkets. Last spring the U.S. Department of Agriculture began a 2-year review of the 213,000 retailers nationwide who had been accepting food stamps. About 26 million Americans use the stamps.

Notable quote: The power over people the Prophet role provides is awesome. Some doctors consciously avoid it. They are right to teach patients self-reliance and discourage dependency behavior, but in doing so they may fail to meet important emotional needs in their patients. Quacks, on the other hand, revel in, encourage and exploit this power. Egomania is commonly found among quacks. They enjoy the adulation . . . their pretense of superiority evokes."—William T. Jarvis, Ph.D., *Bulletin of the Louisville (Ky.) Medical Society, Feb. 1991*

Vitamin C and iron overload. Victor Herbert, M.D., J.D. has asked the FDA to require that vitamin C supplements be labeled: "Warning: Do not take this product unless your body iron status has been assessed by a competent health professional... Vitamin C supplements are dangerous for people with excess body iron. About 10% of Americans have such excess because they inherited a gene for it; few know they have it. In addition, most people receiving frequent blood transfusions have excess body iron, as do the majority of people deficient in either folic acid or vitamin B₁₂. It is important to recognize that weakness, tiredness, and mild anemia can occur with iron excess just as with iron deficiency."

Dieters exaggerate weight loss. A study of 82 adults who had participated in community weight-loss programs has found that the average (mean) self-reported weight was about five pounds less than the weight as measured by the researchers [Journal of the American Dietetic Association 92:1483-1486, 1992]. Those who weighed the most tended to have the largest discrepancies.

Raw milk danger. A survey of 51 state and territorial health departments has tabulated 20 outbreaks of acute diarrhea that occurred between 1981 and 1990, due to drinking unpasteurized (raw) milk during school trips or other organized youth activities [JAMA 268:3228-3230]. Fourteen occurred among children in kindergarten through third grade. In the affected groups, 45% of 1,013 who drank the raw milk became infected with *Campylobacter* organisms. The authors note that the dairy industry has not been able to eradicate the organisms from its herds and that cows excreting them can appear healthy. Thus the only way to prevent human infection is to avoid raw milk.

"Organic food" news. The California Department of Food and Agriculture has fined a San Francisco grocer \$500 for misrepresenting selling conventionally grown produce as "organically grown." This is the first such penalty issued under the California Organic Foods Act of 1990. *Organic Times* has reported that 1991 sales for the organic industry totalled \$1.25 billion, a 25% increase over 1990, and that the number of growers increased to 3,114, up 38% from 1990. Meanwhile, the National Organic Standards Board—charged by a 1990 law to develop federal standards [see NF 8:25-29, 1990]—has had its operating funds slashed from \$120,000 for fiscal year 1992 to \$15,600 for the current fiscal year, despite a request for \$780,000. An article in the Winter 1993 *Organic Farmer* magazine states that the board's work will continue "mostly via phone, fax, and mail," but the October 1993 implementation deadline is "unrealistic, even with full funding."

CDC changes name. A new law has changed the name of the U.S. Centers for Disease Control to the Centers for Disease Control and Prevention. However its initials will remain "CDC," because they are so widely recognized. Headquartered in Atlanta, with some personnel in the Washington, D.C., area, the agency has more than 7,000 employees.

Nutri-System update. *The Diet Business Bulletin* has reported that many suits alleging that Nutri-System's low-fat diet caused gallstone formation have been settled out of court with the stipulation that settlement terms would not be disclosed by the person suing. Three suits that went to court during the past 18 months were decided in favor of the company.

"Tanning tablets" prohibited. Janet V. Hopper, former president and sole shareholder of AMT Research, Inc., of Greensboro, N.C., has consented to a permanent injunction barring her from interstate marketing of any product containing canthaxanthin or any unapproved food additive. According to a report in the January-February 1993 *FDA Consumer*, the company had falsely advertised that its *BronzTan* and *BronzGlo* tablets had government approval for tanning purposes and that no harmful side effects were known. Canthaxanthin is legally used in tiny amounts as a food coloring agent for soups, fruit drinks, salad dressings, catsup, and margarine. Ingestion of larger amounts can tint the skin orange. Despite a warning by the FDA, it has been illegally sold in tanning parlors and by mail as a tablet for skin "tanning." Medical reports have linked canthaxanthin use to hepatitis, generalized itching, hives, and eye problems. The consent decree was based in part on Ms. Hopper's assurance that her company, had been dissolved.

Low-dose caffeine withdrawal. A controlled double-blind study of 62 adults with caffeine intakes equivalent to 2.5 cups of coffee per day found that about half experienced moderate or severe headaches and some experienced anxiety, depression, and/or fatigue when their caffeine intake was stopped abruptly [New England Journal of Medicine 327:1109-1114, 1992]. The authors concluded that people who consume low or moderate amounts of caffeine may have a withdrawal syndrome after their daily consumption of caffeine ceases. Reprints of the report can be obtained from Roland R. Griffiths, Ph.D., Dept. of Psychiatry and Behavioral Sciences, Johns Hopkins University School of Medicine, 5510 National Shock Drive, Suite 3000, Baltimore, MD 21224. *Editor's note: Although not addressed by this study, abrupt withdrawal from one cup of coffee daily can produce severe symptoms in some individuals. This can be avoided by gradually tapering intake over a period of a week or so.*

Dubious cancer remedy banned. The FDA has obtained an injunction forbidding the distribution of Cancell (also called Entelev) to patients. The product, originally called Entelev, is a liquid promoted for the treatment of cancer, AIDS, and many other diseases. It is purported to cure cancer by reducing the voltage of cancer cells until they become "primitive" and self-destruct. In 1989, the FDA reported that Cancell contained inositol, nitric acid, sodium sulfite, potassium hydroxide, sulfuric acid, and catechol. Subsequently, its promoters claimed to be modifying the formulation to make it more effective. Laboratory tests conducted between 1978 and 1991 by the National Cancer Institute found no evidence that Cancell was effective against cancer. The American Cancer Society has published a detailed report advising against its use [CA 43:57-62, 1993].

VITAMIN PUSHERS AND FOOD QUACKS

Victor Herbert, M.D., J.D.

We still are in the midst of a vitamin craze. Nutrition hustlers are cleaning up by stoking our fears and stroking our hopes. With their deceptive credentials, they dominate air waves and publications. Talk show hosts love them because their false promises of superhealth draw huge audiences. The situation now appears even worse than it was more than twenty-five years ago, when FDA Commissioner George P. Larrick stated:

The most widespread and expensive type of quackery in the United States today is the promotion of vitamin products, special dietary foods, and food supplements. Millions of consumers are being misled concerning the need for such products. Complicating this problem is a vast and growing "folklore" or "mythology" of nutrition which is being built up by pseudoscientific literature in books, pamphlets and periodicals. As a result, millions of people are attempting self-medication for imaginary and real illnesses with a multitude of more or less irrational food items. Food quackery today can only be compared to the patent medicine craze which reached its height in the last century.

"Health food" rackets cost Americans billions of dollars a year. The major victims of this waste are the elderly, the pregnant, the sick, and the poor.

The Fundamentals of Good Nutrition

Have you been brainwashed by vitamin pushers? Do you believe you should supplement your diet with extra nutrients? Do you believe that, "If some is good, more is better"? Do you believe extra nutrients can't hurt"? Or that they provide "nutrition insurance"? If you believe any of these things, you have been misled.

The fundamentals of good nutrition are simple: To get the amounts and kinds of nutrients your body needs, eat moderate amounts of food from each of the food groups designated by the U.S. Department of Agriculture's Daily Food Guide, choosing a wide variety within each category. (For

detailed instructions send \$1 for USDA's *Food Guide Pyramid* booklet [Publication No. HG 249] to the Consumer Information Center, Pueblo, CO 81009.) This food plan provides for adequate quantities of all vitamins, minerals, and protein components. Actually, normal people eating a balanced variety of foods are likely to consume *more* nutrients than they need. Of course, health hucksters won't tell you this because their income depends upon withholding that truth. Unlike responsible practitioners, they do not make their living by trying to keep you healthy, but rather by tempting you with false claims. These claims raise their personal appearance fees, sell their books and magazine articles, and sell the products of companies in which (unknown to you) they may have a financial interest.

The Dangers of Excess Vitamins

When on the defensive, quacks are quick to demand, "How do you know it doesn't help?" The reply to this is "How do you know it doesn't *harm*?" Many substances that are harmless in small or moderate doses can be harmful either in large doses or by gradual build-up over many years. Just because a substance (such as a vitamin) is found naturally in food does not mean it is harmless in large doses.

When scientists speak of "excess" vitamins, they mean dosages in excess of the "Recommended Dietary Allowances (RDAs)" set by the Food and Nutrition Board of the National Research Council, National Academy of Sciences. The RDAs are the "levels of intake of essential nutrients considered, in the judgment of the Food and Nutrition Board on the basis of available scientific knowledge, to be adequate to meet the known nutritional needs of practically all healthy persons." RDAs should not be confused with "requirements." They are more than most people require. They are set not only to meet body needs, but to allow substantial storage to cover periods of reduced intake or increased need. Amounts higher than the RDAs serve no vitamin function in the body. They should be considered *drugs* and can be an invitation to trouble.

There are two situations in which the use of vitamins in excess of the RDAs is legitimate. The first is the treatment of

medically diagnosed deficiency states—conditions that are rare except among alcoholics, persons with intestinal malabsorption defects, and the poor, especially those who are pregnant or elderly. The other use is in the treatment of certain conditions in which vitamins are used for their chemical (non-vitamin) actions. None of these situations is suitable for self-treatment.

How can vitamin pushers and food quacks be identified? The following behavior should make you suspicious.

They use anecdotes and testimonials to support their claims.

We all tend to believe what others tell us about personal experiences. But separating cause and effect from coincidence can be difficult. If people tell you that product X has cured their cancer, arthritis, or whatever, be skeptical. They may not actually have had the condition. If they did, their recovery most likely would have occurred without the help of product X. Most single episodes of disease recover with just the passage of time, and most chronic ailments have symptom-free periods. Establishing medical truths requires careful and repeated investigation—with well-designed experiments, not reports of coincidences misperceived as cause-and-effect. That's why testimonial evidence is forbidden in scientific articles and usually is inadmissible in court.

Never underestimate the extent to which people can be fooled by a worthless remedy. During the early 1940s, many thousands of people became convinced that "glyoxylide" could cure cancer. Yet analysis showed it was simply distilled water!

Symptoms that are psychosomatic (bodily reactions to tension) are often relieved by anything taken with a suggestion that it will work. Tiredness and other minor aches and pains may respond to any enthusiastically recommended nostrum. For these problems, even physicians may prescribe a placebo. A placebo is a substance that has no pharmacological effect on the condition for which it is used, but is given to satisfy a patient who supposes it to be a medicine. Vitamins (such as B₁₂) are commonly used in this way.

Placebos act by suggestion. Unfortunately, some doctors swallow the advertising hype or become confused by their own observations and "believe in vitamins" beyond those supplied by a good diet. Those who share such false beliefs do so because they confuse coincidence or placebo action with cause and effect. Homeopathic believers make the same error.

Talk show hosts give quacks a boost when they ask "What do all the vitamins you take do for you personally?" Then thousands or even millions of viewers are treated to the quack's talk of improved health, vigor and vitality—with the implicit point: "It did this for me. It will do the same for you." A most revealing testimonial experience was described during a major network show that hosted several of the world's most prominent promoters of nutritional faddism. While the host was boasting that his new eating program had cured his "hypoglycemia," he mentioned in passing that he was no longer drinking twenty to thirty cups of coffee a day. Neither the host nor any of his "experts" had the good sense to tell their audience how

dangerous it can be to drink so much coffee. Nor did any of them recognize that the host's original symptoms were probably caused by excess caffeine.

They promise quick, dramatic, miraculous cures.

The promises are usually subtle or couched in "weasel words"—so they can deny making them when the feds close in. Such promises are the quacks' most immoral practice. They don't seem to care how many people they break financially or in spirit—by elation over their claims of quick cure followed by deep depression when the claims prove false. Nor do quacks keep count—while they fill their bank accounts—of how many people they lure away from effective medical care into disability or death.

They use disclaimers couched in pseudomedical jargon.

Instead of promising to cure your disease, some quacks will promise to "detoxify" your body, "balance" its chemistry, release its "nerve energy," bring it in harmony with nature, "stimulate" or "strengthen" your immune system, or "support" various organs in your body. (Of course they never identify or make valid before-and-after measurements of any of these processes.) These disclaimers serve two purposes. Since it is impossible to measure the processes they allege, it may be difficult to prove them wrong. Moreover, if a quack is not a physician, the use of nonmedical terminology may help to avoid prosecution for practicing medicine without a license—although it shouldn't.

They display credentials not recognized by responsible scientists or educators.

The backbone of educational integrity in America is a system of accreditation by agencies recognized by the U.S. Secretary of Education and/or the Council on Postsecondary Accreditation. "Degrees" from unaccredited schools are rarely worth the paper they are printed on. In the health field, there is no such thing as a reliable school that is not accredited. Since quacks operate outside of the scientific community, they also tend to form their own "professional" organizations.

In some cases, the only membership requirement is payment of a fee. My office wall displays fancy "professional member" certificates for Charlie Herbert (a cat) and Sassafras

Nutrition Forum (ISSN 0748-8165), © 1993, is published by Stephen Barrett, M.D. All articles and advertising inserts are fully endorsed by Dr. Barrett.

Individual subscriptions in the United States and Canada are \$35 for one year (six issues), payable to Nutrition Forum, P.O. Box 1747, Allentown, PA 18105. Institutional and other multireader subscriptions are \$50 for one year. Overseas subscriptions (via airmail) are \$50 for 1 year. Back issues are \$6 each.

Herbert (a dog). Each was acquired simply by submitting the animal's name, our address, and a check for \$50. Don't assume that all groups with scientific-sounding names are respectable. Find out whether their views are scientifically based.

Unfortunately, possession of an accredited degree does not guarantee reliability. Some schools that teach unscientific methods (chiropractic, naturopathy, and acupuncture) have achieved accreditation. Worse yet, a small percentage of individuals trained in reputable institutions (such as medical or dental schools or accredited universities) have strayed from scientific thought.

Some quacks are promoted with superlatives like "the world's foremost nutritionist" or "America's leading nutrition expert." There is no law against this tactic, just as there is none against calling oneself the "World's Foremost Lover." However, the scientific community recognizes no such title.

They encourage patients to lend political support to their treatment methods.

A century ago, before scientific methodology was generally accepted, valid new ideas were hard to evaluate and were sometimes rejected by a majority of the medical community, only to be upheld later. But today, treatments demonstrated as effective are welcomed by scientific practitioners and do not need a group to crusade for them. *Quacks seek political endorsement because they can't prove that their methods work.* Instead, they may seek to legalize their treatment and force insurance companies to pay for it. Judges and legislators who believe in caveat emptor (let the buyer beware) are natural allies for quacks.

They say that most disease is due to faulty diet and can be treated with "nutritional" methods.

This simply isn't so. Consult your doctor or any recognized textbook of medicine. They will tell you that although diet is a factor in some diseases (most notably coronary heart disease), most diseases have little or nothing to do with diet. Common symptoms like malaise (feeling poorly), tiredness, lack of pep, aches (including headaches) or pains, insomnia and similar complaints are usually the body's reaction to emotional stress. The persistence of such symptoms is a signal to see a doctor to be evaluated for possible physical illness. It is not a reason to take vitamin pills.

Some quacks seem to specialize in the diagnosis and treatment of problems considered rare or even nonexistent by responsible practitioners. Years ago hypothyroidism and

adrenal insufficiency were in vogue. Today's "fad" diagnoses are "hypoglycemia," "mercury amalgam toxicity," "candidiasis hypersensitivity," and "environmental illness." Quacks are also jumping on the allergy bandwagon, falsely claiming that huge numbers of Americans are suffering from undiagnosed allergies, "diagnosing" them with worthless tests, and prescribing worthless "nutritional" treatments.

They recommend a wide variety of substances similar to those found in your body

The underlying idea—like the wishful thinking of primitive tribes—is that taking these substances will strengthen or rejuvenate the corresponding body parts. For example, according to a health food store brochure:

Raw glandular therapy, or "cellular therapy" . . . seems almost too simple to be true. It consists of giving in supplement form (intravenous or oral) those specific tissues from animals that correspond to the "weakened" areas of the human body. In other words, if a person has a weak pancreas, give him raw pancreas substance; if the heart is weak, give raw heart, etc.

Vitamins and other nutrients may be added to the various preparations to make them more marketable. When taken by mouth, such concoctions are no better than placebos. They usually don't do direct harm, but their allure may steer people away from competent professional care. Injections of raw animal tissues, however, can cause severe allergic reactions to their proteins. Some preparations have also caused serious infections.

Proponents of "tissue salts" allege that the basic cause of disease is mineral deficiency—correction of which will enable the body to heal itself. Thus, they claim, one or more of twelve salts are useful against a wide variety of diseases, including appendicitis (ruptured or not), baldness, deafness, insomnia, and worms. Development of this method is attributed to a nineteenth-century physician named W.H. Schuessler.

Enzymes for oral use are another rip-off. They supposedly aid digestion and "support" many other functions within the body. The fact is, however, that enzymes taken by mouth are digested into their component amino acids by the stomach and intestines and therefore don't function as enzymes within the body. Oral pancreatic enzymes have legitimate medical use in diseases involving decreased secretion of one's own pancreatic enzymes. Anyone who actually has a pancreatic enzyme deficiency probably has a serious underlying disease requiring competent medical diagnosis and treatment.

EDITORIAL BOARD

EDITOR: Stephen Barrett, M.D. **SR. ASSOCIATE EDITORS:** Manfred Kroger, Ph.D., Jack Raso, M.S., R.D.; **ASSOCIATE EDITORS:** Michael Botts, Esq.; William T. Jarvis, Ph.D.; Grace Powers Monaco, Esq.; **CONTRIBUTING EDITORS:** Johanna Dwyer, Sc.D., R.D.; Mary Abbott Hess, R.D., M.S.; James J. Kenney, Ph.D., R.D.; Marilyn Larkin; James A. Lowell, Ph.D.; Ira Milner, R.D.; Varro E. Tyler, Ph.D.; and staff members of the Pennsylvania State University Nutrition Information and Resource Center. **SCIENTIFIC CONSULTANTS:** John A. Dodes, D.D.S.; Victor Herbert, M.D., J.D.; Gabe Mirkin, M.D. **PUBLICATIONS CONSULTANT:** George F. Stickley.

When talking about nutrients, they tell only part of the story.

They tell you all the wonderful things that vitamins and minerals do in your body and/or all the horrible things that can happen if you don't get enough. But they conveniently neglect to tell you that a balanced diet can provide all the nutrients you need, and that the USDA Pyramid Food Guide system makes balancing your diet simple. Unfortunately, it is legal to lie in a publication or lecture or on a talk show as long as the claims are not connected to selling a specific product. Many supplement manufacturers use subtle approaches. Some simply say "Buy our product X... It contains nutrients that help promote healthy eyes (or hair, or whatever organ you happen to be concerned about)." Others distribute charts saying what each nutrient does and the signs and symptoms of deficiency disease. This encourages supplementation with the hope of enhancing body functions and/or avoiding the troubles described.

Another type of fraudulent concealment is the promotion of "supplements" and herbal extracts based on incomplete information. Many health food industry products are marketed with claims based on faulty extrapolations of animal research and/or unconfirmed studies on humans. The most notorious such product was L-tryptophan, an amino acid. For many years it was promoted for insomnia, depression, premenstrual syndrome and overweight, even though it had not been proven safe or effective for any of these purposes. In 1989, it triggered an outbreak of eosinophilia-myalgia syndrome, a rare disorder characterized by severe muscle and joint pain, weakness, swelling of the arms and legs, fever, skin rash, and an increase of eosinophils (certain white blood cells) in the blood. Over the next year, more than 1,500 cases and 28 deaths were reported. The outbreak was traced to a manufacturing problem at the plant of a wholesale supplier. The naked truth is that L-tryptophan should not have been marketed to the public in the first place because—like most single-ingredient amino acids—it had not been proven safe for medicinal use. In fact, the FDA had issued a ban during the mid-1970s, but had not enforced it.

They claim that most Americans are poorly nourished.

This is an appeal to fear that is not only untrue, but ignores the fact that the main forms of bad nourishment in the United States are undernourishment among the poverty-stricken and overweight in the population at large, particularly the poor. Poor people can ill afford to waste money on unnecessary vitamin pills. Their food money should be spent for nourishing food. With one exception, food-group diets contain all the nutrients that people need. The exception involves the mineral iron. The average American diet contains barely enough iron to meet the needs of infants, fertile women, and, especially, pregnant women. This problem can be solved simply by cooking in a "Dutch oven" or any iron pot or eating iron-rich foods such as soy beans, liver, and veal muscle.

It is falsely alleged that Americans are so addicted to "junk" foods that an adequate diet is exceptional rather than

usual. It is true that some snack foods are mainly "naked calories" (sugars and/or fats without other nutrients). But it is not necessary for every morsel of food we eat to be loaded with nutrients. No normal person following the USDA's food group system is in any danger of vitamin deficiency.

They tell you that if you eat badly, you'll be OK if you take supplements.

This is the "Nutrition Insurance Gambit." The statement is not only untrue but encourages careless eating habits. The remedy for eating badly is a well balanced diet. If in doubt about the adequacy of your diet, write down what you eat for several days and see whether your daily average is in line with the USDA's guidelines. If you can't do this yourself, your doctor or a registered dietitian can do it for you.

They allege that modern processing methods and storage remove all nutritive value from our food.

It is true that food processing can change the nutrient content of foods. But the changes are not so drastic as the quack, who wants you to buy supplements, would like you to believe. While some processing methods destroy some nutrients, others add them. A balanced variety of foods will provide all the nourishment you need.

Quacks distort and oversimplify. When they say that milling removes B-vitamins, they don't bother to tell you that enrichment puts them back. When they tell you that cooking destroys nutrients, they omit the fact that only a few nutrients are sensitive to heat. Nor do they tell you that these few nutrients are easily obtained from a portion of fresh uncooked fruit, vegetable, or fresh or frozen fruit juice each day.

They claim that fluoridation is dangerous.

Curiously, quacks are not always interested in real deficiencies. Fluoride is necessary to build decay-resistant teeth and strong bones. The best way to obtain adequate amounts of this essential nutrient is to augment community water supplies so their fluoride concentration is about one part fluoride for every million parts of water. But quacks are usually opposed to water fluoridation, and some advocate water filters that remove fluoride. It seems that when they cannot profit from something, they may try to make money by opposing it.

They oppose pasteurization of milk.

One of the strangest aspects of nutrition quackery is its embrace of "raw" (unpasteurized) milk. Public health authorities advocate pasteurization to destroy any disease-producing bacteria that may be present. Health faddists and quacks claim that it destroys essential nutrients. Although about 10 percent of the heat-sensitive vitamins (vitamin C and thiamine) are destroyed during pasteurization, milk would not be a significant source of these nutrients anyway. Raw milk, whether "certified"

or not, can be a source of harmful bacteria that cause dysentery and tuberculosis. The FDA has banned the interstate sale of raw milk and raw-milk products packaged for human consumption. In 1989, a California Superior Court judge ordered the nation's largest raw milk producer to stop advertising that its raw milk products are safe and healthier than pasteurized milk and to label its products with a conspicuous warning.

They claim that soil depletion and the use of "chemical" fertilizers result in less nourishing food.

These claims are used to promote the sale of so-called "organically grown" foods. If a nutrient is missing from the soil, a plant just does not grow. Chemical fertilizers counteract the effects of soil depletion. Plants vary in mineral content, but this is not significant in the American diet. Quacks also lie when they claim that plants grown with natural fertilizers (such as manure) are nutritionally superior to those grown with synthetic fertilizers. Before they can use them, plants convert natural fertilizers into the same chemicals that synthetic fertilizers supply.

They claim that under stress, and in certain diseases, your need for nutrients is increased.

Many vitamin manufacturers have advertised that "stress robs the body of vitamins." One company has asserted that, "if you smoke, diet, or happen to be sick, you may be robbing your body of vitamins." Another has warned that "stress can deplete your body of water-soluble vitamins . . . and daily replacement is necessary." Other products are touted to fill the "special needs of athletes."

While it is true that the need for vitamins may rise slightly under physical stress and in certain diseases, this type of advertising is fraudulent. The average American—stressed or not—is not in danger of vitamin deficiency. The increased needs to which the ads refer almost never rise above the RDAs and can be met by proper eating. Someone who is really in danger of deficiency as a result of illness would be a very ill person who needs medical care, probably in a hospital. But these promotions are aimed at average Americans who certainly don't need vitamin supplements to survive the common cold, a round of golf, or a jog around the neighborhood! Athletes get more than enough vitamins when they eat the food needed to meet their caloric requirements.

Many vitamin pushers suggest that smokers need vitamin C supplements. While it is true that smokers in North America have somewhat lower blood levels of this vitamin, these levels are still far above deficiency levels. In America, cigarette smoking is the leading cause of death preventable by self-discipline. Rather than seeking false comfort by taking vitamin C, smokers who are concerned about their health should stop smoking. Moreover, since doses of vitamin C high enough to acidify the urine speed up excretion of nicotine, they may even cause some smokers to smoke more to avoid symptoms of nicotine withdrawal. Suggestions that "stress vitamins" are helpful against emotional stress are also fraudulent.

They claim you are in danger of being "poisoned" by ordinary food additives and preservatives.

This is a scare tactic designed to undermine your confidence in food scientists and government protection agencies. Quacks want you to think they are out to protect you. They hope that if you trust them, you will buy what they recommend. The fact is that the tiny amounts of additives used in food pose no threat to human health. Some actually protect our health by preventing spoilage, rancidity, and mold growth.

Two examples illustrate how ridiculous quacks can get about food additives, especially those found naturally in food. Calcium propionate is used to preserve bread and occurs naturally in Swiss cheese. Quacks who would steer you toward (higher-priced) bread made without preservatives are careful not to tell you that a one-ounce slice of "natural" Swiss cheese contains the same amount of calcium propionate used to retard spoilage in two one-pound loaves of bread. Similarly, those who warn about monosodium glutamate (MSG) don't tell you that the wheat germ they hustle as a "health food" is a major natural source of this substance.

Also curious is their failure to warn that many plant substances sold in health food stores are potentially toxic and can cause disability or death. The April 6, 1979, *Medical Letter* listed more than thirty such products, most of them used for making herbal teas.

They claim that "natural" vitamins are better than "synthetic" ones.

This claim is a flat lie. Each vitamin is a chain of atoms strung together as a molecule. Molecules made in the "factories" of nature are identical to those made in the factories of chemical companies. Does it make sense to pay extra for vitamins extracted from foods when you can get all you need from the foods themselves?

They claim that sugar is a deadly poison.

Many vitamin pushers would have us believe that sugar is "the killer on the breakfast table" and is the underlying cause of everything from heart disease to hypoglycemia. The fact is, however, that when sugar is used in moderation as part of a normal, balanced diet, it is a perfectly safe source of calories and eating pleasure. In fact, if you ate no sugar, your liver would make it from protein and fat because your brain needs it.

They recommend that everybody take vitamins or "health foods" or both.

Food quacks belittle normal foods and ridicule the food-group systems of good nutrition. They may not tell you that they earn their living from such pronouncements—via public appearance fees, product endorsements, sale of publications, or financial interests in vitamin companies, health food stores, or organic farms.

The very term "health food" is a deceptive slogan. All food is health food in moderation; any food is junk food in excess. Did you ever stop to think that your corner grocery, fruit market, meat market, and supermarket are also health food stores? They are—and they generally charge less than stores that use the slogan.

Many vitamin pushers make misleading claims for bioflavonoids, rutin, inositol, paraaminobenzoic acid (PABA), and other such food substances. These substances are not needed in the diet, and the FDA forbids nutritional claims for them on product labels.

By the way, have you ever wondered why people who eat lots of "health foods" still feel they must load themselves up with vitamin supplements?

They suggest that hair analysis can be used to determine the body's nutritional state.

"Health food" stores and various unscientific practitioners suggest this test. For \$25 to \$50 plus a lock of your hair, you can get an elaborate computer printout of vitamins and minerals you supposedly need. Hair analysis has limited value (mainly in forensic medicine) in the diagnosis of heavy metal poisoning, but it is worthless as a screening device to detect nutritional problems. In fact, a deficiency in the body may be accompanied by an *elevated* hair level. If a hair analysis laboratory recommends supplements, you can be sure that its computers are programmed to recommend them to everyone.

Several years ago Dr. Stephen Barrett sent hair samples from two healthy teenagers under different assumed names to thirteen commercial hair analysis laboratories. The reported levels of most minerals varied considerably between identical samples sent to the same laboratory and from laboratory to laboratory. The labs also disagreed about what was "normal" or "usual" for many of the minerals. So even if hair analysis could be useful in nutritional practice, there's no assurance that commercial laboratories perform it accurately.

They suggest that a questionnaire can be used to indicate whether you need dietary supplements.

No questionnaire can do this. A few entrepreneurs have devised lengthy computer-scored questionnaires with questions about symptoms that could be present if a vitamin deficiency exists. But such symptoms occur much more frequently in conditions unrelated to nutrition. Even when a deficiency actually exists, the tests don't provide enough information to discover the cause so that suitable treatment can be recommended. That requires a physical examination and appropriate laboratory tests. Many responsible nutritionists use a computer to help evaluate their clients' diet. But this is done to make *dietary* recommendations, such as reducing fat content or increasing fiber content. Supplements are seldom useful unless the person is unable (or unwilling) to consume an adequate diet.

Be wary, too, of brief questionnaires purported to provide a basis for determining whether supplements may be

needed. Responsible questionnaires compare the individual's average daily consumption with the recommended numbers of servings from each food group. The safest and best way to get nutrients is generally from food, not pills. So even if a diet is deficient, the most prudent action is usually diet modification rather than supplementation with pills.

They tell you it is easy to lose weight.

Diet quacks would like you to believe that special pills or food combinations can cause "effortless" weight loss. But the only way to lose weight is to burn off more calories than you eat. This requires self-discipline: eating less, exercising more, or preferably doing both. There are 3,500 calories in a pound of body weight. To lose one pound a week (a safe amount), you must eat an average of 500 fewer calories per day than you burn up. The most sensible diet for losing weight is one that is nutritionally balanced in carbohydrates, fats and proteins. Most fad diets "work" by producing temporary weight loss—as a result of calorie restriction. But they are invariably too monotonous and are often too dangerous for long-term use. Unless a dieter develops and maintains better eating and exercise habits, weight lost on a diet will soon return.

They offer phony "vitamins."

With vitamins so popular, why not invent some new ones. Ernst T. Krebs, M.D., and his son Ernst T. Krebs, Jr., invented two of them. In 1949 they patented a substance that they later named pangamate and trade-named "vitamin B-15." The Krebs' also developed the quack cancer remedy, laetrile, which was marketed as "vitamin B-17."

To be properly called a vitamin, a substance must be an organic nutrient that is necessary in the diet, and deficiency of the substance must be shown to cause a specific disease. Neither pangamate nor laetrile is a vitamin. Pangamate is not even a single substance. Different sellers put different synthetic ingredients in the bottle. Laetrile contains six percent of cyanide by weight and has poisoned people.

They warn you not to trust your doctor.

Quacks, who want you to trust them, suggest that most doctors are "butchers" and "poisoners." For the same reason, quacks also claim that doctors are nutrition illiterates. This, too, is untrue.

The principles of nutrition are those of human biochemistry and physiology, courses required in every medical school. Some medical schools don't teach a separate required course labeled "nutrition" because the subject is folded into other courses, at the points where it is most relevant. For example, nutrition in growth and development is taught in pediatrics, nutrition in wound healing is taught in surgery, and nutrition in pregnancy is covered in obstetrics. In addition, many medical schools do offer separate instruction in nutrition.

A physician's training, of course, does not end on the

day of graduation from medical school or completion of specialty training. The medical profession advocates lifelong education, and some states require it for license renewal. Physicians can further their knowledge of nutrition by reading medical journals and textbooks, discussing cases with colleagues, and attending continuing education courses. Most doctors know what nutrients can and cannot do and can tell the difference between a real nutritional discovery and a piece of quack nonsense. Those who are unable to answer questions about dietetics (meal planning) can refer patients to someone who can—usually a registered dietitian.

Like all human beings, doctors sometimes make mistakes. However, quacks deliver mistreatment most of the time.

They claim they are being persecuted by orthodox medicine and that their work is being suppressed.

They may also claim that the American Medical Association is against them because their cures would cut into the incomes that doctors make by keeping people sick. Don't fall for such nonsense! Reputable physicians are plenty busy. Moreover, many doctors engaged in prepaid health plans, group practice, full-time teaching, and government service receive the same salary whether or not their patients are sick—so keeping their patients healthy reduces their workload, not their income.

Quacks claim there is a "controversy" about facts between themselves and "the bureaucrats," organized medicine, or "the establishment." They clamor for medical examination of their claims, but ignore any evidence that refutes them.

Any physician who found a vitamin or other preparation that could cure sterility, heart disease, arthritis, cancer, or

Victor Herbert, M.D., J.D., is professor of medicine at Mt. Sinai School of Medicine in New York City and chief of the Hematology and Nutrition Laboratory at the Sinai-affiliated Bronx VA Medical Center. He is a board member of the National Council Against Health Fraud and a member of the American Cancer Society's Committee on Questionable Methods. He has served on the Food and Nutrition Board of the National Academy of Sciences and its Recommended Dietary Allowances (RDA) Committee. He has written more than 650 scientific articles and received several national awards for his nutrition research. His books include *The Mount Sinai School of Medicine Complete Book of Nutrition* and *Genetic Nutrition: Designing a Diet Based on Your Family Medical History*.

the like, could make an enormous fortune. Patients would flock to such a doctor (as they now do to those who *falsely* claim to cure such problems), and colleagues would shower the doctor with awards—including the \$700,000+ Nobel Prize! And don't forget, doctors get sick, too. Do you believe they would conspire to suppress cures for diseases that also afflict them and their loved ones?

The Bottom Line

Food quacks benefit only themselves, collecting large fees for public appearances, publications, or "consultant" status to vitamin and health food companies which they sometimes control. Their victims are not only milked financially (for billions of dollars each year), but may also suffer serious harm from vitamin overdosage and from seduction away from proper medical care.

There is nutritional deficiency in this country, but it is found primarily among the poor, particularly among those who are elderly, are pregnant or are small children. These groups need improved diets. Their problems will not be solved by the phony panaceas of hucksters, but by better dietary practices. The best way to get vitamins and minerals is in the packages provided by nature: foods that are contained in a balanced and varied diet. If humans needed to eat pills for nutrition, pills would grow on trees.

The basic rule of good nutrition is moderation in all things. Contrary to the claim that "It may help," the advice of food quacks may harm—both your health and your pocketbook. They will continue to cheat the American public, however, until the communications industries develop sufficient concern for the public interest to attack their quackery instead of promoting it. And if the media cannot develop adequate social conscience on their own, they should be forced to do so by stronger laws and more vigorous law enforcement.

I don't mean to imply that everyone who promotes quack ideas is deliberately trying to mislead people. One reason why quackery is so difficult to spot is that most people who spread health misinformation hold sincere beliefs. For them nutrition is not a science but a religion—with quacks as their gurus. But where health is concerned, sincerity is not enough!

BRIEFS

Health-care reform. The President's Task Force on National Health Care Reform, chaired by Hillary Rodham Clinton, is interested in receiving suggestions. Comments should be sent c/o The White House, Washington, DC 20500.

FDA Commissioner retained. On February 26, 1993, David A. Kessler, M.D., J.D., accepted the Clinton Administration's request to remain as FDA Commissioner. Dr. Kessler, who is probably the most effective individual ever to hold this post, was appointed in the fall of 1990. He is highly respected for increasing FDA efficiency and implementing tough enforcement policies.

FTC strengthening urged. More than 275 consumer advocacy organizations, consumer protection officials, and professors of consumer law and consumer economics have urged President Clinton to "bring new leadership" to the Federal Trade Commission. The letter asks the President to appoint new commissioners from the ranks of state and consumer protection officials, consumer advocacy groups, and consumer affairs professionals. The effort was coordinated by the Center for Science in the Public Interest (CSPI). CSPI has accused the FTC of pursuing "numerous policies, first adopted during the Reagan Administration, that delay enforcement actions, narrow the agency's authority, and reduce the agency's effectiveness."

Breastfeeding "reassurance." Florida has passed the nation's first law stating that a woman who nurses in public can't be prosecuted under any of the state's laws against obscenity, lewdness, or nudity.

Dubious marketing maneuver. The Henkel Corporation, a major vitamin E manufacturer, has distributed a brochure containing excerpts of comments from more than forty physicians who had commented in *Medical Tribune* (a medical newspaper) on their experience with megadoses of vitamin E. Most of the comments had been sent after the editor had asked readers to share their experiences. This type of poll has no statistical significance because it is not a random sampling of opinions and is likely to draw many more responses from believers than from nonbelievers. Nevertheless, *Medical Tribune* published the comments in its "Physician Forum" with the headlines "Most respondents say vitamin E confers benefits," "MDs overwhelmingly for vitamin E at 100 IU," and "Doctor's groundswell for vitamin E at megadoses." Henkel's brochure also includes headlines and excerpts of several newspaper articles that reported favorably on vitamin E research. Many of the claims in the excerpts have little or no scientific support and would not be legal on product labels.

Chaparral dangerous. The FDA has warned consumers not to take herbal products containing chaparral because it has been associated with acute hepatitis. Chaparral has been used in teas, capsules, and tablet preparations purported to "cleanse" the bloodstream, delay aging, and treat certain skin conditions. Cases involving jaundice, abdominal pain, and liver and kidney failure have been reported.

Enzymatic Therapy enjoined. The FDA has obtained a consent decree of permanent injunction barring Enzymatic Therapy, Inc., of Green Bay, Wisconsin, from marketing products with unproven therapeutic claims. The court order also bars the company from manufacturing or marketing 56 listed items unless new promotional material for them is approved by the FDA. In recent years, the company has marketed about 300 formulas containing vitamins, minerals, herbs, amino acids, and/or glandular tissue. For many of these products, literature distributed by the company and lectures given at company-sponsored seminars have contained unproven therapeutic claims that would not be legal on the product labels. During 1990, seminar attendees were given a 158-page looseleaf manual describing how Enzymatic Therapy products could be used to treat more than 80 diseases and conditions. The manual included "protocols" for using products against AIDS, multiple sclerosis, cancer, arthritis, and other serious health problems [NF 7:41-44, 1990]. The FDA was also concerned about reports of serious injuries and one death following use of "nutritional supplements" manufactured by Enzymatic Therapy products [FDA Consumer 27(2):31-32, 1993]. In 1991, after six years of investigation and unsuccessful efforts to secure voluntary compliance, the agency initiated suit to obtain a broad injunction.

Adverse food reactions vs. true allergies. A University of Toronto research team has compared 22 adults with proven food allergies with 23 adults who had adverse reactions that were not confirmable by allergy testing. [Journal of the American Dietetic Association 93:40-44, 1993]. The researchers found that: (1) those with confirmed reactions were younger; (2) the confirmed individuals tended to have specific, immediate reactions, while the unconfirmed individuals had nonspecific delayed reactions to an average of five times as many foods; (3) the unconfirmed group were more apt to blame foods not commonly implicated in proven food allergies; and (4) the unconfirmed group had much higher usage of food supplements, but their overall diet was more in line with current nutrition recommendations. No one in the confirmed group reported an adverse reaction to white sugar, but nine in the unconfirmed group did so. The researchers thought that the unconfirmed individuals had been influenced by the popular news media and literature related to "clinical ecology." (Clinical ecology is a pseudoscience based on the idea that immune-system "overload" leads individuals to become hypersensitive to large numbers of common foods and environmental chemicals.)

Free weight-loss report. "Methods for Voluntary Weight Loss and Control," a 20-page summary of findings of a National Institutes of Health Technology Assessment Conference held last year, can be obtained by calling (301) 496-1143.

Dangerous legislation. Strenuous efforts are underway in New York, Maryland, South Dakota, Florida, and North Carolina to gain passage of laws to: (1) prevent state licensing boards from disciplining health practitioners whose methods are not generally recognized as effective by the scientific medical community; and (2) require appointment of at least one "alternative" practitioner to each board. Bills of this type have been passed in Alaska and Washington.

Notable quote. "You've seen the articles in *The New York Times* and elsewhere over the last six months or a year. Now, does this mark a new day in how the press views the vitamin supplement industry or the nutritional supplement industry? Are we going to be friends? Nope, afraid not. For many journalists the industry still has a lousy reputation, ranking just above the tobacco industry, and no group could possibly sink lower in health writers' estimation than the tobacco group."—Said in a speech by Anastasia Toufexis in July 1992 at the National Nutritional Foods Association (NNFA) annual convention and trade show in Nashville, Tennessee. Ms. Toufexis wrote *Time* magazine's April 6, 1992, cover story, "The Real Power of Vitamins," which has been widely circulated by supplement promoters. NNFA has told its members that the article is "a watershed event for the industry . . . the most positive and powerful public relations tool that the industry has been able to use in years." The group has also sent a copy to all congressional representatives and distributed multiple reprints to NNFA members.

CONFESSIONS OF A FORMER WOMEN'S MAGAZINE WRITER

Marilynn Larkin

Writing about "hot" nutrition topics still has impact. During the decade or so that I wrote for women's magazines, I received much positive feedback from readers.

In 1989, at the height of oat bran's popularity as a panacea to lower cholesterol, the president and chief operating officer of a leading cereal manufacturer estimated that sales of oat-bran cereals would grow to nearly \$600 million annually. I wrote five oat-bran stories that year for various women's magazines. A year later, when a study called oat bran's health-promoting properties into question, sales plummeted 50 percent within a week; at that point, I couldn't give away an article on oat bran.

I also covered other "hot" nutrition topics. But although they appeared on the nutrition page, these articles tended to be either "food-of-the-month" stories (the grapefruit diet, carrot power) or quasi-entertainment pieces that positioned foods as medicine: to fight cancer, strengthen the immune system, lower blood pressure, cut cholesterol, stave off heart attacks, prevent osteoporosis, reduce stress, or improve your sex life.

Earning a living this way was quick, easy, and—for a while at least—fun. I readily recycled material from publication to publication, since all were prone to hopping on the same bandwagons. And editors who saw my work in one magazine often asked me to "do a story like this for *our* audience." It never dawned on me that I might be misleading the public by promoting "food-as-magic-bullet" mythology. I labored under the illusion that by carefully executing assignments according to the editors' parameters, I was informing the public and being a good writer.

What I was really doing was helping to sell magazines by presenting a lopsided point of view: the world according to women's magazine editors. Their world (and my assignments) was shaped primarily by two considerations: providing a "nice environment" for advertisers and making sure readers were not challenged by anything more than simple tips for healthy living. (The word *healthful* does not exist in women's magazine stylesheets.)

Elizabeth Whelan, Sc.D., M.P.H., president of the American Council on Science and Health, thinks women's magazines are shirking responsibility by focusing on trivia and ignoring the devastating effects of cigarette smoking. In a recent op-ed piece in *The New York Times*, she said, "What advice do the magazines offer on how to stay healthy? Here is a sampling: Eat lots of broccoli to ward off cancer . . . take vitamins E and C and beta-carotene; eat garlic to fight colds and flu . . . and eat active-culture yogurt to live longer."

Conflicting views are seldom presented in women's magazines. After all, the "logic" goes, readers might become confused if they actually have to weigh more than one side of a story. Instead, editors usually decide in advance what readers should think, infantilizing readers in the process. This condescending philosophy was a major reason why I decided to get out of the whole business and into writing for physicians. Today, more than two years after making the transition, I savor the fact that I am writing for grown-ups.

How Articles Evolve

One reason why trivial and/or incorrect nutrition advice appear so often is the desire to please the magazines' lifeline: advertisers. Most marketing executives view women's magazines as "products" or "vehicles" that are part of a "marketing package" for their wares. That's where the "nice environment" comes in. Before agreeing to buy space, advertisers want to know what kinds of articles will appear in the magazine—and, particularly, what copy will appear near the ad. "Negative" stories—topics that may upset readers or otherwise interfere with a "feel-good" atmosphere—are routinely rejected. Unfortunately, this means that manuscripts that tell the truth (for example, that the link between specific foods and specific health effects is largely hype) seldom get published.

"Women's magazines are controlled by advertisers in ways that other magazines aren't," *Ms.* co-founder Gloria Steinem told a gathering of writers from the American Society of Journal-

ists and Authors in 1991. She described how women's magazines began as catalogs, with short stories woven in between the ads. The link between advertising and editorial has remained, she said, creating a situation wherein "85 percent of women's magazine copy is really 'unmarked advertorial.'" A few months later, co-founder Patricia Carbine talked about "Advertising and Editorial—The Uneasy Coexistence" to a group of advertising, marketing, and public relations professionals attending a forum on business ethics. "Advertisers are insisting on concessions from women's service magazines that they wouldn't insist on from *Time* or *Newsweek*," she said. According to Ms. Carbine, declining circulation has put even greater pressure on women's publications to continually cross the line between advertising and editorial. Examples include presenting a certain number of recipes that use soup as an ingredient to satisfy a soup advertiser, or refusing to run results of "taste tests" that could offend an advertiser whose product appears at the bottom of the heap.

When I wrote regular nutrition columns for women's magazines, my topics were determined in most cases by advertisements already commissioned or those the publication hoped to bring in. "[A major cereal manufacturer] is advertising in September. Why don't you do a fiber story for that issue?" one editor suggested. "We'd love to get an ad from [a leading manufacturer of lowfat dairy products]. We want you to do a story on foods that are low in fat and high in calcium," said another.

Michael Hoyt, associate editor of *Columbia Journalism Review*, has expressed concern about the blurred boundaries between advertising and editorial content. In the March/April 1990 issue, in an article called "When The Walls Come Tumbling Down," he stated:

From a reader's perspective this confluence of advertising and editorial is confusing: Where does the sales pitch end? Where does the editor take over? ... Magazines of all stripes are suddenly competing to give advertisers something extra—"value added" in ad-world lingo—in return for their business. Many of these extras are perfectly legitimate and have little or nothing to do with editorial content; others fall into a gray and foggy area; still others involve the selling of pieces of editorial integrity, from slivers to chunks to truckloads.

When it comes to nutrition information, the "confusion" Hoyt alludes to is rampant. In a recent interview (*not* for a women's magazine), Richard Rivlin, M.D., of New York Hospital told me: "The public is enormously confused. They need a better understanding of the role nutrition plays with respect to disease. We haven't been doing a very good job of putting things in perspective." Writing in the *Journal of the American Medical Association*, Dr. Rivlin stressed that it is more realistic to think that good nutrition can help delay the onset or reduce the effects of such illnesses as heart disease, stroke, cancer, and diabetes—not that nutrition can prevent or eliminate these disorders entirely. He added that proper nutrition won't do much to protect an individual who continues to smoke cigarettes, drinks excessively, or leads a sedentary lifestyle.

But that type of moderate message seldom makes its way into magazines where "food as medicine" themes are regarded as an essential editorial ingredient. During my tenure as a health and nutrition writer, I wrote everything from the "diet that can save your life" to the "fertility diet" and the "brain power diet." I also wrote about diets to calm your kids, boost their I.Q., and keep them from becoming overweight adults.

The Ingredients of a "Good" Nutrition Article

The other force that drives the editorial content of women's magazines is the desire to grab attention to boost sales. The quickest, surest way to sell article ideas to a women's magazine is to come up with a great cover line. Once I learned this secret, getting assignments was a snap. Whereas some writers labored long and hard over query letters, I would think up titles and bullet them on a page, fleshing out the "story" with one or two sentences. Examples include: "16 Great Food Finds," "20 Hunger-Fighting Foods," "6 Myths That Keep You Fat," and "What Your Snacks Say About You." At least 75% of the topics I proposed in this way ended up as assignments.

Of course, the process also worked in reverse. Editors would call me and say, "We want such-and-such story (naming a provocative headline). You figure out what to put in the article." Although all this smacks of deception, I did have scruples. Despite the jazzy-sounding titles, in most instances I merely repackaged basic nutrition advice into my articles, slipping in qualifiers ("there's no proof as yet") for spurious speculations and liberally peppering my articles with "may" and "they speculate." Does this excuse me? Not really. What astounds me in retrospect is how many "experts" were willing to go along with this charade.

Another essential ingredient in good articles is the voice of authority. As a women's magazine writer, I needed "experts" to validate my editor's point of view. Many "experts" who regularly appear in women's magazines are willing to trade scientific credibility for the opportunity to have their name in print. Some would give me quotes even when the premise of a story made little sense. For example, one women's magazine editor asked me to do a feature article called "Ten Foods to Make You Prettier." I balked, saying that unless an "expert" would corroborate that such a story could include some substance, I wouldn't do it. I was given the name of an "authority"

Nutrition Forum (ISSN 0748-8165), © 1993, is published by Stephen Barrett, M.D. All articles and advertising inserts are fully endorsed by Dr. Barrett.

Individual subscriptions in the United States and Canada are \$35 for one year (six issues), payable to Nutrition Forum, P.O. Box 1747, Allentown, PA 18105. Institutional and other multireader subscriptions are \$50 for one year. Overseas subscriptions (via airmail) are \$50 for 1 year. Back issues are \$6 each.

All correspondence should be sent to Stephen Barrett, M.D., P.O. Box 1747, Allentown, PA 18105. Telephone 215-437-1795.

at the school of public health of a major university. *She* convinced *me* it could be done and provided me with additional sources. I not only wrote the article but recycled it to other women's publications under such titles as "Eat Your Way to Perfect Skin" and "Beauty Is More Than Skin Deep."

Some "experts" I had quoted once were only too pleased to appear in subsequent articles—but not just the spin-offs. In some cases, they "trusted me" to put quotes in their mouths without even doing another interview or clearing the information with them. At one point, I had a psychiatrist, a psychologist, several nutritionists, an eating disorder specialist, and a dietitian that I could pull out of my hat (by making up quotes based on past interviews) whenever an editor wanted a particular viewpoint substantiated. In other words, I had "instant sources."

I won't speculate on the reasons why people with M.D.s and Ph.D.s (the ones most coveted as sources by women's magazines), who presumably know better, permit themselves to be used in that way. The fact is, many do. Of course, not all have been manipulated. But I'll bet that most are not challenged, either by the writer who interviews them or by others who are quoted.

"Hiring" of Writers

A little-publicized, unethical practice that is more common than writers would like to admit can directly affect what "expert" information gets into a women's magazine and what doesn't. On several occasions, people from public relations agencies representing weight-loss centers and other clients have called me with a proposition. They would "hire" me to write a nutrition story that quoted their client if I would "place" it in a women's magazine. (I was never asked to place a piece in a more "reputable" type of magazine. I guess it was assumed that only women's magazines, and their writers, could be bought.) For an unscrupulous writer, this is an opportunity to be paid twice for the same article. I have consistently refused such work, telling callers that if their client's views were appropriate for something I am writing, they would be used without charge.

In another typical women's magazine scenario, the writer is required to skip attribution altogether—the rationale being that "we want the magazine to be the authority." The result of this abuse of power is that the magazine gives itself a free hand to say whatever it wants, merely by having the writer pepper the article with convenient phrases such as "experts agree," "scientists have found," and "experts say." What experts? The writer and editor, of course.

Style over Substance

Another practice that makes it easier for writers to write for women's magazines than for many other publications—and that has the potential of leaving readers seriously misinformed—is lack of fact-checking. Although some women's magazines call sources to check quotes for accuracy and require writers to provide backup material for statistics, many (I would venture to guess most) don't. I wrote weekly nutrition columns for one women's magazine that preferred to be the authority (in other words, no experts were to be quoted). In more than a year and a half, no one on the magazine's staff ever asked where I got my information. Each column was composed of an article that provided a good headline, a Q&A that I had made up (including a name and city for the supposed writer), and a "fast fact" pertaining to nutrition (for example, that 40% of consumers eat vanilla ice cream). No one ever asked where my "fast facts" came from. [Editor's note: Fact-checking can improve accuracy, but does not guarantee it. When checkers limit their contact to people mentioned in the article, errors originating from inaccurate or misleading sources may go undetected. The only way to ensure accuracy is expert prepublication review—a process few media outlets utilize.]

In addition to a catchy headline and good sources, the article must "lay out well" on the page. Typically this means using sidebars and boxes, with cute little quizzes ("What's Your Nutrition IQ?"; "Are You An Emotional Eater?"), fascinating facts ("Did You Know..."), or 2-day "starter menus" for special diet stories. It's a plus if the article itself can be done up in an easy-to-swallow format, such as "Your A-Z Guide To Fighting Fat," "Seven Secrets Every Thin Person Knows," or "Nutrition Myths That Keep You Fat." Editors seem to assume that straightforward stories won't be read, that readers must be entertained, and that "text-heavy" pages will intimidate them.

The women's magazine writer must also understand an editor's mandate to "work with the art director." In many cases, this means the writer must include points in the text to validate the accompanying photos. For example, if the art director thinks a story on summer fruit would "look great" accompanied by a photo of bananas, grapefruit, and kiwi fruit, then the writer must make sure these fruits are mentioned in the article. Sometimes the photography is planned or even executed before the article is written.

The power of the art director was carried *ad absurdum* in one article I wrote on eating "mini-meals." I had paid a registered dietitian to plan meals that would meet all the Recommended Dietary Allowances for adult women. Imagine my shock when my editor called to demand that a meal be

Lowell, Ph.D.; Ira Milner, R.D.; Varro E. Tyler, Ph.D.; and staff members of the Pennsylvania State University Nutrition Information and Resource Center. **SCIENTIFIC CONSULTANTS:** John A. Dodes, D.D.S.; Victor Herbert, M.D., J.D.; Gabe Mirkin, M.D. **PUBLICATIONS CONSULTANT:** George F. Stickley.

changed to include the foods that the art director thought would "look good on the page." "Luscious strawberries" and "juicy orange slices" would have to replace raisins and bananas!

The final ingredient in a "good" nutrition story is the writing style. Three tones are permitted:

1. Bouncy two-year-old: "Don't wait! Start now on our power-packed, energy-boosting diet."

2. Concerned parent: "Eclairs are tempting, so have one—very occasionally . . . If you do have one, make it your only indulgence that day"; "If you must use white sauce, remember: the thinner the sauce, the thinner *you'll* stay."

3. Pseudosophisticated "friend": "Of course you can diet and lose weight. You've done it before . . . and before that . . . but each time the pounds you shed creep back, causing you to groan with disappointment when you step on the scale. Yet we all know women whose weight rarely fluctuates more than a pound or two and former fatties who managed to lose weight and *keep it off* for good . . . Now, we bring you the *real* secrets behind their success."

Once a writer has these chatty tones down pat, she simply asks which style the editor wants, and bingo! Another successful assignment!

No Journalistic Skills Required

What probably helped me most in becoming a successful women's magazine writer was the fact that I had no journalism training whatsoever. I have never taken a writing course in my life.

In 1980, I went into business for myself as a freelance public relations person for various agencies in New York City. The skills I acquired made it easy to shift from press kits into women's magazine writing. These included: (1) the ability to write headlines and opening paragraphs that were punchy and attention-grabbing; (2) an unquestioning attitude towards "experts"; and (3) the ability to produce unfailingly upbeat, inoffensive copy.

Writing press kits for new diet pills, migraine medicines, and blood pressure drugs, for example, required me to digest complex information and spew it back in easy-to-swallow, bite-size pieces, rarely using words of more than one syllable and remaining as one-dimensional as possible (sound familiar?). Snappy headlines and subheads were more important than hard information—after all, my primary responsibility was to help ensure that our material wasn't hurled immediately into the "circular file."

I made my first women's magazine contacts when pitching editors with story ideas that would include whatever clients I happened to be handling at the time. If the editors wanted more, I would send a press kit or bulleted list of article ideas that could be built around the client. Some of the "low-end" women's magazines willingly take articles provided by public relations firms, which I promptly produced for them. Several even gave me bylines—a joy to someone starting out in the field.

These assignments, paid for by the public relations

agencies I worked for, provided me with "clips" which I then used to approach larger publications. Soon editors of women's magazines were asking me to write for them on assignment. Within a year, I had so much magazine work that I stopped doing public relations work altogether.

After a number of years playing at this kind of writing, I grew incredibly bored. Women's magazines like to pigeonhole writers (e.g., "health writer," "travel writer," "money writer"). Even though I managed somewhat to defy definition by writing in all three of these categories, editors who gave me "regular work" really wanted me to write the same stories issue after issue, year after year: How to shed five pounds in five days; Think yourself thin; De-stress yourself; Eat right over the holidays; Get in shape for summer; How to stick to your diet while eating out; Why your food diary is your best friend, etc. etc. These are women's magazine "staples"—the stories readers presumably want to read over and over.

Perhaps it's true. Maybe all those women out there really do want to read that stuff. But if that's the case, at least I have the satisfaction of knowing I no longer contribute to the propaganda that feeds such a mindset. And I can't help but believe that women's magazine readers are capable of taking in a healthy dose of hard information, meaningful speculation, and controversy—about food, nutrition, health, life—if their favorite magazines would only make the effort, and take the risk, of presenting them.

This article is based on my experiences in writing for more than a dozen women's magazines and talking with fellow journalists. There is no question that some women's magazines have more editorial "depth" than others. Those that cater to "educated" women generally offer less simplistic-sounding articles than those catering to "the secretary in Middle America." And magazines with bigger editorial budgets are apt to subject articles to more scrutiny than those with small budgets and little money for editorial content. Nevertheless, all operate under pressure from the market forces I have described.

Ms. Larkin is a freelance writer in New York City. In 1985, she received a first-place award for consumer journalism from the National Press Club. Her most recent work is *What You Can Do About Anemia* [Dell Publishing, 1993].

HELP FIGHT QUACKERY

The National Council Against Health Fraud (NCAHF) serves as a clearinghouse on quackery, health fraud, and misinformation. It has more than 1,000 members and has chapters in 13 states. Membership is open to anyone who supports the group's beliefs and purposes. Members receive a bimonthly newsletter, ready access to printed information on hundreds of topics, and discounts on antiquackery publications. The cost is \$20 for regular membership and \$30 for professional membership. NCAHF's address is P.O. Box 1276, Loma Linda, CA 92354. (Telephone: 909-824-4690)

ASSAULT ON FDA CONTINUES

Stephen Barrett, M.D.

The FDA and the supplement industry have been locked in a struggle for more than 25 years. During the mid-1960s, when the FDA attempted to ban various misleading claims, the industry organized a campaign to weaken the agency's jurisdiction over supplement products. The campaign resulted in passage in 1976 of the Proxmire Amendment to the Food, Drug, and Cosmetic Act. The amendment, which one FDA commissioner called "a charlatan's dream," prevents the FDA from regulating vitamins as drugs based on dosage alone. The FDA is still free to regulate supplement products for which therapeutic claims are made—but most manufacturers keep claims off their labels and rely on retailers and media outlets to make the claims for them. The FDA has also attempted to regulate nonvitamin "supplement" products, such as evening primrose oil, black currant oil, coenzyme Q₁₀, and germanium, on grounds that they are unapproved food additives. Courts have upheld this theory in some cases but rejected it in others.

In 1990, Congress enacted the Nutritional Labeling and Education Act, which required the FDA to adopt sweeping new regulations for food labeling. Shortly before the Act's passage, Senator Orrin Hatch (R-UT) engineered an amendment calling for special consideration of dietary supplements and "other similar substances" such as various seed oils, enzymes, amino acids, and herbal tinctures. In 1991, after the FDA convened a Dietary Supplement Task Force, the health-food industry became alarmed that the task force would recommend stopping over-the-counter sales of amino acids, herbs, and other "supplement" products that are really intended for therapeutic purposes [NF 9:9-14, 1992].

Early in 1992, the supplement industry formed the Nutritional Health Alliance to campaign against increased regulation and to oppose bills to strengthen FDA's ability to police the marketplace. In December 1992, bolstered by a vigorous letter-writing campaign, Senator Orrin Hatch (R-UT) gained passage of the Dietary Supplement Act of 1992, which prevents the FDA from issuing new regulations for supplements until the end of 1993. The act also requires the Department of Health and Human Services, the General Accounting Office, and the Office of Technology Assessment to produce certain reports that the industry hopes will support its position that "supplement products" should be minimally regulated.

In April 1993, bills titled the Dietary Supplement and Health Education Act of 1993 were introduced by Senator Hatch and Representative Bill Richardson (D-NM). Hatch's version (S. 784) defines "dietary supplements" as vitamins, minerals, herbs, amino acids, and other substances intended "to supplement the diet by increasing the total diet intake." (This definition covers everything the health-food industry would like to call a supplement.) The bill would also (1) prevent the FDA from classifying such products as drugs or food additives, regulating their dosage, or making them available only by prescription; (2) permit manufacturers to make therapeutic claims based on

flimsy evidence; and (3) stall most FDA regulatory actions by permitting manufacturers who receive a warning letter to protest to the Department of Health and Human Services or seek court review. Richardson's version (H.R. 1709) is similar but not quite as restrictive. If either bill passes, the FDA's ability to protect consumers from fraudulently marketed "nutrition" products will be severely weakened.

To support these bills, proponents are generating mail from "health food" manufacturers, retailers, and distributors, as well as from health-food store shoppers, customers of mail-order companies, multilevel distributors, "natural health" practitioners, and bodybuilding and fitness enthusiasts who use supplements. To fire up their troops, proponents are portraying the FDA as a Gestapo-like agency and are urging consumers to "write to Congress today or kiss your vitamins goodbye!" The campaign's leaders want legislators to believe that the outpouring of mail represents a grass-roots effort by consumers who wish to preserve "freedom of choice." I suspect, however, that most of the mail will come from individuals who have an economic stake in the sale of supplements.

The proposed bills would also establish a National Institutes of Health Office of Dietary Supplements, whose duties would include coordinating and promoting research on "the benefits of dietary supplements in maintaining health and preventing chronic disease and other health-related conditions" and advising the FDA on dietary supplement issues. Establishment of the NIH Office of Alternative Medicine has been trumpeted by "alternative" proponents as "government and scientific recognition" of their methods [NF 10:1-5, 1993]. An NIH Office of Dietary Supplements would undoubtedly be abused in the same way by supplement promoters.

In a speech from the Senate floor, Hatch stated that the FDA has "repeatedly attempted to impose unnecessarily stringent standards that would leave many if most supplement companies with no practical choice but to close their doors." As a result, he claimed, "consumers are left uninformed and the nation pays millions of dollars for health care that could have been saved through disease prevention."

Hatch's idea that FDA regulation leaves consumers uninformed is ludicrous. The supplement industry maintains a never-ending flow of information (most of it misleading) through talk shows, books, health-food magazines and newsletters, public relation firms, oral claims by retailers, and other channels. The idea that its strategies would lower health-care costs is even more ridiculous. Although some of its promoters recommend a diet low in fat and high in fiber, others recommend diets that are unbalanced or nutritionally inadequate. Although some people can benefit from taking supplements, virtually everyone connected with the industry recommends them unnecessarily and/or inappropriately. Even worse, its leaders typically oppose proven public health measures (fluoridation, pasteurization of milk, immunization, and food irradiation).

BRIEFS

Clinical ecology blasted again. "Clinical ecologists" allege that large numbers of people have immune system derangements that increase their sensitivity to low levels of common substances and produce multiple symptoms. They label the condition they postulate "multiple chemical sensitivity (MCS)," "environmental illness," and with several other terms not recognized by the scientific community. The American Medical Association Council on Scientific Affairs has concluded that "until . . . accurate, reproducible, and well-controlled studies are available . . . multiple chemical sensitivity should not be considered a recognized clinical syndrome. Based on reports in the peer-reviewed scientific literature . . . (1) there are no well-controlled studies establishing a clear mechanism or cause for [MCS]; and (2) there are no well-controlled studies providing confirmation of the efficacy of the diagnostic and therapeutic modalities relied on by those who practice clinical ecology" [JAMA 268:3465-3467, 1992]. Reprints can be obtained from the Council at 515 N. State St., Chicago, IL 60610.

Omnitrition sued. A class action suit has been filed against Omnitrition, a multilevel company affiliated with Durk Pearson and Sandy Shaw, authors of *Life Extension*. The suit charges that the company exaggerated the earnings potential of new distributors.

Health food store sales. *Health Foods Business* estimates that 39.2% of sales in health food stores last year were for vitamins and other supplements. Based on its annual survey, the magazine estimated that 7,500 stores grossed \$1.48 billion for these products, up 4.2% from 1991. Total sales for all products were \$3.79 billion (down 0.25%), including \$633 million for herbs and herbal teas (down 3.2 %) and \$110 million for books (up 1%). Homeopathic remedies accounted for 10.9% of the vitamins/supplements category.

Folic acid and pregnancy. The U.S. Centers for Disease Control and Prevention (CDC) has recommended that all women who are capable of becoming pregnant should consume 0.4 mg of folic acid per day to reduce the risk of having a pregnancy affected with spina bifida or other neural tube defects [JAMA 269:1233-1238, 1993]. CDC's report noted that because the effects of higher intakes are not well known, care should be taken to keep total consumption under 1 mg per day because too much folic acid can interfere with early diagnosis of pernicious anemia in people unable to absorb vitamin B₁₂. The estimated average consumption of folic acid is about 0.2 mg per day, but women who select foods consistent with the U.S. Dietary Guidelines and the U.S. Dietary Pyramid are likely to consume 0.4 mg or more per day. Dr. Victor Herbert, who for many years has been recommending folate supplementation during pregnancy, thinks that the prudent level during pregnancy is probably 0.5 mg/day, with some derived from a supplement of less than 0.4 mg per day [Nutrition Today 27(6):30-33, 1992].

Home cholesterol test questioned. Marketing will soon begin for the Accumeter Cholesterol Self-Test, a test recently approved by the FDA for measuring one's total blood cholesterol level. An American Heart Association official has expressed concern that people who find an elevated value may engage in inappropriate self-treatment. The proper response is further testing and interpretation by a physician.

Diet promotions clipped. The attorneys general of Minnesota and Wisconsin settled charges that *Mega Thin 100*, which was sold over-the-counter in pharmacies, had not been proven safe and effective for weight loss. According to the attorneys general, the company falsely claimed in newspaper ads that the pills would inhibit sugar absorption and would reduce weight without dieting or giving up favorite foods. A \$3,000 penalty was split between the two states. The Minnesota attorney general also settled a case requiring Mid-America Weight Loss Centres, doing business as Jenny Craig Weight Loss Centres, to make permanent changes in its advertising and sales presentation. The case involved charges that Jenny Craig personnel had made unsubstantiated claims that 93% of their customers had achieved permanent weight loss. The settlement prohibits the company from misrepresenting its success rates or using the word "permanent" in the name of its maintenance program. The company also paid \$30,000 into the state's consumer education fund.

Vitamin E update. Two large studies have found that supplementation with 100 IU or more vitamin E is associated with fewer deaths from heart disease [New England Journal of Medicine 328:1444-1449, 1450-1456, 1993]. One study involved 87,245 female nurses followed for up to eight years; the other involved 39,910 men followed for four years. A similar association was not found with vitamin C or beta-carotene. Reprints can be obtained from Meir J. Stampfer, M.D., Channing Laboratory, 180 Longwood Ave., Boston, MA 02115 (for study of women) and Eric B. Rimm, Sc.D., Dept. of Nutrition, Harvard School of Public Health, 665 Huntington Ave., Boston, MA 02115 (for study of men). An accompanying editorial by Daniel Steinberg, M.D., Ph.D., cautioned that large, long-term double-blind clinical trials are needed to prove that vitamin E supplementation is actually beneficial [NEJM 328:1487-1489, 1993]. Dr. Steinberg also warned that such supplementation has not been proved risk-free and that "before we lend our imprimatur to the widespread use of a still unproved treatment, one that requires the patient only to pop a few pills, we should ask how many patients will slack off on adherence to better-established, but somewhat onerous, preventive measures such as a cholesterol-lowering diet, regular exercise, and smoking cessation." It has been postulated that vitamin E can help prevent atherosclerosis by interfering with the oxidation of low-density lipoproteins (LDL). Dr. Steinberg expressed hope that, within a few years, questions about vitamin E supplementation will be settled by studies now under way.

Diet survey. The June 1993 issue of *Consumer Reports* summarizes a survey of 95,000 of its readers who have tried to lose weight, including about 19,000 who had used a commercial diet program. The survey found that many people lost weight, but most gained it back within two years. The average respondent who used a commercial program followed it for about six months, lost 10 to 20 percent of starting weight, gained almost half of that weight within six months and more than two thirds after two years. The survey also found that many people who used commercial programs were not overweight. Weight Watchers received the highest reader-satisfaction score.

Health food store investigation. Armed with a hidden camera, "Inside Edition" reporters asked retailers at four stores in New York City what they would recommend for (1) fatigue and headaches, (2) blurred vision, (3) arthritis, (4) strengthening the immune system, (5) improving memory, (6) "cleansing the blood," and/or (7) shortness of breath of a "grandmother who just had bypass surgery." Products were recommended in response to every question. When asked for something that could help people with AIDS, one GNC store manager recommended *NAC*, an amino acid product that he said was one of the store's top sellers. He also said that *NAC* was "supposed to help block the chemical inhibiting the growth of the virus" and did not have the toxic side effects of *AZT*. When confronted later, however, he denied recommending the product for AIDS. It is illegal for retailers to prescribe or to make unproven therapeutic claims for their products. During the "Inside Edition" program, Dr. Stephen Barrett suggested that without illegal prescribing the "health food" industry might not survive.

FTC hits bee pollen. The CC Pollen Company, of Phoenix, Arizona, and its owners (Bruce R. Brown, Carol M. Brown, and Royden Brown) have agreed to pay \$200,000 to settle charges that they falsely represented that bee pollen products could produce weight loss, permanently alleviate allergies, reverse the aging process, and cure, prevent, or alleviate impotence or sexual dysfunction. The company and its owners were also charged with falsely stating that bee pollen products are an effective antibiotic for humans and cannot result in an allergic reaction. Under the agreement, the company and its owners would be prohibited from making all of these claims and would be required to have scientific evidence to support any other health-related claims about any other product for human consumption. Some of the false claims were made in "infomercials" that were misrepresented as news or documentary programs, even though they were paid ads. During one infomercial, entitled "TV Insiders," host Vince Inneo falsely implied that the program was part of a series of independent investigations. The program featured an interview "by satellite" with Gary Null, a New York-based author and talk-show host, who was introduced as "Dr. Gary Null... the authority on health and nutrition" even though he did not have an accredited doctoral degree at that time. The program also cited an article in *Parade* magazine in which President Reagan had attributed his youthfulness to bee pollen. The products offered during the infomercial were *Bee-Young, Pollenergy* (to "restore missing energy"), *Royal Jelly* ("to keep sexually active at any age"), *President's Lunch*, and *First Lady's Lunch Bar*. Although the consent agreement does not constitute an admission of wrongdoing, violating it can trigger a civil penalty of up to \$10,000 per day.

SHARK CARTILAGE IN THE NEWS

Shark cartilage has been called to public attention by a "60 Minutes" program focused on the theories of biochemist William I. Lane, Ph.D., author of *Sharks Don't Get Cancer*. Narrator Mike Wallace began by calling attention to the book and stating that Lane says that sharks don't get cancer. The program focused on a Cuban study of twenty-nine "terminal" cancer patients who were given shark-cartilage preparations. Although the program contained many disclaimers, it was clearly promotional.

Wallace visited the site of the experiment, filmed several of the patients doing exercise, and said that most of the patients felt better several weeks after the treatment had begun. (The fact that "feeling better" does not indicate whether a cancer treatment is effective was not mentioned.) Two American cancer specialists then said that the results were intriguing. One, who aligned with the health-food industry, said that three of the patients appeared to have improved. The other, who appeared to be solidly scientific, noted that evaluation was difficult because many of the x-ray films were of poor quality, but he thought that a few tumors had gotten smaller. (The reasons why this might not be significant were not mentioned.) After

noting that shark cartilage was sold in health-food stores, Wallace remarked on the inadvisability of "going to the nearest health-food store" and was seconded by the radiation therapist who said it would be foolish to do so unless all else had failed.

About two weeks before the program aired, a leading manufacturer of shark-cartilage capsules informed health-food stores about the program and advised stocking up on their product. Following the program, other manufacturers began marketing shark cartilage products and referring to the program in their advertising. The leading distributor of books to health-food stores has advertised *Sharks Don't Get Cancer* with the headline: "As featured on 60 Minutes. Finally, What The World Has Been Waiting For . . . A Major Cancer Breakthrough."

Like all animals, sharks *do* get cancer. Lane's book actually says so, although it claims that the number is "insignificant." The preface notes that "while *ALMOST No Sharks Get Cancer* might have been a bit more accurate, it would have been a rotten title." The Smithsonian Institution's *Registry of Tumors in Lower Animals* indicates that sharks even get cancers of their cartilage (chondromas).

BOOK REVIEWS

Stephen Barrett, M.D.

Title: Family Guide to Natural Medicine (1993)

Editor: Alma E. Guinness

Publisher: Reader's Digest Association, Pleasantville, NY 10570

Price: \$30.00 (hardcover) plus \$4.00 postage/handling.

This beautifully crafted 416-page book was prepared by an editorial staff of about thirty people, with help from 26 consultants and contributors whom the editors regarded as experts in their respective fields. It contains more than 300 beautiful color photographs and many interesting accounts of the history of "natural" methods.

The introduction was written by Andrew Weil, M.D., the book's chief consultant, who acknowledges that many of the methods "remain unproved, controversial, even suspect in the eyes of conventional doctors." He predicts "ever-widening interest in natural and preventive medicine," and states that in his clinical practice, he is 40 or 50 times as likely to prescribe a herbal remedy rather than a prescription drug.

The book's first chapter ("The Realm of Natural Medicine") presents the unscientific theories of Chinese medicine, Ayurvedic medicine, homeopathy, "whole-body healing," chiropractic, naturopathy, vision therapy, and iridology as though they are facts. While noting here and there that "orthodox physicians" do not accept these theories, the book uses weasel words and double-talk to weaken critical comments. Regarding iridology, for example, it states that "by and large, orthodox physicians reject the theory that the iris provides extensive information on illness or disease." Iridologists claim that markings in the colored portion of the eye can be used to diagnose problems throughout the body. The correct view is that every scientific physician familiar with iridology regards it as utter nonsense, and that when iridologists are tested under scientific conditions, they invariably flunk the test.

Chapters 2 to 4, which cover "The Mind and Health," "Bodywork," (massage therapies), and "Movement," provide a hodge-podge of useful, possibly useful, and unlikely-to-be-useful methods. While there is little doubt that a massage can be relaxing, for example, there is no reason to believe that acupressure can "free energy blocks." Chapter 5 ("Eating Well") includes two pages on the ying and yang of macrobiotics, fifteen pages of mostly useless information about vitamins and minerals, and all of two paragraphs on low-fat eating. Chapter 6 ("Herbs") includes tid-bits about herbs plus several pages of drivel about aromatherapy and Bach Flower Remedies. (The latter are scented products claimed to cure disease by dissipating "negative feelings" that block the healing process.) The final chapter summarizes the editor's views of "orthodox," "commonsense," and "natural medicine" options for the treatment of about 50 common ailments. This section intertwines practical advice with nonsense.

The stated aim is to examine "alternative" therapies "under the lens of objective inquiry." The book does nothing of the sort. Practices that are fraudulent or quack—and there are

plenty—are not identified as such. Nonsensical theories are presented with little or no criticism, implying that they are plausible. Brief discussions of "innovation versus quack cures" and "how to avoid quacks and frauds" give mere lip service to these topics. The best thing I can say is that the book provides historical information that might be useful to professionals with a scholarly interest in quackery. Under expert guidance, it might also be useful as a sourcebook for teaching how to dissect fact from fiction in deceptive writings. It is unfortunate that a basically reliable publisher will henceforth be associated with misleading advice.

Title: Therapeutic Claims in Multiple Sclerosis (1992)

Authors: William A. Sibley, M.D., and the Therapeutic Claims Committee of the International Federation of Multiple Sclerosis Societies

Publisher: Demos Publications, Inc., 386 Park Avenue South, New York, NY 10016

Price: \$13.95 (softcover), \$19.95 (hardcover), plus \$4.00 postage/handling

This 212-page classic is divided into six sections. The first section discusses the nature of multiple sclerosis, how the diagnosis should be made, and the natural history of the disease. The second details the difficulties in evaluating methods for treating a disease whose course varies so much from one individual to another. The third discusses promising new treatments for the acute stages, while the fourth covers methods used to prevent worsening of the patient's condition. The fifth covers symptomatic treatment and general management. The final section, "Miscellaneous Empirical Treatments," analyzes 56 unproven products and/or regimens. Each analysis includes a description of the method, the proponents' rationale, a scientific evaluation, estimate of risks and/or costs, and conclusions.

Nutritional approaches are covered in the sections on general management and empirical treatments. Supplementation with polyunsaturated fatty acids and fish oils is regarded as "investigational" because the evidence for which is considered conflicting. Low-fat diets are regarded as unproven because there is no generally accepted rationale for their use and they have not been tested by properly controlled studies. Similar conclusions were reached for allergen-free diets, the Kousmine Diet, the gluten-free, raw food (Evers) diet, the McDougall Diet, the pectin- and fructose-restricted diet, liquid VLC diets, and the sucrose- and tobacco-free diet. Megavitamin and megamineral therapies are regarded as unproven and potentially hazardous. Supplementation with cerebrosides, aloe vera, or enzymes is also regarded as unproven.

This book can be of great value to multiple sclerosis patients (and families) who are uncertain about therapeutic avenues to pursue. It will also be useful to health professionals who must advise people about treatment alternatives, both proven and unproven.

NEW FOOD LABELING REGULATIONS ISSUED

Stephen Barrett, M.D.

On January 6, the FDA and the U.S. Department of Agriculture (USDA) published final regulations that provide for consistent, scientifically based labeling for almost all processed foods [Federal Register 58(3):631-691, 2065-2964, 1993]. The rules, intended to provide more meaningful information about the nutritional value of foods, constitute the most extensive food labeling reform in the country's history.

To arrive at the new rules, the FDA held three public meetings, reviewed public comments, and produced final rules in more than 20 separate proceedings. In addition to oral comments, the agency received more than 40,000 others in writing, the largest number ever received in response to an FDA proposed regulation. About 30,000 were form letters from organized campaigns. The USDA received 1,109 comments, many of which asked that the FDA and USDA label requirements be harmonized.

Modern nutrition labeling began in 1974 when the two agencies established voluntary rules and began requiring nutrition information on labels of products that contain added nutrients or that carry nutrition claims. Other than requiring sodium and permitting potassium to be added to the voluntarily listed components, the rules have remained essentially unchanged.

The new rules provide a basic format for the nutrition panel, which will be titled "Nutrition Facts." This panel must not only include the nutrient contents of the product, but must indicate how the amounts of certain ingredients are related to typical daily caloric intakes of 2,000 or 2,500 calories. The new labels must also disclose the amount per serving of saturated fat, cholesterol, dietary fiber, and other nutrients of health concern to today's consumers. Other provisions include consistency of serving sizes; definitions for core descriptive terms, such as "light," "low fat," and "high fiber"; and provisions for health claims for prepared foods containing certain nutrients. To devise serving sizes, foods were grouped into 139 categories and an amount customarily eaten per occasion was established for each category and translated into label serving sizes.

The FDA estimates that about 90% of processed food will carry nutrition information. In addition, uniform point-of-purchase nutrition information will accompany many fresh

foods, such as fruits, vegetables, raw fish, meat, and poultry. Although this is voluntary, it will be mandated if voluntary compliance is found to be insufficient.

Changing the labels of hundreds of thousands of products is expected to cost the food industry (and ultimately consumers) between \$1.4 and \$2.3 billion over the next 20 years. However, the benefits to public health—measured in monetary terms alone—are estimated to greatly exceed the costs. These expected benefits include decreased rates of coronary heart disease, cancer, osteoporosis, obesity, high blood pressure, and allergic reactions to food.

The proposed rules were spurred primarily by the Nutrition Labeling and Education Act (NLEA) of 1990, which requires nutrition labeling for most foods and authorizes FDA-approved health claims on food labels. Although meat and poultry products, which are regulated by the USDA, were not covered by NLEA, USDA has issued regulations that are similar to those of the FDA. Manufacturers have until May 1994 to comply with most of the new requirements, but changes on some product labels will appear sooner. Both agencies will conduct an extensive educational campaign to help consumers get maximum benefit from the new food labels.

"Daily Values"

As part of its effort to make nutrition information more practical and easier to understand, the FDA has devised a new system called Daily Values (DVs). These values combine the information from two proposed sets of reference values for nutrients: Daily Reference Values (DRVs) and Reference Daily Intakes (RDIs)—neither of which will appear on the labels themselves.

DRVs are for nutrients, such as fat and cholesterol, for which no set of standards previously existed. RDIs are intended to replace the U.S. RDAs (Recommended Daily Allowances), which were introduced in 1973 as reference values for vitamins, minerals, and protein in the labeling of foods and drugs.

The U.S. RDAs (and proposed RDIs) are based on the

DEFINITIONS OF FOOD LABEL TERMS

Term	Definition Proposed in Federal Register, January 6, 1993
Free or without	An amount that is nutritionally trivial and unlikely to have a physiological consequence.
Calorie free	Fewer than 5 calories per serving.
Sugar free	Less than 0.5 grams per serving of monosaccharides and/or disaccharides.
Sodium free or salt free	Less than 5 mg per serving. A claim made for a food normally free of or low in a nutrient must indicate that the situation exists for all similar foods. For example: "spinach: a low-sodium food." Labels of foods containing insignificant amounts of ingredients (such as baking soda or sodium ascorbate) commonly understood to contain sodium must use an asterisk to refer to a note below the ingredient list that the amount of added sodium is trivial.
Low or little	Low enough to allow frequent consumption without exceeding the dietary guidelines. Generally less than 2% of the Daily Value for the nutrient. A claim of "very low" can be made only about sodium.
Low sodium	Less than 140 mg per serving and per 100 grams of food (a little less than half a cup).
Very low sodium	Less than 35 mg per serving and per 100 grams of food.
Low calorie	Less than 40 mg per serving and per 100 grams of food. May be used for meal-type products with 120 calories per 100 grams of food.
Light (or lite)	Contains 1/3 fewer calories than the referenced food. Products deriving more than half their calories from fat must have their fat content reduced by 50% or more with a minimum reduction of more than 3 grams per serving. The percentage of reduction of calories and/or fat must be specified immediately proximal to the claim. May not be used for foods or nutrients meeting the requirements for a "low" claim. The term "light" can be used for a salt substitute if it contains at least 50% less sodium than ordinary table salt. Other use of "light" must specify if it refers to look, taste or odor, unless the meaning of the term is obvious and fundamental to the product's identity. (Thus, light brown sugar would require no explanation).
Light in sodium	Contains at least 50% less sodium than an appropriate comparison food.
Less (or fewer), lower, or reduced	Contains at least 25% less of a nutrient (or calories) than the referenced food. May not be used for foods or nutrients meeting the requirements for a "low" claim.
More	Contains at least 10% more of a desirable nutrient than does a comparable food. The terms "fortified," "enriched," or "added" may be used instead under appropriate circumstances.
High, rich in, or excellent source	Contains 20% or more of the RDA or DRV.
Good source	Contains 10-19% of the RDA or DRV. Can also be described as "contains" or "provides."
Fat free	Less than 0.5 grams of fat per reference amount and serving size, and no added ingredient that is a fat or oil. The term "fat free" may not be used for a food that is inherently free of fat unless there is an accompanying statement that all foods of this type are inherently fat free. Labels of foods containing insignificant amounts of ingredients (such as nuts) commonly understood to contain fats are permitted to use an asterisk to refer to a note below the ingredient list that the amount of added fat is trivial.
Low fat	Contain 3 grams or less of fat per reference amount, per serving size and per 100 grams of product. May not be used for foods inherently low in fat unless accompanied by a disclaimer that all foods of this type are inherently low in fat. May be applied to meal-type products if the meals also derive 30% or fewer of their calories from fat.
(Percent) fat free	Only for foods that meet the FDA definition of low fat.
Reduced or less fat	Reduced fat content by 25% or more, with at least 3 grams less per reference amount and per serving size.
Saturated fat free	May be used for all products that are fat free. Labels of products that are not fat free but contain less than 0.5 grams of saturated fat per reference amount must disclose the amount of total fat.
Low in saturated fat	1 gram or less per serving, with not more than 15% of calories from saturated fat and 1% or less of total fat as trans fatty acids. Labels of foods containing insignificant amounts of ingredients commonly understood to contain saturated fats must state that the amount of saturated fat is trivial. Meal-type products must also derive less than 10% of their calories from saturated fat.
Reduced or less saturated fat	At least 25% less saturated fat per serving than the reference food. When these terms are used the label must indicate the % reduction and the amount of saturated fat in the reference food. The reduction must be at least 1 gram.
Cholesterol free	Less than 2 mg of cholesterol and 2 grams or less of saturated fat per serving. Labels of foods containing insignificant amounts of ingredients commonly understood to contain cholesterol must state that the amount of cholesterol is trivial.
Low in cholesterol	20 mg or less per serving and per 100 grams of food, and 2 grams or less of saturated fat per serving.
Reduced or less cholesterol	At least 25% less cholesterol per serving than its comparison food. The label of a food containing more than 13 grams of total fat per serving or per 100 grams of the food must disclose that fact.
Fresh	Can only be linked to raw food, food that has not been frozen, heated, processed, or preserved. (Low-level irradiation is permissible.)
Freshly	Can be used with a verb such as "prepared," "baked" or "roasted" if the food is recently made and has not heat-processed or preserved. "Freshly frozen" may be used for foods that are quickly frozen while fresh.
Lean	Meat or poultry product with less than 10 grams of fat, less than 4 grams of saturated fat, and less than 95 mg cholesterol per 100 grams.
Extra lean	Meat or poultry product with less than 5 grams of fat, less than 2 grams of saturated fat and less than 95 mg cholesterol per 100 grams.

1968 Recommended Dietary Allowances (RDAs) set by the National Academy of Sciences. The main reason for the change in terminology is to avoid confusion due to the similarity of the terms "RDA" and "U.S. RDA." A second reason is that the FDA believes that most of the U.S. RDAs are higher than necessary.

Despite the new name, the actual values (except for protein) will remain the same for the near future. New values proposed in 1991 could not be incorporated into the final rules because of the Dietary Supplement Act of 1992, passed last October at the behest of Senator Orrin Hatch (R-UT) and the dietary supplement industry.

DRVs for the energy-producing nutrients (fat, carbohydrate, protein, and fiber) are based on the number of calories consumed per day. For labeling purposes, 2,000 calories has been established as the reference for calculating percent Daily Values. This level was chosen, in part, because it approximates the maintenance calorie requirements of the group most often targeted for weight reduction: postmenopausal women. Where space permits, the label will include information in which selected daily values for both a 2,000- and a 2,500-calorie diet are listed; and manufacturers are permitted to list daily values for other calorie levels.

Regardless of calorie level, the DRVs are based on a diet containing 60% carbohydrate, 10% protein, 30% fat (including 10% saturated fat), and 11.5 grams of fiber per 1,000 calories. The DRVs for cholesterol, sodium, and potassium remain the same regardless of calorie level.

Permissible Health Claims

A "health claim" is defined as any type of communication in labeling that is intended to suggest "a direct beneficial relationship between the presence or level of any substance in the food and a health or disease-related condition." Health claims will be permitted only if (1) a food substance is associated with a disease or health-related condition for which the general U.S. population or an identified subgroup is at risk, (2) the claim is made in the context of the product's relationship to overall diet, (3) the claim is supported by publicly available scientific evidence (including experiments that are well designed and properly conducted), and (4) there is significant agreement among qualified experts that the claims are supported by such evidence. In addition, the claims must be "complete, truthful, and not misleading." The FDA rejected the idea that "preliminary evidence" could be used as a basis for asserting a health claim.

The new rules will permit accurate claims about the relationships between calcium and osteoporosis; sodium and high blood pressure; dietary fat and cancer; dietary saturated fat and cholesterol and the risk of coronary heart disease; fiber-containing foods and cancer; fiber-containing foods and heart disease; and foods such as fruits, vegetables, and whole grains that are high in antioxidant vitamins (including vitamin C) and cancer. Government officials believe that this will provide food companies with an incentive to improve the nutritional quality of many types of products.

For each of the seven approved relationships, the FDA has documented the supporting evidence and has proposed model claims that contain the elements required to comply with the new regulations. Manufacturers who wish to use different wording are permitted to petition the FDA for approval. Although FDA approval is not required before alternative wording is used in the marketplace, claims that are not preapproved can trigger regulatory action if the FDA determines that they are false or misleading. The model claims approved in the new rules are:

FRUITS AND VEGETABLES AND CANCER

- "Low-fat diets rich in fruits and vegetables (foods that are low in fat and may contain dietary fiber, vitamin A, and vitamin C) may reduce the risk of some types of cancer, a disease associated with many factors. Broccoli is high in vitamins A and C, and is a good source of dietary fiber."
- "Development of cancer depends upon many factors. Eating a diet low in fat and high in fruits and vegetables, foods that are low in fat and may contain vitamin A, vitamin C, and dietary fiber, may reduce your risk of some cancers. Oranges, a food low in fat, are a good source of fiber and vitamin C."

FIBER-CONTAINING GRAIN PRODUCTS, FRUITS, AND VEGETABLES AND CANCER

- "Low-fat diets rich in fiber-containing grain products, fruits, and vegetables may reduce the risk of some types of cancer, a disease associated with many factors."
- "Development of cancer depends on many factors. Eating a diet low in fat and high in grain products, fruits, and vegetables that contain dietary fiber may reduce your risk of some cancers."

CALCIUM AND OSTEOPOROSIS

- "Regular exercise and a healthy diet with enough calcium helps teen and young adult white and Asian women maintain good bone health and may reduce their risk of osteoporosis later in life."
- [Appropriate for foods exceptionally high in calcium and most calcium supplements]: "Regular exercise and a healthy diet with enough calcium helps teen and young adult women and Asian women maintain good bone health and may reduce their risk of osteoporosis later in life. Adequate calcium intake is important, but daily intakes above about 2,000 mg are not likely to provide additional benefit."

SODIUM AND HYPERTENSION

- "Diets low in sodium may reduce the risk of high blood pressure, a disease associated with many factors."
- "Development of hypertension or high blood pressure depends on many factors. [This product] can be part of a low-sodium, low-salt diet that might reduce the risk of hypertension or high blood pressure."

IMPORTANT ASPECTS OF THE NEW LABEL

The new "Nutrition Facts" panel will be built around a new set of dietary components. The mandatory (underlined> and voluntary components must be placed in the following order: total calories; calories from fat; calories from saturated fat; total fat; saturated fat; stearic acid (on meat and poultry products); polyunsaturated fat; monounsaturated fat; cholesterol; sodium; potassium; total carbohydrate; dietary fiber; soluble fiber; insoluble fiber; sugars; sugar alcohol (e.g., the sugar substitutes xylitol, mannitol, and sorbitol); other carbohydrate; protein; vitamin A; percent of vitamin A present as beta-

carotene; vitamin C; calcium; iron; and other essential vitamins and minerals. If a food is fortified with any of the optional components, or if a claim is made about any of them, the pertinent nutrition information then becomes mandatory. No other types of nutrition components are permitted to appear on the label. (This prevents manufacturers from calling attention to food components that lack nutritional significance or require no special attention from consumers.) Simplified formats are permitted for foods that contain insignificant amounts of seven or more of the mandatory components.

More consistent serving sizes, in both household and metric measures, replace those that used to be set by the manufacturer. The new values are intended to reflect the amounts that people actually eat.

The nutrients required on the nutrition panel are those considered most important to the health of today's consumers, most of whom need to worry about getting too much of certain items (such as fat) rather than too few (as was the case years ago with certain vitamins and minerals).

Conversion guide can help consumers learn caloric value of the nutrients that produce energy (calories).

Nutrition Facts

Serving Size 1/2 cup (114g)
Servings Per Container 4

Amount Per Serving

Calories 260 **Calories from Fat** 120

% Daily Value*

Total Fat 13g **20%**

Saturated Fat 5g **25%**

Cholesterol 30mg **10%**

Sodium 660mg **28%**

Total Carbohydrate 31g **11%**

Dietary Fiber 0g **0%**

Sugars 5g

Protein 5g

Vitamin A 4% • Vitamin C 2%

Calcium 15% • Iron 4%

* Percent Daily Values are based on a 2,000 calorie diet. Your daily values may be higher or lower depending on your calorie needs:

	Calories:	2,000	2,500
Total Fat	Less than	65g	80g
Sat Fat	Less than	20g	25g
Cholesterol	Less than	300mg	300mg
Sodium	Less than	2,400mg	2,400mg
Total Carbohydrate		300g	375g
Dietary Fiber		25g	30g

Calories per gram:
Fat 9 • Carbohydrate 4 • Protein 4

New mandatory components are intended to help consumers wishing to lower the fat content of their diet. However, foods for children under 2 (except infant formula) will not carry information about fat-related components because it is not appropriate to restrict the fat or cholesterol intake of infants or toddlers.

% Daily Value shows how a food fits into the overall daily diet. Some daily values are maximums, as with fat, while others are minimums, as with carbohydrates.

The Daily Values are based on daily diets of 2,000 and 2,500 calories. Individuals should adjust these values to fit their own calorie intake. (Moderately active people consume about 15 calories per day for each pound of body weight.)

DIETARY FAT AND CANCER

- “Development of cancer depends on many factors. A diet low in total fat may reduce the risk of some cancers.”
- “Eating a healthful diet low in fat may help reduce the risk of some types of cancers. Development of cancer is associated with many factors, including a family history of the disease, cigarette smoking and what you eat.”

FRUITS, VEGETABLES, AND GRAIN PRODUCTS THAT CONTAIN FIBER, PARTICULARLY SOLUBLE FIBER, AND RISK OF CORONARY HEART DISEASE

- “Diets low in saturated fat and cholesterol and rich in fruits, vegetables, and grain products that contain some types of dietary fiber, particularly soluble fiber, may reduce the risk of heart disease, a disease associated with many factors.”
- “Development of heart disease depends on many factors. Eating a diet low in saturated fat and cholesterol and high in fruits, vegetables, and grain products that contain fiber may lower blood cholesterol levels and reduce your risk of heart disease.”

DIETARY SATURATED FAT AND CHOLESTEROL AND RISK OF CORONARY HEART DISEASE

- “While many factors affect heart disease, diets low in saturated fat and cholesterol may reduce the risk of this disease.”
- “Development of heart disease depends upon many factors, but its risk may be reduced by diets low in saturated fat and cholesterol and healthy lifestyles.”
- “Development of heart disease depends upon many factors, including a family history of the disease, high blood LDL-cholesterol, diabetes, high blood pressure, being overweight, cigarette smoking and lack of exercise, and the type of dietary pattern. A healthful diet low in saturated fat, total fat and cholesterol, as part of a healthy lifestyle, may lower blood cholesterol levels and may reduce the risk of heart disease.”
- “Many factors, such as a family history of the disease, increased blood and LDL cholesterol levels, high blood pressure, cigarette smoking, diabetes, and being overweight, contribute to developing heart disease. A diet low in saturated fat, cholesterol, and total fat may help reduce the risk of heart disease.”
- “Diets low in saturated fat, cholesterol, and total fat may reduce the risk of heart disease. Heart disease is dependent upon many factors, including diet, a family history of the disease, elevated blood LDL cholesterol levels and physical inactivity.”

The FDA has also acknowledged a benefit for folic acid for women of childbearing age, but has announced that food labeling to that effect must await further study on how to avoid potentially hazardous overuse. Purported relationships that were considered but rejected include omega-3 fatty acids and coronary heart disease; dietary fiber and cardiovascular disease; antioxidant vitamins and cancer; dietary fiber and cancer; and zinc and immune function in the elderly.

The FDA also considered whether to attempt to establish definitions for the terms “natural” and “organic” in food labeling. It concluded that while a definition of “natural” might be useful to consumers, the issue is complicated enough to require a separate rulemaking procedure—which presently is beyond the agency’s resources and priorities. The FDA also decided to defer possible consideration of the term “organic” until the Agriculture Department has set standards as called for by the Organic Foods Production Act of 1990.

The new rules include an interesting provision about disclaimers. The FDA does not believe that health claims for food products should be permitted to include statements about seeking medical advice. The agency is concerned that the appearance of such a claim could mislead consumers to believe that the product possesses therapeutic value and that some consumers might be encouraged to use it for self-treatment rather than seeking appropriate medical attention. The FDA has also cautioned that whether terms like “healthy,” “nutritious” and “wholesome” are health claims will depend upon how they are used.

The FDA continued its policy that any claim that a *single food* (as opposed to overall dietary composition) or *food component* (such as a vitamin, mineral, or other entity said to be a dietary supplement) can be used in the prevention, cure, mitigation, or treatment of a disease or symptom would render the product subject to regulation as a *drug* and would not be appropriate for labeling of a food. However, the regulations published on January 6, 1993, do not cover the labeling of dietary supplements. Senator Hatch’s Dietary Supplement Act of 1992 forced the FDA to delay supplements regulations for several more months.

Dietary Supplements

On June 18, the FDA published final regulations for health claims for dietary supplements [Federal Register 58(116):33690–33751, 1993]. The basic policy will be to subject dietary supplements to the same standards that applies to food in final form. Noting that “a claim linking a nutrient to a specific disease is typically intended to increase intake of the nutrient,” the FDA expressed its desire to ensure that such increased intake would not have adverse health consequences that would negate the claimed benefit.

The proposal defines dietary supplement as “a food, not in conventional food form, that supplies a component to supplement the diet by increasing total dietary intake of that component.” Herbs and nonessential nutrients would be considered foods when marketed primarily for their taste, aroma, or nutritive value, but would be *drugs* if intended to be consumed for a medicinal effect. “Nutritive value means “a value in sustaining human existence by such processes as promoting growth, replacing essential nutrients, or providing energy.” Except for calcium (for osteoporosis), the FDA considers that no other substance currently satisfies the requirements for making a valid health claim on the label of a dietary supplement.

As with foods, dietary supplements are to carry a label headed "Nutrition Facts." Under the proposed rules, "serving size" will be the number of tablets (or capsules, packets, teaspoonfuls, etc.) per serving recommended by the manufacturer, and the term "U.S. RDA," which now appears on supplement labels, will be replaced with "% Daily Value." The actual values (which will be called RDIs instead of U.S. RDAs) will remain the same. However, the FDA has indicated that it will work with the National Academy of Sciences to review the appropriateness of these numbers.

Amino Acids Get Special Attention

Along with its proposed regulations, the FDA released its Dietary Supplements Task Force report, which contains twenty recommendations related to safety and honest labeling. These include: (1) the FDA should use a rulemaking procedure to determine safe levels of daily intake for each vitamin and mineral; (2) capsules and tablets of individual amino acids should be regulated as drugs; (3) other types of "supplements" should be regulated as food additives, which would mean that if a substance has no known nutritive value, the label must say so; (4) the FDA should act against misleading "name claims," including brand names that imply therapeutic benefit; and (5) the FDA should continue to bring actions against "supplements" that are illegally marketed as drugs (intended for unproven therapeutic uses). The task force also urged the agency to establish and implement an educational campaign to provide the public with scientifically objective information about the safety, proper use, benefits, and risks of products.

The FDA's proposed regulations echoed the task force's concern about amino acids: "It is clear that many amino acids are being marketed in violation . . . because they are unapproved food additives, and adequate scientific evidence to ensure their safe use does not exist, or because they are being marketed for therapeutic uses." The proposal asked interested parties to submit data documenting that they are safe and that a legitimate nutritional reason exists for them to continue being marketed as "foods."

Attack on FDA Continues

Although the supplement industry pretends otherwise, a large percentage of its products have no legitimate usage as nutrients and are promoted as therapeutic agents. Since unproven therapeutic claims are not legal on product labels, most claims are promoted through advice in health food stores, other person-to-person contacts, and claims made in books, lectures, articles in magazines and newsletters, and talk-show appearances. Claims that are not directly involved in the sales process are protected by the doctrines of freedom of speech and freedom of the press and are not subject to FDA regulation. In some cases, however, the FDA can protect consumers from wasting money on dubious products by making it illegal to market their ingredients.

The supplement industry has been worried that the FDA would ban individual amino acids and various other types of products that have no legitimate dietary value to consumers. For about two years, the industry has been promoting legislation intended to block the FDA's ability to remove these products from the marketplace [NF 9:9-14, 30, 37, 1992]. Current proposals, introduced by Senator Hatch and Representative Bill Richardson (D-NM), would not only enable worthless products to be marketed but would permit health claims to be based on flimsy evidence and would cripple FDA enforcement efforts [NF 10:21, 1993].

Although the real issue is how to protect consumers from being deceived, the supplement industry and its allies are posing it as a controversy over "freedom." To stir up public support, they have been falsely claiming that the FDA wants to take away their vitamins. One element of their campaign is a videotaped 60-second public service announcement intended to dramatize government interference with people's freedom to take vitamins. The video shows footage from a television program showing a SWAT team, guns drawn, raiding a private home to arrest the owner (played by Mel Gibson), who is located in the kitchen holding a bottle of vitamin C. "It's only vitamins," Gibson protests as he is handcuffed, "vitamin C, you know . . . like in oranges." During the "arrest," viewers are told: "The federal government is actually considering classifying most vitamins and other supplements as drugs. The FDA has already conducted raids on doctors' offices and health food stores. Could raids on individuals be next? Protect your right to vitamins. Call Congress now."

The scenario, of course, is no more realistic than the claims that the "health food" industry makes for most of its products. But if enough people respond to the misrepresentations, Congress may give the industry what it wants.

Dr. Barrett, a psychiatrist, medical editor, and consumer advocate, is a board member of the National Council Against Health Fraud. In 1984, he received the FDA Commissioner's Special Citation Award for Public Service in fighting nutrition quackery. A free copy of the May 1993 *FDA Consumer*, which is focused on labeling, can be obtained from FDA, HFE-88, 5600 Fishers Lane, Rockville, MD 20857 [order #FDA 93-2262]. A 35-page summary of the labeling regulations can be obtained by writing to the same address. The *Task Force on Dietary Supplements Final Report* [order #PB-931-92888] can be obtained by sending \$30 plus two self-addressed labels to the National Technical Information Service, U.S. Department of Commerce, 5285 Port Royal Road, Springfield, VA 22161. The complete food and dietary supplement labeling regulations, which occupy 1,262 pages provide a detailed explanation for each conclusion the FDA has reached, can be reviewed at libraries that subscribe to the *Federal Register*.

BRIEFS

New seafood hotline. The FDA has launched a 24-hour toll-free hotline to answer consumer questions about seafood labeling, buying, handling, and storage for home consumption. FDA seafood specialists will answer questions directly between 10:00 A.M. and 2:00 P.M. Eastern Time, Monday through Friday. At other times callers using a touch-tone phone can listen to recorded messages and order publications. The hotline number, 800-332-4010, can be used in all 50 states and Puerto Rico. The number for the Washington, D.C., area is 202-205-4314.

Chiropractors and supplements. Paul A. Brown, M.D., a Minnesota physician, telephoned 100 chiropractic offices and was informed that 78 of them sold vitamin supplements. Chiropractors who sell supplements typically prescribe them inappropriately and charge two to three times their cost.

New FDA reporting system. The FDA has urged health professionals to increase their reporting of serious adverse events that might be associated with medications and devices. The new initiative, called MEDWatch, is also intended to encompass problems with vitamins, minerals, herbal products, infant formulas, medical food products, and weight-loss products. In a plea to physicians, FDA Commissioner David A. Kessler, M.D., J.D., stated that only a fraction of the serious adverse events encountered are reported [JAMA 269:2765-2768, 1993].

Immune-boosting products attacked. The New York City Department of Consumer Affairs has charged four supplement companies with deceptively promoting products characterized as "immune boosters." The action was taken under a city consumer protection law, passed in 1990, which regulates advertising of products and services claimed or implied to "boost, enhance, stimulate, assist, cure, strengthen or improve the body's immune system." Under this law, no such effect can be claimed without an accurate statement about whether or not the product or service is effective in preventing HIV infection or improving the health of an infected individual. The cited products were *Immune Protectors* (Twin Laboratories, Inc.), *Immunizer Pak Program* and *Immune Nectar* (Nature's Plus), *Pro-Immune Anti-Oxidant* (Nutritional Life Support Systems), and *Ecomer* (a shark liver oil capsule marketed by Scandinavian Natural Health & Beauty Products, Inc.). In announcing the actions, Acting Consumer Affairs Commissioner Mark Schrader called the products "little more than overpriced vitamins, minerals, and herbs."

RDAs to change? The Food and Nutrition Board is considering redefining the basis of the Recommended Dietary Allowances (RDAs). Since their inception, these values have been based on the amounts needed to prevent deficiency (plus moderate extra amounts for storage). Although most nutrition scientists doubt that sufficient data exist, some FNB members and staff think that the RDAs should be raised or be based on "optimal" levels that would help prevent chronic ailments.

Biosphere "experiment" nears end. On September 26, 1993, the crew members of Biosphere 2 will re-enter the earth's atmosphere after spending two years inside the glass-and-steel structure that occupied 3.15 acres in the Arizona desert. About 80% of the food was produced by the crew during the test period, and the rest was produced and stored before the facility was sealed. The diet, which contained little meat, produced significant reductions in weight and cholesterol levels. A 105-page book that describes the crew's food-production experiences and many of the recipes they developed is available for \$15.95 from The Biosphere Press, P.O. Box 689, Oracle, AZ 85623.

Calcium and osteoporosis update. A study has found that supplementation with 1,000 mg per day of calcium significantly reduced bone loss in postmenopausal women [New England Journal of Medicine 328:460-464, 1993]. An accompanying editorial concluded that despite some conflicting studies, "it seems prudent to increase the intake of calcium and vitamin D in most postmenopausal women—calcium to at least 1000 mg and preferably to 1500 per day, and vitamin D to 400 to 800 IU daily—without waiting for more information" [NEJM 328:503-505, 1993].

Caffeine information source. The National Coffee Association has launched an information service that offers original research documents, consumer literature, interviews with experts, and a periodic newsletter called *Coffee Update*. The first two issues of the newsletter provide well-documented responses to several common concerns about caffeine. However, its discussions of caffeine addiction are misleading. Although the newsletter correctly mentions that stopping regular consumption of coffee can produce withdrawal symptoms, it attempts to soft-pedal this by stressing how this problem is minor when compared to addiction to hard drugs. (Nor does it identify the symptoms, which can be severe.) Interested persons can contact Coffee Science Source, 79 Madison Avenue, New York, NY 10016 (Telephone: 212-213-7153).

CHOLESTEROL GUIDELINES REVISED

The National Cholesterol Education Program (NCEP) has released new guidelines that include screening to detect low HDL (high-density lipoprotein) levels as well as high total cholesterol levels [JAMA 269:3015-3023, 1993]. The revised guidelines emphasize increased physical activity and weight loss as well as dietary therapy as the initial approach to treating high cholesterol levels.

The recommendation for HDL screening is a response to growing evidence that a low HDL level imparts increased risk for coronary heart disease (CHD). Under the new guidelines HDL levels below 35 mg/dL are considered a major risk factor. The other major risk factors are: being male (≥ 45 years old) or female (≥ 55 or prematurely menopausal without estrogen replacement therapy), family history of premature CHD, cigarette smoking, high blood pressure, and diabetes. HDL levels of 60 or more, which appear to protect against CHD, are now considered a "negative risk factor."

The new guidelines call for measuring total cholesterol and HDL levels in all adults 20 years of age or older at least once every five years. In individuals free of CHD, total cholesterol levels less than 200 are still classified as "desirable," levels from 200 to 239 as "borderline high," and levels of 240 or more as "high." For those with desirable total levels, however, a low level of HDL indicates that additional follow-up procedures are advisable.

If screening tests reveal that total cholesterol is too high or HDL too low, a lipoprotein analysis that includes LDL (low-density lipoproteins) is recommended. As in the previous

guidelines, LDL levels under 130 are considered "desirable," levels from 130 to 159 are considered "borderline-high risk," and levels of 160 or more are "high-risk." Treatment and follow-up recommendations depend upon the level of LDL, the number of risk factors, and the presence or absence of CHD. The new guidelines call for more aggressive treatment of LDL levels in individuals known to have CHD or other atherosclerotic disease. The target level for these individuals, formerly 130 mg/dL, has been lowered to 100.

Data from the National Health and Nutrition Surveys (NHANES), conducted by the U.S. Centers for Disease Control and Prevention (CDC), indicate that average blood cholesterol levels for adults between the ages of 20 and 74 have consistently declined between 1976 and 1991 [JAMA 269:3002-3008, 1992]. Based on current NCEP guidelines, the proportion of Americans with high blood cholesterol levels fell from 26% in 1976-1980 to 20% in 1988-1991, while the proportion of those with desirable levels rose from 44% to 49%. Based on 1990 population data, it is estimated that 29% (52 million) would be candidates for dietary therapy to lower the blood cholesterol levels and about 7% might ultimately be candidates for drug therapy [JAMA 269:3009-3014, 1993].

A detailed summary of the new NCEP guidelines as well as reprints of the two prevalence studies can be obtained from James I. Cleeman, M.D., National Cholesterol Education Program, National Heart, Lung, and Blood Institute, National Institutes of Health, Bldg. 31, Room 4A-05, Bethesda, MD 20892.

RECENT BOOKS ON NUTRITION AND FITNESS

Mystical Diets: Paranormal, Spiritual, and Occult Nutrition Practices. *Nutrition Forum* senior associate editor Jack Raso, M.S., R.D., reports on his personal investigations of macrobiotics, Edgar Cayce, Anthroposophic medicine, multi-level marketing (Km and Nature's Sunshine Products), mail-order nutrition, chiropractic, naturopathy, "complementary" and "alternative" medicine, Gerson diet, Natural Hygiene, Ayurvedic medicine, and schools offering dubious credentials. Hardcover, 1993, 300 pages. Available for \$26.00 postpaid from LVCAHF, Inc., P.O. Box 1747, Allentown, PA 18105.

Genetic Nutrition. Artemis Simopolis, M.D., Victor Herbert, M.D., J.D., and Beverly Jacobson tell how to integrate information about heredity with basic nutrition principles to arrive at an optimal individual dietary program. Suggests what to eat or avoid if one has a family history of obesity, heart disease, diabetes, cancer, high blood pressure, alcoholism, food allergies, or various uncommon genetic disorders. Hardcover, 1993, 335 pages. Available for \$22.00 plus \$1.50 postage from Special Sales Dept., Macmillan Publishing Company, 866 Third Avenue, New York, NY 10022; or call 1-800-323-7445.

Walking: A Complete Guide to the Complete Exercise. Casey Meyers, a prominent fitness writer and walking enthusiast, has produced an excellent guide for all levels of participation from beginner to race-walker. Softcover, 1992, 332 pages. Copies can be ordered for \$12.00 plus \$2 postage plus state sales tax from Random House, 400 Hahn Road Westminster, MD 21157 or by calling 1-800-726-0600.

ACSM's Fitness Book. Human Kinetics Publishers, Inc., and four experts from The Pennsylvania State University have produced an excellent step-by-step guide to cardiovascular fitness, muscular strength, endurance, and flexibility. Developed by the American College of Sports Medicine, it includes a self-assessment test, and tells why to exercise, how to achieve various fitness levels, and how to choose equipment and facilities. Softcover, 1992, 128 pages, \$11.95 (\$14.95 in Canada). Human Kinetics has also published *ACSM's Health/Fitness Facility Standards and Guidelines*, which advises how to design a commercial health/fitness facility. Hardcover, 256 pages, 1992, \$36.00 (\$45.00 in Canada). Copies can be ordered by calling 1-800-747-4457 (or 1-800-465-7301 in Canada).

CHELATION THERAPY: UNPROVEN CLAIMS AND UNSOUND THEORIES

Saul Green, Ph.D.

Chelation therapy is a series of intravenous infusions containing a synthetic amino acid (EDTA) and various other substances. Proponents claim it is effective against atherosclerosis and many other serious health problems. Its use is widespread because patients have been led to believe that it is a valid alternative to established medical interventions such as coronary bypass surgery. However, there is no scientific evidence that this is so.

The proponents' viewpoints have been summarized in four books: *The Chelation Answer: How to Prevent Hardening of the Arteries and Rejuvenate Your Cardiovascular System* (1982), by Morton Walker, D.P.M., and Garry Gordon, M.D.; *Chelation Therapy: The Key to Unclogging Your Arteries* (1985), by John Parks Trowbridge, M.D., and Morton Walker D.P.M.; *A Textbook on EDTA Chelation Therapy* (1989), by Elmer M. Cranton, M.D.; and *Bypassing Bypass: The New Technique of Chelation Therapy* (2nd edition, 1990), by Elmer Cranton, M.D., and Arline Brecher. The scientific jargon in these books may create the false impression that chelation therapy for atherosclerosis, and a host of other conditions, is scientifically sound. The authors allege that between 300,000 and 500,000 patients have safely benefited. However, their evidence consists of anecdotes, testimonials, and poorly designed experiments.

This article identifies the major claims made for chelation and examines each in light of established scientific fact. The sources used for this review included position papers of professional societies, technical textbooks, research and review articles, newspaper articles, patient testimonials, medical records, legal depositions, transcripts of court testimony, privately published books, clinic brochures, and personal correspondence.

Early History

The term chelate, from the Greek *chele* for claw, refers to the "claw-like" structure of the organic chemical ethylenediaminetetraacetic acid (EDTA), first synthesized in Germany in the 1930s. With this claw, EDTA binds di- and

trivalent metallic ions to form a stable ring structure. EDTA is water-soluble and chelates only metallic ions that are dissolved in water. At pH 7.4 (the normal pH of blood) the strength with which EDTA binds dissolved metals, in decreasing order, is: iron⁺⁺⁺ (ferric ion), mercury⁺⁺, copper⁺⁺, aluminum⁺⁺⁺, nickel⁺⁺, lead⁺⁺, cobalt⁺⁺, zinc⁺⁺, iron⁺⁺ (ferrous ion), cadmium⁺⁺, manganese⁺⁺, magnesium⁺⁺, and calcium⁺⁺.

Mercury, lead, and cadmium cannot be metabolized by the body and, if accumulated, can cause toxic effects by interfering with various physiological functions. These substances are called "heavy metals," a term applied to metallic elements whose specific gravity is about 5.0 or greater, especially those that are poisonous. Except for aluminum, the other elements in the above list are essential nutrients that are needed for normal metabolic activity.

After EDTA was found effective in chelating and removing toxic metals from the blood, some scientists postulated that hardened arteries could be softened if the calcium in their walls was removed. The first indication that EDTA treatment might benefit patients with atherosclerosis came from Clarke, Clarke, and Mosher, who, in 1956, reported that patients with occlusive peripheral vascular disease said they felt better after treatment with EDTA [*American Journal of Medical Science* 230:654-666, 1956].

In 1960, Meltzer et al., who had studied ten patients with angina pectoris, reported that there was no objective evidence of improvement in any of them that could be ascribed to the course of EDTA chelation treatment. However, during the next two months, most of the patients began reporting unusual improvement in their symptoms. Prompted by these results, Kitchell et al. studied the effects of chelation on 28 additional patients and reappraised the course of the ten patients used in the original trial [*American Journal of Cardiology* 11:501-506, 1963]. They found that although 25 of the 38 patients had exhibited improved anginal patterns and half had shown improvement in electrocardiographic patterns several months after the treatment had begun, these effects were not lasting. At the time of the report, 12 of the 38 had died and only

15 reported feeling better. (This "improvement" was not significant, however, because it was no better than would be expected with proven methods and because there was no control group for comparison.) Kitchell et al. concluded that EDTA chelation, as used in this study, was "not a useful clinical tool in the treatment of coronary disease."

The "Approved" Protocol

The primary organization promoting chelation therapy is the American College of Advancement in Medicine (ACAM), which was founded in 1973 as the American Academy for Medical Preventives. Since its inception, ACAM's focus has been the promotion of chelation therapy. The group conducts courses, sponsors the *American Journal of Advancement of Medicine*, and administers a "certification" program that is not recognized by the scientific community. The 1992-93 edition of *Encyclopedia of Medical Organizations and Agencies* states that ACAM has 450 members.

ACAM's protocol for "the safe and effective administration of EDTA chelation therapy" is included in Cranton's "textbook," a 420-page special issue of the journal that contains 28 articles and a foreword by Linus Pauling. The protocol calls for intravenous infusion of 500 to 1,000 ml of a solution containing 50 mg EDTA per kilogram of body weight, plus heparin, magnesium chloride, a local anesthetic (to prevent pain at the infusion site), several B-vitamins, and 4 to 20 grams of vitamin C. This solution is infused slowly over 3.5 to 4 hours, one to three times a week. The initial recommendation is about 30 such treatments, with the possibility of additional ones later. Additional vitamins, minerals, and other substances—prescribed orally—"vary according to preferences of both patients and physicians." Lifestyle modification, which includes stress reduction, caffeine avoidance, alcohol limitation, smoking cessation, exercise, and nutritional counseling, is encouraged as part of the complete therapeutic program. The number of treatments to achieve "optimal therapeutic benefit" for patients with symptomatic disease is said to range from 20 ("minimum"), 30 (usually needed), or 40 ("not uncommon" before benefit is reported") to as many as 100 or more over a period of several years. "Full benefit does not normally occur for up to 3 months after a series is completed," the protocol states;—and "follow-up treatments may be given once or twice monthly for long-term maintenance, to sustain improvement and to prevent recurrence of symptoms." The cost, typically \$75 to \$100 per treatment, is not covered by most insurance companies. Some chelationists, in an attempt to secure coverage for their patients, misstate on their insurance claims that they are treating heavy-metal poisoning.

Unproven Claims

Proponents claim that chelation therapy is effective against atherosclerosis, coronary heart disease, and peripheral vascular disease. Its supposed benefits include increased collateral blood circulation; decreased blood viscosity; improved cell

membrane function; improved intracellular organelle function; decreased arterial vasospasm; decreased free radical formation; inhibition of the aging process; reversal of atherosclerosis; decrease in angina; reversal of gangrene; improvement of skin color, healing of diabetic ulcers. Proponents also claim that chelation is effective against arthritis; multiple sclerosis; Parkinson's disease; psoriasis; Alzheimer's disease; and problems with vision, hearing, smell, muscle coordination, and sexual potency. None of these claimed benefits has been demonstrated by well-designed clinical trials.

In a retrospective study of 2,870 patients treated with NaMgEDTA, Olszewer and Carter (1989) concluded that EDTA chelation therapy benefited patients with cardiac disease, peripheral vascular disease and cerebrovascular disease. These conclusions were not justified because the people who received the treatment were not compared to people who did not.

In 1990, these authors carried out a "double-blind study" in which EDTA chelation was used to treat ten patients with peripheral vascular disease. The authors claimed that this was the first such study. The patients' progress was evaluated by measuring changes in their blood pressure and their performance in exercise stress tests before, during, and after the course of treatment. The authors claimed that EDTA had a significant impact on the patients' clinical status because the removal of calcium, copper and zinc from the vascular compartment corrected cholesterol and lipoprotein metabolism; triggered a parathyroid response that pulled calcium from the bones; decreased platelet aggregation; lessened iron-generated free radical formation; reduced membrane lipid peroxidation; decreased plaque formation; and prevented intracellular calcium accumulation.

Between 1963 and 1985, independent physicians published at least fifteen separate reports documenting the case histories of more than seventy patients who had received chelation treatments. They found no evidence of change in the atherosclerotic disease process, no decrease in the size of atherosclerotic plaques, and no evidence that narrowed arteries opened wider.

More recently, the results of two randomized, controlled, double-blind clinical trials of chelation therapy were published in peer-reviewed German medical journals. The first was conducted by Curt Diehm, M.D., at the University of Heidelberg Medical Clinic [Zeit. Deutsch Herzstiftung. Vol 10, July 1986]. Diehm studied 45 patients who had intermittent claudication, a condition in which impaired circulation causes

the individual to develop pain in the legs upon walking. About half of the patients were treated with EDTA and the rest received Bencyclan, a bloodthinning agent. In addition to determining the effect of each agent on the ability to perform pain-free walking exercises, Diehm measured the progress of the disease process in each patient during the four-week treatment period and three months after treatment was stopped. Statistical evaluation of the results after the blinding code was broken showed that patients in both groups had equally increased ability to perform pain-free walking exercises and that treatment with EDTA did not result in any change in the patients' blood flow, red cell viscosity, red-cell aggregation, or triglyceride and cholesterol levels. Diehm also concluded that the improvements in walking measurements in both groups were directly related to his success in convincing them of his strong interest in their well being and his ability to motivate them to make an effort to perform greater activity.

In the second trial, R. Hopf, a cardiologist at the University of Frankfurt, tested chelation in patients with coronary heart disease [Zeit. f. Kardiologie, 76, #2, 1987]. In this trial, 16 patients with angiographic evidence of coronary heart disease were randomized and divided into an EDTA-treated and an untreated group. Before treatment, the treated group averaged 2.1 significantly narrowed coronary arteries, while the untreated group averaged 2.6. Patients were infused with 500 ml of either the EDTA solution or dilute salt water (a placebo) at three-day intervals for a total of 20 infusions. On completion of the trial, patients in both groups said they felt better and performed weightlifting tests equally well. However, comparison of both groups before and after treatment, using angiography and other tests, indicated no improvement in blood flow through the patients' coronary arteries and a slight progression of their atherosclerosis. Hopf concluded that chelation had no effect on diseased coronary arteries.

Dubious Safety

Proponents also claim that chelation has been demonstrated to be safe. In *Bypassing Bypass*, Cranton declares that six million chelation treatments have been given safely over the last forty years. In his textbook, however, he warns of the seriousness of the possible side effects and advises that prospective patients be given a complete physical examination and be tested to rule out hypocalcemia, kidney impairment, allergic conditions (sensitivity to components of the EDTA infusion fluids), hypoglycemia, blood-clotting problems, congestive heart failure, liver impairment, and tuberculosis.

Other observers have reported cases of hypocalcemia

leading to cardiac arrhythmias and tetany; kidney damage; decreased blood clotting ability with abnormal bleeding; thrombophlebitis and embolism; hypoglycemia and insulin shock; severe vasculitis and autoimmune related hemolytic anemia, dermatitis with pruritus and generalized eczema; and extensive clumping of platelets in the blood of some patients with atherosclerosis and other chronic diseases.

An important theoretical consideration should also be considered. The trace metal most dramatically lost as a result of EDTA chelation is zinc. French researchers have found that 24 hours after an infusion of EDTA, the urine of human subjects contained 15 times the normal amount of zinc [British Journal of Clinical Pharmacology 31:347-349, 1991]. Without replacement, the loss of this much zinc over the months during which 30 to 40 treatments are delivered will increase the potential for severe impairment of immune function, precancerous cellular mutations, loss in selective permeability of cell membranes and altered solubility of pancreatic insulin. Although proponent literature advises that supplemental zinc be administered to guard against zinc depletion, studies showing that this supplementation actually prevents depletion have not been published in the peer-reviewed scientific literature.

Unsound Theories

Over the past 40 years, proponents have invoked various biochemical mechanisms to justify their use of EDTA chelation. Each time critics proved that the mechanism in vogue was scientifically untenable, a new one was postulated together with new dogma.

- *Proposed mechanism #1: The "roto-rooter" hypothesis (1960s-1970s).* Throughout the 1960s chelation proponents claimed that the structure of arterial plaque depended on the calcium it contained. They suggested that this calcium was like the rivets in a steel structure and that removing it would cause the plaque to disintegrate, widening the affected arteries and increasing blood flow. This mechanism was compared to "roto-rooter" cleaning of a clogged household water pipe.

Rebuttal: Plaque is an integral part of the artery wall and not a deposit on its surface. Calcium enters arterial plaque in the late stages of its enlargement. Since EDTA cannot pass through the artery cell membranes it cannot chelate the calcium there. Chelation proponents have never presented evidence that chelation therapy causes softening of hardened arteries, removes calcium from arterial plaque or causes the plaque structure to disintegrate.

Even if a chelating substance could impact on arterial disease, there is good reason to doubt that EDTA would be an

effective agent. Of all the synthetic chelating agents that have been used to bind metals in the body, EDTA is probably the least effective. Because it is water-soluble, it cannot penetrate the lipid-rich cell membranes. Because it is nonspecific, it binds the other divalent and trivalent metal ions in a mixture before it binds calcium. It is rapidly eliminated from the body, carries all bound trace metals with it, and can deplete nutritionally important trace metals.

• *Proposed mechanism #2: Parathyroid hormone (PTH) and plaque decalcification* (1970s–1980s). By the mid-70s the roto-rooster hypothesis had been repudiated. However, because proponents still believed that the structural integrity of arterial plaque depended on its calcium content, a new rationale was needed. In *The Chelation Answer*, Walker proposed that when ionic calcium was removed from serum by EDTA chelation, it was replaced by calcium from bone. This stimulated the parathyroid gland to secrete PTH, which promoted remineralization of bone. Walker alleged that the calcium for this bone remineralization was supplied through serum by “gradual transfer” of calcium from hardened arterial tissue and plaque. This, he said, softened the arteries and caused plaque to disintegrate.

Rebuttal: Every metabolic process in our tissues depends somewhat on calcium for its activity. To ensure human survival, the neuromuscular system must be protected by preventing a loss of calcium from the soft tissues. The calcium in blood plasma is strictly maintained between 9.0 and 11.0 mg per 100 ml in order to replenish any calcium that might be lost from soft tissues. In adult humans, the principal calcium storage depots are the bones, which contain over 99% (1,300 grams) of the calcium in the body. The rest is contained in the soft tissues (0.6%, 7 grams), plasma (0.03%, 350 mg), and extravascular fluids (0.07%, 700 mg). The homeostatic mechanism by which the plasma calcium level is maintained involves the action of PTH, and 1,25 dihydroxyvitamin D₃. These hormones regulate absorption of calcium from the gut, reabsorption in the kidney tubules, and mobilization from the bone.

The remineralization of bone uses calcium drawn from the plasma. A fall in plasma calcium triggers secretion of extra PTH, increases calcium reabsorption in the kidney tubules and synthesis by kidney tissue of 1,25 dihydroxyvitamin D₃, which causes increased calcium absorption from the gut. These PTH actions on the kidney and the gut maintain plasma calcium levels while bone remineralization takes place.

Calcium in the soft tissues is kept from reaching toxic concentrations (too high or too low) by an exchange reaction with divalent ions in the extracellular fluid. There is no normal physiological mechanism by which the soft tissues supply calcium for bone remineralization, and there is no homeostatic process that can selectively direct decalcification of hardened arteries while leaving normal tissues untouched.

• *Proposed mechanism #3: EDTA chelation blocks production of free radicals involved in a chain of reactions that result in atherosclerosis.* (1980s to present). By the early 1980s, the extensive knowledge amassed by scientists about what “free radicals” were, how they were generated, and what damage they might do in the body allowed Cranton to posit the

“current dogma” in the 1990 edition of *Bypassing Bypass*.

According to Cranton, free radicals are produced in the body by toxic metals and by abnormally placed iron and copper that are released into the local blood stream when blood clots in occluded arteries. These metals generate free radicals, which oxidize fatty acids to lipid peroxides, which then generate new free radicals themselves. This chain of oxidation reactions causes arterial cell-membrane damage and plaque formation. When EDTA binds iron, it becomes chemically unreactive and stops catalyzing the production of the free radicals. Thus, EDTA chelation curbs the pathological processes that cause atheromas (plaque) by greatly reducing the amount of free radicals generated in the atherosclerotic blood vessels.

Rebuttal: Ionic iron has two electrons in its outermost or N shell and 14 electrons in its M shell. This configuration gives ionic iron the distinct characteristic of being able to accept three pairs of electrons from other ions. As long as one pair of these electrons is left unbound, ionic iron remains highly reactive.

When iron is dissolved in water at a pH of 7.0 or more, its three pairs of electrons will be bound to three OH groups of the water. The resulting ferric hydroxide is insoluble and precipitates. In contrast, when ionic iron is chelated with EDTA, only two of the three pairs of available electrons are bound. The binding of just two of the three pairs of electrons allows the iron to exist in physiological solutions (at pH 7) in a soluble yet stable form. More importantly, since the EDTA only forms bonds with two of the three pairs of electrons, it allows the remaining pair to be fully involved in oxidation reactions that generate free radicals. Therefore, if EDTA chelates ionic iron, it does not stop it from generating free radicals. Rather, EDTA chelation keeps iron dissolved in the blood stream for extended periods and magnifies the extent to which it catalyzes production of tissue-damaging free radicals.

Under normal circumstances most of the iron in the body is bound to proteins and is not able to generate free radicals. As a result, the few free radicals that are generated by ionic iron are fully dealt with by existing antioxidant enzyme systems. However, when something causes the release of iron from these protein complexes, the amount of ionic iron is markedly increased and the potential for free-radical production is exacerbated. High doses of vitamin C increase the amount of ionic iron in the circulation by promoting its release from transferrin (the iron-transport protein) and from ferritin (the iron-storage protein), and by increasing the absorption of dietary iron from the gut. Since EDTA infusion solutions include megadoses of vitamin C, the possibility exists that chelation therapy will increase the formation of free radicals that cause tissue damage!

• *Proposed mechanism #4: Chelation therapy prevents mutations of cells that become an atheroma.* Atheromas are benign tumors that arise from mutated artery cells. Artery cells mutate when their DNA is damaged by free radicals. When these cells grow, they become a benign tumor called an atheroma (plaque).

Rebuttal: Arterial atheromas are not derived from

mutant cells but from events that cause damage and processes that attempt repair. Low-density lipoproteins (LDL) in the plasma cross the endothelial cell layer of the artery at a point where an injury has occurred and are deposited in the subendothelial layer. Monocytes are attracted to the injured area and migrate between the endothelial cells to the subendothelial layers. These monocytes are converted to macrophages which engulf the LDL and become the foam cells or "the fatty streak." The fibrous plaque—the accumulation of foam cells ruptures the endothelial cell layer causing platelets to aggregate at the site. Platelet growth factor is released, stimulating smooth muscle cell proliferation and the deposition of more LDL. Smooth muscle cells produce collagen and form a fibrous, collagen-rich cap over the site (plaque). At this stage the plaque contains cholesterol, lipid particles, and the debris from dead cells. If this cap is dislodged, there is a rapid repetition of the above steps and the plaque enlarges. The atheroma—smooth muscle cell proliferation results in an infiltration into the intima of the arterial wall. As the atheroma enlarges, the small blood vessels surrounding it rupture and bleed, causing calcification inside the atheroma. As the atheroma continues to enlarge, it causes narrowing of the artery.

The Phantom Study

In October 1989, chelation therapy was listed as one of "The Top Ten Health Frauds" in an article in *FDA Consumer*. The article reported that both the FDA and the American Heart Association have said that there is no scientific evidence that chelation therapy is effective against cardiovascular disease. Three issues later, a letter from a proponent complained that the listing was inappropriate because the FDA had approved the protocol of a clinical trial that was underway. The letter was followed by "an apology for the error," which stated that the editor had not been aware that chelation therapy had been approved for a study. The editor's note also quoted an FDA official who said that the study should "unequivocally answer at least several questions related to the utility of chelation therapy in . . . intermittent claudication."

The FDA should not have backed down because mere approval for a clinical trial is not proof that method works. Nevertheless, for several years, proponents continued to trumpet the *existence* of the study as evidence that their claims were justified. The study, however, has not been completed. According to proponents, a drug company that was involved in funding the study changed its mind, leaving them without the resources to complete it. Even if the study had been completed and had demonstrated benefit in patients with intermittent claudication, it would not have proven that chelation is safe or effective for anything else.

In 1992, a group of cardiovascular surgeons in Denmark published results of a double-blinded, randomized, placebo-controlled study of EDTA treatment for severe intermittent claudication [*Journal of Internal Medicine* 231:261–267, 1992]. A total of 153 patients in two groups received 20 infusions

of EDTA or a placebo for 5 to 9 weeks, in a clinical protocol duplicating the conditions used by Olszewer and Carter in 1990. The changes seen in pain-free and maximal walking distances were similar for the EDTA-treated and the placebo group, and there were no long-term therapeutic effects noted in 3-month and 6-month follow-ups. These investigators concluded that chelation was not effective against intermittent claudication.

Summary and Conclusions

Chelation therapists state they have administered millions of EDTA treatments to hundreds of thousands of patients over the past 40 years. Protagonist publications contain their claims of numerous clinical successes and speculations couched in modern scientific terms, seeking to explain how chelation therapy could work. Since there is no evidence showing the treatment has modified the disease process, it is clear that the "benefits" being described are the result of the compassionate attention paid to the problems of the patient and to the encouragement given them to cope with their symptoms, and/or to changes in patients' lifestyle, the same ones recommended by scientific practitioners.

If chelation therapists practiced in a scientific manner, their publications would show an interest in obtaining objective proof that chelation could alter the progress of the atherosclerosis, that occluded blood vessels could be cleared, that plaque deposits could be reduced, and that hardened arteries could be "softened." Their data would include carefully documented case reports with long-term follow-up, comparisons of angiograms or ultrasound tests before and after chelation, and data from autopsies of former patients. But chelationists have published no such data. The few well-designed studies that have addressed the efficacy of chelation for atherosclerotic diseases have been carried out by "establishment" medical scientists. Without exception, these found no evidence that chelation worked.

Based on numerous reviews of the world's medical literature, these same conclusions have been reached by the FDA, National Institutes of Health, National Research Council, California Medical Society, American Medical Association, Centers for Disease Control and Prevention, American Heart Association, American College of Physicians, American Academy of Family Practice, American Society for Clinical Pharmacology Therapeutics, American College of Cardiology, and American Osteopathic Association.

Notwithstanding claims to the contrary, the chelation "establishment" is not being victimized by a prejudiced and arrogant medical orthodoxy, but by its own unwillingness to mount a rigorous, placebo-controlled, double-blind clinical trial and stand by the results.

Dr. Green is a biochemist who did cancer research at Memorial Sloan-Kettering Cancer Center for 23 years. He consults on scientific methodology and has a special interest in unproven methods.

BRIEFS

Trouble for diet guru. On August 10, New York State licensing authorities suspended the medical license of Robert C. Atkins, M.D., after investigation into a case in which a 77-year-old breast cancer patient used a hand-held pump to inject herself with ozone gas. According to press reports, the suspension was triggered by a complaint from an emergency room physician who treated the woman for left-sided weakness caused by a brain embolism (blood vessel obstruction). In his newsletter (*Health Revelations*), Atkins stated that the patient had merely "suffered a minor reaction that left her weak-kneed" and that she had returned to him for further therapy. On August 17th, a New York State Supreme Court judge ruled that Atkins can resume seeing patients as long as he does not treat them with ozone. Atkins, who also writes books and hosts a radio talk show, uses "nutritional" methods to treat the gamut of disease, prescribes and markets his own line of "targeted nutrition" products. A notice posted at the cashier's cage in the lobby of his office building states: "As of May 18, 1993, the receipts/superbills that you will be receiving will no longer state 'Prescribed Medicine.' Instead, they will state 'Vitamin/Mineral/Herbal supplements.' This is due to the fact that the insurance companies are asking us to be more specific than we have been in the past. . . . We recommend that you do not submit the vitamins to your insurance carrier for reimbursement. It may affect your ability to collect on the rest of your claim."

Calcium supplementation among adolescent girls. A double-blind, placebo-controlled study of 12-year-old girls found that daily supplementation with 500 mg of calcium citrate maleate for 18 months resulted in increases in bone density that the researchers felt might lower their risk of osteoporotic fractures in later life [JAMA 270:841-844, 1993]. Reprints can be obtained from Tom Lloyd, Ph.D., Milton S. Hershey Medical Center, Hershey, PA 17033.

Suit over book's advice settled. The suit by Maurice Fishman against Robert E. Kowalski and Harper & Row Publishers has been settled with payment of an undisclosed sum. The suit charges that Fishman had become very ill as a result of following advice given in an early edition of Kowalski's book, *The 8-Week Cholesterol Cure*. The book had advised taking niacin in high doses but did not indicate the potential risks or the importance of medical supervision.

New cholesterol report. The *Harvard Health Letter* has issued an excellent 36-page special booklet about the role of blood cholesterol in cardiovascular disease. The report, which is easy to read but covers the subject matter in depth, includes basic biochemistry, diagnostic and treatment guidelines, dietary modification, drug treatment, and research pertaining to antioxidants. Copies are available for \$16 from Harvard Medical School, Health Publications Group, Dept. CHO-Rep, P.O. Box 380, Boston, MA 02117. Multiple-copy discount rates are available.

Irradiation ban extended. A law has been passed in New York State extending the ban on selling or distributing irradiated food until the end of 1995.

Sharper Image tarnished. The Sharper Image Corporation and its president, Richard Thalheimer, have signed an FTC consent agreement not to make unsubstantiated claims that any U.S. Government agency has recognized *Essential Factors with Oxy-Energizer* as effective for relieving fatigue or producing energy. Ads for the product had stated: "Oxy-Energizer is the first nutritional supplement ever to be granted a US patent. Supported by over 300 independent clinical trials, this anti-fatigue formula consistently demonstrated increases in stamina, endurance, recovery time, and cardiovascular function—results that simply can't be duplicated by any other nutritional supplement. . . . Oxy-Energizer contains a trade secret blend of potassium, magnesium and aspartic acid. Double-blind swimming, running, and aerobics studies consistently show improvements in stamina and endurance for subjects who regularly take these active ingredients. It can help you accomplish more at the office because you're not fighting tiredness. After work, you have more energy to enjoy sports or a late evening out." The ad also stated that "fitness authority" Kathy Smith "gets extra energy" from the product and had used it daily for five years to help maintain her busy pace. A two-month supply cost about \$1.25 per day. During 1990, the company's mail-order catalog claimed a readership of over 20 million.

FBI interested in health frauds. Spurred in part by the Clinton Administration's wish to control health-care costs, the Federal Bureau of Investigation has expressed interest in hearing from individuals with knowledge of health-related frauds under federal jurisdiction. These include fraudulent insurance billing and schemes involving use of the mail or telephone.

ANTIQUACKERY BLOCKBUSTER PUBLISHED

Prometheus Books has published *The Health Robbers: A Close Look at Quackery in America*, edited by Stephen Barrett, M.D., and William T. Jarvis, Ph.D. The 544-page book, which lists for \$25.95, has more than 20 contributors and a foreword by Ann Landers. Its 36 chapters cover chiropractic, homeopathy, naturopathy, acupuncture, faith healing, vitamin pushers, mail-order quackery, "fad" diagnoses, overselling of herbs, cancer and arthritis quackery, unproven "allergies," dubious dental care, multilevel marketing, immunoquackery, "organic" foods, weight-control facts and fads, occult practices, holistic hodgepodge, prominent promoters, why quackery persists, what can be done about it, and many other topics. Nutrition Forum readers can obtain a discount by ordering from LVCAHF, P.O. Box 1747, Allentown, PA 18105. The price is \$25 postpaid for American orders and US\$27 postpaid for Canadian orders.

“Homeless” claim may be a ploy. Press reports indicate that many if not all of the people displaying “Homeless. Work for food” signs near busy intersections are not seeking work but are begging for money from sympathetic drivers. Many such individuals collect hundreds of dollars a day and are not homeless.

“Nutritional” therapies for cancer. The American Cancer Society has published a position paper recommending against use of pau d’arco tea, Hoxsey herbal treatment, macrobiotic diets, the Gerson diet, Kelley metabolic therapy, Manner metabolic therapy, and megadoses of vitamin C for the treatment of cancer [CA 43:309–319, 1993]. The report concludes: “None of these approaches is supported by adequate clinical data. Some involve a diet that is nutritionally inadequate. Some involve potentially toxic doses of vitamins and/or other substances. Some are quite expensive. All pose the risk that patients who use them will abandon effective treatment.”

Amalgam fillings judged safe. A U.S. Public Health Service has issued a 200-page report concluding that mercury in dental amalgam does not appear to cause adverse health effects in the vast majority of people who receive them. Although noting that there was “insufficient scientific evidence to completely rule out the possibility” of long-term health risks, the report concluded that there is no reason to have amalgam fillings removed. A small percentage of dentists advocate removal of mercury-amalgam fillings based on unsubstantiated claims that they cause a large number of diseases. Consumers Union has concluded that dentists who engage in this practice should have their license revoked. The advice for removal often includes dietary supplementation to minimize “toxicity” allegedly associated with the removal process. Single copies of the report can be obtained by writing to PHS Subcommittee on Risk Management, CCEHRP, HFZ-1, 5600 Fishers Lane, Rockville, MD 20857.

Food safety report. The American Council on Science and Health has published a 36-page booklet, *Eating Safely: Avoiding Foodborne Illness*, which discusses what consumers, government agencies, and the food industry should do to prevent food poisoning. The report is available for \$3.85 from the American Council on Science and Health, 1995 Broadway, 2nd Floor, New York, NY 10023.

Pharmacists flunk student’s “vitamin test.” Donna J. Mitchell, a Kent State University graduate student, recently visited ten drugstores in three small communities within a 20-mile radius of Youngstown, Ohio, stating: “I’ve been really tired lately. Is there any vitamin supplement that could help?” Although the correct answer is no, six of the pharmacists recommended a multivitamin and two recommended a B-vitamin. None of these eight asked whether a doctor had been consulted. The pharmacists who said that a vitamin would not help suggested getting more sleep. One also recommended seeing a doctor (correct advice), while the other suggested doing exercise. The study was supervised by William M. London, Ed.D., associate professor of health education at Kent State.

Labs settle charges for billing errors. Three of the nation’s largest medical laboratories, while admitting no wrongdoing, have agreed to pay large penalties to settle federal charges that they had falsely billed for blood tests. MetPath and MetWest agreed to pay \$39.8 million after being charged with misleading doctors into ordering unnecessary tests for iron storage, cholesterol and glucose as part of a series of screening tests. (The labs charged Medicare separately for tests that the doctors thought were included in a screening package.) Last year, National Health Laboratories agreed to refund \$111 million to settle charges that it had submitted similar false claims to Medicare, Medicaid and CHAMPUS. After the settlement was announced, CBS-TV’s “60 Minutes” demonstrated how five of its investigators gave blood samples to National Health Laboratories and found that unnecessary tests were still performed and billed.

Drifting smoke jeopardizes restaurant workers. A literature review has found that the levels of environmental tobacco smoke (ETS) in restaurants is 1.6 to 2.0 times higher than in the offices of other businesses and 1.5 times higher than in residences with at least one smoker. The study also found that the levels in bars were 3.9 to 6.1 times higher than in offices and 4.4 to 4.5 times higher than in residences. Noting that epidemiological evidence suggests there may be a 50% increase in lung-cancer risk among food-service workers that is partly attributable to ETS exposure in the workplace, the study’s author concluded: (1) ETS is a significant occupational hazard for food-service workers, and (2) smoking should be prohibited in restaurants and bars [JAMA 270:490–493, 1993]. Reprints are available from Michael Siegel, M.D., Office on Smoking and Health, Centers for Disease Control and Prevention, MS K50, 4770 Buford Highway, N.E., Atlanta, GA 30341. According to a press release, Los Angeles-based California Pizza Kitchen, which has 34 outlets nationwide, was the first national restaurant company to ban smoking in all of its outlets (in July 1991).

Royal jelly defrocked. A federal court has ordered destruction of quantities of several Regina Royal Jelly products seized in January 1992 from Bee-Alive Inc., of Valley Cottage, N.Y. The FDA initiated the seizure because labeling (including promotional literature) had falsely represented that the products were safe and effective for the treatment of disease. In 1989, the agency had warned the company that promotional material distributed with *Regina Royal Concorde* had made illegal statements that the product was useful in treating or preventing chronic Epstein-Barr virus syndrome, gastrointestinal ulcers, colitis, low blood pressure, arteriosclerosis, nervous breakdowns, infertility, impotence, depression, rheumatoid arthritis, Alzheimer’s disease, anemia, asthma, hemorrhoids, migraine headaches, and other problems. Although Bee-Alive, Inc., promised to stop distributing literature making these claims, it continued to advertise that Regina Royal Jelly could help children resist childhood ailments, “offers daytime vitality and nighttime tranquility,” increases mental and physical stamina, and “seems to improve the immune system.”

FDA DOCUMENTS WIDESPREAD CRIMINAL ACTIVITY

An FDA report has described how the "dietary supplement" industry is engaging in widespread criminal activity in the marketing of their products. The report was released on July 29 when FDA Commissioner David A. Kessler, M.D., J.D., testified before the Subcommittee on Health and the Environment of the U.S. House of Representatives Committee on Energy and Commerce, chaired by Rep. Henry A. Waxman (D-CA). The hearing was held to gather information related to dietary supplement regulation.

Bills introduced by Senator Orrin Hatch (R-UT) and Representative Bill Richardson (D-NM) are intended to weaken FDA regulation by exempting certain products and making the enforcement process more cumbersome [NF 10:21, 1993]. The bills are being supported by a massive "grass-roots" campaign by supplement marketers and by consumers who are being told that unless they act, they will lose the right to purchase vitamins without a prescription. At the hearing, Dr. Kessler stated:

"Contrary to what Members of Congress may be hearing, FDA has no intention of forcing consumers to get a doctor's prescription to obtain vitamins or minerals. Nor is the agency intent on forcing health food stores out of business. . . .

"The current debate is about the safety and proper labeling of these products. . . . While today's debate is being shaped by some recent regulatory and Congressional concerns, the fundamental issue has been with us for decades. . . . the conflict between what marketers want to claim about unproven remedies and the government's responsibility to ensure that those claims have a scientific basis.

"The challenge to all participants in the dietary supplement debate . . . is to strike the right balance between ensuring the safety and proper labeling of all of these products while at the same time preserving consumers' freedom of choice. Freedom of choice means little unless consumers have accurate information on safety and effectiveness in deciding whether to purchase these products."

With his testimony, Commissioner Kessler released a 110-page report called *Unsubstantiated Claims and Documented Health Hazards in the Dietary Supplement Marketplace*. The report has four sections:

- A list of more than 500 "dietary supplements" and the unsubstantiated claims made for them in company catalogs and other product literature.

- Examples of FDA enforcement actions (seizures and warning letters) taken against 188 dietary supplements from November 1990 through June 1993. The report notes: "As the other sections of this report make clear, this investment of resources has failed to stem the tide of unsubstantiated claims."

- A list of oral representations made for specific products for high blood pressure, immune system problems, and cancer, by employees of stores selling dietary supplements. The list was compiled by FDA personnel in each of the FDA's 21 district offices throughout the United States who visited local health-food stores, posing as prospective customers. The inves-

tigators asked "What do you sell to help high blood pressure?" "Do you have anything to help fight infection or help my immune system?" and "Do you have anything that works on cancer?" Of 129 requests for information summarized in this section of the FDA report, 120 resulted in recommendations of specific dietary supplements. On six occasions, employees merely provided references from reading materials on dietary supplements. Store employees declined to make recommendations in only three. In 21 cases, employees made direct use of *Prescription for Nutritional Healing*, a 384-page book whose publisher (Avery Publishing Group, Garden City, N.Y.) promises will increase their sales.

- A report of serious adverse reactions associated with selected ingredients marketed as dietary supplements. The report focused on nine herbals (chaparral, comfrey, yohimbe, lobelia, germander, willow bark, jin bu huan, ma huang, and a Chinese herbal preparation containing *Stephania* and *Magnolia* species); two amino acids (L-tryptophan and phenylalanine); vitamin A, vitamin B₆, niacin, selenium, and germanium.

The report concludes: "The history of health quackery in this century demonstrates that enforcement actions may cause manufacturers to remove claims from the label—but the products stay on the market. Even without claims on the label, sales literature and salespeople continue to make unsubstantiated claims. Moreover, products continue to be bought and used because of the original unsubstantiated claims. . . .

"The bottom line is this: The marketplace has changed little over the years despite FDA's efforts. If anything, unsubstantiated claims are becoming more exaggerated, more products of unknown effect are available, and their use is escalating.

"When it comes to dietary supplements, the position of the Food and Drug Administration is straightforward: Dietary supplements should be safe, and any health claim on their labels or in promotional literature should be scientifically valid."

Section 201(g)(1) of the federal Food, Drug, and Cosmetic Act defines "drug" as any article (except devices) "intended for use in the diagnosis, cure, mitigation, treatment, or prevention of disease" and "articles (other than food) intended to affect the structure or function of the body." FDA Regulation 201.126 requires labeling to contain adequate directions for all intended uses. Labeling includes any written, printed or graphic material that accompanies a product. Intended use is determined by the facts at hand. Drugs not generally recognized as safe and effective by experts are "new" drugs. Marketing an unapproved (by FDA) new drug in interstate commerce is a federal crime. Under state laws, health-food store retailers are not permitted to "diagnose" or to "prescribe" products to customers. Unless they are licensed as a health professional—which few are—these activities constitute practicing medicine without a license, which is a crime.

Copies of Commissioner Kessler's testimony (\$5) and the FDA report (\$18) are available from LVCAHF, Inc., P.O. Box 1747, Allentown, PA 18105.

"THE REXALL TRADITION"

Joan Benson, M.Ed.

Rexall Showcase International (RSI), launched in 1990, is a direct marketing ("multilevel") company that sells weight-control products, dietary supplements, homeopathic remedies, and water filters. It is a subsidiary of Rexall Sundown, Inc., of Ft. Lauderdale, Florida, whose stock was recently listed on the National Association of Securities Dealers Automated Quotation (NASDAQ) National Market System.

RSI is described to prospects as the newest addition to the Rexall Family of Companies, "one of the best known, most successful corporate families in America." RSI hopes to capitalize on the Rexall name, "the trust that goes with the name, and the warm fuzzy childhood memories associated with Rexall Drugstores." According to an RSI brochure, a survey of more than 30,000 households found that 75% recognized the Rexall name and that trust in the name was "exceptionally high."

This article is based on an investigation I conducted during 1992 as a project for a health education class at Kent State University. The more recent material has been added by Dr. Stephen Barrett.

Rexall's Roots

In the video *Why Rexall Expands to Network Marketing* (1990), Rexall Division's Chief Executive Officer Armend Szmulewitz provides a brief history of Rexall's development:

In 1903, a gentleman named Louis Liggett decided to do something with the independent pharmacist. Those pharmacists were providing medical care to the individual people. Not the medical care we're used to today; it was done on an individualized basis. Lou said, "If I can pool that strength . . . I can come up with a method of taking individual pharmacists and individual markets and bringing them together into a national organization." It began what came to be known as "the Rexall concept." In the beginning it was called United Drug.

According to Szmulewitz, Liggett developed products that pharmacists "could proudly prescribe on an over-the-counter basis to their patients. That's really the beginning of

what we call today OTC, but in those days they were called patent medicines. . . . In 1903 . . . the pharmacist was the doctor in the town. . . . He worked in concert with the [medical] doctor." Liggett called his line Rexall Products [short for 'Rx to all.']. As the Rexall name gained recognition, Szmulewitz continued, "the items became stronger than the store" and the stores became Rexall stores. In the mid-1980s, the Rexall name and distribution rights were purchased by RSI's parent company.

"With that name came a great tradition," Szmulewitz asserted. "We asked, 'How do we get back to what Rexall was, bringing it back to the person, to the independent pharmacist?' We can't do that. But the person-to-person concept will work—bringing the Rexall store to somebody's house." Noting that people typically take only a second to decide whether to buy a product on the shelf, Szmulewitz said that RSI's story needs to be told in a different format: "Very similar to how the independent pharmacist told it many times. The consumer came in, 'Doc I got something wrong, what do you think? They [pharmacists] spend the time. 'Tell me what's wrong.' This is what you need. This is what I think will help.'" Szmulewitz continued: "If we can explain it to someone, if we can train them on how to sell it, train them how to use it, train on what the benefits are, and have those people explain it to other people, we've now brought back what always worked in the Rexall concept: One person talking to another."

An article in the March 1, 1982 issue of *Business Week* magazine provides a somewhat less glowing perspective. It states that the Rexall name had once appeared on about 300 company-owned stores and 12,000 franchised outlets (about 20% of the country's drugstores). During the 1970s, however, Rexall was unable to withstand competition from rivals that built modern outlets in high-density shopping areas. In 1977, the chain was sold for \$16 million to a group of private investors, which divested itself of the stores, pared its manufacturing capacity, and became primarily a distributor of vitamins, health foods, and plastic products such as toothbrushes. Former franchisees were permitted to keep using the Rexall name, but a former company official said this might not promote Rexall products because some of the stores were "eyesores" that conveyed a negative public image.

Today, although many pharmacies carry Rexall products, few still use the Rexall name. Inspection of twenty recent Yellow Page directories selected randomly at a public library found only three "Rexall" pharmacies out of about 1,000 listed. Moreover, the law limits what pharmacists can do when people ask them to recommend products.

The Sundown Connection

In 1985, operating control of the Rexall name and distribution rights were acquired by Sundown Vitamins, Inc., a company founded in 1976 by Carl DeSantis. DeSantis, who had worked in advertising and management for Super X Drug Stores and Walgreen Drug Stores, has been board chairman, chief executive officer, president, and principal stockholder ever since. In April 1993, Sundown Vitamins changed its name to Rexall Sundown, Inc., shortly before raising \$32.9 million by selling 2.5 million shares of its stock to the public. The offering's stated purpose was to raise funds to acquire its own vitamin manufacturing facility.

According to its June 18, 1993 prospectus, Rexall Sundown, Inc., markets approximately 740 products through retailers, mail-order ads and catalogs, and independent distributors. Sundown® nutritional products are sold through mass merchandisers, drugstore chains, and supermarkets. Rexall® nutritional products are sold through independent drugstores. Thompson™ products are sold in health-food stores. (Thompson Nutritional Products was founded in 1935 and acquired by Sundown in 1990.) The mail-order sales are made through the company's SDV Vitamins division. Person-to-person sales are made through RSI. Rexall Sundown also sells OTC drug products such as cold remedies and analgesics under the Rexall trademark. Total sales grew from \$24.1 million in fiscal 1988 to \$93.1 million in fiscal 1993 (which ended August 31, 1993).

Under federal laws, products marketed for preventing or treating disease are "drugs" that would be illegal to sell unless proven safe and effective for their intended purposes. Although no health claims are made for most products in the Thompson and SDV catalogs, a few are questionable. Thompson's *PMS Formula for Women* ("beneficial in reducing the severity of PMS symptoms"), contains 200 mg of vitamin B₆, a dose that can produce nerve toxicity if taken for several months. Its *CoQ-10* "may revitalize the immune system, protect and strengthen the heart and cardiovascular system, normalize high blood pressure and assist in controlling periodontal disease." Its *Free Form Lysine 500 MG* is claimed to "reduce the severity and recurrence of Herpes Simplex viral infections and aid in the production of antibodies, hormones, and enzymes." SDV's catalog includes *Memo-Vite*, *eyetamins*; *Hair, Skin, and Nails* ("The nutrients your body needs for healthy, lustrous hair, glowing skin, and strong nails"); *Ginkgo Biloba* ("might be the answer" for depression, poor circulation, lack of energy, swollen and achy legs, dizziness, ringing in the ears, or occasionally forgetting one's address or phone number); *Green Tea Extract* ("support for weight loss diets"); and *Aloe Vera Softgels* ("may possibly help reduce the symptoms of arthritis").

RSI's Products

RSI's offerings include the following:

- **Weight-control products.** RSI's original product, *Bios Life Diet*, was a powdered mixture of guar gum and oat fiber fortified with a few vitamins and minerals. According to a two-page flyer (#CF7157) titled "The Facts . . . Why We Chose the Bios Life Diet — What Needs to be Known!!" the product "can help you lose weight without feeling hungry even if you do not follow a formal diet. In addition it can slash your cholesterol levels at the same time!! . . . You simply eat less food at each meal because of the full feeling you receive from taking the Bios snack prior to meals. . . . Top medical experts say the benefits derived from weight loss and lowering cholesterol can greatly reduce the risk of deadly heart disease." (The fact sheet also states that it is "for informational purposes only, cannot be reprinted or referenced.") *Bios Fruit Bars* (\$1.65) are said to provide a high-fiber, low-fat snack that, combined with a glass of water, make you "feel full so that you can resist the foods you should avoid." Recently *Bios Life Diet* was replaced by *Bios Life 2*, which has a greater variety of fibers and contains a patented chromium product said to "help control appetite and, in particular, to help to control sugar cravings."

- **Showcase Nutritionals.** These include twelve supplements described in a 1991 brochure as "scientifically correct, break-through products" whose "every ingredient has been thoroughly researched and documented in peer-reviewed literature as having merit in augmenting or otherwise stimulating the functions of certain organs, tissues and systems in the human body." The May/June 1991 issue of *Rexall Showcase International News* claims nutritional needs can be customized: "Building from a general nutritional base—with a product such as *Plenamins*, *Daily Essentials* or *Teen Essentials*"—you can add products such as *Essential Bodyguard*, *Essential B-Concentrate* or *Essential-C 6+6* [a vitamin C supplement] "to find a combination that suits your diet or lifestyle." Such a program would cost from 18¢ to 96¢ per day, depending on the products chosen.

- **Homeopathic products.** *In•Vigor•Ol* is said to be a "natural, effective, invigorating tonic" for people troubled by "everyday fatigue, general tired feeling, and exhaustion." *Protect•Ol* is "indicated as the initial phase in cleansing the body from many environmental pollutants." and that it "enhances the effectiveness and assimilation when beginning any nutritive and homeopathic program." *Calmplex•2000* "is a solution to everyday stress, simple nervous tension and insomnia." *Reliev•Ol* lozenges are for "the relief of cough, cold, and allergy symptoms." *Metaba-TROL*, part of the Bios Life 2 Weight Management Program, is "to affect your mental, emotional and metabolic inclinations to eat at inappropriate times . . . a godsend for people who eat because of stress, anxiety or fear, for binge eaters and nervous nibblers." Homeopathy is based on the notion that symptoms can be cured by administering extremely small doses of substances that produce similar symptoms in healthy people ("like cures like"). Although federal law recognizes homeopathic products as drugs, the FDA has not required proof that they are safe or effective.

SHOWCASE NUTRITIONALS

Product Name	Description*	Analysis by Stephen Barrett, M.D.
Ultimate Plenamins \$16.95/130 days	A "total-nutrition" family vitamin/mineral formula with 42 nutrients. Ingredients include ginseng, bee pollen, PABA and inositol.	No better than many other multivitamin/mineral products, but almost twice the price of Centrum and triple that of some generic Centrum equivalents.
Daily Essentials \$8.95/30-120 days	General purpose nutritional supplement to meet people's needs at different times in their lives.	Contains RDA amounts of most ingredients but extra vitamin C, vitamin E, and beta-carotene. Vitamin needs vary little during a person's lifetime.
Energy Essentials \$9.50/15-60 days	Provides the nutrients your body needs to help maximize its natural energy-generating abilities.	Falsely implies that a supplement is needed to provide or increase energy.
Teen Essentials \$8.95/30 days	For the special needs of growing, busy young people. Contains the vitamins and minerals vital to healthy tissue growth, along with a complex of B vitamins to enhance energy. Also contains PABA, recognized for its effective role in skin protection.	Teens do not have special needs for supplements. PABA is used in some skin products that protect against the sun's rays. It does not benefit the skin when taken orally.
Workout Essentials \$7.95/60 days	Just as your skin needs a moisturizer after being exposed to the sun, you need Showcase Workout Essentials—a unique combination of vitamins, minerals and amino acids formulated to aid in your own natural muscle recovery process. Provides the nutrients that strenuous exercise depletes.	There is no scientific evidence that supplements are needed or can help recovery from exercise. Strenuous exercise is unlikely to deplete the body of nutrients. Athletes get more than enough vitamins, minerals and amino acids when eating enough to meet their caloric requirements.
Diet Essentials \$7.95/30-120 days	Enhanced to keep your energy level high, even when your calorie intake is low.	A severe calorie deficit can contribute to fatigue, but vitamins and minerals do not supply energy.
Senior Essentials \$7.95/30 days	To help seniors to avoid some of the nutrition problems that can slow them down when they really want to keep moving. Contains B-complex vitamins to aid in the conversion of fats, proteins and carbohydrates into energy.	People who eat well do not develop nutrition problems that can slow them down. Implies that the product may make users feel energetic.
Essential Bodyguard \$15.95/24-120 days	Because today's stressful lifestyles can deplete the nutrients your body needs to maintain a healthy immune system, you may want to enlist the help of Essential Bodyguard. Contains beta carotene and vitamins C and E, whose antioxidant properties help eliminate dangerous toxins in your system..	This is doubletalk. It is not true that stressful lifestyles deplete the nutrients needed to maintain a healthy immune system. Nor is it proven that antioxidants "help eliminate dangerous toxins" from your system or that supplementation enhances such a process.
Essential B Concentrate \$5.50/100 days	Research shows that nearly all people can benefit by supplementing their intake of these essential nutrients. Each tablet supplies a complex of 100% of the Recommended Daily Allowance of all essential B vitamins. Because B vitamins are water-soluble, your body needs daily replenishment.	Research does not show that nearly everyone can benefit from supplementation. Even if it did, it would not make sense to take this product, either alone or in addition to a more complete multivitamin/mineral product. B-vitamins do not need to be replenished daily because the body normally stores at least several weeks' supply.
Essential Fish Oil Concentrate \$6.95/30 days	Provides omega-3 fatty acids from fish liver oils, which have been shown to have a positive effect on cholesterol levels.	Fish oils will raise cholesterol levels in some people and can have other adverse side effects. They are not suitable for self-medication and would not be part of most medically supervised cholesterol-control regimens. Experts recommend that fish oils be obtained from fish, not supplements.
Essential Enzymes \$9.75/90 tablets	May be helpful if there is a deficiency of natural enzymes or when additional enzymes may be required. Improper digestive enzymes may be the cause of bloating, cramps, or other manifestations of intestinal gas.	Cramps and bloating can have many causes, including a high-fiber diet. Some require medical attention. Enzyme deficiency is not a likely cause. If such a deficiency exists, it should be medically diagnosed. Laypersons are not qualified to do this.

*Sources: Showcase Nutritionals brochure, 4/3/91, *Showcase International News*, May/June 1991, and *News from Showcase International*, Jan/Feb 1992.

- ClearSource water filters. These include countertop (\$169), undercounter (\$199), whole house (\$895), shower (\$129), and portable (\$79) units.

The prices mentioned above are "retail." Distributors pay about 30% less. RSI's total sales to distributors were \$7.8 million for the six months ending February 28, 1993.

RSI's Sales Tools

Multilevel marketing (also called direct or network marketing) is a form of direct sales in which independent distributors sell products, typically in their customers' home or by telephone. Distributors may profit from their own sales and also from those of people they recruit.

RSI recruits through individual contacts and group meetings, using testimonials and high-tech materials as recruiting tools. My distributor's kit, which cost \$43, contained a manual; a copy of the company's magazine *News from Rexall Showcase International*; a video called "Good Wealth to All"; two audiotapes — "Quick Start" and "The Right Choice"; credit and insurance applications; order forms; and brochures on the company's products and compensation plan.

- *News from Showcase International* reports on conferences, successful distributors, and new products and sales aids. It answers questions about products and contains testimonials, some of which were presented at an RSI conference.

- "Good Wealth to All" features cheerful, attractive people using RSI's products. It gives the history of Rexall, concentrating on the name-recognition factor. The testimonials include one by former astronaut Edward Mitchell, the sixth man to land on the moon and now an RSI distributor. The video includes shots of an Apollo rocket lifting off and shots of laboratories that convey a scientific image.

- "Quick Start" was made in 1991 by RSI's director of training. It is his personal testimonial to success in the business. It provides an overview of network marketing, the reasons people should get involved, and how to succeed if you have the requisite qualities.

- "The Right Choice" tells why various distributors decided to get involved with network marketing and RSI. It also includes a sales pitch for RSI's products.

I also acquired numerous photocopied handouts, two more videotapes, and eight more audiotapes.

- The audiotapes "You and the Bios Life Diet Plan" and "Electronic Journal, Volume 3" are conversations between Dr. Allan Bruckheim and Edward Nessel, RSI vice president for communications. They discuss Bruckheim's career and the advantages of the *Bios Life Diet* over other diet programs. Bruckheim said he joined Rexall so he could make "more house calls" through tapes such as this and through the distributor network. He said he wants to help more people achieve their health goals by communicating how to prevent disease.

- "The Westchester Study and the Bios-Life Diet Story" and "The Bios-Life Weight Management Program" videos are "fireside chats" with Bruckheim, who assures that he is "a real doctor" who takes care of "real people." The Westchester

Study was described as an 8-week double-blind study done with people recruited through newspaper ads and flyers at shopping malls. They had to be at least 20 pounds overweight. Those on the Bios-Life program had better results than those on another fiber product. Despite this optimistic message, RSI's fact sheet #CF7157 states: "It is prohibited and fully against Rexall Showcase International company policy for any independent Distributor to make any representation and give any warranty that Bios Life Diet will produce the benefits in the study."

- The "Bios Life Weight Management Program" video describes both the products and the need to combine them with exercise, a healthier diet, and certain supplements.

- The photocopied handouts—19 in all—included articles from health-food industry publications, newspaper and magazine articles, scientific reports, and promotional materials from supplement manufacturers.

For those who are serious about making a success of the business, RSI's New Distributor Assignment Packet recommended an initial purchase of \$1,138.20 worth of products, \$91.75 worth of sales aids, and three distributor kits for \$105.00.

Inspirational Meetings

RSI's mission is "to move products of honesty that will enhance health and wellness." Its success formula is to share products that are "emotional, consumable, reasonably priced, and work" in order to share the opportunity to become a

EDITOR'S NOTE:

RSI's medical advisor, Allan Bruckheim, M.D., is associate professor of family medicine at New York Medical College. He writes syndicated newspaper columns and has hosted radio programs through which he has spoken out against quackery on many occasions. He has directed a family practice residency program and headed a committee on drugs and therapeutics of the American Academy of Family Physicians. In 1990, when an article about his Westchester Diet Study appeared in the *National Enquirer*, I asked why the results had not been submitted to a medical journal. He replied that the data belonged to the company that had sponsored the study (*not* RSI).

More recently, I asked how he could be medical advisor to a company marketing homeopathic remedies. He replied that they are not medical products and that RSI gets its advice about them from another doctor whom they consider an expert on the subject. He added that many people believe homeopathic products have helped them and that "alternative" methods may well provide benefits medical science can't explain.

Rexall Sundown's communications director Edward Nessel responded to a preview of this article with the following statement: "In a perfect world in which everyone ate healthy, balanced and nutritious foods every day, kept their weight under control and exercised properly, there probably would not be as great a need or demand for many of our products. Unfortunately, this is not the case. And Rexall International's natural vitamin and other nutritional supplements can indeed play a helpful role in maintaining proper nutrition."

— Stephen Barrett, M.D.

distributor and teach others to do the same. It offers prospective distributors a chance to fulfill the American dream of being their own boss with unlimited earning potential. Most of RSI's recruiting is done at "Business Opportunity" meetings that are hosted by local distributors. RSI prefers the attendees to be "warm market": family and friends who are there by personal invitation. In July 1992, I attended two meetings at a local motel. At the first meeting, the host (Paul) discussed the company's history, products, and philosophy in glowing terms.

The first products described were RSI's *ClearSource* water filters. After predicting that 97% of all medium- and above-income families will use some type of filtration device by the year 2000, Paul stated that RSI's unit will yield water whose quality is the same as that of bottled water—for only 2¢ a gallon. He then described his experiences with RSI's homeopathic products. Paul said he uses *In•Vigor•Ol* "instead of coffee in the morning because "it helps relieve what stress creates, and that's fatigue." After asking whether anyone smoked cigarettes or was exposed to drifting smoke, he touted *Protect•Ol* for "the initial phase in cleansing the body from many environmental pollutants." He then suggested *Calmplex•2000* as "an effective solution to everyday stress, simple nervous tension, and insomnia." Next he touted *Energy Essentials* ("for people who are always on the go, depleting their bodies of certain nutrients") and *Workout Essentials* (supported by a testimonial from a bodybuilder). Then Paul described how the guar gum in the *Bios Life Diet*, when mixed with water, skim milk, or juice, "gently expands in your stomach creating a full feeling. So when you . . . eat the meals you're used to . . . you just eat less."

"Because this is a product regulated by the FDA, we can't make medical claims," he added. "But we can share experiences. A lot of people who have used the *Bios Life Diet* have been very successful in lowering their blood serum cholesterol. . . . [Guar gum] cleanses the system of all those good, fatty foods we all eat. . . . the LDL cholesterol, which is the bad cholesterol, the yellow, gooey, sticky stuff that constricts in arteries and veins and causes strokes and heart attacks. . . . And when this fiber expands . . . the cholesterol sticks to it and flushes it through your system."

Finally, Paul outlined the various steps through which distributors can increase their income by selling products and recruiting other distributors.

The second meeting, held a week later, featured a speaker (Roger) who described his business background and the advantages he saw in affiliating with RSI. "We're looking for a few exceptional people—people who are self-starters, people who are willing to take hold of something and run with it, and make a commitment and follow through to it. This is not a business for wishers. This is for people who want to get involved and do," Roger said. Paul added that those who worked 20 or more hours a week could expect to earn between \$30 and \$60 per hour. He reviewed several RSI products but spent most of the time stressing financial opportunity. This time, when discussing RSI's water-treatment system, Paul cited a *Boston Globe* article which said that there are 20,000 new cases of cancer every year related to chlorine in the water.

On September 12, 1992, I attended a day-long RSI Regional District Conference and Quick Start Training Session for distributors, held at a hotel in Cuyahoga Falls, Ohio. About forty well-dressed people attended, mostly men in their mid-thirties to mid-forties. The principal speaker was Lou Prescott, RSI's president and chief executive officer. The points he made included:

- Document what happens when using the *Bios Life Diet*, so the company can accumulate "solid anecdotal data."

- Americans eat so much junk food we have about 75% . . . deficient in one way or another with essential nutrients. Of course, different people, different lifestyles, demand different nutritional needs. Rexall, which has "the largest deposit of research of information on nutritional supplements and its impact on the human body of any company in the world," did research and came up with optimum formulations for different lifestyles. "The American public has been ahead of the medical community in believing they needed nutritional supplements. Now, a good portion of the medical community is coming on board."

- *Protect•Ol* "goes into the cells and cleanses the cells of toxins." When cells are attacked by toxins, they "cannot operate at optimum levels. So whatever you put into the body can not be converted with optimum efficiency. . . . This product cleanses the body." It is "designed to take for the rest of your life because we live in a toxic environment."

Prescott's remarks were followed by those of a dozen distributors who talked about their success in making money and/or using RSI products. Rexall Sundown's prospectus indicates that Prescott is no longer with the company but will receive severance pay of \$372,970.

In 1992, a class-action suit was filed against RSI, Prescott, and DeSantis by Patrick J. Hines, a former distributor, who charged that RSI was an illegal pyramid scheme and that the profit potential of becoming a distributor has been exaggerated. The suit papers state: "Of the hundreds of individuals who Hines knew as participating in RSI, almost all are inactive and have sustained the loss of most or all of their investment and have sustained additional economic loss." The prospectus states that the suit is "without merit."

The Rexall Tradition?

RSI's brochures and meetings contain many references to scientific breakthroughs, space-age technology, and research facts and figures. Its sales pitches warn about nutritional deficiency, pollution, and the effects of stress. Its products are promised to provide weight loss without hunger; to meet special nutritional needs; to relieve insomnia, fatigue, and everyday stress; and to make you rich and your own boss in the process. Do you believe that RSI's products are effective for these purposes? Do you think its distributors are qualified to determine who may benefit from them?

BRIEFS

Another B₆ warning. Katharina Dalton, a British physician who operates a clinic for treating premenstrual syndrome, believes that nerve toxicity from B₆ (pyridoxine) supplements is much more common than it is reported. In a recent letter, she stated that she lectures frequently and has "yet to meet an audience that does not have a few members who are suffering neurological symptoms with B₆... Too often the early signs are neglected, and it should be noted that they take at least six months... to appear." In 1987, Dr. Dalton reported on more than 100 women who had developed such symptoms as twitching, bone pains, abnormal skin sensations, muscle weakness, and the feeling of electric shocks down the spine [Acta Neurologica Scandinavica 76:8-11, 1987]. A few years later, Dutch experts who conducted a literature search identified twelve controlled trials and concluded: (1) most of these were poorly designed, and (2) there was no evidence that B₆ is effective against PMS [British Journal of Obstetrics and Gynecology 97:847-852, 1990].

Letter scam stopped. Thousands of restaurateurs have received fraudulent letters claiming that the writer's silk blazer had been soiled by a waiter who spilled a drink while the writer was dining at the restaurant. The letters, accompanied by a phony receipt, requested reimbursement for dry-cleaning expense of \$9.20. Six days after the letters were mailed, postal officials began blocking delivery of responses to the letters sent by recipients to an address in Florida. More than 1,000 letters enclosing payment were detained and returned to their senders. The scheme's perpetrator was identified as a British citizen named John Walker, who said he had answered a newspaper ad and had been given a plane ticket and several hundred dollars to set up an office in Florida for the Health Advice Bureau, an organization that may not exist. Florida officials said they would not prosecute Walker because they had their hands full with cases that were more serious and because no victim had lost money. However, authorities in Suffolk County, New York, charged him with scheming to defraud in the first degree, which is a felony.

Libel actions settled. A total of \$34,000 has been paid out-of-court to settle a lawsuit by Dr. Victor Herbert and demands by Drs. Stephen Barrett, William T. Jarvis, and John H. Renner against Loren Israelson, a Utah attorney affiliated with the health-food industry. The problem arose during a speech at the April 1992 Natural Products Expo West in which Israelson said that the four were "vicious and pathological and would stop at nothing" and that *Vegetarian Times* magazine had published a well-written article criticizing them. The speech was tape-recorded and offered for sale, along with tapes of other talks at the meeting, through an ad in *Natural Foods Merchandiser*. The *Vegetarian Times* article, to which the four had strenuously objected [NF 9:15, 1992], led to out-of-court settlements in which they received a total of \$21,000. The magazine also published a lengthy rebuttal letter by Dr. Barrett.

FDA approves BST. The FDA has approved the sale and use of bovine somatotropin (BST), a genetically engineered hormone that increases milk production in cows. Use cannot begin immediately, however, because Congress enacted a 90-day moratorium to give the White House Office of Management and Budget time to study the possible reaction by consumers and BST's economic impact on the dairy industry. Genetically engineered BST, which supplements the cow's natural BST, does not alter the milk or enter the milk supply. Since there is no detectable difference in milk from treated and untreated cows, the FDA has refused to order that products from treated cows be labeled. BST opponents argue that the drug will drive small dairy farmers out of business by increasing an already overabundant supply of milk. Proponents counter that increased production from fewer cows will make the farming industry more efficient. The drug will be marketed under the name Posilac.

Iron warnings urged. The attorneys general of 32 states have asked the FDA to require iron supplemented to be labeled: "Warning—Keep away from children. Contains iron which can be harmful or fatal if swallowed." They have also asked the FDA to require that supplements containing 30 mg or more of iron be packaged in child-resistant blister packs and that the manufacture of iron supplements that look like candy and have a sweet coating be discontinued. Since 1986, according to New York Attorney General Robert Abrams, more than 40 children ages 9 months to 3 years have died in the United States after swallowing iron supplements.

Notable quote: "Although some people can benefit from taking supplements, virtually everyone connected with the health-food industry recommends them unnecessarily and/or inappropriately. In fact, having observed the industry for many years, I consider it a form of organized crime... I have collected advertisements and product literature containing false, misleading, and unsubstantiated claims for thousands of products sold through health-food stores, multilevel (person-to-person) companies, and the offices of unscientific practitioners. Every one of these documents is evidence of violation of federal and state criminal laws." —Stephen Barrett, M.D., testimony at a Congressional subcommittee hearing on dietary supplement regulation, October 18, 1993.

Nutrition Forum (ISSN 0748-8165), © 1993, is published by Stephen Barrett, M.D. All articles and advertising inserts are fully endorsed by Dr. Barrett.

Individual subscriptions in the United States and Canada are \$35 for one year (six issues), payable to Nutrition Forum, P.O. Box 1747, Allentown, PA 18105. Institutional and other multireader subscriptions are \$50 for one year. Overseas subscriptions (via airmail) are \$50 for 1 year. Back issues are \$6 each.

All correspondence should be sent to Stephen Barrett, M.D., P.O. Box 1747, Allentown, PA 18105. Telephone 215-437-1795.

Extraordinary orange juice. Just Pik'd® is a fresh-squeezed, fresh-frozen orange juice that tastes similar to freshly squeezed juice. It differs from other frozen or packaged juice because it is neither pasteurized nor made from concentrate. (Pasteurization prolongs shelf life but deteriorates flavor.) *Editor's note: Although Just Pik'd® costs about twice as much as juice made from concentrate, it is well worth the extra cost. Availability can be determined by contacting The Fresh Juice Company at 350 Northern Blvd., Great Neck, NY 11021 (516-482-5190).*

Diet-pill companies charged. The New York City Department of Consumer Affairs has charged seven over-the-counter diet-aid makers with deceptive advertising. Six of the seven ads appeared in national women's magazines, and one was in a supplement to the *Daily News*. The companies were Hanover Labs, of Livingston, N.J. (for *Lipotrim*); Martrim, of Lawrence, Ks.; Prolab Nutrition, of Berlin, Conn. (for *Tight and Firm* capsules); Universal, of New Brunswick, N.J. (*Tone 'N'Tighten*), Body by Jay Fitness Enterprises, of Santee, Calif. (*Fat Burning System*); America's Best Nutritionals, of Destin, Fla. (*Trim Now*); and World Wide Marketing, of Hollywood, Calif. (*Nutra Trim*). The products were variously claimed to block absorption of calories, help the body burn fat, and/or guarantee effortless weight loss even while continuing to consume a diet rich in fat and calories.

NRC report boosts fluoridation. A 197-page National Research Council report has concluded that currently allowed fluoride levels in drinking water do not pose a risk of health problems. Based on a review of available data, the NRC subcommittee that wrote the report concluded that the Environmental Protection Agency's ceiling of 4 ppm (parts per million) is appropriate unless new data show otherwise. Levels of 4 ppm or above occur only in a few regions of the country where the natural concentration of fluoride is high. The level in artificially fluoridated water is about 1 ppm. The report debunks allegations that fluoridation causes bone fractures, adverse effects on reproduction, genetic defects, cancer, and several other diseases. It also pinpoints areas in which further research would be desirable. Copies can be obtained for \$35 plus \$4 shipping by calling 800-624-6262.

Government advertising fraud. The Florida Department of Citrus has published a booklet that contains several pages of misleading information about vitamin C. Among other things, the booklet suggests that vitamin C "may offer remarkable protection against heart disease" and "can help prevent tuberculosis." (The latter claim is attributed to "Dr. Irwin Stone," but does not indicate that Stone's "Ph.D. degree was from Donsbach University, an unaccredited correspondence school.) The booklet also claims (falsely) that vitamin C must be ingested daily because it cannot be stored in the body. The Department, which is funded by a tax on citrus fruits, has engaged in misleading advertising for many years. In 1987, for example, its ads suggested the potassium content of grapefruits could help control high blood pressure [NF 4:56].

School lunches unbalanced. According to an Associated Press report, school lunches tend to exceed the percentages of fat and saturated fat recommended by U.S. government guidelines. The report cited a 1992 survey of 545 schools by Mathematica Policy Research of Princeton, N.J., which found that the lunches derived an average of 38% of their calories from fat, with 15% from saturated fat. Agriculture Department officials have expressed concern about this situation. Senator Patrick Leahy (R-VT) has introduced legislation to require school lunches to meet the U.S. Dietary Guidelines.

Food composition book revised. The J.B. Lippincott Company has published the 16th edition of *Bowes and Church's Food Values of Portions Commonly Used*, updated by Jean Pennington, Ph.D., R.D. This 510-page compendium covers 8,500 generic and brand-name foods, based on data from industry, trade associations and the U.S. Department of Agriculture. Each entry includes the amounts per portion of 10 vitamins, 9 minerals, fat (by type), cholesterol, carbohydrate, protein and calories. Supplementary tables indicate the amounts of amino acids, caffeine, gluten, purines, and various other components in many foods. The first edition was published more than fifty years ago. Copies can be ordered for \$29.95 plus \$3.50 shipping from J.B. Lippincott Company, 227 East Washington Square, Philadelphia, PA 19106.

"Slimming" herbs cause kidney failure. Belgian researchers have reported 48 cases of kidney failure among women who had followed an herbal weight-loss regimen at a Belgian medical clinic [Lancet 341:387-391, 1993]. Although the toxic agent was not precisely identified, it appeared related to the presence of *Stephania tetrandra* in Chinese herbal capsules dispensed at the clinic. The authors believe that the cases "add support to the arguments against uncontrolled therapy with herbal preparations."

Lipoprotein(a) update. A prospective 5-year study of 14,916 male physicians aged 40 to 84 years has found no association between Lp(a) levels and the risk of heart attacks [JAMA 270:2195-2199, 1993]. This result conflicts with many previous studies—most of them retrospective—which suggested that high Lp(a) increased the odds of having a heart attack and therefore should be considered a risk factor, particularly in younger individuals and in others with no predisposing risk factors. An editorial accompanying this report concludes that screening a population for high Lp(a) levels is unlikely to be worthwhile because the cost is high, the association with heart-attack risk is unproven, and lowering Lp(a) levels has not been proven to prevent heart attacks [JAMA 270:2224-2225, 1993]. The editorial notes that Lp(a) or its various subtypes may still turn out to be clinically significant, so further research is needed. Lp(a) is a type of low-density lipoprotein (LDL) that has a strong hereditary component and is influenced little or not at all by diet or by most cholesterol-lowering drugs. Reprints of the study can be obtained from Paul M. Ridker, M.D., Brigham and Women's Hospital, 900 Commonwealth Ave., Boston, MA 02215.

UPDATE: HEALTH CLAIMS FOR SUPPLEMENTS

The FDA has proposed to allow claims related to folic acid and birth defects but to ban claims related to five other nutrient-disease relationships [Federal Register 58:53254-53317, 1993]. The standard used to evaluate health claims related to supplements is whether or not there is "significant scientific agreement" that a claim is valid.

The folic acid proposals were issued in response to a Public Health Service recommendation that women of child-bearing age should consume at least 0.4 mg of folic acid daily. One proposal requires folic acid fortification of enriched breads and flours and other cereal grain products. Another would amend food additive regulations to specify foods to which folic acid could be added. The third would permit the labels of products that are good sources of folic acid to state that daily consumption of the vitamin by women of childbearing age may reduce the risk of neural tube defects in their offspring. The most common defects are anencephaly (absence of most of the brain and spinal cord) and spina bifida (imperfect closure of the spinal column, which commonly results in neurological defects). In making these proposals, the FDA noted that doses higher than 1 mg are potentially dangerous because they can mask the anemia of pernicious anemia (vitamin B₁₂ deficiency), enabling neurological damage to progress untreated. These proposals attempt to minimize the risk of folic acid deficiency without significantly increasing the hazard of masking the early signs of pernicious anemia.

The claims that the FDA proposes to ban are:

- *Dietary fiber and cancer:* Although many studies have shown correlations between diets high in fiber-containing foods (whole grains, fruits, and vegetables) and colon cancer, the diets differ in levels of many nutrients and types of dietary fiber, thus making it difficult to ascribe the observed effect to a single nutrient. Because a supplement would contain only fiber and there is no evidence that any specific fiber itself caused the effects seen in studies involving fiber-rich diets, an appropriate basis for authorizing a claim for dietary fiber and cancer does not exist.

- *Dietary fiber and cardiovascular disease:* Although studies have shown relationships between consumption of soluble dietary fibers and blood cholesterol levels, the studies have generally been small, short-term, and unable to distinguish the effects of fiber from those of concomitant weight loss and changes in other dietary components. In addition, description and measurement of types of dietary fiber have not been standardized.

- *Omega-3 fatty acids and coronary heart disease (CHD):* Although ingestion of omega-3 fatty acids may favorably influence blood cholesterol and triglyceride levels and clotting characteristics related to platelets, these factors and CHD are not yet closely related to the risk of CHD. In addition, there is insufficient evidence that consumption of fish oils *alone* will produce the apparently beneficial effects found in studies relating fish consumption to the incidence of CHD.

- *Zinc and immune function in the elderly:* Although adequate dietary zinc is known to be essential for normal immune function, a specific protective role of zinc supplementation among elderly people has not been demonstrated. In fact, there is some evidence from recent studies that high levels of zinc intake will suppress immune function.

- *Antioxidant vitamins and cancer:* While populations with diets rich in fruits and vegetables experience many health advantages, including lower rates of some types of cancers, it is not possible to specifically determine that the two antioxidant vitamins (beta-carotene and vitamin C) contained in fruits and vegetables are responsible for this effect or to rule out the possibility of significant positive effects from nonmeasured components in these foods. Nor is there significant scientific agreement on whether the apparent positive effects of fruits and vegetables result from a single or combined effect of beta-carotene and vitamin C and other nutrients with antioxidant function (such as selenium), from other nutritive compounds in such foods, from nonmeasured components of such diets, or from displacement of other known risk factors within the total diet.

On November 1-3, a symposium on antioxidants, cancer, and heart disease was held at the National Academy of Sciences. The meeting, initiated by the FDA, was cosponsored by the NIH Office of Disease Prevention; National Cancer Institute; National Heart, Lung, and Blood Institute; and U.S. Centers for Disease Control and Prevention. The meeting's purpose was to discuss the available evidence, unmet research needs, and ways to facilitate research to meet these needs. The FDA will consider the results of this symposium along with other evidence before making its final decision about the proposed labeling rule.

Although bills to weaken FDA regulation of dietary supplements [see NF 10:21, 1993] have acquired many co-sponsors, Congress adjourned its 1993 session without voting on the bills introduced by Senator Hatch and Representative Richardson. However, action is expected early in 1994.

“Out on a Limb” “Alternative Nutrition” against AIDS

Jack Raso, M.S., R.D.

Are reputable organizations and champions of alternative healthcare combining to shepherd registered dietitians aboard the “holistic” bandwagon?

On November 4, 1993, I attended a conference titled “Alternative Nutrition Strategies for HIV/AIDS,” held in the auditorium of the American Red Cross in Greater New York (near Lincoln Center). Besides Red Cross, sponsors included: Nutritionists in AIDS Care (NIAC), a special-interest group of the Greater New York Dietetic Association; Gay Men’s Health Crisis (GMHC); and Ciatelli Associates Inc., in Manhattan, part of the New York/Virgin Islands AIDS Education and Training Center. A mailing from Ciatelli Associates stated that the goals of the conference were: (1) to inform health professionals about the availability and efficacy of “alternative nutrition therapies” for HIV-infected persons, and (2) to encourage collaboration among “main-stream nutritionists,” practitioners of “alternative nutrition,” researchers, and other healthcare providers. A company representative told me that over 330 people had registered for the conference. She stated that the registrants included physicians and nurses but that most were registered dietitians. The American Dietetic Association had approved the program for continuing education credit. Other attendees apparently included nondietitian nutritionists, “health educators,” and PWAs (persons with AIDS).

According to a flyer, the Training Center for Health Professionals (TCHP) of Ciatelli Associates is a nonprofit organization that gives managerial, instructional, and technical assistance to health and human service providers serving the disadvantaged. The flyer states that Ciatelli Associates has trained more than thirty thousand service providers since 1977 and has had training contracts with many agencies, including the Department of Health and Human Services, the New York State Department of Health, the New Jersey State Department of Health, and the Centers for Disease Control (CDC). It further states: “More than merely

dictating the content of our training programs, TCHP develops industry groups to perform needs assessments. Our training curriculum is developed only after learning from providers and other experts which issues need to be addressed.”

“A Very Unusual Situation”

Co-moderator Dena Rakower, M.S., R.D., made the welcoming remarks. She stated:

We’re not endorsing any particular speakers or any particular supplement or alternative strategy. What we are here to discuss, though, is this controversial subject of alternative strategies for HIV care....What we hope to do is discuss the variety of viewpoints. It’s a very unusual situation, I feel, where we have pulled together people that [are] often feeling very polarized....I think it’s a very exciting thing that we’re starting here, and I hope that, more and more, we can learn from each other and start using these ideas as we think are appropriate.

Rakower apprised us that Joseph J. Jacobs, M.D., M.B.A., director of the Office of Alternative Medicine of the National Institutes of Health (NIH), had withdrawn from the conference “at the last minute.” Michael Jacobson, Ph.D., cofounder and director of the Center for Science in the Public Interest (CSPI), in Washington, D.C., took Jacobs’ place as the first lecturer. CSPI publishes *Nutrition Action Healthletter*. Jacobson’s subject was the “history of nutrition.” He began with what he called a disclaimer: “I know a little bit about nutrition. I know less about supplements—vitamins and minerals. I know virtually nothing about herbs. And I know even less about AIDS.” He added that he was not a historian. Nevertheless, he divided his “somewhat personal history of

nutrition" into five "distinct" ages, ranging from the age of "blissful ignorance," which he said had lasted from prehistoric times until about 1900 C.E. and during which "many people did pretty well," to the supposedly incipient "age of other stuff," an "era" characterized by nutritional supplements and non-nutrient food constituents.

"Nutrient Pharmaco-Therapy"

The next lecturer was Raxit J. Jariwalla, Ph.D., a senior research scientist at the Linus Pauling Institute of Science and Medicine, in Palo Alto, California. Jariwalla advocated "nutrient pharmaco-therapy," which a slide defined as the use of specific micronutrients in amounts at which they exhibit pharmacologic properties. A slide titled "Why Vitamin C in AIDS?" offered a threefold rationale for such use of ascorbic acid: (1) favorable anecdotes and "preliminary observations," (2) demonstration of antiviral effects on both RNA and DNA viruses (in vitro), and (3) inhibition of a retrovirus (avian sarcoma virus) in chicken cells. Jariwalla's talk mainly concerned the effects of ascorbic acid in large amounts on HIV-infected laboratory cultures. Yet he concluded:

Ascorbate concentrations capable of suppressing HIV in vitro are obtainable in blood and body fluids by oral supplementation, and much higher doses by intravenous infusion. Ascorbate in combination with thiols [sulfur-containing organic compounds such as N-acetylcysteine] offers astonishing possibilities for nutrient intervention in HIV infection.... Controlled, large-scale clinical trials of ascorbate and thiol efficacy in HIV-infected persons are urgently warranted.

"Won Over"

The next featured speaker was Carol-Jane Rand, R.D., the GMHC staff nutritionist who had designed the conference. The title of her talk was: "How Much Ascorbic Acid Can Humans Absorb?/The Safety of Megadoses." Rand stated:

When I first started working at GMHC, it wasn't very surprising [that] the clients really wanted to know whether they should be taking lots of multi-vitamins, and basically I was ignorant.... I knew almost nothing about the use of vitamin-mineral supplements—an area which...had never particularly interested me.... I was something of a doubting Thomas with respect to ascorbate when I first started at GMHC and rather mentally pooh-poohed the whole thing.... [But I] was rather won over by reading Dr. Jariwalla's research and talking to some clients.

Rand cited a particular doctor's treatment of AIDS with as much as 200 grams of ascorbate daily—reportedly with minimal diarrhea. However, she explained:

Since urinary excretion with respect to ascorbate is kind of a rough...indicator of how much has actually gotten into...the bloodstream, urinary excretion of ascorbate is used as a flag to see whether ascorbate has been absorbed. What we are looking at here, unfortunately, is a study on one young man. In fact, another proviso...is [that] almost all the studies having to do with megadoses, even the best-controlled ones, were done with an appallingly small sample of people; and so, while the results that I'm going to show tend to sort of confirm each other, we're...talking about extremely small samples and an extremely small number of researchers, too. It's...essentially a group of about six or seven people that I will be quoting over and over again—which is not because...I didn't want to use more references, but because...it seems like most of the research was done by this small group, mostly in the late '70s and '80s.

The work Rand cited included experiments with rodents and an unpublished study conducted at the Linus Pauling Institute. Her handout listed as references seventeen published works: two books and fifteen articles. Three of the articles pertain to experiments with rodents. In the handout's introduction, Rand stated that, "as an HIV/AIDS nutritionist," she had been "exposed to" a body of research "suggesting" that vitamin C in very large amounts "might...mitigate" the oxidation products of chronic infection and "directly inhibit" HIV replication. Despite such iffiness, she concluded in her handout: "Ascorbate plasma levels which might significantly inhibit HIV appear attainable with doses of approximately 3–6 grams ascorbate per day." Moreover, at the close of her talk, she recommended responding to diarrhea merely by reducing the dose of vitamin C, and to nausea by switching to a buffered form.

During the panel discussion that followed, "AIDS nutrition consultant" Amanda Bell, M.S., R.D., opined that the message of the conference was that nutritionists should be political activists for supplementation studies.

Nutrition Forum (ISSN 0748-8165), © 1994, is published bi-monthly by Jack Raso, M.S., R.D., and Zhixin (David) Xu, M.S.

Subscriptions for individuals in the United States and Canada cost \$35 for one year (six issues), payable to Nutrition Forum at P.O. Box 747924, Rego Park, NY 11374. Multireader (e.g., institutional) and overseas (airmail) subscriptions cost \$50 for one year. Back issues are available at \$6.00 each.

"More than a Little Disdain" for Science

After a break, AIDS activist Fred Bingham affirmatively addressed the question: "Are Antioxidants Useful Co-Therapies for HIV/AIDS?" Bingham is the founder and executive director of DAAIR—Direct AIDS Alternative Information Resources—which he described as a "buyers' club" based in his apartment that sells preparations such as vitamin E, beta-carotene, and N-acetyl-L-cysteine. DAAIR's automated telephone message system provides information on two-hour "Introduction to DAAIR" classes, specifies the business hours of its "members-only store," and offers its free 150-page membership packet. (The sidebar on pages 4 and 5 describes the store and its offerings.)

Bingham mostly read his lecture from his handout. He stated:

As someone who was diagnosed with AIDS in mid-1989, who has since normalized his immune parameters and stayed healthy while maintaining a negative viral titer utilizing the basic theories and clinical practices I am about to discuss, and as someone who has lost all of his closest friends, I find myself understandably frustrated by the slow pace and commercial biases of Western empiricism.

Bingham said he had been a gardener and described his response to the AIDS diagnosis: "I treated myself like I was this garden gone haywire." Later, during a panel discussion, he called his AIDS diagnosis "debatable." He further stated:

There's a massive, gaping black hole in the research out there....I emphasize that this is not because these [antioxidant] compounds are not useful or that they do not possess strong clinical potentials for either slowing or stopping the progression of HIV infection—and I'm a very good example of that. It simply means that no one has yet....[figured] out a way to make...large sums of money from them, or, worse yet, how to make money without economically threatening existing methods that attempt to control this complex constellation of syndromes we call AIDS. I witnessed in agonizing detail the wasting away of each of my friends as if they were under massive free-radical assault, much like that seen under extensive, end-stage chemotherapy....

I come...before you today as a PWA who begrudgingly uses phrases and words such as "possibly

may," "potentially might," "may be," and "might be" with more than a little disdain for the allegedly impartial and cautious scientific methodology.

Bingham said he uses substances such as glutathione (a sulfur-containing tripeptide coenzyme) and St. John's wort (an aromatic herb) intravenously every day. After he finished his "read-along," a moderator remarked: "That was a handful."

Plunging into Murky Water

Clinical nutritionist Amanda Bell shared Bingham's topic. She stated:

On one hand, I want to do anything and everything I can for...the patient, and I'm willing to just step out on a limb. I feel like I need to do whatever it takes to improve quality of life and wellness in this person. And, on the other hand, I want to structure my recommendations around well researched therapies which I can trust as safe and beneficial clinically....I obviously don't want to do any harm....So this is a great conflict as a nutrition and healthcare provider out in the field.

Bell introduced her overview of nine "major categories of natural antioxidants" with the statement: "Antioxidants may [have] a vital role in the challenging and complex treatment regimen for persons with HIV infection." She said: "If I sound iffy on this, I'm not a researcher." Her handout centered on glutathione, N-acetylcysteine (NAC), and coenzyme Q₁₀, but it also referred to catalases, peroxidases, superoxide dismutase, vitamin E, flavonoids, and phenolic acids. According to the handout, a month's supply of just two preparations, "OTC" NAC and coenzyme Q₁₀, could cost up to \$72.

Bell concluded:

To supplement or not to supplement—this is the question....You must take into consideration the cost/benefit of utilizing some of these compounds....

These therapies are available over the counter and are commonly self-prescribed. As a result, [as] persons giving healthcare information, we lose our ability to prevent megadosing and to be able to express unknown side effects. And, in fact...we're not always aware when there are therapeutic successes of these compounds. But, from my perspective, things are changing. Efforts to integrate these alternative

therapies with more traditional treatments and bring them into our clinical settings are paying off. Our knowledge about antioxidants and their clinical effect is growing rapidly. More persons with HIV infection are presenting to us with extensive antioxidant use, and they are more and more candid about their benefits and their harm. I have personally had great success with a number of [HIV-infected] clients in decreasing subjective sense of fatigue...over an extended period of time using a mixture of well known antioxidants.

In conclusion, there is controversy regarding the theory of oxidative stress and oxidative imbalance and if it exists at all. There is also uncertainty regarding its role in the...progression of HIV infection. Since the water remains murky, we need to continue our efforts to increase the database, expand research studies, and promote the patient/healthcare provider alliance. In essence, what is our primary goal? It is to...[help] persons with HIV infection. For them, and for us, we must take a pro-active position, because researchers will possibly be split in the oxidative-stress controversy for a very, very long time. And this is time that people with HIV infection do not have.

“Herbs Are Your Friends”

After lunch, acupuncturist Letha Hadadi, M.S., gave a lecture titled “Chinese Herbal Medicine and HIV.” In 1991 and 1992, Hadadi was a columnist for *Free Spirit* (“New York City’s Magazine of Personal Transformation”) a bimonthly that reportedly has about 200,000 readers. Therein, she promoted not just acupuncture and herbalism but homeopathy and Bach flower therapy. Hadadi has also conducted walking tours of herb markets in New York City’s Chinatown through the New York Open Center, a nonprofit “holistic learning center” in Manhattan.

Hadadi stated:

I’d like to give you a very different experience this afternoon from what we had this morning. I want to get you experientially involved and remind you that herbs are your friends, friends that you had ever since you were a kid....As you become more comfortable with...herbs...you won’t worry about [milligrams], about dosage, because you’ll remember that herbs are foods, and foods are for us, to keep us strong—and it’s the strong people who stay around.

Then she asked us to join her in “something unusual”—“a little bit of a meditation, a visualization, to bring home this information to you on another level, not the intellec-

Inside DAAIR

DAAIR—Direct AIDS Alternative Information Resources—describes itself in a flyer as a volunteer-operated, nonprofit organization “formed to promote self-empowered healing from HIV disease through the use of natural therapies (particularly nutrients) and minimally toxic drugs.” One of its stated purposes is “to strengthen the entire physical and mental body...particularly by using therapeutic substances with low toxicities, including nutrients and herbs, which are traditionally known to support overall body functions and the ability to fight disease in a *biologically sustainable* manner.” DAAIR’s “basic” supplementation regimens, termed “personal HIV protocols,” range in price from about \$48 a month to more than \$200 a month.

The “DAAIR Buyers’ Club Catalog,” part of its membership packet, lists: 23 “main products,” including chlorella-and-alfalfa tablets; 8 “reduced-price protocol” products; and 54 “adjunct products,” including “enteric-coated” adenosine triphosphate (ATP), “gradual release” vitamin C tablets, shark-cartilage capsules and powder, superoxide dismutase (SOD) tablets, and *Silv-Immune*, a colloid of silver. The membership packet also includes a special form for ordering imported oral and injectable preparations of glycyrrhizin, the sweet extract of licorice root (*Glycyrrhiza*).

Another section, titled “Dietary Guidelines for People Living with HIV,” recommends buying “organic food as much as possible” because “average supermarket

food” is “damaged in a great many ways,” and including “live food” (“food that still contains enzymes”) in the diet because most such foods contain enzymes that “help you to digest them.”

On December 1, 1993, *NF*’s co-publisher Zhixin (David) Xu, M.S., visited DAAIR’s store, which is located in the living room of a second-story walkup on Manhattan’s East 30th Street. Political flyers covered the upper half of the apartment door, which was unlocked. Mr. Xu passed a kitchenette before entering the company of seven individuals, one of whom handed him a membership packet. The following conversation took place between them.

Xu: This is an apartment, right?

DAAIR: Well, temporarily, until there’s enough money to have a store....

Xu (referring to scores of bottles on a large shelving unit): So these are all the herbs or nutrients?

DAAIR: Right....

Xu: So you have different nutrients for different symptoms?

DAAIR: Well, yes. It’s, it’s— That’s one way—yes, yes.

Xu: How about if people don’t have any symptoms?

DAAIR (referring to membership packet): Well, you really should read that....Most viral and bacterial infections, over a long period, take out of the body certain nutrients, which the diet

tual level...but something...deeper and more fundamental.” After requesting that we close our eyes and uncross our legs, she stated:

There are a couple of concepts in Asian medicine that are different from Western herbology and Western medicine, that are extremely important. One of them is heating and cooling. Heating you might call inflammatory; cooling you might call anti-inflammatory....

So now, with your eyes closed, think of something heating. The most heating thing I can think of is fire. We're going to put it below the navel, right around your navel. And that's a big flame. And I'm going to close my eyes and join you, too.

And into that flame we might put breathing that's very gentle, and as we inhale, the flame gets bigger. And what else are we going to put into that? Ginger, pepper—warming herbs that are digestible....Just feel that fire.

And now you're in a kitchen. We might move that fire up towards the liver area and find other warming herbs, like garlic. That stimulates liver. We might move higher, up to the lungs. Don't even take notes now; just visualize this. Echinacea—very heating, very drying, very dangerous for people who have fever....It's very strongly anti-toxin.

As we go, all of this clears our phlegm and puri-

fies our senses. But we also need to cool down. We can't stay hot all the time. Imagine above your head the moon—silver, radiant, purifying. Take it within you. Put your head down and put the cooling essence, then some cooling herbs. Imagine in your lungs honeysuckle. Honeysuckle kills pneumonia germs, anti-inflammatory. In your liver put *Isatis*, wild *Isatis*....[It] kills hepatitis germs.

Other cooling remedies: While we're in the urinary area, put sarsaparilla...anti-inflammatory, antiseptic. Bring that cooling energy all the way down to the bottom of your feet. Now we surround your energy with cooling energy from the moon and from cooling herbs. You're breathing deeply.

You can use this kind of meditation anytime, because even in our workdays, we need this kind of energy all the time...warming, powerful energy the Chinese might call *chi*. We just call it energy, here in the West.

After the meditation session, Hadadi said: “I wonder how many more thousands of years will be necessary of so-called controlled testing before...herbs will be trusted.” She had provided two handouts. One had six packets of herb samples stapled to it. She categorized two of these herbs—false ginseng and *Astragalus*—as “energy (Qi) building.” Hadadi claimed that the latter “raises your energy up and sends your arm out to the surface, out to the periphery.” According to her

doesn't replace; and so the idea is not to cure by taking nutrients, but to replace all those things that the body is really kind of eliminating very quickly in the disease process.

Xu: When you don't have any symptoms really, probably it's not for you?

DAAIR: No. What you should be doing...I would think, is taking a multivitamin and vitamin C, because...those processes are invisible. So, look [at] your idea of what a multivitamin is. You might look on the bottle and—I mean, usually people take one pill a day or two pills a day, but you really want to take much more....

Xu (referring to a multivitamin on sale): So this is not really for people with full-blown AIDS?

DAAIR:I think everybody should be taking supplements if they have any level of infection whatsoever....Everything [here] has been chosen specially for HIV-related diseases....

Xu: What are [Chinese herbs] supposed to do?

DAAIR:They're all kind of antiviral....

Xu: Do you have anything...for losing your hair and losing appetite and losing weight?...You don't have anything specific?

DAAIR:It's very dangerous these days for nonprofessionals... for people who are not doctors, to say anything....One can have a consultation with Fred [Bingham], and he's really studied. He is an expert, and he'll tell you what he thinks....

Now there's a law that anybody who works in a health food store can be arrested if they tell you...“Take this 'cause your

hair's falling out.” So it's very difficult. See, I don't want to take the responsibility....Anyway, I think a lot of these things don't work like Western medicine: you have this disease, so you take this antibiotic. It doesn't work that way. It's much more basic. The whole system has to be healthy, and so therefore you take a lot of things.

But some things are specific....All the information that would be available here [in the membership packet] is for that....You should...ask your questions when Fred speaks at one of the meetings....at the Gay [and Lesbian Community] Center....

Xu: It's very confusing.

DAAIR: I know. That's why I say read this [membership packet] three times, and you'll begin to get it....The concept is to stop the oxidation and take the antioxidants, which help that, like [vitamins] C and E.

Xu: [Do antioxidants] slow down the process?

DAAIR: Well, yes. [They] slow down the disease process by keeping the body strong:...enzymes and vitamins and...amino acids...and herbs....

Xu: How could I decide what is right for me?

DAAIR: It's all in there [the membership packet]....A basic vitamin and antioxidants, and...if you have indigestion...then you would take acidophilus....

Xu: Sometimes, when you take all these different things, it might do something bad. Don't you think so?

DAAIR: Well, probably not.

other handout: dryness and redness of the tongue manifest an excessively rapid metabolism; paleness and puffiness of the tongue manifest underactivity of the endocrine system; and colds and flu can “penetrate” the surface of the body when “defensive qi” is weak.

Hadadi distinguished between Western medicine and Chinese herbalism:

When you open a Western herb book, it'll say an herb is used traditionally to treat something. But that doesn't address...either you the reader or...your client. It doesn't say that this client of yours needs this herb now....

Asian doctors have some ways of looking at the body and the person that seem very primitive. But, with an illness like AIDS, you don't need the fine-tuning diagnosis all the time....The tongue is the internal organ of the body we can look at directly....And if that's hot, if that's dry, if it's red and cracked, the internal organs are dehydrated, too. So we need moistening, cooling herbs....

You can't use a Chinese herb like a Western drug. Sorry....They're intended as food supplements to help metabolism, to help nutrition.

She said that the cost of a month's supply of herbal pills was about \$56. Hadadi told us to contact the Institute for Traditional Medicine, in Portland, Oregon, for detailed literature on Chinese herbalism, and she provided its toll-free number. The requested mailing I received from the institute a few days later consisted of nine flyers. One, titled “Food Therapy—Chinese Style,” states: “Diabetes is classified as a yin deficiency syndrome; spices disperse fluids and can damage the yin, so they are avoided.” It claims that sour (“puckery”) foods tend to restrain diarrhea, leukorrhea, perspiration, productive coughs, sinus drainage, and frequent urination; that “sweet” foods, including most meats, aid digestion; that “naturally salty” foods help to reduce “swellings,” including lymphatic swelling, obesity, thyroid and breast lumps, and “local accumulations”; that bitter foods are useful against infections, skin diseases, tumors, and spontaneous bleeding; that spicy foods are helpful in treating “abdominal pains associated with bloating”; and that “oily, soft, and slippery” foods are helpful to individuals whose hair, intestines, lungs, and skin are dry. Another flyer claims: “At its best, Chinese medicine can cure or help to cure conditions that have been called incurable.”

“Nutrition Specialist”

The next lecturer was Jon D. Kaiser, M.D., a private practitioner in San Francisco who described acupuncture, amino acid supplementation, guided imagery, and homeopathy in his handout as “potentially successful treatment in-

terventions.” The conference circular billed him as a “nutrition specialist.” Kaiser's “comprehensive treatment program for HIV” consists of three categories: (1) “natural therapies” such as acupuncture; (2) “psychological/emotional support,” including “spiritual growth”; and (3) conventional medicine. His “supplement schedule” included daily intake of up to four multivitamin/mineral tablets, plus up to four grams of vitamin C. In part, Kaiser proposed an intake of four to eight grams of vitamin C for chronic sinusitis, an intake of 25 to 75 milligrams of B-complex vitamins in “time released” form for fatigue, and acupuncture for peripheral neuropathy.

An Evidence-Based Approach

The last lecturer was William Kassler, M.D., M.P.H., M.S., a medical epidemiologist in the Division of STD/HIV Prevention at the Centers for Disease Control. Unfortunately, many attendees left the conference shortly after Jon Kaiser's talk. Kassler upheld an evidence-based approach as crucial to clinical decision-making. He stated that a “tremendous paradigm shift” is taking place, a change from opinion-based to evidence-based clinical practice. He expounded:

An evidence-based approach...de-emphasizes intuition, prediction, and unsystematic observations from clinical experience as sufficient rationale for guiding our decisions. [It] emphasizes basing clinical decisions on evidence of safety and of efficacy....exercising reticence about recommending therapeutic modalities that lack this evidence, and...adopting rigorous methodologic criteria for evaluating safety and efficacy. The gold standard has become the double-blind, randomized control trial, but other rigorous methodologies do exist.

The hallmark of a rigorous methodology is that [it is] unbiased [and] reproducible [and] includes appropriate comparison groups and appropriate clinical outcome measures.

When the evidence does not exist, an evidence-based approach would have us exercise caution in interpreting the information gained from unsystematic observations and from studies lacking rigorous methodology. That includes the anecdotal and testimonial claims frequently cited as evidence for alternative treatments....

An evidence-based approach would have us recognize the limitations of authority, intuition, experience, opinion, theory, and passionately held conviction.

In a conference replete with ambiguous or equivocal messages, garbled facts, and mysticism, Kassler came through with refreshing clarity.

Politics of Inclusion?

Later that month, I phoned Victor Herbert, M.D., J.D. (professor of medicine at Mt. Sinai School of Medicine in New York City), The American Dietetic Association (ADA), NIAC, CDC, and NIH.

Dr. Herbert stated that intake of megadoses of vitamin C can kill AIDS patients by superimposing vitamin-C hyperosmotic diarrhea on AIDS secretory diarrhea, thus causing hypovolemic shock. He further stated that excessive intake of vitamin C increases generation of free radicals and impairs immune function. Herbert said he had witnessed only one such case of hypovolemic shock but added that he does not see patients in the emergency room. CDC spokesperson Chuck Fallis informed me that CDC is not aware of any source of information on the incidence of vitamin C-induced hypovolemic shock in AIDS patients. He suggested that I call NIH.

I did not receive a definitive response to my question regarding hypovolemic shock when I phoned NIH in November. I called again on December 3, 1993, and spoke with Karen Lee, public affairs specialist at NIH's National Institute of Allergy and Infectious Diseases, which Lee described as the leading institute at NIH for AIDS research. Lee told me that she personally was not aware of any source of information on the incidence of vitamin C-induced diarrhetic complications. On December 15, she left a message on my answering device: "I've been searching around for information and our AIDS Division suggested that you might call the Linus Pauling Institute. They are developing this concept.... The researcher is Dr. Jariwalla."

Despite the lack of data, exacerbation of diarrhea due to ingestion of vitamin C seems a legitimate issue. As a reasonably healthy but misguided nutrition major in the 1980s, I ordinarily ingested more than 7,500 mg of vitamin C daily in various forms, at least 500 mg at a time and usually with food. Not infrequently, abdominal pangs and explosive diarrhea ensued. "Buffered" forms were not perceptibly gentler.

I described the "alternative nutrition" conference to Nathan Dutko, ADA's Coordinator of Credentialing, as largely a combination of irrelevant opinions and advocacy of unscientific empiricism and medical mysticism. Dutko called ADA's review of continuing education (C.E.) programs "a paper review only." He said that the conference had met ADA's criteria and that C.E. credit approval does not constitute endorsement of a program. I stated that approval of a program for C.E. credit implies approval of the program itself. "That is a common misconception," Dutko responded. After I conveyed a few of the conference's highlights and some background information, he said he didn't know whether ADA would have approved the program for credit if such information had been available during review. I proposed that ADA expand its criteria for approval.

On December 2, 1993, I phoned Varro E. Tyler, Ph.D., Sc.D., professor of pharmacognosy at Purdue University, and told him about Fred Bingham's purported usage of St. John's wort. Dr. Tyler responded: "If he's injecting a crude extract of St. John's wort, he's doing himself more harm than good." Tyler also stated that two pigments in the herb—hypericin and pseudohypericin—are anti-retroviral and that mild photosensitivity is a possible side effect of injecting them.

On the same day, NIAC's chairperson responded to my two tape-recorded requests for information. On my answering device, she stated that she hadn't been "really in charge of the conference" and would ask two people to contact me. The next day, I left a message for her on NIAC's answering device, stating that I would rather hear her assessment of the conference than that of its designer, Carol-Jane Rand. I have not received a response to this request.

Later that day, Rand called on behalf of NIAC. I asked her what she thought the conference had accomplished. Rand opined that it had "accomplished an enormous amount" and that it had had "an equal number of proponents and critics." She stated that the "two major objectives" of the conference had been "to get a dialog started" and to present "new ideas" to "university-trained nutritionists." Referring to the conclusions in her handout, I said it was inappropriate for her to have drawn any conclusions from insufficient information. She responded, in part: "You may be correct."

The Bottom Line

Will clinical dietitians—mostly unsung team players—become crowdpleasing empirics and mystics? I doubt it. However, I also doubt that dietitians or their clients will benefit from consorting with such types. Far be it from me to derogate educating dietitians and other health professionals about alternative medicine. But, while alternative practitioners and purveyors of dubious products may clue us into their philosophies, they do so only promotionally. Laxity on the part of proscientific organizations, however well-intentioned, will invite further inroads by nondietitian pseudonutritionists.

But the real bottom line lies beyond the watering-down of the dietetic profession, the diffusion of responsibility, and the doublespeak of semi-approval: It is one thing for practitioners to discuss questionable methods; it is another to encourage, albeit tacitly, desperate people to use them.

Jack Raso is co-editor/publisher of *Nutrition Forum* and author of *Mystical Diets: Paranormal, Spiritual, and Occult Nutrition Practices* (Prometheus Books, 1993) and *"Alternative" Healthcare: A Comprehensive Guide* (scheduled for publication in mid-1994).

BRIEFS

“Organic” law strengthened. Under a new law, producers, processors, distributors, and retailers in Texas may not label, advertise, or represent as “organic” any food or fiber without being certified by the State or by a designated organic certifying agent. The law defines organic food as “food produced through organic farming and processed, packaged, transported, and stored to maintain maximum nutritional value without the use of artificial preservatives, coloring or other additives, ionizing radiation, or synthetic pesticides.” Organic farming is defined as “a system of ecological soil management that relies on building humus level through crop rotations, recycling organic wastes, and applying balanced mineral amendments, or that uses, when necessary, mechanical, botanical, or biological controls with minimum adverse effects on health and environment.” Once regulations have been established, the Texas Department of Agriculture may charge annual certification fees of up to \$5,000 for processors and \$2,500 for producers, distributors, retailers, and certifying agents. Violators of the law could be criminally prosecuted or subjected to a civil penalty of up to \$500 per day.

Notable quote. “Unnecessary surgery is the abusive use of what works and is entirely different from quackery, which is the use of what does not work. Another big difference is that quackery is organized. There is no national organization of ‘Surgeons Dedicated to Unnecessary Surgery,’ but there are national organizations dedicated to quackery.” —*Victor Herbert, M.D., December 1993 American Health*

Calories underestimated on food labels. Researchers who purchased and analyzed samples of various “diet” and “health” foods found that nearly all of 20 products regionally distributed or locally prepared had significantly more calories than indicated on their labels [JAMA 270:1454–1456, 1993]. Nationally distributed foods (20 products tested), however, had accurate caloric labeling. The researchers believe that the understatement of calories was not due to random error and could cause consumers to underestimate their caloric intake. Reprints of the study can be obtained from David B. Allison, Ph.D., Obesity Research Center, 411 W. 114th St., Suite 3D, New York, NY 10025.

Mail-order megabucks. *Diet Business Bulletin* has reported that Susan Powter’s Stop the Insanity™ Program grossed an estimated \$50–\$60 million in 1993 and \$100 million since its inception, netting an estimated \$15 million for her. The program, promoted through infomercials and other ads, sells for about \$80 plus shipping. It includes five audiocassettes, a videotape, a guide to food fat content, a low-fat recipe book, and calipers for monitoring body-fat percentage. Ms. Powder, who says she lost 133 pounds using her methods, stresses fitness as a goal and warns against fad diets.

Cholesterol-lowering reduces carotid artery thickening. A 4-year double-blind study has demonstrated that improving blood cholesterol levels can reduce or stop atherosclerotic changes in the main (carotid) arteries to the head [Circulation 88:20–28, 1993]. This conclusion was reached by comparing 24 patients who received cholesterol-lowering drugs (cholestipol and niacin) with 22 patients who were given placebos. The drug recipients had significant declines in total and LDL cholesterol levels and increases in HDL cholesterol. Other studies have found that improved cholesterol levels produced similar effects in the coronary and femoral arteries. Reprints can be obtained from Wendy J. Mack, M.D., USC School of Medicine, 2250 Alcazar St., Los Angeles, CA 90033.

“Fountain of youth” ring sentenced. David Halpern, of Pebble Beach, California, and his sister and brother-in-law have received prison sentences for conspiracy and other felonies involved in operating an international black market in unapproved “fountain of youth” drugs. In 1992, the trio was charged with illegally importing more than 15 tons of products promoted for the treatment of more than a hundred diseases and conditions. The products, whose market value exceeded \$5 million, included procaine derivatives such as *Gerovital H3*, “sexual tonics” containing yohimbine and methyltestosterone, and injectable animal tissues used for “cell therapy.” The products had been imported for sale to wholesalers, health food stores, gymnasiums, chiropractors, and individual consumers. Halpern was sentenced to two years in prison and three years supervised release. The others were each sentenced to eight months in prison and three years supervised release.

Food consumption trends. Household food consumption data from the 1977–78 and 1987–88 Nationwide Food Consumption Surveys conducted by USDA’s Human Nutrition Information Service show that Americans have been shifting their eating patterns. The overall shift has been away from animal products and toward crop products, but the changes tended to vary with household income. For example, whereas wealthier households generally consumed more fresh fruits and dark-green vegetables, poor households tended to consume less. The full report, *Changes in Food Consumption and Expenditures in American Households During the 1980’s*, #SB-849, can be obtained for \$12 plus postage by calling (800) 999-6779 or (703) 834-0125.

Rare animals under siege. Many restaurants in China serve foods made from endangered species of wild animals. Many of these foods are popular because of traditional beliefs that they have great medicinal value. Eating rare and expensive game is also a popular way to flaunt wealth.

Progressive or Renegade?

Shari Lieberman Up-Close

Part 1

Jack Raso, M.S., R.D.

Shari Lieberman is the only dietitian The American Dietetic Association (ADA) has disciplined for violating its contemporary ethical standards, which were established in 1985. In 1986, ADA censured her for failing to adhere to two Standards of Responsibility. In 1987, Dr. Stephen Barrett asked ADA to determine whether Lieberman was still violating the standards. No formal investigation took place, however, because she resigned her ADA membership after ADA notified her of Barrett's complaint. In 1989, new charges were filed, based on alleged misinformation in her column in the magazine *Better Nutrition for Today's Living*. Last January, after a lengthy appeals process, ADA suspended Lieberman's Registered Dietitian credential for a period of at least three years for violating Principle 7 of the Code of Ethics for the Profession of Dietetics. Principle 7 states: "The dietetic practitioner practices dietetics based on scientific principles and current information."

Free Spirit?

On January 20, less than two weeks after the suspension took effect, *NF* associate editor Zhixin (David) Xu (pronounced "she"), M.S., called Lieberman to arrange a consultation. On her answering device, he said he had read her ad in *Free Spirit* ("The New York City Magazine of Personal Transformation"). Lieberman's "directory" listing in the magazine's December 1993/January 1994 issue included: a close-up of her; the initials "PhD, CNS, RD" after her name; and, just below these initials, the terms "Clinical Nutritionist," "Preventive Medicine," and "Progressive Nutrition." Her listing in the February/March 1994 issue included the same initials.

Lieberman is a "health editor" of another bimonthly, *Newlife* ("America's Holistic Magazine"), which claims 250,000 readers. Its November/December 1993 issue included a nearly

identical ad, which stated: "Stress—including emotional, environmental, physical, chemical and mental—has a direct impact on our nutritional requirements. Stress lowers our body reserves of vitamins and minerals and at the same time increases our needs." The latter ad billed Lieberman as a clinical nutritionist and exercise physiologist; the initials "CNS" were absent. The March/April 1994 issue of *Newlife* carries the same ad.

"CNS" stands for "Certified Nutrition Specialist," a "credential" available from the Certification Board for Nutrition Specialists (CBNS) to holders of nutrition-related advanced degrees. Lieberman is the board's secretary. A January 1994 mailing from CBNS (dated Fall 1993) offered "certification without examination" to applicants with a master's or doctoral degree and, respectively, 14,000 or 10,000 hours of "qualifying experience." Such experience includes consulting, patient care, product development, oral presentations at "journal clubs," writing a book chapter (worth 400 "bonus" hours), and other activities.

Lieberman received her doctorate in 1993 from The Union Institute, an "alternative" school that offers B.A., B.S., and Ph.D. degrees in customizable fields through "distant learning" programs. The institute has offices in Cincinnati, Los Angeles, North Miami Beach, Sacramento, and San Diego. Graduate school enrollees, called "learners," must design their own programs, develop them in consultation with faculty advisors, implement them, establish and chair their own doctoral committees, and draft their own transcripts. There are no compulsory courses, and faculty members function primarily as "facilitators." The doctoral program necessitates only 35 days of residency: 10 at an entry colloquium, 15 at school-sponsored seminars, and 10 "peer days." Peer days are interdisciplinary sessions that do not strictly entail residency; only learners arrange and attend them.

A 1993–1994 introductory booklet describes The Union Institute's doctoral program:

The Graduate School requires individually tailored plans of doctoral study that lead to proficiency in the fields of study. There are no prescribed courses.... Each plan is designed to continue, capitalize upon, and recognize competency in accord with the learner's and the committee's definition of proficiency at the doctoral level.

No credits are counted; rather, an entire program is scrupulously planned and evaluated. Rather than completing a series of courses, learners move through a series of stages....

[R]ecognition may be granted for prior learning that has a demonstrated relationship to the learner's statement of proficiency at the doctoral level. Adjunct faculty members... perform the evaluation of prior learning. Evaluation may include criticisms of performances, scored grades on written examinations, and/or product assessments, done in collaboration with the learner and core faculty advisors.

In July 1992, I attended a Union Institute entry colloquium for two days and concluded that the significance of the institute's degrees is questionable. *Mystical Diets* (Prometheus Books, 1993) describes my experience.

Lieberman's "project demonstrating excellence" (PDE), The Union Institute's equivalent of a dissertation, is titled "Functional neuromuscular stimulation: A non-invasive approach for objective evaluation of muscle fatigue and recovery characteristics." For her PDE, which is some seventy-five pages long, typed and double-spaced, Lieberman measured the effects of a high-carbohydrate drink and a high-fiber drink (placebo) on the performance of paralyzed leg muscles in five males with spinal injury lesions.

Lieberman has advertised regularly in both *Free Spirit* and *Newlife* for several years. For the latter periodical, she has also written an advice column, which was called "Nutrition Hotline" in 1989 and 1990 and is now called "Q & A On Nutrition and Health." Below are examples of the questionable counsel in this column, with cover dates in parentheses.

- "[Bad breath] could be the result of a dental problem or some digestive disturbance. You could try any or all of the following: a digestive enzyme, comfrey-pepsin (herbs), chlorophyll, a fiber supplement and acidofilus [sic]." (January/February 1990) [In *The Honest Herbal* (1993), Varro E. Tyler, Ph.D., Sc.D., writes: "Although comfrey is presently one of the most common herbs sold to the American public, there is reason to believe that using it internally is definitely hazardous to the health. All comfrey species investigated have been found to contain hepatotoxic pyrrolizidine alkaloids."]

- "I have had excellent clinical results using vitamin B6 along with niacin [to treat neuropathy].... Phosphatidyl choline may also help." (March/April 1991) [Vitamin B₆ in high doses is neurotoxic.]

- "I have found the following to be extremely effective [against herpes simplex virus type 1]: L-lysine, beta-carotene, and Omega 3 fatty acids (fish oil). The herb Black Walnut has been used with success by many for this problem." (July/August 1991)

- "Taking bromelain internally as well [as applying fresh pineapple to a scar] may be useful [in diminishing the scar]." (March/April 1993)

- "Your concerns [about antibiotic therapy] are certainly justified. This [development of resistant strains] is a major pitfall of constant antibiotic intervention. The following herbs have been used for centuries for... [nonspecific urethritis] and related problems: uva ursi, buchu, garlic and raspberry leaf." (September/October 1993)

- "I have found that avoidance of refined sugar products are [sic] extremely important [for bladder control]. Also, acidophilus supplementation may be useful as well." (March/April 1994, under the heading "I Gotta Go.")

- "Your concerns [about taking antibiotics for prostatitis] are valid.... Saw palmetto is a natural herb used for centuries for prostatitis. Pygeum africanum is yet another herb which has demonstrated excellent results as well." (March/April 1994)

The March 1987 issue of *Whole Life* included an ad that described the "progressive screening tools" Lieberman utilized: (1) "hair analysis," whereby "hair is used instead of bone to assess mineral imbalances and toxic metal accumulation"; (2) iridology, whose basic premise is that "the condition of all organs and systems in the body is 'mapped' in the iris"; (3) "saliva test," wherein "saliva is crystallized to find what specific herbs an individual needs for the healing process"; (4) "nutritional blood interpretation," wherein blood is "used to find nutritional imbalances"; and (5) "nutritional kinesiology," which involves "muscle testing" and apparently is a variant of a vitalistic system called applied kinesiology.

Lieberman continues to write an advice column, called "Nutrition Hotline," for *Better Nutrition for Today's Living*. Identical leaflets I received from the University of Bridgeport (Connecticut), one in 1992 and another recently, list her as a faculty member in an 18-weekend M.S. program in human nutrition. Moreover, she has coauthored two books: *Design Your Own Vitamin and Mineral Program* (1987) and *The Real Vitamin & Mineral Book: Going Beyond the RDA for Optimum Health* (1990). In both books, she stated:

My becoming a... nutritionist—as well as my writing this book—came about in a rather roundabout way. Initially, I wanted to be a medical doctor. I was interested in science, and I wanted to work with people, to help them. I thought being a physician would allow me to do this.

However, as a pre-med student, I learned that traditional Western medicine takes quite a rigid and fragmented approach. It is primarily concerned with treating isolated symptoms and diseases, rather than promoting the health of the whole person.... [I]t became clear to me that nutrition should be our first line of defense if an illness or condition is not life-threatening. Compared... [with] modern Western medicine,

Nutrition Forum (ISSN 0748-8165), © 1994, is published bi-monthly by Jack Raso, M.S., R.D., and Zhixin (David) Xu, M.S.

Subscriptions for individuals in the United States and Canada cost \$35 for one year (six issues), payable to *Nutrition Forum* at P.O. Box 747924, Rego Park, NY 11374. Multireader (e.g., institutional) and overseas (airmail) subscriptions cost \$50 for one year. Back issues are available at \$6.00 each.

the nutritional approach is a safe, nontoxic, effective alternative.

The Real Vitamin & Mineral Book recommends as "ODAs" ("Optimum Daily Allowances") for men and women: 10,000 to 50,000 IUs vitamin A, 25 to 300 mg niacin or niacinamide (or a combination of both), 25 to 300 mg vitamin B₆, and 500 to 5,000 mg vitamin C. Intake of these nutrients at levels approaching Lieberman's maximum "allowances" can have adverse effects.

Preliminary Information

Xu spoke with Lieberman by phone on January 21. Lieberman told him:

We'll go over diet and exercise and whatever else you need. There are several screening tools. One of them is hair mineral analysis. That will give me an idea of the balance of calcium, magnesium, [and] zinc [and will tell whether you] were... exposed to anything toxic in the environment, like lead or mercury. It tests for about twenty-two minerals.

I also do an herbal crystal test, where the saliva is crystallized, and through the pattern that's formed, you could see which herb or plant substances an individual needs to heal. For example, is there an underlying hormonal problem? Do I need to work on your immune system? What areas need to be worked on? And then which herb or plant substances would be best suited for you?...Everything's sent out.

The fee for the visit is \$175, and that includes the test[s]. The follow-up, two weeks later, is \$125. I get all of your test results back. You and I sit down. We go over everything in detail; so when I design your program, you'll know exactly what you're taking and why.

After that, I generally follow up one to two months later, five to six months later. So it's not the kind of thing where you have to keep coming back to me all the time....

I think it's important that you understand exactly what you're taking and why you're taking it....[The first visit]...will be about forty-five minutes to an hour....It takes...at least forty-five minutes.

Xu inquired about insurance. Lieberman responded: "Well, you know, I'm a Ph.D., and sometimes they do [cover charges]. It is certainly worth giving it a try. There's nothing to lose by doing that."

A few days later, Lieberman told Xu not to consume onion or garlic on the day of the appointment.

The First Consultation

In an interview in the January 1993 issue of *Health*

Foods Business, Lieberman stated that she saw about thirty people a week in her private practice and that health food stores are "sometimes the only place where people can find [nutrition] information." However, she cautioned health food retailers against saying "anything that could be misinterpreted as a prescription or cure," adding: "It's all in the way you say it."

Xu's first consultation with Lieberman took place on January 28 in the spacious living room of an apartment in a luxury high-rise near Manhattan's Washington Square. Born and raised in mainland China, Xu is 30 years old and reasonably healthy. He is not a health professional. He answered all of Lieberman's questions honestly except a question regarding his occupation (he is co-publisher of *NF*). In the room were a computer, a shelving unit, a sofa, a large exercise device, and several tennis trophies. On the shelving unit were a bodybuilding supplement (*Hot Stuff*) and a liquid ginseng preparation.

Xu noted the latter. Lieberman stated:

I feel much more comfortable using herbs and medicinal plants than drugs. And, you know, when people—when physicians, when doctors—become a little arrogant...when you talk about herbs, I say, "Let me ask you a question: You want to use something that people have been using for four thousand years, effectively, or do you want to use something that someone's been using for twenty years, with three pages of side effects?" It's not a trick question, but I think we're going to go over it with you. It's very funny, actually.

After asking Xu his birth date, she said: "I've had an office my whole life, and what happened was, one building closed and another building this; and I just— It was impossible...."

Xu inquired: "You have been always practicing out of this building?"

"No, no," Lieberman replied. "I've had an office actually most of the time."

She used scissors to cut about a tablespoonful of hair from Xu's nape and put the sample in a small bag. Then she asked his weight.

"I used to weigh 155," Xu responded. "Now it's only like 140."

When she asked Xu his height, he expressed uncertainty. Lieberman told him to stand and stated: "I'm five-seven and a half. You're at least as tall as I am. I'm not wearing heels. We're about the same height. We can go shopping together!"

She also asked Xu his occupation, address, and phone number and inquired whether he smoked and how long he had lived in the borough of Queens. Later she asked: "Is there any past medical history I should know, David—any illness or surgery, anything you can think of?"

"I used to get colds when I was in Peking, China...like

flus, all the time," Xu responded. "But since I came here—it's surprising—I never get it anymore."

"It's usually the opposite, do you know that?" said Lieberman. "Usually people move here and they start getting sick. That's funny.... You're the first person I've seen in a long time who felt better living in New York."

In response to her question concerning his family's medical history, Xu stated that his grandmother had had high blood pressure and had died of a stroke, that his father had had cataract surgery, and that his 57-year-old mother was suffering headaches and unspecified symptoms.

Lieberman inquired: "What are some of the things you want to work on, David? Is there anything specific? You talked about the hair loss; that was one thing."

"My hair, my weight," said Xu.

"When did the hair loss start?" she asked.

"I think probably it started a year ago," he replied. "I don't know [if] it's normal or...what."

"Not necessarily," said Lieberman. "When did the weight loss occur? Did that also occur over the year?"

"Yes," Xu replied. "Like, all...[my] jeans used to be tight, and now...[they're] so loose...[I can't] wear [them] anymore."

"Are you getting any heart palpitations at all?" Lieberman asked. "Do you ever feel your heart beating? If you're laying down at night, do you...feel the sensation?"

"No," said Xu.

Lieberman asked: "Have you felt unusually tired, or have you felt unusually hyper?"

"I think I'm getting more nervous," Xu replied. "I don't know why. I used to be very calm, the first few years I'm in this country, and nowadays, it's just—"

"Living in New York, babe," Lieberman explained. "You were very calm and much more easygoing, and now you find yourself more nervous; and that wasn't the problem before."

"Yes," said Xu.

Lieberman stated: "Okay. I think I know what's wrong with you, by the way; so I want to ask you some more questions."

Xu added: "When I was...a high-school/college student, I used to...[have] a lot of dreams, nightmares even."

"Yes."

"Nowadays," he continued, "I just could not, no matter how—"

"You don't," Lieberman interrupted, "or you don't remember any of your dreams. You don't even recall dreaming. How long has that been?"

Seven years, Xu answered.

"How is your short-term memory?" asked Lieberman.

"Is there any change in that? Do you forget, if you saw a movie, what the name of the movie was? Are you forgetting things?"

"I think it's fine," Xu replied.

"Is there any change in your concentration?" she inquired. "Like, when you read something, do you feel that you have to read it more than once? Has there been any change in that at all?"

"No," said Xu.

"Are you sleeping okay?" she asked. "Do you have any problems falling asleep and staying asleep?"

Xu answered: "I think I could not sleep too much nowadays. Like, I go to sleep...one o'clock and I still wake up at six or seven."

"When you get up at 6:00 A.M.," she queried, "are you kind of wired when you wake up? Are you a little wired when you wake up in the morning?"

"What do you mean, 'wired'?" he asked.

Lieberman responded: "Almost that nervous kind of— You feel like, you know, when you get out of bed, that—"

"I feel that I'm not ready to really get out of bed," said Xu. "Usually I stay...[in bed] for thirty minutes or something. I wait until my alarm goes off."

PREVENTIVE MEDICINE
PROGRESSIVE NUTRITION

THE TIME HAS COME FOR NUTRITION TO TAKE ITS RIGHTFUL PLACE ALONGSIDE MEDICINE AND OTHER THERAPIES

Nutrition has emerged as an alternative and adjunctive therapy for virtually all areas of health care. Medical research has shown that nutrition is necessary in the prevention and treatment of cancer, heart disease and diabetes. The National Cancer Institute has stated that over 30% of all cancers could be avoided through diet modification and as much as 90% could be prevented if environmental carcinogens are avoided.

Research has demonstrated that excesses of certain nutrients enhance immunity. Nutrition has also been shown to be important in the treatment and prevention of osteoporosis, intestinal and bowel disorders, skin problems, hormonal problems, allergies, hypercholesterolemia as well as other related problems. Excesses of certain nutrients have also been shown to be protective against environmental pollutants. Stress - including emotional, environmental, physical, chemical and mental - has a direct impact on our

nutritional requirements. Stress lowers our body reserves of vitamins and minerals and at the same time increases our needs.

To OPTIMIZE and INDIVIDUALIZE your nutritional program I use the most progressive non-invasive nutritional screening tools. The tools enable me to create an OPTIMAL NUTRITIONAL PROGRAM that allows the body to use its remarkable capacity to heal itself. In addition, I incorporate diet and exercise into your program to make it complete.

Understanding your OPTIMAL NUTRITIONAL PROGRAM is as important as the program itself. I spend time explaining all your results in detail so that when I design your program, you will know exactly what you are taking and why. Education is an important part of patient care. It allows patient independence rather than dependence so frequent visits are not necessary.

If you would like more information, please feel free to call.

(212) 529-1297

Ask About my New Weight-Loss Program

Lieberman asked: "Do you urinate frequently? Is it normal? Do you wake up at night to go to the bathroom? Anything unusual like that?"

"No," said Xu.

"Do you move your bowels every day normally?" she asked.

"Yes."

"Has there been any change in that at all?" she queried. "Is it more frequent during the day, or is it just once a day normally?"

"No change," answered Xu.

"Have you felt unusually tired?" she asked.

"No."

"Have you felt any, you know, the malaise like you're about to get sick, but you don't—like you feel like you're getting a flu, but you don't—[for example,] a little sensation in your throat? Anything like that?"

"No."

"Great," Lieberman responded. "Okay, fine. Is there any other symptom going on with you? Even if you think it's not related, is there anything else I should know? I—I have a feeling what's going on with you, and I will tell you in a moment."

Xu replied that he had "sort of" lost his appetite. "I'm not that interested in going to the restaurant," he said. "And usually I eat so simple at home now."

Lieberman asked him: "Have you noticed any change in your sex drive, libido? Is that down?"

"Not really," said Xu.

"It's the same."

"Yes," he stated.

"Okay," said Lieberman. "Is there anything else you've noticed that's changed?"

Xu responded negatively.

"A Little Bit of an Endocrine-Thyroid Imbalance"

Lieberman stated:

My opinion's that I think it's your—I think—I think you have a marginal thyroid problem. I'm telling you that just from what you told me today. When I get the saliva test back, it will show me; so will the hair. I don't think it's severe enough that it would show on a blood test, by the way. I think that on a blood test, it would probably be normal. But it's just off enough to create—It could create hair loss, nervousness, loss of appetite, weight loss. Some people do get palpitations, by the way. You don't, because I had asked you about that already.

I think that there's a little bit of an endocrine-thyroid imbalance we see right now; and when I get your results back, we can see that for sure.

Let me show you what I would like you to do. Are you taking any vitamins or minerals now, David?

Xu told her he takes vitamin C in both "time-released" and chewable forms. He said he hates swallowing pills.

Lieberman responded:

You know what I should do, then? Then I should make sure that I give you things in capsules. I think you'd have a much easier time with a capsule than a tablet. These Americans, we're used to swallowing, like, you know, twenty-five different pills at one time. But I can give you capsules, so you'll have a choice of taking the capsule or opening it up and putting it in juice. Okay? The vitamin C I can give you in a powder. That's easy. Put it in some juice, and just mix it up and drink it down....

I'm going to give you a couple things today really just for the thyroid. I'd like to get your results back before I do anything else. All right? I don't just want to give you things by chance.

I'm going to give you a liquid kelp extract. It's like seaweed, and it contains iodine, which is food for the

Progressive Nutrition?

Herbal crystallization analysis (HCA) is performed by having the patient lick a slide, which is sent to a laboratory for analysis. The lab then issues a report based on crystal patterns that supposedly indicate organ dysfunctions and herbs that the body needs to remedy them. The test is reportedly based on the work of Rudolf Steiner, an occultist who, in the 1920s, developed a system of identifying botanical specimens by crystallizing the sap with a copper sulfate solution. Proponents of the test purport to match the crystal patterns of the saliva with those of about eight hundred herbs. Neither HCA nor the theory behind it has the slightest validity.

Hair analysis is performed by obtaining a small quantity of the patient's hair, usually from the back of the neck, and sending it to a commercial laboratory. The lab then issues a computerized report listing supposed deficiencies or excesses of minerals. Some reports include elaborate specu-

lations about the significance of these values relative to disease, and some also include suggestions for supplementation. Medical authorities agree that hair analysis is not an appropriate way to assess the body's nutritional state. It has limited usefulness as a screening procedure for the diagnosis of heavy metal poisoning [JAMA 254:1041-1045, 1985].

In 1985, New York Attorney General Robert Abrams filed suit against a bogus nutritionist and the laboratories he used for HCA and hair analysis. The HCA laboratory (Herbal Tracers, Ltd., of Hewlett, N.Y.) agreed to pay \$5,000 for court costs and penalties and to stop representing the test as valid for use in the diagnosis, prevention, or treatment of disease. The hair analysis laboratory (Doctor's Data, of Chicago) agreed to pay \$25,000 and to stop accepting human hair specimens from residents of New York State unless it could obtain a permit from the state department of health.

—Stephen Barrett, M.D.

thyroid. It's natural. Okay?...It has a little eyedropper, and you're gonna do four drops a day.

"Into my eye?" asked Xu.

"No," said Lieberman. "Little juice or a little water. You're gonna drink it; you're gonna take it orally. Okay? I'm gonna ask you to do that and—"

Xu interrupted: "So basically this is for prevention? Or do I have a problem? I mean—"

"I think you may have a marginal problem with your thyroid," Lieberman stated. "I— I think that is what's going on. Okay? When I get your test results back, it will [tell me if] that [is so]."

Xu asked: "But I have to start taking this now, or wait until the test is—?"

Lieberman replied:

Try taking it now. Because it's—it's—it's safe and it's natural, and I don't—I would want you to start it immediately to see if there's a *ch*—I mean, I would like to stop some of this between now and when I see you. I would be very happy.

So I want you to take the kelp. The vitamin C—I'd like you to take a thousand milligrams breakfast and dinner.

Xu responded: "I tend to take...not that much, because...sometimes I'm afraid if I'm taking, swallowing too much, it's gonna do more harm than good."

Lieberman assured him:

No. Would you rather take the vitamin C as a powder? And then you don't have to swallow a pill. Get a powder. It's easy. Just put it in some juice; maybe use a quarter of a teaspoon. It's very simple.

And—the sleep thing. I don't want to do anything for that until I get your results back. Okay.

Xu stated: "Before I decided to see you, I was thinking: 'Could...weight loss...[be] related to my diet?'"

"Yes, yes," answered Lieberman. "Your thyroid could be related to your diet and your nutrition. If you're not eating enough, if there's been a change, you could have created a little bit of a problem, absolutely—yes."

"It's Not Medicine"

Next, she addressed Xu's hair loss: "There's one other thing I want you to do topically. It's something you have to do with your head. You're going to get— It's called cayenne or capsicum."

Xu remarked: "The impression I got from your ad was...[that] you are not gonna give me anything—"

"No," said Lieberman. "I wanna give you—I—"

"I was thinking," Xu continued, "you are going to tell me: 'Eat more carrots, eat more beef, or eat more what'—that kind of advice. It was a little bit surprising that you are telling me to take vitamins."

"Yeah," responded Lieberman. "I'm gonna go over the diet with you next. That's not going to be enough to make a change with what you're coming in with. Okay? I don't know that you need to swallow a lot of things, but—"

"I don't like to take medicine," said Xu. "That's why—"

"It's not medicine," declared Lieberman. "You can eat seaweed if you don't want to take the pills. I don't care how you do it. You could— If you want, you could eat seaweed every day. You can do that instead. Be my guest. But there's no other way that I'm gonna get iodine down your throat, unless you ate seaweed. You can. It's just easier this way."

Xu responded: "It's just my impression: I thought...that's the reason that I don't want to go to...a physician...—because they are going to try...to prescribe a drug...medicine for me."

Lieberman stated: "I will not prescribe drugs nor medicine to you [because]: (a) I'm not a physician [and] (b) that's not my philosophy. No, I'm a P— I'm a doctor—"

"But these pills I have to take—" Xu interrupted.

"The *World Organic Liquid Kelp*," Lieberman explained, "is just seaweed extract. It's seaweed in a bottle; that's what it is. Okay? The vitamin C— There is no way I can get this dose of vitamin C [2 grams/day] down your throat through food in this country. It's impossible."

"You think so?" asked Xu.

"If you find a way of doing it," she told him, "you'll win a Nobel Prize. It's impossible." She further stated:

The cayenne and the capsicum—...I'm not asking you to eat it. What I'm asking you to do is to— You're gonna make a little paste with water, and you're gonna massage your scalp with it...

Let me tell you how to do it, because what that does is...it increases blood supply to here [the scalp]. So I wanna address the hair loss immediately, okay?

This is a hot spice. Okay? It's like hot red peppers, where [sic] people put in, like, Indian food. Okay. You'd better be really careful with this, man. You better not touch your eyes. You have to be very careful. This stuff burns. Okay?...

You're gonna buy cayenne capsules. It's just gonna be the herb. It's gonna be a powder. You're gonna make a paste with water.... You're gonna massage your scalp. Okay? Be careful it doesn't drip in your eyes. You will kill me....

Massage it, leave it on for twenty minutes, and then wash your hair.

Xu stated: "So when I wash my hair, the water's gonna drop onto my eyes."

"Well, close your eyes," Lieberman advised. "Bend your head back when you're washing your hair, and just be very careful when you're washing. I have patients do this all the time.... You won't die from it; it just burns. Okay?"

Dietary Advice

Later she stated:

I don't wanna give you anything else until I get your results back. Then I can be very specific and say: "Your zinc is low, your copper's high, your manganese is low." I don't know that today....

This [advice] I would give you anyway, because I'm sure that your thyroid is implicated in this, and that is also why you've lost weight.

Next, Lieberman addressed diet. She told Xu: "What I'd like you to do is be a little bit careful about what you're eating." She asked him to describe his "typical" breakfast, lunch, and dinner. Xu briefly did so. Lieberman advised him to avoid "processed food," salt, and sugar. She further stated:

Your ancestors didn't use butter and margarine, my little cupcake; nor is milk consumed in China. So I think that one of my goals with you is to have you eat a little bit more closely, culturally and genetically, what you are accustomed to eating. Okay? In China they normally don't eat a lot of bread. They certainly don't eat cereal and milk in the morning....

Some of this—what I'm thinking of is your thyroid—could have been induced from a change in diet—eating things that are creating a little bit of an immune reaction.

Xu inquired: "So you mean that the change in diet could cause some problem?"

"Yes," answered Lieberman. "Absolutely."

"But can I get used to it," asked Xu, "or...do I have to go back to the old way...?"

Lieberman responded:

Will you get used to it? I doubt it....I really want you to avoid butter and oil and margarine. Your ancestors didn't eat butter and oil and margarine....

I've actually had...patients come here from the Philippines, China, and Japan with lupus or an autoimmune disorder, and it was absolutely caused by a change in diet....But it's very weird.

Xu stated: "Everybody eats butter, cheese, potato chips....So I have to do in Rome as the [Romans do]."

"No, baby," said Lieberman. "It isn't the dietary pattern that anyone on the planet should ever try to emulate. And the Chinese population as a whole is a far healthier population than here. And when you see people start to get sick in any country that starts to adapt to a more Westernized way of eating, they start to get heart disease, cancer, diabetes, high blood pressure."

Xu asked Lieberman why some of his Chinese friends who had emigrated to the U.S. did not share his health problems. She stated:

They might be experiencing it in another way....Maybe they won't see anything till twenty years down the line, and by the time they see it, the shit will have already hit the fan....

I would...like you to try and get a rice cereal or a corn cereal, something that isn't wheat or oats. Once again, these are not grains that were used in the Chinese culture. They were used in my culture. My ancestors are from Russia, so we ate all kinds of, like, broccoli and oats and all that kind of shit. Your ancestors didn't eat that way....

Try rice and corn cereal. You get it at the health food store. They have thousands of different kinds of great cereal.

Toward the end of the consultation, which lasted more than forty-five minutes, Lieberman told Xu:

That [dietary] shift could have done something to your thyroid a little bit....I don't think that you have a serious

medical problem, by the way, and if I did, I would tell you. I think that you have—I think you have a little something going on that could have been influenced by diet.

The other thing here—and I want you to understand my philosophy: Given the pollution here—the hormones, the pesticides, everything that we're bombarded with, living here—I just don't believe that all of that can be dealt with with food. So I'm gonna ask you to probably do some degree of supplementation. I will keep it to a minimum 'cause I don't think that you need to take a lot of stuff. But, like, antioxidants like beta-carotene and [vitamins] C and E—how the hell am I gonna get that in food?

Lieberman emphatically recommended aerobic exercise such as jogging and stationary-bicycling. She said: "You could jog in place and listen to music, David. You know, if the weather's shitty outside, do it at home."

She gave Xu five items: (1) a business card, (2) preprinted instructions concerning aerobic exercise, (3) preprinted dietary instructions, (4) handwritten instructions concerning vitamin C and kelp supplements and the herbal paste, and (5) a seven-day diet history form. The dietary instructions included: "Avoid sugar. Use honey, maple syrup, blackstrap molasses (in moderation)." The business card and three instructional items all bore the initials "CNS" and "RD."

Before paying Lieberman, Xu inquired if she was an R.D. Her reply was affirmative.

A few days after the session, Xu told me he felt he had consulted a fortuneteller. "On what basis," he said, "could she tell me I had a thyroid problem?"

Comments

Several years ago, a prominent adversary of quackery suggested that I investigate Lieberman by visiting her as a patient. I responded that I was disinclined to ruffle an entrepreneur in an uphill profession. Lieberman's apparent independence appealed to me, partly because my occupational environment was demoralizing. At the time, I worked as a clinical dietitian in a hospital that served a poor community. "Crisis medicine" was the order of the day and patient dietary noncompliance seemed rampant. It was verboten for registered dietitians to prescribe diets. The paperwork was redundant and extensive, leaving time only for thumbnail nutritional counseling. Dietitians used the neologism "chartologist" to refer to health professionals who expediently tended to medical records (charts) at the expense of patient care. Foodservice had dominion over clinical dietetics and generally straitjacketed or skewed its aims.

In contrast, I vaguely considered Lieberman a trailblazer of sorts. She appeared to be doing what I had entered the field to do: educating patients who wanted to learn. Perhaps naively, I had persevered in the formal study of nutrition to become a clinician, not a foodservice adjunct.

But unscientific diagnostics and catchy promotion do not contribute to the advancement of the dietetic profession, much less to the welfare of patients. ADA could invigorate the profession, and thus combat quackery, by creating expressly for clinical R.D.s an educational "corridor" whose endpoint is a distinctly nutrition-related doctorate—a credential with clout. Of course, this would not ensure the scientific practice of dietetics; however, it would almost ensure that practitioners thus credentialed had the erudition, training, and recognition to practice intelligently and successfully. What's your opinion?

The next issue will feature an account of David Xu's return visit to Lieberman.

BOOK REVIEW

Title: The Complete Medicinal Herbal (1993)

Author: Penelope Ody

Publisher: Dorling Kindersley, Inc., New York, N.Y.

Price: \$29.95 hardcover

Reviewed by: Varro E. Tyler, Ph.D., Sc.D.

This herbal is particularly hazardous because its appearance lends it undeserved credibility. The colored illustrations are numerous and extremely well done. Typically, they picture the various parts used of the medicinal herbs, fresh and dried, together with some of the dosage forms prepared from them. The book's format is also attractive. This initial visual feast is likely to lure some readers into believing that the text is equally useful. Unfortunately, such is not the case. Much of the information presented as authoritative is not, errors of commission and omission abound, and many of the assertions are based on hope or belief rather than on scientific or clinically proven facts. And no references are provided that could help careful readers to determine which is which. Thus, English herbalist Penelope Ody frustrates the reader's search for herbal truth much as her namesake, the wife of Odysseus, frustrated her many suitors.

The book is well organized. A short history of herbal use in various cultures is followed by illustrated monographs of some eighty-five representative plant drugs and a section on the preparation of various dosage forms. Numerous tables enable readers to select herbs for self-treatment of various illnesses, although they are cautioned against such action in the customary small print on the copyright page. The volume concludes with some miscellaneous considerations and an index. It is well printed and well bound in Italy.

A few examples will serve to illustrate the text's unreliability. In May 1979, the Herb Trade Association urged its members not to sell pokeroot as a food or beverage because of its toxic character. Ody not only monographs the herb but recommends its use for tonsillitis, with the qualifying statement that the fresh root, not the dried, is toxic. She apparently is unaware of a case in Baltimore in 1938 wherein more than twenty-five people on six floors of a building were poisoned when dried pokeroot was milled in the structure. Comfrey root is recommended for external use with no mention of the need

to restrict application to intact skin. In fact, a poultice is suggested for bleeding hemorrhoids. The occurrence of toxic pyrrolizidine alkaloids (PAs) in the borage plant is not mentioned. In the coltsfoot monograph, it is claimed that PAs may no longer be present in a decoction of the plant—which is untrue.

Moving on from the serious to the ridiculous: Placing a pounded cabbage leaf in bra cups for mastitis or engorged breasts is counseled, apparently with a straight face. Hops is said to contain a high proportion of estrogen—a statement that will raise the eyebrows of some pharmaceutical manufacturers who have thought it necessary all these years to process large quantities of pregnant mare's urine for such compounds. It is recommended that fresh, not dried, hops be used for insomnia; yet scientists have shown that 2-methyl-3-butane-2-ol, a sedative principle, increases in concentration in the herb for at least two years after drying.

Botanically oriented readers will be disturbed by the absence of author citations from scientific plant names. [For example, for the sake of formality, writers would initially refer to *Panax ginseng* as "*Panax ginseng* C.A. Mey."—J.R.] The practice of referring to rhizomes or rhizomes and roots (e.g., ginger, rhubarb, and valerian) simply as "roots" and the lack of a clear differentiation of aloe gel from the parenchyma cells, and of aloe latex or juice from the pericyclic tubules, are also disturbing. The designation of the plants yielding medicinal rhubarb only as *Rheum palmatum* enormously simplifies the numerous species and hybrids of this taxonomically difficult genus.

In summary, aside from the excellent illustrations, there appears to be no justification for publishing this book. Its existence will simply provide more ammunition for critics of phytomedicines seeking evidence that herbalism is unscientific and that herbs are therefore unworthy of consideration. In fact, some uses of herbs are disreputable, but others are not. Publishers who market attractively packaged but scientifically unsound herbals do more harm than they will ever know.

Dr. Tyler is professor of pharmacognosy at Purdue University and author of *The Honest Herbal* (Haworth, 1993), an evaluation of popular herbs. Copies can be obtained for \$22 postpaid from LVCAHF Books, P.O. Box 1747, Allentown, PA 18105.

BRIEFS

More on "Alternative Nutrition" & AIDS (see last issue). The Winter 1993/94 issue of *Treatment Issues*, "The Gay Men's Health Crisis Newsletter of Experimental AIDS Therapies," included an article titled "An Alternative Treatment Activist Manifesto," based on the writings of an apparently skeptical proponent who died of AIDS last July. Although the article advocates controlled clinical trials of "alternative treatments," it states:

Since toxicity studies on most alternative therapies have not been conducted—and since many alternative treatment practitioners often recommend these therapies in very high doses—it must be asserted that they may be toxic. For the most part, if a proponent of a specific alternative therapy has observed negative side-effects, there has been no mandate, no regulation, and therefore no institutionalized reason to disclose such information. Additionally, profit is as big a motive for the "alternative" medical community as it is for the conventional pharmaceutical industry.

While some alternative treatment proponents have no financial investment in proposed therapies, the emotional investment in the therapy's success is usually high. Many alternative treatment enthusiasts have a strong desire to prove conventional Western medicine wrong. This sentiment sometimes precludes objective evaluation....[N]o study of an alternative treatment in AIDS has been able to stand up to scientific scrutiny.

Amway portrayed as cult. The February 15 edition of the syndicated, tabloid-style broadcast newsmagazine "American Journal" (*AJ*) featured a blistering report on Amway Corp., a multilevel marketing company that sells household products and food supplements. At an introductory meeting secretly videotaped by *AJ*, an Amway senior associate claimed: "I'm talking to you about a hundred thousand dollars a year that you can make in your spare time without giving up what you do during the day." However, a former independent distributor stated: "Most distributors...are not gonna make money; they're gonna lose money. So what's gonna keep them involved is constant brainwashing and manipulation and cult-style tactics." According to *AJ*, Amway tells distributors to listen to instructional audiocassettes during the day, such as one that states: "We talk about woman being in submission to man, to her husband. 'Course, that's what God's word says, but a lot of people want to disagree with it." *AJ* concluded: "[Y]ou have to build a network of hundreds of independent distributors before you turn a worthwhile profit....[T]heir own literature points out that the average income from selling Amway is only \$65 a month, and that's before expenses."

Insurance to cover Ornish program. Mutual of Omaha has agreed to cover the cost (about \$5,000 for one year) of participating in a program developed by Dean Ornish, M.D. The program, which several hospitals are planning to replicate, includes smoking cessation, exercise, a near-vegetarian 10% fat diet, group counseling, and relaxation exercises. Ornish's research suggests that his program can cause regression of coronary atherosclerosis.

New FDA labeling standards. On December 29, the Food and Drug Administration announced standards to ensure that the labeling of dietary supplements is truthful and scientifically valid. The new rules will not affect consumer access to supplements. According to the new regulations, labels on dietary supplements must provide the same basic nutritional information found on the labels of nearly all conventional foods [Federal Register 59:350-437, 1994]. The rules also make dietary supplements subject to the same standard for providing disease-related information as Congress had mandated for conventional foods. In addition, they convey authorization of a label claim regarding folic acid and the risk of neural tube birth defects. FDA had previously approved a label claim regarding calcium and osteoporosis. The new rules will permit health claims on labels if there is significant agreement among scientific experts that the claims are valid. FDA Commissioner David A. Kessler, M.D., stated: "This is the standard Congress established for health claims on labeling of conventional foods. It's a flexible standard that will keep unsubstantiated claims out of the marketplace." The health claim standard is scheduled to take effect in July 1994. Rules on nutrition labeling and nutrient content claims ("high," "low," etc.) are scheduled to take effect a year later.

"Ergogenic aids" debunked. Two pharmacists have produced a comprehensive analysis of 19 "natural" substances claimed to help build muscles, increase stamina, enhance energy, or facilitate weight loss [Annals of Pharmacotherapy 27:607-615, 1993]. Claims for these substances were gathered from ads in bodybuilding magazines, product labels, and fact sheets for health food retailers. The authors concluded: (1) "anabolic" claims for Argentinean bull testes, boron, cyclofinil, dicobenzide, gamma oryzanol, *Menispermum canadense*, plant sterols (diosgenin, smlagenin, hecogenin), and saw palmetto berries were unfounded; (2) certain claims for chromium picolinate, clenbuterol, guarana, inosine, kola nut, and ma huang have scientific support, but products containing these substances are marketed in a misleading manner; (3) claims that yohimbe bark is an anabolic agent are supported by studies in animals but not humans; and (4) claims for arginine/ornithine, carnitine, and *Gymnema sylvestre* have some scientific support [although there is still little or no proven value for their use by athletes].

What chance do consumers have of finding a reliable "nutritionist" through the Yellow Pages? About 40 percent, according to Ira Milner, R.D., New York area network coordinator for the National Council Against Health Fraud. The council sponsored a multistate survey of nutrition practitioners listed in the Yellow Pages in 1992 and 1993. The "credential" initials sported by dubious practitioners included: CCN (certified clinical nutritionist), CCT (certified colon therapist), and CNC (certified nutrition consultant or counselor). Milner, who directed the survey and performed a 1994 follow-up sponsored by Nutrition Forum, will provide details in the next issue of *NF*.

The Color of Quackery? Fingering the Phony Nutritionists of the Yellow Pages

Ira Milner, R.D.

Seekers of responsible nutrition counselors need to be especially careful when they let their "fingers do the walking" through the Yellow Pages. A 32-state survey sponsored by the National Council Against Health Fraud (NCAHF) found that consumers had less than a fifty-fifty chance of finding a reliable "nutritionist" through the directory. The study provides a clear indication of the extent of nutritional pseudomedicine. Multitudinous pseudo-experts, many with questionable degrees and certificates, have been dispensing bad advice, much of which leads to expensive and useless supplementation and invalid or inappropriate diagnostics.

"The Biggest Ad in the Yellow Pages"

Kurt W. Donsbach, D.C., who apparently holds several advanced "degrees" from unaccredited institutions, in 1978 founded his own unaccredited school, Donsbach University (later renamed the International University for Nutrition Education), a notorious source of "mail-order" degrees. Donsbach claimed that his "university" had graduated over a thousand people before it closed. NINE™—The National Institute of Nutritional Education—issued the title CN™ (Certified Nutritionist) to about 735 people and "educated" 7,000 others between 1980 and 1993, according to the January 1993 issue of *Health Foods Business*. NINE's introductory mailing states that its program "is designed to supplement professions with nutritional counseling in such fields as chiropractics [sic], counseling, education, herbology, nutrition, medicine, pharmacology, and psychology...." (NF co-editor Jack Raso has described many sources of health-related pseudocredentials in *Mystical Diets* and *Alternative Healthcare: A Comprehensive Guide*, both published by Prometheus Books.)

Donsbach U. alum Gary Pace was an electrical engineer before he turned to a career in nutrition and duped hundreds of Long Island, New York, residents. In 1985, New York State Attorney General Robert Abrams filed a civil suit against him, accusing him of practicing medicine without a license, false advertising, and illegal use of educational credentials. Pace's schemes, said Abrams, "induced hundreds of

customers to pay hundreds of dollars to him for improper physical examinations [including breast and pelvic exams], worthless laboratory tests [hair analysis and herbal crystallization analysis], bogus nutritional advice, and unnecessary vitamin, mineral, and herbal supplements." In a July 1985 issue of *Newsday*, one of his patients revealed that she had consulted him "because he had the biggest ad in the Yellow Pages."

The 1982-1985 NCAHF Study

In the January/February 1986 issue of its newsletter, NCAHF reported the results of the first study of nutrition practitioners listed in the Yellow Pages. Using information from ads and listings published in the preceding four years, the council categorized practitioners from 41 areas in 17 states as "clearly spurious," "suspicious," "undeterminable [sic]," and "apparently qualified." Only 13% of 439 "nutritionists" listed in the Yellow Pages appeared qualified, 24% were ranked as "clearly spurious," 31% were "suspicious," and 31% were "undeterminable." Under the heading "Dietitians," 8% of the 53 entrants were considered spurious. In a subsection under the heading "Physicians and Surgeons" titled "Nutrition," 46% of the 24 entrants were also deemed spurious, and none was categorized as "apparently qualified." Their offerings included acupuncture, chelation therapy, life extension, and orthomolecular medicine.

I decided to broaden the scope of this study. As coordinator of NCAHF's Task Force on Nutrition Diploma Mills, I was especially interested in identifying all of the operational degree mills in the U.S. and in determining which ones so-called nutritionists patronized most.

Study Design

The 1992-1993 study differed from the original study in one important way: In the latter, the ranking of practitioners was based solely on information in the ad or listing; in the recent study, volunteers ranked practitioners in their respective areas on the basis of interviews or familiarity with the practitioners.

General Results of NCAHF Survey of Nutrition Practitioners in Yellow Pages

	SPURIOUS	SUSPICIOUS	RELIABLE
"Dietitians"	9% (21 of 231)*	3% (7 of 231)	84% (194 of 231)
"Nutritionists"	46% (286 of 618)**	12% (73 of 618)	40% (245 of 618)
Physicians***	55% (68 of 124)	13% (16 of 124)	32% (40 of 124)

*including General Nutrition Centers (GNCs), Diet Center facilities, Herbalife distributors, a Formu-3 International distributor, and a former vitamin company employee who used hair analysis

**including 68 chiropractors, 37 practitioners who used hair analysis, 22 N.D.s, 17 Ph.D.s, and 5 acupuncturists

***20 of 32 states reporting

Prospective volunteers were contacted in September 1992. State legislative chairpersons with The American Dietetic Association provided many contacts. The volunteers consisted of registered dietitians, public health nutritionists, dietetic interns, and undergraduate and graduate nutrition students. Data were collected from 64 areas in 32 states. Volunteers were asked to submit copies of: (1) all listings under the headings "Dietitians" and "Nutritionists"; (2) all listings under the subheadings "Nutrition" and "Preventive Medicine" (under "Physicians and Surgeons"); and (3) all corresponding ads. However, I also received unsolicited listings under other headings, including "Health & Diet Products," "Health, Fitness & Nutrition Consultants," and "Weight Control Services." Volunteers ranked practitioners according to the following criteria.

- **Spurious:** The business utilized invalid methods of treatment, diagnosis, or nutritional assessment (e.g., applied kinesiology, chelation therapy, hair analysis, and iridology) or publicized a degree from an unaccredited school. Spurious businesses included supplement distributors and multilevel-marketing (MLM) companies such as Herbalife, Nu Skin, and Sunrider.
- **Suspicious:** The practitioner did not comply with the volunteer's request for information on credentials or methods utilized.
- **Reliable:** The practitioner was a registered dietitian (R.D.) or had a nutrition-related degree from an accredited institution.
- **Other:** The above categories did not befit the practitioner or business; for example, a senior citizen center or a provider of enteral nutrition products to healthcare facilities.

Volunteers were asked to contact every business they did not recognize as reliable and to obtain information about credentials, methods, and, if possible, advice to clients.

Health Food Stores, Chiropractors, Naturopaths et al.

Consumers had a much better chance (84%) of finding a responsible nutrition practitioner through listings under the heading "Dietitians" than through those under the headings "Nutritionists" (40%) and "Physicians" (33%). Of the 231 entrants listed under "Dietitians," 21 (9%) were judged "spurious." These included Diet Center facilities, distributors for MLM companies such as Herbalife, a fake nutritionist with a bogus doctorate who practiced iridology, a former vitamin company salesman who used hair analysis, and numerous General Nutrition Corporation (GNC) outlets. When a GNC employee was asked why her store was listed under "Dietitians," she replied: "Because we have the literature in the store to help people." Spurious "dietitians" were found in eight states. New York, North Carolina, and California had the highest percentages. For six states, either there was no "Dietitians" heading or volunteers did not provide the listings under this heading.

A word is in order concerning the debatable categorization of Diet Center facilities as "spurious." All of the facilities are franchises. Although the corporate staff includes registered dietitians, only non-health professionals—typically former clients—counsel dieters, who are required to take a nutritional

Nutrition Forum (ISSN 0748-8165), © 1994, is published bi-monthly by Jack Raso, M.S., R.D., and Zhixin (David) Xu, M.S.

Subscriptions for individuals in the United States and Canada cost \$35 for one year (six issues), payable to Nutrition Forum at P.O. Box 747924, Rego Park, NY 11374. Multireader (e.g., institutional) and overseas (airmail) subscriptions cost \$50 for one year. Back issues are available at \$6.00 per copy.

supplement. The facilities offer prepackaged cuisine. Certainly, listing such a business, whatever its merits, under the heading "Dietitians" is misleading.

Of the 618 entrants listed under the heading "Nutritionists," 358 (58%) were either spurious or suspicious. Sixty-three percent of ads and boxed listings under this heading were for bogus nutritionists, many of whom placed the biggest ads. For thirteen states, at least half of the listings represented such practitioners. The top five states were Arkansas (one listing), New Mexico (61%), Arizona (59%), Nevada (58%), and Florida (55%). New Mexico and Florida license dietitians and nutritionists.

Of the 286 "spurious" nutritionists, 37 (13%) used hair analysis.

Sixty-nine chiropractors (11%) were listed under "Nutritionists." All were categorized as spurious except one, who employed a registered dietitian to do nutrition counseling. Their offerings included supplements (57%), applied kinesiology (19%), hair analysis (9%), homeopathy (6%), and acupuncture (3%).

Twenty-two of the entrants listed under "Nutritionists" claimed to be naturopaths.

An Alphabet Soup of Empty Credentials and Titles

Under the heading "Nutritionists," 24 listings included the initials "Ph.D." Of these, 17 referred to bogus doctorates, representing 6% of those "nutritionists" deemed spurious and 71% of all "Ph.D." nutritionists. Five of these phony Ph.D.s were naturopaths, two were chiropractors, and one was an acupuncturist and Doctor of Oriental Medicine (OMD).

Among the aforementioned naturopaths was Robert H. Sorge, founder and director of the Christian-oriented Abunda Life Health Hotel & Clinic, in Asbury Park, New Jersey. An Abunda Life brochure described his educational background:

In 1964 he received his doctorate in naturopathic medicine from the Anglo American Institute Of Drugless Therapy in Great Britain. And in 1972 he earned his doctorate of philosophy in naturopathic medicine from the United States School of Naturopathic Medicine and applied sciences [sic], one of the old naturopathic schools licensed around the turn of the century by a special act of the United States Congress.

According to *Bear's Guide to Earning College Degrees Non-Traditionally* (1992), the Anglo-American Institute of Drugless Therapy is an unaccredited correspondence school that claims more than seven thousand graduates.

Of the 17 phony "Ph.D." nutritionists, three held a "doctorate" from Donsbach University; two from the International University for Nutrition Education (formerly

Donsbach U.), an unaccredited correspondence school; one from the American Holistic College of Nutrition, another unaccredited correspondence school; one from the Clayton School of Homeopathy; one from Clayton University (originally called Open University and later called American International Open University), an unaccredited correspondence school in St. Louis, Missouri; and one from Ryokan College, an unaccredited school that offers degrees only in psychology. A New Orleans chiropractor claimed a Ph.D. degree in kinesiology but did not state the source of this alleged degree. And a California practitioner claimed, unconvincingly, a Ph.D. degree in nutrition science from the University of Munich.

The "credential" initials sported by dubious nutrition practitioners included: CCN—certified clinical nutritionist, CN—certified nutritionist, CCT—certified colon therapist, RCT—registered colon therapist, CMT—certified massage therapist, CNC—certified nutrition consultant, NC—nutrition counselor, HMD—homeopathic medical doctor, NMD—doctor of nutrimericine, and ND—doctor of naturopathy. Jack Raso called the Triad Medical Center, in Reno, Nevada, and was told that a homeopathic medical doctor was "kind of— sort of the same thing" as a holistic medical doctor.

Anne Murray of Albuquerque styled herself "MLD." Murray is a graduate of the Vodder School International for Manual Lymph Drainage, in Walchsee, Austria, and a member of the American Massage Therapy Association. Her pamphlet states that practitioners of manual lymph drainage (MLD) "can manually remove the blockages in the [lymph] system and promote proper lymph flow." Blockages, Murray claims, "allow toxins and plasma to accumulate[,] interfering with cell nourishment and depressing the immune system." The conditions MLD practitioners treat reportedly include acne, allergies, chronic fatigue syndrome, colitis, multiple sclerosis, osteoporosis, Parkinson's disease, "post tooth extraction," rheumatoid arthritis, and varicose veins.

Physicians on the Fringe

Some M.D.s and D.O.s—for example, so-called nutritionally oriented doctors or medical nutritionists—utilize a variety of pseudoscientific and unsound nutritional and medical methods. In 20 states, 55% of physicians listed under the heading "Physicians and Surgeons" were "spurious." Although more commonly listed under the subheadings "Nutrition" and "Preventive Medicine," some fringe physicians were listed under the subheadings "Allergy," "Holistic Medicine," and "Homeopathy." Twelve percent of them sold supplements in their offices. Their dubious methods included

chelation therapy (8%), homeopathy (8%), orthomolecular medicine (5%), acupuncture (4%), clinical ecology (4%), dark field microscopy (3%), hair analysis (3%), vitamin injections (3%), ayurveda (1%), and colonic irrigation (1%).

Other Phony Nutritionists

Dubious nutrition practitioners were also listed under other headings in the Yellow Pages, including: "Acupuncture," "Health & Diet Products," "Health, Fitness & Nutrition Consultants," "Herbs," "Holistic Practitioners," "Weight Control Services," and "Wellness Programs." Many of the listings under these headings were for chiropractors, homeopaths, naturopaths, health food stores, and MLM companies, including Aloe Vera International, Herbalife, Matol Botanical International (purveyors of *Km*), Nu Skin International, Shaklee Corporation, and Sunrider International.

Wake-Up Call?

John H. Renner, M.D., president and medical director of the Consumer Health Information Research Institute (CHIRI), has stated: "It's big news when a fake doctor manages to practice without valid credentials, but thousands of nutritionists are practicing with questionable degrees and credentials." Hundreds of such nutritionists are listed in the Yellow Pages.

One volunteer wrote: "Unfortunately, the people who are spurious have the most soothing voices and promote themselves extremely well. The dietitians that I called did not do as good of a job promoting themselves." Only a relative handful of R.D.s are disreputable; most are good bets as sources of nutrition information. However, in the health marketplace, clinical R.D.s and other qualified nutrition advisors are up against a shuffle of dubious practitioners, many of whom

depreciate dietitians. For example, a biochemist told me: "Dietitians basically manipulate food and menus. Nutritionists recommend dietary changes and food supplements." A "CCN" who graduated from the International University for Nutrition Education stated:

Dietitians have been around a long time. They work in hospitals and do menu planning.... Nutritionists are more clinical and take a more individualized [approach].... [They are] more tailored to the individual, using vitamins and minerals in therapeutic doses.... [They take a] more active rather than passive approach.... If you want a nutritionist, [the practitioner] shouldn't be a member of The American Dietetic Association.

A pharmacist and self-styled naturopath who graduated from Donsbach University said:

[Consumers] need to know what type of nutritionist they're interested in.... Most R.D.s wouldn't entertain the idea of being aware that enzyme production decreases around the age of 35.... Dietitians follow hospital menus.... [Consumers should] look to more unorthodox nutritionists... with other credentials.

Are clinical dietitians the Rodney Dangerfields of healthcare?

[**Editor's note:** It is a considerable marketing advantage to hold a doctorate and/or to lack ethics. Furthermore, I surmise that, to the public, the Registered Dietitian credential is a somewhat vague, "generalist" credential in comparison with the "specialist" quasi- and pseudocredentials of unscientific nutrition practitioners. Chiropractors and N.D.s, after all, are "doctors." Perhaps that is primarily what dieters and nutrition buffs in general want to hear.—J.R.]

Parsley—No Sage

Shari Lieberman Up-Close

Part 2

Jack Raso, M.S., R.D.

In our last issue, *NF* associate editor David Xu and I presented a report of his "comprehensive consult" with Shari Lieberman. Last January, The American Dietetic Association suspended her Registered Dietitian (R.D.) credential for a period of three years, after which she may apply for reinstatement. Despite the suspension, Lieberman has called herself an R.D.—for example, in an ad in the April/May 1994 issue of *Free Spirit* and another in the Spring 1994 *Newlife Expo* catalog. Xu's follow-up visit to her did not take place until March 25. (In the interim, Lieberman had traveled to Brazil, and Xu to mainland China.)

"The Testimonial Queen"

At the 1992 Convention and Trade Show of the National Nutritional Foods Association (NNFA), Lieberman conducted a "workshop" on "dispensing nutritional information" during which she named herself "the testimonial queen." NNFA is a guild of health food retailers. Lieberman stated:

[W]hat you're going to learn today is how you can get around—how you can actually talk with a customer who comes into your store, without being arrested....

Raymond J. Shamberger Ph.D., Laboratory Director
CLIA # 36D0339322

[I] really care about *you*, and, you know, there's a limitation to how tightly your hands can be tied....

Now, it's all in the way that you say it.... It really is in the way that you say it. You have to be very aware when you speak with someone, because— Listen: Don't put it past somebody to send somebody into your store as a setup.... I don't want you to be paranoid; I only want you to be prepared. Okay? So, there's a very big difference between prescribing, diagnosing, and something that you're presenting for educational purposes. It's a big difference.

Lieberman urged owners and employees of health food stores to build a "reference library" consisting of: (1) files of articles on numerous supplement ingredients, (2) books, (3) a rack of handouts from supplement companies, and (4) a loose-leaf collection of testimonials requested from customers. She expounded:

If someone has had incredible results using a nutritional supplement of any sort, ask them to write a testimonial. They are very, very useful tools. And you all have people coming into your stores who are taking supplements. Even if they're referred by a nutritionist or a nutritional physician, you might wanna have a testimonial from them for the referral to the person that they're seeing. Testimonials are key, really key; and I cannot emphasize that to you enough.

When I'm on air, really most of what I do is simply take testimonials. I have to be careful what I say; so I've had a lot of experience with this. It's all in the way that you say it....

Any person can share information with another person. You just have to be careful in how you say it. You can show their testimonial. Okay?

I'm sort'a giving you ways that you can kind'a maneuver through the tide. Okay? [It] really isn't difficult.

"I'm Only Doing Things More on a Preventive Level"

During the first consultation, Lieberman opined that Xu had "a marginal thyroid problem"—"a little bit of an endocrine-thyroid imbalance." She further opined that a blood test would not indicate this "problem." However, she stated that the results of two tests, herbal crystallization analysis (HCA) and hair analysis, would "show" her "for sure." The second consultation (or "extended consult") included the following conversation.

Xu: So where is my result?

Lieberman [explaining 6-page "hair element analysis" report from Omegatech, of Cleveland, Ohio]: Calcium and magnesium fall within the reference range, but they're a little— I would say they're low-normal. And we certainly want to make sure that they don't go down.... But as of now, they're okay.... They could be a little bit better, but [it's] not a major ordeal.

The zinc level also looks pretty good; that's for the immune system.

Your copper level is low. Copper is a major mineral that's involved in cholesterol regulation. It's involved in the immune response.... So the copper level looks like it's a little bit of a problem. Okay?

Chromium is low for many people.... Chromium's really important for blood sugar control....

Xu: Am I very low? I mean, lower than regular people?

Lieberman: Yes. It's pretty low.... I don't see anything here that's terrible.... But I would say overall we sort of see a pattern of you being on the low side of things.

Xu: Okay. Why?

Lieberman: It was probably as a result of moving out of China... [to America]. I'm sure if you were living at home [i.e., China, where Xu was born and raised], it would be a little bit different. Okay?...

Xu: So, do I have to do anything, or—?

Lieberman: Yes. Let's talk about it.... You're a little low.... So, what I'd like to do is recommend something in terms of bringing some of those levels up and also... for prevention. Why not?

Xu [referring to a supplement "checklist" sheet Lieberman had prepared for him]: So, what you are saying is also written here, right?

Lieberman: Yes, yes.... Let me show you what... I'd like to do.... [Y]ou got the liquid kelp? [She had recommended a specific kelp preparation as an iodine supplement "for the thyroid" during the first consultation.]

Xu: No.

Lieberman: You didn't?

Xu: No....

Lieberman: Okay. Do you customarily eat seaweed or stuff like that, or not really?

Xu: Not really, no.

Lieberman: You should get it.... Oh, and most important... is the thing about hair loss. What do you think this [i.e., hair] is made out of? Minerals. Predominately minerals and some protein.

Xu: Okay. So?

Lieberman: We're gonna give you minerals. I'm gonna get the protein from food. I'm going to recommend a supplement called "Optimum Protection." The reason I'm recommending this is because it will give you calcium, magnesium, zinc, B-complex, vitamin A, beta-carotene, vitamin E, selenium, chromium, manganese, zinc.

I'm giving you a chelated copper, two milligrams... 'cause your copper level is real low....

The reason I had given you— This ["Io-Dyn (drops) World Organic"] is liquid kelp, and the reason I had recommended it was specifically for the hair loss, because this is oftentimes controlled by the thyroid gland. You don't have to have a thyroid disorder; your thyroid can be maybe [sic] not functioning... optimally. A change in living conditions, a change in environment, a change in your food—there are many, many different things that can actually affect that. This would be the equivalent of eating some seaweed every day....

I'm only doing things more on a preventive level.

"Weird.... Very Weird"

Lieberman [explaining HCA and the results thereof]: I would relate this [HCA] most closely to acupuncture. If someone goes through a traditional Chinese acupuncture diagnosis, they will pick up the same exact things I do with this test. It's not medical. So this is basically going to tell me which herbs would be the best for you, and what do these herbs correspond to. So let's look at each one.

Example of HCA report (1984) from Herbal Tracers, Ltd. (Lieberman did not use this lab.) Practitioners interpret the report (left) by aligning it with the guide (right). The number of x's supposedly indicates how much help "corresponding" organs need.

THE INDICATIONS OF THIS SHEET DO NOT CONSTITUTE AN APPRAISAL OF HEALTH, BUT ARE INDICATIONS OF SIMILAR CRYSTAL PATTERNS ONLY

- ### BODY SYSTEM GUIDE
- The traditional use of these herbs suggest that they have been used for the:
1. General Constitution
 2. Respiratory system
 3. Endocrine system
 4. Kidneys
 5. Focus _____
 6. Liver _____
 7. Reproductive system
 8. Digestive system
 9. Nervous system
 10. Blood sugar
 11. Arteries
 12. Abnormal cell potential
 13. Small intestines
 14. Colon
 15. Bladder
 16. Blood pressure reg.
 17. Lymphatic system
 18. Blood oxygen
 19. Pain
 20. Gall bladder
 21. Infection
 22. Circulatory system
 23. Hormones
 24. Calcium

Circulation shows up a lot. You have a circulation of a 60-year-old man. [Xu is 30.] That's inexcusable. I ain't giving you anything to swallow. You're gonna have to do some exercise....Even if you begged me, I'm not.

The circulation is a problem, one of your major ones. The other thing that's showing up is the lymphatic/immune system....

Xu: Sound pretty bad...?

Lieberman: Um, it looks like an area to me that needs the most amount of work....

Small intestines and colon also show up as an area of focus....I don't think I need to give you something to swallow for this. I think you need to clean up your diet a little bit. I'd like to do as much dietary intervention to spare you swallowing a lot of pills.

Nervous system shows up....I think that exercise would be great for you. So would meditation.

Digestive system shows up as a little bit of a problem....This is related to hair loss, by the way....There is something going on hormonally.

Xu: How can you get [indications for] these herbs from my [saliva]—?

Lieberman: When that's sent to them, there's a powder, and within the crystal they see lots of other little patterns they actually match it to. They have thirty crystals of pure herb....It has nothing to do with what you eat....It's based on the work of Rudolf Steiner, [according to]...which...your body will tell you what it needs. [Steiner (1861-1925) founded anthroposophy, an arcane, Christianized spinoff of Theosophy that posits four components of the human organism: a physical body, a vegetal "etheric" body, an animalistic "astral" or "soul" body, and an "ego" or "spirit."]

Xu: So I need to eat more parsley? [Parsley is a mild diuretic and gastric stimulant.]

Lieberman: Parsley. When I send this in, it's not uniform....There's lots of different patterns in here, and [under a microscope] they will look like any one of thirty herbs. So they just match it....It's weird. It's very weird....Weird stuff, kind'a like if one would talk about *chi* in acupuncture. I mean, how does one explain it to an American person? It'd be like: "Can I measure it? Uh, how do you know—?"

But we're talking about a system that does not involve modern medicine at all. This is not looking at you to diagnose a disease. This is looking at you to say: "This area needs to be worked on, that area needs to be worked on, this area needs to be worked on, [and] these are the herbs that can...—"

So, hormonal balance does show up. That is related to your hair loss, by the way. So I'm— I'm happy that it showed up, 'cause it's something that I can work on.

The herbal extract that I'm going to give you will of course contain some parsley, and it will also contain herbs with similar principles as well.

The liver shows up, too....That's...a little on overload, slight overload. There's nothing wrong with your liver. So I want— I want you to understand that there's nothing wrong—....I'm looking at things that would be best handled as a preventive thing to do.

As far as the hair loss is concerned, it looks like, hormonally and with respect to minerals, there could be something going on— nothing terminal, but little things here and there. Okay?...

The reason I do it [i.e., use HCA], quite frankly, is: I get blood tests on people and they [the tests] tell me absolutely nothing. People coming in who don't feel well—their blood test is fine. [But] it doesn't

mean there's nothing wrong with them; it means that, on a medical level, nothing could be detected. I'm delighted; I think it's great....

These [two items, "LYM" and "PRO," on the supplement list] are herbal tinctures....*PRO* will contain parsley...damiana [an alleged aphrodisiac that appears medically useless], which is another herb.... "PRO" stands for "prostate reproductive system." It's for men. That's for hormones. *LYM* is for the immune system and the lymphatic system. It contains things like echinacea.... It has a number of herbs in it for that purpose. [It's] totally natural and it's herbal....

[During the first consultation, Lieberman had recommended cayenne powder in the form of a topical paste for hair loss.] [T]he cayenne works great, David. It really works great....

"At this Point in Time..."

Xu: [Y]ou are...a dietitian, right?

Lieberman: Yes.

Xu: A registered dietitian, right?

Lieberman: Yes....I'm an herbalist, too....I design herbal products, with technical support....If I'm gonna give you the [hypothetical] bottle [of herbal pills] and say that this is gonna cause you to lose weight, in this country you're making a drug claim. It's all bullshit, David....It's a stupid thing, but that's the way it is....

What I want you to do for me is, I would like you to call me in about a month. I wanna know how you are and how you feel, what you're doing, [if]...you have any questions. Let me get a sense of where you're at.... I probably wouldn't see you for two months or so....I'd repeat the herb crystal test and I would give you the results on the phone....

Are you giving me a check?

Lieberman's receipt and the supplement sheet bore the initials "R.D." after her name.

On April 12, Xu went to Hickey Chemists, in Manhattan, to determine the ingredients of the herbal supplements Lieberman had recommended: *PRO*, *LYM*, and *Io-Dyn*. She had directed him to this pharmacy, which she had praised during

her NNFA seminar. Xu asked a stock clerk where these supplements were. The clerk appeared puzzled and referred Xu to a man behind the prescription counter. The counterman expressed puzzlement initially but in a moment spoke Lieberman's name. The clerk told Xu that the supplements were out of stock.

On April 14, about a week after the mailing of *NF*'s March/April issue, a friend of mine phoned Lieberman as a potential client. Lieberman described the "two screening tools" she uses: "hair mineral analysis" and "an herb crystal test." She stated that these were "completely non-medical" and "not diagnostic." She explained: "They just kind of give me an idea about your biochemistry."

My friend asked Lieberman if she was a dietitian. She replied:

Um, well, a diet— I— I'm— I'm a nutritionist because that— It requires a graduate level of education, and I have both a master's degree and a Ph.D. in nutrition.... [I] do have a *tra*i— I do have training as a dietitian as well.

He asked her if she was a registered dietitian. She responded: "Can I ask you who gave you my phone number?" My friend repeated the question and Lieberman answered: "Um, at this point in time, no, I'm not."

The Bottom Line

Lieberman's approach to nutritional "healing" appears substantially based on mysticism and unscientific empiricism. She continues to engage in practices that are, in my opinion, incompatible with the R.D. credential.

Jack Raso is co-editor/publisher of *Nutrition Forum* and vice president of the New York State Chapter of the National Council Against Health Fraud.

BOOK REVIEW

Title: "Alternative" Healthcare: A Comprehensive Guide (1993)

Author: Jack Raso

Publisher: Prometheus Books, Buffalo, N.Y.

Price: \$26.95 hardcover

Reviewed by: John E. Dodes, D.D.S.

What happens to someone who is brought up in a very religious home, is taught to accept the assertions of authorities without question, and enters adulthood believing all the health claims he reads or hears in the popular media? Jack Raso describes just such an odyssey, from believer to skeptic, in his first book, *Mystical Diets* (Prometheus Books, 1993). His new book is a welcome companion and complement to his first.

Raso has obviously spent a great deal of time analyzing the fundamental beliefs of alternative healthcare. He concludes that two distinct philosophic "pillars" underlie these beliefs: unscientific empiricism, which "esteems knowledge derived from experience—trial and error—but devalues knowledge

gained by analysis and the systematic organization of information"; and universal skepticism, which "in its extreme form...holds that humans cannot know anything—that truth and falsity are indistinguishable." These two worldviews lead inexorably to the logical errors and bizarre practices of alternative healthcare

The book is divided into four parts. Part I, "Spirits in the Material World," deals with vitalism and other supernaturalistic theories and lists hundreds of related "healing" methods. I particularly enjoyed Raso's insightful discussion of the much-hyped, but flawed, survey of "unconventional medicine" usage published in the *The New England Journal of Medicine* in January 1993. Raso points out that this study, which claimed that "unconventional medicine" had an "enormous presence" in the U.S. healthcare system, was based on a misleading definition of the term "unconventional." For example, the researchers labeled commercial weight-loss programs, massage, and self-help group therapy "unconventional." At all events, as Raso states, "...only 11 percent of the interviewees had reported consulting a provider of 'unconventional therapy'" and "All the

'unconventional therapy' patients with cancer, diabetes, lung disease, skin problems, high blood pressure, and urinary disease had consulted a medical doctor."

Part II, "Spiritual Healing," deals predominantly with yoga, ayurveda, macrobotics, and the Edgar Cayce approach to healing. By "spiritual healing," Raso means "health-centered systems and methods that affirm the idea of 'life after death' and borrow conspicuously from religious traditions." The three chapters of Part II effectively lay bare the fuzzy thinking and economic fraud that "spiritual healing" entails.

In Part III, "Pseudonatural Healing," Raso examines naturopathy, homeopathy, and Natural Hygiene (founded by the inventor of the graham cracker). The descriptions are succinct and enlightening.

Part IV, "Physical Cultism," includes accounts of Raso's visits to a dozen practitioners of "bodywork"—suggesting valor "above and beyond the call of duty." Bodywork, according to Raso, encompasses "many treatments that involve touching, manipulation, and/or exercise of the body and, in most cases, supposed alignment of the body's 'energy field' or removal of blockages to the flow of 'energy.'" Raso's descriptions are priceless. Although I've been involved in the anti-health fraud movement for many years, I didn't know exactly what happens to people who undergo rolling, polarity therapy, *jin shin do*, or the Alexander technique. Raso elucidates these and many other kinds of bodywork.

The final chapter focuses on "mystical chiropractic."

As Raso states, "...chiropractors have been among the chief innovators and supporters of mystical healing since the inception of their trade." This is undoubtedly true. Chiropractors have converged around false allegations against amalgam fillings, antibiotics, fluoridation, and vaccination. Citing research by Yale anatomy professor Dr. Edmund Crelin, Raso convincingly argues that chiropractic subluxations "do not occur." One finishes this chapter with a better understanding of why chiropractors are so quick to adopt unscientific methods.

My only criticism of the book is that, because of the author's desire for comprehensiveness, the text includes long lists the reader must plow through. The contents of these lists would have been less daunting had Raso placed the information in tables or boxes. In any case, this minor drawback is more than made up for by the superb glossary and excellent bibliography. Covering 70 pages, the "Glossary of Supernaturalistic Methods" is, without a doubt, the best glossary on alternative healthcare that I have seen. It runs the gamut from absent healing to zone therapy, including nearly every questionable health method I've ever heard of and many I hadn't heard of. This makes "*Alternative Healthcare*" an indispensable reference book that will have a prominent place on my desk and, I hope, yours.

Dr. Dodes, who practices in Woodhaven, N.Y., is president of the New York State Chapter of the National Council Against Health Fraud. Copies of "*Alternative Healthcare*" are available at \$26 each postpaid (Canada: \$27) from LVCAHF, Inc., P.O. Box 1747, Allentown, PA 18105.

Escaping the Prison of the Intellect: A Journey from Here to Here
By Deepak Chopra. San Rafael, CA: New World Library, 1992.. Running time: 47:43. Price \$10.95.

READERS' FORUM

Need for Nutrition-Specific Doctorate

We began subscribing to NF last January and just love it so far.

In response to your article on Shari Lieberman [last issue's "Progressive or Renegade?"], we wanted to let you know that we wholeheartedly agree that there is a need for a doctoral degree in nutrition (such as "NutritionD") similar to the PharmD degree available to pharmacists. It would certainly give us the prestige and clout we are longing for.

This idea was expressed in an article that appeared in the *Journal of The American Dietetic Association* a while ago [February 1993], but we have not seen or heard anything about it since. Please let us know if you do!

Thanks and keep up the good work.

Joan M. Trimble, R.D., C.N.S.D.
Clinical Nutrition Manager
Somerset Medical Center, Somerville, N.J.

Jack Raso responds: Thanks for faxing this excellent article, titled "Educational empowerment of the clinical dietitian: A proposed practice doctorate curriculum." The authors endorsed the development of diagnostics-centered programs leading to a "NutritionD" degree. The proposed degree is a professional (nondissertation) doctorate specific to dietetics and "aligned academically in rank" with the M.D. degree. The authors suggested that such a doctorate would engender in dietitians "a preference for leading rather than assisting other professionals." The article concludes, in part: "[M]eeting this educational challenge should move clinical dietitians to the forefront of health/medical nutrition practice."

David Xu and I emphasize that this newsletter is a forum—a participatory resource—and invite readers to submit publishable letters that reinforce or raise questions about articles or items herein. Involved subscribers are an inspiration. Please share your experiences, insights, opinions, questions, and concerns with fellow readers by writing!

BRIEFS

Antioxidant benefits disputed. Researchers have proposed that supplementation with beta-carotene (a form of provitamin A) and/or alpha-tocopherol (a form of vitamin E) "may have harmful as well as beneficial effects" [NEJM 330:1029-1035, 1994]. Both nutrients are antioxidants. In a randomized, double-blind study, they followed 29,133 male long-term smokers in Finland for 5 to 8 years. The participants received daily: (1) 20 mg synthetic beta-carotene, (2) 50 mg synthetic alpha-tocopherol, (3) both supplements, or (4) a placebo. The investigators found that: (1) the antioxidant regimens had not prevented lung cancer, (2) the incidence of lung cancer was higher among participants who had received beta-carotene than among those who had not, (3) alpha-tocopherol supplementation had had no effect on the incidence of lung cancer or on mortality due thereto, (4) the death rate due to hemorrhagic stroke was higher among participants who had received alpha-tocopherol, and (5) alpha-tocopherol supplementation appears protective against prostate and colorectal cancer. The researchers write: "Beta carotene may not be the active cancer-inhibiting component of the fruits and vegetables identified as protective in observational studies, or the intake of beta carotene may be only a nonspecific marker for lifestyles that protect against cancer." An editorial in the same issue states that the results of the trial "do not disprove the potential benefits of antioxidant vitamins, but they do provide timely support for skepticism and for a moratorium on unsubstantiated health claims." The April 14 issue of *The New York Times* quotes Dr. Gilbert S. Omenn, dean of the School of Public Health at the University of Washington: "This study raises a big yellow caution flag."

Chung eyes supplement industry. The April 21 edition of the CBS broadcast newsmagazine "Eye to Eye with Connie Chung" featured a segment titled "Vitamin War," which Chung introduced with the statement: "Vitamins may be the 'Jaws' of the '90s. Just when you think it's safe to take them, another wave of research rocks the boat." The segment depicted the supplement marketplace as an unregulated, four-billion-dollar industry that uses scare tactics to stir up protests against regulation.

Health food store sales. *Health Foods Business* estimates that 38.5% of sales in health food stores last year were for vitamin supplements and similar products. On the basis of its annual survey, the magazine estimated that 7,500 stores grossed \$1.74 billion for these products, representing a 17% increase from 1992. Total sales for all products were \$4.52 billion (up 19%), including \$679 million for herbs and herbal teas (up 7.2%) and \$131 million for books (up 19%). Homeopathic "remedies" accounted for 8.9% of the vitamins/supplements category (about 5% fewer dollars than in 1992).

FTC nails Nu Skin. Nu Skin International, Inc., and three of its distributors have agreed to pay a total of \$1,225,000 to settle charges that they made false and unsubstantiated claims for Nu Skin products and exaggerated potential earnings for distributors. Nu Skin is a multilevel-marketing company that sells skin care products and dietary supplements. Under the agreement, the accused parties admit no wrongdoing but are prohibited from making unsubstantiated claims that: (1) *Nutriol Hair Fitness Preparation* or any substantially similar product can prevent or remedy hair loss or is as effective or more effective than the prescription drug minoxidil (Rogaine), (2) *Face Lift with Activator* or any similar product can permanently remove wrinkles or is equivalent to or better than the prescription drug tretinoin (Retin-A), and (3) *Cell-Trex* or any similar product will promote the healing of third-degree burns. The agreement also specifies how potential earnings must be accurately disclosed. The money will be available to provide redress to consumers, with any leftover amount going to the U.S. Treasury.

"Osteoporosis gene" identified. Australian researchers have identified a single gene that controls loss of bone mass and the development of osteoporosis as humans age [Nature 367(6460):216-217, 1994]. They identified two types of the gene in 250 twins whose bone density varied according to the type of gene. The gene specifies the vitamin D-receptor code and thereby controls the buildup and disintegration of bone.

Calcium and osteoporosis. A two-year study has found that calcium supplementation reduced bone loss in normal postmenopausal women who had an average calcium intake of 750 mg per day [NEJM 328:460-464, 1993]. The study involved 122 normal women who were at least three years postmenopausal. Half were given 500 mg calcium twice daily, while the rest received a placebo. The placebo group lost bone at a rate of about 1% per year, while the calcium group had half to two thirds this rate of loss. An accompanying editorial identifies several questions that research has not yet answered. Its author, however, says there are enough data to recommend that most postmenopausal women consume at least 1,000 mg and preferably 1,500 mg of calcium per day, as well as 400 to 800 IU vitamin D [NEJM 328:503-505, 1993]. Decreasing bone loss reduces the incidence of hip fractures, which are a serious problem among elderly women.

ADA approves naturopathy-school program. Last summer ADA approved a "didactic program in dietetics" at Seattle's Bastyr University. Completion of such a program is the profession's minimum academic requirement. Bastyr is an accredited school of "natural health sciences" that has offered courses in auriculotherapy (ear acupuncture), electroacupuncture, homeopathy, *jin shin, tui na*, and "whole foods." (*Jin shin* and *tui na* are vitalistic forms of "body-work.") ADA approval will remain in effect at least until March 2003. An item in the April 1994 issue of *Vegetarian Times* states:

[N]utrition students...will be able to graduate from a program with the nutrition community's imprimatur of respectability: approval by the American Dietetic Association....The approval means that the college's nutrition program is consistent with the "mission and philosophy" of the ADA, says Beverly Mitchell, administrator of the ADA's department of education....

Bastyr's nutrition department chair Joan Popyach [a registered dietitian with a Ph.D. degree in nutrition] says that the certification makes her university the only natural health science college to have won the ADA's mark of approval. According to Suzanne Myer, co-director of Bastyr's dietetic program, what will set the college's program apart from other ADA-approved programs is its emphasis on whole foods and alternative protein sources....

Though the ADA says its mark of approval is not a comment on the validity of alternative medicine, Popyach says she hopes the approval is "a sign of growing respectability [for alternative health care providers] by the nutrition community and the public at large."

ADA's approval is based on its review of a detailed application. The process did not involve an on-site evaluation of Bastyr's teachings. In late April, Dr. Stephen Barrett phoned ADA and asked an official why ADA had approved a program at a school that teaches "health nonsense." The official told Barrett that the application had met ADA's criteria for approval and that a lawsuit could have resulted if ADA had not followed its own rules. Dr. Barrett requested a copy of the application but was told that the evaluation process is confidential.

Ban proposed for lead-soldered cans. FDA has proposed banning the use of lead-soldered cans for foods sold in the United States. American manufacturers stopped using lead-soldered cans in late 1991, but about 10% of imported foods are still packaged in them.

Menu "labeling" proposed. FDA has proposed demanding that restaurant menus conveying health or nutrient-content claims meet some of the labeling requirements for grocery store food. The proposal would require a reasonable basis for such claims.

Behavior not related to sweetener use. A controlled double-blind study has found no relationship between children's intake of dietary sucrose or aspartame and their behavior and cognitive function [NEJM 330:301-307, 1994]. The study involved 25 normal preschool children (ages 3 to 5) and 23 school-age children (ages 6 to 10) described by their parents as sensitive to sugar. During consecutive 3-week periods, the children and their families followed diets high in sugar, aspartame, or saccharin (considered the placebo). For the children described as sugar-sensitive, no difference was found in any of 39 behavioral or cognitive variables among the three diets. For the preschoolers, only 4 of 31 measures differed from one diet to another, but there was no consistent pattern. The researchers concluded: "Even when intake exceeds typical dietary levels, neither dietary sucrose nor aspartame affects children's behavior or cognitive function." Reprints are available from Mark L. Wolraich, M.D., Child Development Center, 2100 Pierce Avenue, Nashville, TN 37232.

"TMJ dentist" found guilty of perjury. In 1989, the broadcast newsmagazine "20/20" presented a piece on fraud committed by dentists treating TMJ (temporomandibular joint syndrome), a painful jaw disorder. The program included an interview with John Dodes, D.D.S., president of the New York State Chapter of the National Council Against Health Fraud. The thrust of the segment was that Owen Rogal, D.D.S., of Philadelphia, was over-diagnosing and over-treating patients. Rogal claimed that reporter John Stossel had TMJ, but several other dentists, including Dodes, informed Stossel that his jaws were perfectly normal.

Rogal sued ABC News and Stossel for defamation and subpoenaed Dr. Dodes for deposition. Rogal lost the suit, and ABC News and Stossel sued him and his attorney, M. Mark Mendel, for perjury and professional misconduct, respectively. On March 29, Judge Joseph I. McGlynn, Jr., ruled that both Rogal and Mendel were guilty and set a date for the imposition of sanctions.

McGlynn stated: "Dr. Rogal's testimony was so thoroughly discredited by these outright contradictions and numerous inconsistencies that the jury had little difficulty in rejecting his claim. Ordinarily an adverse verdict would be a sufficient sanction. But Dr. Rogal showed such an utter contempt for the oath that additional sanctions are called for."

Monsanto sues BST critics. Monsanto Chemical Company has filed suit against two dairy producers, charging that their promotional materials falsely imply that milk from untreated cows is safer or better than milk from cows treated with bovine somatotropin (BST). BST, also called bovine growth hormone (BGH), is produced naturally in the anterior pituitary gland of cattle. Injections of BST can boost the milk output of cows by about 15%. Using recombinant DNA technology, scientists have been able to make it at a price low enough for commercial use. Milk produced by BST-treated cows is no different from milk produced by untreated cows, and small amounts are found in all cows' milk. BST treatment does not increase these levels. Moreover, BST is digested like any other protein in milk and is not biologically active when ingested. However, the health food industry and opponents of biotechnology are spreading false claims that it is dangerous and is bad for the health of cows. FDA has proposed that labels claiming that milk was not produced by BST-treated cows must also state: "No significant difference has been shown between milk derived from rBST-treated and non-rBST-treated cows."

“Alternative” Healthcare

A Comprehensive Guide

Jack Raso, M.S., R.D.

This important new reference book addresses the vast array of treatments and philosophies that postulate supernatural phenomena as the key to health and disease. Author Jack Raso has combined his own personal experience with alternative healthcare, in-depth research on the wide variety of methodologies, and an educational background in health science and nutrition to simplify the often confusing field of “alternative” healing techniques. Raso also includes an account of his own personal odyssey from believer to skeptic, demonstrating how easily a person raised in a devoutly religious tradition accepts supernatural explanations and mystical approaches to physical ailments.

Also included are discussions of such techniques as hands-on healing, Qigong, and faith healing. Raso concludes with a first-hand account of his many revealing visits to various “alternative” medical practitioners as well as an encyclopedic glossary of “alterna-

“alternative” healthcare terminology that fully explains the formidable jargon so often used by proponents of “alternative” treatment.

Mystical Diets

Paranormal, Spiritual, and Occult Nutrition Practices

Jack Raso, M.S., R.D.

A revealing first-person account of a onetime believer’s four-year exploration of “holistic” healthcare and nutrition esoterica. Chapters cover supernaturalistic beliefs, practices, and systems that tie in with what the author calls “paranormal nutrition,” particularly: Anthroposophy, applied kinesiology, Ayurveda, the Edgar Cayce tradition, chiropractic, Gerson therapy, macrobiotics, multilevel and mail-order marketing of nutrition products, Natural Hygiene, naturopathy, nutripathy, “nutritional herbology,” “nontraditional” health education, Theosophy, and vitalistic healthcare. The glossary is a substantial resource in itself, including descriptions of more than seventy-five “alternative” methods and systems.

Alternative Healthcare, Ayurveda, and Neo-Hinduism

Jack Raso

In *Mystical Diets: Paranormal, Spiritual, and Occult Nutrition Practices* (1993), I introduced the term "paranormal nutrition" (the book's working title) to categorize the nutritional precepts of systems with implicit or overt supernatural premises, for example: anthroposophy, ayurveda, Gerson therapy, macrobiotics, Natural Hygiene, nutripathy, and nutritional herbology.

Alternative healthcare is profuse with paranormal nutrition. It behooves us to examine this milieu, a phantasmagoria of systems and methods whose only common theme is distrust of science. To ignore the theoretical underpinnings of alternative medicine is to misunderstand the dynamics of popular nutrition. Ayurveda provides a case study.

Part I: Supernaturalism

A front-page headline in the June 13 issue of *The New York Times* read: "As Life's Questions Get Harder, Magic Casts a Wider Spell." The crux of the article is that "illusion and delusion in art and commerce are wrapped around daily life like an impossibly knotted necklace." Television and cinema abound with affirmative talk of supernatural "entities" (e.g., angels), "places" (e.g., heaven), and miracles. Magic—any art that purports to sway or predict courses of events supernaturally—comes in countless forms. Many are socially acceptable. Indeed, in most American circles, at least a veneer of marginal deference for the "white magic" of major religions is de rigueur. The April 4 issue of *U.S. News & World Report* presented the findings of a recent poll on religious beliefs. According to the article, aptly titled "Spiritual America," about 95 percent of Americans affirm belief in God or a "universal spirit" and only 9 percent deny having a religious affiliation. Do religious beliefs predispose believers to supernaturalistic health methods?

Ancient Wisdom?

During prime time on July 5, NBC broadcast "Cured! Secrets of Alternative Healing," a misbegotten special for which I had been interviewed on camera last September. This was a tedious collection of mini-docudramas tending to canonize vitalistic "medicine." The "skits" included "Samuel Hahnemann" (founder of homeopathy), "Witchcraft" (the

cult of the wise woman"), "Franz Mezzmer [sic]" (propounder of animal magnetism), and "Ancient Acupuncture." Moderator Kenneth Harvey described herbal medicine, homeopathy, and hypnosis as "modern techniques based upon ancient wisdom." He stated: "A lot of things we do to make ourselves feel better is based on natural healing wisdom going back centuries." Host Olympia Dukakis concluded: "Tonight we have seen how five ordinary people reached back into the past to discover healing wisdom that eased their modern afflictions....All of these alternative treatments, founded upon timeless wisdom, are available right now in virtually every community in America...In the twenty-first century, the new medicine will combine all known healing techniques: conventional medicine, alternative medicine, and ancient wisdom."

Ancient wisdom—or what passes for it—has long fascinated me. We tend not only to be curious about ancient products of human endeavor but to yearn for them. Even stagnant, absurd health methods may "improve" with great age. In *Occult Science in Medicine*, first published over a century ago, Franz Hartmann, M.D., expressed a misguided attitude that is prevalent today:

There is a certain law of periodicity, according to which forms disappear and the truths which they contained reappear...embodied in new forms. Seasons go and come, civilizations pass away and grow again, exhibiting the same characteristics possessed by the former, sciences are lost and rediscovered, and the science of medicine forms no exception to this general rule. Many valuable treasures of

the past have been buried in forgetfulness; many ideas that shone like luminous stars in the sky of ancient medicine have disappeared during the revolution of thought, and begin to rise again on the mental horizon, where they are christened with new names and stared at in surprise as something supposed never to have existed before.

Consider just a few forms of born-again "medicine" and their postulates: acupuncture (*chi* and a network of invisible "channels"), ayurveda (*prana*), homeopathy ("vital force"), macrobiotics (yin and yang), naturopathy ("life force"), shiatsu (*ki*), transcendental meditation ("cosmic consciousness"), and past-life therapy (reincarnation).

"Body-Mind-Spiritism"

The keystone of alternative healthcare is a notion for which I have coined the term "body-mind-spiritism." This refers to a supposed semiautonomy of body and mind, or of body, mind, and spirit. Proponents tend to blur the distinction between mind and spirit (soul). Yet an understanding of this distinction is crucial to the unraveling of many alternative approaches. The word "mind" refers basically to sequences of thoughts and sensations, a process that occurs continuously until death. The mind is not a material thing, but a concept representing the cascade of multitudinous physiological events that amount to thinking. Thinking is a "two-faced" activity: subjective and psychological at the macro-level, objective and physiological at the micro-level. Psychological terms such as *apathy*, *depression*, *fear*, *neurosis*, and *obsession* describe only the macro-level of thinking. All thoughts and feelings arise from physiological processes that occur in the central nervous system, especially the brain. The mind is a macro-level (large-scale or global) property of the brain. The mind, the brain, and the nerve cells of the brain are analogous, respectively, to water, water molecules, and the atoms of which water molecules are composed. Liquidity is a collective, macroscopic property of water molecules at room temperature. The elements of water—hydrogen and oxygen—bear no resemblance to water. As with liquidity, the mind is a manifestation of matter at high levels of complexity. The foregoing description is consistent with materialism and the identity theory of mind/body (also called physicalism)—a naturalistic theory. According to naturalism, nature consists of all that exists—nothing lies above or beyond it.

Naturalism is the basis of science. Its antithesis is supernaturalism, according to which there are quasi-entities outside the universe (natural world) that at least occasionally affect courses of events. Alleged supernatural beings and forces are, by definition, inherently mysterious—probably even inherently incomprehensible, since beings and forces are explicitly definable only in naturalistic terms. Medical supernaturalists portray the mind either as a reflection of a "vital force" or as a function of a "cosmic consciousness." Although scientists have not yet worked out a definitive theory of mind, impenetrable or unknown forces or substances will not figure in any real understanding of the nature of thinking.

Recourses to supernatural, paranormal (not scientifically explainable), or limitless beings or "forces" are recourses to fantasyland and, therefore, have quite unpredictable and fuzzy results. Supernaturalistic theories—premises involving immeasurable or indefinable "agents"—hold sway in the realm of alternative healthcare. The following theories are among the most important basic beliefs in alternative medicine.

Mind/body dualism: Mind and body are disparate and separable.

Mind/body interactionism: Mind and body are disparate entities that affect each other.

Monotheism: There is a perfect, eternal, almighty, omniscient, benevolent being who created and rules the universe, i.e., God.

Mysticism: All conclusions, beliefs, and opinions based on analysis, deduction, and/or common experience are illusory. True knowledge is attainable only through contemplative or intuitive union (or near-union) with God, a "higher reality," or the universe, but such knowledge is indescribable.

Pantheism: "God" and "nature" are synonymous. [Pantheism, which has an affinity with Eastern mysticism, is both naturalistic and trivial unless the believer ascribes supernatural phenomena or a morality to "nature." Unnecessary capitalization of the word "nature" usually indicates supernaturalistic pantheism.]

Vitalism: An invisible, intangible, unique form of energy is responsible for all the activities of a living organism and [according to some vitalists] can exist independently of the organism. [There are more than forty synonyms for "life force," ranging from the generic (e.g., *élan vital*) to the sectarian (e.g., *chi*, *orgone*, *prana*, and *soul*) and the obscure (e.g., *entelechy* and *essence*).]

The lure of mysticism lies in the desire to validate subjective experience. The appeal of pantheism lies in the yearning for connectedness and in the desire to legitimize traditional beliefs, which many people misconstrue as "natural laws." The appeal of vitalism—the supreme sticking point between scientific medicine and alternative healthcare—lies in its compatibility with humankind's longing for immortality. Self-confidence, belongingness, and supernormality are potent, highly salable wishes.

Nutrition Forum (ISSN 0748-8165), © 1994, is published bimonthly by Jack Raso, M.S., R.D., and Zhixin (David) Xu, M.S.

Subscriptions for individuals in the United States and Canada cost \$35 for one year (six issues), payable to Nutrition Forum at P.O. Box 747924, Rego Park, NY 11374. Multireader (e.g., institutional) and overseas (airmail) subscriptions cost \$50 for one year. Back issues are available at \$6.00 per copy.

Ayurvedists, occultists, other paranormalists, and dime-store metaphysicians make much of consciousness and fields of "energy." For example, Sri Swami Rama, founder and "spiritual head" of the Himalayan International Institute of Yoga Science and Philosophy, promotes the theory of the *koshas* (literally, "sheaths") as "a complete model of a human being." According to an ancient Hindu treatise, the *koshas* surround the atman (soul, or "true self") of living humans. Supposedly, the atman is identical with Brahman, an ineffable, eternal, omnipresent, absolute being. Union with Brahman—i.e., personal extinction—is the supreme goal of Hinduism. The *koshas* include: (1) the physical or material sheath (human body; also called the food sheath), which is the

outermost covering; (2) the vital or "pranic" sheath, which animates the body; (3) the mental sheath, which receives sensory impressions; (4) the intelligence sheath, the seat of discrimination and volition; and (5) the sheath of bliss, the innermost and subtlest covering—a "pool of boundless joy," according to the Himalayan Institute. Besides the *koshas*, the "subtle anatomy" of ayurveda includes: (1) *nadis*, "canals" (*srotas*) that carry *prana* ("cosmic energy") throughout the body; (2) chakras, "centers of consciousness" that connect body and soul; and (3) 107 *marmas*, which are somewhat like acupuncture points.

Do such timeworn postulates better our understanding of the world, or do they facilitate misunderstandings that allay our fears and empower religionists,

con men, megalomaniacs, and single-minded cranks? Supernaturalistic pantheism and the "strong holistic" worldview, which says that the universe is uninterrupted in substance, implicitly posit the aether (ether), a hypothetical medium for light disproved in the nine-

teenth century. Nevertheless, modern paranormalists cling to the notion of an ethereal connection between human minds and "cosmic consciousness." In *Physics and Psychics* (1990), Dr. Victor J. Stenger, professor of physics and astronomy at the University of Hawaii, explains that the constituents of matter do not interact through "invisible fields" but by exchanging particles such as photons. He writes:

MIRACLE CURES!
Watching this show could save your life!

CURED!
Secrets of Alternative Healing

Hosted By
Olympia Dukakis

8:00PM 4 WNBC
ALL-NEW TWO-HOUR SPECIAL!

Ad in a New York City edition of the July 2–8, 1994, issue of *TV Guide*

[N]o evidence exists that human consciousness is connected in any way to an all-pervading cosmic fluid, through electromagnetic aural waves or quantum mechanical particle waves. To the best of our knowledge, the universe is composed of discrete chunks of matter that interact locally....

[T]he classical gravitational and electromagnetic fields of nineteenth-century physics have become the mathematical tools for describing particle interactions in the twentieth. They have no reality other than mathematical, though in physics classes they are normally presented as real entities—contributing greatly to the confusion that is exploited by paranormalists....

Alternative healthcare represents an attempt to de-secularize medicine and sanitize religion.

A Religious Undertow

Most opponents of quackery critique alternative methods in terms of science, the law, and politics. This is well and good. Typically, however, they are publicly reticent about picking apart the religious undercurrent that fuels the alternative medicine movement. Critics who are religious generally either play down this undercurrent or review it from a standpoint involving denominational beliefs. For example, in *Can You Trust Your Doctor? The Complete Guide to New Age Medicine and Its Threat to Your Family* (1991), fundamentalist Christians John F. Ankerberg and John F. Weldon, M.Div., Ph.D., D.Min., describe acupuncture as an invitation to "spiritistic operations," applied kinesiology as adaptable to "occultic purposes," crystal healing as an "energy therapy" whose power source is the "spirit world," and homeopathy as the modern harbinger of "new age healing" whose occasional effectiveness may be due to "spiritistic power." On the other hand, critics who are atheists or agnostics are disinclined to risk alienating current and potential antiquackery allies. Moreover, ethnic identification can narrow anyone's criticisms.

Apparently, many health professionals treat rationalism and religious unbelief as mere personal options rather than as integral to the scientific perspective. On May 19, I gave a

presentation titled "Alternative Healthcare and Supernaturalism" at a Purdue University conference on "nutrition fraud." To say the least, I was not a hit. For example, one evaluation form respondent expressed a lack of appreciation for the setting forth of a "personal belief system." Another respondent said I should have "↓" my "theological beliefs." Another, a self-proclaimed Christian, evidently found my "philosophy somewhat offensive." If a speaker at such a conference verbalized accord with, say, secular humanism or communism, it would be justifiable to charge him with promoting a personal belief system. But rationalism and religious unbelief are not mere matters of opinion. Moreover, they are contrary to theology, which is always and only a matter of opinion. It is no wonder that even health professionals who are staunchly rational skeptics beat around the burning bush of medical supernaturalism. Attacking it head-on threatens neighboring religious beliefs and upsets those who have internalized them. However, having studied alternative healthcare up close since 1989, I suspect that to overlook or downgrade its religious undercurrent is a disservice to the public. Furthermore, I consider the term "religious skeptic" an oxymoron. Science follows sound evidence. Religion accommodates experiential evidence and accepts, rejects, or warps all manner of evidence according to preconceived notions. This is the essence of pseudoscience.

Part II: Metaphysical Delusion

In *Metaphysical Delusion* (1991), philosophy professor Fraser Cowley writes:

People profess to believe what they desire to believe in order to believe it....

Religions provide a sense of what we are, where we stand, how we ought to live, and of a meaning and purpose in life. Anxiety may be defined negatively as the lack of all that. It arises when some established faith ceases to appease it. But positively it is, I think, the obscure apprehension of our freedom. Where we stand and the meaning or purpose of our lives depend on us. That this should not be so is what we desire and the activities of believing are the expression of that desire. When anxiety arises, it demands appeasement, not analysis, and people who lose one faith commonly seek another.

Hinduism, the extremely complex religious tradition that predominates in India, has had a profound influence on alternative healthcare. The main doctrines of Hinduism include nirvana (union with Brahman), nonviolence, reincarnation, supernaturalistic pantheism, and yoga. There are many kinds of yoga. Hatha yoga, a system marked by various stylized physical postures, is the most popular form in the West, but other forms are more spiritual; and the ultimate goal of all traditional modes is union with Brahman. Gurus, meditation, yoga, chakras, and "subtle" (nonphysical) bodies are prominent and uncontested parts of alternative medicine.

"Temple of Truth"?

The word "ashram" refers to any base for a religious community led by a guru (spiritual teacher or master). Ashrams dot the U.S., but, to my knowledge, their number is unknown, no doubt partly because they encompass everything from private houses, storefronts, and urban walkups to extensive retreats and monastic villages. They are hotbeds of pseudo-healing. On May 21 and 22, I attended an "open donation weekend" titled "Earth Awakening & Self Renewal" at Ananda Ashram, one of the major ashrams on the East Coast. For insight into why people embrace magical methods, nothing beats mingling with believers.

Part of the Yoga Society of New York, Ananda Ashram covers more than ninety acres in Harriman, a village in upstate New York near Monroe. It encompasses a lake, an islet, and about a dozen buildings, including two houses for residents, three for guests, and "The Healing Center." One of my companions informed me that the Yoga Society has purchased land in California to develop as an even larger communal complex. Ramamurti S. Mishra, M.D., founded the ashram in 1964. He adopted the name "Brahmananda Sarasvati" in 1984 and is now referred to as "Shri Brahmananda Sarasvati Udasina" or, affectionately, as "Guruji." According to the ashram's Summer 1994 catalog, Brahmananda had been a professor of medicine and surgery in Bombay. It further states:

During the last years of his life of tireless service to humanity, Shri Brahmananda's physical health began to fail progressively. He suffered several heart attacks and, in 1983, a severe stroke which permanently affected his speech and the right side of his body.... He accepted his stroke as his "final enlightenment"....

Brahmananda "left his physical body" last year. In one of his "meditations," Brahmananda claimed that behind one's "physical and psychological body" lies a "body of electricity" whose manifestations include tingling, chills, thrills, and extreme happiness. In another, he claimed that humans have five "bodies": material, electrical, mental, psychosomatic, and temporospatial. The Spring 1994 issue of *Sanskrit Today* included excerpts from a 1993 interview with Brahmananda. The interviewer asked him: "What is the most important teaching you received from your teacher?" Brahmananda responded, in part:

Thou Art That.... What role has religion? One point—they all agree unanimously—that is that you are not the body and mind....

We are not united—but one. Therefore, you cannot see outside God.... God can lose everything without you. Because no more would God be absolute.

The weekend schedule at Ananda included *agnihotra* (a daily rite of contemplation), "crystal meditation," hatha yoga, *homa* (a fire-veneration rite), Qigong (so-called Chinese yoga), *satsang* (religious discourse), and other activities. The ashram also offers workshops and lectures on such subjects as acu-yoga, astrology, ayurveda, *hasya* yoga ("healing through humor"), and "natural food preparation and balancing."

Businessman Ashok Parmar, his wife Indira Parmar, M.S.W., C.S.W., and their daughter accompanied me to the ashram. Mr. and Mrs. Parmar are humanistic Hindus who do not believe in reincarnation. During the drive to Monroe, Mr. Parmar described ayurveda as "time-tested." I countered that this term was misleading—that time does not actually test anything and that most people who use ayurveda do so because it is part of the tradition into which they have been indoctrinated. I later told him that a putative remedy of apparent utility in the short term may prove deleterious in the long run; hence the desirability of elaborate, lengthy experimentation.

We arrived at the ashram on Saturday evening shortly after mealtime, ate salad and vegetarian patties, and around 7:30 attended a session incorporating *homa*, meditation, and *satsang*. Joan Suval, who had been Brahmananda's main disciple, presided. According to newspaper clippings exhibited in the dining room foyer, Mrs. Suval is a former New York City actress who led a hectic life before she became a "stress therapist." The article stated that she had been director of the ashram from 1966 to 1971.

The session took place in the multiunit Main House. There, in just three rooms and a hallway, about fifty pictures of Brahmananda were on view. Decked with garland, a large, framed photo of the guru dominated the "meditation room." It stood on a very low, cushioned, wooden chair. Also inside the frame was a small photo of Brahmananda's corpse. A candle and a magnifying glass lay near the photos. On the

carpeted floor in front of the chair were two plastic containers of cookies ("religious dessert"), a vase of cut flowers, and a plate covered with a paper napkin. Three chakra diagrams hung on the walls. One described chakras as "the Vibration Centers of the Individual and the Cosmic Existence for Spiritual Healing and Self-Realization."

At the fireplace, someone tended a nontraditional *yagnakund*—a flaming piece of charcoal with incense in a metal container. Mr. Parmar explained that, traditionally, *yagnakunds* are ritually constructed with bricks and cow dung. He said that one of the purposes of the *homa* is to purify the air and that it symbolizes the five Vedic "elements": earth, sky, water, sun (light and fire), and air. As we entered the room, participants sang a Sanskrit song, and naturopath Ramesh Lahiri, a resident of the ashram, played a harmonium (reed organ). The music reminded me of a particularly spooky sequence in the film "Horror Hotel." About thirty people were present. Most sat on the floor. I found sitting on a pillow at floor level without back support quite uncomfortable.

After the music stopped, Mrs. Suval asked us to "just relax" and said of Brahmananda: "He is even more powerful and more with us...." She spoke in a soothing, almost hypnotic voice.

About thirteen minutes of silence followed Suval's preliminary comments. Then the music resumed, now a dirge. After this interlude, Suval welcomed us and asked how many of us had "felt happy" during the period of silent meditation. She said Brahmananda had correctly predicted that more people would come to the ashram when he was in his "formless form" than when he was in his "physical form." She requested that newcomers stand and introduce themselves. Later, Suval said that the "duty" of Ananda Ashram is to present not only the teachings of Brahmananda but those of "other masters." She described Ananda as "a place where all avenues of truth are open," said that Brahmananda had advised using "Mother Nature" as the "greatest role model," and read two poems, one titled "Consciousness." After expounding on these, Suval read from Brahmananda's 1965 lecture notes:

Theologians have trouble proving the existence of a god who is separate from us, but this is self-evident. Even the man who denies his self proves it by his own existence. There is no need to prove the existence of the sun, when we have its rays before us; no need to prove the existence of electricity, when we have the shining light of the electric lamp. Neither is there any need to prove the existence of God, because you—you are the light radiation of God.

Do you wish to understand this god? If you do, then try to know and understand *your* consciousness. Then what you know about that will also apply to cosmic consciousness. They are not two, your consciousness and cosmic consciousness. The whole concept of a separate, individual existence depends only on superstition, imagination, a phantom understanding....

To introduce God through his universe is a detour. Find god-consciousness by consciousness.

Suval also read from *The New Alchemy to Turn You On*, by Bhagwan Shree Rajneesh (1931-1990). Originally known as

Chandra Mohan Jain and later as Osho, Rajneesh promoted sexual indulgence as a spiritual path. The title "Bhagwan" means "god-man" or "blessed one"; "Bhagwan Shree" means "honored lord"; and "Rajneesh" derives from the Sanskrit word for "king" or "ruler." A self-proclaimed messiah, Rajneesh owned 85 Rolls-Royces and a Lear jet. (Mr. Parmar described Rajneesh's lifestyle as a satirical reaction to Hindu fundamentalism.) Rajneesh died of heart failure at age 58.

Suval invited questions but added: "They should not be theoretical questions. Are there any questions from the heart? Practical questions?" She characterized Ananda as "an ashram of self-analysis....some kind of magnificent temple of truth, of peace." She said that Brahmananda was known as "the smiling guru" and that he had even enjoyed his stroke. Later, a woman named Krishna played a guitar and sang facing the guru's picture. The refrain was: "You said you'd always be around."

The Parmars and I stayed overnight in Panini House, named after a Sanskrit grammarian. Therein, another garlanded photo of Brahmananda stood on a thronelike wooden chair—a *gurugadi*, or "master's throne." The bedroom doors were not lockable from the outside. There were small, cardboard instructional signs in bedrooms, bathrooms, and corridors, such as one that read: "Please keep the plastic shower curtain inside the bathtub and remove hair from tub drain." Mr. Parmar characterized Ananda's philosophy as "a kind of bhakti yoga"—an approach based on unquestioning faith rather than on the pursuit of knowledge. (He later added that some of Brahmananda's followers would take exception to this characterization.)

Freedom? Or Nothing Left to Lose?

On Sunday afternoon, I lent a hand as the Parmars prepared dinner for residents and visitors. Ananda's cuisine is lactovegetarian. Mr. Parmar added a small amount of asafoetida to a mixture. He explained that ayurvedic doctors use asafoetida as a remedy for gastrointestinal distress, while ayurvedic cooks include it in dishes that contain ingredients likely to cause such distress (e.g., lentils). He stated that the main reason for its inclusion is not flavor but prevention.

Before and during dinnertime, I conversed with Ramesh Lahiri, a lecturer on "living food nutrition" and

"enzymatic food." Lahiri said he was a member of the American Natural Hygiene Society and a graduate of a 4½-year naturopathy degree program in India. He described his nutritional philosophy as a hybrid of ayurveda, Natural Hygiene (the subject of the absurd bestseller *Fit for Life*), and the teachings of Gary Null. He claimed he does not consume any heated foods except—"once in a blue moon"—"thin, watery" soup such as miso. He further claimed that intestinal flora produces sufficient vitamin B₁₂ in humans. I observed as he put the ingredients of his meal into a blender: apple, banana, raisins, sesame seeds, sunflower sprouts, and spices. He said he sometimes includes almonds.

Lahiri was 5'8" tall and weighed between 118 and 120 pounds. "Freedom is the most important thing," he told me. I asked him if he thought that the primary health benefit of consuming only uncooked food was freedom from the trouble of cooking. "Yes, absolutely," he replied.

On June 13, I phoned the ashram, primarily to ascertain the age at which the guru had died. The person who answered the phone said he supposed that Brahmananda had been 72, but he referred me to Bharati, a representative, for an "official" answer. I told Bharati that I was writing an article on Hinduism and ayurveda for *Nutrition Forum*, that I had attended the "Earth Awakening" weekend at the ashram, that the article deals partly with Ananda Ashram, and that, as a matter of course, I wanted to learn Brahmananda's age at death. My simple question precipitated an interview—but I was the interviewee! Bharati referred me to Ananda's Summer 1994 catalog for information about the guru. I told her that the catalog does not mention his age. Bharati stated: "He was never interested in mentioning that; so we honor him that way....He would never talk about his age." After I told her I would write that Ananda declined to provide the information, she said that he had died at 70. She further stated that Ananda was on the Cult Awareness Network's "list." "We're not a religion," she told me. "[W]e have a lot of freedom." (On June 24, I called the national office of the Cult Awareness Network—CAN—in Chicago. I spoke with Marty Butz. Butz told me that, although CAN has files on organizations about which it receives inquiries, it does not maintain a "list of cults." "We don't typically label groups as cults," he said.)

Does the Ananda lifestyle—marked by faith, orderliness, simplism, and sophistry—exemplify utopianism or reactionary escapism?

Part III: Ayurveda and TM

I have reviewed ayurveda in detail in *Mystical Diets* and *"Alternative" Healthcare: A Comprehensive Guide* (1994). It is a major wellspring of "paranormal nutrition." Here, however, my principal aim is to illuminate the magical thinking and ritualism that are part and parcel of ayurveda.

Yoga Has a Sister

Ayurveda, the so-called science of life, is the medical phase of Hinduism and perhaps the best modern example of religious "medicine." Promoters applaud it as the

"most ancient" and "most complete" system of "natural medicine." Yoga and ayurveda are separate doctrines with common sources. An article in the March/April 1994 issue of *Yoga International* calls ayurveda "yoga's sister science."

Whether you can take ayurveda out of Hinduism is debatable, but you can't take Hinduism out of ayurveda. Ayurveda is based principally on two texts regarded as supplemental to the *Atharva-veda*, the last of the four fundamental Hindu scriptures (the Vedas). *The Encyclopedia of Eastern Philosophy and Religion* (1989) states that the *Atharva-veda* is "devoted to the 'knowledge of magic spells'" and "can be seen as the oldest document of Indian medicine." The *Atharva-veda* features magical formulas, curses, and mystical hymns. More than a hundred hymns relate to putative botanical cures for various maladies—including conditions purportedly due to demons, ghosts, and gods. "Remedies" and "preventives" include amulets, exorcism, invocations, and other incantations.

The branches of ayurveda may include the following.

- (1) **Internal (general) medicine**
- (2) **Surgery**
- (3) **Ophthalmology and otolaryngology**
- (4) **Toxicology**
- (5) **Psychiatry** (e.g., "treatment" of seizures supposedly due to evil spirits)
- (6) **Pediatrics or gynecology/pediatrics**
- (7) **Geriatrics** (including yoga therapy)
- (8) **Sexology** (also called "virilisation therapy" and the "science of aphrodisiacs")
- (9) **Panchakarma**

Only four branches are in considerable use today: internal medicine, geriatrics, sexology, and *panchakarma*.

Panchakarma, whose status as a branch is debatable, is a set of five "purificatory steps" or "elimination therapies":

- (1) **Emesis therapy:** "therapeutic vomiting"
- (2) **Purgation therapy:** evacuation of the bowels with a laxative
- (3) **Errhine therapy** (nasal insufflation therapy): intranasal application of "decongestants" such as medicated oils, powdered herbs, and ghee (a semifluid clarified butter)
- (4) **Oily enema therapy**
- (5) **Decoction (watery) enema therapy**

Some ayurvedists regard the two types of enema therapy as one step and bloodletting therapy as the fifth. The aforementioned *Yoga International* article concludes:

Recently Pancha Karma practices have been introduced into a major hospital facility for the first time. Through Sharp's Clinic in San Diego, California, the Center for Mind Body Medicine, established by Dr. Deepak Chopra and Dr. David Simon, offers Pancha Karma treatment. The Center hopes to serve as a model for introducing Ayurveda and, specifically, Pancha Karma into hospitals throughout the United

States. In time this ancient therapy is bound to become one of the most important "new" healing methods in an increasingly health-conscious society.

Ayurvedic diagnosis involves examination of the eyes, face, lips, tongue, and nails. Ayurvedists associate parts of the lips and tongue, for example, with internal organs and maintain that discolorations, lines, cracks, and irritability in various areas indicate disorders in "corresponding" organs.

Ayurvedic Nutrition: More than a Matter of "Taste"

Tridosha, the principal ayurvedic theory, holds that five *mahabhutas* (literally, "great elements") constitute the human body: earth, air, fire, water, and *akasha* (ether, which supposedly pervades the universe). The preponderance of these "elements" determines various constitutional types, each prone to ailments due to a deficiency or excess of one or more elements. The terms "*pitta*," "*kapha*," and "*vata*" refer to the fundamental constitutional types and to their characteristic physiological forces (*doshas*). There are ten "body types": *pitta*, *kapha*, *vata*, and seven combination types. Each *dosha* is a blend of two *mahabhutas*: *pitta* of fire and water, *kapha* of earth and water, and *vata* of air and *akasha*. The thrust of ayurveda is to balance these three alleged forces. Toward this end, ayurvedic "remedies" supposedly augment or depress particular *doshas*, primarily through their "taste" (*rasa*).

Food constituents such as vitamins have no place in ayurvedic nutrition theory, which centers on "constitutional type," the season of the year, and sensory, macroscopic, and imaginary food characteristics. Supposedly, how much of each *dosha* the body produces depends mainly on diet—specifically, on how much of each *rasa* one consumes. There are six *rasas*: astringent, bitter, pungent, salty, sour, and sweet. A food's *rasa* purportedly indicates whether it will increase or decrease a particular *dosha*. The sensitivity of each *dosha* purportedly varies seasonally; that is, each *dosha* is more excitable during particular times of the year. Thus, ayurveda discourages the consumption of foods considered likely to increase a *dosha* prone to excitement.

Ayurveda also posits twenty "attributes" beyond the *rasas*—*gunas*, which likewise affect the *doshas*. The *gunas* include: heavy (e.g., avocado and cheese), light (e.g., ghee and lettuce), cold (e.g., coconut and milk), hot (e.g., chili, garlic, and yogurt), oily (e.g., ghee and soybeans), dry (e.g., corn and dark greens), slimy (e.g., okra), soft (e.g., tapioca), and sharp (e.g., chili). "Heavy" foods, for instance, allegedly contribute to strength and stability but tire the digestive system and depress appetite; while "light" foods supposedly increase digestion and appetite. "Cold" ("cooling") foods tend to quiet digestion, while "hot" ("heating") foods—including honey, red lentils, and yogurt—stimulate the "digestive fire." In *The Ayurvedic Cookbook: A Personalized Guide to Good Nutrition and Health* (1990), Amadea Morningstar writes:

The nature of Ayurveda is commonsensical...

I would recommend experimenting with foods.

Let yourself notice whatever effects they have on you, if any....

The concept of heating and cooling foods is widespread in many cultures. And yet there is much disagreement between cultures (and practices of healing) as to what constitutes the relative attributes of a given food. For example, Indian Ayurveda considers yogurt heating. In neighboring Tibet, yogurt is regarded as cool. And this from two cultures which practice relatively similar forms of natural medicine, both with good results!...Experiment for yourself, while allowing the experience of the centuries to guide you.

A booklet published in 1992 by Maharishi Ayur-Veda Products International, Inc., states: "You can enjoy a balanced diet naturally, according to your own instincts, rather than through intellectual or laboratory analysis....An innate sense of which foods are best for you is already built into your mind and body....[A]s you bring your mind-body type into balance you will spontaneously be aware of which foods are best for you."

Ayurveda further postulates that foods yield an "aftertaste"; that the "aftertaste" of some foods is different from their *rasa*; and that, therefore, after assimilation, some foods have an effect (*vipaka*) different from that indicated by their *rasa*. Moreover, the addition of spices or other seasonings to a food supposedly changes its "taste" and, thus, its effect on the doshas.

Ayurvedic dieting boils down to intuitive eating consistent with an elaborate but open-ended system. This system, which I regard as "nutrimedical" witchcraft, keeps individual experience on a pedestal and science at bay. (The January/February 1991 issue of *Nutrition Today* features an excellent article on ayurvedic nutrition.)

Empire of the "Giggling Guru"

Maharishi Mahesh Yogi, sometimes called the "giggling guru," was born in India in 1911. He was a disciple of Swami Brahmananda Saraswati—also known as Guru Dev—a leader of Vedantic Hinduism (India's main religion). Guru Dev died in 1953. From his yogic teachings, the maharishi (literally, "great seer") reportedly distilled Transcendental Meditation®, or TM®. In 1958, according to *TM: Discovering Inner Energy and Overcoming Stress* (1975), he "announced a plan to spread the benefits of TM all over the world." The guru gained prominence in the West in the 1960s, when he debated the Archbishop of Canterbury on British television and obtained the support of the Beatles.

The maharishi's many organizations include: Maharishi Ayur-Ved Products International, Inc. (MAPI); Maharishi International University (MIU); Maharishi AyurVedic Universities (or Schools) and Maharishi Vedic Universities (or Schools); and The Natural Law Party (NLP).

MAPI, in Lancaster, Massachusetts, sells such products as: *Maharishi Amrit Kalash Nectar* and *Maharishi Amrit Kalash Ambrosia*, "daily herbal supplements" that are "time-tested" and, with daily use, allegedly support

"underlying, holistic growth"; other *rasayanas*—"food supplements" that "are legendary for enhancing overall well-being"; "targeted nutrition" herbal "formulas" that "work holistically" (e.g., *Cough Soothe*); and "mind-body" teas and seasonings. A 1994 MAPI "Total Health Catalog" includes a list of 20 approaches that supposedly constitute "a complete system of reliable, natural health care," for example: TM, *panchakarma*, ayurvedic dietary programs, "pulse reading" ("to identify any existing or future imbalance and to indicate the necessary treatment programs to restore and maintain perfect health"), *Gandharva-Ved* therapy ("the use of melodic sequences of Vedic sound to restore physiological balance in the individual and nature as a whole"), Maharishi *gyotish* (Hindu astrology), and Maharishi *yagya* (a ceremony that focuses on Hindu deities).

MAPI has recently targeted health food stores as outlets for its herbal beverage preparations, herbal supplements, and aromatherapy products (e.g., *Pitta Aroma Oil*—"Cooling and relaxing to help balance Pitta"). With the slogan "Take a stand for higher profits," it offers display stands to retailers, such as one that describes *Vata Tea* as "calming," *Pitta Tea* as "cooling," and *Kapha Tea* as "stimulating."

MIU offers accredited bachelor's, master's, and doctoral degree programs in various fields, including an M.A. program in the "Science of Creative Intelligence" (SCI). The SCI program features a course titled "The Unified Field of Natural Law as the Source of All Streams of Knowledge II." Another course covers such ayurvedic approaches as *Gandharva-Ved* therapy, *gyotish*, and *yagya*. SCI, which is TM philosophy, posits the "Maharishi Effect." The gist of this claim is: if the square root of at least one percent of any population practices TM-Sidhi ("yogic flying") dedicatedly, quality of life will increase for the entire population.

On June 15, I conversed by phone with Richard LaMarita, director of New York City's Maharishi AyurVeda School. He told me that, within the last year, TM centers had become, "officially and legally," Maharishi AyurVedic (or Vedic) Universities (or Schools). He said that each state has at least one school.

One of NLP's purported goals is to eliminate disease and "culture ideal health and vitality for everyone" by "bringing life into accord with natural law."

I Take the First Step

On May 25, I attended an introductory lecture on TM at the Maharishi AyurVeda School. This nonprofit school and another enterprise, the Maharishi Vedic School (also called the Maharishi School of Vedic Sciences), share the ninth floor of a 12-story office building in Manhattan's Flatiron District. A brochure I received from the school states:

TM is a simple, natural, easily learned mental technique, practiced for 15 to 20 minutes in the morning and evening, while sitting comfortably with the eyes closed. During this technique, the individual's awareness settles down and experiences a unique state of restful alertness—as the body becomes deeply relaxed, the mind transcends all mental

activity to experience the simplest form of human awareness. This is transcendental consciousness.

The TM program, founded 30 years ago by Maharishi Mahesh Yogi, is a practical technique. It does not require adopting any specific beliefs or lifestyle. Over three million people worldwide—of every age, education, profession, religion, and background—have learned TM and enjoyed its benefits.

Transcendental meditators mentally repeat a mantra—a supposedly divine term that a TM teacher purportedly has chosen expressly for the enrollee. Officially, learning TM entails seven steps: (1) The introductory lecture, about 60 to 75 minutes long, imparts, according to the aforementioned brochure, “a vision of the possibilities” TM affords. This step and the following two are free prerequisites to hands-on learning, which costs \$1,000 for adults and \$600 for full-time students. (2) The preparatory lecture, also about 60 to 75 minutes long, focuses on the “mechanics” and origin of TM. (3) The personal interview, conducted by a “qualified” TM teacher, is available as an appendage to the second step and reportedly takes 15 minutes. The following four steps reportedly take 1½ to 2 hours each and must be completed on consecutive days. (4) According to one of the lecturers, personal (private) instruction begins with a short ceremony that includes Sanskrit singing, and enrollees must bring: a new, clean white handkerchief “to symbolize purification”; 2 or 3 sweet fruits “to symbolize sweetness and...growth”; and 6 to 12 freshly cut flowers “to symbolize blossoming.” During this stage, the enrollee receives a mantra. This step seems to be an initiation rite similar to a *puja*, a traditional Hindu worship ceremony involving flowers and mantras. (5) The first of three classes titled “Verification and Validation of Experiences” purportedly serves to verify “the correctness of the practice.” (6) The second class supposedly promotes “understanding the mechanics of stabilizing the benefits” of TM.

Dawn of a New Era in Health Care: Announcing the Opening of Maharishi Ayur Veda School

Celebrating Knowledge of Natural Law

Vedic Wisdom for Perfect Health and A Disease-Free Society

Short Courses for Everyone

His Holiness

Maharishi Mahesh Yogi

who introduced Transcendental Meditation 37 ago and brought enlightenment to millions of people in the world, is now introducing total knowledge of Natural Law for everyone to spontaneously think and act according to Natural law so that Natural Law is not violated by anyone, no one makes mistakes, and no one creates the ground for suffering.

Maharishi's Vedic Science and Technology, the science and technology of consciousness, develops full creative genius of everyone, promotes perfect health of the individual and collective health of the nation, and introduces automation in administration for stress-free problem-free management.

“Everyone must have this beautiful knowledge and these programs of prevention to maintain perfect health.”

—Maharishi

Maharishi Ayur Veda School offers the knowledge to create perfect health and a disease-free society through prevention-oriented health education.

Maharishi Ayur Veda School invites everyone — working people, students, retired people — to participate in its course and programs.

SPECIAL SHORT COURSES FOR THE WHOLE POPULATION

- **Self-Pulse Reading**—to detect physiological imbalances and rectify them through proper diet before disease arises
- **Good Health Through Prevention**
- **Yoga and Breathing Exercises**
- **Diet, Digestion, and Nutrition**
- **Reversal of Aging**
- **Retired Life in Bliss**
- **Transcendental Meditation**—scientifically validated technique to relieve stress and develop the full creative potential of mind and body
- **Transcendental Meditation Sidhi Program**—Yogic Flying for optimal brain functioning, bubbling bliss, and support of Natural Law in daily life
- **Human Physiology: The Expression of Veda and Vedic Literature**—The recent discovery of total Natural Law within

human physiology demonstrates the potential for a mistake-free life

HEALTH PROGRAMS FOR CORPORATIONS

To reduce health care costs by securing the health of each employee and the collective health of the whole company.

**SPECIAL SUMMER
PROGRAM FOR ALL
UNIVERSITY STUDENTS**
Eight one-week courses from mid-June to mid-August.

**COURSES FOR
HIGH SCHOOL STUDENTS**
To tap the infinite creative potential of their own consciousness.

Maharishi Ayur Veda School is prepared to create a disease-free New York. The challenge is—how soon? Just as soon as people respond. President Clinton expressed the need for immediate action:
“All of our efforts to strengthen the economy will fail unless we also take this year—not next year, not five years from now, but this year—bold steps to reform our health care system.” (from President Clinton's address to Congress, February 17, 1993)

Short Courses Available Now

Part of ad in the March 30, 1994, issue of *The New York Times*

(7) The third class deals with the development of alleged “higher states of consciousness” through TM.

The introductory lecture struck me as a low-budget infomercial. In the room where it took place, posters defined Maharishi Vedic University as “the university of consciousness...of pure and applied knowledge, the Ved” (i.e., the Vedas). A conspicuous poster in the front of the room, titled “Reversal of Ageing,” featured a list of more than a dozen alleged effects of

practicing TM, including mitigation of “behavioral rigidity” and heightening of creativity, abstract reasoning, and intelligence. Near this poster stood a framed photo of the maharishi. There were three attendees. The lecturers—Janet Hoffman and Alexander Grzesik—were soft-spoken and sat in armchairs on a low, carpeted platform.

Hoffman, a TM teacher, stated: “The technique does not involve any kind of philosophy or religion.... If you have religious beliefs, TM is not going to interfere with them.... It... works because it’s—it’s based on laws of nature....” She portrayed TM as an applied science and claimed that the practice engenders a particularly “intense state of wakefulness... clarity, uh, liveliness of mind, consciousness... which transcends that surface level of mind....”

Grzesik expounded:

During TM—even though you’re getting deep, profound rest—you’re in a state of wakeful awareness. You know what’s going on; you’re not in a trance.... But the deep rest that you gain during transcendental meditation is such that it makes—it makes your life more productive; it makes your life more dynamic and successful, because your thoughts are much more clearer.... You get the total... picture of—of life. All your intelligence is open to you.... TM eliminates stress in the mind and the body.... In fact, it makes the body/mind relationship—they both work together—it makes it more, uh, uh, more intelligent. What it does is, it makes our intelligence more intelligent, and—and it also increases energy and improves efficiency.

After Grzesik completed her spiel, Hoffman said: “[T]he individual and society are harmonious if they’re functioning according to natural law.” She thereupon described the so-called Maharishi Effect. I asked her: “What is the relationship between TM and such methods as the *yagya*?” Hoffman claimed: “There is no relationship.” However, she added that *yagyas* boost TM. She stated: “A *yagya* is a performance that works on subtle levels of nature, influencing the... functioning of laws of nature.” Hoffman likened *yagyas* to overseas phone calls and to traveling by car or by air.

Research outside the TM community has cast doubt on the therapeutic usefulness of TM and other forms of meditation.

The Mind-Field of TM

During my second visit to the AyurVeda School, on June 2, I noticed a cryptic message on a blackboard that stood on a tripod in the waiting room: “PERSONAL CHECKING—PLEASE BE SEATED AND WAIT FOR THE CHECKER.” There I paged through two large loose-leaf collections of Maharishi-related articles, press clippings, letters from governmental officials, and promotional literature. An article published in 50 newspapers over two successive months in 1987 was titled: “Old is sometimes new again in medicine.”

Richard LaMarita gave the preparatory lecture. There were six attendees. LaMarita stated:

There’s a very strong theory that... simply states that our mind does not reside in our head.... This type of finding and this type of idea that we know is revolutionary—... put it into the context of what the world was like a hundred years ago.... [W]e’re not at the end of knowledge... and we have a lot to learn.... And this [i.e., TM] could be something that’s very much on the cutting edge and could be something commonplace in the next 25 years, if it takes that long.

He claimed that, during TM, practitioners attain a state of “unbounded” and “pure” mind. “[W]hat we’re doing, literally,” he said, “is taking the mind and drawing it back to its source.” He described the supposed accomplishment of this as “the secret of successful activity.” He further stated:

TM is a natural technique. It’s a natural technique simply because it uses the nature of the mind, and that is it. It doesn’t go against the nature of the mind....

This field within the mind—your consciousness—... is a field of creativity and intelligence and energy.... So, if the mind was given the opportunity to go in that direction, it would naturally go there.... In TM... we set up a very simple initial condition. Once you set up that condition, you just let go....

There are many techniques of meditation around, but TM is unique. It’s unique because it’s simple.

Apparently, the “simple initial condition” to which LaMarita referred centers on the mantra, which he described as a sound that does not have a meaning but has a “known effect.”

I asked LaMarita if the source of the mind is the brain. “No,” he answered. “That’s the hardware of the cosmic computer.” Then I asked him how instructors choose a mantra for an enrollee. He responded: “There are sets of mantras.... I’m not going to give you the details.... It’s like a scientific procedure, almost.” The enrollment form described TM as “the practical aspect of the Science of Creative Intelligence.” LaMarita told us that the “nonrefundable fee” of \$1,000 “includes a lifetime of follow-up” and is “really like a membership fee.”

Here, There and Everywhere

“The control switch for the body is in the mind,” declared author Deepak Chopra, M.D., on Phil Donahue’s talk show several years ago. Chopra is ayurveda’s foremost luminary in the U.S. He was born and raised and attended medical school in India. After graduation, he moved to the United States and completed residencies in internal medicine and endocrinology. He became a disciple of Maharishi Mahesh Yogi in 1985 and remained so until mid-1993. In a letter to leaders in the TM movement, dated July 16, 1993, the Maharishi National Council of the Age of Enlightenment confirmed Chopra’s departure and instructed TM councilors to desist from promoting Chopra or his works. The letter stated: “This policy is extremely important for the purity of the teaching.”

Upon leaving the movement, Chopra affiliated himself with Sharp HealthCare, a large chain of hospitals in San Diego, and helped to organize the Sharp Institute for Human Potential and Mind Body Medicine. In June, I received a mailing from the

An Invitation to Create Health

Learn How To Maximize Your Health and Happiness by following Steps 1, 2, and 3

Step One:

Fill out the Body Type Questionnaire to the right. It will help you learn some of the basic characteristics of your body type.

After you answer each of the questions, add the total number of answers under Vata, Pitta, and Kapha, respectively. The column(s) with the highest total(s) indicate which of these fundamental principles of nature, Vata, Pitta, and Kapha, are dominant in your psychophysiology. This is a preliminary indication; for a comprehensive evaluation, please consult a physician trained in Maharishi Ayur-Veda.

Step Two:

Use Maharishi Ayur-Veda Teas, Seasonings, and Aroma Oils to help restore the proper balance to your diet and physiology.

For a steadying, settling influence use Vata Tea, Seasoning, and Aroma Oil. These are also recommended for Vata body types and during Vata season, generally November through February, or whenever the weather is cold and dry.

To cool and soothe the physiology and emotions use Pitta Tea, Seasoning and Aroma Oil. These are also recommended for Pitta body types, and during Pitta season, generally July through October, or whenever the weather is hot.

For a warming, energizing influence use Kapha Tea, Seasoning, and Aroma Oil. These are also recommended for Kapha body types, and during Kapha season, generally March through June, or whenever the weather is cold and wet.

Step Three:

Learn more about Maharishi Ayur-Veda, your individual body type, and which foods are best for your type.

There are books, tapes, seminars, and courses available on Maharishi Ayur-Veda. The "Fundamentals of Maharishi Ayur-Veda" is a comprehensive video tape which features leading physicians discussing body types, daily routines, diet, exercise, stress management, oil massage, and much more. (\$24.95)

These educational materials are not intended to replace standard medical care. If you have any medical questions, please contact your physician.

Maharishi Ayur-Veda Products are available from:

Place an X by the one answer which describes you best, even if 2 or 3 answers seem to apply.

	VATA	PITTA	KAPHA
AMOUNT OF HAIR	___ average	___ thinning	___ thick
TYPE OF HAIR	___ dry	___ medium	___ oily
COLOR OF HAIR	___ light brown	___ red/auburn	___ dark brown/black
SKIN	___ dry, rough	___ soft, med. oily	___ oily, moist
COMPLEXION	___ darker	___ pink to red	___ pale, white
EYES	___ small	___ medium	___ large
WHITES OF THE EYES	___ blue or brown	___ yellow or red	___ white and glossy
SIZE OF TEETH	___ very large or very small	___ small to medium	___ medium to large
TEETH	___ shaded	___ yellowish	___ pearl white
MENTAL ACTIVITY	___ quick mind, restless	___ sharp intellect, aggressive	___ calm, steady, stable
MEMORY	___ short term is best	___ good general memory	___ long term is best
DREAMS	___ fearful, flying, running, jumping	___ anger, fiery, violent	___ water, clouds, relationships, romance
WEATHER	___ aversion to cold	___ aversion to hot	___ aversion to damp, cool
SLEEP	___ interrupted, light	___ sound, medium length	___ sound, heavy, long
REACT TO STRESS	___ excite very quickly	___ anger easily, quick temper	___ slow to get irritated
RESTING PULSE RATE (beats/min)			
WOMEN	___ 80-100	___ 70-80	___ 60-70
MEN	___ 70-90	___ 60-70	___ 50-60
BODY SIZE	___ small frame	___ medium frame	___ large frame
WEIGHT	___ thin, hard to gain	___ medium weight	___ heavy, easy to gain
ENDURANCE	___ poor	___ good	___ excellent
STRENGTH	___ poor	___ good	___ excellent
HUNGER	___ irregular	___ sharp, needs food	___ can easily miss meals
FOOD & DRINK	___ prefer warm	___ prefer cold	___ prefer dry & warm
EAT	___ quickly	___ med. speed	___ slowly
FINANCIAL	___ doesn't save, spends quickly	___ saves but big spender	___ saves regularly, accumulates wealth
SEX DRIVE	___ variable, irregular	___ moderate	___ strong
ELIMINATION	___ dry, hard, constipation	___ many, soft to normal	___ heavy, slow, thick regular
WALK	___ fast, quickly	___ average	___ slow & steady
VOICE	___ high pitch, fast	___ medium pitch, clear	___ low pitch, deep resonating
MOODS	___ changes quickly	___ slowly changing	___ steady, non-changing

TOTALS: Vata ___ Pitta ___ Kapha ___
(See Step One for further instructions.)

institute offering a program titled "Training in Mind Body Medicine and Ayurveda." This program, scheduled for August 31 to September 4, is open to "health professionals"—e.g., acupuncturists and "body workers"—and laypersons alike.

A statement from his 1992 audiotape "Escaping the Prison of the Intellect" exemplifies Chopra's metaphysics: "The truth is, I'm here, but I am also everywhere else; that you're there, but you're also here, because here is there, and there is everywhere, and, of course, everywhere is nowhere, specifically." The audiotape is subtitled: "A Journey from Here to Here." But this is getting us nowhere, so to speak. (I, for one, would think twice before asking Chopra for directions.) On another audiotape, "Sacred Verses, Healing Sounds" (1994), Chopra contends that "consciousness... is the maker of reality," cites Genesis, and asserts: "Our essential state as human beings is that we are unconditioned spirit.... [O]ut of the spirit emerges the mind."

On the evening of January 24, Chopra appeared on the TV Food Network's "Getting Healthy," a series hosted by Gayle Gardner (formerly of NBC Sports) and featuring "nutrition expert" Stephanie Beling, M.D. Chopra stated:

[N]ow the prevailing scientific wisdom says that the average human potential could be a hundred and twenty [years of age]. But why are we setting that limitation? Just because we've set limitations in the past. And we've always transcended them.... [T]he moment you start setting up certain ideas that you hold to be true in your consciousness, they become true for you....

It's part of our cultural indoctrination, literally. We become victims... [of "the collective mind"]....

I think... Einstein's equation [$E = mc^2$] fell short, with all due respects; because Einstein said energy and matter are inseparably one. We have to include a third ingredient, that he did not address: that energy, matter, and *information* are inseparably one—because every field of energy is simultaneously a field of information.... Matter and energy are subject to decay, dissipation, and entropy; but information keeps increasing....

We are in that phase of our evolution where we're becoming aware that we are that privileged species on earth through which the universe has chosen to become self-conscious.

Chopra held Dr. Beling's wrist for about ten seconds and pronounced her "a *vata* body type"—fast and, "under normal circumstances," enthusiastic, vivacious, and "fun to be with." He held Gardner's wrist for about six seconds and pronounced her "a combination of *kapha* and *pitta*"—passionate, articulate, courageous, chivalrous, imaginative, and "very visual." (Utilizing "pulse diagnosis" on *Donahue*, Chopra had decided that the host was romantic and charming, quick-tempered when under stress, and prone to "something like an ulcer" when under "a lot of stress.")

A caller asked Chopra if he "had any specific diet that M.S. [multiple sclerosis] patients should be following." He responded: "If I were seeing you, I'd do exactly the same thing that I did with the two young ladies here... find out your body type and then give you an appropriate diet based on your body type, irrespective of what disease you had."

He described his nutritional philosophy:

You know, in nature, the animals in the forest don't have the vaguest notion what the USDA is recommending in 1994.... They follow inner cues, and we have the same abilities. In fact, we have better abilities....

[Y]ou have the same energy inside you that the universe has, and that's called *prana*. And the concept exists that food that is *alive* has more *prana* than food that is dead, so to speak. So anything that comes in a can or has a label would probably have very little *prana* inside it. But anything that's fresh and is just out there from nature without having gone through the process of refrigeration and cold storage and transportation—You know, that's one of the things that has not been recognized by Western science: that there is an energy component and a *vitality* to food that you can't sort of quantify in terms of calories and protein and carbohydrate. And yet it may be the most important thing.

Chopra termed food irradiation "frightening"; suggested that human beings are essentially spiritual beings who occasionally have "human experiences"; claimed that "the spirit" is a "real force" reachable by meditation; and asserted that "cynical mistrust" is "one of the risk factors for accelerated aging." During an interview for a *Forbes* magazine profile (April 11, 1994), Chopra, responding to skeptical questions, restated the claim about cynical mistrust.

THE BOTTOM LINE

Many people, even some health professionals, advocate creating an atmosphere of mutual respect and "openness" in regard to alternative healthcare. I favor reserving "respect" for methods with adequate experimental evidence of safety and efficacy. I also favor restraining openness—that is, open-mindedness—lest it slip into simple-mindedness.

One should not conclusively judge a health-related method solely on the basis of theory, context, source, and the credibility or implausibility of claims for the method.

However, when scientific findings are lacking or conflicting, theory alone is at least a fair guide to a method's worthiness as a healthcare *candidate*. Supernaturalistic theories, such as those of ayurveda, should arouse caution. Far too often, they inspire the desperate, the misguided, the delusional, and the greedy.

"Alternativists" ought to call a spade a spade. Many are pushing religion but calling it medicine, healthcare, healing, or therapy. Or, worse, freedom.

The Three Faces of Medical Unreason

Jack Raso

In 1992, the Office for the Study of Unconventional Medical Practices of the National Institutes of Health (NIH) materialized, the result of an October 1991 congressional mandate. It is now called the Office of Alternative Medicine (OAM). One of its functions is to allocate grants for research on alternative methods. According to a summer 1994 issue of *The Cancer Letter*, Joseph J. Jacobs, M.D., M.B.A., a Yale-educated pediatrician, decided to quit directorship of the OAM and spoke of "a conflict with conscience." Among other things, Jacobs had met with opposition to his approval of a prospective candidate to the OAM's advisory committee—a member of the American Cancer Society's Committee on Questionable Methods of Cancer Management. In an interview in the September 1994 issue of *Omni*, Jacobs categorized as alternative medicine "those things not taken seriously by the medical profession." He suggested that he had been "born into" alternative medicine because his mother, a Mohawk, had administered herbal remedies to him, practiced Mohawk and Christian prayers, and taken him to faith healing sessions. Jacobs told interviewer Doug Stewart:

Demand [for unproven treatments] seems to be coming from people looking for solutions to everyday problems. Those people want results right away. The tremendous public demand for information about alternative therapies is partly a desire for quick fixes. People want pills to cure the common cold and vitamin supplements to prevent cancer and coronary artery disease while avoiding doing exercise and following ten-percent fat diets. Those are the wrong reasons for being interested, but add to the demand nonetheless.

In the words of an article in the June 1994 issue of the alternativist newsletter *Health Waves*, the OAM has been "torn between conventional NIH methods of research & less rigorous testing used by many alternative practitioners." The OAM's 1993 budget was only \$2 million, its 1994 budget \$3.5 million. Just the same, should taxpayers foot the cost of testing methods that lack a sound theoretical basis?

Synonyms for unscientific healthcare include: alternative healing, alternative health, alternative health care, alternative therapeutics, complementary health care, complementary medicine, fringe medicine, holistic

healing, holistic health, holistic (or wholistic) medicine, innovative medicine, New Age medicine, new medicine, planet medicine, unconventional medicine, and unconventional therapy. Anthropologist Richard Grossinger, Ph.D., in *Planet Medicine* (1987), described the book's title as an umbrella term for all forms of medicine, "prehistoric and contemporary," unscientific and scientific. The usefulness of such a definition is doubtful. In a 1992 issue of its newsletter, ANTHA—the Anthroposophical Therapy & Hygiene Association—apparently equated the neologism *extentional* with *alternative*, *complementary*, and *unconventional*. In a 1993 issue, ANTHA apparently equated the term "extended therapeutics" with "complementary medicine." Loose nomenclature is the law of the land of unscientific healthcare.

In 1991, I began cataloging currently publicized health-related systems and methods with implicit or overt supernatural premises. (I outlined six basic supernaturalistic theories important to alternative healthcare in the previous issue of *Nutrition Forum*.) According to supernaturalism, there are quasi-entities outside the universe (natural world) that at least occasionally affect courses of events. My list contains well over three hundred items. Some items on the list—e.g., acupuncture, ayurveda, fundamentalist chiropractic, homeopathy, and naturopathy—are standbys. Others—e.g., macrobiotics, shiatsu, and therapeutic touch—are more or less prominent. But many are unfamiliar, including actualism, acuscope therapy, alchemical hypnotherapy, *Bindegewebsmassage*, concept-therapy®, cosmic vibrational healing, equestrian transformational expression, eutony, jin shin, kum nye, mahikari, nutripathy, the Orionic healing system, pigeon remedy, pranic healing, sotai, spagyrics, and the Zen Alexander technique. Others are neither well known nor quite unfamiliar, including applied kinesiology, aromatherapy, Bach flower therapy, dreamwork, inner child therapy, iridology, Jungian psychology, and reflexology. More than a hundred of these systems, "modalities," and pseudodiagnostic methods have alternate names. For example, actualism is also called agni yoga, fire yoga, and lightwork; rebirthing is also called conscious breathing, conscious connected breathing, circular breathing, free breathing, and vivation; and rolfiing® is also called structural integration and structural processing.

Of course, some alternative approaches are not even quasi-supernaturalistic—for example, the Bates method, chelation therapy (also called EDTA chelation therapy), clinical ecology, colon hydrotherapy (also called colonic irrigation, colon health care, and colon therapy), cytotoxic testing, the Feingold diet, Hoxsey therapy (Hoxsey treatment), live-cell analysis, orthomolecular medicine, and ozone therapy. Supernaturalism is therefore not the bedrock of alternative healthcare. What lies “below”?

The Abyss

Unscientific empiricism and universal skepticism compose the theoretical core of alternative healthcare. Proponents do not acknowledge this core, which is less a foundation than an abyss. Moderate empiricism, in the form of meticulous observation, is an element of the scientific method. So is qualified, constructive skepticism, in the form of methodical doubt leading to criticism. However, both hardcore empiricism and total skepticism are akin to mysticism—the stuff of Hinduism and ayurveda.

Unscientific empiricism esteems knowledge derived from practical activity—trial and error—and devalues knowledge gained by analysis and the systematic organization of information. Empirics are guided primarily by experience rather than by systematically organized knowledge. A diehard empiric might assert that one has experienced milking a cow if one has merely had a dream or hallucination in which one has done so—even if the dreamer or hallucinator has never spent a waking moment near so much as a cow's carcass! In the January/February 1994 issue of *Nutrition Forum*, I described an “alternative nutrition” conference at which an acupuncturist lectured on traditional Chinese medicine and led more than three hundred and thirty people in meditation. Most of the attendees were legitimate health professionals, and The American Dietetic Association had approved the program for continuing education credit. The acupuncturist said she wanted us to become “experientially involved” in Chinese herbalism. Accordingly, she asked us to visualize moving fire and “cooling energy from the moon” around our bodies, and to imagine placing various “warming herbs” in the fire and “cooling herbs” in the lunar energy. I experienced only boredom. (A profile in the January 28, 1994, issue of *New York Newsday* stated that this acupuncturist had been “diagnosed with ‘incurable depression’ on three separate occasions.”)

A television commercial for an over-the-counter analgesic epitomizes the mindset of empirics. In it, a confident-sounding man says of the product: “I use it. That's how I know it's better. I use it.”

Medical empirics substitute experience for scientific knowledge in selecting or improvising treatment.

They approve the formulation of hypotheses and the assiduous, concerted, systematic testing of them only when the results of theorizing and testing appear to support what they “know” from personal observation. Methods that smack of unbridled empiricism include creative visualization, imagineering, interactive guided imagerySM, Pealeism, Silva mind control, and the Simonton method. Terms for identical or similar methods include: visualization, visualization therapy, guided visualization, imagery, guided imagery, guided fantasy, mental imagery, active imagination, imaging, creative imaging, dynamic imaging, positive imaging, positive thinking, positive visualization, directed day-dream, directed waking dream, waking dream therapy, led meditation, inner guide meditation, initiated symbol projection, imaginal medicine, and pathworking.

On the August 8, 1994, edition of NBC's “Sunday Today in New York,” a physician-author stated: “Outcome is the measure of success, not whether we can explain it or not.” The word “outcome” means “result” and connotes finality. However, when believers testify to the alleged beneficialness of this or that alternative method, their opinions often proceed from a combination of faith in the method—and/or practitioner—and a sense of well-being. This combination can mask pathology. The “cure” may be transitory or even backfire.

Universal skepticism, also called systematic or ideological skepticism, is more insidious and elusive than empiricism. In its extreme form, it holds that humans cannot know anything—that truth and falsity are indistinguishable. This is absurd because it entails that humans cannot know whether the claim itself is true or false. In its other main form, universal skepticism holds that humans can never be *certain* about anything. This doctrine is likewise absurd because it casts doubt upon itself. Healthy skepticism—the tendency to disbelieve—is often a commendable impetus to learning (represented by the maxim “Look before you leap”). The danger of extreme skepticism lies in the belief that attempts to verify claims or to justify actions are futile.

The universal skeptics of alternative healthcare at least imply: (1) that nothing yields knowledge, or that everything is open to doubt or interpretation, and (2) that, therefore, practitioner and patient should discuss what feels right and proceed accordingly. Wayward empiricism and universal skepticism open the door to all manner of voodooism, hocus-pocus, mumbo-jumbo, and whimsicality.

Nutrition Forum (ISSN 0748-8165), © 1994, is published bimonthly by Prometheus Books, Journals Division.

Subscriptions for individuals in the United States and Canada cost \$35 for one year (six issues), payable to Prometheus Books, Journals Division, at 59 John Glenn Drive, Amherst, New York 14228-2197. Multireader (e.g., institutional) and overseas (airmail) subscriptions cost \$50 for one year.

Manuscripts and all editorial correspondence should be directed to: Jack Raso, P.O. Box 740045, Rego Park, N.Y. 11374.

Carnival of Souls

It is a principle of physics that matter and energy are interconvertible, equivalent, two forms of the same thing. Einstein formulated this axiom as “ $E = mc^2$.” Yet vitalism—alternative healthcare’s paramount theory—hinges on the existence of a nonmaterial, divine, or personalized form of energy. In reality, energy is an impersonal quality of matter that enables work. Nonmaterial things “exist” only as thoughts and are not measurable. Generic terms for the pseudo-energy of alternative healthcare include: vital force (*force vitale*), vital energy, inner vital energy, vital cosmic force, vital energy force, vital element, vital principle, vital spirit, vital life spirit, vital magnetism, vitalistic principle, life force, life power, universal life force, cosmic life force, vital life force, vital life force energy, life energy, universal life energy, cosmic life energy, universal life force energy, internal energy, nerve force, nerve energy, personal energy, subtle energy, vitality energy, energy of being, the force of life, and *élan vital*. In addition to these synonyms, there are many sectarian terms for the same idea, including: animal magnetism (mesmerism), *chi* or *Qi* (ancient Chinese tradition), etheronic force (Edgar Cayce), innate intelligence or Innate (Daniel David Palmer, the founder of chiropractic), *ki* (Japanese tradition, Shinto), mana (ancient Hawaiian tradition, Huna), orgone (orgonomy), *prana* (Hinduism), *reiki* (Usui system of natural healing), *vis medicatrix naturae* (naturopathy), and soul or spirit (Christianity).

Other terms for alleged forms of energy relevant to alternative healthcare include: bio-current, bioenergy, biomagnetic waves, bioplasma (bioplasmic energy or psychotronic energy), the ECK, entelechy, essence, kundalini (Shakti), life-fields (L-fields, electrodynamic fields, or bioelectric fields), MariEL, M-fields, morphogenic fields (morphogenetic fields, morphic fields, or morphic resonance), odic force (od or odyle), paraelectricity, psi-fields, psi plasma, psychic energy (psychic force), *seiki*, tachyon energy (tachyon field energy), *vis formativa*, and zero-point energy (virtual energy).

Field of Dreams

Thus, alternative healthcare recognizes alleged forms of energy that are alien to physics. Proponents ensoul the mind and secularize the soul, giving it a scientific face. They claim that soul-like or godly “energy” is adaptable to the prevention, diagnosis, and treatment of disease, the improvement of health and physical fitness, and the prolongation of life. And they say that such “energy” and the physical phase of

the human organism interact through nonphysical entities. For example, acupuncture is a millennia-old practice based on the assumption that *chi* (*qi*) and the physical body interact through an elaborate system of channels or pathways inside the body. Meridians—longitudinal lines on the surface of the body—represent these “pathways.” This word “meridians” also refers to the alleged pathways themselves. Acupuncture points—also called acupoints, loci, and *tsubos*—are alleged points of communication between external parts of the body and internal organ-like entities. Acupoints supposedly exist throughout the skin, but some do not lie along the meridians and others lack a specific location. Furthermore, although the classic number of acupoints is 365 (correlated with the number of days in a year), some proponents maintain that the number exceeds two thousand. Acupuncturists insert needles at select points, then rotate the needles or use them to conduct a weak electric current. The mainland Chinese invented “acupuncture anesthesia” (or “acupuncture analgesia”) in 1958. Practitioners of another Chinese method, medical Qigong, dispense with needles and allegedly influence their patients’ *chi* directly.

Chakras—transformative vortices or “energy centers”—supposedly enable interaction between the body and *prana*, which is the Hindu equivalent of *chi*. They are analogous to the “energy pathways” of acupuncture rather than to acupoints. Although hypothetically there are only five to seven major “body chakras,” there is no consensus on the total number; yogis posit hundreds of minor chakras. Proponents usually portray chakras as spanning the body from the head to the base of the spine, but there is really no consensus on their location, nor on their alleged functions.

Occultists maintain that “subtle energy” envelops the human body. This “energy” supposedly constitutes several “subtle bodies”—e.g., a “life-body,” a “mortal soul,” and a soul—or an entity, sometimes layered, whose appellations include: astral body, aura, aureole, auric body, auric field, bioenergy field, biofield, bioplasmic body, bioplasmic force field, doppelgänger, dream body, energy body, etheric body, etheric double, human atmosphere, human energy field, human rainbow, sidereal body, spiritual body, star body, subtle body, subtle organizing energy field, and vital body. Other such “bodies” include the “mental body” and the “causal body.”

Feelings

For the moment, let’s forget that proponents have not stated what particles compose the “vital force.” (Light and other forms of electromagnetic radiation, for example, consist of photons.)

Is the "vital force" detectable? The answer depends on what constitutes detection. In *The Energy Within* (1992), martial artist Richard M. Chin, M.D., O.M.D. ("doctor of oriental medicine") asserts that one can "actually feel" the alleged force if one suspends disbelief "long enough to begin the work to find it." Apparently, the "right" frame of mind makes "perception" of the so-called vital force unavoidable. Purported signs of the "vital force" or the like include the following.

- chills
- the comfort, reassurance, warmth, or rejection one feels upon being touched by another person
- extreme happiness
- flow (apparent ease or effortlessness of performance)
- sudden alertness, clarity, or vigor
- thrills

In February 1994, I visited Zili Xu, a Qigong diplomate born and raised in mainland China. Qigong (*chee-gung*, "energy work") is an ancient Chinese system of "therapy," "prevention," and "life prolongation" that involves patterned breathing, posture, stylized movements, visualization, and contemplation. I asked Zili if he could emit *chi* from his hand. He claimed that he could but that the practice was debilitating. I told him I did not believe that *chi* exists. A moment later, he offered to demonstrate the purported phenomenon. He indicated that I should extend my forearm perpendicularly from my trunk with the palm of my hand open. For a few minutes, he variously positioned and moved one or both of his hands around my open palm. He touched my hand only once or twice, apparently to adjust it. He asked me several times if I felt anything and I said no. After the "demonstration," I stated that I had had a slight sensation in my fingers but added that it was attributable to my keeping my hand and arm steady. He stated that he had relieved back pain with this form of Qigong but said it was very important for the patient to believe in the method.

How do vitalistic "healers" judge the efficacy of their "ministrations"? In *Spiritual Aspects of the Healing Arts* (1985)—a "holistic healing" anthology compiled by Dora Kunz, the clairvoyant co-developer of therapeutic touch—psychiatrist Laurence J. Bendit, M.D., wrote:

Even so dread a state as the schizophrenic breakdown is now seen as at least potentially therapeutic. As the child with measles develops immunity to that disease, so the schizophrenic may so change inside that he emerges from the ordeal not a wreck but a new man, more integrated to his own deeper nature, more spiritualized.

And this applies also to death: physical death may result from the release of the healing forces inside a patient. It is not then a tragedy but a triumph for the healing powers.

If acute illness and death are good signs, obviously vitalistic "healers" can't go wrong!

The Tangled Web of Healthcare Exotica

Below I describe supernaturalistic methods I became aware of after I finished my second book, *"Alternative" Healthcare: A Comprehensive Guide* (1994). All have been promoted within the last five years. Often, it is difficult or impossible to determine where one method ends and another begins. The small-fry and mom-and-pop methods of the alternative-medicine marketplace vastly outnumber the showstoppers. To brush them off is a folly, for their collective effect is widespread and formidable.

7 keys meditation program: System based on seven so-called spiritual keys "revealed" to David Wheeler. The "Keys" purportedly can "unlock" one's maximum potential for "transformation" and healing. During "Initiation," students receive the "Keys" and allegedly access the "Universal Energy" or "Divine Energy" inside themselves. Supposedly, this "energy" is transmittable.

Acu-point therapy: Mode of counseling psychology based partly on acupuncture theory and promoted by Mitchell J. Rabin, M.A.

Advanced energy healing: Alleged "journey" into "higher realms" of understanding whereby one supposedly connects with one's "divine self." Taught by Robert T. Jaffe, M.D., the method involves meditation and, for "physical healing," the awareness release technique®.

Agartha personal life-balancing program (Agartha program): 35-day audiotape program for reducing stress and promoting "complete health." Each of the seven "harmonic" tapes combines sounds purportedly "developed" to alter "energy currents" within specific chakras. The program's creator, author Meredith Lady Young, allegedly has a "non-physical" teacher called "Mentor." In the booklet titled "The Agartha Program I Use Guide®: A Personal Life Balancing Program" (Stillpoint Publishing, 1986), Young states the premise of her program: "All physical matter is really a composite of light waves and sound frequencies." The booklet claims: "The sound vibrations produced by the music gently massage the energy center or 'chakra,' thereby reducing distress and improving the flow of life force through the body. THE RESULTING BENEFIT IS TO ALLOW YOU TO USE YOUR FULL POTENTIAL IN EVERY ASPECT OF YOUR LIFE."

Alpha calm therapy: Combination of guided imagery and Ericksonian hypnotherapy (a "non-directive" form of hypnotism).

Amplified energy therapy: Form of "energy healing" promoted by Richard Gordon. Its premise is that people can learn to maneuver their "life-force energy" toward following the body's "innate intelligence."

BioEssence therapy: System developed by Paul Pitchford. It includes BioEssence bodywork (based on Zen shiatsu), BioEssence "release work" (which involves stylized breathing), diet, herbalism, Qigong, tai chi, and traditional Chinese "diagnostic" methods.

Chakra and cellular memory healing: System promoted by author and "reiki master" Dr. Ojela Frank. It involves affirmations, "conscious breathing" (probably rebirthing), counseling, "emotional healing," "energy self-assessment," and guided imagery, and occasionally "regression work." "Regression work" probably refers to past-life therapy (also called regression therapy), whose crux is past-life regression.

Chinese dietotherapy: Alleged preventive and therapeutic system that involves: (1) prescribing "medicinal foods" and mixtures of foods and drugs, and (2) prescribing intake of particular foods. Supposedly, the curative effect of a food or food-drug mixture depends on its "nature" and "flavor." The "natures" are: cold, hot, warm, and cool. The "flavors" are: salty, sour, sweet, bitter, and pungent. Practitioners purportedly seek to neutralize illness by prescribing foods and food-drug mixtures whose "nature" and "flavor" antagonize the "nature" and "flavor" of the disease.

Connective tissue therapy (CTT): "Spiritual" mode of bodywork developed by Paul and Nancy Marcus. It allegedly helps to free "stagnant energy." ("Bodywork" is a generic term for manual or physical-exercise related "healing.")

Contact reflex analysisSM (CRA): Variant of applied kinesiology (AK) cofounded by chiropractor Dick A. Versendaal (of Holland, Michigan), who is its chief proponent. According to CRA theory, the surface of the human body has about seventy-five "reflex" points that serve as windows to numerous conditions. The practitioner pulls downward on the patient's outstretched arm while he keeps part of his hand on a "reflex" point. Versendaal claims that the back of the hand is electronegative, the palm is positive, and the fingers are neutral. Arm weakness supposedly indicates an incipient or full-blown health problem corresponding to the "reflex" point. Practitioners prescribe nutritional supplements for the alleged problems they thus "discover." A massage therapist's ad in the May/June 1994 issue of *Newlife* claimed that CRA can help most health problems, including cardiac problems and viral infections. AK is an elaborate system of pseudodiagnosis and treatment centering on "muscle testing." Detroit chiropractor George J. Goodheart, Jr., introduced applied kinesiology as a diagnostic method in 1964. He theorized that muscle groups share "energy pathways" with internal organs and that, therefore, every organ dysfunction is discoverable in a related muscle. Testing muscles for relative strength and tone supposedly taps the body's "innate intelligence" and enables practitioners to detect specific dysfunctions.

Core zero balancing (zero balancing): Variant of acupressure that posits "bone energy," chakras, and an "energy body." "Acupressure" refers to any treatment involving the surface stimulation of acupuncture points either with the hands alone or with hand-held tools. The word may also refer specifically to shiatsu (see "Whole health shiatsu," below).

Creative concentrationTM: Program involving "energy work" and meditation promoted by Miriam Belov, M.A.

Crystal therapeuticsSM: System based on the books *Crystal Therapeutics* and *Advanced Crystal Therapeutics*, both by Ojela Frank (see "Chakra and cellular memory healing," above). It involves "energy assessment," crystal healing, energy balancing, guided imagery, and counseling. (The November/December 1989 issue of *Newlife* carried an ad for a seven-level training program in crystal therapeutics. In the ad, the title "Rev." preceded Frank's name.)

Daoyin: Reputed prototype of Qigong. An alleged means of physical fitness, it involves formal breathing, dozens of postures, and, supposedly, conscious maneuvering of *chi* inside oneself.

Divine will healing: Method promoted by Ram Smith, a staff member at the Poconos retreat of the Ananda Church of Self-Realization. It derives from the teachings of Paramahansa Yogananda (1893-1952). Its main postulate is that people can transmit or project "divine healing light" by aligning their will with "divine will."

Dr. Lynch's holistic self-health program: Three-month path to "total well-being" developed by chiropractor James P.B. Lynch, author of the book of the same name. The cornerstone of the program and lifestyle is a teaching tool Lynch calls the "holistic triangle," which consists of: (1) a mental/spiritual "base" of education, motivation, and self-love; (2) a physical "side," which focuses on exercise and physical treatment; and (3) a chemical "side," which involves "detoxification" ("cleansing") through diet. Lynch postulates that everyone possesses "innate powers" that are usable for self-healing. A flyer I received in August 1994 from Lynch's office includes acupressure and "chiropractic adjustments" in a list titled "Physical," and homeopathy and macrobiotics in a list titled "Chemical." It states: "Love is the most powerful healing force!" In an Old Testament vein (David versus Goliath), it depicts chiropractors, faith healers, the health food industry, naturopaths, and "nutritionalists" as loving, God-trusting wielders of truth.

Ecstasy breathing[®]: Process created by Valnn Dayne involving music and breath regeneration[®], a variant of rebirthing. Its alleged purpose is "reconnection" with a "Power of Life" that is greater than oneself. Rebirthing is a mode of bodywork in which practitioners induce clients to hyperventilate and encourage them to reenact the birth process. It is the crux of primal therapy—the subject of the 1970 book *The Primal Scream*.

Etheric touch: Variant of contact healing (the laying on of hands) and chakra healing expounded by hypnotist Ted Andrews in *The Healer's Manual: A Beginner's Guide to Vibrational Therapies* (1993). Its basic premise is that, through the hands, humans can sense "energy imbalances" and project "vibrations" (augmentable with "divine force") that boost self-healing. The method does not entail physical contact.

Feng shui (pronounced "foong shway" or "fung schway"): Ancient Chinese art of situating or orienting material structures and towns. Its purported objective is to "rebalance" and unblock "stagnant" *chi*. This allegedly enables stability of health.

Five rites of rejuvenation: Set of Tibetan exercises that allegedly increases the flow of "vital energy" and enables tapping the "Fountain of Youth."

Going Home™: Derivative of Hemi-Sync® introduced in 1994 by The Monroe Institute, in Virginia. The institute's introductory postcard stated that this 12-audiotope system offers "extraordinary opportunities" to people who want to overcome their fear of death. Hemi-Sync is an audiotape system that allegedly can control pain, increase strength, lower blood pressure, reduce appetite, weaken addictive behavior, hasten recovery from illness or surgery, enhance recovery of speech and motor skills after a stroke, and control the metabolism of food by either maximizing or minimizing "the caloric value retained." A 1993 institute bulletin stated that Hemi-Sync 2000—an "intensive," residential form—involves "training in manipulation of subtle energy fields that directly effect [sic] the physical body." (My advice is: stay home.)

Heartwood massage: "Holistic" system promoted by the Heartwood Institute, Ltd., in Garberville, California. It involves Swedish massage, hypnotherapy, and polarity energy balancing. According to "polarity" theory, the top and right side of the body have a positive charge, and the feet and left side have a negative charge. Thus, practitioners place their right hand (+) on "negatively charged" parts of the client's body, and their left hand (-) on "positively charged" parts.

Herbal crystallization analysis (HCA, herbal identification, herbal tracer test): Pseudodiagnostic method developed by George Benner, a "Master Herbologist." Apparently, Benner's primary inspiration was a method of botanical identification developed by occultist Rudolf Steiner in the 1920s. Steiner's method involved crystallizing the sap of botanical specimens with a solution of copper sulfate. The result was a crystalline fingerprint of the herb. Benner similarly processed saliva. He decided that resultant salivary configurations correlated with the configurations of folkloric botanical prescriptions for the donors' health problems. The number of specimens of a single herb that match a saliva specimen is allegedly a barometer of the donor's need for that herb: the more matches, the greater the need.

Infantile *tuina* therapy (infantile *tuina*): Adaptation of *tui na* (literally "push" and "grab," respectively) to children under or around age five. *Tui na*, also called *tuina* therapy, is an ancient Chinese form of "remedial" massage that supposedly promotes the circulation of *chi* and restores the balance of yin and yang (cosmic poles).

Light energy implantations: One of Ojela Frank's offerings (see "Chakra and cellular memory healing," above). It is an adjunct to chakra healing in which chakras are the objects of "implantations."

Love-powered diet: "Revolutionary" system concocted by Victoria Moran and based on the Twelve Steps. Twelve-Step programs purportedly advance recovery from various addictions and compulsive behaviors. They oblige participants to foster a connection with God or an alleged transpersonal "spiritual energy" or superhuman "power." Organizations that use the Twelve Steps include Alcoholics Anonymous, Emotions Anonymous, Fundamentalists Anonymous, Overeaters Anonymous, and Sexaholics Anonymous. In *The Love-Powered Diet: When Willpower Is Not Enough* (1992), Moran uses the terms *God*, *Goddess*, *Higher Power*, *Higher Self*, *Love*, *Nature*, and *Spirit* interchangeably. The first principles of her system add up to: People with eating-related problems (e.g., bingeing) cannot resolve them on their own; with their permission, however, a "Higher Power" will "work some wonders" in their lives. Moran advises writing, praying, and talking casually to God and provides anthroposophical, Christian, Hindu, Native American, and Sikh prayers.

Magical aromatherapy: Vitalistic offshoot of aromatherapy (also called conventional or holistic aromatherapy) expounded by author Scott Cunningham. Generic aromatherapy is the use of essential oils from plants, flowers, or wood resins to affect mood or promote health. Manners of use include sniffing, ingestion, and application to the skin (usually with massage). The following attributes distinguish magical aromatherapy. (1) Self-administration is preferable. (2) Its aims (e.g., love and money) need not relate to health. (3) Visualization of a needed change accompanies inhalation of a scent. (4) "Bioelectrical energy," which Cunningham describes as "non-physical" and "natural," merges with the scent and is programmable by visualization.

Micromovement bodywork: Purportedly down-to-earth form of bodywork that posits "kinesthetic melodies" and myriad elusive processes that carry the "pulse of life." Practitioners supposedly help clients "dance free" of tension and pain.

Neo-Reichian massage: System based on theories developed by Wilhelm Reich (1897–1957), the "discoverer" of orgone (a variant of the "vital force"). Practitioners purport to locate and dissolve "holding patterns" ("body armoring"). Reich postulated that obstructions to orgone cause neuroses and most physical disorders. Muscular contractions ("body armor") in various parts of the body supposedly manifest such "blockages."

Neural therapy: Form of "energy medicine" akin to acupuncture developed in Germany circa 1930 by two brothers, Ferdinand and Walter Huneke (also spelled "Huehneke"), both medical doctors. The Hunekes maintained that injections of local anesthetics into areas of "energy" disturbance ("interference fields") could bring relief from pain, immobility, and dysfunction. Injection sites include acupoints, scars, and the sites of old fractures or past infection. Neural therapy purportedly energizes "short-circuited" cells and helps the regulation of "biological energy." Proponents recommend it for hundreds of health problems.

N.I.A. technique: Form of exercise that allegedly integrates body, mind, and spirit and "opens" the heart and mind. "N.I.A." stands for "neural intermuscular action."

Nutrition kinesiology (NK): Alleged means of identifying: (1) health-impairing (e.g., allergenic) foods and other substances and (2) "corrective" nutrients. NK involves "muscle testing" à la applied kinesiology (see "Contact reflex analysis," above) and "acupoint tests."

OMNI-FORCE: Modular home-study program developed by Gérard V. Sunner, a psychiatrist, hypnotist, and reputed world-renowned expert in "Eastern medicine." The program involves self-hypnosis and acupressure. It supposedly enables followers to "recharge" their "energy," "liberate" their alleged sixth sense and possibly their "seventh," and direct "healing energy" to any part of the body. A mailing I received in July 1994 from the program's publisher, Pierre Pasteur, claims that, with consistent use of OMNI-FORCE, one will meet dangerous situations calmly and "do exactly what's necessary to get out of the situation without any bad consequences." It further claims that, through OMNI-FORCE, one "will eat exactly the same quantity that [one's] body needs, without wanting to eat more."

One Brain™: Variant of applied kinesiology (AK) whose premise is that the human body retains the dischargeable "energy" of "negative" experiences and beliefs. Proponents recommend One Brain for addictions, anxiety, compulsions, depression, dyslexia and other learning disabilities, low self-esteem, and phobias.

Planetary herbology (planetary herbalism): Integrative system of medical herbalism forged by Michael Tierra, C.A., N.D., O.M.D. (respectively, "certified acupuncturist," "doctor of naturopathy," and "doctor of oriental medicine"). Tierra dedicated *Planetary Herbology* (Lotus Press, 1988) to "all green, growing, flowering ones of this beautiful planet, who embody the universal creative healing energy." Therein, he describes herbs partly in terms of "energetics" and the "acupuncture meridian pathways" the herbs affect. "Energetics" is based on the concepts of "energies"—e.g., "heating," "cooling," "slightly warm," and neutral—and "flavors" ("tastes")—e.g., bland (mildly sweet) and salty. These concepts stem from traditional Chinese medicine and ayurveda (specifically *tridosha*), respectively.

Pointing therapy: Form of acupressure derived from Chinese martial arts—Chinese *wushu*, also called *wushu* or kung fu (*gongfu*). The method involves "pointing" (poking), pressing, pinching, patting, knocking, and pounding acupoints, all manually.

Polarity energy balancing massage: System based on the work of Randolph Stone (1890–1982), a chiropractor and naturopath. It has four branches: (1) energy balancing bodywork technique, (2) polarity yoga, (3) diet, and (4) "body/mind/spiritual" psychology.

Power yoga: Variant of *astanga* (raja) yoga—the reputed prototype of hatha yoga. Like *astanga* yoga, power yoga involves a series of postures and, as an accompaniment, a breathing technique called *ujaya* (*ujjayi*). The series of postures is purportedly designed to effect "therapeutic" bodily "alignment" and to "release" stress, tightness, and toxins from the "body-mind." *Ujaya* supposedly helps cellular purification.

Pranic psychotherapy: "Subspecialty" of pranic healing, which is a set of methods compiled by Dr. Choa Kok Sui. Pranic healing posits acupoints, chakras, meridians ("bioplasmic channels"), and a three-layered "energy body." Pranic psychotherapy includes four "healing techniques" in addition to those of pranic healing: (1) a "cleansing technique" for the removal and disintegration of "traumatic psychic energy" and such; (2) an "advanced form of energizing" for the disintegration of "etheric parasites" and the repair of external "etheric webs" that lie in a one-to-one relation behind chakras; (3) activation and inhibition of chakras; and (4) creation of a "positive thought entity" for the patient. Sui, who is nothing if not imaginative, expounds pranic psychotherapy in his book of the same name (Samuel Weiser, 1993).

Psychogenetics: Pseudodiagnostic method promoted by Gayatri Rein Reich. It posits decipherable patterns of "psychological DNA" that are "inherited" by fetuses.

Reich blood test: Pseudodiagnostic component of organomic medicine, the brainchild of psychoanalyst Wilhelm Reich (see "Neo-Reichian massage," above). Reich coined the word "orgone" to refer to his hypothetical fundamental, omnipresent, life-sustaining, intelligent radiation. The Reich blood test is a purported means of ascertaining overall "energetic health." Its premise is that the morphology of erythrocytes indicates the "energetic state" of an organism at the time of their removal. Supposedly, red blood cells with "bions" (which resemble blue beads) at their center are abnormal. Proponents characterize bions as semi-living, bacterium-sized, vesicular manifestations of orgone and as the building blocks of cells.

The professional activities of medical organomists include administering "orgone charged" water and applying the following devices. The orgone field meter and the *vacor* tube contribute to pseudodiagnosis. The meter allegedly shows the extent and strength of the patient's "orgone energy field." The *vacor* tube is an "orgone charged" glass vacuum tube that supposedly glows under

the influence of the patient's "orgone energy field." The "medical dor-buster" purportedly siphons a toxic form of orgone—"dor" (an acronym for "deadly orgone")—from the patient's body.

Shamanic psychotherapy: Mode of "spiritual healing" based on shamanism and the doctrine of reincarnation. It posits "missing soul parts."

Somatic dialogue: Mode of bodywork promoted by Chuck Ruland. It is a combination of hakomi body-centered psychotherapy, postural integration, and core zero balancing (see above). Hakomi is a spinoff of Reichian therapy (see "Neo-Reichian massage" and "Reich blood test," both above). Postural integration is a vitalistic form of bodywork. Somatic dialogue posits physical, emotional, and "energetic" bodies. Treatment supposedly results in the "discharge" of "imprints of the past."

Somatic emotional therapy: "Synthesis" of bioenergetics, rebirthing (see "Ecstasy breathing," above), and "somatic therapy" forged by certified social worker Jerry Josepher. Bioenergetics is an offshoot of Reichian therapy developed by psychiatrist Alexander Lowen, who rejected Wilhelm Reich's orgone theory but posited a "life energy," which he termed "bioenergy." (See "Neo-Reichian massage" and "Reich blood test," both above.)

Song channeling: Adjunct to rebirthing (see "Ecstasy breathing," above) promoted by music therapist Scott Kalechstein. It supposedly helps clients "open deeply" to healing. Channeling is the purported transmission of information or energy from a nonphysical source through human beings.

Soul amplification: Series of eleven "healing" sessions proffered by Ojela Frank (see "Chakra and cellular memory healing," above). It involves energy balancing, rebirthing, "energy activations," "advanced spiritual initiations," "soul bonding," meditation, and channeling.

Syntonics: Vitalistic "self-help" program created by author Dr. Robert Kronmeyer. It includes "syntonic food combining." (The term "food combining" refers to any dietary practice based on the notion that a meal's healthfulness depends considerably on the compatibility of its macroscopic components and/or the sequence of ingestion. Chief among the systems that include food combining are ayurveda, macrobiotics, and Natural Hygiene.)

Taido: Variant of reiki that does not entail physical contact. Both reiki and taido are forms of energy field work. "Energy field work" refers to any method or combination of methods involving aura analysis and aura balancing, with or without touch. Taido was developed in Japan in the 1980s.

Takionic: "Technology" for *chi* enhancement and "optimal health" promoted by Dr. Yung Chia, who advocates the integration of spirituality, science, and technology.

Tatwa meditation: Cornerstone of a nameless "holistic" system of "self-healing" involving astrology. "Spiritual teacher" Emahmn (sic) of Crestone, Colorado, "discovered" the system. *Tatwas*, which supposedly have "healing powers," are Hindu mandalas—designs that symbolize the unity of the soul with the universe.

Vitality fasting and rejuvenation: Program promoted by Edward Bauman and purportedly designed to "cleanse" the body, mind, and spirit. It involves fasting with juices and broth, "emotional release," and meditation.

Whole health shiatsu: Combination of shiatsu and dietary treatment expounded by coauthors Shizuko Yamamoto and Patrick McCarty. Shiatsu is a threefold form of massage whose purported goal is to promote health by increasing the flow of *ki* in the body. "Ki" is a Japanese word that signifies both breath and attention ("mental force"). It refers to an alleged original, fundamental, supernatural, governable, creative "energy of being" concentrated in the abdomen.

Zhan zhuang chi kung (zhan zhuang): Reputedly one of the most powerful forms of Qigong (*chi kung*). It allegedly boosts immunity and creates "inner peace."

Zhenjiu (acu-moxibustion, acupuncture-moxibustion therapy, chen-chiou therapy, China zhenjiuology, zhenjiuological therapy): Combination of acupuncture and moxibustion (also called moxibustion therapy). "Jiu" means moxibustion in Chinese. In traditional Chinese medicine, "moxibustion" refers broadly to the placement of hot objects, or the burning of objects, on acupoints. This allegedly supports yang, the masculine cosmic principle.

In my view, the meta-manifestations of alternative healthcare are: "spiritual healing" (e.g., yoga and ayurveda), "natural healing" (e.g., naturopathy and homeopathy), and "hands-on healing" (e.g., acupressure and reflexology). By "meta-manifestations," I mean broadest aspects, or thematic forms. These meta-manifestations create a mirage of a multisystem that is: (1) "spiritual" (a buzzword for "supportive of religious beliefs"), (2) "natural" (read "safe and not altogether unpleasant; nontechnological or low-tech"), and (3) "hands-on" (read "down-home, nontechnological").

"Spiritual Healing": Death Be Not Fatal

"Spiritual healing" comprises health-centered systems and methods that affirm the idea of "life after death" and borrow conspicuously from religious traditions. However, the term has divergent meanings. For example, it may refer to faith healing or to spirit healing. "Faith healing" usually means any form of religious "healing" wherein a "specialist" (typically a member of clergy) petitions God in the presence of the patient. Unbelievers purportedly risk watering down the healing process. Spirit healing is a form of channeling

whose advocates claim that healing is the work of divine power or of deceased doctors who have not let death stand in the way of their practice. As a metamorphosis, "spiritual healing" is based on four assumptions: (1) that the ultimate source of healing is supernatural; (2) that this source is usable directly by the ill person, through other persons, and/or through intermediary supernatural entities; (3) that death indicates the beginning of a transition either to an afterworld or to another incarnation; and (4) that all human beings are paranormally or supernaturally interconnected. Spiritual approaches include angelic healing, anthroposophical medicine, ayurveda, the Edgar Cayce tradition, Christian evangelical healing, Christian Science, exorcism, macrobiotics, shamanism, Sufi healing, and Tibetan medicine.

"Spiritual healing" posits and emphasizes a bright aspect of illness and thus often provides comfort in the form of unrealistic hope. The "spiritual healer" who focuses this hope on "cleansing," "spiritual reclamation," and "life after death" may claim that healing occurred even if the patient died from the "blessed" and "transformative" illness. Illustrative of this claim is the bumper-sticker message: "Real success is ending up in heaven." Deathbed sentimentality and claims of postmortem effects beneficial to the patient are outrageous "consolation prizes." "Spiritual healing" traffics in the false hope of everlasting life and the fear of personal nonexistence, feeding into and feeding on scientific illiteracy and a climate of "pro-paranormal" credulity.

"Natural Healing": Not Necessarily Naturalistic

In an article in the March/April 1993 issue of *Newlife*, ayurvedist Deepak Chopra, M.D., stated:

Nature is self-sustaining, once we cease to interfere. The same pulsation of life flows through the entire world, emanating from the gods or God. That unimaginable force created the galaxies and at the same time preserves the most fragile mountain flower.

"Natural healers" and their sympathizers have romanticized nature out of reality and into "supernature." "Natural healing" is a catchall for health-centered systems and methods purportedly based on "natural laws" (actually traditional beliefs). The multiformity of "natural healing" affords a "safe house" to supernaturalistic systems and methods, including: absent healing, acupuncture and acupressure, aikido, anthroposophy, applied kinesiology, Aston-patterning®, astrology, ayurveda, bioenergetics, the Edgar Cayce approach, the charismatic movement, fundamentalist chiropractic, Christian Science, cranial osteopathy, dianetics, exorcism, hydrotherapy and kneipping, iridology, jin shin do® bodymind acupressure™, jin shin jyutsu®, Jungian psychology, the laying on of hands,

lomi-lomi (also called lomi), macrobiotics, mesmerism, nature cure, naturopathy, orgonomic medicine, past-life therapy, polarity therapy, primal therapy, psychic healing, radiesthesia and radionics, reflexology, reiki, rolfing®, shamanism, tai chi, therapeutic touch, Touch for Health, transcendental meditation® (TM®), yoga, and "vibrational medicine" ("vibrational healing"). Vibrational medicine includes aromatherapy, chakra therapy, color therapy, crystal therapy, flower essence therapy, gem therapy, homeopathy, psychic surgery, and toning (a form of music therapy).

Scientists define natural laws as descriptions (explanations) of relationships between objects, events, and forces based on meticulous observation and precise reasoning—for example, the law of gravity. Such relationships are not inherently directive: they do not ordain human behaviors. Advocates of alternative healthcare, however, use the term "natural laws" to connote a morality of nature. (Many theists hold that the word "law" implies the existence of a lawgiver.)

In a letter to me dated June 14, 1994, the manager of the Committees on Publication of The First Church of Christ, Scientist stated: "We do not consider healing through scientific prayer to be 'supernatural.' Because Christian Science is based on the Bible and the teachings of Christ Jesus, we believe that this method of 'healthcare' is divinely natural."

The mainstays of "natural healing" are wishful thinking, superstition, unscientific empiricism, guesswork, and enmity toward scientific healthcare. Rituals and proselytism communicate its "spiritual" basis.

"Hands-On Healing": Touch and Go

Bodywork—the term is generally interchangeable with "hands-on healing" and "hands-on health"—involves touching, manipulating, and/or exercising the body. Many types of bodywork supposedly also involve adjusting the body's "energy field" or removing blockages to "energy." Bodywork encompasses massage therapy, body-centered psychotherapy (also called body-oriented psychotherapy, body psychotherapy, direct body-contact psychotherapy, and humanistic body psychotherapy), and touch therapy. "Touch therapy" and "touch healing" are generic terms for the laying on of hands and its variants, including MariEL, OMEGA, reiki, and therapeutic touch. Energy field work overlaps with bodywork. Supernaturalistic forms of bodywork include actualism bodywork, acupuncture, acu-yoga, AMMA therapy®, aromatherapy, *Bindgewebsmassage*, biodynamic massage, bioenergetics, body harmony, bodywork tantra, *chi nei tsang*, fundamentalist chiropractic, core energetics, craniosacral therapy, *do-in*, Esalen massage, the hakomi method, hatha yoga, Hawaiian temple bodywork, healing light kung fu, holotropic breathwork™, jin shin do®, jin shin jyutsu®, kum nye, life impressions bodywork, lomi-lomi, manual organ

stimulation therapy (MOST), marma therapy, the metamorphic technique, moxibustion, Ohashiatsu[®], ortho-bionomy[™], phoenix[®] rising yoga therapy, polarity balancing, the radiance technique[®], Radix, rebirthing, reflexology, Reichian massage, reiki, rolfing[®], the Rubenfeld synergy[®] method, shiatsu, sotai, Tibetan pulsing, Touch for Health, Trager psychophysical integration[®], and Chinese Qigong massage—including amma, *tui na* (Taoist healing acupressure), and *dian xue*.

The Bottom Line

Practitioners of alternative healthcare do not conform to current scientific standards. Many pay lip service to science, but some of these hypocrites—and many proponents who forthrightly poo-hoo science—talk up religion, spiritualism, or occultism as indispensable to the practice of medicine. Such systems, on the contrary, contribute nothing to sane healthcare.

BRIEFS

Linus Pauling (1901–1994). Linus Carl Pauling, Ph.D., died of cancer on August 19. Dr. Pauling won the Nobel Prize for chemistry in 1954, for his research on the nature of the chemical bond, and the Nobel Peace Prize in 1962. His books include *Vitamin C and the Common Cold* (1970), *Vitamin C and Cancer* (1979), and *How to Live Longer and Feel Better* (1986). Pauling, who reportedly ingested well over ten grams of vitamin C daily, proposed that massive doses of the nutrient could prevent the common cold and might benefit cancer patients. Research has not borne out these ideas. In *Vitamin C and the Common Cold*, he attacked the health food industry for jargonizing and thereby misleading consumers. Later, however, he soured toward similar critics after they criticized him, and he became one of the health food industry's standard-bearers.

Pauling's wife died of stomach cancer. In the May 1985 issue of this newsletter, James Lowell, Ph.D., conveyed the observations of Arthur B. Robinson, Ph.D., a former Pauling collaborator: Pauling had claimed that, because he and his wife took ten grams of vitamin C daily, they never had colds. Actually, Pauling had come down with the cold "frequently." Pauling had also claimed that his wife had stopped taking vitamin C by the time of her cancer diagnosis. Actually, she had taken teaspoonfuls with orange juice regularly.

GNC expands. General Nutrition Companies, Inc., has paid \$62 million to acquire the 204 stores operated by Nature Food Centres, previously the nation's second-largest chain of health food stores. About sixty-five percent of the stores will assume the GNC name. GNCI predicts that by the end of the year, it will operate 2,100 stores (about twenty-five percent of all U.S. health food stores).

GNC penalized \$2.4 million. The Federal Trade Commission (FTC) has reached a consent agreement under which General Nutrition Corporation would pay \$2.4 million to settle charges that it had falsely advertised 41 products, most of which had been packaged by other manufacturers. Many of the products were phony ergogenic aids.

Mail-order weight-loss scheme attacked. The Vermont Attorney General has filed a consumer fraud lawsuit against Lowensen International Inc., a Canadian company doing business as the "National Medical Research Institute" (reportedly in Swanton, Vermont). The lawsuit alleges that Lowensen had disseminated promotional matter throughout the United States with weight-loss claims endorsed by "Dr. Alan Lacey, M.D."—the pen name of a nonphysician. The promotional matter claimed that *Panderyl* capsules "normalized dietary thermogenesis" and had enabled one user to shed 35 pounds in six weeks "while eating normally."

New FTC guidelines for health claims. The 28-page "Enforcement Policy Statement for Food Advertising" provides guidelines for labeling similar to those of the FDA. The FTC will disallow health claims not supported by "significant scientific agreement."

BST report. An excellent 18-page report on "The Efficacy, Safety and Benefits of Bovine Somatotropin and Porcine Somatotropin" is available for \$3.85 from the American Council on Science and Health, 1995 Broadway, 2nd Floor, New York, NY 10023.

NEW ANTIQUACKERY BOOK

The Vitamin Pushers: How the Health Food Industry Is Selling America a Bill of Goods is an investigative report that convincingly portrays the health food industry as a form of organized crime. Written by Stephen Barrett, M.D., and Victor Herbert, M.D., J.D., the 548-page book covers propaganda techniques, "nutrition insurance," "stress vitamins," the pharmacy connection, so-called ergogenic aids, dubious diagnostic methods, fad diagnoses, nutrition cultism, the endless parade of gurus, the multi-level-marketing mirage, "chiropractic nutrition," homeopathic fakery, nutrition and the media, "vitamin wars," and companies that have marketed illegally. It includes a glossary of supplements and health foods. A hundred illustrations bring home the industry's marketing tactics. Copies are available to readers of *Nutrition Forum* at the reduced prices of \$26.00 (U.S.) and \$28.30 (Canada). (Regular prices are \$29 and \$31 respectively.) Order from: LVCAHF Books, P.O. Box 1747, Allentown, PA 18105.

QUESTIONABLE HERBAL PRODUCTS

Varro E. Tyler

Americans are bombarded almost daily with propaganda concerning the alleged effectiveness of certain herbal preparations—"cures" for everything from AIDS to cancer. Thinking persons must often wonder how much herbal-product "information" is factual and how much is promotional hyperbole. Many such preparations may be sold legally as dietary supplements (foods) in the United States as long as no indications of therapeutic use appear on the package label or in accompanying literature. Some manufacturers circumvent this restriction by pointing to claims made in literature not directly associated with the "supplement." Moreover, there are no enforced standards of quality for such products sold in the United States. Consequently, the actual contents of the preparation may differ from the listed contents. Below I discuss some of the products about which readers have inquired.

Putting on Hairs?

Question: Does *101 Formula*, manufactured in Beijing by the Zhangguang Pilatory General Factory, really cure baldness? The package insert suggests that it can turn Kojaks into young Beatles. [Editor's note: I bought a bottle of "101" in Beijing in September and mailed the box and insert to Dr. Tyler.—J.R.]

Response: This "Hair Regrowth Liniment" consists of an extract of nine herbs in aqueous alcohol: angelica, astragalus, ginger, ginseng, hickory nuts, lovage, safflower, sage, and an ingredient that could not be identified (its English name on the

package is probably a misspelling). The generic name of safflower is misspelled. There is no substantial clinical evidence to support the effectiveness of any of the formula's identifiable ingredients as hair regrowth stimulants. Even if there were, the action of this preparation would be uncertain because the quantities of the constituents are not declared. This is a common shortcoming with herbal products.

Without specific information on the quantities of component herbs, it is impossible to state with certainty whether the herbs will have any therapeutic effect. This preparation is especially suspect because the stated names of two of the ingredients are taken from the homeopathic literature (e.g., "Aralia Quinquifolia" instead of *Panax quinquefolius*). This raises the question of whether at least some of the ingredients are present in minute amounts.

Another Wrinkle?

Question: Kombucha, or tea fungus, is said to eliminate wrinkles, prevent cancer, lower cholesterol, help with allergies, stop infectious diarrhea, recolor gray hair, and do many other wonderful things. Could you direct me to unbiased information about it?

Response: A beverage native to Asia, kombucha became popular in Russia, and from there its use spread to Western Europe and the United States. It is prepared by inoculating sweetened black tea with a complex mixture of yeasts and bacteria, sometimes referred to collectively as Manchurian mushroom. In addition to small amounts of alcohol, the drink usually contains about

No Male-Pattern Baldness in Zhejiang, China

As reported in the N.Y. Times 1/26/88

Dr. Zhao Zhangguang, Chinese farmer and traditional "Barefoot Doctor," developed a formula of 8 medicinal herbs that created thicker, fuller and healthier hair on men with thinning hair.

Reporter sent to investigate rumors

"He came to see me," Dr. Zhao said. "Of course he didn't believe anything." The reporter from Hangzhou, happened to be suffering from thinning hair. "I gave him some of my formula and after about 3 months he began to see hair."

Word spilled out of China. 101 FORMULA was so popular in Japan, travel agencies organized trips to China so men could order the product. A famous Japanese pop-singer said on the radio that "101 worked wonders" on his head.

101 FORMULA wins world acclaim

The King of Belgium issued the top award to 101 FORMULA at the *Brussels Eureka World Fair* in 1987. Other laurels include the *Industrial & Commercial Golden Cup* in Paris and in 1989 the *Oscar Top Prize* at the 16th New Science & Tech Exposition in Geneva.

Introducing 101A

Dr. Zhao has now improved 101 FORMULA. The new 101A scored a 84% effective rate in test conducted on 395 men. It also rated 95% effective in controlling hair loss.* 101A is now available in the U.S. Cost is \$89 for a 2 months supply and includes shipping and handling. Send your check or money order to Stevens 101 Int'l, 444 Brickell Ave., #51G, Miami, FL 33131.

*Granted No. (89) Guang An Men Hospital, China. Technical appraisal passed 11/26/88

Ad in the December 1991 issue of *Longevity*

3% of acetic acid and additional quantities of gluconic, lactic, tartaric, and other plant acids. Also usually present are such compounds as invertase, amylase, and a proteolytic enzyme.

Unfortunately, reliable scientific and clinical studies of kombucha apparently have not been published—not in the English-language literature, at least. Unbiased printed information is, therefore, not readily available. Nearly all of the evidence for the efficacy of kombucha is anecdotal, consisting of testimonials from patients and physicians who found it useful in treating various diseases or syndromes. Recent studies have shown that placebos work about 35% of the time and that up to 70% of patients claim relief from treatments known to be ineffective. In light of these findings, it is obvious that little confidence should be placed in anecdotal information.

As a refreshing drink, kombucha probably has merit, but it would be unwise to expect more. It may not be in the best interests of consumers to ingest habitually a drink containing large amounts of plant acids.

Pine Solution?

Question: I am looking for information on the herb Pycnogenol. Does it really help to lower high blood pressure and relieve arthritic pain?

Response: Commercial Pycnogenol is not an herb but a concentrate of 85% oligomeric proanthocyanidins extracted from the bark of *Pinus pinaster* Soland. growing in France. Here it is marketed by M.W. International, Inc., of Hillside, New Jersey. The proanthocyanidins (a type of bioflavonoid) in Pycnogenol are active free-radical scavengers. Because of their collagen-protecting properties, they are thought to have some favorable effects, including lessening of capillary fragility and improvement of peripheral circulation. However, substantial clinical evidence to support the use of Pycnogenol for hypertension or arthritic pain is lacking.

OTC Cure for BPH?

Question: My husband responded to an advertisement and received the attached brochure about *Prostata*. What do you think about the product?

Response: In 1990, the FDA banned the sale in the U.S. of all over-the-counter products for treating benign prostatic hypertrophy (BPH). The agency said it had taken this

Ad in the November/December 1994 issue of *Natural Health*

action because: (1) it had not received data proving the alleged effectiveness of such products, and (2) use of such products might delay proper medical treatment. In view of this, I think it strange that Life Force Laboratories, of Marina Del Rey, California, says in their brochure that *Prostata* will “protect or restore the health of the prostate gland.”

Prostata contains pygeum, ginseng, horsetail, hydrangea, saw palmetto, and zinc. The product literature does not make known the amounts of these ingredients. Both pygeum and saw palmetto, if they are present in therapeutic quantities, are probably effective for BPH. Such efficacy is supported by numerous clinical trials carried out in several European countries. There is no reliable evidence that the other ingredients are either effective for BPH or harmful. Finally, in one clinical study, 13% of the patients given pygeum developed gastric symptoms.

Cancer Remedy?

Question: Literature on Essiac[®] tea, an herbal formula that originated in Canada, describes it as a “beneficial treatment for cancer.” What is your opinion?

Response: *Essiac* consists of burdock root, Turkish rhubarb, slippery elm, and cress in quantities undisclosed on the label. None of these ingredients has been clinically proven to be of value in the treatment of cancer. Rhubarb, if it is present in a therapeutic amount, would act as a laxative.

Nutrition Forum (ISSN 0748-8165), © 1994, is published bimonthly by Prometheus Books, Journals Division.

Subscriptions for individuals in the United States and Canada cost \$35 for one year (six issues), payable to Prometheus Books, Journals Division, at 59 John Glenn Drive, Amherst, New York 14228-2197. Multireader (e.g., institutional) and overseas (airmail) subscriptions cost \$50 for one year.

Manuscripts and all editorial correspondence should be directed to: Jack Raso, P.O. Box 740045, Rego Park, N.Y. 11374.

In 1983, Food and Drug Canada examined case reports submitted on 87 cancer patients who had used the product. Of these, 78 showed no benefit, four saw worsening cancer, and two had died. Three patients had stabilized, but they had also received conventional cancer therapy. After this review, the Preclinical New Drug Submission for *Essiac* was revoked. A year later, the U.S. National Cancer Institute studied *Essiac* and concluded that it was ineffective against tumors. Still, it is sold as food in both the United States and Canada.

“Unnatural” (and Unspecified) Conditions

Question: *Km*, manufactured by Matol Botanical International, purportedly will “enable your body to rid itself of many unnatural conditions.” What are these conditions?

Response: The conditions are not specified in print, and the label does not make known the amounts of the 14 herbs that *Km* contains. So it is impossible to determine whether any of them is present in a therapeutic amount. If cascara and dandelion root are present in therapeutic quantities, the preparation would act as a laxative. The promotional literature states that the 585 mg. of potassium in one serving is equivalent to that found in one banana. Small amounts of calcium, iron, and iodine are also present. Available information compels us to conclude that *Km* is principally a potassium supplement.

Editor’s note: For further information on *Km* and Matol, see my article in the September/October 1991 issue of *NF* or Chapter 10 of *Mystical Diets*.—J.R.

“Rite” for Obesity?

Question: I received an advertisement for *Lite & Rite*, a 100% herbal product that contains epitonin, weidewinde, and fucus vesiculosus. The manufacturer claims that it is “a virtual elixir that produces unbounded energy, a feeling and appearance of

youth and a slimmer, healthier body.” Have you any idea what these herbs can do? Is the product effective against obesity?

Response: “Epitonin” is a fanciful name for ephedra, the Chinese herb containing ephedrine. “Weidewinde” is a misspelling of “Weidenrinde,” the German name for willow bark. “Fucus vesiculosus” is the scientific name of a brown alga that yields kelp products. Because ingredient quantities are not disclosed, it is impossible to determine whether the product has any significant physiologic effects.

Some people have advocated the use of kelp to control obesity, but probably only an iodine deficiency would warrant such use. Willow bark contains salicin, a compound converted to salicylic acid in the body. It might act as an analgesic but would not effect weight loss. Ephedra might produce a short-term decrease in appetite, but there is no substantial clinical evidence that it is a safe or effective facilitator of weight loss in the obese. In any case, it is a central nervous system stimulant and increases blood pressure and heart rate. Such side effects make the indiscriminate use of ephedra products highly inadvisable.

Jack Raso in Beijing herbal apothecary, September 1994. The drawers in the background contain herbs. The store’s prepackaged offerings included *Growth Granule* and *Oolong Anti-Obesity Tea*.

Many other herbal products on the American market are alleged to induce weight loss. None has been found by the FDA to be effective for this purpose. Most such products contain diuretics and laxatives; together, these cause losses of water and fecal matter and, thus, a superficial,

temporary loss of weight. Herbs are poor remedies for obesity.

Varro E. Tyler, Ph.D., Sc.D., is professor of pharmacognosy at Purdue University and author of *The Honest Herbal: A Sensible Guide to the Use of Herbs and Related Remedies/Third Edition* (1993). Copies are obtainable for \$22 postpaid from LVCAHF Books, P.O. Box 1747, Allentown, PA 18105.

The Nitty-Gritty of Nutritional Health Fraud

A Review of The Vitamin Pushers

Jack Raso

Stephen Barrett, M.D., and Victor Herbert, M.D., J.D., are standouts in the anti-health-fraud movement, probably the most knowledgeable and effective critics of alternative medicine in the country. Their latest joint literary effort is *The Vitamin Pushers: How the "Health Food" Industry is Selling America a Bill of Goods* (Prometheus Books, 1994).

Three books were pivotal during my bumpy conversion from manic pill-popping to nutrition skepticism in the 1980s: (1) *Nutrition Cultism: Facts and Fictions*, by Dr. Herbert; (2) the second edition of *The Health Robbers* (1980), edited by Dr. Barrett; and (3) *The New Nuts Among the Berries* (1977), by Ronald Deutsch. Also helpful were John Fried's *The Vitamin Conspiracy* (1975)—Prometheus Books published the 1984 edition, *Vitamin Politics*—and *Vitamins and "Health" Foods: The Great American Hustle* (1981), by Drs. Herbert and Barrett. *Nutrition Cultism* stands on my desk, a subtle daily reminder of my former credulity; for example, regarding so-called vitamin B₁₅. This was the subject of a curiosity-provoking cover story in the March 13, 1978, issue of *New York*. Above a shiny tablet, the words "WONDER DRUG" spanned the cover.

And I believed.

Many people still seek magic bullets, pick-me-ups, panaceas, and sacraments in the form of food supplements and charmingly marketed placebos. In keeping with its complete title, *The Vitamin Pushers*

pertains less to supplements of any kind than to:

- promoters of medical irrationalism;
- their training schools;
- the ploys and sales tactics that promote their methods, programs, and wares;
- their run-ins with authorities; and
- the exaltation of their claims and practices by the media.

This hardcover is well over five hundred pages long and amply illustrated. Although the man in the street is its apparent target audience, the book contains a wealth of particulars for seasoned adversaries of health fraud. Below I paraphrase some of the conclusions and information in the book.

- A sure sign that a treatment is ineffective is a political campaign to legalize it. (P. 35)
- Unlike scientists and scientific practitioners, quacks rarely criticize their own methodology or that of other quacks. (P. 71)
- In 1993, sales of books in health food stores exceeded \$130 million. (P. 80)
- "Medical Poll Reveals 8 Out of 10 Doctors Take an Antioxidant for Good Health." Or so claims a 1994 ad from KAL,[®] Inc., of Woodland Hills, California. The ad cites "1992 Medical Tribune." However, *Medical Tribune*, a newspaper for physicians, conducted no such survey. Its editor merely asked doctors to report their experiences with vitamin E. Eighty percent of the responses were positive. (Pp. 141–142) [This ad is on page 63 of the November 1994 issue of *Longevity* and depicts free radicals as "out-of-control 'pac-men.'"]
- "Set-N-Me-Free," of Portland, Oregon, markets an "inch-loss program" that allegedly slenderness people by "cleansing" them of "toxins that hold cellulite in place." (P. 164)
- In 1989, there was an outbreak of eosinophilia-myalgia syndrome (EMS) among users of L-tryptophan supplements. EMS is marked by muscular pain (myalgia) and an increase in eosinophils (a type of white blood cell). The outbreak was due to specific manufacturing conditions at a Japanese company called Showa Denko K.K. Although Showa Denko maintained that L-tryptophan was being marketed as a "dietary supplement," company memos and a brochure represented it as a drug.

Free Radicals Attacking a Human Cell

Segment of "medical poll" ad in the November 1994 issue of *Longevity*

Other documents revealed that, in 1998, the company had become aware of unidentified impurities in its L-tryptophan. Then it began using a new strain of bacteria to produce the amino acid, a bioengineered modification of previous strains. Showa Denko *did not* inform the FDA of the impurities, *did not* inform the agency of the modification, *did not* test the modified product for safety in humans, and *did not* increase filtration to remove the impurities (a measure that would have slowed production). (Pp. 404–409)

I particularly enjoyed the partial account of a 1992 question-and-answer session between attorney David L. Suggs and GNC board chairman Jerry D. Horn (pp. 410–412), for example:

Suggs: Wouldn't you agree that your company shouldn't sell pills to people to take unless the pills provide some benefit and the pills are safe?

Horn: The latter part. We shouldn't sell pills that are not safe.

Suggs: Okay. How about the benefit part?

Horn: The benefit to each individual is up to them. We don't tell them what kind of groceries to buy in the grocery store.

Suggs: Well, you weren't selling groceries in your stores, were you?

Horn: We were selling food. Food products.

Suggs: People weren't taking your products for food purposes, were they?

Horn: I would say many of them are. You know, like broccoli. You might buy broccoli in pill form.

Incidentally, "GNC" stands for both General Nutrition Corporation and General Nutrition Centers (the stores). Today, the parent corporation is General Nutrition Companies, Inc. (GNCI).

In the second week of October, through Compu-Serve's "Holistic Health Forum," John Hammell, political coordinator of The Life Extension Foundation, urged "forum" members to phone Prometheus Books' toll-free line for "free" review copies of *The Vitamin Pushers*, which he described as a laughable "piece of trash." On October 27, Michael Powers, the advertising and promotion manager at Prometheus, told me that three callers who had requested review copies had "invented bogus newspapers." However, he said he doubted that there had been a significant number of fraudulent requests.

It is no wonder that healthcare "holists" and their sympathizers are concerned about this book: (1) Nutritional alternativism is the main engine of the alternative-medicine movement, a yawning gateway to healthcare's "Emerald City." (2) *The Vitamin Pushers* is the most up-to-date and comprehensive exposé of nutritional alternativism. (3) It is bound to cause cognitive dissonance in any reader who is not a rational skeptic or true believer. In the 1980s, I was such a reader, and I remain grateful to Drs. Barrett and Herbert.

Books, Lies, & Audiotape

This occasional section lists those books, audiocassettes, and other products received gratis from publishers or distributors that meet one or both of the following criteria. (1) The work or its subject matter interests me. (2) The work deals with food, nutrition, physical fitness, and/or alternative healthcare—authoritatively, propagandistically, inexpertly, or nonsensically. Comments follow most listings.—*J.R.*

The Alexander Technique: Natural Poise for Health

By Richard Brennan. Rockport, MA: Element Inc., 1991. Softcover. Pp. 114. Price \$8.95.

My book *Alternative Healthcare: A Comprehensive Guide* deals almost exclusively with supernaturalistic and quasi-supernaturalistic methods. Methods arguably on the borderline between quasi-supernaturalism and naturalism include aroma behavior conditioning (ABC), firewalking, and three forms of bodywork: the Alexander technique, Aston-patterning®, and rolfling. Of all the modes of bodywork I experienced during the development of *Alternative Healthcare*, the Alexander technique seemed the most useful, but it is also the most demanding of clients. Brennan defines the technique as "a method of becoming more aware of ourselves as we go about our everyday activities" (p. 2). Its focus is improvement of posture: maintaining alignment of the head, neck, and back supposedly leads to optimal overall physical functioning. Teachers of the technique convey it by manually pressing on various parts of the student's body and repeatedly uttering "directions" such as "Allow the neck to be free." I concluded that it "may, with perseverance, improve posture." On pages 30–31,

Brennan states: "[T]he habitual way of being that so many of us are encouraged to fall into from a very early age is bound to affect our physical, mental and even our spiritual well-being....[T]he Alexander Technique not only helps posture and coordination, it also balances emotions and helps to bring us peace of mind." It might also make one excessively conscious of one's carriage.

Alternative Medicine: The Definitive Guide

Compiled by The Burton Goldberg Group. Puyallup, WA: Future Medicine Publishing™, Inc., 1993. Hardcover. Pp. 1,068. Price \$59.95.

This propagandistic tome is neither definitive nor much of a guide. Indeed, it hardly deserves to be called comprehensive. Future Medicine styles itself "The Voice of Alternative Medicine." In the preface, businessman Burton Goldberg states: "Conventional medicine is superb when it comes to surgery, emergency, and trauma. But there's no question that alternative medicine works better for just about everything else...." The chapter titled "Mind/Body Medicine" quotes *Proverbs*, prominently and without comment. On the other hand, the book is a conversation piece, and anti-health-fraud activists may find the recurrent "Where to Find Help" and recommended-reading sections useful.

Alternative Medicine Yellow Pages: The Comprehensive Guide to the New World of Health

Compiled and edited by Melinda Bonk. Puyallup, WA: Future Medicine Publishing™, Inc., 1994. Softcover. Price \$12.95.

The companion to *Alternative Medicine: The Definitive Guide*, this book lists practitioners of alternative healthcare in the U.S. and Canada. The pages do not have identifying numbers.

American Heart Association Cookbook/Fifth Edition

By the American Heart AssociationSM. New York: Ballantine Books, 1994. Softcover. Pp. 500. Price \$6.99.

Ancient Inventions

By Peter James and Nick Thorpe. New York: Ballantine Books, 1994. Hardcover. Pp. 672. Price \$29.95.

One of the twelve chapters deals with medicine and includes a section on acupuncture. Another deals with diet and drugs. The authors pronounce so-called acupuncture anesthesia one of the "crowning glories" of the revival of acupuncture in modern China. They state, incorrectly: "It played a crucial role in convincing Western scientists beyond any doubt that acupuncture works."

Choices: Realistic Alternatives in Cancer Treatment/Second Revised Edition

By Marion Morra and Eve Potts. New York: Avon Books, 1994. Softcover. Pp. 921. Price \$15.00.

This is an excellent, comprehensive reference book. Following a chapter on investigational (experimental) cancer treatments is one on unproven (scientifically footless) methods. Unproven "remedies" include: Gerson therapy (see *Mystical Diets* and *NF*, Vol. 3, No. 2), Hoxsey treatment (see *NF*, Vol. 4, No. 12), immunoaugmentative therapy (IAT), laetrile (see *NF*, Vol. 5, No. 5), Livingston-Wheeler therapy, macrobiotic diets (see *NF*, Vol. 7, Nos. 2 and 3), metabolic therapy (see *NF*, Vol. 5 No. 8), psychic surgery, shark cartilage treatment (see *The Vitamin Pushers*), and the Simonton method (see *"Alternative" Healthcare: A Comprehensive Guide*). Of the 26 chapters, all except three have a question-and-answer format.

The Complete Vitamin Book

By Carl Lowe. New York: The Berkley Publishing Group, 1994. Softcover. Pp. 310. Price \$5.99.

On pages 11-14, the author relates the story of his turnarounds regarding vitamin supplements: When he was in his twenties and thirties, he took vitamin pills, but he later stopped. As a health writer specializing in nutrition, Lowe believed that eating a wide variety of fruits and vegetables, consuming meat only in moderation, exercising reasonably, and maintaining a desirable weight rendered vitamin supplementation a waste of money. When he was 42 years old, he began getting chest discomfort during his daily three-mile runs. At age 43, he underwent two angioplasties for the same artery.

Lowe states:

Why did this heart problem happen to me after years of exercising, eating right, and watching my weight and cholesterol? Aside from the fact that heart disease runs in my family, I firmly believe that the fact that I didn't take extra vitamins—particularly the antioxidant vitamins C and E and beta-carotene—influenced the development of my disease....The conventional medical wisdom claims that my becoming a victim of heart disease at the age of forty-three had nothing to do with vitamins. I don't believe it, because I do know that following all of the approved methods of preventing heart disease didn't work for me.

On page 25, he states: "The standard position that a balanced diet will supply all the vitamins that a healthy person needs does not adequately acknowledge the latest scientific findings....Since you can take vitamin supplements at levels that certainly will do no harm, it's a smart bet to take them and try to reap the benefits....[T]he possible good you will be doing yourself makes vitamins a good bet." Although this stance is problematic, the book is largely reliable.

The Consumer's Good Chemical Guide: A Jargon-free Guide to the Chemicals of Everyday Life

By John Emsley. New York: W.H. Freeman and Company Limited, 1994. Hardcover. Pp. 347. Price \$24.95.

Deadly Doctrine: Health, Illness, and Christian God-Talk

By Wendell W. Watters. Amherst, NY: Prometheus Books, 1992. Hardcover. Pp. 198. Price \$24.95.

Dr. Watters is Professor Emeritus in Psychiatry at McMaster University, Hamilton, Ontario. His thesis, in a sound bite, is that Christian indoctrination "may be hazardous to your health." The same, according to Watters, goes for Christianity as a movement. *Deadly Doctrine* is readable and insightful, but I have a quibble: In the introduction, Watters asserts, cryptically: "...many of the foods we eat contain additives that are harmful to human health in a variety of ways." I consider this, generously, an exaggeration. Below are excerpts.

- Under the influence of a belief system that promotes...hostility and distrust between two "parts" [body and soul] of the indivisible whole human being, it requires almost superhuman effort for an individual to develop any sense of unity or wholeness. Without integration of the whole person, there can be no real self, no self-esteem, and no self-mastery. (P. 38)
- The most destructive aspect of both prayer and [mystical religious] meditation is that they discourage the development of human-to-human communication skills as well as the formation of human support groups to aid in solving those problems that can be solved and coping adaptively with those existential problems that cannot. (P. 70)
- For Christians, guilt is a desirable feeling since it is meant to bring people to Jesus through conversion, confession of sins, and alms-giving....[However,] guilt, rather than leading to behavioral change, in fact may reinforce the maladaptive behavior patterns....The Christian Church, the House that Guilt Built, behaves very much like the firms that manufacture body soaps and deodorants....[T]he true Christian has been brain-washed into believing that he was born wicked, that he should suffer as Christ suffered in order to please God, and that he should aspire to a humanly impossible level of perfection....The church essentially makes people feel guilty for being alive.... (Pp. 80-85)
- Some of the more devastating teachings of Christianity might play a part in the genesis of schizophrenia and depressive disorders. (P. 150)
- Being religious is quite definitely not associated with greater mental health when compared to a scientific, questing approach to life. (P. 157)
- Many physicians are either religious themselves or are still very much affected by the fallout from Christianity's emphasis on the human-to-god bond over the human-to-human bond....[The] band-aid brand of medicine allows them to remain at a comfortable distance from their patients and their human problems....[P]atients expect a magic pill to make them feel better, thus enabling them to avoid confronting deeper issues in their lives. (P. 169)

Emotional Healing with Homeopathy: A Self-Help Manual

By Peter Chappell. Rockport, MA: Element, Inc., 1994. Softcover. Pp. 245. Price \$13.95.

The book is also subtitled *A Practical Guide*. Chappell is Director of Overseas Training for the London College of Classical Homeopathy. In Chapter Five, he outlines several "vitaly important" homeopathic principles, including the following.

Like cures like: A substance with specific effects in a healthy person can cure similar symptoms in an unhealthy person.

Potentiation: The process of repeated dilution and vigorous shaking of harmful substances renders them "medically active" yet "free of side effects."

The single remedy: Since there is "one soul in one body," there is only "one core problem at any time"; therefore, only one remedy is necessary "to create a curative action."

The whole picture: "The single remedy is selected to cover the whole picture of the person....every aspect of their personal situation, from the widest possible aspects and issues to the smallest and oddest details...."

Hierarchy of symptoms: "Mind symptoms" are usually more important than physical symptoms.

Dynamic vitality: Humans consist of a "soul energy" and a so-called physical body in which this vibrates. The "physical body" is actually an "energy pattern"—"a vibrational body of energy, vitality." The soul "sends out messages" to the mind. These messages "activate energetic feelings and actions of speech, movement, etc."

Direction of cure: Cures involve: (1) the soul, (2) thoughts and feelings, and (3) physical processes. Usually, "inner peace" is the first response to a remedy, "better energy" the second, and "physical" cure the last.

The Encyclopedia of Eastern Philosophy and Religion

By Ingrid Fischer-Schreiber, Franz-Karl Ehrhard, Kurt Friedrichs, and Michael Diener. Boston: Shambhala Publications, Inc., 1989. Softcover. Pp. 468. Price \$22.50.

The authors state in the introduction that their work "ventures into an area where, as far as the presentation of the material to Western readers is concerned, no fixed standards of form or content have yet been achieved—and indeed, perhaps none can be set." Headwords range from alternative standbys—such as *asana*, *ayurveda*, *chakra*, *ch'i*, *ch'i-kung*, *maharishi*, *mantra*, *meditation*, and *yoga*—to the subtler concepts of alternative healthcare—e.g., *akasha*, *Brahman*, *do*, *guna*, *kundalini*, *mandala*, *mindfulness*, *nadi*, *nirvana*, *samadhi*, and *satori*. Symbols for the doctrines that are the book's subject matter—Buddhism, Hinduism, Taoism, and Zen—correspondingly precede the definitions of terms that have different doctrinal meanings. For example, the word "samadhi" has one meaning in Hinduism and another in Buddhism and Zen; the two definitions are separate (preceded by symbols), but they share one heading.

In the introduction, the authors seem advocates of mysticism. I imagine that believers will find this book supportive of their faith and that those critics of supernaturalistic "healing" who are sticklers for detail will find it enlightening.

The Harvest Collection: A Vegetarian Cookbook for All Seasons

By Gardner Merchant. Garden City Park, NY: Avery Publishing Group, 1994. Softcover. Pp. 106. Price \$12.95.

This oversize book is attractive and well organized. Each main recipe has an illustrative color photo and does not exceed one page.

The Healing Cuisine: India's Art of Ayurvedic Cooking

By Harish Johari. Rochester, VT: Healing Arts Press, 1994. Softcover. Pp. 264. Price \$16.95.

Health Risks of Weight Loss

By Frances M. Berg. Hettinger, ND: *Healthy Weight Journal*, 1994. Softcover. Pp. 193. Price \$19.95.

Frances M. Berg, M.S., L.N., is editor and publisher of *Healthy Weight Journal* (formerly *Obesity & Health*), an excellent

bimonthly in its 9th year of publication that covers the gamut of issues pertaining to human body weight. According to the journal's mission statement, Ms. Berg and the members of her advisory board (including Stephen Barrett, M.D.) are "committed to exposing fraud and deception, to promoting the acceptance of a wider range of sizes, and to encouraging healthful living." To order the book or to subscribe to the journal, call 1-800-633-0023.

Health Through Balance: An Introduction to Tibetan Medicine

By Yeshe Donden. Edited and translated by Jeffrey Hopkins. Co-translated by Lobsang Rabgay and Alan Wallace. Ithaca, NY: Snow Lion Publications, 1986. Softcover. Pp. 252. Price \$14.95.

At the outset of the first chapter, the author states: "In the Tibetan system we believe that whether we are physically healthy or not, basically all of us are sick."

Heinerman's Encyclopedia of Fruits, Vegetables and Herbs

By John Heinerman. Foreword by Lendon H. Smith, M.D. West Nyack, NY: Parker Publishing Company, Inc., 1988. Softcover. Pp. 400. Price \$10.95.

Hidden Treasure: Discovering the God Within

By Thomas Ehrhardt. Virginia Beach, VA: A.R.E. Press, 1994. Hardcover. Pp. 118. Price \$14.95.

According to the back matter, Ehrhardt "abandoned a lifetime of atheism after undergoing a series of conversion experiences" and eventually became a minister. On page 16, he states: "Religion originally drew its knowledge from a source far higher than mere human thought...[T]he universe is the physical expression of a spiritual reality....Science...can't really tell us with certainty where the universe comes from—but religion can." If there is treasure in this eye-catching book, it is hidden indeed. (See the entry *A Physician's Diary*, below.)

How and Why We Age

By Leonard Hayflick. New York: Ballantine Books, 1994. Hardcover. Pp. 377. Price \$24.00.

Prof. Hayflick is an award-winning gerontologist and microbiologist. His name may ring a bell because of the Hayflick Limit—his finding that normal human embryonic fibroblasts double in vitro 40 to 60 times (in about two years). On page 289, Dr. Hayflick states:

In view of the overwhelming evidence that it will postpone disease and prolong life, why has there not been a mass movement to adopt the caloric restriction regimen? Aside from the fact that dietary restriction has not been proven conclusively to work in humans, I think the answer is that, for most people, the quality of their lives is more important than the quantity. I believe that a change in lifestyle, especially reducing daily caloric intake to levels of borderline hunger or near starvation, is too high a price for most people to pay for postponing disease and achieving greater longevity. Furthermore, we do not know what the long-term effects of caloric restriction might be on cognition.

The Joy of Health: A Doctor's Guide to Nutrition and Alternative Medicine

By Zoltan P. Rona. St. Paul, MN: Llewellyn Publications, 1994. Softcover. Pp. 262. Price \$12.95.

Not Milk...Nut Milks! 40 of the Most Original Dairy-Free Milk Recipes Ever!

By Candia Lea Cole. Santa Barbara, CA: Woodbridge Press Publishing Company, 1992. Softcover. Pp. 125. Price \$7.95.

On pages 15–16, the author states: "I found that I had often naively savored foods in incompatible combinations

(as many people do) and indulged in them at times of the year when they offered unsuitable kinds of fuel for the body's changing needs....As I gradually grew more in tune with the kinds of whole foods that Nature provides in seasonal order for the body to sustain balance and regenerate itself (versus foods that cause imbalance and degeneration), a more loving appreciation of my body and Nature began to take root in me." Ms. Cole is also the author of *Super Smoothies!* (see below).

A Physician's Diary: Case Histories of Hope and Healing with Edgar Cayce's and Other Natural Remedies

By Dana Myatt. Virginia Beach, VA: A.R.E. Press, 1994. Softcover. Pp. 233. Price \$13.95.

The author received her N.D. (doctor of naturopathy) degree from the National College of Naturopathic Medicine, in Portland, Oregon. A.R.E. Press is the publishing arm of the Association for Research and Enlightenment, Inc. (A.R.E.®), the chief disseminator of the "psychic" teachings of Edgar Cayce. For further information on A.R.E. and the Edgar Cayce tradition, see my article in the January/February 1991 issue of *NF*, Chapter 5 of *Mystical Diets*, or Chapter 7 of *"Alternative" Healthcare: A Comprehensive Guide*.

Pranic Psychotherapy

By Choa Kok Sui. York Beach, ME: Samuel Weiser, Inc., 1993. Softcover. Pp. 159. Price \$14.95.

According to its cover, this book is "an invaluable contribution to the field of holistic health." Considering the field, this may be true. Under the heading "Drawing In Ground, Air and Tree Prana," Sui tells would-be absorbers of "earth ki" to remove their shoes, stating that leather and rubber shoes "reduce the drawing in of prana by 30-50 percent"—a claim he does not reference. (For a description of pranic psychotherapy and other supernaturalistic methods, see the previous issue of *NF*.)

The Singing Cure: An Introduction to Voice Movement Therapy

By Paul Newham. Boston: Shambhala Publications, Inc., 1994. Softcover. Pp. 256. Price \$15.00.

Staying Young: How to Prevent, Slow or Reverse More Than 60 Signs of Aging

By Tom Monte and the editors of *Prevention* magazine. Emmaus, PA: Rodale Press, Inc., 1994. Hardcover. Pp. 342. Price \$24.95.

Thomas J. Monte is the coauthor of *Recalled by Life* (1982) and its mainly nuts-and-bolts sequel, *Living Well Naturally* (1984). He is the author of *The Way of Hope: Michio Kushi's Anti-AIDS Program* (1989). *Recalled by Life* and *The Way of Hope* are paeans to macrobiotics. The former is dedicated "To the Lamb of God...." (Regarding these three books, see *Mystical Diets*.) On page 314 of *Staying Young*, Monte and associates endorse religious praying as an efficient way of improving health.

Super Smoothies! Taste the Nectar of Life

By Candia Lea Cole. Santa Barbara, CA: Woodbridge Press Publishing Company, 1993. Softcover. Pp. 192. Price \$11.95.

This is principally a book of recipes for blenderized combos, almost exclusively of various plant foods (primarily fruits). The front matter quotes the author: "After a personal history of ill-health that was ineffectively medicated by prescription drugs, there was nowhere else to turn for help except back to nature" (p. 11). It further states that her recipes honor "creation (the life essence)." On page 29, Ms. Cole states: "Sometimes in our haste to appease the appetite, the flavors on our palates all but cause us to remember what food really is. Flavor, fiber, vitamins and minerals, yes; but I prefer to consider food also as containing the

seeds of divine intelligence." Ms. Cole is also the author of *Not Milk...Nut Milks!* (see above).

Taming the Diet Dragon: Using Language and Imagery for Weight Control and Body Transformation/Second Edition

By Constance C. Kirk. St. Paul, MN: Llewellyn Publications, 1994. Softcover. Pp. 235. Price \$4.99.

In the chapter titled "Imagery: The Power Source," Dr. Kirk describes imagery as "the most creative force innately available to human beings" (p. 81). She claims that people can learn to "unleash the power of imagination by transforming images into positive energy" and to use imagery to "literally change" their physiology "in order to...burn fat faster...and establish a lower biological weight naturally" (p. 82).

The Twelve Stages of Healing: A Network Approach to Wholeness

By Donald M. Epstein, with Nathaniel Altman. San Rafael, CA: Co-published by Amber-Allen Publishing and New World Library, 1994. Softcover. Pp. 225. Price \$12.95.

See the entry "Twelve stages of healing" in this issue's "Nutrition Nonsense and Healthcare Esoterica."

Audiocassettes Received

Sacred Verses, Healing Sounds. Volume I: Commentary and Selected Verses from The Bhagavad Gita

By Deepak Chopra. San Rafael, CA: New World Library, 1994. Running time: 128 min. Price \$16.95.

The *Bhagavad Gita* is an influential Hindu poetry book of unknown authorship composed between 500 and 200 B.C.E. See *NF*, Vol. 11, No. 4.

Understanding Alternative Medicine

Introduced by Peter Graves. Puyallup, WA: Future Medicine Publishing™, Inc., 1993. Running time: approx. 94 min. No price given.

The cover states in boldface: "One out of three Americans uses some sort of alternative medical treatment." Let me lay this myth of pseudovalidation to rest: It traces to a national telephone survey conducted in 1991 by David M. Eisenberg, M.D., et al. and published in the January 28, 1993, issue of *The New England Journal of Medicine*. Eisenberg is the primary author of *Encounters with Qi: Exploring Chinese Medicine*, first published in 1985. Reportedly, one of the focal questions to which the researchers had sought answers was: "What is the extent of use of unconventional therapy in the United States?" In the abstract, they stated: "One in three respondents (34 percent) reported using at least one unconventional therapy in the past year, and a third of these saw providers for unconventional therapy." (If this is so, only about 11 percent of the respondents visited such practitioners.) The researchers' working definition of "unconventional therapies" was: "medical interventions not taught widely at U.S. medical schools or generally available at U.S. hospitals." The trouble is, they included as "unconventional": relaxation techniques, chiropractic, massage, commercial weight-loss programs, "lifestyle diets," self-help groups, biofeedback, and hypnosis. These practices do not necessarily evoke (or correspond to) the label "alternative." All of them have scientific, naturalistic, or nearly naturalistic forms that are acceptable adjuncts to standard treatment, including: autogenic training (AT, or autogenics) and autogenic therapy (hypnotic relaxation techniques); orthopractic (a system involving massage); the Pritikin program; Swedish massage; and Weight Watchers.

The researchers stated: "Relaxation techniques, chiropractic, and massage were the unconventional therapies used most often in 1990." This did not surprise me in the least. (For further details, see Chapter 4 of my book *"Alternative" Healthcare: A Comprehensive Guide*.)

Nutrition Nonsense & Healthcare Esoterica

This occasional section will contain: (1) brief descriptions of mystical health-related methods I have not described elsewhere and (2) revisions of such descriptions. References are within brackets.—J.R.

Aura imaging photography (aura imaging): Variant of Kirlian photography—the basis of Kirlian diagnosis, which supposedly involves indirect analysis of the human “energy field” (“aura”). Aura imaging is a purported means of reading the “true character” of individuals. It is promoted in the U.S. by Johannes R. Fisslinger, the German author of *Aura Visions* and *Aura Imaging Photography*. It “pretty much” hinges on the *Aura Camera 3000*, also called the *Aura Image Camera 3000*, a computer system that produces instant photos. The “aura” colors in such photos purportedly “reflect your emotional-psychological health and spiritual well being.” A flyer titled “Aura Consciousness” provides examples: “Red in the heart center may mean courage. The same red seen in the left [energy] field may mean a change to a more energetic life coming in the near future.” A black-and-white ad features alleged photos of an aura “before and after a therapy session and healing.” The camera is the centerpiece of the *Aura Imaging System*, which includes a printout device and a video device. [“Pre-Registration Catalog of Workshops” for the New York, November 18–20, 1994, Whole Life Expo, pp. 6 and 8; personal phone conversation on November 2, 1994, with Paul, representing the Progen Company, in Redwood City, California; mailing from Progen Company post-marked November 2, 1994]

Beyond TherapySM: Variant of dreamwork promoted by psychotherapist Ken Costello, M.A. “Dreamwork” refers to any systematic inquiry into or use of dreams for the purported purpose of healing or self-development. The premise of Beyond Therapy is that everyone is a “Spiritual Being” with a whispering “Inner Self.” [Display on p. 27 of the November/December issue of *Newlife*]

Black Hat tantric Buddhist feng shui: Form of *feng shui* (see below) promoted by Nancy SantoPietro, a psychotherapist specializing in the “psycho-spiritual healing process.” According to her flyer, *feng shui* “was initially used to site auspicious locations for ancestral burial plots” in ancient Asia. *Mademoiselle* quotes SantoPietro: “When your environment is aligned, your chi can flow and all things are possible.” The Black Hat Sect is an “esoteric” school of *feng shui* that emphasizes *YI*—“the powerful use of blessings.” [Ad on page 86 of the October/November 1994 issue of *Free Spirit*; flyer received from Nancy SantoPietro, of Brooklyn, New York, on October 21, 1994; *Mademoiselle*, November 1994, p. 168]

Feng shui (pronounced “foong shway” or “fung schway”): “A kind of ‘acupuncture for spaces,’” according to Martin Wright. *Feng shui* is the ancient Chinese art of situating or orienting material structures and towns to increase the inflow of “good” energy and restrain “bad” energy. Well-being of the residents allegedly results. The premise is that all areas, large and small, have a distinctive “energy” that is guidable by changing the area’s configuration (e.g., removing an ornament from an apartment, or adding one to a particular corner of a room). No-noes include clutter, dark corners, gloomy colors, low ceilings, and sharp, pointed objects. “Feng shui” literally means “wind water.” [*Gulliver’s Macrocasm*, Fall 1994, pp. 16–17. This magazine/class schedule, also called *Macrocasm*, is published by Gulliver’s Living & Learning Center, in New York City.]

Future life progression: Form of “hypnotherapy” provided by Chet B. Snow, Ph.D., the author of *Mass Dreams of the Future* and a reputed expert on Edgar Cayce (see *NF*, Vol. 8, No. 1). It is an alleged means of viewing the life of a future incarnation of oneself. To accomplish this, one must “step into” space-time. [Edition of the syndicated newsmagazine “Sightings” broadcast twice on WNYW (Fox) on October 9, 1994; “Pre-Registration Catalog of Workshops” for the New York, November 18–20, 1994, Whole Life Expo, p. 13]

Holoenergetic healing® (holoenergetics®): Quasi-psychotherapeutic form of “energy healing” christened and promoted by Leonard Laskow, M.D., author of *Healing With Love* (Harper, 1992). In an interview for *Yoga Journal*, Laskow described the first of a series of alleged revelatory experiences that had led to his development of holoenergetics:

It was about two o’clock in the morning [at a meditation retreat], and I was in deep meditation. Suddenly, there was this incredible presence, and a voice that said, “Your work is to heal with love.” As soon as I heard it, I knew that it was telling the truth.

The following ideas underlie Laskow’s method. (1) Separation is illusory. (2) Maintenance of this illusion requires “energy.” (3) Often, physical or mental illness or stress is symptomatic of such consumption of “energy.” (4) Releasing oneself from the illusion of separation liberates tremendous “energy.” (5) Healing is the gradual elimination of the illusion of separation. Holoenergetics comprises four stages: (1) the recognition phase, wherein the patient purportedly identifies the source of his or her illness; (2) the resonance phase, wherein the patient allegedly comes to terms with the aforesaid source; (3) release, wherein the patient supposedly releases the “disharmonious energetic pattern” associated with the source; and (4) the reformation phase, wherein, according to Laskow, the patient replaces the “dysfunctional” pattern with an image symbolizing “the positive life-force intent...the energy that’s aligned with the natural order and harmony of the inherent healing process of the body.”

[Flyer received in November 1994 from Dr. Laskow’s office in Mill Valley, California; *Yoga Journal*, March/April 1991, pp. 43–49]

Motherhand shiatsu: Form of shiatsu whose main distinction appears to be that the “giver” and the “receiver” are “equally clothed” during sessions. [Ad on page 67 of the October/November 1994 issue of *Free Spirit*]

Network spinal analysis (network chiropractic, network chiropractic spinal analysis, Network): Distinctly vitalistic form of chiropractic developed by Donald Epstein, D.C. It embraces the following postulates. (1) An innate or “resident” intelligence, defined as inborn wisdom, governs all human biological processes through the nervous system. (2) This “intelligence” directs the “life force” (“vital life energy” or “vital life force”), which bestirs every cell. (3) Malposition of the spinal cord, nerves, and vertebrae can cause mechanical tension that may impede the “vital life force.” (4) Mental and chemical stress can cause such mechanical tension. (5) Removing mechanical impediments to the “vital life force” heightens the operation of “innate intelligence” naturally. (6) “The universe and society are intrinsically good.” A 1992 *Los Angeles Times* article quoted Epstein: “[T]he body’s innate intelligence will never do anything to harm the body.... The body will choose when to release material it doesn’t need, be it emotionally, physically or chemically. A person may cry, shake,

sneeze or even vomit." (See "Twelve stages of healing," below.) [Mailing postmarked November 3, 1994, from the Association for Network Chiropractic, in Longmont, Colorado. This mailing included: *Network Chiropractic Alignment for Growth*, Vol. 1, No. 4, ©1993 Innate Intelligence, Inc.; and a reprint of an article in the April 9, 1992, issue of the *Los Angeles Times*, titled "A Lighter Touch."]

Open Mind™ programming (Open Mind advanced programming): Use of Open Mind™ "soundtracks," a group of musical audiocassettes, to (for example) attract love or wealth, maximize one's creativity, build one's self-esteem, reduce stress, take charge of illness, overcome shyness, and expand one's "psychic powers." The tapes reportedly contain "success affirmations." [*SuperLife™*, Fall 1994, page 23. This catalog is published by Zygon International, Inc., in Redmond, Washington.]

Osteokinetics®: Nonmassage mode of bodywork involving: (1) nonmechanical traction and (2) "palpation" of bones, purportedly by "vital life force energy." It supposedly addresses pain, flexibility problems, and somatizations of emotionality and "psychology." [Display on p. 32 of November/December 1994 issue of *NewLife*]

Passion-for-life psychotherapy: Shamanistic method promoted by Batya D. Winninger, M.A., C.S.W. It posits "past lives." [Ad on page 92 of the October/November 1994 issue of *Free Spirit*]

Self expression therapy: "Holistic" form of "psychotherapy" promoted by Ralph Gray, C.S.W. It purportedly involves listening carefully to one's "true inner self," reconnecting thoughts and feelings, "releasing" physical and emotional "blockages," and recovering one's "authenticity." [Display on p. 30 of the November/December 1994 issue of *NewLife*]

Sound energetics: Invention of Helena Reilly, M.A., that purportedly involves analysis of vocal "frequencies" and the use of "personalized" tones to remove "blockages" and "negative energy patterns." [Ad on page 57 of the October/November 1994 issue of *Free Spirit*]

Spirit releasement therapy: Supposedly complementary method developed by William Baldwin, author of *Spirit Releasement Therapy: A Technique Manual/Second Edition* (Human Potential Foundation Press, 1992). It is a treatment for demonization (possession), which Baldwin terms "spirit attachment." [*Re-Source*, Autumn 1994, Vol. 5, No. 3, p. 33. This "resource guide" is published by the Institute of Noetic Sciences, in Sausalito, California.]

SuperShape psychological conditioning system: Audio subsidiary to the SuperShape permanent weight control system, a 4-audiocassette course for weight loss, "body shaping," and

maintenance of "ideal body size." The "conditioning system" consists of two audiocassettes whose "soundtracks" allegedly "implant high self-esteem and 'thin within' mental conditioning" into one's "inner mind." [*SuperLife™*, Fall 1994, page H8. This catalog is published by Zygon International, Inc., in Redmond, Washington.]

Thai massage: Mode of bodywork that borrows from acupressure, reflexology, and "passive" yoga therapy (a variant of hatha yoga). [Fall 1994–Spring 1995 Schedule of Events, Heartwood Institute, Garberville, California]

Twelve stages of healing: Alleged extraordinary approach to healing physical, mental, and spiritual ills. In 1983, the method's "discoverer," chiropractor Donald M. Epstein, invented a mode of chiropractic called network chiropractic. (A new term for the latter method is "network spinal analysis"; see above. It is also called network chiropractic spinal analysis.) Supposedly, 12 "stages of consciousness" are common to all humanity. Nearly all of Epstein's stages involve both: (1) yoga- or Qigong-like exercises and (2) declarations. For example, the first stage ("Suffering") involves declaring: "Right now, I am helpless" and "Nothing works at this time." On page 19 of *The Twelve Stages of Healing*, Epstein states: "The most appropriate response to Suffering is to stop thinking about its causes." (See this issue's "Books, Lies, & Audiotape.") The 7th stage involves "declaring": "Oooh," "Ahhh," and "Whoosh." The 9th stage involves declaring, "I experience my vital force"; and the 11th stage, "May it be on Earth as it is in Heaven." [*The Twelve Stages of Healing: A Network Approach to Wholeness* (1994); personal phone conversation on November 3, 1994, with representative of The Association for Network Chiropractic, in Longmont, Colorado; press release from New World Library, San Rafael, California]

UltraVit 7-day juice slimming program: "Mild fasting" program involving vegetable juice, sauerkraut juice, and dietary supplements. By drinking only the *UltraVit* juices and avoiding intake of solid foods for one week, one supposedly cleanses one's digestive tract. Through the program, one allegedly also "selectively burn[s] up damaged and dead cell tissue" and frees amino acids from "old cells" for recycling into healthy cells. [*SuperLife™*, Fall 1994, page 60. This catalog is published by Zygon International, Inc., in Redmond, Washington.]

UN system: Form of chakra healing whereby seminar-trained individuals purportedly access an "energy" capable of helping in, for example: activation of the immune system, stabilization of "planetary influences," and terrestrial "anchoring" of light. [Ad on p. 65 of the October/November issue of *Free Spirit*]

READERS' FORUM

Doctor of Philosophy...or Nutrition?

Dear Mr. Raso:

In the recent edition of *Forum*, Vol. 11, No. 3, May/June 1994, a question was raised regarding availability of a doctoral degree in nutrition. A number of doctoral degrees in nutrition are available in the U.S. A listing of these programs is available from several sources, including The American Institute of Nutrition. This office publishes a listing of doctoral programs in nutrition in the U.S. You may wish to contact: Dr. Richard G. Allison, Ph.D., 9650 Rockville Pike, Bethesda, MD 20814.

Especially those doctoral programs in nutrition that are affiliated with medical centers are likely to have more clinically related programs. Most doctoral degree programs provide options as to a dissertation versus other clinically oriented options. These programs also provide very strong background courses in health sciences, thus preparing graduates to be very effective in the medical setting. This would be ideal as academic preparation for a strong leadership role in clinical dietetics.

Eleanor A. Young, Ph.D., R.D., L.D.
Professor, The University of Texas Health Science Center
at San Antonio

Thanks for the information. However, you may have missed the point I tried to make in both the March/April and May/June issues: It is not that clinical R.D.s lack sources of clinical nutrition-related doctorates; it is that no unmistakably nutrition-related doctorate (e.g., "NutritionD") is available. It is high time that the definition for "clinician" included clinical dietitians. I would like to see institutions of higher learning with nutrition-related doctoral programs adopt an open-door policy toward clinical dietitians with a health-related master's degree. Indeed, I would like to see them roll out the red carpet to such dietitians, in the manner of "distant learning" institutions.

**Emblem of the Chicago
National College of
Nnaprapathy**

"Diploma Mill Bill" → Kentucky-Fried Quacks?

Dear Nutrition Forum:

Regarding your article "The Color of Quackery?" [NF, Vol. 11, No. 3], I would like to commend to health professionals a solution we have found in Kentucky. In 1988 our General Assembly passed a fraudulent degree act, also called the diploma mill bill. This act prohibits any person from holding himself out as a bona fide practitioner in any health profession unless his degree was issued by an institution accredited by a regional or professional accrediting agency recognized by the U.S. Department of Education [USDE] or the Council on Postsecondary Accreditation [COPA]. Any professional health group or consortium could seek this law. In our case it was the Kentucky Dietetic Association and the Attorney General's Health Fraud Task Force.

This bill is difficult to testify against in legislative committees. Few persons are willing to step forward to defend their diploma-mill degree. In our case there was no opposition.

Another benefit is that bona fide professionals who have advertised in the [Yellow Pages] section of another professional group have been required to remove their ads from that section and place it in a more appropriate Yellow Pages category. For example, a physician advertising himself as an expert in weight control placed his ad under "Dietitians." The attorney general's office informed him that his ad must henceforth appear in a physician category. This would also apply if a masseur/masseuse place an ad under "Physical Therapists," etc.

Formerly, some dietitians had complained to the Yellow Pages people about a health food store listing under "Dietitians," but the Yellow Pages will place an ad wherever anyone wants it, without investigation. Dietetic associations, which have so recently attained credentials in many states, have members educated in the legislative process. They should take the lead in seeking this valuable legislation.

Nancy C. Tullis, R.D., C.N., Louisville, Kentucky

On October 24, I spoke with Tess Kirsch, of the Commission on Recognition of Postsecondary Accreditation (CORPA).

Ms. Kirsch informed me that on January 1, 1994, CORPA became the "successor organization" to the defunct COPA. She further stated that CORPA "has continued the recognition process that COPA had done previously."

Note: Healthcare-related professional accrediting agencies recognized by both the USDE and CORPA include: the American Dental Association, The American Dietetic Association, the American Medical Association, the Association of American Medical Colleges, the Council on Naturopathic Medical Education, the American Osteopathic Association, the American Optometric Association, the American Physical Therapy Association, the American Psychological Association, and others.

Coming to Grips with Naprapathy

Dear Mr. Raso:

I am a member of the NCAHF [National Council Against Health Fraud] and a subscriber to *Nutrition Forum*....The purpose of my writing...is to commend you on your new book "*Alternative Healthcare*," which arrived yesterday; I have just about finished reading it. Although I am familiar with some of the material from *Forum*, I am finding much that is new. The format allows me to have a huge amount of information at my fingertips. This will be of value when I lecture—with the alphabetically arranged reference material, which I can use to deal with questions about some of the modalities with which I am less familiar....

I would like to share with you an experience of [seven or eight years] ago involving a "therapy" that you didn't include in your book: naprapathy. Our high school extension program listed a course called "Nutrition for People on the Go" taught by a naprapath....I maintained my "cool" fairly well until he claimed that Linus Pauling had received a Nobel Prize for...vitamin C research! His approach seemed basically the Natural Hygiene nuttiness with some applied kinesiology thrown in for good measure. At one point he asked me if I was a "sugar person"....I responded that I do indeed ingest refined sugar. (Have you ever noticed that, if there is one thing that all the fringe people are psychotic about, it's sugar?) And he invited me to participate in an experiment. First, he had me extend an arm and told me to resist the pressure he applied. Then, when I was able to move him away, he produced a restaurant-size packet of sugar and told me to pour half of it under my tongue without swallowing. To prove the weakening effect of that evil substance, he had me extend my arm again and resist his pressure. Naturally, he was stronger than I this time around. Also, naturally, he changed the fulcrum.... He told us that he ingests forty supplements daily (where does he have room for dinner?), that eating melons along with other types of fruit was unhealthy ("We don't know why; it just is"), and that he and other "alternative healers" are more interested

in philosophy than in science ("If it seems like a good idea, it probably works").

Since one of the world's only two "colleges" of naprapathy is in Chicago, I am disappointed that you didn't include the modality [in *"Alternative" Healthcare*]. I have been to their headquarters, a dismal, dreary old building on Chicago's northwest side....I find them interesting in a repugnant sort of way, like viewing a bad accident that you don't want to look at but can't keep yourself from watching.

Kurt Youngmann, Highland Park, Illinois

Mystical Diets (1993) deals with naprapathy in three places. *"Alternative" Healthcare's* working title was "Mystical Healing"—a term I use to refer to the vast assortment of health-related systems and methods that posit, or at least point to, supernatural "phenomena." I did not describe naprapathy in the latter book because I did not (and do not) discern supernaturalism either in the system or in related claims.

Comments: Naprapathy is a system of bodywork that originated with chiropractic professor Dr. Oakley G. Smith, author of *Modernized Chiropractic* (1906). The 1987–1989 catalog of the Chicago National College of Naprapathy quotes Smith, who described his system as originally a "reaction" to medicinal, osteopathic, and chiropractic principles. According to the 1994–95 catalog, naprapathy: (1) is a professional healthcare system; (2) is based partly on the principle that soft connective tissue in a state of contraction can cause "neurovascular interference," which may cause "circulatory congestion" and "nerve irritation"; (3) contends that reducing this "interference" (primarily by hand) paves the way for optimal homeostasis; and (4) in practice, includes "noninvasive modalities" such as nutrition counseling. The 36-month program is accredited by the Council of Colleges of the American Naprapathic Association, which is not a nationally recognized accrediting agency. Recently, school representatives told me that the only other school of naprapathy in the world is in Sweden.

A flyer I received from the school in September states: "An irregular and stressful lifestyle imposes additional 'silent' nutritional needs that the patient may not be aware of. Your Naprapath is well qualified to assess and advise concerning the adequacy of your nutritional intake." Well qualified? According to the school's current catalog, only three of the school's "degree" courses deal expressly with nutrition: "Science of Nutrition and Diet" I and II (SND 501 and SND 601) and "Clinical Nutrition Approach to Wellness" (NCN 603). Another course, "Naprapathic Therapeutics," includes the topic "diet and exercise counseling." SND 501 reportedly covers the "basic principles" of human nutrition. SND 601, a "continuation" of the former course, reportedly emphasizes current issues in diet and nutrition. NCN 603 covers the relationship of food and food supplements to health.

(Linus Pauling, who died of prostate cancer in August at 93, received two Nobel Prizes, both unshared: the first for his research on how atoms coalesce into molecules,

the second for campaigning against nuclear testing. According to the September 5, 1994, issue of *People*, he did not become a high school diplomate until after he had won the Nobel Peace Prize.)

"Religious Connections": Hidden Agenda?

Dear Mr. Raso:

I have enjoyed reading *Nutrition Forum* for some years now and wanted to applaud your recent issue about Ayurveda. You very clearly and correctly identified these questionable healing practices as religious in nature. I have found that most participants in such practices are unaware of the religious connections and that many so-called alternative methods are based entirely on a particular religious philosophy.

As you can see by the enclosed book [*The Hidden Agenda: A Critical View of Alternative Medical Therapies*], written by my wife [registered dietitian Sharon Sneed], who has a Ph.D. in nutrition, and myself, I have a substantial interest in the subject. The religious connections of these practices are by and large either ignored or unknown by the public. It is shocking to see public institutions and even the government be unwitting participants in what are in essence religious rituals.

Those promoting such health cults have clearly recognized the value of what [meditation researcher] Herbert Benson [M.D.] calls the "faith factor" in furthering their cause. It is particularly disturbing to see large, well-respected health organizations such as Sharp HealthCare in San Diego embrace such practices. I spoke on this very subject at a national Family Practice meeting in San Diego two years ago. Afterwards I was introduced to one of the medical directors for Sharp and we discussed Chopra's Ayurvedic scheme. From our discussion and the supporting papers I sent, they knew very clearly what they were buying into.

While I think it possible we may differ about spiritual matters, I wholeheartedly concur that "many are pushing religion but calling it medicine." Whether that occurs within or [outside] of any particular religious belief is irrelevant....[It is] a disservice to both science and soul. If I can ever be of service in this area, please call.

David L. Sneed, D.O., Austin, Texas

Thanks for your vote of support and for the copy of your book. *The Hidden Agenda* (Thomas Nelson Publishers, 1991) is readable, but it implicitly promotes an imagined alliance of science and Christianity as the superior alternative to New Age medicine and "Eastern religions." (I would prefer New Age eclecticism, which tends toward hedonism, to Christianity, which tends toward masochism. I'm glad I need not choose.) "Trouble spots" in your book include the following. On page 4, you cite "natural foods" as a "scientifically proven beneficial technique." On page 162, you claim that the Holy Spirit brought a naturopath to the "understanding" that New Age methods are unchristian attempts at sorcery. On page 217, you state: "God is sovereign and can

cure." On page 234, you describe prayer as part of the "antidote" to doctrinally "contaminated" medical practices. The appendix lists some twenty-eight "alternative health care practices" and describes them partly in terms of "spiritual concerns"—e.g., "completely unbiblical," "completely contrary to biblical warning," "a clear violation of Biblical warnings," and "invites demonic influence."

You quote Scripture in several places. Doing so to fight medical supernaturalism invites the exchange of one set of irrational beliefs for another, or the muddling of both sets. It is rather like pitting "vital energy" against the "vital force." The September/October 1994 *Bulletin Board* of the National Council Against Health Fraud includes a brief with the heading: "CHRISTIAN MINISTRIES FIND QUACKERY TOUGH TO TACKLE." According thereto, at least two Christian ministries that have dispraisingly informed their supporters about "New Age medicine" have more or less backed down because of financial concerns. The brief concludes: "Leaders have expressed dismay over the stranglehold quack practitioners have on their constituencies." This did not surprise me.

Dr. Sneed, if you believe in demons, the Holy Spirit, and the soul, let me assure you that we differ enormously on "spiritual matters." Such beliefs—no matter what the bible says, seems to say, or supposedly says—conduce to acceptance of vitalism and magic, key ingredients of the alternative-medicine and New Age movements. In *The Supernatural, the Occult, and the Bible* (Prometheus Books, 1990), Prof. Gerald A. Larue, president of the Committee for the Scientific Examination of Religion, illustrates biblical recognition of astrology, clairvoyance, levitation, magical healing, and giants relative to whom the ancient Jews were like insects. I also recommend *Deadly Doctrine: Health, Illness, and Christian God-Talk* (see this issue's "Books, Lies, & Audiotape").

I would venture to say that blind or inhumane greed is our mutual target, Dr. Sneed. But I have an additional target: the organized irrationalism that lulls the desperate and the disadvantaged, empowers the greedy, and supernaturalizes evil.

Note: So-called Christian skeptics are the most ardent "religious skeptics," but the primary objects of their half-baked skepticism are New Age practices, which they treat as corrosive to Christianity. Some Christians are pushing religion but calling it skepticism.

The Haunting

Dear Jack Raso,

Thought you might be interested in this flyer I recently received. It brings back memories of your article "Out on a Limb" [NF, Vol. 11, No. 1]. Do you suppose the ADA [The American Dietetic Association] is going to award CEUs [continuing education units] for this program? It doesn't look like a balanced program to me.

It saddens and embarrasses me to see the profession of dietetics going in this direction. Awareness of "alternative

weirdness" is one thing; supporting and sponsoring a program is another. Is it me who's crazy, or the rest of the ADA?

You summed it up beautifully in your article's concluding remarks: "...the doublespeak of semi-approval: it is one thing for practitioners to discuss questionable methods; it is another to encourage, albeit tacitly, desperate people to use them." The Western Colorado Dietetic Association is inviting big problems.

Gayl Easter, Denver, Colorado

P.S. I am an R.D., too. But the "body snatchers" haven't gotten me yet!

I became aware of the November 1993 "alternative nutrition" conference when I received a flyer in the mail. I deemed it more or less unnewsworthy and eventually decided not to attend. I changed my mind after *NF* associate editor Ira Milner, R.D., urged me to go. It seems to me that dietitians, once notable holdouts and even pariahs to alternativists, are increasingly coming out in favor of alternative healthcare.

Comments: Ms. Easter is the Denver Dietetic Association's Consumer Issues Chairperson. The title of the prospective seminar to which she alluded is "Exploring Controversial Therapies in Nutrition." The following information derives from the flyer. The seminar has two sponsors: (1) the Western Colorado Dietetic Association and (2) Valley View Hospital, in Colorado's Glenwood Springs (the seminar site). Six CEUs "have been applied for with ADA." The speakers total four: (1) Jackie Nielsen, M.S., R.D., Colorado's area network coordinator for the National Council Against Health Fraud; (2) Tara Skye Goldin, a "Naturopathic Physician"; (3) Bing Lee, an "Acupuncturist" who graduated from the "College of Acupuncture and Oriental Medicine in San Francisco"; and (4) Brigitte Mars, an "Herbalist" who owns Unity Herbs, in Boulder. The title of Mars' talk is "Herbal Nutrition and Healing." Math is not my forte, but I count three alternativists and one critic.

On October 19, the day I received Ms. Easter's letter, I phoned ADA, the Colorado Dietetic Association (CDA), seminar contact Cindy Krisinger, and Ms. Easter, in that order. I also attempted to call the "College of Acupuncture and Oriental Medicine." In the office of the Commission on Dietetic Registration (the credentialing agency for ADA), someone who identified herself as Carla told me that the state of Colorado is responsible for dietetic CEU approvals for programs within the state. She further said that ADA does not review Colorado programs for the state but simply enters such approvals "into the C.E. database system." Carla referred me to the CDA. There, Beth answered the phone and told me that the CDA "has nothing to do with" the Controversial Therapies seminar. She suggested that I call the contact whose phone number was on the flyer. So I phoned Cindy Krisinger and asked her if any agency had authorized dietetic CEUs for the seminar. Ms. Krisinger stated: "We put this together kind of quick." She said that the sponsors thus had not yet applied to ADA for CEUs, but she added that she very much expected approval. Ms. Easter

told me that she had called the CDA that day and that a spokeswoman had indicated unfamiliarity with the seminar.

I called the directory assistance line for area code 415 to get the number of the "College of Acupuncture and Oriental Medicine." Evidently, both the operator and a supervisor looked for such a listing in San Francisco but did not find even a "long shot," except for the "United Acupuncturists of California"—whose phone went unanswered.

On the following day, I phoned the American College of Traditional Chinese Medicine, in San Francisco, the only such institution in San Francisco listed in the 1992–1993 *Holistic Health Directory*. Victoria answered the phone and told me she thought that the "College of Acupuncture and Oriental Medicine" had closed down several years ago. Next, I turned to *Alternative Medicine: The Definitive Guide* (1993)—see this issue's "Books, Lies, & Audiotape"—and phoned the number therein for the American Association of Acupuncture and Oriental Medicine (AAAOM), in Raleigh, North Carolina. I contacted a management company that used to represent AAAOM, which is in Pennsylvania. Joy answered AAAOM's phone and told me that AAAOM did not have a listing for the "College of Acupuncture and Oriental Medicine." Then, for the third time in two days, I tried to

reach the United Acupuncturists of California, to no avail.

On October 21, Cindy Krisinger stated on my answering device that the "Controversial Therapies" conference had been "approved for six [C.E.] hours with ADA."

Incidentally, Ms. Easter and I also exchanged dim views of NBC's "The Other Side," a paranormal-promoting morning talk show that purports to take "an objective look at psychic phenomena, ESP, ghosts, alternative healing, and more." The show's name refers to "the other side of everyday existence." Recent editions of the show had focused on near-death experiences (NDEs) and "miraculous healing" (including vibrational medicine). Later topics have included: angels ("divine bodyguards"), contact with "departed loved ones," "full moon madness," Ouija, so-called out-of-body experiences (OBEs or OOBs), unearthly aliens "breeding" with humans, "the violent world of the poltergeist," and "unfriendly ghosts....hauntings." I have noticed much more credulity (true or false) than objectivity. The host is Dr. Will Miller, a licensed psychotherapist and Baptist minister. In the October 22–28 issue of *TV Guide*, freelancer Mark Nollinger called "reality-based programming targeting unreality" TV's hottest trend. He quoted the executive producer of "Sightings": "It's 20/20 meets *The Twilight Zone*."

Loose Ends

Jack Raso

With our last issue, *Nutrition Forum* entered its 10th year of continuous publication. In the 1980s, *NF* was my foremost beacon of skepticism in nutritional matters, amidst a vast swampland of disinformation and "health porn." By "health porn," I mean titillating misrepresentations of opinions or limited findings as grounds for the general use or disuse of a method, product, or substance. During the development of this issue, I told *NF*'s originator, Dr. Stephen Barrett, that it would be offbeat. He responded that all of the recent issues were offbeat.

But *NF*, in my view, has always been offbeat. My twist has been to foster rational skepticism explicitly and to explain unscientific dietary and nutritional practices in the context of *medical alternativism*—my term for the movement whose goal is to undermine health science.

Below I deal with three letters from nonsubscribers who expressed discontent with articles of mine published in *NF* this year.

Further "Out on a Limb"?

In a letter dated June 14, Robert Dostis, M.S., R.D., and Margaret Dziadek, C.S.W., R.D., both with the Gay Men's Health Crisis, Inc. (GMHC), stated:

Your article, "Out on a Limb," in the January/February 1994 issue of *Nutrition Forum*, paints a very distorted picture of the "Alternative Nutrition Strategies for

HIV/AIDS" conference that the Gay Men's Health Crisis cosponsored in November 1993....The purpose of November's conference was to provide a forum for the exchange of ideas and experiences in dealing with HIV-related nutrition problems. Our aim was to open dialogue among people with different approaches to the same problems, without either endorsement or dismissal, in an atmosphere of mutual respect and openness....

Despite your disparagement of much that was said as "advocacy of unscientific empiricism," you apparently do not object to anecdotal evidence when it's *your* anecdotal evidence. I refer to your efforts, described at the end of the article, to find support for your belief that megadoses of vitamin C could result in hypovolemic shock. You found interest, but no scientific verification, yet still expressed belief based on the experience of your own diarrhea and one doctor's report of having witnessed one case of hypovolemic shock....

The response of those attending has been overwhelmingly favorable, and we are proud to have opened this door....

Honestly, I am fed up with pleas for "open dialogue" in regard to alternative healthcare (see this issue's "Readers' Forum"). Carol-Jane Rand, R.D., the GMHC staff nutritionist who had designed the conference, phoned me on December 3, 1993, and claimed that the conference had had "an equal number of proponents and critics." The main speakers at the conference numbered eight. I heard very few critical statements from any of these speakers regarding specific

methods advanced at the conference: acupuncture, antioxidant "co-therapies," Chinese herbal medicine, and nutrient pharmaco-therapy (the use of specific micronutrients, e.g., vitamin C, in amounts at which they exhibit pharmacologic properties). Incidentally, the 1993 GMHC paperback *Living with AIDS: A Guide to Resources in New York City/Third Edition* includes a two-page section titled "Holistic/Alternative Therapy Services." The stated offerings of the 19 organizations listed include: acupuncture (e.g., at GMHC), ayurveda, hatha yoga, "holistic psychotherapy," homeopathy, "imagery," "IV vitamin therapies," ozone therapy, "polarity sessions," rebirthing, "spiritual healing," transcendental meditation, and "visualization."

I have never expressed a belief that "megadoses of vitamin C could result in hypovolemic shock." I stated: "Despite the lack of data, exacerbation of diarrhea due to ingestion of vitamin C seems a legitimate issue." While my mention of my apparently vitamin C-induced diarrhea was arguably misplaced, consider that, in making such mention, I was not promoting a product, a private practice, a store, or an institute. In other words, I did not (and do not) have a vested interest in unselling vitamin C supplementation. (I take dietary supplements, but not megadoses of vitamin C and not regularly.)

I do not doubt that GMHC's participation in the conference was based on good intentions. However, in my opinion, the conference was, as a whole, a disgrace to its sponsors and something of a disservice to HIV-infected persons.

The Executioner's Song?

In a letter dated July 5, Robert Crayhon, host of a radio show called "The Voice of Wellness," stated:

"Forum" comes from the Latin, meaning the outdoor meeting place where legal and political business is conducted. As chief writer, publisher and editor, [sic] your publication can hardly be considered an open discussion. You are jury, judge, and executioner, with all of the scientific objectivity of a kangaroo court. Not only is your lack of nutrition knowledge evident in your article, your style implies that anything you put in quotes is "bad." This is "fake" investigative journalism of the worst kind.

In a letter, I asked Mr. Crayhon to specify both the article to which he had referred and the statements therein that, in his opinion, evidenced a lack of nutrition knowledge. In a two-page reply mailed later that month, Mr. Crayhon stated: "Your lack of nutrition knowledge shines through in many areas, notably in your dismissal of higher doses of vitamins as merely something that 'can have adverse effects.'" He did not specify the article to which he had referred; and, despite his allusion to "many areas" of knowledge deficit, he specified only one instance that supposedly demonstrates the alleged deficit.

This newsletter is not a free-for-all arena. At least three members of the editorial board perform a prepublication review of each article I write. Nonmembers have also participated in the review process. Way too many publications provide a platform for true believers, irrationalists, and exploiters of the wide-eyed. *Nutrition Forum*, as I see it, is primarily a forum of and for skeptical health professionals.

In the sense that I consider claims and methods and develop critiques for publication, I am a judge. If I merely conveyed claims and described methods uncritically, I would be a funnel for misinformation and disinformation. In his reply, Mr. Crayhon stated that he considered me an executioner because (he said) I was trying to undermine the career of a particular health professional. This was (and is) not so; but, in any case, such an endeavor does not warrant calling the attempter an executioner.

Finally, I *sometimes* use quotation marks under the following circumstances.

- I don't know the meaning (or intended meaning) of a term.
- A term refers to something ill-defined, or the existence of the referent is unproven, unlikely, or untestable.
- A phrase or statement is ambiguous, outlandish, or incomprehensible.
- A designation is (1) ambiguous, (2) misleading, or (3) both nonstandard and self-applied.
- Without quotation marks, a term would lend unmerited credibility to a method, system, or product.

Case closed?

BRIEFS

Cranberry juice against UTI. In a double-blind trial, elderly women who drank cranberry juice daily over a six-month period had lower bacterial counts and a lower incidence of urinary tract infection [JAMA 271:751-754, 1994]. The benefits apparently are unrelated to changes in the acidity of urine. (The median pH of the cranberry juice group was higher than that of the placebo group.) The authors cautioned that further research is necessary to determine whether these findings are useful to the prevention or treatment of urinary tract infections. Reprints are obtainable from: Jerry Avorn, M.D., Program for the Analysis of

Clinical Strategies, Brigham and Women's Hospital, 221 Longwood Ave., Boston, MA 02115.

Free sample. Readers have phoned to inquire about *The Diet Business Bulletin*, the quarterly newsletter cited in the brief on Susan Powter [NF, Vol. 11, No. 1]. To obtain a free sample of the *Bulletin*, edited and published by John S. LaRosa, call (516) 791-6579. Mr. LaRosa is president of Marketdata Enterprises, Inc., which offers diet industry-related mailing lists, market research reports, and custom research.

FTC trims Cybergenuics. L&S Research and its founder and CEO Scott Chinery have agreed to pay \$1.45 million to settle charges that they made numerous false and unsubstantiated claims in the advertising and sale of *Cybergenuics Total Body Building System*, *Cybergenuics for Hard Gainers*, *Cybertrim*, *Quicktrim*, and *Mega-Fat Burner Tablet* (also called *SuperFat-Loss Tablet*). The FTC had also charged that "before-and-after" photos used in the ads were deceptive because they did not reflect the typical or usual experience of users. The consent agreement prohibits claims that use of these or similar products can cause more muscle gain or fat loss than nonuse, unless there is reliable scientific evidence to support such an assertion. The agreement also bans unsubstantiated claims that the inclusion of chromium picolinate in a product or program can cause muscle-building, weight loss, or a reduction in blood cholesterol.

"Hatch bill" enacted. On October 25, President Clinton signed the Dietary Supplement Health and Education Act of 1994 (DSHEA), whose spearhead was Republican Utah senator Orrin Hatch. The law impairs the FDA's ability to regulate the supplement industry. For example, in matters of safety, the agency now has the burden of proof. DSHEA also charges the FDA with developing label standards specific to dietary supplements before 1997, and the Secretary of Health and Human Services with establishing an Office of Dietary Supplements within the National Institutes of Health. Dr. Stephen Barrett will explore relevant questions in the next issue of *NF*.

Health-fraud opponents petition FDA. Forty-two critics of quackery and pseudoscience have jointly asked the Food and Drug Administration: (1) to require that all over-the-counter "homeopathic drugs meet the same standards of safety and effectiveness as nonhomeopathic OTC drugs" and (2) to issue a warning to the effect that the FDA does not recognize homeopathic "remedies" as effective. (See the entry *Emotional Healing with Homoeopathy: A Self-Help Manual* in this issue's "Books, Lies, & Audiotape.")

Hypnotists restrained. The Oregon Attorney General has obtained consent agreements halting schemes by two hypnotists who had promised high success rates for weight reduction and smoking cessation. Bob Dean had claimed in ads that women who attend his seminars typically reduce their dress size and that men would reduce their waists by 2-3 inches in only four weeks. Those who attended his "free" seminar were told that weight-loss success required buying a series of tapes and following a stringent diet and lifetime maintenance rules. Bobbie Lee Chaffin, operating under the names Roberto Di Silva and Doctor Michael LaSalle, claimed a 96% success rate that was unsubstantiated. Dean was assessed \$500 and ordered to comply with refund requests from any Oregonian who had purchased tapes during the previous two years. Chaffin was assessed \$2,400. Neither is permitted to continue doing business in Oregon.

Lieberman's name absent from CBNS mailing. A mailing received in October from the Certification Board for Nutrition Specialists (CBNS), source of the credential styled C.N.S. (Certified Nutrition Specialist), lists Penelope Edwards, M.P.H., C.N.S., as secretary. A mailing dated Fall 1993 had listed Shari Lieberman, Ph.D., C.N.S., as secretary. (Lieberman was the subject of two *NF* articles this year.) In the 1994 cover letter, CBNS president Stanley Wallach, M.D., stated that CBNS had grandfathered more than four hundred nutrition professionals into Certified Nutrition Specialists. He further stated: "The C.N.S. credential is the result of several years of study by a committee convened by the American College of Nutrition. Once it was decided to create this credential, the committee was incorporated separately. It is now independent of any existing board or professional society."

Nutrition Forum gets new publisher. Prometheus Books Publishers, Inc., Journals Division, has replaced the partnership of Jack Raso and David Xu as publisher of *NF*, which is in its tenth year of continuous publication. Paul Kurtz, Ph.D., founded Prometheus in 1969. It is the world's preeminent publisher of books on freethinking and skepticism. Its Consumer Health Library® includes *A Consumer's Guide to "Alternative Medicine," Examining Holistic Medicine, The Faith Healers, The Health Robbers, Vitamin Politics, The Vitamin Pushers* (see review in this issue), and Jack Raso's *Mystical Diets* and *"Alternative" Healthcare: A Comprehensive Guide*. (To order any of these books or to request a catalog, call 1-800-421-0351.) The Journals Division is responsible for printing, mailing, and marketing *NF*, while Jack Raso continues to function as editor in chief and "desktop publisher." (Associate editor David Xu has commenced employment with General Media Publishing Group, which publishes *Longevity*, *Omni*, and *Penthouse*.)

Sara Lee sees the "lite"? Sara Lee Corporation has agreed to pay \$130,000 to settle charges brought by 13 state attorney generals. The company had designated several of its sausage products "lite" or "light" despite the products' high fat content. (For example, over 76% of the calories in *Hillshire Farm's Lite Smoked Sausage* came from fat.) The settlement also requires Sara Lee to disclose the percentage of fat reduction for "lite" sausage products and prohibits "percent fat-free" claims unless the product is low in fat.

Skeptic spotlights alternative healthcare. An article by Jack Raso heads up the current issue of *Skeptic* (Vol. 2, No. 4). Published by the Skeptics Society, a membership-based organization, *Skeptic* is an absorbing, well-illustrated quarterly whose specialty is dissecting claims related to cults, health, history, and religion. Each issue is about a hundred pages long and revolves around a theme. The current issue is available for \$8 (which covers shipping and handling) from: Skeptics Society, 2761 N. Marengo Ave., Altadena, CA 91001. For further information, call (818) 794-3119.

Wholly, Holy, Holy Pills, Magic, and Religion at the Whole Life Expo

Jack Raso

Alternative healthcare is but one division of a motley collection of movements whose central thesis seems to be: Faith, based on common sense, subjective experience, and/or revelation, preempts rational understanding. I call this accumulation of movements *alternativism*. Alternativism includes: semibiblicism (e.g., millennialism), conspiracy-theorizing, the Fortean movement, parapsychology, pseudoscientific historical revisionism, pseudoscientific multiculturalism, UFO abductionism, unconventional religions, and socioeconomic alternativism. Socioeconomic alternativism includes communalism, "natural" lifestyles, naturism (nudism), multilevel (network) marketing, and organic farming. Such movements converge at dozens of "human potential" or "personal growth" fairs around the country every year. Most alternative movements manifest a laissez-faire disposition toward most antiestablishment movements and religious underdogs; the result is that all manner of poppycock and humbug goes uncriticized (at least publicly) by insiders at large.

Earth vs. the Flying Saucers

On November 18, I attended the eighth

New York Whole Life Expo, at the Roosevelt Hotel in midtown Manhattan. As I waited for a friend at the hotel's main entrance, I spoke with a smoker whose "badge" indicated he was an exhibitor. He told me he was an old hand at health expos. The general information section of the official program guide described the three-day affair as "the largest showcase in the world for holistic health and New Age awareness, with a commitment to healing ourselves and healing the planet." According to this section, the expo included more than a hundred 30-minute lectures,

more than seventy-five 1½-hour workshops, 150 exhibits, a bookstore, "psychic readings," and massage sessions. The "psychic readings" were available in "The Intuitive Arts Environment," where astrologers, clairvoyants, numerologists, "psychometrists," and "readers" of palms, "runestones," and tarot cards carried on their trades. ("Runestones" are stones, or stony objects, that bear runes—magical characters, e.g., ancient Germanic letters.) In short, the expo was an "amusement park" for dietary-supplement poppers and soul-seekers (who apparently deal with their "mortal coil" by taking "natural" supplements, meditating, and

Centerpiece (shown at actual size) of *New Frontier* cover

assuming yogic postures). The cover of the November/December 1994 issue of *New Frontier*, the "Magazine of Transformation," may have captured the spirit, so to speak, of the event. Complimentary copies of this issue were available at the expo.

On November 22, I spoke by phone with Michael C. Luckman, the New York expo's public relations director. At the expo, Mr. Luckman had lectured on "UFOs as the New Religion" and conducted a workshop titled "Earth vs. The Flying Saucers—Only This Time It's for Real." ("Earth vs. the Flying Saucers" is a 1956 sci-fi flick.) The program guide stated that his workshop would include reportage of "unprecedented changes in the world political landscape that appear to be directly related to coming UFO contact." Luckman told me that the Whole Life Expo had originated about ten years ago and that the expos take place annually in at least eight major cities across the U.S., including Los Angeles. He referred me to an article about the expo in the "Metro Section" of the November 20, 1994, issue of *The New York Times*. A photo of exhibitors wearing "head pyramids" accompanied Douglas Martin's uncritical article, which started: "Believers in an afterlife have always operated pretty much on faith. But as more and more people are revived from what appears to be death, the view from the other side is becoming clearer." According to Martin, Paul Andrews, the expo's executive producer, had had a near-death experience in 1976 that left him cocksure he was a "spiritual entity."

The "Brainy" Naturopath

Karen Purcell, "N.D.," who practices a form of "naturopathic health care," reportedly of her own invention, in Manhattan, ran the first exhibit we visited. There, with the help of her husband, she proffered iridology exams and "herb supplements" marketed by Nature's Sunshine Products, Inc. (NSP), a multilevel marketing company [see NF 9:17-23, 1993]. A flyer, a checklist form, and a questionnaire described Purcell as an "N.D.," a "Doctor of Naturopathy," and a "One Brain Facilitator." Another flyer, titled "Optimum Health," appends the initials "B.M." and "M.M." to her name. (On November 22, Purcell told me that these initials stand for "Bachelor of Music" and "Master of Music.") A business card stapled to a Nature's Sunshine leaflet designated Purcell a "Doctor of Naturopathy," a "Master Herbalist," an iridologist, and a "One Brain' Emotional Stress Defusion [sic] Facilitator." The "Optimum Health" flyer states:

For years health problems prevented Dr. Karen Purcell from continuing a promising operatic career and left her frustrated, stressed and depressed....

During the 1980's, Dr. Purcell was introduced to holistic health disciplines. She began applying these to her life and found them to be quite effective. As her health improved Dr. Purcell began

training in holistic health. She became a Master Herbalist, an Iridologist, and a Doctor of Naturopathy. In addition, she has added the *ONE BRAIN* method of psychological wellness, and *CONTACT REFLEX ANALYSIS* [see NF 11:47, 1994] to her credentials.

However, Purcell matter-of-factly described the source of her naturopathy "degree" as a "short-lived" correspondence school, the Natural Health Academy, which she said had been in Teaneck (a township of northeast New Jersey). She added that, to practice naturopathy in New York State, an N.D. degree was superfluous.

Back to the Future?

Purcell virtually equated One Brain™ with applied kinesiology. I submitted to a complimentary "kinesiology test." Facing me as we both stood, "Dr." Purcell gently held my wrists and moved my arms in unison for several minutes. While she moved my arms, she articulated ranges of numbers (e.g., "one to ten, ten to twenty"). During pauses, she "homed in" on a number, articulating identical numbers repeatedly. "This is present, past, future," she said as she began manipulating my arms. She stated:

[It's] very gentle muscle testing....It's real gentle....[I]t just sort of goes by itself. It's, like, very happy to bring up some of your, you know, past traumas and hopefully dump them....When I'm touching you, you know what I know [I didn't] and I know what you know. So—hah! Interesting. Inner energy transfer makes life real interesting, then, doesn't it? Okay. So, um, we're looking for three priorities ["top three areas of negative emotional charge," according to her "Issues Evaluation" form], in order of priority—what your body is dealing with that it would like to have released....

Nineteen. [The nineteenth item on the aforementioned form was "Relationship issue."] Is it nineteen? Is it anything else? Okay. It comes up: A relationship issue would be [the] number one [priority] that your body is disturbed about, and it's—it's stressful....

[I'll] show you the one's that come up...somewhere in your little brain.

"Okay, that's what your conscious is talkin' about," Purcell told me, alluding to three items on the "Issues Evaluation" form. In descending order of alleged importance, these were: "relationship issue," "unresolved grief," and "guilt or shame." "If you want to play it further,"

Nutrition Forum (ISSN 0748-8165), © 1995, is published bimonthly by Prometheus Books, Journals Division.

Subscriptions for individuals in the United States and Canada cost \$35 for one year (six issues), payable to Prometheus Books, Journals Division, at 59 John Glenn Drive, Amherst, New York 14228-2197. Multireader (e.g., institutional) and overseas (airmail) subscriptions cost \$50 for one year.

Manuscripts and all editorial correspondence should be directed to: Jack Raso, P.O. Box 740045, Rego Park, N.Y. 11374.

she stated, "you can take this other questionnaire, and you can go and fill it out; and we have yet to know the answers. And then we see how much is—is—is true. [It's a] truth and lie game, you know?" The 31 items on her One Brain questionnaire included: "I never seem to have enough money," "I have high blood pressure," "I have a serious degenerative illness," and "I often feel very restless, and I don't know why." Purcell said of One Brain: "It's totally noninvasive, and it's your body....I'm not interjecting any of my own self onto you....All I'm doing is, like, steering the ship." Later, she demonstrated patterned eye movements as an example of a corrective measure, offered "iris analysis" at a cost of \$10 per exam, and claimed she could trace some problems to a "past life" of individuals.

Purcell was in San Diego when I interviewed her by phone on November 22. She stated that she often uses herbs initially and that NSP "has extraordinary quality control." "When the emotional issues are being addressed," she said, "then the nutritionals [sic]...work better, because the emotional issues are probably what made the person sick in the first place." Purcell summed up her philosophy: "The person is a whole person when the mind and the body and the emotions and the spirit are dealt with effectively."

Unjuicy "Juice"

Next, I conversed with Jerome M. Dano, an independent distributor who ran one of the two *Juice Plus*+™ exhibits at the expo. A flyer describes the product as:

"A HOLISTIC APPROACH TO
NUTRITION AND ENERGY"

JUICE IN A CAPSULE:

Another flyer states:

A daily dose of Juice Plus+™ gel caps [i.e., 2 "Orchard Blend" capsules and 2 "Garden Blend" capsules] actually exceeds the benefits of juicing by providing higher levels of enzymes and keeping important fiber. It's like eating pounds and pounds of raw vegetables and fruits! (Without the hassle of shopping, chopping and cleanup!)

According to this flyer, the "Garden Blend" variety consists of "cell builders," including the following vegetables.

- Carrots, which allegedly clean the walls of blood cells
- Barley, which supposedly "rejuvenates nerves"

- Beets, which supposedly remove fat and prevent sterility
- Kale, which "contains 40 times more calcium than milk"
- Spinach, which "contains 10 times more calcium than milk"

Stapled to the latter flyer was another, titled "COMMON SIGNS TO LOOK FOR," which features a list of 34 "benefits found by people taking Juice PLUS+." These include the following.

- General sense of well-being
- More energy
- Less craving for sweets
- Crave fruit, vegetables & salad
- Weight loss
- Weight gain (if desired)
- Loss of inches from waist & hips
- Look better
- Easier to quit smoking
- Easier to start exercise program

The other side of this flyer bears a list of athletes and sport teams "using" *Juice Plus*. On this list is "Smokey Santillo." A multicolor leaflet describes "Dr. Humbart Santillo" as an author, a *Juice Plus* pioneer, a "leading naturopathic physician," and an "enzyme specialist." The text of another multicolor flyer begins:

Most significantly, each ORCHARD BLEND and GARDEN BLEND capsule contains natural food enzymes....The natural food enzymes found in fruits and vegetables release the food components in the food you eat and make them "bio-available" to you. With these natural food enzymes, the food you eat is broken down more effectively so your body can absorb proteins, complex carbohydrates, vitamins, minerals, electrolytes and other necessary nutrients....[I]t would be nearly impossible to eat the large quantities of fresh produce each day to obtain all the enzymes found in JUICE PLUS+™.

A follow-up mailing from Dano postmarked December 5 included a flyer that quoted Santillo: "Aging correlates perfectly with the enzyme reserve in the body. However, there are only two ways to preserve and replenish our enzyme level: by eating raw food and by taking enzyme supplements."

EDITORIAL BOARD

EDITORS: Jack Raso, M.S., R.D., Manfred Kroger, Ph.D. **EDITOR EMERITUS:** Stephen Barrett, M.D. **SENIOR ASSOCIATE EDITOR:** Michael K. Botts, Esq. **ASSOCIATE EDITORS:** William T. Jarvis, Ph.D.; Ira Milner, R.D.; Grace Powers Monaco, Esq.; Zhixin (David) Xu, M.S. **CONTRIBUTING EDITORS:** Johanna Dwyer, Sc.D., R.D.; James J. Kenney, Ph.D., R.D.; Marilyn Larkin; James A. Paperback Writer

I have paged through four of Santillo's books, all paperbacks published by Hohm Press, in Prescott, Arizona: (1) *Food Enzymes: The Missing Link to Radiant Health* (1987), also subtitled *The Key to Radiant Health*; (2) the expanded edition of *Food Enzymes* (1993), which, according to the cover, "CONTAINS NEW INFORMATION ON JUICES PLUS ENZYMES"; (3) *Intuitive Eating* (1993), and (4) *Natural Healing with Herbs* (1984) [see NF 8:32, 1991]. In the introduction to *Intuitive Eating*, Santillo favorably cites Prof. Arnold Ehret's *Mucusless Diet Healing System*. Therein, Ehret, a Christian naturopath who died in 1922, stated that venereal disease was easily curable by diet and fasting, that gonorrhoea was "simply an elimination through this natural elimination organ," that drugs and extreme meat consumption were the principal causes of venereal disease, and that the "mucusless" diet "eliminated" masturbation, nocturnal emissions, and prostitution.

The cover of the first edition of *Food Enzymes* appends the initials "B.S., M.H." to Santillo's name. It also states he holds several "degrees," including: "Doctor of Naturopathy," "Health Practitioner," "Iridology Certificate of Merit," "Master Herbalist," and a "Doctor's degree from the Concept-Therapy Institute" that he allegedly earned after eight years of study. In September 1993, I phoned the Concept-Therapy Institute to inquire about his "Doctor's degree." A representative told me that Santillo had received an "honorary degree" for attending all of the institute's courses. She emphasized that the "degree" was an "honorary certificate." (For information on concept-therapy®, see *"Alternative" Healthcare: A Comprehensive Guide.*)

On the cover of the second edition of *Food Enzymes*, the initials "MH, N.D." (sic) adorn Santillo's name; the covers of *Intuitive Eating* and *Natural Healing with Herbs* designate him "N.D."

Santillo has made the following unfounded claims about food enzymes.

- [The belief] that enzymes are protein molecules...is incorrect...Once we cook food at high temperatures...the enzyme is destroyed...Although the physical protein molecule is still present, it has lost its life force. [*Food Enzymes*, 2nd ed., p. 2, and *Intuitive Eating*, p. 93]
- The difference between live (raw) and dead food is enzymatic activity. [*Food Enzymes*, 2nd ed., p. 6]
- [T]he enzymes in raw food actually digest 5 to 75 percent of the food itself *without* the help of the enzymes secreted by the body. [*Food Enzymes*, 2nd ed., p. 11]
- [Food enzymes are] something that every person could use during therapy, or as a health supplement, that could act as foundation and adjunct to both medical and non-medical therapies. [*Intuitive Eating*, p. 91]

On November 25, I called Hohm Press to ascertain the source of Santillo's apparent N.D. degree. The person who answered the phone did not declare the organization I had reached but, upon my asking, said her name was Tina.

Tina asked me to wait a moment and then said that no one there had the information I wanted. I asked her to convey my request to "Dr. Santillo." On the morning of November 29, Tina called and told me that the source of "Smokey's" naturopathy "degree" is the Anglo-American Institute of Drugless Therapy. I asked the location of the school, but Tina said she didn't have any idea about that. I further inquired if the word "Hohm" in "Hohm Press" was a euphemism for "home." "Kind of," she replied.

I discuss the Anglo-American Institute of Drugless Therapy in the section following the next.

Requiem for an Enzyme

Mr. Dano, the *Juice Plus* distributor from Huntington, New York, told us:

Juice Plus is a good alternative if you're not eating...[the recommended number of] servings each day....They get the fruits and vegetables when they're fully ripe, okay? In fact, other people might be throwing them away by now....So, you get them when they're richest; [then] they juice it. Okay? So they convert it to a juice, and then you go through a process called flash drying....It's a process, like, at 60°, which dries it out. When you dry it out, when you take the liquid and other waste products out, you take the sugar and the sodium out. That's why you see so little sugar and sodium—and calories. There's like one or two calories per capsule, okay?...Now you gotta reconstitute it with the water. You don't drink it with coffee or anything hot because heat kills enzymes. At 49° F, all enzymes are killed.

"Why wouldn't you want to kill the enzymes?" I asked Dano. He replied: "Enzymes are an integral, important part of helping the body, the chemical reactions in your body, break down everything else and get it absorbed." I inquired whether the enzymes in the product entered the bloodstream. He had said so during his introduction but now said he was not "a hundred percent sure." (Why would anyone without suicidal impulses want assorted plant enzymes to enter his bloodstream, anyway?) Dano stated that four *Juice Plus* capsules were the "equivalent of more than five servings" of fruits and vegetables. My companion remarked that \$50 for a month's supply was a little steep. Dano responded: "If you buy it by the four-month supply, that's \$1.25 a day. And, for the equivalent of all of eight pounds of fruits and vegetables a day, that's cheap." (A daily intake of eight pounds of fruits and vegetables is not prudent.) According to a lab report I received from Dano on December 6, two "Orchard Blend" capsules contained 22 percent more fiber than 8 ounces of fresh squeezed fruit juice, and two "Garden Blend" capsules contained a little less than that in 8 ounces of fresh squeezed vegetable juice. The fiber content of eight pounds of fruits and vegetables far exceeds that of four capsules of *Juice Plus*. To furnish fiber in rival amounts, each of the four capsules would have to be too large to swallow whole.

Abunda Life

At the table designated "Abunda Life Times," information was available on the Abunda Life Holistic Retreat and Clinic, in Asbury Park, New Jersey. The establishment is also known as Abunda Life, the Abunda Life Health Hotel and Clinic, the Abunda Life Holistic Hotel and Clinic, and the Abunda Life Holistic Healing Retreat. According to a brochure titled "The Vacation with a Purpose," which I received several years ago, founder and "Holistic Director" Robert H. Sorge (pronounced "Sorj") holds a "doctorate of philosophy in naturopathic medicine from the United States School of Naturopathic Medicine and applied sciences [sic]." An ad in the "Profiles" section of the November/December 1989 issue of *NewLife* magazine stated that Sorge had graduated magna cum laude from the "U.S. School of Naturopathy." Around that time, I phoned Abunda Life at least twice and requested information about this supposed school, to no avail. On May 9, 1994, I spoke by phone with Sandy Voit, Bastyr University's Dean of Students. Voit said that, although he had worked at Bastyr for 12 years, he had never heard of the U.S. School of Naturopathy. I called Abunda Life's "wellness clinic" on the afternoon of November 28. The woman who answered the phone said that Sorge was not in the office and offered her assistance. However, she told me she didn't know anything about the school.

The "Vacation" brochure also states that, in 1964, Sorge "received his doctorate in naturopathic medicine from the Anglo American Institute Of Drugless Therapy in Great Britain." According to the 11th edition of *Bear's Guide to Earning College Degrees Non-Traditionally* (1992), the Anglo-American Institute of Drugless Therapy is an unaccredited correspondence school in Renfrew, Scotland, founded in 1911. After my call to the clinic, William T. Jarvis, Ph.D., founder and president of the National Council Against Health Fraud, told me he had never heard of the U.S. School of Naturopathy. However, he said he had obtained a "Doctor of Naturopathy" degree from the Anglo-American Institute (then in Bournemouth, England) in the late 1970s. It had cost \$51. The course had consisted of a loose-leaf book, about 1½ inches thick, that contained 45 lessons ranging from 1 to 7 pages. Among other subjects, the lessons covered chiropractic, color therapy, iridology, and naprapathy [see NF 11: 63-64, 1994]. Jarvis's "thesis," dated January 1977, is a poetic but simplistic work 2½ pages long and double-spaced. It concludes:

Mother Earth is alive and well and she wants us to be too. If we'll just give her half a chance she'll give us even more than that. Let us therefore listen to her voice and live happy and healthy lives.

After my chat with Dr. Jarvis, I received a call from Marcus Antonius of Abunda Life, who said of the U.S. School of Naturopathy: "I think it's in Illinois." He stated that Sorge had been at the expo on November 19 and that Abunda Life had "gotten a lot of business" as a result of distributing free literature there. On December 3, I received a 33-page

brochure from Abunda Life titled "Nutritional Testing & Personal Health Evaluation." Twenty-four pages include at least one affirmation of God, Jesus Christ, or the Bible. Page 16 states:

Today they [i.e., the "immoral" people who constitute the "Medical Establishment"] want to claim Naturopathy, Nutrition, Herbs, Natural Vitamins, Colon Hydrotherapy, Massage and Natural Healing is the practice of medicine. We say clearly, emphatically and absolutely, it is not and to attempt to stop the teaching and practice of principles that God has given us for our health and healing is not only repressive and immoral, but those who attempt to prevent this gospel from getting to "we the people" may be in jeopardy of the plagues and curses of God soon to come upon the earth.... No force can prevent the gospel of our King.

According to the brochure, the offerings at Abunda Life include "The Bach Flower Emotional Profile Test," "Basil [sic] Metabolism," "Cybernetic Command Therapy," foot reflexology, "Iridology Analysis," and "Radionic Scanning."

Sorge is also editor of *The Abundant Life Times*, a bimonthly magazine that purportedly is "committed to proclaim the Glory of Our Great Creator God" and "distributed free to health minded individuals seeking an alternative to both establishment drug medicine and the New Age form of holism steeped in Eastern philosophy." The June 1993 issue included three ads for the Abunda Life Church, which shares the hotel's address and offers such "services" as Christian hypnotherapy, Christian meditation ("C.M."), and "spiritual healing" (including the laying on of hands).

The Pit and the Pendulum

One exhibit promoted dietary supplements marketed by Kroeger Herb Products, in Boulder, Colorado. The "product guide" states that founder Hanna Kroeger was born in Turkey to German Christian missionaries, opened one of the first American health food stores (New Age Foods) in 1958, and began Kroeger Herb Products in 1978. According to the guide, Ms. Kroeger "believes that God can heal any ailment, at any time, and that it is up to us to seek and apply an action that will provide an avenue of healing, such as nutrition, herbs or spiritual methods." The guide describes 17 books and booklets by Kroeger, including: "Alzheimer's Science and God," *Cookbook for Electro-Chemical Energies*, "The Pendulum, the Bible and Your Survival," and *The Seven Spiritual Causes of Ill Health*. The dozens of supplements described in the guide include:

- **Bio Pep:** "A subtle combination of herbs to stimulate and balance the aura and rejuvenate in a way unlike ordinary 'pep' products."
- **Circu Flow:** "When unobstructed, the blood carries vital cargo to cells in need and removes wastes."
- **Female Balance:** "Formulated to provide natural estrogen to women that need hormonal balancing."

- **Spiro Kete:** "Helps promote conditions unfavorable to spiral tailed bacteria."

A woman at the exhibit told us that *Circu Flow* is also referred to as "Herbal Chelation" and was formerly called "Our Lord's Formula." In her booklet "Arteriosclerosis and Herbal Chelation" (1984), Kroeger states:

The word from the Bible comes to me as I write about how arteriosclerosis can be healed....

In my life I learned that everything Our Lord does, works. So, the Herbal Chelation (which I never claimed it was my formula,) [sic] works. It is Our Lord's formula.

It was in the rush hour of the day when a man approached me asking how he could avoid a bypass operation....I had to say "No, I have nothing to offer."..."Jesus, help," I murmured and here the heavens opened. "Take Equisitum, concentrate [sic], Hawthorne, Aloe Vera gel." I listened and that was Our Lord's instruction....Our Lord had given the formula for him....Again He in His Mercy reached down to us mortals to heal us....

Kroeger concludes:

My advice:

**CLEAN YOUR ARTERIES
WITH HERBAL CHELATION**

Just "Sei/No"

Free literature at the Seicho-No-Ie exhibit described this sect as a "supradenominational truth movement" and wonderful philosophy of life founded in Japan in 1930 by Dr. Masaharu Taniguchi. A glossy flyer titled "You are a Child of God!" says of him:

[O]ne day, while in deep meditation, he received the divine inspirations that were to form the basis for the Truth of Life Movement. After receiving these inspirations, Dr. Taniguchi began spreading the teachings to others. Many miraculous healings took place; people recovered from various diseases, including cancer and tuberculosis.

The flyer further states: that humans possess all the "creative powers of God"; that Seicho-No-Ie incorporates the teachings of Christianity, Buddhism, and Shinto; that there is no sin and, therefore, no need for redemption; and that the "physical world" is a "reflection of the mind."

Women at the exhibit, apparently Japanese, solicitously asked us to take paper signs bearing such statements as "Become a Person Who is Loved and a Person who Loves" and "Discard your critical Nature and you Liberate your Mind." The "fine print" on each card states: "Repeat these words 20 times a day to impress your subconscious mind. Words have power."

YECK! More "Ancient Wisdom"

"Do you believe in dreams?" a stranger asked me as I neared the Eckankar exhibit. Recent issues of the newsletter of the New York Satsang Society, a chartered affiliate, state: "Eckankar is a religion that teaches there is a spiritual essence, known as the ECK, that connects each of us with the Heart of God. We can experience the ECK as inner Light and Sound." *Eckankar: Ancient Wisdom for Today* (1993) includes the following definitions.

ECK—The Divine, or Holy, Spirit; the Audible Life Stream; the essence of God which supports and sustains all life; the Life Force.

Light and Sound of God—The Holy Spirit. The two aspects through which God appears in the lower worlds.

Eckankar was founded in 1965 by Kentucky-born Paul Twitchell (also known as Peddar Zaskq), a former Scientologist who died in 1971. *Harper's Encyclopedia of Mystical and Paranormal Experience* (1991) states: "In 1944, while Twitchell was serving aboard a Navy ship...a Tibetan master named Rebazar Tarzs appeared to him in his soul body. Tarzs, who claimed to be about five hundred years old, introduced Twitchell to...ECKANKAR." *The Fringes of Reason* (1989), an entertaining, skeptical "field guide" to New Age beliefs, describes this international religion as:

The Stupidest Cult. A coloring-book occult/oriental philosophy in which daydreaming and wishful thinking become "the ancient science of soul travel." Learn to project your astral body *while driving!!* Strange astral-world cosmology reminiscent of 1940s pulp science fiction. Proof that you can't go broke underestimating the intelligence of the American seeker.

Tales from the "Dark Side"

Seichim reiki (pronounced "say-keem RAY-key") is a composite of seichim and "traditional" reiki. A leaflet titled "Living Light Energy" describes seichim as an ancient Egyptian healing art that was "rediscovered" recently in New York. Reiki is largely a variant of aura balancing and the laying on of hands. Another leaflet, titled "Seichim Reiki—The Unifying Force," distinguishes seichim reiki from reiki: "Seichim Reiki aligns the complete chakra system with the seven fold nature of universal life energy. Traditional Reiki aligns only the upper four chakras with the three fold nature of universal life energy."

The **shadow sound therapy**© (SST) exhibit promoted the work of the method's originator, Jungian psychoanalyst and "sound healer" Elidé M. Solomont, Ph.D. Solomont is the author of the spiral-bound *You Are Who You Hate* (1993), according to which SST is a union of "music and talk therapies" whose philosophy is: People who listen to unfamiliar, unstructured, or inharmonic music face their own "shadow"; interpreting unconscious images can effect

healing. In a classified ad in the December 1994/January 1995 issue of *Free Spirit*, Solomont defined "shadow" as the "dark side that creates disappointments." On page 2 of her book, she defines her method as "a variation of guided imagery and music" that "involves listening in a relaxed state to selected abstract music, in order to elicit mental imagery, symbols, and deep feelings." She holds that "the creator" made the first sounds and that sound gave birth to the earth and human beings.

The **Multy-Tranz** is a wandlike, plug-in, acoustical "probe" invented by Brian David Andersen. It allegedly improves the quality and taste of any liquid, relieves headaches and tension in pets and animals, prevents hang-over from intake of beer or wine, stimulates and balances "chakra and acupuncture systems," and triples the "use" of any razor. I sampled treated and untreated water and preferred the latter. During a long-distance conversation with me on December 2, Andersen said he hoped that a battery-operated version would be available within two months.

Nu Energy Magnetics, of Ontario, Canada, markets a variety of "bio-magnetic" products, including the *SERENITY "2000" Weigh-Less Earrings*. These allegedly "combine the ancient science of acupressure with magnetism for a drug-free effective weight loss." A flyer states that magnets "supply the compatible magnetic energy which stimulates the body to heal itself."

Is the "therapeutic magnetism" promoted by Nu Energy passé? **Tachyon Energy Research, Inc.** markets *Takionic™* products, which allegedly combine Optimum Resonance Materials™ (ORMs) and "tachyon energy." These "enchanting," "State-of-the-Heart" products include *Takionic Water*, *Takionic Insoles*, the *Takionic Headband*, and the *Takionic Belt*. A leaflet defines ORM as

"special materials that emit photons (light) energy of a specific (4–16 millimicron) wavelength." This wavelength, according to the flyer, heightens "receptivity to Tachyon energy." The leaflet describes tachyons as: "particles that travel faster than light.... *The Most Abundant, Natural Source of Energy in the Universe*.... associated with... 'chi.'... the vital energy." It claims that "tachyon energy.... helps to promote greater harmony of spirit, mind and body." The very existence of tachyons is doubtful.

The Bottom Line

Apparently, the primary business of the Whole Life Expo is to increase the irrationality on which supplement "pushers," crackpot gadgeteers, and assorted religionists feed. Many intelligent people allege that some practices are worthwhile because they are at least subjectively beneficial—for example, dietary supplementation, hatha yoga, Qigong, religious observances, and trying to think positively with the help of pop-psychology books. However, implicit in this viewpoint is the position that the personal, superficial "end" justifies the means. Alternativists thus seem to imply that such practices should arouse no more skepticism than any art form. To be sure, some alternativist methods—e.g., aikido, aromatherapy, hatha yoga, *kum nye*, Qigong, tai chi, and Tragerwork—are *viewable* as art forms. But, while people may create watercolors, dance, play a musical instrument, or tend a garden for the sake of their health, they do not undertake such generic activities on the basis of extravagant claims and/or seductive theories that are full of holes. Such claims and theories are the stuff of alternativism—and define the allure of Whole Life Expos and the like.

Healthcare Esoterica

Here is another installment of the never-ending story of hard-to-swallow health-related methods.

References are within brackets.—J.R.

Alternative 12 Steps: Nontheistic and purportedly secular derivative of the Twelve Steps. The Twelve Steps—e.g., "[We] came to believe that a Power greater than ourselves could restore us to sanity"—are the variable basis of such programs as Alcoholics Anonymous. In *The Alternative 12 Steps* (1991), Martha Cleveland, Ph.D., a self-styled atheist/agnostic, and Arlys G., a longtime atheist, define the Twelve Steps as "a program for living, a program of action fueled by spiritual energy" that suggests "a system of holistic healing—a practical system of action" integrating "mind, body and spirit" (p. 5). Three of the authors' "Steps" affirmatively mention "spiritual resources" or "spiritual energy." [1]

Atlantean healing ray training: Instruction in an alleged prototypal healing system (including "Healing at a Distance"), provided by Michael E. Morgan. Morgan is a trance channeler for Yokar, the "Atlantean Scientist-priest." [2]

Biofeedback without machines: "Modality" for relatively stressless living and for using inner resources to discover

one's identity and potential, according to George E. Soroka in his book of the same name (p. 5). The term "biofeedback" refers to any method involving electronic devices wherewith individuals attempt to influence autonomic or muscular activities. Soroka's method joins biofeedback and a form of counseling that includes transactional analysis (TA).

TA is a system of psychotherapy created by psychiatrist Eric Berne, M.D. (who died in 1970), and the subject of two bestsellers that remain in print: *Games People Play: The Psychology of Human Relationships* (1964) and *I'm OK—You're OK* (1967). Fundamental to TA is the hypothesis that "ego states"—attitudes during transactions and corresponding sets of behavior patterns—fall into three categories: parental (preceptive or didactic, admonitory), adult (evaluative), and child-like (emotional and creative).

In his book, Soroka states that everyone is "plugged into the universe at large" (p. 4), that this (alleged) connection is a transcendent source of awesome power (*ibid.*), and that biofeedback enables people to begin an exploration of

"the cosmic energy force" (pp. 155–156). He also suggests that God is immanent in human beings (p. 144). [3, 4, 5, 6]

BodyWisdom (BodyWisdom therapy): Yogic form of body-oriented psychotherapy (see *"Alternative Healthcare: A Comprehensive Guide"*) promoted by Margo G. Steinfeld, M.A. One of its premises is that, as the body "aligns," physical and emotional blockages and the "life force" become free [7]

Chi-Therapy™ (Gestalt energy work): Apparent mixture of bioenergetics, Ericksonian hypnotherapy, Gestalt psychotherapy, inner child work, neuro-linguistic programming (NLP), and tai chi promoted by John Mastro, C.S.W., and Robin Mastro, M.F.A. (See "Meta-Therapy™," below.)

- **Bioenergetics** is an offshoot of Reichian therapy [see NF 11: 48–50, 1994].
- **Gestalt therapy** (which shares little with Gestalt psychology) is the brainchild of psychiatrist Frederick (Fritz) Perls (1893–1970), who posited five "personality layers." Supposedly, one reaches the "death layer" when "blocked feelings" and "psychic energy" condense and knot, and the "life layer" with the release of "blocked energies." [4, 8]
- **Inner child work** is a form of "psychotherapy" popularized by author and theologian John Bradshaw. Its main target is shame. [9]
- **NLP** is a quasi-spiritual "performance psychology" technique whose crux is "NLP modelling"—imitating the behavior of high achievers. [10]
- **Tai chi** is an ancient Chinese system of ballet-like exercises. Practice thereof purportedly facilitates the movement of *chi* ("life energy") through the body by dissolving blockages both within the body and between the body and the environment.

Chi-Therapy allegedly softens "frozen or constricted areas" of one's "energy field." [11]

Craniosacral-visceral balancing: Apparent spinoff of craniosacral balancing (see *"Alternative Healthcare: A Comprehensive Guide"*) practiced by Barbara Chang of New York City. Its postulates include the following. (1) One's body is a mirror of one's soul. (2) "When your Soul-Will is aligned with your Ego-Will, your inborn intuitive and artistic genius gloriously expresses its creativity!" (3) "People are extremely tender inside." Chang recommends the method for asthma, chronic pain, depression, migraines, whiplash, trauma due to incest, and TMJ (temporomandibular joint syndrome). [12, 13]

Emotional-kinesthetic psychotherapy (EKP): Mode of bodywork among whose three foci is "psychospiritual development." [14]

Hug therapy (therapeutic hugging): Variant of therapeutic touch put forward by Kathleen Keating Schloessinger, R.N., M.A., in the bestseller *The Hug Therapy Book* (1983) and a companion volume. It is a set of "techniques" based on the "friendly science" and "art" of "nonsexual" hugging. The "advanced techniques" include "Zen hugging" and guided imagery (e.g., imagining being hugged by a favorite friend who is a good hugger). The author posits a "spirit," a "life energy that heals," and a "place" at everyone's "center" where unadulterated love is discoverable. [15, 16]

Depiction of session in Johrei Fellowship flyer

Intuitive energy healing: Variant of shiatsu practiced by Linda Moskowitz, who recommends it especially for postpartum and postoperative conditions. [17]

Johrei: Supposedly purificatory method that defines the Johrei Fellowship, a worldwide interfaith association with a center in Manhattan. Purportedly, sessions take about twenty minutes, do not entail physical contact, and are always free of charge. Besides the method, the term "Johrei" denotes a paradisiacal doctrine and an alleged something that, through the focusing of "Divine Light," naturally eases physical and mental distress. Japanese businessman Mokichi Okada founded the movement in 1935. Okada allegedly had learned "God's Divine Plan" for the "New Age" through a series of divine revelations. Johrei's principles include the "Law of Purification," which holds that sickness is simply "Nature's" way of restoring health, and the "Law of Spiritual Affinity," which holds that innumerable "spiritual cords" dominate human existence. Another principle is that one's health and material resources are functions of one's "spiritual condition." [18, 19, 20]

Jungian past-life therapy: Combination of Jungian psychology and past-life therapy promoted by Roger J. Woolger. Jungian psychology embraces all quasi-psychological practices based on the theories of psychoanalyst Carl Gustav Jung (1875–1961), who held that studying the (alleged) "racial unconscious" could enhance understanding of the individual unconscious. "Past-life therapy" refers to any mode of "psychotherapy" centering on alleged previous humanoid incarnations of individual patients. [21, 22]

Meta-Therapy™: Reputed synthesis of Gestalt psychotherapy and "T'ai Chi energy work" originated by John Mastro, C.S.W. (See "Chi-Therapy™," above.) [23]

Pesso Boyden System/Psychomotor (psychomotor therapy, Pesso system): Form of "group therapy" involving bodywork, founded in 1961 by Albert and Diane Pesso. The method allegedly permits clients to discharge "energy held from past events." [14]

Shandra-chi: Mode of bodywork allegedly developed by Nancy Deutsch, C.S.W., Mitch Klicka, M.A., and "beings of light," including "Archangel Michael." The method supposedly releases the "energies" of stressful events from the cells of the human body. [24]

SHENSM (Specific Human Energy Nexus Therapy, SHEN therapy): Psychological form of so-called touch therapy. One of its premises is that an "emotional energy field" (also called the *chi field* and the *biofield*) permeates and surrounds the "physical body." [14]

Somasynthesis: Form of body-oriented psychotherapy (see "Alternative" Healthcare: A Comprehensive Guide) developed by chiropractor Clyde W. Ford and based partly on theories set forth by Carl Jung, Wilhelm Reich, and Roberto Assagioli (1888–1974), the originator of psychosynthesis. It supposedly promotes "spiritual health." [14]

Taoist healing imagery: Set of Chinese "healing techniques" advanced by Kenneth Cohen in his audiocassette of the same name. The "techniques" include: Tan Tien Breathing, which supposedly "stimulates the internal reservoir of energy"; Dragon and Tiger Meditation, whose purported purpose is to increase vitality; Golden Light Solar Meditation, whereby one allegedly absorbs "life energy from nature"; and "Spirit Goes on a Distant Journey." Supplement Bill Passes

Stephen Barrett

The Dietary Supplement Health and Education Act (DSHEA) of 1994, purported to "assure consumers access to all supplements on the market as long as they are not unsafe," was signed by President Clinton on October 25. Passage capped an aggressive three-year lobbying campaign by the health food industry, whose intention had been to cripple FDA regulation of its products. Senator Orrin Hatch (R-UT) had championed the bill, an early version of which *The New York Times* had described as "The 1993 Snake Oil Protection Act."

Three industry-related groups led the drive for passage: (1) the Nutritional Health Alliance (NHA), an umbrella organization formed early in 1992, which coordinated all segments of the supplement industry; (2) the National Nutritional Foods Association (NNFA), the major trade association of supplement manufacturers, distributors, and retailers; and (3) Citizens for Health (CFH), a "consumer" group organized by Alexander Schauss.

The most active opposing force was the Center for Science in the Public Interest (CSPI), a consumer-protection group concerned with accurate labeling of nutritional products.

To support their legislative agenda, proponents generated mail and phone calls from manufacturers, retailers, and distributors of health foods; patrons of health food stores; customers of mail-order companies; multilevel-marketing distributors; "natural health" practitioners; and bodybuilding and fitness enthusiasts who use supplements. This outpouring of messages was represented as a grassroots effort by consumers who wished to preserve "freedom of choice." Most of the barrage, however, came from supplement sellers and their confused customers.

To mobilize their troops, NHA and its allies harped on two themes: (1) if sellers don't act, most of them will be put out of business; and (2) if consumers don't protest, the FDA will deprive them of their right to buy vitamins.

To fire up consumers, the coalition portrayed the FDA as a Gestapo-like agency and urged supplement users to "write to Congress today or kiss your vitamins goodbye!" NHA even claimed, falsely, that "if the FDA has its way, you will have to go to a doctor for prescriptions for many supplements and then pay \$80 for a supplement which presently costs \$10 at a health food store." Many stores set up a "political action center" that displayed sample letters and stationery with which customers could write their own letters. Some stores offered discounts as an incentive to potential letter-writers. Many held a "blackout day," during which they exhibited empty shelves, draped "endangered" products in black and refused to sell them, or conducted other publicity stunts to reinforce their message. Virtually every periodical philosophically aligned with the health food industry published articles and editorials urging readers to write their legislators on this issue. Hundreds of radio talk shows, many with supplement companies among their sponsors, served as vehicles for health food industry propaganda. Several groups organized fax campaigns as well. As pressure from constituents mounted, a majority of Congressional representatives became co-sponsors of Hatch's bill or a similar one in the House.

The Senate passed a version of Hatch's bill on August 13, but Representative Henry Waxman (D-CA) prevented consideration by the House until Hatch agreed to make certain concessions. According to *Health Foods Business*, during the final two weeks of the Congressional session, CFH set up a toll-free number whereby members could call the Capitol switchboard. According to Alexander Schauss, House majority leader Richard Gephardt received over ten thousand phone calls on the issue and "other Congressmen complained that constituents were jamming their confidential fax machines with letters imploring them to pass the bill." The final "compromise" still favors the supplement industry.

Pandora's Pillbox?

DSHEA defines the term "dietary supplement," places the burden of proof of safety on the FDA, sets standards for the distribution of third-party literature, allows statements regarding "nutritional support" under certain circumstances, gives specifications for label information on ingredients and nutrients, and requires good manufacturing practices. It also mandates the establishment of an advisory commission and an office within the National Institutes of Health (NIH), both of which are discussed below. DSHEA's main provisions are:

- DSHEA defines "dietary supplement" as any product except tobacco that contains at least one of the following: (1) a vitamin, (2) a mineral, (3) an herb or botanical, (4) an amino acid, (5) a dietary substance "for use to supplement the diet by increasing total dietary intake," or (6) any concentrate, metabolite, constituent, extract,

or combination of any of the aforementioned ingredients. Products that meet this definition are excluded from regulation as a drug or food additive. (Drugs and food additives require premarket approval.) The 5th category apparently includes virtually any substance a manufacturer chooses to call a supplement. This provision is bad because it enables manufacturers to market large numbers of worthless substances as long as no direct health claims are made for them. (The claims, of course, will reach consumers through other channels.)

- The burden of proving safety is shifted from the manufacturers to the FDA. The FDA can object only if a product or ingredient presents a "significant and unreasonable risk of illness or injury" or poses an imminent safety hazard. DSHEA does not define "unreasonable risk"; defining it might require lengthy litigation. Before DSHEA, the FDA could ban worthless "dietary supplements" by regulating them as "unapproved food additives."
- Third-party literature can be used to promote supplements to consumers if: (1) they are not false or misleading; (2) they do not promote a particular manufacturer or brand; (3) they are presented with other items on the same subject, so as to provide "a balanced view of the available scientific information"; and (4) they are physically separated from supplement products when displayed in a store. In any proceeding to establish that such material is misleading, the FDA would bear the burden of proof. The terms "misleading" and "balanced" are not defined. Even if they were, there is no provision for enforcing the requirement that the information meet any standard. Nor does the FDA have the resources to monitor what takes place in individual stores. This provision greatly weakens the ability of the FDA to protect consumers from unsubstantiated claims used to sell products. In the past, promotional literature was considered a form of labeling, and therapeutic claims in such literature would render the product a "drug" subject to enforcement. If a dispute arose, it was the manufacturer's obligation to prove that experts generally considered the product safe and effective for its intended purposes.
- A claim may be made for a dietary supplement in the following forms: (1) a claim of benefit related to a classical nutrient deficiency that discloses the prevalence of such disease in the United States, (2) an accurate description of how a nutrient affects the structure or function of the human body, and (3) a general description of well-being resulting from consumption of a dietary ingredient. The statement must be truthful, not misleading, and accompanied by a prominently displayed disclaimer: "This statement has not been evaluated by the Food and Drug Administration. This product is not intended to diagnose, treat, cure, or prevent any disease."

This provision may enable manufacturers to flood the market with misleading statements about the function of nutrients in the body. (For example, a statement about the role of vitamin A in eye function, even if it is literally true, would be misleading if it implies that taking vitamin A supplements improves the vision of well-nourished persons.) DSHEA requires that manufacturers submit "structure/function" statements to the FDA within 30 days after first using them for marketing, but substantiation is not required. The FDA probably won't have the resources to challenge misleading claims of this type, and even if misleading claims are withdrawn, they will have been permitted to influence consumer purchases for significant periods of time.

DSHEA requires an independent Commission on Dietary Supplement Labels, composed of seven members with expertise and experience in the manufacture, regulation, distribution, and use of dietary supplements. At least three members must be "qualified by scientific training and experience to evaluate the benefits to health of the use of dietary supplements." However, members and staff of the Commission must be "without bias in the issue of dietary supplements." According to DSHEA, the Commission will review claims and statements about dietary supplements and make nonbinding recommendations for regulating the claims and statements, including those in marketing literature. The Commission's report is due in two years, and subsequent rule-making must be completed within two

years after the report is made. If it is not, the FDA dietary supplement regulations published on January 4, 1994, would be nullified.

DSHEA further calls for the establishment of an Office of Dietary Supplements within the NIH to: (1) explore the potential role of dietary supplements in the improvement of healthcare; (2) promote the scientific study of supplements for maintaining health and preventing chronic disease and other health-related conditions; (3) advise other federal agencies; (4) compile a database of scientific research related to dietary supplements and individual nutrients; and (5) coordinate NIH funding related to research on dietary supplements. The Act authorizes \$5 million for fiscal year 1994 to enable the Office to carry out its functions. Proponents of alternative healthcare have trumpeted the establishment of the NIH Office of Alternative Medicine as "government and scientific recognition" of their methods. Undoubtedly, the NIH supplement office will be abused in the same way by supplement promoters. And it appears that Senators Hatch and Tom Harkin (D-IA) are planning to promote additional pro-quackery legislation when Congress reconvenes.

Stephen Barrett, M.D., is the founder of *Nutrition Forum* and a board member of the National Council Against Health Fraud. The drive for DSHEA passage is described in more detail in *The Vitamin Pushers* (Prometheus Books, 1994), which was reviewed in the previous issue of *NF*. A copy of the Act plus the Congressional Research Service's 14-page report on DSHEA are available for \$5 from LVCAHF, P.O. Box 1747, Allentown, PA 18105.

BRIEFS

Alfalfa toxicity suspected. Victor Herbert, M.D., J.D., has warned that alfalfa tablets may contain l-canavanine, an amino acid capable of triggering autoimmune disease in susceptible individuals [*American Journal of Clinical Nutrition* 60:639-40, 1994].

Alternativist funding schemes proposed. According to a report in *Natural Foods Merchandiser*, a healthcare reform bill introduced in Vermont would permit people to establish a tax-deductible personal savings account to cover expenses not included by typical healthcare plans. These would include "vitamins and dietary supplements intended to remedy dietary deficiencies and promote wellness" and "subscriptions to publications whose primary purpose is to assist consumers to make well informed choices regarding their wellness and health-care." A proposal on the national level includes similar medical expense accounts that include coverage of dietary supplements and "alternative" practitioners.

Iron warning proposed. The FDA has proposed that oral products containing at least 30 mg iron per dose bear a warning. Since 1938, more than 110,000 incidents of iron ingestion by children have been reported to poison control centers, with at least 33 deaths.

Another marketing tool. The mission statement of *Better Nutrition for Today's Living* (BNTL) declares: "[Our] mission is to educate our readers on natural products carried in retail stores. This education process will move products off the store shelf via editorials designed to enhance the appropriateness and usefulness of health nutrition products....In the end, everybody wins: Consumers, Retailers, Manufacturers and BNTL." Many stores purchase copies of the magazine in large quantities for free distribution to customers. Its articles and editorials make unsubstantiated claims that would not be legal on product labels. Manufacturers wishing to capitalize on this can time their ads with the help of BNTL's editorial calendar, which indicates when the various categories of supplement ingredients will be featured. The publisher also recommends using BNTL "as part of your staff training program" and creating a special display each month with the products featured in the current issue. A recent mailing to health food retailers included the assertions: "60.3% of BNTL readers state that magazine education is their number one influence on new product purchasing" and "\$91.97 is the average amount each BNTL reader spends in natural food stores each month."

Chelation therapy update. A double-blind study has demonstrated that chelation therapy has no value in the treatment of intermittent claudication, a condition of impaired blood circulation to the legs [Circulation 90:1194–1199, 1994]. The study, conducted in New Zealand, involved 15 patients who received intravenous infusions of EDTA (a synthetic amino acid, purportedly the essential ingredient) plus vitamins, and 17 patients who received similar infusions without EDTA. The proportion of patients showing improvement in pain-free walking was similar in both groups.

FDA pesticide report. In 1993, the FDA checked 5,703 samples of domestic food and 6,463 samples of imported foods for which there was no reason to suspect problems and found that 64% of domestic foods and 69% of imported foods had no pesticide residues and only 1% of both groups foods had violative levels. The agency also checked pesticide levels in foods in which a problem was suspected and found violative levels in 17% of 223 domestic samples and in 11% of 362 imported samples. The FDA's annual Total Diet Study, based on an analysis of 1,556 food items representing the diets of American consumers, has concluded that dietary intakes of pesticides are well within accepted safety standards. Copies of the report, "Residue Monitoring—1993," are available from: Norma J. Yess, FDA, HFS-308, 200 "C" St., S.W., Washington, DC 20204.

Pharmacists attack homeopathy. District 7 of the National Association of Boards of Pharmacy (NABP), which includes Alaska, Idaho, Montana, Oregon, and Washington, has resolved that "homeopathy not become part of pharmacy's standard of practice until it is proven scientifically." The resolution was developed in response to increases in the number of pharmacies (especially chain pharmacies) that actively sell homeopathic products. NABP will consider the resolution at its national meeting in May 1995. The American Pharmaceutical Association's recently revised code of ethics does not consider whether it is ethical to sell products that don't work.

"Primetime" blasts "health" products. A segment titled "All Natural?" headed up the pre-recorded Thanksgiving Day edition of ABC's "Primetime Live." Its message was that some products for sale in health food stores "may be dangerous, even fatal." The segment featured an undercover investigation of a health food trade show in Baltimore. One vendor there cast oxygen as "vitamin O," the "most vital nutrient." Another stated that her products, liquid supplements styled "Herbs for Kids," do not cause "toxic buildups" and that it is impossible to overdose on them. The narrator, incidentally, categorized niacin as a mineral.

rBGH bill introduced. H.R. 4618, introduced by Congressman Bernard Sanders (I-VT), would require: (1) labeling of all milk and dairy products derived from cows injected with recombinant bovine growth hormone (rBGH), (2) government development of a test to detect synthetic rBGH in milk, and (3) a tax on farmers who use rBGH to indemnify farmers and communities economically hurt by the hormone's use. The FDA does not require labeling of these products because rBGH does not change the character of the milk but merely increases the amount of milk produced. H.R. 4618 is being spearheaded by the Pure Food Campaign ("an international boycott of genetically engineered foods"), a project of Jeremy Rifkin's Foundation on Economic Trends. Opponents of rBGH are framing their case as a consumer "right-to-know" issue. However, Rifkin's real agenda is to stop all forms of biotechnology. A recent mailing from the Pure Food Campaign states that H.R. 4618, "if passed, will mean the end of rBGH."

Sugar-hyperactivity claim squashed. The National Advertising Division (NAD) of the Council of Better Business Bureaus has upheld a complaint by the Sugar Association about a television ad for *Gobble Stix* turkey snacks. The ad had depicted a child bouncing erratically around a room, off the ceiling, walls, and furniture, as if he were a pinball. The visual was accompanied by the sounds of a pinball machine and breaking glass, and the question: "Too much sugar and junk in your kid's snacks?" The Association charged that the ad exploited the myth that eating sugar causes or contributes to behavioral disorders in children. After reviewing extensive scientific documentation, NAD agreed and noted: "The greater weight of evidence does not support the implied claim in the commercial that sugary snacks will or even may induce overly active or disruptive behavior in otherwise normal children." The manufacturer (Jerome Foods) contended that the ad was intended to be funny and was not an attack on sugar. But NAD felt that "since the notion of a 'sugar high' is a common parental belief...it would not be unreasonable to interpret the commercial's visual in this way."

Weight cycling downplayed. The National Task Force on the Prevention and Treatment of Obesity has come to the following conclusions. (1) There is no convincing evidence that human weight cycling ("yo-yo dieting") adversely affects body composition, energy expenditure, risk factors for cardiovascular disease, or future attempts to lose weight. (2) Obese persons should not allow concerns about weight cycling to deter them from trying to control their body weight [JAMA 272:1196–1202, 1994]. Reprints of the report are available from: Susan Zelitch Yanovski, M.D., Division of Digestive Diseases and Nutrition, National Institutes of Health, Building 31, Room 9A23, Bethesda, MD 20892.

The Fast Track to Nutrition "Credentials"

Jack Raso

In early 1994, I began mapping out a study of unconventional sources of nutrition-related "credentials," especially correspondence courses. I launched the study on July 17. The American Council on Science and Health (ACSH) has scheduled publication of my report thereof for June, in its magazine, *Priorities*. In this article, I describe 16 of the 50 "credentialing" organizations I tried to contact.

I Was a Would-be Herbologist/Natural Hygienist/Naturopath/Theologian/Yogi

My study of nutrition-related "credentialing" organizations followed a long personal investigation of alternative health education. By "alternative health education," I mean: (1) indoctrination in alternative healthcare, (2) nontraditional didactic programs that afford such indoctrination, and (3) nontraditional didactic programs in science-oriented healthcare.

Education is a subject close to my heart, as I love learning but hate red tape and academic politics. I prize my self-orchestrated learning above the entirety of my formal education. Originally a humanities major, I studied at three vocational schools before I returned to college in 1981 to become a nutritionist. In 1985, I entered graduate school, where my focus was exercise physiology. Though I excelled as a student, overall my experiences with formal education, especially graduate education,

left me profoundly dissatisfied. Causes included favoritism and other forms of unfairness, inefficiency (e.g., busywork and soporific lectures), and professorial wheeling and dealing.

Such discontent, combined with occupational burnout (why be a "clerical dietitian" in a revolving-door "repair shop" when you can become a "healthcare holist" and buck, or chuck, the system?), spurred my seeking a suitable offbeat path to credentials between early 1989 and late 1992. During this period, I formally applied to an M.A. degree program in theology and to 10 unconventional didactic programs. I completed the admissions process for seven of the unconventional programs and obtained admission. (Admission to two of the three programs for which I had not completed the admissions process seemed well within reach.) The nine health-related program providers included: (1) the California Institute of Integral Studies, in San Francisco ("bridging Eastern and Western traditions of knowledge...joining the transpersonal and spiritual

dimensions of life with community service," according to its 1988-1990 catalog); (2) Emerson College of Herbology Ltd., a correspondence school in Ontario, Canada (see my book *Mystical Diets*); (3) the Himalayan International Institute of Yoga Science and Philosophy, in Honesdale, Pennsylvania; (4) Lesley College Graduate School (see below); (5) the Life Science Institute (see below); (6) the National College of Naturopathic Medicine, in Portland, Oregon; (7) The Union Institute (see *Mystical Diets*),

My potential certificate, depicted in an October 1994 mailing from the Institute for Educational Therapy (IET)

whose alumni include Shari Lieberman and Gary Null; (8) the University of Bridgeport, in Connecticut; and (9) Walden University (see below).

Disillusionment was the principal benefit of this pursuit. At its beginning, I felt that conventional healthcare was in need of a spiritual dimension. For most of the 4-year period, I was at once skeptical of and hopeful about alternative healthcare, which seemed to me commonsensical, humane, patient-centered, health-minded, nutrition-based, and acceptant of spirituality. Proponents take pains to nurture this image. In contrast, establishmentarian healthcare appears labyrinthine, inhuman, machine-centered, disease-minded, drug-based, and dismissive toward spirituality. To be sure, some of the shortcomings and overkills of conventional healthcare in the U.S. lie along these lines.

However, I concluded: (1) that conventional healthcare does not need spirituality but more reasonableness and a better connection with science, and (2) that alternative health education, on the whole, has a very poor connection with science. Indeed, some of the methods into which organizations indoctrinate would-be practitioners have a plainer connection with religion. (For examples of such methods, see this issue's "Healthcare Esoterica.")

Who's Minding the (Academic Department) Store?

Accreditation is an especially thorny matter as regards alternative health education. Academic accreditation is recognition, by an agency or association, that an educational institution, university school, academic department, or didactic program meets the reviewing body's administrative, organizational, and fiscal criteria. The many "accrediting bodies" or "accrediting groups" in the United States range from the spurious to the reputable. The U.S. Secretary of Education and the Commission on Recognition of Postsecondary Accreditation (CORPA), a non-governmental organization, autonomously "recognize" (validate) some sources of accreditation; i.e., they accredit some of the "accreditors." Accreditation by a recognized entity indicates only relative organizational soundness and intra-disciplinary programmatic soundness. It nonetheless at least weeds out fly-by-night and financially shaky organizations. Thus, absence of recognition by either the Secretary of Education or CORPA is grounds for suspicion. However, by no means does accreditation by a recognized entity import that the teachings of an organization have a scientific basis. Recognized accrediting entities comprise: (1) six regional accrediting bodies, which have the authority to accredit colleges and universities in respective regions of the U.S.; and (2) a motley group of more than fifty "national, professional and specialized" accrediting bodies. The latter group includes accrediting entities for schools that specialize in and endorse Christianity, Judaism, chiropractic, naturopathy, and traditional Chinese medicine.

Unconventional Nutrition Education: The Good, the Bad, and the Abysmal

Below are descriptions of some of the organizations from which my associates and I have received printed material. Except for comments, the descriptions: (1) merely convey questionnaire responses and/or representations made in promotional literature we received since mid-July 1994, (2) do not cover undergraduate degree programs, and (3) do not cover programs without a distinct, alleged, or optional relation to nutrition. In the "comments" sections, the term "accredited" means "possessing accreditation by an entity recognized by the U.S. Secretary of Education or CORPA"; and "unaccredited" indicates lack of such accreditation. An asterisk preceding an organization's name indicates receipt of questionnaire responses from that organization. Information on prerequisites for admission and requirements for completion of programs is not exhaustive but includes all important nonfinancial matters.

- **AMERICAN COLLEGE OF NATURAL HEALTH.** Divisions include The Clayton School of Natural Healing (TCS), founded in 1980, and The American Holistic College of Nutrition (AHCN). TCS and AHCN share a toll-free number, a fax number, and an address in Birmingham, Alabama. Both are "members" of the World Association of Universities and Colleges (W.A.U.C.), a "global accreditation association" founded in 1991. TCS offers "home study" programs leading to the degrees of Doctor of Naturopathy (N.D.), Doctor of Holistic Health (H.H.D.), and Doctor of Science (D.Sc.). AHCN's correspondence programs include an M.S./Ph.D. program and a B.S./M.S./Ph.D. program. Completion of either Ph.D. program requires a nutrition-related "dissertation" of 7,500 to 10,000 words. Prerequisites for admission: *at most*, a high school diploma or equivalent.

Comments: The American College of Natural Health, TCS, and AHCN are unaccredited. A mailing from TCS and AHCN postmarked November 2, 1994, included an undated memo from Dr. Maxine Asher, president of the W.A.U.C. (which recently moved from Gretna, Louisiana, to Las Vegas, Nevada). It stated: "The W.A.U.C. is at this time seeking approval from numerous ministries abroad as well as from the United States Office [sic] of Education....By the end of 1994, many such approvals will be secured." On January 13, I called the W.A.U.C. to inquire if the "Office of Education" had granted approval. The woman who answered the phone asked me to convey my question through Dr. Asher's voice mail. I did so and provided

Nutrition Forum (ISSN 0748-8165), © 1995, is published bimonthly by Prometheus Books, Journals Division.

Subscriptions for individuals in the United States and Canada cost \$35 for one year (6 issues), payable to Prometheus Books, Journals Division, at 59 John Glenn Drive, Amherst, New York 14228-2197. Multireader (e.g., institutional) and overseas (airmail) subscriptions cost \$50 annually.

Manuscripts and all editorial correspondence should be directed to: Jack Raso, P.O. Box 740045, Rego Park, NY 11374.

my phone and fax numbers and my address. I have not received a response from Asher. Later that day, I called TCS/AHCN and asked the woman who had answered the phone if the W.A.U.C. accredits TCS. She replied that the association accredits both TCS and AHCN. According to *Bear's Guide to Earning College Degrees Non-Traditionally* (1992), AHCN was founded in the 1980s.

- ***AMERICAN COLLEGE OF NUTRIPATHY (ACN)**, Scottsdale, Arizona. Founded in 1976, ACN offers three certificate programs by correspondence, designated "Basic Nutripathy," "Advanced Nutripathy," and "Nutripathic Practitioner." These are accredited by the International Accrediting Commission for Schools, Colleges and Theological Seminaries. In late July 1994, the three programs had 1,000 enrollees and three faculty members (all full-time).

Comments: ACN is unaccredited. Nutripathy is a theistic, vitalistic "science of health" that involves "biochemical analysis" of saliva and urine, color therapy (chromotherapy), food combining, hair analysis, and a variant of Bach flower therapy. In the tenth edition of *Nutripathy...The Final Solution to Your Health Dilemma* (1978), nutripathy's founder, Gary A. Martin, D.N., D.Sc., Ph.D., Th.D., defined "chromotherapy" as "the use of color to apply appropriate healing vibrations to weak and damaged organs." The term "food combining" refers to any dietary practice whose premise is that a meal's healthfulness depends considerably on the compatibility of its macroscopic components and/or the sequence of ingestion. Bach flower therapy is a quasi-homeopathic system. Martin was the questionnaire respondent for ACN and North American University (NAU; see below). His title at both organizations is "Exec. Trustee." ACN and NAU share a toll-free number with HealthWatchers System®, which markets dietary supplements by mail. ACN and HealthWatchers also share a P.O. box.

- **AMERICAN INSTITUTE OF HOLISTIC THEOLOGY (AIHT)**, Youngstown, Ohio. Nutrition-related correspondence programs include Doctor of Divinity (D.D.), Doctor of Naturology (D.N.), and one of three Ph.D. curriculums in metaphysics. Prerequisites for admission: *at most*, a high school diploma or equivalent. Requirements for completion of the aforementioned programs: (1) a grade of at least 80% in all courses and (2) a 20-page dissertation that does not draw from required reading, on a "metaphysical topic" of the student's choice.

Comments: The institute is unaccredited. According to the course catalog AIHT mailed to me in November 1994, "Naturology" is a "religious science of health" whose premise is that "God created humans with certain dietary

and environmental needs, and placed the fulfillment of those needs in the natural substances and environment."

- ***BERNADEAN UNIVERSITY**, Woodland Hills, California. Founded in 1954, Bernadean offers programs leading to certificates, diplomas, and degrees in nutrition, "herbology," homeopathy, weight control, and naturopathy (including a 10-course Doctor of Naturopathy program). In late December 1994, Bernadean's nutrition-related programs had 150 enrollees and 10 faculty members (three of whom were full-time).

Comments: This is an admittedly unaccredited correspondence school that had originally operated from Las Vegas and moved to Van Nuys, California. A 1977 court order had prompted this relocation. The Doctor of Naturopathy program includes courses in acupuncture, "alternative" cancer "therapies," Bach flower therapy, homeopathy, iridology, and reflexology. The acting dean's response was sketchy. A poorly photocopied pamphlet I received from the school circa 1992 offered correspondence courses leading to designations such as: Alternative Cancer Specialist, Cancer Researcher, Certified Dietitian, Certified Nutritionist, Certified Homeopath, Homeopathic Physician, Naturopathic Physician, and Certified Iridologist. Doctoral degrees available included: Doctor of Homeopathy (H.D.), Doctor of Iridology (I.D.), Doctor of Naturopathy (N.D.), and Doctor of Preventive Medicine (P.M.D.). For the lowdown on Bernadean, see *The Vitamin Pushers* (Prometheus Books, 1994).

- **CALIFORNIA COLLEGE FOR HEALTH SCIENCES (CCHS)**, National City, California. CCHS offers an "independent study" program with an emphasis in Community Health Administration and Wellness Promotion. It leads to a Master of Science degree. CCHS is accredited by the Accrediting Commission of the Distance Education and Training Council. Prerequisites for admission: (1) a baccalaureate from an accredited college or university and (2) completion of an introductory psychology course. Requirements for completion of program: completion of 36 graduate semester credits, at least 27 through CCHS. The two nutrition-related courses in the program are optional.

Comments: CCHS is accredited. It was founded in 1976 (according to the 1994-95 "Directory of Accredited Institutions" of the Distance Education and Training Council), in 1978 (according to the *1995 Higher Education Directory*®), or in 1979 (according to *College Degrees by Mail* and the 11th edition of *Bear's Guide to Earning College Degrees Non-Traditionally*). According to the Graduate Studies Catalog I received in 1990 or 1991, the required courses included three nutrition-related courses: a 3-credit course and two 1-credit courses. The graduate program seems creditable.

EDITORIAL BOARD

EDITORS: Jack Raso, M.S., R.D., Manfred Kroger, Ph.D. **EDITOR EMERITUS:** Stephen Barrett, M.D. **SENIOR ASSOCIATE EDITOR:** Michael K. Botts, Esq. **ASSOCIATE EDITORS:** William T. Jarvis, Ph.D.; Ira Milner, R.D.; Grace Powers Monaco, Esq.; Zhixin (David) Xu, M.S. **CONTRIBUTING EDITORS:** Johanna Dwyer, Sc.D., R.D.; James J. Kenney, Ph.D., R.D.; Marilyn Larkin; William M. London, Ed.D.; James A. Lowell, Ph.D.; Varro E. Tyler, Ph.D., Sc.D. **SCIENTIFIC CONSULTANTS:** John E. Dodes, D.D.S.; Victor Herbert, M.D., J.D.; Gabe Mirkin, M.D. **INFORMATION CONSULTANTS:** Inna Lipnitsky, M.S.L.I.S.; Yelena Vasilyeva, M.S., M.S.L.I.S.

- ***GREENWICH UNIVERSITY, Hilo, Hawaii.** Founded in 1972, Greenwich offers "individualized" correspondence programs leading to master's and doctoral degrees in all fields. The university has applied for accreditation to the Pacific Association of Schools and Colleges. Basic prerequisites for admission: (1) a written self-description, and (2) letters of reference from people who know the applicant well, including at least one from a person conversant with the applicant's career. Prerequisites for admission to a master's degree program: a bachelor's degree. Prerequisites for admission to a doctoral program: earned bachelor's and master's degrees or: (1) an earned bachelor's degree, (2) considerable academic and professional experience in the field of the proposed doctorate, and (3) enrollment in a Greenwich master's degree program that largely involves writing a thesis of 40–60 pages or submitting a "comparable" collection of shorter papers. Requirements for completion of doctoral program: (1) completing "coursework" and (2) completing a dissertation or "comparable major project." In late July 1994, the university did not have any full-time faculty members.

Comments: The university is admittedly unaccredited and offers "distance education" only. Neither CORPA nor the U.S. Secretary of Education recognizes the Pacific Association of Schools and Colleges. See "National Institute of Nutritional Education," below.

- ***INSTITUTE FOR EDUCATIONAL THERAPY (IET), Cotati, California.** Founded in 1982, IET offers a 550-hour Nutrition Consultant Training Program, which comprises three certificate programs that students may pursue on-site or by correspondence: (1) a 150-hour Diet Counselor program, (2) a 150-hour Nutrition Educator program, and (3) a 250-hour Clinical Nutrition Consultant Program. The institute is accredited by the Council for Private Postsecondary and Vocational Education, in Sacramento, California. Basic prerequisites for admission: (1) age of at least 18 years, and (2) good health. Prerequisites for admission to Nutrition Educator program: completion of Diet Counselor courses. Prerequisites for admission to Nutrition Consultant program: completion of Diet Counselor and Nutrition Educator courses. Requirements for completion of programs: (1) submitting to a 15-minute telephone critique by an instructor after completion of each assignment (i.e., a total of 1½ hours of oral evaluation), and (2) obtaining a grade of at least 75% on a written final exam. Additional requirements for completion of Clinical Nutrition Consultant program: (1) a "research paper" relevant to at least one case study of a personal client, and (2) oral presentation of a case history the student has taken. The description of the required Diet Counselor course titled "Allergy and Immune Support" includes the statement: "The use of specific foods, fresh juice, herbs, broth, and cleansing aids will be introduced as well as specific programs for cleaning and healing the organs of elimination." The "required materials" in the Nutrition Educator program include a "Hair Analysis."

By mid-January 1995, IET had given Diet Counselor certificates to 120 people, Nutrition Educator certificates to 45, and Nutrition Consultant certificates to 20. Then, the program had 75 enrollees and eight faculty members (three of whom were full-time).

Comments: IET is unaccredited. I received two mailings from IET that included a program catalog, both in January. The first, postmarked January 13, was addressed to *Nutrition Forum*. The second, postmarked January 19, was addressed to a relative of mine, who had signed a check for \$4.00 for the catalog. The catalogs differed.

- **INTERNATIONAL SOCIETY OF NATUROPATHY (ISN), Los Altos, California.** Founded before 1960, this "fraternal, closed" society offers correspondence courses leading to master's and doctoral degrees in nutrition, "natural nutrition," nutritional science, and naturopathy. Prerequisites for admission: membership in ISN. Requirements for completion of programs: (1) 180 credits (master's degree) or 240 credits (doctorate), and (2) a thesis of at least 2,500 words.

Comments: On July 17, 1994, I mailed identical requests for information to ISN and its "sister college," Harmony College of Applied Science, which shares an address with ISN. I have not received a response from Harmony. In late 1989, I received a catalog from Harmony that offered a correspondence curriculum leading to a Ph.D. degree in nutrition or nutritional science. Both ISN and Harmony are unaccredited.

- **LASALLE UNIVERSITY, Mandeville, Louisiana.** LaSalle offers a Ph.D. program leading to the designation "Certified Holistic Practitioner" (CHP), a Ph.D. program in nutrition counseling, and a Doctor of Naturopathy (N.D.) program. The university, "one of the world's largest Christian Institutions," is accredited by the Council on Postsecondary Christian Education (COPCE), in Washington, D.C. Prerequisites for admission: "Sixty (60) units, the equivalent of 50% of the credit needed for a bachelors [sic] degree, or the passing of a Special Admissions Exam."

Comments: According to *Bear's Guide to Earning College Degrees Non-Traditionally* (1992), this unaccredited correspondence school was founded in 1986. LaSalle also offers "external degree" programs at the master's and doctoral levels in health services management and customizable fields, e.g., "Nutrition & Fitness." On an introductory audiocassette I received from the school before the study began, someone stated:

The extension education outreach ministry offers theocentric, nonsecular programs to enhance world solutions.... [A]t LaSalle, we assess and award credit for the competencies and skills gained through work and life experience.... But the big problem, for some students, is procrastination. These students want to get into the program.... But they keep putting it off.... [P]rocrastination causes more lost opportunities than anything.... God bless you.

• LESLEY COLLEGE, Cambridge, Massachusetts. Through its Graduate School, Lesley offers an Independent Study Degree Program that is "individually designed" and leads to an M.A. or M.Ed. degree, or to a Certificate of Advanced Graduate Study (C.A.G.S.), in customizable fields. Prerequisites for admission to a master's degree program: a bachelor's degree. Prerequisites for admission to the C.A.G.S. program: a master's degree. The program may include apprenticeships, courses, "directed" readings, fieldwork, lectures, and tutorials, and it requires completion of a "major" project, such as a thesis or book.

Comments: Founded in 1909, Lesley is accredited by a regional accrediting body. I obtained admission to its Independent Study Degree Program in 1990. My faculty advisor, a registered dietitian, said she planned to include a naturopath on my three-person faculty team. A brochure I received in February describes her as a practitioner of "clinical/holistic" nutrition who "actively pursues" interests in "cross-cultural healing," dream interpretation, "Focusing" (see this issue's "Healthcare Esoterica"), and spirituality.

• *LIFE SCIENCE INSTITUTE, Inc., Austin, Texas. Founded in 1976 or 1978, the institute offers a "Certification Course in Natural Hygiene" through a company called *Feeling Fit...for Life!*®. This 106-lesson "independent study" program in "health science" leads ultimately to a "Certificate of Completion as a Natural Hygienist." After successful completion of the first 54 lessons, students receive a "Certificate of Proficiency." Prerequisites for admission: none. Requirements for completion of program: taking 20 tests and submitting them for grading. In late August 1994, the program had 500 enrollees. In mid-January, the program had more than five hundred enrollees, over four thousand graduates, and 17 faculty members (12 of whom were full-time). In January, program accreditation was "in process" (sic).

Comments: *Feeling Fit...for Life!* and the Life Science Institute responded separately to questionnaire items, in July 1994 and January 1995 respectively. Natural Hygiene is a health-centered philosophy of "natural living" whose ideal diet consists of uncooked, unprocessed foods from the plant kingdom [see NF 7:33-36, 1990]. "Feeling Fit" is the latest incarnation of an organization whose former names, manifestations, and affiliates include: American College of Health Science (Austin, Texas), American Health Sciences Institute (Manchaca, Texas), American Wellness Retreat (Burnet, Texas), College of Life Science (Austin), Freedom Associates (Austin), Health Enterprises (Austin), Health Excellence (Manchaca), Health Excellence Systems (Manchaca), Health Watchers' Wellness Network, Life Science (Manchaca), and Life Science Institute (Austin and Manchaca). The objection of the D.A.'s office to the use of the word "college" on the school's letterhead prompted a name change in 1983, to "Life Science Institute."

In an undated form letter I received in February, the institute's president stated: that the company would soon offer the correspondence course as the "Health Facilitator, Level I certification program"; that the institute's goal was to

offer Level II by June 1995; and that the institute was also shooting for an operational degree program by early 1996. In quasi-personalized letters dated December 27, 1994, January 5, 1995, and January 17, 1995, the Director of Student Services stated: "Sections of the course have been translated into French and are part of the curriculum at the University of Paris School of Medicine...to be taught to its medical students."

On May 13, 1986, Harvey Diamond, coauthor of the bestseller *Fit for Life* (1985) and recipient of a Ph.D. degree from the American College of Health Science, appeared on ABC News' "Nightline" and stated that the "University of Paris School of Medicine" had just transcribed the "entire course" offered by his alma mater and was "using it for" its 5,500 medical students. In a letter to Ira Milner, R.D., dated February 22, 1988, T.C. Fry, today Educational Advisor at the Life Science Institute, attested to the inclusion of the course in the medical curriculum of the University of Paris. However, the director of the University of Paris Medical School had told Milner, in a letter dated November 19, 1987:

We have never heard of the so-called "American College of Health Sciences." We have no knowledge of a publication of our School which would be a transcription of the "health and nutrition course" of the so-called "American College of Health Sciences."...I will order an inquiry concerning this problem.

• NATIONAL INSTITUTE OF NUTRITIONAL EDUCATION (NINE™), Aurora, Colorado. Founded in Florida in 1980, NINE offers a 180-hour Independent Studies Program that leads to a certificate and eligibility to apply for certification as a Certified Nutritionist (CN)™. Textbooks include *Alternative Medicine: The Definitive Guide* [see NF 11:57, 1994] and *The Turning Point*. Prerequisites for admission: a college degree (waived until 1996). Requirements for graduation and certificate (prerequisites for CN certification): (1) completion of all program courses, (2) a cumulative GPA (grade point average) of 2.5 (4.0 = "A"), and (3) an average grade of at least "C+" on exams. Requirements for CN certification: (1) successful completion of 5 or 6 exams and (2) one year of experience in "dealing with the public," managing people who do so, or holding a health-related administrative position. The School Director (James R. Johnson, Ph.D.) can waive CN certification requirements. "The institute teaches about the values of fasting, detoxification, uses of nutritional supplements above the RDA, accessory nutrients and the use of herbs and herbal therapies." NINE's graduating class of 1994 comprised 36 people.

Comments: NINE is unaccredited. On page 249 of *The Turning Point: Science, Society, and the Rising Culture* (1983), physicist Fritjof Capra, Ph.D., declared: "Even more important than the detailed composition of our diet are the following three requirements: our foods should be *natural*, consisting of organic food elements in their natural, unaltered state; they should be *whole*, complete and unfragmented, neither refined nor enriched; and they should be *poison-free*, organically grown, free from poisonous chemical residues and additives."

Under the heading "Affiliations" in its 1994–1995 "Student Catalog," NINE claims an "articulation agreement" with Regis University, a prestigious Catholic institution in Denver, Colorado. However, on February 9, in a message on my answering device, Karen Weber, Assistant to the President of Regis, stated: "Actually, Regis University never had an articulation agreement with NINE." She defined "articulation agreement" as "an agreement between two institutions of higher education, typically one lower division [and] one upper division, where certain lower-division courses taken at the lower-division school will apply toward degree requirements at the senior institution."

According to *The Vitamin Pushers*, NINE's founder and president, James R. Johnson, claimed a Ph.D. degree from an unaccredited organization, "Occidental University...in St. Louis." *Bear's Guide to Earning Non-Traditional College Degrees* (1988) stated that "Occidental University of St. Louis" is the original name of the International Institute for Advanced Studies. The 11th edition of *Bear's Guide to Earning Degrees Non-Traditionally* (1992) states that "Occidental University" is the institute's original name, that the institute was "begun" in St. Louis in 1972, and that it "evolved" into Greenwich University (see above). The latter edition of *Bear's Guide* listed both the International Institute for Advanced Studies and Greenwich University as operational schools. (According to a 1989 catalog I received from the former organization, it was founded in Clayton, Missouri, in 1972; the catalog and the 10th edition of *Bear's Guide* gave the same Clayton, Missouri, address.) *Bear's College Degrees by Mail* (1992) describes the institute as Greenwich University's "predecessor."

- ***NORTH AMERICAN UNIVERSITY (NAU), Scottsdale, Arizona.** Founded in 1992, NAU offers three nutrition-related graduate programs through "off-campus study": (1) a "wellness science" program leading to an M.S. degree, (2) a "Doctor of Wellness Science" program leading to a D.Sc. degree, and (3) a "Doctor of Wellness Science Philosophy" degree program. The programs are accredited by the International Accrediting Commission for Schools, Colleges and Theological Seminaries. Prerequisites for admission: (1) a high school diploma or equivalent, (2) reaching 18 years of age by the end of the third month following admission, (3) literacy in English, (4) "good moral character," and (5) agreement with the "mind-body-spirit" philosophy of NAU. Students may receive credit for preadmission "education, life experiences, military experiences, etc." In late July 1994, NAU's nutrition-related programs had 50 enrollees and two faculty members, both full-time.

Comments: NAU is unaccredited. It also offers a "Bachelor of Wellness Science" (B.S.) degree program, which is nutrition-related. See "American College of Nutripathy," above.

- **ST. MARTIN UNIVERSITY (University of St. Martin).** The university's "External Degree Program" is "administered

from" Reynosa, Republic of Mexico. The "School Mail Center" is in Ada, Oklahoma. Founded in 1984, St. Martin is accredited by the InterAmerican Association of Postsecondary Colleges and Schools. It offers "custom tailored" degree programs as well as "off-campus" programs in nutritional science and "holistic health science" that lead to master's and doctoral degrees. For example, the university "confers" the degree of "Doctor of Nutrition." Prerequisites for admission to master's degree programs: (1) a bachelor's degree (obtainable by correspondence through St. Martin) and (2) at least 30 "major course hours" (which the applicant may pursue through St. Martin). Prerequisites for admission to doctoral programs: (1) a master's degree and (2) at least 30 "major course hours" at the master's level (which the applicant may pursue at St. Martin). Requirements for graduation: (1) a "satisfactory" grade in all required courses, and (2) a "professional thesis." Duration of programs: approximately 12–18 months per degree. Courses in the College of Nutritional Science include: Food Combinations, Hair Mineral Analysis, Herbology I and II, Macrobiotics, Natural Dietetics, and Reflexology I. Courses in the College of Holistic Health Science include: Ayurvedic Therapy, Enzyme Therapy, Juicing Therapy, Oriental Herbology, Psycho-Cybernetics (sic), Tissue Cleansing, and Zone Therapy.

Comments: Courses in the College of Health Science include Chelation Therapy, Homeopathy, Naprapathy [see NF 11:63–64, 1994], Naturopathy, Taichiology (sic), and WALTER Therapy. The School of Holistic Therapy offers a correspondence program leading to an "Associate of Science Degree in Holistic Science" and "registration as a Practitioner of Holistic Therapy." There are no prerequisites for admission. The five courses in this program are: Collateral Therapy, Herbal Therapy, Iridology, Meridian Therapy, and Zone Reflexology.

- **WALDEN UNIVERSITY, Minneapolis, Minnesota.** Through its Institute for Advanced Studies, Walden offers a customizable program leading to a Ph.D. degree in health services. Prerequisites for admission: (1) a master's degree from an accredited institution or (in exceptional cases) submission of a "prior learning portfolio," (2) at least 3 years of relevant professional experience, and (3) attendance at an admissions/orientation workshop (A/OW), which begins on a Friday evening and ends on the afternoon of the following Sunday. Requirements for completion of program: (1) fulfillment of a "learning agreement," an individualized study plan within a Walden curricular framework; (2) submission of a dissertation; (3) oral presentation thereof; (4) attendance at one 3-week summer session or two 2-week summer sessions; and (5) attendance at one 4-day "regional intensive" session per 12-month period of enrollment.

Comments: Founded in 1970, Walden is accredited by a regional accrediting body. I applied to the aforementioned doctoral program in 1992, and I received an invitation to attend an A/OW. I have not discerned any cause for concern about the program or the university.

General Comments

Later this year, *NF* will feature a detailed report of my study of nutrition-related “credentialing” organizations. A few personal remarks probably are in order here. First, during four years of seeking a suitable nontraditional path to credentials, my desire for a streamlined application process and a streamlined didactic program overrode my desire for

a spiritual dimension. Regrettably, it seems that most streamlined health-related programs with streamlined preadmission procedures harbor unscientific teachings. Second, I believe that a distinctly nutrition-related doctorate (e.g., NutritionD) would invigorate the profession of clinical dietetics and thus weaken pseudocredentialism. It seems to me that, while nutritionist licensing has merit, the public wants “nutrition doctors,” not licensees or registrants.

HEALTHCARE ESOTERICA

Here's another batch of mystical alternative “health” methods. References are in boldface within brackets.—*J.R.*

Alchemia: Form of channeling that allegedly involves activating “Universal Fifth Dimensional Energy.” [1]

Alchemia breathwork: System that allegedly transforms “karmic situations” and, through “focused use” of the “Breath” and the “Life Force,” frees “suppressed energy.” It involves alchemia® heart breath, purportedly an initial step toward discovering “energy blockages.” [2]

Alchemical synergy®: Form of “hypnotherapy” whose purported goal is to develop the “optimum potential” of individuals by connecting them with their respective “inner master.” [1]

Barbara Brennan healing science: “Spiritual” system concocted by Barbara Ann Brennan, author of the bestseller *Hands of Light: A Guide to Healing Through the Human Energy Field* and *Light Emerging: The Journey of Personal Healing*, both published by Bantam. Brennan, who holds a master’s degree in atmospheric physics, founded the Barbara Brennan School of Healing, in East Hampton, New York, in 1982. Her system is a form of so-called energy field work that involves “Core Star healing” and “Hara healing.”* According to the 1994–1995 *Holistic Health Directory & Resource Guide*, “the healer works to clear the client’s [energy] field of unhealthy and blocked energies, charge depleted areas, repair distorted patterns, and balance the entire field.” [3, 4] *Hara” is a Japanese word that some spiritualists use to denote the *tanden*—the alleged seat of *ki* (supernatural “energy”) in humans, slightly below the navel.

Barefoot shiatsu massage: Variant of shiatsu practiced by Viola M. Timbers, R.N., B.A., of New York City [5]. During a phone conversation with me on January 29, Ms. Timbers stated:

[Shiatsu]...really is acupuncture without needles. But, in barefoot shiatsu, I use my feet a little bit. I can stand on the back, but I support my weight on the chair; and I walk on my hands. I walk on certain part—I use my feet on certain parts of the body. But I also use my palms, my hands, my palms, my thumb, and my elbows and knees. I use various parts of my body to apply pressure to the, uh, what you call the meridians....

BEYOND MEDICINE: “Multi-dimensional approach” promoted by Shoshana Margolin, M.A., N.D., D.H.M. It involves “full-spectrum homeopathy,” “holographic bio-analysis,” “holistic girth control,” and “physical & nutritional re-balancing.” One of its premises is that people are “multi-dimensional Beings.” [6]

BodyMind therapy: System taught by The BodyMind Academy, in Bellevue, Washington. It comprises: (1) BodyMind breathwork, which includes rebirthing; (2) BodyMind massage; (3) BodyMind counseling hypnotherapy, which involves Jungian psychology and neuro-linguistic programming (NLP); and (4) BodyMind shiatsu, which purportedly involves pulse reading. [7]

Ching Lo (meridian therapy): Alleged external stimulation of *Qi* (*chi*) and “Blood” in diverse ways, including acupuncture, cupping, moxabustion, scraping, and application of “acu-powder,” electricity, herbs, or magnets. [8]

Choi kwang do: Modern, noncompetitive martial art whose major interests are health, human potential, and self-defense. Its basis includes “chiropractic medicine,” and its teachings encompass hatha yoga, “herbology,” “holistic” nutrition, and shiatsu. [9, 10]

The Clean-Me-Out Program™: Neo-Christian system of “self-healing” developed principally by Richard Anderson, N.D., N.M.D. Two herbal supplements constitute its backbone: *Chomper*, whose eleven herbs include cascara sagrada (a laxative) and lobelia (ingestion of which is risky); and *Herbal Nutrition*, whose ten herbs include alfalfa, comfrey (which is poisonous), horsetail (a weak diuretic), and licorice root. Besides these and other supplements, the program involves enemas and avoiding intake of meat and dairy products. In the fourth (second revised) edition of *Cleanse & Purify Thyself* (1994), Anderson states that “cooked, frozen, canned and processed foods...drain the life force from the body.” In Chapter 9, he describes a “profound Divine experience” wherein a female “Divine Being” filled him with “information.” He states that purification is a “guaranteed entrance” into heaven and that people who are willing to purify themselves “shall have the help of God’s mightiest messengers and, if necessary, legions of angelic beings.” [11, 12]

Core transformationSM (core transformation process): Ten-step “self-help” technique pioneered by Connirae Andreas, Ph.D. (with Tamara Andreas), in *Core Transformation: Reaching the Wellspring Within*. It posits an “inner being,” “inner self,” “inner essence,” or “core self.” In 1994, Advanced Communication Training, Inc., billed the technique as an amazing breakthrough in the fields of neuro-linguistic programming (NLP), psychology, and religion that is “useful with” nail-biting, trauma, and weight loss. [13]

Dimensional clearing: "Process" allegedly designed to clear the human "energy field" of "external elements" that are not part of the self, such as "Lost Souls," "Thought Forms," and "fragments" of other people. [14]

Energis™: "A profoundly intuitive yet practical 'hands-on' subtle energy process that gently and naturally stimulates the electrical systems and magnetic fields of the body," according to the Health Optimizing Institute's classified ad in the 1992-1993 *Holistic Health Directory* (p. 125). The institute is in Del Mar, California. The ad referred to "Energis™ Training & Research." On December 21, 1994, I used the institute's "800" voice mail to request printed information about the method. The next day, Gary Houston (or Huston) stated on my answering device: "That program is shelved or on the back burner, so to speak, because we're involved in some other, newer developments in energy medicine....I just don't have anything [i.e., literature on Energis] to pass along. That *Holistic Health Directory*, I think, is a couple of years old. It's a very fast-moving, fast-changing field."

Etheric release: Form of "energy work" whose premise is that restricting emotional expression can cause malfunctions in one's "physical body." [2]

Focusing (focusing-therapy): "Natural" stepwise system of "personal growth" based on the work of psychology professor Eugene (Gene) T. Gendlin, Ph.D., author of *Focusing* (1981) and *Let the Body Interpret Your Dreams* (1986). It involves dreamwork and inner child work (see "*Alternative Healthcare: A Comprehensive Guide*"). The purported effects of Focusing include: direct contact with the (allegedly palpable) "wisdom" of one's body (i.e., prenatal "bodily meaning"); the flowing of "life's energy" in "new ways of being"; discovery of one's "genuine self"; and an increase in personal "whole[ness]." [15]

Humanistic therapy: Method whose purported goal is to heal the "inner child." It posits a boundless human spirit. [16]

Human resources chi gong: Form of Qigong (*chi gong*) taught by Warner Chen, O.M.D., L.Ac. (licensed acupuncturist), Ph.D., of New York City. Chen describes *chi* as a "vital force or vital energy" similar to electricity. He recommends his "energy techniques" for alcoholism, allergies, arthritis, asthma, cancer, depression, diabetes, drug addiction, going bald, hernias, impotence, insomnia, neuralgia, sciatica, and other conditions. (See "Marrow cleansing chi gong," below.) [17]

I-Chuan (Da Cheng Chuan): Martial art modernized in the 1940s by Wang Xiang Zhai. Its ancient central practice is *Zhang Zhuang*—standing like a tree and meditating. [18]

Integrated kinesiology: Reportedly dynamic and eclectic variant of applied kinesiology (see *Mystical Diets*) taught by Dr. Craig Rubenstein. It includes the visceral meridian manipulation technique (VMM), "a mixture of classic organ manipulation, meridian therapy and kinesiology." [19]

Integrative yoga therapy: "Wellness" program developed by Joseph LePage, M.A. It involves guided imagery. [20]

Inter-light kinesiology (agape quest program): "Specialized Kinesiology" system that involves more than twenty "modalities," including acupressure, affirmations, "flower essences," "Muscle Testing," and tuning forks. These "powerfully integrated techniques" allegedly "unlock blockages." [21]

Kelley/Radix® work (Kelley/Radix personal growth work): Brand of Radix taught by Kelley/Radix, an organization in Vancouver, Washington, founded by Charles R. Kelley, Ph.D. Kelly, an author and psychologist, developed Radix in the 1960s and early 1970s. (The 1994 Kelly/Radix Schedule described "Chuck" and "Erica" as the "two founders" of Radix.) Alternate names for Radix include "neo-Reichian therapy" and the "Radix neo-Reichian program of personal growth." Radix borrows from Reichian therapy, another form of body-oriented psychotherapy, the concepts of "life energy" and "muscular armor." It postulates that muscle tension is the mechanism of volition and an access to one's "life force." In Radix terminology, "radix" means "life force" or "life energy." Kelley's organization offers a correspondence course titled "Science and the Life Force," which includes such topics as "radix = God = ether?" [22]

Kriya massage (kriya bodywork): Mode of bodywork that allegedly uses "universal, life-affirming energy." [1]

Life span nutrition (limbic eating): Dietetic philosophy expounded by its formulator, Majid Ali, M.D., in *The Butterfly and Life Span Nutrition* (1992). On page 214, Ali describes enzymes as the "LIFE FORCE OF FOODS...the life in foods." He states that enzymes give "foods in Nature their life" and distinguish "living organisms from nonliving objects" (p. 214). Ali further states: "I consider the wisdom of the ancients in matters of human nutrition the bedrock of all strategies for sound nutrition for the life span" (p. 221). The four "critical aspects" of life span nutrition (pp. 256-258) include the following. (1) "We are what we observe." Therefore, one should learn to observe how one responds to food and vice versa. (2) "Bowel is the most important defense organ of the body." Therefore, one should understand the "ecology" of one's bowel. (3) "Injured foods injure tissues." Fertilizers, pesticides, preservatives, processing, and spoilage are injurious. (4) "We must respect our food if our food is to respect us....The acid test of common sense must be accepted as the true test of what is right and what is not in nutrition." [23]

Marrow cleansing chi gong: Form of Qigong (*chi gong*) taught by Warner Chen, O.M.D., L.Ac., Ph.D., of New York City. (See "Human resources chi gong," above.) [17]

Mentalphysics: Purported practical, wholistic, futuristic science and "super yoga" founded in 1927 by Rev. Edwin J. Dingle, an English journalist and publisher who died in 1972. Mentalphysics supposedly brings out the "hidden meaning" of the Bible and reportedly involves "astral travel," aura reading ("aura study"), chanting, *jin shin jyutsu* (a variant of shiatsu), meditation (including guided meditation), *pranayama* ("deep scientific breathing exercises"), "pranic therapy" (a variant of channeling), reflexology, shiatsu, and individualization of diet according to "chemical type." [24]

Metaphysical hypnosis (metaphysical hypnotism): "Natural" yet "spiritual" method that, purportedly, involves autohypnosis, speeds healing, and can even effect "miraculous" healing. Dorothy H. McCrary, Ms.D. ("Doctor of Metaphysics"), trains "professionals" in this form of "suggestive therapy" in Manhattan. In a mailing postmarked January 9, "Dr." McCrary stated: "I am able to take a subject into any portion of our Universal Creative System....able to take a patient into...other solar systems....to his or her Mother Planet...[which] will converse with It's [sic] child and give healing instructions. I have taken subjects back millions of years before they became humans...." [25, 26]

Ortho-bionomy™ (OB): The bodywork field's answer to homeopathy, according to the Society of Ortho-Bionomy International. OB is a "complete system" of "natural manipulative therapy" and "self-healing" developed by Dr. Arthur Lincoln Pauls, a British osteopath who introduced it in the U.S. in 1976. Pauls, who reportedly believes in a "life force" or "life energy," defines "ortho-bionomy" as "the correct application of the laws of life." His system involves touching, dialogue, and instruction in common movements. Sessions may also include so-called energy field work. [27, 28]

Pre-cognitive re-education: Process that allegedly releases the "energetic thought forms" of "negativity." It posits a "HIGHER SELF"—a "place" of infinite wisdom. [29]

Process acupressure: Combination of "traditional" acupressure, "psychological process work," and zero balancing. Zero balancing is a reportedly adaptable mode of bodywork founded and named by Fritz Frederick Smith, an acupuncturist, medical doctor, and osteopath. Aminah Raheem, Ph.D., author of *Soul Return*, developed process acupressure, which involves the "body energy" theories of acupuncture, tai chi, and yoga, and posits "energy systems" consisting of "meridians" and chakras. [30, 31]

Psychic self-defense: Five-cassette audiotape program whose premise is that "negative forces," "negative influences," or "negative thought-forms"—a usually imperceptible form of "subtle energy"—are often the source of addictions, "bad luck," depression, and other problems. It is a form of so-called aura balancing. [32]

Psychic shield: Six-cassette purported complement to psychic self-defense (see above). It is a form of so-called chakra balancing. [32]

Reiki-alchemy®: Union of alchemia (see above) and reiki. Reiki is a variant of the laying on of hands that posits "Universal Life Force Energy." [1]

Reimprinting with divine intervention: "Powerful therapeutic process" developed by Gerry Schmidt. Supposedly, it involves divine assistance and healthfully transforms childhood experiences. [33]

Resonant kinesiologySM (RK): Meditative form of bodywork pioneered and taught by Susan Gallagher Borg, B.A., author of *Sing Your Body*. It involves touching, bodily postures, and vocal sounds. One of RK's postulates is: "Our bodies are metaphors for what we have learned to believe." In an article, Borg stated: "When a Resonant Kinesiologist works...s/he relates to the client in a vibrational manner that is similar to the phenomenon of two similar bells hanging near each other—when one bell is struck, the other will ring also." [34]

Rosen method: "Psycho-physical" system of bodywork developed in the 1970s by San Francisco physical therapist Marion Rosen. It purportedly unlocks the unconscious and integrates mind, body, emotions, and spirit. The method involves "non-intrusive" touching, verbal interaction, and "experiencing breath as the gateway to awareness." One of its postulates is that the body protects everyone from painful past experiences by separating the person from his or her "essential self" ("true self"). Shortness of breath and chronic muscle tension supposedly manifest this alleged protection. [35, 36, 37]

Shamanic counseling: Reputed blend of shamanism and clinical psychology practiced by Leslie Gray, Ph.D. It involves "power animal retrieval" and prerecorded chanting and drumming. Gray has described it as "an approach that does not make that mind/body split." Allegedly, "power animal retrieval" is the "bringing back" of a "guardian spirit." [38]

Silva mind control (Silva method, Silva mind control method, Silva mind control system, Silva method of mind development, Silva mind control method of mental dynamics, Silva mental dynamics): Brainchild of José Silva codeveloped by Burt Goldman. Silva, an unschooled electronics engineer born in Texas in 1914, expounded his method with different coauthors in *The Silva Mind Control Method* (1978) and *The Silva Mind Control Method of Mental Dynamics* (1988), both published by Pocket Books. Silva mind control is a "positive thinking philosophy" of meditative "self-help" that purportedly effects alpha rhythm, a brain wave that occurs in humans during wakeful relaxation. Proponents have averred that the method enables telepathy. On page 123 of the latter book, Silva and Goldman stated:

What we know of as now is the past of the future and the future of the past. Because there is no now, we can work wonders when we seek to change the future by looking to the past.... Through the use of directed, dynamic thought, the past can be changed by modifying your conception of the past.

The "mighty" principles of Silva mind control ("universal rules," "immutable laws of nature") include the following.

- **Mentalism:** "*The universe is a mental creation of God. ... We are aspects of the totality of Creation. As we are relative to God, so is our universe relative to us.*" This principle appears identical with pantheistic (monistic) idealism.
- **Correspondence:** "*As above, so below; as below, so above.*" As it is on the physical plane, so it is on the mental; as it is on the mental plane, so it is on the spiritual." This seems comparable to the double-aspect (or dual aspect) theory of mind, which holds that mind and body are manifestations of an ultimate process or substance—in the case of the Silva method, "Creation" or God (the "Creator").
- **Vibration:** According to this principle, "vibration" is the root of health, illness, success, and failure. "Adjust the vibrations to the proper level and a healing takes place."
- **Gender:** "*All things have a masculine and feminine aspect.*" According to this principle, gender "manifests" on physical, mental, and spiritual planes. The masculine "force" is outgoing, positive, and instigative, while the feminine "force" is "incoming," receptive, negative, and creative.

[39, 40, 41, 42]

SomatoEmotional ReleaseSM: Mode of body-oriented psychotherapy developed by John E. Upledger, D.O., and biophysicist Dr. Zvi Karni. One of its postulates is that emotional trauma can result in the localization of "physical forces" as devitalizing "dysfunctional areas" ("energy cysts"). The method also posits spiritual "dysfunctions." [30]

Soul-centered psychology: Afrocentric mode of "psychotherapy" promoted by John Bolling, M.D. Supposedly, practitioners use "soul perception" to harmonize "the archetypal energies of the psyche." [43]

"Tap, tap" system: Part of a nameless system of "self-help" expounded by Claude M. Bristol and Harold Sherman in *TNT: The Power Within You*, first published in 1954. The larger system involves positive thinking and posits telepathy. The authors described "TNT" as a "magnetic creative power" within people, a combination of a mental image of anything reasonable that one wants plus faith in oneself and in God (the "Great Creator"). The "tap, tap system" is simply repeated visualization of whatever one desires. [44]

Theocentric psychology: Christian system of "psychology" and psychological counseling "therapies," including marriage counseling and "sex therapy." [45]

Transformational counseling: "Holistic" system of "facilitation" taught by the American Association of Alternative Therapists (ASAT). It encompasses "dream therapy," parts therapy, progression/regression therapy, and psycho-neuro integration (PNI). A purported aim of PNI (also called psychic healing) is the "recharging" and realignment of "subtle energy centers." Apparently, the chief postulate of transformational counseling is that beliefs are the "real" cause of mental, physical, emotional, and "etheric" problems. [46]

Transition method: Subject of an "incredible" correspondence course offered by The Transition Institute®, in Conifer, Colorado. The institute's president, reputed former millionaire Bob Scheinfeld, assembled and christened the method, which purportedly spawns "daily miracles." One of its postulates is that a "vast communications network" interconnects all earthlings; supposedly, this (alleged) linkage exists in humans at the level of the unconscious. [47]

Unergi© method (Unergi holistic therapy): "Self-care" system that integrates the Alexander technique [see NF 11:57, 1994], Gestalt therapy [see NF 12:8, 1995], and Rubenfeld synergy© (see *Alternative Healthcare: A Comprehensive Guide*), a form of body-oriented psychotherapy. It involves dreamwork, "healing touch," inner child work [see NF 12:8, 1995], and meditation. Apparently, "Holistic Therapist" Ute Arnold developed the method in or before 1978. [48]

Vodou (vodoun, vodun, voodoo, voodooism): Fusion of Roman Catholicism and ancient African polytheism and ancestor worship, practiced chiefly in Caribbean countries. Vodou priestess Mama Lola, of New York City, promotes the religion as "a spiritual tradition of healing." [49]

READERS' FORUM

Don't Worry, Be Happy

Dear Mr. Raso,

I am a registered dietitian working in an outpatient clinic which provides HIV-primary care. I read *Nutrition Forum*...[because] it provides invaluable information about health care fraud, a problem often encountered by the HIV-positive population.

I am distressed that you have opted to bring religion into the discussion. In the November/December 1994 issue of *NF*, you critique three publications which appear to be primarily addressing religious beliefs. (I did not read these books.) I believe it is important to keep religion out of the discussion of health care fraud, because belief systems' benefits are highly subjective. Crossing the line into questioning faiths, revealing your personal beliefs, threatens to undermine your objectivity. Only in cases where the clear goal of an organization is to reap profits by marketing highly questionable health products or cures does it seem appropriate. It's these "fringe" groups of all religious circles that tend to get media attention. For most, however, their faiths offer, among other things, community support, assistance to those in need, spiritual relief through meditation or prayer, and a sense of well-being. Our own beliefs, Mr. Raso, are irrelevant to the original cause for preventing victimization by health care fraud. Thank you for taking this into consideration.

—**Laura F. Wilson, R.D.**, Haelen Center, New Haven, Conn.

I appreciate your speaking your piece. I assume that the publications to which you alluded are: (1) *Deadly Doctrine: Health, Illness, and Christian God-Talk*, (2) *The Encyclopedia of Eastern Philosophy and Religion*, and (3) *Hidden Treasure: Discovering the God Within*. I reviewed *Deadly Doctrine* to reinforce my response to Dr. Sneed's letter; the encyclopedia because, as a critic of alternative healthcare, I have found it helpful; and *Hidden Treasure* because it conveys the common alternativist viewpoint that spirituality is the necessary backdrop and unique generator of materiality. This worldview fosters believing that if one shapes up spiritually, one will improve physically. On page 105 of *Hidden Treasure*, author Thomas Ehrhardt states: "Many of the 'bad' things that happen in the world today do so simply because we've lost contact with God and the spiritual realms...[O]ur sinking into material reality has been the cause of many regrettable

occurrences on the earth...." The book is readable, its jacket is eye-catching, and its message, which I don't treasure, is relevant to health fraud.

My no-holds-barred, iconoclastic approach to health fraud probably rubs many readers the wrong way. But I will not repudiate it, for there is a dearth of health-fraud opponents who deal with the religious and quasi-religious notions that facilitate such victimization. It's a largely thankless task, but somebody has to do it.

I am a religious nonbeliever. However, religious unbelief per se does not comprise personal beliefs. It is a state of not having any religious beliefs. It includes atheism and unbelief in afterworlds, angels, Satan, etc. Finally, it is perfectly consistent with science. I very much doubt that religious unbelief per se impairs objectivity in matters of science; indeed, I would venture calling it almost necessary for such objectivity. "Preventing victimization by health care fraud" may be the "original cause" of many people who want to maintain blind spots. It is not mine.

By the way, because the word "Haelen" rang a bell, I called directory assistance on January 23. The operator told me there was no listing for a "Haelen Center" in New Haven.—*J.R.*

Trend or Foe?

Dear Jack,

I am writing about the letter from Gayl Easter [NF 11:65, 1994]...regarding the...seminar entitled "Exploring Controversial Therapies in Nutrition," held in Glenwood Springs, Colorado [on November 18, 1994]. I would like your readers to know that the Colorado Dietetic Association (CDA) *did not approve CEUs* [continuing education units] *for the entire program*. The only portion that was approved was my presentation. CDA is very careful about its CEU curriculum, and I am proud of its scrutiny in this area. The purpose of my talk was to provide a set of guidelines for evaluating the so-called "Controversial Therapies." In fact, I stressed the point rather strongly that desperate people are prone to exploitation by the practitioners of these therapies.

I hope this clears up any misunderstandings.

—**Jackie Nielsen, M.S., R.D.**, Colorado Area Network Coordinator, National Council Against Health Fraud

Note: The Western Colorado Dietetic Association (WCDA) and a hospital were the sponsors of the "Controversial Therapies" seminar. On February 6, I phoned the CDA and spoke with Beth, a secretary, who stated that the CDA "covers all of Colorado" and described the WCDA as one of the CDA's "district" associations. Later that day, I phoned CDA president Rosanne G. Ainscough, who confirmed Beth's statements and added that the CDA does not have jurisdiction over the "planning of the programs" in "individual districts."

However, in a letter to Gayl Easter dated November 5, 1994, Ms. Ainscough had stated:

...The fact that CDA approved the *program* [emphasis added] for continuing education credit does not constitute an endorsement of the program or any of its speakers.... We reviewed the objectives of the conference and feel that WCDA is responding to a trend that ADA [The American Dietetic Association] has identified that there will be increased use of alternative medicine in the future and dietitians need to be

informed about these alternatives. We feel there is a difference between alternative therapies and quackery....

Quackery and "alternative therapies" are indeed different; but if the word "quackery" refers to the health-related teachings and practices of pretenders to medical expertise, alternative healthcare abounds in quackery. Jackie Nielsen's anti-health fraud efforts are undeniably praiseworthy. However, the manner of trendiness exhibited by the WCDA bears scrutiny.

On February 7, I phoned Jackie Nielsen and ADA. I asked Ms. Nielsen, for how many CEUs had the CDA approved her presentation. She responded that she had requested two. However, less than a month before the seminar, seminar representative Cindy Krisinger had stated on my answering device that "Controversial Therapies" had been "approved for six [continuing education] hours with ADA."

I asked Maggie Walls at ADA if the association had published a position paper on alternative healthcare. She replied that there was none. It is overdue.—J.R.

BRIEFS

Food stamp fraud. The U.S. Secret Service estimates that \$2 billion of the \$24 billion in food stamps issued annually are redeemed illegally. According to an Associated Press report, virtually every city has an underground system for diverting food stamps, and millions of dollars in illegal profits have been transferred overseas. Most schemes involve retailers who buy them for 50 to 70 cents on the dollar and redeem the stamps for face value or pass them to wholesalers for supplies. Recipients who sell their stamps typically use the cash to buy drugs, alcohol, clothing, or other goods not covered by the food stamp program. States using electronic cards instead of stamps have discovered conspiracies between recipients and grocers to empty accounts and split the proceeds. Instances have also been reported wherein supermarket cashiers passed debit cards through the electronic scanner several times and pocketed cash equivalent to the extra amount debited to the cardholder's account. Some middlemen approach indigents at shelters to obtain their stamps or debit cards.

Lieberman sues ADA. Shari Lieberman, Ph.D., has sued The American Dietetic Association (ADA) for defamation. In January 1994, ADA suspended her R.D. (Registered Dietitian) credential for three years for not practicing "dietetics based on scientific principles and current information." Her suit charges that ADA had no right to use opinions she conveyed through publications as the basis for its conclusion. Lieberman is a board member of the American Preventive Medical Association (APMA), which describes itself as "the public policy advocate for doctors and other health care practitioners who use nutritional approaches and other progressive therapies in patient care." Licensed APMA members can participate in an insurance policy that covers expenses incurred in defending against administrative actions (such as disciplinary actions by state licensing boards). APMA, Julian M. Whitaker, M.D. (an APMA officer who edits *Health & Healing*®

newsletter), Citizens for Health (an opponent of FDA regulation of the supplement marketplace), and the National Institute of Nutritional Education (see this issue's "School Daze") have urged contributing to the Shari Lieberman Legal Defense Fund. (In the January 1995 supplement to his newsletter, Whitaker called *NF* associate editor Ira Milner, R.D., a "disgruntled member" of ADA.)

Choices: Not Choice (a re-review)

I was off guard. In the November/December 1994 issue of *NF*, I favorably reviewed the third edition of *Choices: Realistic Alternatives in Cancer Treatment* (1994). A trusted associate of mine had voiced approval of the previous edition of the book and had thus predisposed me to acceptance. In my mini-review, I called *Choices* "an excellent, comprehensive reference book." It is not excellent. Chapter 24 includes a section, titled "Relaxation Techniques," that *implicitly* recommends Silva mind control (see this issue's "Healthcare Esoterica") and the Simonton method (a mode of visualization). Moreover, the section *explicitly* recommends therapeutic touch. The subsection on therapeutic touch includes the following paragraph (p. 738).—J.R.

Everybody has the latent ability to use their own natural energy in healing. The technique is being taught at many nursing schools around the country. Scientifically, it is believed that electron-transfer resonance explains what happens when hands are used to transfer energy to another part of the body. Some people unconsciously are able to focus their natural bioenergy field and become known as "healers." But most people can learn the technique and use it on themselves.

The Enchanted Forest A "Treasury" of Healthcare Esoterica

Jack Raso

Medical alternativists portray those who continually pick holes in their methods as conspirators, exalters of conventional healthcare, and would-be restrainers of discriminating consumers—in short, as underinformed and/or self-serving members in good standing of the Establishment (or worse, a totalitarian cabal). That many people would buy such assertions is understandable. I myself often wonder what motivates persevering opponents of alternative healthcare, especially since the mainstream medical and dietetic communities seem uninterested in them. For me, fighting medical alternativism has been a distinctly nonlucrative, mostly joyless activity. I do it primarily because I abhor proselytical irrationalism.

I remember one criticism of my work frequently: In late 1992, a new acquaintance of mine told me he had chronic fatigue syndrome. A conventional physician, he said, had misdiagnosed his condition and prescribed a drug that worsened it. He stated that he had later turned to an herbalist. Since conventional medicine needed vast reform, he said bitterly, opponents of alternative healthcare were barking up the wrong tree.

The harm lingers from a somewhat similar experience I had as a 17-year-old in 1972. Its chief orchestrator was a conventional physician, but I blame the experience on organized irrationalism. I submit that alternative healthcare is an especially insidious form thereof and, as such, does pervasive, though unspectacular, harm. Philosophy professor George Englebretsen voiced my sentiments pithily in the May/June 1995 issue of *Skeptical Inquirer*: "The rationalist often, and understandably, wants to say that those who live in ignorance deserve the consequences. But...all of us suffer the consequences of willful stupidity."

Fast Backward?

In the introduction to *Natural Medicine*, published in 1979 in Britain, author Brian Inglis stated:

My aim has been to trace the development of the theories and practices of natural medicine from their source in tribal communities up to the present...In [my book] *Fringe Medicine*, a journalist's eye view of the scene in the

1960s, it was easy to sort the alternative therapies out into a few well-defined categories. Today "paramedical practitioners"...are increasingly being tempted to learn and practice a variety of methods. Old forms of therapy, too, are being imported, or revived, or adapted; and so rapid is the process of transformation that what is intended as a survey takes on the complexion of a running commentary.

The major distinctions of alternative healthcare vis-à-vis science-oriented healthcare include runaway cross-pollination and a lack of constructive infighting. Since the late 1950s, well over six hundred health-related methods—i.e., freestanding methods, multimethod systems, component methods, and general "approaches"—that I consider mystical or supernaturalistic have been subjects of uncritical public discourse in English (most since 1980). Broadly, mysticism is belief in realities accessible only through subjective experience. Supernaturalism is belief in entities, or forces, that are outside of, yet affect, the universe. The vast majority of the systems and methods of alternative healthcare are mystical or supernaturalistic. It may be cavalier to judge methods solely on the basis of the theories that underlie them, the methods' contexts, their histories, and the credibility or implausibility of claims for the methods. However, such information furnishes valuable clues, especially when pertinent scientific findings are nonexistent, meager, or discrepant.

Describing alternativist methods sometimes seems an exercise in masochism. My descriptions nearly always arise from painstaking examination of the writings of proponents. I try hard not to overinterpret their descriptions. The trouble is, promoters of particular methods tend to describe them circularly and in (popular) generalities. That they do so is no wonder: Alternative healthcare is a "melting pot" of religion, occultism, folklore, parapsychology, poppsychology, pseudoscience, and medical guesswork. It abounds in theoretical rubbish of the sort that appeals to the scientifically illiterate, superstitious, more or less God-fearing everyman. In the sprawling, animistic "enchanted forest" of medical alternativism, ideas run hog-wild, words have magical power, illness ("dis-ease") is an educational opportunity, the impossible is a challenge, wishful thinking is industry, faith is the ticket, and death is a transition.

According to a recent nationwide poll of college students, 71 percent believe in ghosts. To believers in ghosts—nonentities that ultimately are friendly, since they represent an afterlife—at least some of the many other nonentities that alternativists posit (e.g., *chi*, *kundalini*, *prana*, *shakti*, Shin-ki, and Shintu-Riki) must seem scientifically acceptable.

The alternativist methods I describe below are mystical or supernaturalistic and range from the plausible to the ridiculous.

Acupuncture energetics: Practice of acupuncture with the purported intention of treating acupuncture points so that they “resonate” with “archaic pathways” of the “bodymind.” It involves acupuncture imaging (see below).¹

Acupuncture imaging: Component of acupuncture energetics (see above) according to which the practitioner simultaneously palpates an acupuncture “zone” and describes it to the client in “energetic” terms. Joint focusing on “affected” zones supposedly enables channeling of the client’s “true healing intention” to “appropriate” zones, which purportedly effects “bodymind integration.”¹

Ancient Christian magic: Group of spells (e.g., for healing), recipes, and amulet recommendations conveyed in the book of the same name. Apparently, the basis of this brand of magic is “ritual power.”²

Apitherapy (bee sting therapy): Use of bees to sting persons who have multiple sclerosis into remission. Supposedly, the “energetics” of bees and their venom is key to the method.³

Applied kinesiology (AK): System of pseudodiagnosis and pseudotherapy developed between 1964 and 1973 by Detroit chiropractor George J. Goodheart, Jr. Its centerpiece is “muscle testing.” According to AK theory, specific muscles and other specific organs are uniquely interrelated so that the resistance of a particular muscle to manual pressure indicates the condition of the associated organ. AK also includes “clinical nutrition,” “dietary management,” and “meridian therapy” (apparently acupuncture).^{4, 5, 6, 7}

Astrological counseling: “Psycho-spiritual” mode of pseudopsychotherapy practiced by author and certified social worker Laurie A. Baum, M.S.W. Its basis is astrology.⁸

Awareness Release Technique® (A.R.T.): Form of “energy healing” developed by homeopath Robert T. Jaffe, M.D., founder of the School of Energy Mastery, in Sedona, Arizona. One of its premises is that “psychological issues” alter the “human energy field” and cause disease. The method seems a variant of the laying on of hands.⁹

Bach flower therapy (Bach flower essence method, Bach flower essence system): Quasi-homeopathic system of pseudodiagnosis and pseudotherapy developed in the 1930s by British physician Edward Bach (1886–1936). Bach put forth his philosophy in *Heal Thyself: An Explanation of the Real Cause and Cure of Disease*, first published in 1931. Therein he described five

“fundamental truths,” in sum: (1) Souls, invincible and immortal sparks of the “Almighty,” are the “real,” “Higher” selves of humans. (2) Humanity’s purpose is to develop virtues and wipe out all intrapersonal wrongs. Souls know what circumstances conduce to the perfection of human nature. (3) One’s lifetime is a minuscule part of one’s evolution. (4) When one’s “Soul” and personality are “in harmony,” one is healthy and happy. The straying of the personality from the dictates of the “Soul” is the “root cause” of disease and unhappiness. (5) The “Creator of all things” is “Love,” and everything of which humans are conscious manifests the “Creator.”

Bach held that disease was essentially beneficial and that its design was to subject the personality to the “Divine will” of the “Soul.” Supposedly, he “psychically” discovered the specific “healing” effects of 38 wildflowers. The “life force” (“soul quality” or “energy wavelength”) of each of these flowers allegedly is transferable to water and thence to humans. Each of the so-called Bach flower remedies is a liquid that supposedly contains a “soul quality” with an affinity to a human “soul quality”; and each vegetable “soul quality” allegedly harmonizes its human counterpart with the “Soul.” The bases of classical “diagnosis” are conversation and intuition. Administration of the “remedies” is usually oral but may be external.^{10,11,12,13,14,15,16,17}

Balanced Health: Offshoot of applied kinesiology (see above) taught by The Academy of Systematic Kinesiology, in Britain. “Treatment” may include chakra “corrections.”⁴

Bhramari: Yogic mode of breathing that imitates the sound of the bumblebee, purportedly affects two important chakras in the meditator, and allegedly soothes the meditator’s nervous system. However, longtime yoga teacher Michael Grady has implied that the practice may not soothe the nervous systems of bystanders, writing: “It may disturb others who share your living space. Even if you are practicing in a separate room behind a closed door, the drone can cause a spouse or roommate to check on the mysterious ‘alarm clock’ or ‘motor.’” The Sanskrit word “bhramara” means bumblebee.¹⁸

Biogram therapy (biogram healing, biogram healing system, biogram mind-body healing): “Treatment” developed by Dr. Richard Johnson that involves guided imagery and is the basis of an audiocassette program. “Biogram” refers to an alleged something that communicates directly with the source of a malady to initiate the healing process on mental and physical levels. The premises of biogram therapy include the following. (1) One can learn how to use one’s mind to correct any “negative physical conditions” in various areas of the body. (2) Everyone possesses a “cellular memory,” the experience of one’s ancestors in genetic code, which may cause

Nutrition Forum (ISSN 0748-8165), © 1995, is published bimonthly by Prometheus Books, Journals Division.

Subscriptions for individuals in the United States and Canada cost \$35 for one year (6 issues), payable to Prometheus Books, Journals Division, at 59 John Glenn Drive, Amherst, New York 14228-2197. Multireader (e.g., institutional) and overseas (airmail) subscriptions cost \$50 annually.

Manuscripts and all editorial correspondence should be directed to: Jack Raso, 71-11 60th Avenue, Maspeth, NY 11378-2908.

otherwise inexplicable difficulties for the individual. (3) One can develop the ability to “see” inside one’s body with one’s mind and the ability to derive information from one’s “DNA archives” (the “Library of Time”), with which one can “retrain” oneself at the cellular level.^{19, 20}

BioKinesiology: Offshoot of applied kinesiology (see above) developed in the mid-1970s by John Barton. Its main premise is that “stressful emotions” are the basis of most illnesses. Alleged “correction” involves dietary supplementation.⁴

Biological Immunity Analysis™ (BIA, Biological Immunity System™): Companion to nutripathy (see below) developed by Gary A. Martin, D.N., Ph.D., Th.D., D.Sc. BIA is a “complete holistic system” whose centerpiece is purported deciphering, with the Biological Immunity CompuSystem™, of “Physical-Mental-Emotional frequencies” in specimens of urine and saliva. It allegedly reveals the donor’s “Soul Pattern” (“the pattern inherent in your Soul,” “a gift from God”).^{21, 22, 23}

Biomagnetic therapy: Pseudotherapeutic application of magnets whose apparent main premise is that their north pole causes contraction and their south pole dissipates “energy.”²⁴

BioSonic Repatterning™: System that encompasses cymatics and toning. Cymatics is “the science of wave phenomena.” Cymatic therapy is an acupressure-like method wherein devices send “beneficial” sound through the skin. Its purported objective is to reestablish “healthy resonance” in tissues. Toning is a vocal method that supposedly brings new “life energy” to “inhibited” or “unbalanced” parts of the body. BioSonic Repatterning also involves using “bija mantras” (“healing mantras” that purportedly activate “elemental energy qualities”) and tuning forks (to produce “Balance,” supposedly the “natural state” of humans).^{12, 25, 26, 27, 28}

Blue water technique: Mode of meditation in which one supposedly uses one’s “consciousness” to search one’s body for the source of hunger or pain. The meditator purportedly localizes the source and, three times, visualizes blue water slowly filling the area and then draining from it.²⁹

C.A.R.E. (Chakra Armor Release of Emotions): System promoted by author Raphael Rettner, D.C. Apparently, its main premise is that emotions are “involved in” four “energy pathways”: acupuncture meridians, chakras, “polarity elements,” and “armor”—“a muscle spasm due to an unexpressed emotion.”³⁰

Chi (ki) energy flow: “Treatment” reportedly invented by Masato Nakagawa, Ph.D., the founder of shinkiko (see below). It allegedly relieves discomfort and pain by improving “energy flow.”^{31, 32}

Chinese auricular therapy (Chinese auricular acupuncture, traditional Chinese auricular acu-points therapy, traditional Chinese auricular acupuncture, traditional Chinese auricular therapy): Technique of traditional Chinese medicine (TCM) whose “channel theory” differs from that of “body acupuncture.” Its apparent chief postulate is that several areas and more than a hundred acupuncture points on the auricle (the outer portion of the ear) interactively relate to other areas or to diseases. The fetuslike contour of the auricle inspired the distribution of points thereon. The technique includes auricular analgesia (also called auricular analgesic acupuncture and auricular acupuncture analgesia), auricular diagnosis, auricular magnetic therapy (also called magnetotherapy), auricular massage, auricular moxibustion, auricular point injection, the auricular point laser-stimulating method (also called laser needling), bleeding manipulation (also called bloodletting therapy), and the seed-pressure method. Chinese auricular therapy differs from auriculotherapy (see “Alternative” Healthcare: A Comprehensive Guide).³³

Christian yoga: “Wholistic modality” promoted by the Institute of Wholistic Studies (at Our Lady of Lourdes Wellness Center), in Collingswood, New Jersey. Purportedly, it is a blending of body, mind, and spirit, and a process of “releasing the physical and mental limitations that hinder access to the Divine.”^{34, 35}

Clinical kinesiology: Offshoot of applied kinesiology (see above) developed largely by Alan Beardall, an American chiropractor who died in 1988. One of its premises is that points on the skull (“cranial diagnostic points”) “represent” different areas of the body and thus facilitate finding areas of dysfunction. Another is that points along the “Central meridian” represent therapeutic entryways.⁴

Colorology: Method promoted by “trans-channel” (sic) Lin Rivers. It purportedly activates “energy points” in the body and leads to a “higher level of mind, body and spirit.”³⁶

Colorpuncture™ (colorpuncture system, Osho esoteric colorpuncture system): Combination of “Energy Emission analysis” (Kirlian photography) and a form of color therapy. German naturopath Peter Mandel, who developed esotericism (see below), named the system. “Treatment” involves application of colored light, with a device that resembles a penlight, to “acupuncture receptors” in the skin. According to colorpuncture theory, color is “life energy” that carries “healing information,” and acupuncture meridians convey this information to the cells and organs that need it.³⁷

EDITORIAL BOARD

EDITORS: Jack Raso, M.S., R.D., Manfred Kroger, Ph.D. **EDITOR EMERITUS:** Stephen Barrett, M.D. **SENIOR ASSOCIATE EDITOR:** Michael K. Botts, Esq. **ASSOCIATE EDITORS:** William T. Jarvis, Ph.D.; Ira Milner, R.D.; Grace Powers Monaco, Esq.; Zhixin (David) Xu, M.S. **CONTRIBUTING EDITORS:** Kurt Butler, M.S.; Johanna Dwyer, Sc.D., R.D.; James J. Kenney, Ph.D., R.D.; Marilynn Larkin; William M. London, Ed.D.; James A. Lowell, Ph.D.; Varro E. Tyler, Ph.D., Sc.D. **SCIENTIFIC CONSULTANTS:** John E. Dodes, D.D.S.; Victor Herbert, M.D., J.D.; Gabe Mirkin, M.D. **INFORMATION CONSULTANT:** Inna Lipnitsky, M.S.L.I.S.

Cranial facial balancing: Method promoted by Innes Frey, of New York City. It purportedly involves stimulation of “lymph drainage reflexes” and “meridian points” on the face, neck, and shoulders. Such stimulation supposedly conduces to the “balance” and “integration” of bodily systems.³⁸

Creative kinesiology: Offshoot of applied kinesiology (see above) codeveloped circa 1990 by acupuncturist Haakon Lovell and psychotherapist Carrie Jost. It posits an “astral body,” an “etheric body,” chakras, and *chi*.⁴

Deep emotional release bodywork system: Supposedly revolutionary system taught by “gifted healer” James Hyman. It apparently comprises Deep Emotional Breathwork, Emotional Release, and Chi Kung Empowerment, each of which purportedly releases “blocked energy” from the body.⁸

Directed esoteric toning: Form of toning (see “BioSonic Repatterning™,” above) that posits a “spiritual self,” chakras, *prana*, kundalini, clairaudience, and clairvoyance.³⁹

Ehretism: System of “healing” originated by Prof. Arnold Ehret, who died in 1922. His books include (1) *Definite Cure of Chronic Constipation*, (2) *Mucusless Diet Healing System: A Scientific Method of Eating Your Way to Health* (1970), (3) *Rational Fasting: A Scientific Method of Fasting Your Way to Health* (1971; published in German in 1914), and (4) *The Story of My Life*, all of which are available from Benedict Lust Publications, in New York (see “Grape cure,” below). The centerpiece of Ehretism is the mucusless diet, which consists of all green vegetables and all fruit. In an essay titled “My Mucusless Diet and Naturopathy,” Ehret held that “internal impurity” (“mucus”) was the only disease, and that “unusable food elements,” mainly from “mucus-forming foods,” caused it. “Mucus-forming foods,” according to one of Ehret’s articles, include dairy products, eggs, fats, meat, and all starchy foods. In one of the 25 “lessons” that constitute the text of *Mucusless Diet Healing System*, Ehret, citing *Genesis*, called fruits and “starchless greenleaf vegetables” the “natural food of man.” (See “Rational fasting,” below.)^{40, 41, 42}

Esogetics: System developed and named by German naturopath Peter Mandel and practiced at the Mandel Institute, in Bruchsal, Germany. It reportedly boils down to the “science of bio-energy,” whose “levels” range from the material to the esoteric. One of the premises of esogetics is that colored light transmitted by acupuncture meridians tends to heal specific forms of disease and dysfunction.³⁷

Flower essence therapy: Enlargement of Bach flower therapy (see above) pioneered in the 1970s by Richard Katz, who founded the Flower Essence Society (FES) in 1979. The system involves purported intake of “flower essences”—“subtle liquid extracts” whose alleged active ingredients are “life forces” from wildflowers or “pristine” garden blossoms.^{15, 43, 44}

Grape cure (grape diet): Form of “mono diet” promoted by Johanna Brandt, N.D., “Ph.N.,” author of *The Grape Cure* (© 1928). Benedict Lust Publications, which has a P.O. box in Manhattan, published a paperback edition in 1967 and is a distributor of Brandt’s book and similar works. The term “mono diet” refers to any regimen characterized by the restriction of food intake to one

specific kind of food. The front matter of the softcover edition of *The Grape Cure* quotes the author: “My discovery of the Grape diet is the direct result of Divine Illumination.” The grape diet consists of grapes or grape juice. Brandt held that the mind operated through “magnetism” and that the grape cure contributed to the purification and buildup of “magnetism.” She recommended it for appendicitis, cancer, diabetes, gout, pyorrhea, rheumatism, scurvy, “sex problems,” tuberculosis, “unnatural cravings” (as for alcoholic beverages, coffee, tea, and tobacco), and other conditions. Under the heading “Sex Problems,” she stated: “By the magical purification of the blood the nerves are stabilized, self-control is established and our God-given heritage of sense and desire is transmitted into divine creative power.”⁴²

Hakomi integrative somatics: System of bodywork originated by Pat Ogden. Its basic premise is that body, mind, and spirit are one continuous “movement.”⁴⁵

Harner Method Shamanic Counseling (HMSC): Admixture of classic shamanism and the work of author Michael Harner, Ph.D., founder and director of The Foundation for Shamanic Studies. The purported thrust of HMSC is problem-solving by divination. Supposedly, practitioners (“ordinary reality HMSC counselors”) serve merely as facilitators, and sacred teachers in “nonordinary reality” are the “real” counselors.^{46, 47}

Health kinesiology: Offshoot of applied kinesiology (see above) created by psychologist Dr. Jimmy Scott. It involves the ancient Chinese theory of the “Five Elements” and posits acupuncture points, a “meridian system,” and “reflex points” for the “Five Elements” in the area of the navel. “Corrective treatments” may include crystals, gems, magnets, and homeopathic “remedies.”⁴

HealthWatchers System™: “Specialized application” of Biological Immunity Analysis™ (see above) to weight management. Its centerpiece is the HealthWatchers Analysis™, a purported test of urine and saliva for “the physical and emotional frequency” of an individual’s “Stress Pattern.” HealthWatchers System®, a mail-order house in Scottsdale, Arizona, defines “Stress Pattern” as “the resistance created by People, Places, Circumstances and Events attracted to you because they are opposed to your Soul Pattern”; “Soul Pattern” as “the pattern inherent in your Soul...the point-of-view from which you are able to see and express life when you are free from your Stress Pattern”; and “Soul” as “the immortal, spiritual, moral or emotional nature of a human being.”^{23, 48}

Ho’oponopono: Reputed ancient Hawaiian process whose alleged main purpose is discovery of the “Divinity” within oneself. Apparently, this supposedly enables removal of “the internal cause” of stress. The method purportedly: “releases” problems and “blocks” that cause “imbalance,” stress, and “dis-ease” in “the self”; brings peace and “balance” through a physical, mental, and spiritual “cleansing” that involves repentance and “transmutation”; and creates “balance,” freedom, love, peace, and wisdom within individuals (and other social entities) and the “Universe.” According to The Foundation of I, Inc., in Mamaroneck, New York, Ho’oponopono “can be used for animate and inanimate objects” and “on any problem or situation.”^{49, 50, 51}

Human ecology balancing sciences: Offshoot of applied kinesiology put together by physicist Steven Rochlitz. It supposedly involves the “balancing” of “meridian disorganization” and of “energy.”⁴

Iroquois medical botany: Traditional usage of herbs as medicines in the culture of the six Native American peoples that constitute the Iroquois League. According to the Iroquois theory of disease, symptoms are manifestations of a disturbance of the “vital principle” within an individual and result from any of four acts: (1) violating a divine guideline, (2) self-denial, (3) interacting with entities or events that give off “negative power” or evil, and (4) offending an individual who has access to “great knowledge” regarding the manipulation of “spirit forces.” Iroquois herbal “medicines” include “antighost” plants, “anti-witching remedies,” and “cures” for “bad luck” and even death.⁵²

Kinesiology (kinesiologies): Applied kinesiology (see above) and its offshoots, e.g., Touch for Health (TFH). (In conventional health-care, kinesiology is the study of muscles and human motion.)⁴

Kobayashi technique(s): Allegedly rejuvenescent system of movements, postures, exercises, and diet promoted by “Master Healer” Ken Kobayashi. It purportedly involves using “the” Shintsu-Riki®—“Healing Ki energy.” “Elements” of the Kobayashi technique include acupuncture, *do-in* (a form of acupressure that resembles hatha yoga), shiatsu, and herbal teas.^{53, 54}

Laserpuncture: Technique involving application of a laser beam to acupuncture points.⁴³

Laura Norman method: Form of reflexology taught at the Laura Norman & Associates Reflexology Center, in Manhattan. It includes hand reflexology and foot reflexology and emphasizes the latter. Laura Norman, M.S., is the author of *Feet First: A Guide to Foot Reflexology* (Simon & Schuster). A 1995 ad for the center defines “foot reflexology” as “an ancient healing technique that uses steady pressure to stimulate reflex points on the feet, accelerating the body’s own healing abilities to corresponding organs and glands throughout the body.” A Reflexology Center leaflet on display at a health spa in May 1995 states that reflexology can “cleanse the body of toxins” and enhance creativity, productivity, and relationships.^{55, 56, 57}

Lepore technique (LePore technique): Variant of applied kinesiology (see above) developed by Donald J. Lepore, N.D., D.N., N.M.D. Its centerpiece is the M.R.T. (“Muscle Response Test” or “Muscle Response Testing”) technique (or method), which allegedly can: (1) pinpoint allergens (“metabolic antagonists”), (2) “measure” their “nutritional” neutralizers (e.g., herbs and homeopathic “remedies”), and (3) “measure” nutrients that facilitate absorption of the neutralizers. The M.R.T. technique involves rubbing the thymus, purportedly to activate acupuncture points, and rubbing “the mastoid gland behind both ears,” purportedly to relax acupuncture points. The practitioner may perform it for a sleeping child or an invalid (even a comatose person) through a surrogate standing near the subject. The Lepore technique encompasses glandular therapy and two quasi-homeopathic systems: Bach flower therapy (see above) and cell

salt therapy (also called tissue salt therapy). The main premise of glandular therapy is that intake of glandular substances quickly results in their nutritive uptake by glands similar to the substances.^{24, 58}

Life care kinesiology (Life Care): Offshoot of applied kinesiology (see above) put together by Richard Beale. It posits “acupuncture end points” and involves “chakra meditation.”⁴

Light ray rejuvenation system (light ray system): Mode of facial that “works positively on the physical, emotional, mental, and spiritual body.” It involves application of an electric current to facial muscles, purportedly at the “EARTH frequency”—“the frequency of psychics and healers.”⁵⁹

Magno-therapy: Method promoted by author Dr. Jesse F. Partridge. Apparently, it allegedly heals many types of disease through “body energy.”⁶⁰

Marma science (Dhanur Veda’s science of marmas): System of pseudodiagnosis and pseudotherapy promoted by Joseph Kurian. It posits 107 *marmas* in the human body. Marmas are alleged channels that regulate the flow of information, nutrients, and toxins throughout the body. Supposedly, damage to the “marma system” (e.g., from diet or stress) results in susceptibility to disease, and proper stimulation of marmas enables protection from any environmental threat. Marma science also posits chakras. It involves Nadi Sutra Kriya, purportedly a way of touching marmas to create a “balancing effect,” and the use of special oils, purportedly to unblock marmas.⁶¹

Metal and gem therapy: Pseudotherapeutic application of metals, gems, and gemstones. Its apparent main premise is that different metals and gemstones affect the body’s “electromagnetic field” differently. For example, emeralds, purportedly, can balance chakras and can heal and cleanse one’s “aura.” Obsidian supposedly can eliminate “negativity” and draw one’s “aura” toward the body.²⁴

Nadi shodhanam (channel purification): Yogic mode of breathing that supposedly cleanses *nadis*—the alleged “subtle vessels” of the “physical and subtle bodies.” The purported result is a reduction of nervous tension.⁶²

Nutripathy: “A religious science of experiencing mental, financial, physical, social and spiritual health using specific universal laws,” according to *Nutripathy...The Key to Your Prosperity, Success and Spiritual Fulfillment* (1984). Gary A. Martin, D.N., Ph.D., Th.D., D.Sc., originated the system in the late 1970s, allegedly thanks to divine influence. It involves hair analysis (“mineral analysis from hair”) and a variation of Bach flower therapy (see above). Its premises include the following. (1) God is in everyone. (2) One’s “True Self” is God (“Love”). (3) “Proper nutrition” and realization of one’s “true identity” together make for a perfect life. [See Chapter 12 of *Mystical Diets*; NF 12:15, 1995; and NF 4:57–61, 1987.]^{63, 64}

Oki-do (okido, okido way of living): An “organic, natural way to ultimate health” that draws on “Chinese Chikwando,” macrobiotics, tai chi, Tibetan medicine, yoga, and Zen. “Chinese Chikwando” supposedly involves using “*chi* energy” for healing. It is not a martial art.^{31, 32}

Okinawan karate (Shorin Ryu karate): Meditative form of karate that, purportedly, frees the minds of practitioners, nourishes their spirits, and strengthens their bodies. "Shorin Ryu" is the technical name for a style and school of Okinawan karate.^{65, 66}

Optimum Health Balance: Offshoot of applied kinesiology (see above) developed by Charles Benham. Practitioners place "remedies" or "supplements" on clients, supposedly to channel the "energy patterns" of such things.⁴

Original Ingham Method™ (Ingham method, Ingham method of foot reflexology, Ingham technique): Form of reflexology promoted by the International Institute of Reflexology®, in St. Petersburg, Florida. The institute defines "reflexology" as "a science which deals with the principle that there are reflexes in the feet relative to each and every organ and all parts of the body." The Ingham method emerged from the work of Eunice D. Ingham Stopfel (1879–1974) and her nephew Dwight C. Byer. Ingham developed a style of foot reflexology she called the Ingham Reflex Method of Compression Massage. In the 1930s, she "refined" zone theory (see "Zone therapy," below) by mapping the feet with "organ reflexes" (e.g., the "heart reflex"). Allegedly, each of these areas is a conduit to a corresponding part of the body.^{56, 67, 68, 69}

Professional Kinesiology Practice (PKP, PKP approach): Offshoot of applied kinesiology (see above) developed after 1985 by Bruce Dewe, M.D., and his wife Joan, both of New Zealand. During a session, the client decides on a goal, and the practitioner performs "muscle testing" on the client, purportedly to determine if the goal is appropriate. PKP involves the ancient Chinese theory of the "Five Elements." Its supposed thrust is to "balance the life energy forces."⁴

Psycho-kinetic Health (PKH): Offshoot of applied kinesiology (see above) developed in Britain. Its main premise is that practitioners can feel and see "energy blocks" in clients and remove the "blocks" through "mental effort." PKH also posits "meridians" and "subtle body energies."⁴

Rational fasting: Irrational manner of fasting promoted by Prof. Arnold Ehret in his book of the same name (see "Ehretism," above). It includes the "Superior Fast" ("superior fasting"), an ascetic mode of fasting that purportedly is part of the key to "the revelation of a superior spiritual world."⁴¹

Raw juice therapy: Purported "Natural" therapy proposed in *Drink Your Troubles Away* (1991). It centers on ingestion of juice extracted fresh, with electric juicers, from fruits and vegetables. Its supposed intention is to correct "colloidal cell chemical composition" that has become "unbalanced" because of "unnatural" habits. Unpleasant reactions to raw juice therapy allegedly indicate that the juices do not "harmonize" with an unhealthy gastrointestinal condition or with an "acid condition" of the blood; supposedly, such reactions are thus signs of improvement.⁷⁰

Reflexology workout: Group of procedures that involve massage of the feet and hands and allegedly enable push-button control of hormone release. It purportedly is the equivalent of an internal massage. (See "Laura Norman method" and "Original Ingham Method™," both above; and "Zone therapy," below).⁷¹

Rei-so (spiritual diagnosis): Pseudodiagnostic method whose apparent main premise is that dead people, in the form of spirits (interpretable as consciousness, energy, or vibration), can influence living people who had an intimate relationship with them. Supposedly, spirits create darkness in the "auras" of people they are affecting negatively.⁷²

Self expansion therapy: Style of quasipsychotherapy practiced by certified social worker Ralph Gray, of New York City. Supposedly, the means whereby one attains "growth" and "transformation" include: listening carefully to one's "true inner self," "re-connecting" one's thoughts and feelings, recovering one's "authenticity," and releasing physical and emotional "blockages." (In the November/December 1994 issue of *NF*, I incorrectly referred to this method as self *expression* therapy.)⁷³

Self-help for stress and pain: Offshoot of applied kinesiology (see above) originated by Elizabeth and Hamilton Barhydt and described in their book of the same name, published in 1989.⁴

Shamanic extraction healing (extraction method of healing): Method that purportedly involves sensing and removing "localized spiritual illness and pain."⁴⁷

Shinkiko: Allegedly "the ultimate healing art from Japan," an "intuitive medical science" founded by Masato Nakagawa, Ph.D. Similar to Qigong, shinkiko purportedly involves therapeutic application of "Shin-ki" ("healing-energy"). Supposedly, shinkiko "therapists" can tap a "limitless universal energy source." Proponents recommend the system for many health problems, including AIDS, cancer, cholecystitis, cirrhosis, deafness, glaucoma, hepatitis, and nephritis.⁷⁴

61-points relaxation exercise (61-points exercise, 61-points, shavayatra): Meditative mode of exercise whereby one purportedly travels mentally throughout one's body while one is supine and corpse-like. ("Shavayatra" means "traveling through the corpse.") The 61 points are specific parts of the body. Supposedly, the practice affects one's "pranic field" and eliminates muscular tension.⁷⁵

Sonopuncture: Technique involving application of ultrasound to classical acupuncture points.⁴³

Sound energetics™: Method invented and practiced by Helena Reilly, M.A. It involves purported analysis of the voice and the application of sound at frequencies that allegedly release "psychological and emotional energies." The principle of sound energetics is that one's voice is a "reflection and map" of one's "energetic vibration overall."^{76, 77}

Spiritual midwifery: Childbearing philosophy promoted by Ina May Gaskin in her book of the same name. It posits "spiritual energy" that is "Holy"; indivision of humanity ("We are all One"); *shakti* (divine female "energy"); and God. Moreover, it euphemizes contractions as "energy rushes" and postulates that "a husband and wife form a single energy unit."⁷⁸

Stress pattern processing™: "Modality" whose centerpiece is the HealthWatchers Analysis™ (see "HealthWatchers System™," above). One of its premises is that humans are "electrically driven" spiritual beings.²³

Stress Release (Stress Release approach): Offshoot of applied kinesiology (see above) developed by Dr. Wayne Topping. It posits a "meridian network."⁴

Subatomic healing: Form of so-called psychic healing practiced by medium and "hypno-therapist" Heshheru Amenrahetep, who recommends it for AIDS, cancer, mental confusion, and other health problems.⁷⁹

Subtle aromatherapy: Form of vibrational healing (see "Vibrational medicine," below) promoted by Patricia Davis in her book of the same name. "Aromatherapy" refers to any application of essential oils that is purportedly for beauty or health. Essential oils allegedly can restore "balance" and "harmony" not only to one's body but also to one's life. "Subtle aromatherapy" refers to any use of essential oils with the purported objective of: (1) healing the "physical body" by affecting the "subtle body" ("energetic body"), or (2) contributing to personal and spiritual growth.^{80, 81}

Taido: "Technique" developed by Toshihisa Hiraki that uses hands "as empowered by universal energy."⁸²

Tensegrity: Series of movements promoted by author Carlos Castaneda, Ph.D., who supposedly learned them from his teacher, reputed Yaqui sorcerer (*brujo*) Juan Matus (Don Juan). The method posits an "energy body." (According to Castaneda, his teacher was born in 1891. However, the alleged reality of Castaneda's Don Juan is doubtful.)^{83, 84, 85}

Thai massage: Millennia-old, meditative, "sacred" form of body-work that draws on acupressure, reflexology, shiatsu, and yoga.⁸⁶

Three in One (Three in One Concepts process, Three in One approach): Offshoot of applied kinesiology (see above) whose development began in 1972. Its apparent thrust is to "defuse" the "negative emotional charge" caused by "negative experiences." One Brain™ [see NF 12:2-3, 1995] is a derivative of Three in One.⁴

Time Line Therapy™: Branch of neuro-linguistic programming (NLP) created by Dr. Tad James. Time Line Therapy is a group of "techniques," one of whose premises is that people store their "experience of time" on a line in space. Journeying on this so-called timeline to the past and future allegedly charges one's "life-energy" and prepares one for the "incredibly powerful magic" of Huna (an esoteric tradition native to the Hawaiian Islands).^{87, 88}

Ujjayi (ujjayi breathing): Audible form of *pranayama* whereby one purportedly develops awareness of one's "subtle body." The Sanskrit word "pranayama" refers to any yogic regulation of breathing with the intent of controlling the *prana* ("cosmic energy" or "vital energy") of one's body. Supposedly, ujjayi affects *udana* (also spelled "uddana"), a form of *prana* that is "upward-flowing" and purportedly functions as something of an escape hatch for the soul at death. Proponents recommend ujjayi especially for insomnia and mental tension. The practice allegedly strengthens the digestive and nervous systems and eliminates phlegm.^{89, 90}

Vibrational medicine (vibrational healing, energy medicine, subtle-energy medicine): "Healing philosophy" whose main "tenet" is that humans are "dynamic energy systems ["body/mind/spirit" complexes] which reflect evolutionary patterns of soul growth." Its premises include the following. (1) Health and illness originate in "subtle energy systems." (2) These systems coordinate the "life-force" and the "physical body." (3) Emotions, spirituality, and nutritional and environmental factors affect the "subtle energy systems."

Vibrational medicine embraces acupuncture, aromatherapy (see "Subtle aromatherapy," above), Bach flower therapy (see above), "chakra rebalancing," channeling, color breathing, color therapy (chromotherapy), crystal therapy, distant healing, EAV (Electroacupuncture According to Voll), flower essence therapy (see above), homeopathy, Kirlian photography, laserpuncture (see above), the laying on of hands, mesmerism, moxibustion, orthomolecular medicine, past-life regression, psychic surgery, radionics, the Simonton method, sonopuncture (see above), toning (see "BioSonic Repatterning™," above), Transcendental Meditation® [see NF 11:38-40, 1994], and therapeutic touch [see NF 12:24, 1995].^{43, 91}

Zone therapy (reflex zone therapy, reflex zone massage): Variant of acupressure from which the Original Ingham Method™ (see above) developed. William H. Fitz-Gerald, born in Connecticut in 1872, founded zone therapy circa 1913. His colleague Edwin F. Bowers, M.D., named and codeveloped the system, whose basic modes are hand reflexology and foot reflexology. Fitz-Gerald sectioned human anatomy lengthwise into ten "zones" and taught that "bioelectrical energy" flowed through them to "reflex points" in the hands and feet. According to "zone theory," body parts within a particular zone share an "energy flow" and, therefore, any problem in one part of a zone is modifiable by pressing any other part within the same zone. Some proponents use the term "zone therapy" as a synonym for the word "reflexology," which is generic. For example, in *Massage Techniques* (1986), D. Baloti Lawrence stated that reflexology included acupressure and acupuncture.^{15, 67, 92, 93, 94, 95, 96}

The Bottom Line

Proponents of alternative healthcare clamor for "health freedom" or "medical freedom." But medical alternativism and other forms of organized irrationalism conduce not to freedom but to human enslavement. Inability to make informed choices renders freedom of choice meaningless. In the healthcare marketplace, many choices stem from a combination of wishful thinking (or desperation), internalized advertising, and a distrust of establishmentarian (science-oriented) medicine. I regard alternative healthcare as the new opiate of the people. It gives wrong and conflicting, but seductive, answers to existential questions that science-oriented healthcare generally sidesteps.

NF coeditor Jack Raso is the author of *Mystical Diets: Paranormal, Spiritual, and Occult Nutrition Practices* (Prometheus Books, 1993) and *Alternative Healthcare: A Comprehensive Guide* (Prometheus Books, 1994). He is a board member of the National Council Against Health Fraud.

Marketing of Ephedra Products in Health Food Stores

Jennifer E. Pumphrey

The herbal remedy ephedra, also called ma huang, consists of the green stems of various *Ephedra* species, some of which contain the bronchodilator ephedrine and related compounds with similar physiological effects. Ephedrine increases blood pressure and heart rate. Side effects of large doses include dizziness, headache, insomnia, nervousness, palpitations, and vomiting. Ingestion of ephedra by persons with diabetes, heart disease, hypertension, or thyroid disease is risky. Most nonprescription herbal "cold

care" products contain ephedra or a related herb. Ephedra is also an ingredient of products promoted as aids to dieters or as "energy boosters." Some of the names of products that list ephedra as an ingredient imply that the products can: accelerate a change in "shape," provide a surge of good health, relieve allergies, or supercharge users.

In late 1994, I visited ten health food stores I had singled out, with a random number table, from *The Cleveland-Metropolitan Area Yellow Pages*. In each store, I found an

“energy booster” containing ephedra, brought it to an employee, and asked: (1) “Do you think this works?” and (2) “Is it safe? Does it have any side effects?” Below are the employees’ responses.

1. It’s very good. The extra-strength works better. There are no stimulants. It’s one hundred percent herbal. That’s why we carry it. You won’t find side effects here, only in the drugstores.
2. It works well. I use it all the time. It’s safe, real safe. There are no side effects—none.
3. It’s good and safe to use. There are no side effects, because it’s natural and not like a drug. Your body needs it anyways.
4. It’s all herbal; so there are no side effects.
5. The extra-strength products aren’t good to use every day because you don’t want your body to rely on it, but it has no side effects. The regular-strength is okay to use every day. No side effects; it won’t make you shaky.
6. [It’s] good to use. It has guarana and ma huang in it, which are stimulants. They get you going but won’t cause jitters. [An 800-mg tablet of guarana contains approximately 30 mg caffeine.]
7. It has some caffeine in it, but it’s not as strong. It’s not a drug, because it hasn’t been taken out of its natural state. It’s better for you.
8. [It] contains things the body needs. No major side effects. It has ma huang in it, which is a stimulant; it acts like caffeine [and] works well.
9. [It] contains guarana and ma huang, which are powerful herbs. You should avoid taking them if you have high blood pressure.
10. You shouldn’t [use it] if you have high blood pressure. It’s a powerful stimulant and can cause heart palpitations.

In only one store (#10) did an employee specify a side effect. Considering (a) the riskiness of ingesting ephedra, (b) the considerable availability of products that contain it, and (c) the inadequacy of warnings on “energy boosters” (and “diet aids”) that contain ephedra, the employees’ responses suggest a need for labeling reform.

Ms. Pumphrey, a former health food store employee, is pursuing a doctorate in clinical psychology. Her findings concerning ephedra were part of an investigation of five herbal ingredients that she performed under Dr. William M. London, Associate Professor of Health Education at Kent State University.

Readers’ Forum

Mystical Misplacement

Dear Mr. Raso,

Last August 17, I wrote to Barnes and Noble...to inform them that they had misclassified your *Mystical Diets* in the New Age section. Today, February 13, I got an answer from them. They have recoded [your book] as regular Health.

—Kurt Youngmann, Highland Park, Ill.

Around 1989, I spotted a hardcover titled *Understanding the New Age* (1988) in the New Age section of a chain bookstore and bought it. The book is a panoramic critique of New Age beliefs, practices, and gurus. But, in my opinion, it did not belong in the New Age section, since it depicts the movement as harmful. Nor would it have belonged in the science section, since the clear stance of its author, religion writer Russell Chandler, M.Div., was mainstream Christian. The title *Christianly Understanding the New Age* would have more befitted this interesting book, which should have been in the religion section. The Library of Congress catalogs books according to subject matter, regardless of the author’s viewpoint. However, this probably has little effect on their placement in bookstores.—J.R.

Comments: In his August letter to the Customer Relations Department of Barnes and Noble Bookstores, in New York City, Mr. Youngmann stated that the computer at the company’s Deerfield, Illinois, store listed *Mystical Diets* as available in the New Age section. He further stated that he could not find the book there and that someone had then directed him to the “Holistic” shelves of the store’s “Health” section, where he obtained it. He

wrote: “I am surprised that no one has taken the time to check the contents and subject matter of *Mystical Diets* beyond the title.”

Last year, during a live radio interview concerning my second book, *“Alternative” Healthcare: A Comprehensive Guide*, a cohost aborted the segment after I explained that I was not an apologist for alternative medicine—a fact of which he apparently had been unaware. He insisted that the title of the book was misleading because it suggested approval of alternative healthcare! I asked him if he’d had the opportunity to page through the book, and he responded that of course he had done so!

Incidentally, the February 25, 1995, issue of *Science News* included a 4-page advertisement for Science News Books. On its “bestsellers list” was *The Complete Medicinal Herbal*, by Penelope Ody. In his review of the herbal in the March/April 1994 issue of *NF*, Varro Tyler, Professor of Pharmacognosy at Purdue University, concluded: “Aside from the excellent illustrations, there appears to be no justification for publishing this book.” However, the advertisement’s description of the book was uncritical. On February 27, I phoned the magazine’s business offices and conversed with Madeline, of Science News Books. Madeline told me that both *Science News* and Science News Books are departments of Science Service, and that she had participated in the selection of books. I said I was surprised to find the herbal in the Science News Books section of the magazine. “Well, not all of our books are technical-science type of things, and that would be one of them,” she responded. “But you see also there [in the ad] we have the Leonardo da Vinci T-shirt.” “But that’s not pseudoscience,” I countered. I added that the mere inclusion of such a book in this section of *Science News* suggests approval.

To Live and Supplement (or Not) in L.A.

Dear Mr. Raso:

I am a subscriber to *Nutrition Forum* and follow with interest your exposés of claims regarding nutritional supplements.... I am writing to inquire if you know anything about Biometrics International, Inc., [a multilevel marketing company] in Newbury Park, CA.... A well-meaning friend sent me a box of... *Turbo Sport* and *Bio Fuel* [which purportedly]... do all sorts of wondrous things, such as enhance metabolism, combat fatigue, reduce the absorption of bodily fat, etc. It "cured" a baby with Tuberous Sclerosis (??)....

The vitamin supplements contain as much as 500% of the RDA.... I enclose some of the printed matter that accompanied the bottles....

Needless to say, I have no intention of taking the stuff and am returning it to the sender....

—Elaine S. Hofberg, Los Angeles, Cal.

There is no information on Biometrics in my databases. I called the company on March 1. The woman who answered the phone requested that I inform her of my name and address, and she said she would have a distributor call me to arrange a meeting. She described the company's distributors as "very knowledgeable." I told her that, since I didn't know anything about the company's supplements, a meeting would be "too much, too soon"; and I asked her if she could send me information. She said she couldn't.

Tuberous sclerosis (TS) is a syndrome that includes convulsive seizures and progressive mental disorder. Actually, an item in the issue of *Bio News* that you sent me suggests that ingestion of two Biometrics supplements caused "personality changes" in a 2-year-old girl with TS, "almost immediately."—J.R.

Comments: One need not delve into the scientific literature to assess some of Biometrics' claims. Modest skepticism will do. For example, the flyer Ms. Hofberg sent me states, without a reference, that *Bio Fuel* "ensures proper cellular nourishment" and thus "reduces cravings for foods that are high in sugar and fat." What distinguishes "proper" from improper "cellular nourishment," and how does "proper cellular nourishment" reduce cravings for sugary and fatty foods? The flyer further states, also without a reference, that *Lite-N-Up* "reduces the absorption of dietary fat and sugar" and "may help you feel less hungry." Does the possibility of a decrease in hunger warrant ingestion of a product that (allegedly) hinders a fundamental physiological process? If ingestion of the product *guaranteed* a decrease in hunger, wouldn't it have side effects, e.g., indigestion? The flyer also claims that *Get-Go-N* "provides a burst of physical and mental energy" for "mood enhancement" and increases alertness and stamina; and that *Power Melt* "enhances the body's natural metabolic process of thermal energy generation, so that you burn more calories to generate body heat." Aren't all these descriptions more suggestive of drugs than of dietary supplements?

Multilevel marketing (MLM), also called network marketing, is a form of direct sales in which independent distributors sell products to various contacts and recruit persons to sell and recruit. Recruiting a certain number of people entitles a distributor to a percentage of their sales. In a paper he prepared for a 1991 conference on religion and capitalism, David G. Bromley of Virginia Commonwealth University described MLM organizations as "quasi-religious." He stated:

For the quasi-religious corporates, personal commitment and belief in the cause are more important than specific skills or prior experience.... Once recruited, distributors form tight-knit networks of true believers who are on a mission and who seek to enlist others to their cause. Quasi-religious corporates usually have charismatic leaders, minimal bureaucracy, few rules and little hierarchy of authority. Their allure is the promise to restore a naturally ordained order of prosperity and unity of life.

MLM companies encourage, and feed on, faith and simplism.

Food Stamp Fraud Revisited

Dear Mr. Raso,

The March/April 1995 *Nutrition Forum* cites an Associated Press [AP] report suggesting that "\$2 billion of the \$24 billion in food stamps issued annually are redeemed illegally." This figure is much misunderstood, and in the current political climate surrounding food and nutrition programs, deserves to be explained.

The \$2 billion figure quoted does not refer to the street and retailer trafficking discussed in your brief...—it refers to food stamps overpaid to recipients by local agencies. According to USDA's Inspector General, the Department over-issued \$1.8 billion in food stamps in fiscal 1993 (the most recent year for which figures are available). The Inspector General estimated that 23 percent of this amount was overpaid because of recipient fraud. The remainder was the result of worker error.

At a congressional hearing in February (the source of your AP report, I suspect), officials from the USDA, Secret Service, and Justice Department could not estimate the extent of street and retailer trafficking, although they acknowledged it is significant.

As USDA officials have said, rates of over-issuance and trafficking must be lowered. Improving the integrity of the Food Stamp Program would allow us to properly focus on the very real nutritional benefits that it provides to 26 million persons, the majority of whom are children.

—Dominic Madigan, Editor, *Nutrition Week*
(published by the Community Nutrition Institute),
Washington, D.C.

We appreciate the clarification.—J.R.

B r i e f s

FTC goes for "Jug-ular." In April, as part of a settlement of charges by the Federal Trade Commission (FTC), Third Option Laboratories Inc., of Muscle Shoals, Alabama, agreed to pay \$480,000 and to notify customers that it had made false health

claims for its product "Jogging in a Jug," a mixture of apple juice, grape juice, and vinegar. The company had claimed that the drink, which sold for \$6 to \$7 per half-gallon, alleviated arthritis and heart disease, lowered serum cholesterol, cleaned

internal organs, and reduced spasms and swelling of the legs. [Washington Post, April 14, 1995]

Bee aware. A consent order issued in January by the Federal Trade Commission (FTC) prohibits Bee-Sweet, Inc., of North Carolina, from representing bee pollen products as a cure or palliative for certain conditions and ailments, and from "misrepresenting the existence, contents, validity, results, conclusions, or interpretations of any test or study." [Federal Register 60:10861, 1995]

Bone to pick. A consent order issued in January by the FTC prohibits California's RN Nutrition, which markets the calcium supplement *BoneRestore*, from using the product's name "in a misleading way." The order also restricts the company's use of testimonial endorsements that do not typify results. [Federal Register 60:6533, 1995]

Free sample. *Probe* is a unique monthly newsletter of science and health edited and published by investigative journalist David R. Zimmerman, who set up the periodical in 1989 to avoid censorship. For a free sample, send a SASE (postage is 55¢) to: The Probe Newsletter, Inc., Box 1321, Cathedral Station, New York, NY 10025-1321. You may request a free copy of the April 1 issue, which centers on alternativest incursions into the medical "heartland." A one-year subscription costs \$60. For 13 issues, please mention this brief and send payment with order.

Gov.-run "natural" clinic. In February, the eleven members of Seattle's Metropolitan King County Council unanimously approved a motion to set up the country's first government-run clinic for "natural medicine." Bastyr University will manage the center, and staffers will include "alternative-therapy providers," according to the February 25 edition of the *Seattle Times*.

Nutrition

Vol. 12, No. 4

ISSN 0748-8165

In early May, I received from author and antiquackery activist Kurt Butler a photocopy of his and another review of my 1993 book, *Mystical Diets: Paranormal, Spiritual, and Occult Nutrition Practices*. In the March/April 1995 issue of the *Journal of Nutrition Education (JNE)*, registered dietitian Phyllis Havens' pan preceded Butler's commendatory piece. She stated:

From believer...to jaded skeptic, Raso has chosen this book to be a catharsis of all of his experiences with a "representative variety" of metaphysical beliefs and "religious" health practices....[He] describes his encounters with practitioners and the history of their controversial healing therapies [sic] and diet plans, attacking them all as "unscientific, cultist, elitist, and silly."

However, none of my published writings includes the word *cultist*, *elitist*, or *silly*. Not even the dust jackets of my two books bear any of these three words! The terms "jaded" and "representative variety" are also absent from my published writings. Butler and I conversed by phone on the day I received the photocopy, and he proposed writing the following article.

On May 6, after our conversation, I mailed a letter to *JNE's* "Reviews Editor," Laurie J. Chang, M.P.H. Therein, I informed Ms. Chang that *Mystical Diets* does not include the words *cultist*, *elitist*, and *silly*. On June 19, managing editor Karen Price told me that *JNE* would print a correction.

See "Editor's Note" on page 52. — J.R.

ANTI-SCIENCE LIBRARIANS AND BOOK REVIEWERS

Kurt Butler

Rationalist critics of unscientific theories and anti-science scams concerning nutrition and health have always had rough going. Reporters, talk-show hosts, and publishers and retailers of books and magazines strongly prefer crackpots, miracle mongers, and supplement pushers. But there are others in positions of literary influence siding with the irrationalists. The events I recount in this article illustrate what I think is a growing problem that educators and health professionals, especially nutritionists, should address.

Rationalists Need Not Apply

In 1992, Prometheus Books published my *Consumer's Guide to "Alternative Medicine."* Based on a quarter-century of study, it is a compilation critical of scores of supposed remedies, most nutrition-related and most bogus. Prometheus sent review copies and a press release to several hundred newspapers, magazines, electronic news outlets, and talk shows. I personally mailed and faxed friendly letters to most of the talk shows and some of the print media, saying I would be happy to discuss the book or adapt portions of it.

Considering all this effort and expense, I was sure I could soon chip away at alternative medicine's free ride

with the media. Alas, few media contacts called me, and I participated in about ten shows—by phone. In Hawaii, where I live, talk shows and newspapers ignored the book, but they have long been quick to interview and promote every celebrity quack who visits the state. The media seem interested in unscientific and fringe health practices mostly from a pandering, sensationalist point of view.

So do book retailers. The big chains make millions of dollars selling an endless stream of "new and improved" books on diet and health, most of them worthless and some dangerous. They generally don't stock skeptical books that could spoil the party. Imagine a Waldenbooks ad campaign and window display for a book that exposes a dozen of its recent and current bestsellers as little more than lucrative hoaxes.

Apparently, small independent bookstores aren't much better. I wanted to make the *Consumer's Guide* available to acquaintances on rural Oahu through such a store. I asked the owner if he would stock the book on consignment—no charge to him unless he sold it. He glanced through it, lingered for a moment in the section on chiropractic nutrition fraud, then contemptuously tossed the book to me. "I won't carry a book that slanders chiropractors," he said. Most of the books in the health section of his store were questionable, including two chiropractic tracts.

Of course, there is no chance of placing rationalist books in health food stores. Because rationalist books on health and nutrition are widely unwelcome, libraries are crucial.

Guide Pronounced "Extremely Biased and One-Sided"

Endorsements, even raves, from such quality periodicals as the *American Journal of Health Promotion*, *Cooking Light*, and the newsletter of the National Council Against Health Fraud encouraged me. I assumed that the librarians who acquire books for the thousands of public, private, and academic libraries across the country would be fair-minded and ensure the accessibility, if not the visibility, of my work.

I was wrong. In June 1994, Prometheus Books forwarded to me a copy of a review in *Academic Library Book Reviews (ALBR)*, a journal published in Lynbrook, New York. The reviewer, identified only as "JMC," had savaged my labor of love and reason as "extremely biased and one-sided" and rated it "not recommended." JMC did not cite any statements in my book to support the allegation of extreme bias, yet recommended *The Encyclopedia of Alternative Health Care* (which I had critiqued in my book) for balance. The encyclopedia is a "love feast" for proponents of dozens of dubious systems and methods, including ayurveda, Bach flower therapy, bioenergetics, flower essence therapy, food combining à la Natural Hygiene, homeopathy, iridology, macrobiotics, "muscle testing" à la applied kinesiology, orthomolecular medicine, past life therapy, polarity therapy, radiesthesia, Radix, reiki, and shamanism. According to its cover, the author, Kristin Gottschalk Olsen, holds a master's degree in "Holistic Health Education" from John F. Kennedy University. The "General Catalog 1991-1994" of John F. Kennedy University (JFKU) in Orinda, California, stated:

The Master of Arts in Holistic Health Education is the only degree program in the United States that combines training in education and communication with the study of holism, somatic counseling and movement, with an emphasis on how they apply to individual, group and family well-being....Students receive theoretical grounding in the nature of consciousness, mind/body/spirit interaction, and principles of holism....Disease is no longer viewed as an externally imposed process to be cured, but as an opportunity to learn about oneself, one's relationships and one's environment.

(JFKU continues to offer an M.A. program in "Holistic Health Education," through the Department of Holistic Health of its Graduate School for Holistic Studies, formerly the Graduate School for the Study of Human Consciousness.)

Olsen does not provide references in her encyclopedia. She merely refers readers to specific alternative publications and organizations. She does not refer to any skeptical writings or organizations.

I fired off an angry letter to the publisher and the editor of *ALBR*, with a copy of the letter for JMC and a ten-dollar

check for a sample copy of the journal. I hoped to respond to the review through a published letter to the editor or an ad. In my letter, I asked for information about JMC's credentials and for previous *ALBR* reviews of health-related books. I challenged JMC to specify any false statements or unsupported conclusions in my book, and to submit my book, her review, and Olsen's encyclopedia to a panel of health professionals and academics for a threefold review.

The Plot Thickens

Months passed without a response. I phoned *ALBR*'s office several times. Each time, an answering machine took my call, and I provided my name and phone number, but I did not receive a return call. I mailed a copy of my original letter to *ALBR* and phoned the office several more times, to no avail.

Finally, about a year after publication of JMC's review, I engaged a private investigator in Brooklyn, New York, and asked him to contact *ALBR*'s publisher and editor, hand-deliver a letter from me, and request a reply. The PI sent me his report in May 1994. In it, he said he had made several attempts to speak with someone at *ALBR* by phone, without success. Then he had followed the address *ALBR* had given to Prometheus Books—to a huge commercial warehouse that bore no indication of the journal. However, Preston Threiber greeted the investigator there and said he was *ALBR*'s publisher. Threiber stated that the editor, Hanna Merker, wasn't there and that she visited about twice a month. He expressed familiarity with my letter and said he didn't have an explanation for Merker's failure to reply. He refused to provide a list of library subscribers to the journal. The PI gave Threiber my new letter and a copy of my first letter. Threiber promised to forward the letters to Merker and said she would respond shortly. She didn't.

The PI obtained a sample copy of the journal and sent it to me. Inside the back cover is a list of some fifty reviewers. From this I gathered that JMC was: "Janet M. Coggan, MLS, University of Florida Health Science Center Library, Gainesville, a reference librarian with a particular interest in patient education and consumer health." I sent her a copy of my year-old letter and requested a prompt reply. I also sent a copy to the director of the library, Faith Meakin, and inquired about Coggan's credentials. In my supplementary letter to Coggan, I wagered \$1,000 that a panel of at least ten health professionals and academics who use the library would disagree with her assessment of my book and would judge her unqualified to review health-related books for libraries.

Nutrition Forum (ISSN 0748-8165) is published bimonthly for \$35.00 (individuals in U.S. and Canada) or \$50 (institutional, overseas) per year by Prometheus Books, 59 John Glenn Drive, Amherst, NY 14228-2197. Second-class postage pending at Buffalo, NY. POSTMASTER: Send address changes to Prometheus Books at address above. Manuscripts and all editorial correspondence should be directed to: Jack Raso, 71-11 60th Avenue, Maspeth, NY 11378-2908.

Months passed without a response from either Coggan or Meakin. Finally, on May 2 of this year, I reached Coggan by phone at her office. I introduced myself and asked her if she had received my letter. She said yes. I inquired about her credentials. She responded angrily that she didn't have to talk to me, and she told me to complain to Hanna Merker. As I responded, she hung up. An hour later, I faxed her a letter, in which I stated my belief that people who tell students, professionals, and academics in the health field what to read should be qualified in the field. She didn't respond.

I asked a research firm to perform a computer search for all of Coggan's book reviews. The firm couldn't find any, and told me that book reviewers are not indexed and that there is no practical way to find all of a given writer's reviews.

Recommendations

Ideally, any book review published in a given periodical should be reviewable in the periodical by the book's author, primary author, or editor. However, my tribulations with *ALBR* provide practical lessons for nutritionists, health educators, and librarians:

- Skeptical health professionals should volunteer their expertise to the acquisition committees of libraries. They should also donate reliable books. Librarians should seek their input.
- Skeptical health professionals should offer to write book reviews.
- Editors of health-related journals should inspect the credentials and previous writings of reviewers, and should not retain reviewers with a demonstrable anti-science bias.
- The backgrounds of medical librarians who decide the acquisition of books should include at least several postsecondary health courses.
- Librarians should make a concerted effort to limit acquisition of "health porn" books and to increase acquisition of pro-science health books.

Kurt Butler, M.S., is a former science teacher and the coauthor of *The New Handbook of Health and Preventive Medicine*, published by Prometheus Books.

BACK TO SCHOOL (DAZE)

Jack Raso

This article is a continuation of "School Daze: The Fast Track to Nutrition 'Credentials'" [NF 12:13-19, 1995].* Between mid-July 1994 and February 27, 1995, with *Nutrition Forum* letterheads and envelopes and first-class postage, I mailed (1) a one-page itemized request for perusable information and (2) a one-page questionnaire to 50 "credentialing" organizations with addresses in 23 states. Selection of organizations was arbitrary. However, all had offered health-centered or customizable didactic programs within the previous seven years. By February 26, my associates and I had received course descriptions from 27 organizations, including questionnaire responses from eleven. Each offered at least one didactic program that: (1) covered human health and nutrition, or was adaptable to such a focus; (2) did not involve attendance, or required short attendance; and (3) culminated in a certificate (certification), a nondegree diploma, or a graduate degree.

Transitions

The U.S. Postal Service returned inquiries addressed to eight organizations, but I contacted three of these during

the aforesaid period. Of these eight addressees, the five I did not contact during the study were: (1) Clayton University, (2) the International Institute for Advanced Studies, (3) Nutritionists Institute of America, Inc., (4) Southwest University, and (5) Westbrook University.

Southwest University is operational. Sometime between 1989 and 1992, it moved from one suburb of New Orleans, Louisiana, to another: from Metairie to its present address, in Kenner. The university's 1989 catalog offered "non-residential" programs leading to Doctor of Philosophy degrees in counseling psychology, education, health services administration, and "holistic health sciences." However, the 12th edition of *Bears' Guide to Earning College Degrees Nontraditionally*, published in April, states: "In late 1994, the Board of Regents of Louisiana attempted to close Southwest University. The University went to court, where the closing order was quashed, and the university was subsequently licensed by the Board of Regents, with Southwest agreeing to stop offering doctorates." I called Southwest University on May 12, requested printed material, and received its 1994/95 catalog later that month. I describe the school in the penultimate section of this article.

EDITORIAL BOARD

EDITORS: Jack Raso, M.S., R.D., Manfred Kroger, Ph.D. **EDITOR EMERITUS:** Stephen Barrett, M.D. **SENIOR ASSOCIATE EDITOR:** Michael K. Botts, Esq. **ASSOCIATE EDITORS:** William T. Jarvis, Ph.D.; Ira Milner, R.D.; Grace Powers Monaco, Esq.; Zhixin (David) Xu, M.S. **CONTRIBUTING EDITORS:** Kurt Butler, M.S.; Johanna Dwyer, Sc.D., R.D.; James J. Kenney, Ph.D., R.D.; Marilynn Larkin; William M. London, Ed.D.; James A. Lowell, Ph.D.; Varro E. Tyler, Ph.D., Sc.D. **SCIENTIFIC CONSULTANTS:** John E. Dodes, D.D.S.; Victor Herbert, M.D., J.D.; Gabe Mirkin, M.D. **INFORMATION CONSULTANT:** Inna Lipnitsky, M.S.L.I.S.

When I phoned Clayton University, an unaccredited correspondence school, in November 1992, a prerecorded message stated that the school was neither mailing catalogs nor admitting students "at this time." According to *Bears' Guide*, Clayton University apparently functions only as a "transcript service" in the U.S.; and the International Institute for Advanced Studies is part of Greenwich University, also an unaccredited correspondence school [see NF 12:16 and 18, 1995]. We also did not receive any response from Somerset University, another unaccredited correspondence school. The *Guide* says of Somerset: "In the past, correspondence has been sent to a convenience address in Metairie, Louisiana, but now it appears to be going directly to England, even though the university cannot legally operate in England."

Fast Tracks...or Dead Ends?

In this section are descriptions of 12 of the 27 organizations from which we received course literature during the study. Except for comments, they: (1) merely convey questionnaire responses and/or representations made in promotional literature my associates and I received between mid-July 1994 and February 26, 1995; (2) do not cover undergraduate degree programs; and (3) do not cover programs without a distinct, alleged, or optional relation to nutrition. In the "comments" sections, the term "accredited" means "possessing accreditation by an entity recognized by the U.S. Secretary of Education or by the Commission on Recognition of Postsecondary Accreditation (CORPA)." An asterisk preceding the name of an organization indicates receipt of questionnaire responses from that organization.

American Academy of Nutrition, Corona del Mar, California. Founded in 1985, the academy offers The Comprehensive Nutrition Program, a "guided independent study" program that, in February 1995, consisted of six courses. Each course leads to a Certificate of Continuing Education. The program leads to a diploma. The academy is accredited by the Accrediting Commission of the Distance Education and Training Council. Prerequisites for admission: none. Requirements for completion of program: a grade of at least "C" ("average") in all courses. Duration of program: less than six months to 15 months. One of the faculty members is a chiropractor and "Certified Applied Kinesiologist" [see NF 12:26, 1995]. Another is Ann Louise Gittleman, M.S., C.N.S. (Certified Nutrition Specialist), author of several books, including the bestseller *Beyond Pritikin*.

Comments: The academy is accredited. Clinical dietitian Elaine Marie Kane, R.D., reviewed *Beyond Pritikin* (Bantam Books, 1988), for *Current Diet Review*. In the November/December 1988 issue thereof, she stated:

Beyond Pritikin is an attempt to disqualify the benefits of a low-fat diet and a misrepresentation of the scientific evidence surrounding the essential fatty acids....[A]...dietary restriction the author includes is food combining, which is not substantiated

by any scientific literature....The author also claims that essential fats will control yeast infections. The facts that the author refers to are taken from two books, *The Missing Diagnosis* and *The Yeast Connection*...which contain purely conjectural information....Finally, Gittleman states: "essential fat alleviates 90 percent of PMS tensions and discomfort." However, current clinical data do not link PMS to any dietary deficiency for fats, vitamins or minerals.

***Ayurveda Holistic Center, Bayville, New York.** Founded in 1991, the center offers a correspondence program leading to the "certification degree" of "Ayurvedic Practitioner." Prerequisites for admission to either program: (1) an ayurvedic consultation; (2) following the resultant ayurvedic plan; (3) reading *Ayurvedic Healing*, *The Yoga of Herbs*, *Yoga Vani*, and *Ayurveda: The Science of Self-Healing*; and (4) a personal interview. Requirements for completion of programs: "successful" completion of homework (which takes 2-4 hours per week), internships, and final exams. A question in a "sample chapter" of the course reads: "Which herbs and spices would you use to heal female reproductive problems?" The chapter also tells students: "Choose 10 cooking spices and begin to use them medicinally for yourself and family." On January 14, 1995, all of the center's nutrition-related programs had 40 enrollees and one faculty member.

Comments: I received two mailings from this admittedly unaccredited center during the study. According to a leaflet in the earlier mailing, the center offered three programs leading to a "certification degree": (1) a correspondence course, (2) a 44-hour on-site program, and (3) a 14-day off-site program for groups of 5-10 students. I received a different leaflet with the questionnaire. It did not include a description of an off-site group program, and it described two program sections, each of which takes 108 hours and leads to a "Certification Diploma." Students spend 65 hours per section in classes at the center.

The Ayurvedic Institute, Albuquerque, New Mexico. Founded in 1984 in Santa Fe, New Mexico, the institute offers a 12-lesson correspondence course leading to a "certificate of completion." Lessons include "Diagnosis" and "Medicinals." Prerequisites for admission: none. Requirements for completion of program: (1) taking three written exams and (2) finishing the program within a period of one year.

Comments: The institute is admittedly unaccredited and does not offer a degree program. A letter therefrom dated January 10, 1995, stated: "Our institute does not offer nutrition related courses." However, three other components of this mailing listed "Food" as a lesson in the correspondence course: a catalog, a flyer, and the "table of contents" from the correspondence course. They likewise listed "Therapeutics of Indigestion." Moreover, according to the "table of contents," three other lessons cover nutrition-related subjects.

***Bastyr University** (formerly John Bastyr College), Seattle, Washington. Founded in 1978, Bastyr offers a 7-course Distance Learning Program that leads to a "Certificate of Completion for the Natural Health and Nutrition Program." In August 1994, this program had four faculty members. Courses include "Fundamental Principles of Chinese Medicine," "Introduction to Nutrition in Natural Medicine" (which covers "detoxification"), and "Nutrition and the Natural Products Industry" (which covers the "clinical use" of nutritional supplements). Prerequisites for admission: none. Requirements for completion of program: (1) completion of course assignments and (2) taking a proctored final exam.

Comments: Bastyr is accredited by a regional accrediting body. Its N.D. program, which requires residence, is accredited by the Commission on Accreditation of the Council on Naturopathic Medical Education. Its Didactic Program in Dietetics, which also requires residence, is approved by the Division of Education Accreditation/Approval of The American Dietetic Association. Its M.S. program in Acupuncture and its M.S. program in Acupuncture and Oriental Medicine are accredited by the National Accreditation Commission for Schools and Colleges of Acupuncture and Oriental Medicine.

Columbia Pacific University (CPU), San Rafael, California. The School of Health and Human Services offers a customizable, self-paced "independent study" program that leads to a Ph.D. or D.Sc. degree. Prerequisites for admission: a master's degree or "equivalent." Requirements for completion of program: (1) completion of workbooks, (2) earning 48 credits through "coursework" and "independent learning contracts," and (3) a dissertation. In an introductory form letter that was part of a mailing postmarked February 3, CPU's president stated that the university had more than five thousand students and provides a "special opportunity" for students to convert their "professional skills and background" into "academic credits" toward a degree.

Comments: Founded in 1978, CPU is unaccredited. Neither *NF* associate editor David Xu nor I received a response to our formal request for information, dated July 17, 1994. The "Admissions Bulletin" costs \$5. In January 1995, I anonymously asked CPU to send information to a relative of mine, who received only a leaflet. Catalogs dated October 1989, January 1993, and January 1994 stated that the university's "institutional memberships and affiliations" include the American Holistic Medical Foundation, the American Holistic Nurses Association, the Association for Holistic Health, and the Coalition for Alternatives in Nutrition and Health Care. Incidentally, William Harwood, M.A., M.Litt., author of *Mythology's Last Gods* (Prometheus Books, 1992) holds a Ph.D. degree from CPU.

East West School of Herbalism (East West Herb School), Santa Cruz, California. East West offers two correspondence courses: (1) a 12-lesson "Home Study

Course in Herbal Medicine" and (2) "The Professional Herbalist Course," which includes 36 lessons (12 from the former course). Lessons range in length from about fifteen pages to 50 pages. Each lesson includes a test and projects. Students must complete these and submit them for grading. On completion of the "Professional" course, students have the option of taking a final exam, successful completion of which entitles them to a "certificate in Herbal Studies." Those who complete the "Professional" course can "diagnose according to wholistic Oriental healing systems and prescribe herbs...." Prerequisites for admission to either course: none.

Comment: The school is unaccredited.

Goddard College, Plainfield, Vermont. Chartered as Goddard Seminary in 1863 and as a college in 1938, Goddard offers an "individually designed" off-campus program in liberal arts studies that leads to an M.A. degree. Requirements for completion of program: (1) attendance at a 1-week "beginning-of-semester residency" every semester, and (2) earning 36 "semester-hour equivalents of graduate credit." Duration of program: at least 3 semesters.

Comments: Goddard is accredited by a regional accrediting body. According to its graduate "Interim Bulletin 1990," completion of the M.A. program requires creation of a "final product," such as a "formal thesis," that represents a "major learning activity."

Hippocrates Health Institute, West Palm Beach, Florida. Hippocrates offers a "Health Educator (H.E.*)" program that requires residence for eight consecutive weeks, includes a workshop in neuro-linguistic programming, and culminates in "full certification." Students are "exposed to" such "modalities and disciplines" as aromatherapy [see *NF* 12:31, 1995], chiropractic, colon hydrotherapy, "Cranial Sacral" therapy, "electromagnetics," holistic dentistry, iridology, live cell analysis, polarity balancing, reflexology [see *NF* 12:29-31, 1995], and vibrational healing [see *NF* 12:31, 1995]. Prerequisites for admission: (1) an essay, no longer than three "typed" pages, that emphasizes why the applicant wants to attend the program; and (2) a phone interview. Requirements for completion of program: (1) completion of all writing assignments; (2) an "acceptable" attendance record in all classes; (3) demonstration on exams of mastery of fundamental Hippocrates concepts; (4) a grade of "pass" on the midterm and final exams; (5) giving at least one 15-minute talk on the Hippocrates lifestyle; (6) reading *Food Enzymes: The Missing Link to Vibrant Health* (sic), *The Hippocrates Diet and Health Program*, *Hippocrates Health Program*, *Sprouts For The Love of Everybody*, *The Wheatgrass Book*, and *Belief*; (7) writing a "critique," consisting of at least 750 words, of two of the aforementioned books; and (8) submitting, by the end of the seventh week, a portfolio including one's résumé, a "private lifestyle evaluation," and an outline of a "health/lifestyle course."

Comments: The Hippocrates system is a variant of nature cure. Dr. Ann Wigmore (1909–1994) founded this unaccredited institute in 1957, developed wheatgrass therapy, and authored *Why Suffer?* and *The Hippocrates Diet and Health Program* (1984). In the latter book, she stated that enzymes store “life energy” and that this is not measurable scientifically. *Food Enzymes: The Missing Link to Vibrant Health* is a misnomer for *Food Enzymes: The Missing Link to Radiant Health*, whose author is Humbart “Smokey” Santillo [see NF 12:4, 1995]. According to a profile of Santillo I received in 1994 from Hohm Press, he earned a “Doctor’s degree” from the Concept-Therapy Institute (see *Alternative Healthcare: A Comprehensive Guide*) and obtained the “degrees” of: “Doctor of Naturopathy” (from the Anglo-American Institute of Drugless Therapy [see NF 12:5, 1995]), “Health Practitioner” (from Hippocrates Health Institute of Boston [a defunct branch of the institute]), “Iridology Certificate of Merit,” and “Master Herbalist” (from the School of Natural Healing [see below]). Brian R. Clement, the institute’s director, wrote two of the other books on Hippocrates’ required reading list: *Hippocrates Health Program: A Proven Guide to Healthful Living* (1989) and *Belief: All There Is* (1991). In the latter, he states: “Belief can bring you anything that you desire.”

On January 17, I phoned the home of H.E. program director John Cattone, N.D., and requested information about H.E. certification. Later that day, on my answering machine, Cattone confirmed his wife’s statement that the program leads to a “Health Educator certificate.” Evidently thinking I was a potential enrollee, he left two further messages on my machine, on January 19 and January 26, asking me to phone him. I did not. On the 19th, he stated: “We’re...carrying the prices through to...the end of January.” A week later, he stated: “The 31st is our deadline for our 1994 prices to be extended throughout the 1995 season.” And on Sunday, February 12, he stated: “I just wanted to let you know that this is the last three days of our 1994 program prices. On Tuesday the 14th, this Valentine’s Day, the last of our obligations to people...that have [had] prices extended to them [ends] on that date, and the 1995 prices will officially go in[to effect] at the end of that day.”

***Institute of Chinese Herbology (ICH), Oakland, California.** Founded in 1986, ICH offers two “home study” programs: (1) Comprehensive Practitioner Training (125 hours), which leads to a “Certificate of Completion,” and (2) Advanced Certified Herbalist Training, which leads to “full Herbalist Certification.” Prerequisites for admission to the “comprehensive” program: none. Prerequisites for admission to the “advanced” program: completion of the “comprehensive” program. Requirements for completion of Comprehensive Practitioner Training: (1) taking all program courses and (2) completing a “self-administered review assignment.” Requirements for completion of “advanced” training: (1) writing 30 case studies and (2) passing a written “take-home” exam.

Comment: ICH is admittedly unaccredited.

Professional Career Development Institute, Atlanta, Georgia. Through The School of Fitness and Nutrition, the institute offers The Professional Fitness and Nutrition Program, a self-paced, 18-lesson “home study” course leading to a diploma that symbolizes “professional fitness and nutrition expertise.” Students can proceed from enrollment to graduation in less than a year. The institute is accredited by the Accrediting Commission of the National Home Study Council. Prerequisites for admission: none.

Comments: Both CORPA and the U.S. Secretary of Education recognize the Distance Education and Training Council (DETC, previously called the National Home Study Council). According to the DETC’s 1994–95 “Directory of Accredited Institutions,” the Professional Career Development Institute was founded in 1987.

***School of Healing Arts, San Diego, California.** Founded in 1984 as the Institute of Health Sciences, the school, now nonprofit, received its current name in 1990. It is “approved” by the California Council of Private Post Secondary Vocational Education (CCPPVE), the Board of Registered Nurses, and the American Board of Hypnotherapy and Vocational Rehabilitation. The school offers a 300-hour “home study” program leading to certification as a “Nutritional Counselor.” Completion thereof generally takes 4–6 months. Prerequisites for admission: none. Requirements for completion of program: (1) a 50-hour “internship” involving case studies of self-selected “clients,” (2) a “thesis,” and (3) taking a written final exam. Courses include Herbology, Oriental Health Assessment/Body Psychology, and Body Chemistry Balancing, which covers “hair analysis” and “nutritional interpretation” of blood and urine. In late January 1995, the program had 50 enrollees and eight faculty members (only one of whom was full-time).

Comment: The school is admittedly unaccredited.

***The School of Natural Healing (SNH), Springville, Utah.** Founded in 1953, SNH offers a Master of Herbology program that comprises: (1) a 41-“course” Herbalist Home Study program that leads to “The School of Natural Healing Herbalist Diploma” and the title “Herbalist;” (2) a Master Herbalist Home Study program, which includes the aforementioned program plus 15 “courses,” and which leads to eligibility to pursue certification, and (3) a 6-day Master Herbalist Certification Seminar, which takes place at the school, includes courses titled “Diagnostics” and “Drug Substitution,” and leads to a Master of Herbology diploma and the title “Master of Herbology.” Completion of the Master Herbalist program takes 12–14 months if the student studies for one hour daily. One of the required textbooks in the Master Herbalist curriculum is *Regenerative Diet*. Its author, SNH founder John R. Christopher, N.D., M.H., was an iridologist who died in 1983. The study guide for this book includes questions concerning “the difference between live and dead food” and the “mono-diet.” Prerequisites for admission to the Master of Herbology program: none.

Requirements for completion of the Master Herbalist program: (1) a grade of at least 70% on exams and (2) a 5,000-word "master's thesis" on one herb. Requirements for "Master of Herbology" certification: (1) completion of the Master Herbalist program, (2) attendance at the Master Herbalist Certification Seminar, (3) completion of all assignments, and (4) a grade of at least 70% on exams. In August 1994, the school had 1,400 enrollees and nine faculty members (four of whom were full-time). Over nine hundred people have received an Herbalist certificate from SNH, and over two hundred a "Master Herbalist" diploma.

Comments: The school is admittedly unaccredited. On January 9, I conversed by phone with the assistant registrar, Dean Morris, who told me that completion of the 7th level involves reading *Regenerative Diet*. He vaguely described the diet as a "mucusless diet system" [see NF 12:28, 1995] that "works with herbs as supplements." I gather from the study guide for the book that "mucusless" means "consisting mostly of raw (unprocessed, unheated) foods."

A course catalog I received from SNH in late February states: "Dr. Christopher's message is that God intended that every man and woman have the knowledge to properly care for his or her own body." With this catalog came a required textbook in the Herbalist Home Study curriculum: *Every Woman's Herbal* (1994), which recommends Bach's Rescue Remedy® [see NF 12:26, 1995] for parturition and for postpartum shock. The book describes this product as "a homeopathic preparation made of flower essences." It also recommends ingestion of comfrey tea for postpartum perineal soreness or swelling, jaundice in newborns, and broken bones. Ingestion of comfrey is risky.

Honorable Mentions?

Below I describe, largely in the manner stated above, two organizations I did not contact during the study.

Pacific Western University, Honolulu, Hawaii. Founded in 1977, this "off-campus, non-traditional, alternative education university" offers self-paced programs leading to customizable master's and doctoral degrees in various fields. Its catalog lists 26 faculty members, four of whom hold doctorates only from Pacific Western University [see "Comments"]. Prerequisites for admission to master's degree program: (1) a "legally conferred" bachelor's degree and (2) "professional experience." Prerequisites for admission to doctoral program: (1) a "legally conferred" bachelor's degree, and (2) a "legally conferred" master's degree, or "the equivalency in credits/experience." Requirements for completion of either program: (1) completion of a "fill-in-the-blanks" résumé ("portfolio guide"); (2) answers (three of which must comprise 200 words each) to four career-related

questions; (3) completion of a "Graduate Qualifying Exercise," usually 12 pages long; and (4) a "Master's Thesis" or "Project" for a master's degree, or, for a doctorate, (a) a dissertation or (b) a published book, a set of published articles, or "equivalent accomplishment," plus a "Research Summary." Duration of program: much less than a year to more than two years. In May 1995, students and alumnae/i totaled 17,000.

Comments: The university is admittedly unaccredited. Apparently, the doctorate held by R. Frank Sutter, Vice President and Director of Admissions, also came from Pacific Western.

Southwest University, New Orleans (Kenner), Louisiana. Southwest offers "non-residential," customizable programs in various fields. The list of majors in its 1994/95 catalog includes "Holistic Health Sciences." Prerequisites for admission to master's degree programs: (1) a bachelor's degree from a "recognized" college or university, or (2) 180 quarter units (120 semester hours) from a "recognized" college or university, or (3) the "equivalency" thereof. Requirements for completion of program: (1) completion of 45 quarter units above the bachelor's degree, 35 of which must be completed with Southwest; and (2) a "Master's Thesis" or completion of additional courses. Duration of program: one year.

Comments: Founded in 1982 in Phoenix, Arizona (per *Bears' Guide*), Southwest is unaccredited. One of the "Primary Degree Programs" the 1994/95 catalog describes leads to a bachelor of science degree in "holistic health sciences." Courses therein include "Nutrition, Health and Disease" and "Reflexology Techniques." On May 25, I phoned the university and asked administrator Reg Sheldrick, Ph.D., if Southwest could adapt this baccalaureate program to a master's degree. He responded:

Yeah. Let me tell you this: Back about, maybe, five or so years ago, we offered a bachelor's, master's, and doctorate; and it was very, very popular, and a lot of people enrolled in it. *But*, over the years, less and less and less textbooks became available; and as they discontinued and went out of print and out of stock and not reprinted, we dropped the doctoral program; and then about two years ago, half the books we used in the master's [program] went out. But...most of the books we used in the bachelor's stayed in. And so we kind'a revised that a little bit, and we said, if anybody was interested in a master's level, then we could take some of those courses and maybe expand them just a little bit—just a little bit more work for the master's—and perhaps throw in an independent study, in lieu of one textbook-based course. So our master's requirement in...all degree programs except the M.B.A. is 35 units, or 7 study courses.... And sometimes, one of those courses could come from a counseling psychology program....

General Comments

Promotional literature received during the study from 27 organizations, overall, suggests that nutrition-related pseudocredentialing is rampant. At least 21 (78%) of these organizations offered correspondence programs. Terms with which proponents describe such programs include: *alternative education, distance education, distance learning, experience-based education, extension education, external degree studies, home study, independent study, guided independent study, nonresident, non-residential, non-traditional education, and off-campus study*. Degrees available through nutrition-related correspondence programs included: Doctor of Divinity (D.D.), Doctor of Holistic Health (H.H.D.), Doctor of Naturology (D.N.),

Doctor of Naturopathy (N.D.), Doctor of Philosophy (Ph.D.), and Doctor of Science (D.Sc.). "D.N.," incidentally, also represents two other nutrition-related pseudocredentials: the degrees of "Doctor of Naprapathy" [see NF 11:63-64, 1994] and "Doctor of Nutripathy." A Master Herbalist (M.H.) diploma was likewise available through correspondence. Obtaining a Health Educator (H.E.) certificate required residence for eight consecutive weeks. The H.E. certificate, the M.H. diploma, and all of the aforementioned correspondence doctorates were not creditable.

* On May 12, Andrea Case, editor of *Priorities*, told me she had rescheduled publication of my report on nutrition-related "credentialing" organizations for September.

Readers' Forum

The letters below arrived between my virtual completion (in late April) of the May/June 1995 issue of *NF* and its publication.—J.R.

Religion and Blue-Green Algae

Dear Mr. Raso,

Congratulations on another fine edition of *Nutrition Forum* [Vol. 12, No. 2]. It is enjoyable to see a skeptical, iconoclastic mind at work. It is interesting that the subject of religion keeps coming up. Obviously, many people are sensitive about it. I have always thought that there were parallels between the acceptance of health-related belief systems and religious belief systems....But, there is one important difference: There are a few people who get into religion for the money, but there are many people who join health bandwagons for the money. Look at all the Shaklee, Amway, Usana, and other dealers...who sell vitamins, herbs, etc., on multi-level or network marketing [MLM] plans. These programs are half merchandising and half pyramid schemes. I believe it's the money that makes believers out of people.

Many people have urged me to look into blue-green algae as a supplement for vegetarians because it contains vitamin B-12 and a host of trace minerals that are assumed to be lacking in a vegetarian diet. Do you know anything about the use of algae as a food?

—Ralph Cinque

Dr. Cinque's Health Retreat
Buda, Tex.

I covered the quasi-religiousness of MLM companies briefly in the previous issue of *NF*. Blue-green algae are photosynthetic microorganisms classifiable as bacteria or plants. Regarding blue-green algae and vitamin B₁₂, on May 5, I phoned Varro E. Tyler, Ph.D., Sc.D., professor of pharmacognosy at Purdue University. He stated:

Probably most of ...[the vitamin B₁₂ content of blue-green algae] is due to the fact that the stuff is grown in...lakes...in Mexico that are contaminated with fecal matter; and the feces, of course, animal feces, have

considerable B₁₂ in them....I suspect that's where most of it comes from, the stuff not being thoroughly washed before it's dried, because B₁₂ is not, in any quantity at least, a normal constituent in plant cells....I'm not at all sure it's sanitary in most cases....Spirulina is the biggie, of course....Spirulina is a blue-green [alga], but not all blue-green algae are spirulina....It tastes like grass.

In *The Honest Herbal* (1993), Dr. Tyler states: "Depending on the species, dried spirulina does contain between 0.5 and 2 µg. (microgram) per gram of vitamin B₁₂. However, selective assay procedures suggest that more than 80% of the 'vitamin B₁₂' in spirulina is, in fact, analogues of the vitamin which have no vitamin B₁₂ activity in humans." (The RDA for vitamin B₁₂ for nonpregnant, nonlactating adults is 2 µg.) In *Total Nutrition* (1995), Dr. Victor Herbert states that most of the supposed B₁₂ in spirulina and tempeh consists of vitamin B₁₂ analogues, and that some of these may block metabolism of the vitamin in humans.

On June 15, I conversed by phone with nutritionist Regina Capobianco, of New York City. In the premier issue (1995) of *Vegetarian Singles News*, she had advertised *Super Blue-Green™* algae [see NF 5:17-19, 1988] as an "excellent source" of vitamin B₁₂. I told Capobianco that my wife and I were strict vegetarians (untrue) and inquired about vitamin B₁₂. She replied that the product was "very high" in vitamin B₁₂, said she had been a vegetarian for ten years, and claimed that blue-green algae had been her sole source of vitamin B₁₂.

Comments: Ralph C. Cinque is a major proponent of Natural Hygiene [see NF 12:17, 1995; NF 7:33-36, 1990; and NF 3:57-59, 1986]. Although his doctoral degree is chiropractic, he has styled himself a "chiropractic heretic." In a letter to me dated January 27, 1994, he described alternative medicine as mostly nonsense and stated, in effect, that Natural Hygiene "should drop out of the 'alternative' health movement." In another, dated February 14, 1994, he called religion "a form of mass insanity." I would like to hear from other proponents of particular alternativist methods who frown upon alternative healthcare.

"God, etc."

Dear Jack:

I have been a bit concerned about the tone of your remarks regarding Dr. David Sneed's book [NF 11:64-65, 1994] and those directed at religion. However, I feel that your answer to Laura Wilson, R.D. [NF 12:23, 1995], was very well done and addressed my concerns as well. As a Christian agnostic who chooses to believe, I have no argument with your views, but as one who is trying to forge a coalition against irresponsible health care, I do not want to see us get sidetracked onto debates that have no chance of being resolved, i.e., the existence of God, etc. Having focused for years on the behavioral aspects of quackery, I agree with you that it is "religious and quasi-religious notions that facilitate" much of the victimization associated with health fraud and quackery. I'm sure...you realize that in order to be effective in this sensitive area, we have to be very careful with the tone of our language. We need to help each other with this difficult communications task.

Thanks for your dedication and excellent work.

—William Jarvis, Ph.D.

President, The National Council Against Health Fraud,
Inc. (NCAHF)

Perhaps I came down too hard on Dr. Sneed. I have meant to be stimulating, not divisive. However, my chief motivation is a loathing for organized, proselytical irrationalism. I consider patently religious opposition to alternative healthcare equivalent to hypocrisy. Nevertheless, an alliance of agnostics, religious nonbelievers, and religious moderates against health fraud and quackery seems to me not only tenable but very desirable. I emphasize "moderates" partly because faith healing (e.g., Christian evangelical healing), more than a dozen other theistic methods, and exorcism are, when practitioners deliberately distort the truth about them, forms of health fraud.

The statement "God exists" and its negation are vacuous. Further, I suppose that belief in a generic, nondescript God, per se, is innocuous. I am dismissive toward such claims. However, statements such as "Without fail, the angels answer the prayers and calls of all humanity" (*Commune with the Angels: A Heavenly Handbook*, p. XI) are, in my opinion, poisonous. Most theists believe in a particular supernatural source of edicts (many of which are unhealthy) and in supernatural causes of earthly events. As you know, medical alternativists, especially those who publicly invoke unknowables such as God, play up to such believers. I myself, between mid-1974 and late 1989, was an agnostic with alternativist leanings.

Incidentally, on the May 17 edition of "Primetime Live," alternative-medicine proponent Andrew Weil, M.D., author of *Natural Health, Natural Medicine* (Houghton Mifflin) and a *Natural Health* columnist, stated:

I'm willing to entertain any idea, and we hear a lot of strange ones out there in the world of alternative medicine.

I'm willing to consider it. But then I have to have proof. I have to see evidence. But that's different from rejecting an idea out of hand without even seeking to verify it.

Then interviewer Nancy Snyderman, M.D., asked him: "Do you have to believe in God to be good at this?" Weil replied: "No. I don't think you have to believe in God. I think you have to believe, really, in a way, in yourself, and maybe believe in the miraculous nature of the human body." He did not say who should pay for the testing of "strange" claims.

Comments: I conversed by phone with Dr. Jarvis about his statements above on May 2, the day I received his letter. I respect him greatly. I urge readers to seek membership in NCAHF, which publishes an interesting bimonthly newsletter edited by Jarvis. Request applications from: Membership Chairman, P.O. Box 1276, Loma Linda, CA 92354-1276.

Like a Prayer?

Dear Mr. Raso:

I had to send you this clipping right away [Julia Lieblich, "Federally funded prayer study raises hackles," *Contra Costa Times* (Walnut Creek, Ca.), March 6, 1995]....I'm still laughing.

Love *Nutrition Forum*.

—Judy Bieser, R.D.

Walnut Creek, Ca.

Comments: The article quoted Annie Laurie Gaylor, editor of *Freethought Today*: "Cemeteries are full of people who prayed to live." The Freedom From Religion Foundation, Inc. (FFRF), in Madison, Wisconsin, publishes this monthly newspaper. On May 8, the FFRF faxed me the "Notice of Grant Award," the grant application's synopsis of the project, and a FFRF press release thereon titled "Nothing Fails Like Prayer." In the September/October 1994 issue of *NF*, I asked: "Should taxpayers foot the cost of testing methods that lack a sound theoretical basis?" Apparently, the FFRF's answer is no.

In 1993, through the National Institutes of Health, the Office of Alternative Medicine awarded \$28,797 to psychiatry professor Scott R. Walker, M.D., and associates for "Intercessory Prayer: A Pilot Investigation." The purported aim of this study was "to test the hypothesis that prayers on behalf of a specific individual, by concerned but uninvolved believers, can have a significant impact on the recovery of individuals seeking help for problems related to the use of psychoactive chemicals." According to the May 1995 issue of *Freethought Today*, the grant application said the project would involve telling clients that "an outside group of individuals may or may not pray by first name for their recovery from substance abuse and problems associated with it."

The article Ms. Bieser mailed to me posed the following questions. What would happen if: (1) a friend or relative of a client in the "no-pray-ers" group prays for the client, (2) Catholic prayers outdo Protestant prayers, (3)

clients "receive negative prayers," (4) God's answer to a prayer is no, or (5) clients pray for themselves.

Haelen Words

Dear Jack,

Thank you for printing my letter in *Nutrition Forum*, Vol. 12, No. 2. Your comments were noteworthy. However, I would hardly agree that "religious unbelief" is "necessary for such objectivity." For those of us [who are] religious believers, nothing is more disturbing than to see frauds distorting belief systems to benefit their own power and monetary gains.

In any case, the Haelen Center is located at the Hospital of St. Raphael...[in] New Haven, Ct.

On another issue, what do you think about Ross Laboratory's marketing campaign for *Advera* [a high-calorie, low-fat beverage]? I think it is unethical, and Ross ought to be ashamed of itself for preying on the fears of HIV(+) persons. The product is costly [and] tastes lousy (according to my patients who tried it), and the study Ross reported in *Applied Nutritional Investigation*, Vol. 9, No. 6, pp. 507-512, was innately flawed...[because it compared] *Advera* to *Ensure*, [which is] considerably lower in calories and protein. Ross has opted to bypass the health professional and hit the TV and airwaves, as well as community organizations, to spread its good news. Needless to say, I do not recommend the product.

—Laura F. Wilson, R.D.

Haelen Center
New Haven, Ct.

I'm glad you wrote me again. However, you have somewhat distorted my statement, which was: "I very much doubt that religious unbelief per se impairs objectivity in matters of science; indeed, I would *venture* calling it *almost* necessary for such objectivity" (italics added). Let me add that, by "religious unbelief," I meant religious *nonbelief*, which is not necessarily disbelief—the conviction that something is untrue. In my opinion, impairment of objectivity in matters of science varies with: the particular scientific question; the particular religion; the degree of belief or disbelief therein, affinity thereto, or dislike thereof; and, perhaps, the degree of peer pressure and the degree of persuasiveness of coreligionists.

Before I received your letter on May 13, Drs. Barrett and Kroger and I had not heard of *Advera*™. On May 15, I phoned the Consumer Relations Department of Ross Products twice, first as a *Nutrition Forum* editor and second as a consumer, and requested printed material on *Advera*. I also phoned, as an editor, a Ross sales representative in Pennsylvania, and, on his answering machine, requested printed material. Two days later, I received literature on the beverage from Ross Products Division in Columbus, Ohio, and from the sales rep. Later that month, Ross Laboratories, in Columbus, Ohio, mailed a response to the request I had made as a consumer, under a relative's name. These mailings do not evidence that Ross is "preying on the fears" of persons infected with HIV. I have tasted vanilla, chocolate, and "orange cream" *Advera*, on the rocks. I found only the chocolate variety palatable.

Comments: A leaflet describing the Haelen Center accompanied Ms. Wilson's letter. I do not discern anything untoward about the center.

Healthcare Esoterica

Jack Raso

Will medical alternativists ever run out of ways to package magic, the universe, and alleged deities and soul-like forces?

Something (in the Way Chi Moves)

Alternative Medicine: Expanding Medical Horizons, released by the National Institutes of Health last March, defines "qi": "in Eastern philosophies, the energy that connects and animates everything in the universe; includes both individual qi (personal life force) and universal qi, which are coextensive through the practice of mind-body disciplines, such as traditional meditation, aikido, and tai chi." Proponents of traditional Chinese medicine (TCM) claim that this alleged something—whose names include *ch'i*, *Qi*, and *ki*—has profound physiologic effects. Has anyone nailed down what it is?

In 1988, PBS aired an episode of "Innovation" titled "East Meets West," in which author Ted J. Kaptchiuk, O.M.D., stated:

The question of what is *qi* is complicated obviously. It has to do something with the vitality principle that makes things alive. It also has to do with passing gas. It has to include what you feel about your parents. It simultaneously has to include athlete's foot on your toes.

Then David Eisenberg, M.D., author of *Encounters with Qi*, said:

To a Chinese clinician...*qi* is not a concept; it's a physical entity that can be measured, palpated, pushed, pulled, sent through needles, elevated, and decreased. And thus far, there's not a lot of good evidence that it can be tracked, measured by machines, as we understand machines these days. The Chinese insist, though, that it is very much physical and they can feel it; we just can't measure it.

Then Kaptchiuk stated:

I don't think it's a real thing—real thing in the sense of "you'll get it in a machine," or "you'll discover it under a microscope," or "you'll have a measurement"—because as soon as you do that, it won't be *qi*; it will be a scientific phenomena that doesn't include everything that *qi* is.

And the Beat Goes On

Below I describe more than three dozen methods that I consider mystical or supernaturalistic.

Apple diet (apple-cleansing regimen, apple-diet cleansing routine, apple-diet regimen, apple-diet therapy): Alleged purificatory "reducing aid" inspired by the "readings" of "religious seer" Edgar Cayce (1877-1945). The three-day regimen, which involves enemas, restricts food intake to raw apples (especially Delicious and Jonathan, and peeled unless they are organic), black coffee, and olive oil. Cayce recommended the diet for numerous ailments, including anemia, debilitation, and "subluxations."¹

Ayurvedic acupuncture: Subject of *The Lost Secrets of Ayurvedic Acupuncture* (1994). The publisher thereof, Lotus Press, in Twin Lakes, Wisconsin, describes the system as part of the surgical branch of ayurveda [see NF 11:37, 1994]. The basis of ayurvedic acupuncture is the *Suchi Veda*.²

Belly Bean diet: "Weight loss" program promoted in 1990 and 1991 that involved: (1) consuming three "nutritionally balanced," low-fat meals daily with a total caloric value between 1,000 and 2,000; (2) drinking an additional 5 to 6 glasses of water daily; (3) snacking between meals on First Fitness Belly BeansTM, a "100% all-natural" candy-like "appetite control drug" that allegedly contained a "highly potentized homeopathic appetite control formulation"; and (4) continuing to eat *Belly Beans* after attainment of "desired weight."³

Beyond Dieting: Subject of the book *Beyond Dieting: An Edgar Cayce Program for Permanent Weight Control* (out of print). A purported way to lose weight, it involves some of the "key ideas" in the "readings" of clairvoyant Edgar Cayce (1877-1945).⁴ (See "Weight No More," below.)

Biogenic support (homeovitic support): Phase of homeovitics (see below) whose alleged aim is to minimize production of free radicals during Clearing (see below) and homeovitic detoxification (see below). It involves: (1) administration of the *Biosode*, a flavorless, odorless, watery HoBoN product that purportedly contains "complementaries...blended in a vitalized potency spectrum"; and (2) dietary "support" and/or supplementation.^{5,6}

Body reflexology: Form of reflexology or acupressure that encompasses pressing, pulling, massaging, and clamping "reflex points" on the face, tongue, ears, scalp, nape, hands, crotch, buttocks, shins, and feet. These so-called reflex points, also termed "reflexes" and

"reflex buttons," include about a hundred pinnal "acupoints." *Body Reflexology* (1994) defines "reflex points" as "energy junctions that relay and reinforce energy along meridian lines of the body, passing energy toward the organs and the nervous system." The book states that the palm of the right hand is "positive" and "stimulates energy," and that the palm of the left hand is "negative," sedative, and "cleaning."⁷

Chakra yoga: Combination of "focused" hatha yoga, "sounding techniques," and visualization promoted by Jason Kanter. One of its premises is that each chakra ("vital energy" center) corresponds to a "major aspect" of the "psyche." The purported design of the method is to maximize the ability to utilize "vital life energies" for healing and "integration."⁸

Classical homeopathy: Form of homeopathy [see NF 11:58-59, 1994] that involves extensive questioning of the patient by the practitioner, purportedly to determine the "single remedy" for that patient.⁹ (See "Homeovitics," below.)

Clearing: Phase of homeovitics (see below) that allegedly activates all "vital pathways" through administration of the *Detoxosode O-S*, a flavorless, odorless, watery HoBoN product that purportedly contains "complementaries...blended in a vitalized potency spectrum."^{6,10}

Combine spirituality and psychotherapy: Eclectic "integrative system" practiced, and apparently developed, by author Bernard Green, Ph.D. It includes "consciousness expansion," "nutritional psychology," psychosynthesis (see below), "Simonton techniques," and "Sufi psychology."¹¹

Contemporary homeopathy: Form of homeopathy [see NF 11:58-59, 1994] whose purported "intervention" is augmentation of all symptoms of a disease through administration of homeopathic preparations.⁹

Creative Force Techniques (CFTs): Alleged all-purpose method promoted by "Mind Imaging expert" Gini Graham Scott, Ph.D., author of *The Empowered Mind: How to Harness the Creative Force within You* (Prentice Hall). CFTs purportedly can: put one in touch with the "inner power" of one's subconscious, focus this "mighty force" with laserlike precision, and enable one to "tune into the other person's 'inner essence.'"¹²

Creative meditation: Subject of Richard O. Peterson's 1990 book of the same name. It allegedly uses "vibrational patterns" to effect "attunement," self-guidance, and self-healing. The last of the seven principles of this purportedly unique approach to meditation is:

HoBoN logo

"Creative meditation is first directed to at-onement [sic] with God ["Creative Forces"] without expectations of benefits; the resources of God are then accessible for self-knowledge, self-guidance, and self-healing."^{13, 14}

Divine healing from Japan: Form of "hands on healing" practiced and promoted by Prof. Tadamasu Fukaya, a Tenrikyo reverend and "Master of Sazuke Healing." In a lecture, Fukaya stated that human bodies are loans from "God the Parent" and that, therefore, we should treat them according to the will of "God the Parent" (e.g., by not becoming infatuated and not indulging "carnal desires").^{15, 16} (See "Tenrikyo," below.)

G-Jo acupressure: "Healing Art of the Orient" promoted by the G-Jo Institute, which has a P.O. box in Hollywood, Florida. Certification by the institute as a "Master of G-Jo Acupressure" requires only one weekend of home study. The institute claims that G-Jo acupressure is foolproof and that it instantly heals hundreds of "injuries & ailments."¹⁷

"Healing the Heart" workshop: "Psychospiritual" component of a "healing" program run by cardiologist Stephen Sinatra, M.D., director of the New England Heart Center, in Manchester, Connecticut. The program reportedly includes meditation and a "visualization" wherein patients request guidance from believable "spiritual powers." Sinatra has stated that healing occurs "when people accept their heart disease as a way toward growth."¹⁸

Homeovitic detoxification: Phase of homeovitics (see below) that allegedly increases the body's "innate healing energy."¹⁹

Homeovitics (homoeovitics): Form of contemporary homeopathy (see above) begun in 1979 by Allen Morgan Kratz, Pharm.D., and promoted by HoBoN, a "pharmaceutical manufacturer" in Naples, Florida. ("HoBoN" stands for "Homoeovitic [or "Homeovitic"] + Bio + Nutritional.") A booklet received from the company in 1993 defined "homoeovitics" as "the intensification of the body's healing energies through the use of vitalization." A "Practitioner's Handbook" received from HoBoN in June 1995 states:

Vitalization increases the vital energy of a substance by a stepwise series of dilutions with succussions [vigorous shaking]. This energy can then be transferred from this vitalized substance to activate a less energetic one. This transfer of energy is known as resonance. It occurs when the vitalized substance (vitic) is similar or identical (homeo) to the less energetic one.

The crux of homeovitics is administration of "homeovitic + bio + nutritional" (or "homeovitic formulae"). These are HoBoN products that, allegedly, "function by Homoeovitic bioresonance," add "energy" to the body, and intensify its "innate healing energy." Homeovitics encompasses Clearing, homeovitic detoxification, and biogenic support (see above for all).^{10, 20, 21}

Huichol shamanism: Form of shamanism promoted by the Dance of the Deer Foundation, taught by its director, "shaman healer" Brant Secunda, and practiced by the Huichols, a tribe of Indians living in central western Mexico, near Ixtlan.^{22, 23, 24}

IIP Consciousness Development Program: System developed by Waldo Vierra, M.D., who founded the International Institute of Projectiology (IIP) in Brazil in 1988. Kevin de La Tour, coordinator of IIP's U.S. headquarters, in New York City, has defined projectiology as "basically...the science that studies the out-of-body experience and other, related paranormal phenomena." IIP conducts "workshops" wherein some persons allegedly have experienced "astral projection." Simone de La Tour, an IIP seminar leader, has written: "Many individuals report having realized significant benefits in the areas of health, life success and spiritual development." The IIP Consciousness Development Program purportedly consists of "systematic training and practice in controlling and managing bioenergy and states of consciousness for the purpose of improving the quality of one's life and accelerating personal development." Allegedly, the program can prevent and correct illness, promote "natural" sleep, amplify intellectual capacity, increase "psychic abilities," enable discovery of "past life recall capabilities," and eliminate fear of death.^{25, 26, 27}

Inner child cards: "Divination system" created by Isha Lerner and "professional astrologer" Mark Lerner, coauthors of *Inner Child Cards: A Journey into Fairy Tales, Myth, and Nature* (1992). The system features this book and a fairy-tale adaptation of the 78-card tarot. It purportedly "reawakens the child within by gently helping us to interact with the most potent archetypes of the inner world." The book's preface states: "Each of us is as rich and divine as the cosmic Creator who guides us. *Inner Child Cards* is a tribute to our radiant selves, the starchildren who live within our hearts...."^{28, 29}

Inner guide work: Hypnotic technique that purportedly helps people contact their "true inner wisdom." Allegedly, control of "the process" ultimately passes from the "hypnotherapist" to "Inner Guides."³⁰

Kalaripayat: Ayurvedic system promoted by Joseph Kurian [see NF 12:29, 1995]. It purportedly involves stimulation of *marmas*. Allegedly, this restores "full circulation," overpowers "blocks," and eliminates toxins.³¹ (See "Marma healing," below.)

Karuna reiki (formerly called Sai Baba reiki): Form of reiki (see Chapter 11 of *Alternative Healthcare: A Comprehensive Guide*) named and taught by "Reiki Master" William Lee Rand. Rand is the author of *Reiki, The Healing Touch*; founder of The Center for Reiki Training, in Southfield, Michigan; and editor in

chief of *Reiki News*, a quarterly published by the Center. Reiki is a variant of the laying on of hands. *The Reiki Handbook* (1992) describes it as a "healing art" whereby "therapists" channel *reiki*, "universal life energy power," through their bodies for storage in the solar plexus, and into "dis-eased" individuals for "rebalancing." The Sanskrit word "karuna" is translatable as "compassionate action." The purported focus of karuna reiki is development of *karuna*.^{32, 33}

Local healing: "Biofield healing that uses the practitioner's hands on the subject's body," according to *Alternative Medicine: Expanding Medical Horizons* (the so-called Chantilly Report), released by the National Institutes of Health in March 1995. The report defines "biofield" as "a massless field" that: (1) is not necessarily electromagnetic, (2) surrounds and permeates living bodies, (3) affects the body, and (4) possibly is related to *qi* (*chi*).

LooyenWork®: Approach to "body therapy" that involves "body reading" and "movement re-education" and allegedly can increase the "flow" of clients' "energy." "Body reading" purportedly is a "sophisticated" form of observation that enables practitioners to reach the root of the client's problem.³⁴

Marma healing (ayurveda marma healing): A purported complete system for health, longevity, and beauty. Its bases are: (1) ayurveda, "the science of life"; (2) *Dhanur Veda*, "the science of the battlefield"; (3) *Kaya Kalpa*; and (4) marma science [see NF 12:29, 1995]. The apparent main premise of marma healing is that blockages in a system of 107 "energy channels" (*marmas*) in the human body: (1) unbalance *doshas*, the three (alleged) forces that govern health and longevity, and (2) thus create physical illness, chronic bodily conditions, mental instability, and emotional disorders. Purported repair of "marma blockages" depends partly on herbal preparations.^{35, 36} (See "*Kalaripayat*," above.)

Medicine cards: Native American "divination system" featuring cards that depict "power animals." One of its purported aims is to teach "the healing medicine of animals." Another is to show "the way to healing of the body, emotions, mind, and spirit."³⁷

Metta Touch™: Apparently, a blend of techniques from acupressure, reflexology, shiatsu, Swedish massage, Thai massage [see NF 12:31, 1995], and yoga. One of its purported aims is to "bridge the connection between" the practitioner, the patient, and the "cosmic life force."³⁸

Neuro-bioenergetic treatment: Variant of acupuncture pioneered by Yee Wing Tong, M.D. It involves intramuscular injections of Novocain.³⁹

Nsoromma body therapy: Mode of bodywork promoted by painter Vivinne (Narmada) Williams, M.F.A. It purportedly integrates relaxation, shiatsu, and yoga.⁴⁰

P.E.E.R. (Primary Emotional Energy Recovery, P.E.E.R. counseling): An alleged way to "access energy" by learning how to release "emotions locked up in the body." It involves bodily movements and exercises. According to P.E.E.R. theory, when one releases these "frozen, repressed" emotions, the body "accesses and/or recovers" the "energy" it was using to "hold down" the emotions. Dan Jones and John Lee cofounded P.E.E.R. training. Practitioners are called facilitators.⁴¹

Psycho-pictography: Subject of the bestseller of the same name, written by "self-help" guru Vernon Howard. Supposedly, it is a way of using the "miracle power" of one's mind, through mental images, to decipher spiritual and psychological truths.⁴²

Psychosynthesis: "Spiritual psychotherapy" originated in 1910 by Italian psychiatrist Roberto Assagioli, M.D. (1888–1974), and developed by Johannes Schultz. Its purported design is to effect the "integration" and "growth" of the self and to release and direct "psychic energies" allegedly generated thereby.^{43, 44, 45, 46, 47}

Rakta moksha: Ayurvedic form of bloodletting according to whose theory: "toxemia" is the "basic cause" of hypertension, "thrombotic elements," and repeated acne, eczema, herpetic symptoms, hives, leukoderma, and scabies; *pitta* ("fire plus water," one of the three ayurvedic "humors") is a derivative of disintegrated red blood cells in the liver; an increase of *pitta* in the blood may cause many disorders; and extraction of a small amount of venous blood relieves the "tension" caused by "*pittagenic* toxins" in the blood.⁴⁸

Sacred psychology: "Experiential psychology" developed by psychologist Jean Houston, former president of the Association for Humanistic Psychology. It posits three realms of experience: (1) ordinary reality, (2) a "collective unconscious," and (3) "the realm of God," which purportedly is immanent in the "High Self."⁴⁵

Tenrikyo: Sect founded in 1838 by Japanese housewife Miki Nakagama (1798–1887), through whom "God the Parent" allegedly appeared in order to save humankind. It emphasizes faith healing, teaching, and "unity of life."^{47, 49}

Tibetan reiki: Form of reiki promoted by Gary Jirauch, of New York City, and allegedly taught very selectively at Tibetan ashrams. In a telephone interview on May 13, Jirauch—a "Reiki Master," "Seichim Reiki Master," and "ordained minister of spiritual healing"—said of Tibetan reiki:

Actually, it's an extension of the traditional reiki program.... Tibetan reiki basically is a continued discipline of reiki to help enhance traditional reiki, to make it more whole. It goes back into some of the ancient concepts the Tibetans knew in relation to healing and purification and enlightenment, and defines them in a simple way, like, works in a very simple way like reiki works. It's a variant of reiki that I practice, and several people across the United

States are now practicing different forms of it. It all gets down into that definition of what you define as reiki; and "reiki" is a very generic term to use for anything having to do with this type of energy work.

(See "Karuna reiki," above.)^{50, 51, 52}

Traditional Dhanur Veda diagnosis: Pseudodiagnostic method whose purported goal is identification of "marma blockages." Allegedly, this requires "deep inner concentration" and can happen by phone and with minimal conversation.³⁶ (See "Marma healing," above.)

Weight No More (the *Weight No More* approach to weight loss; the *Weight No More* program; the *Body, Mind, and Spirit Diet*): Subject of the book *Weight No More: A Weight Loss Program That Can Work* (1990). The "readings" of clairvoyant Edgar Cayce (1877–1945) constitute the program's basis. The main premise of this theistic method is that humans consist of three "bodies": physical, mental, and spiritual. According to the aforementioned book, tapping into "the Life Force" in a "positive way" (allowing it to "flow without hindrance" through the body) is the key to correcting any physical problem.^{53, 54} (See "Beyond Dieting," above.)

Zarlen therapy (Zarlen direct channelling): Purported very advanced "mental healing" technique "discovered" by Jonathan Sherwood in 1984 in New Zealand. Dr. Sherwood is the author of *Zarlen Speaks: A New Beginning* and the pamphlet "Zarlen Therapy" (©1987). In the latter, he described "Zarlen" as his guide and as a "past life existence" that he had. He defined "guide" as "a value of information which carries an identity with it as to not only when the information was gained but also how." A flyer from the Queensland Awareness Centre, in Australia, stated: "When Zarlen first made contact with Jonathan in 1984, he stated that he had not had communication with humans for over 25,000 years and that he had returned to assist with a spiritual transition which the human race was about to pass through." Zarlen therapy allegedly can "re-pattern the higher brain functions" so that one is "completely back in tune." Application of the technique takes about three minutes.^{55, 56, 57}

Zulu Sangoma bones: African "divination method" promoted by the Katush Motivational & Holistic Centre, in South Africa. The method features herbal "remedies" and "Sangomas"—alleged links with instructive ancestral spirits.⁵⁸

Editor's Note

Some ten years ago, I analyzed about fifty *Library Journal* and *Publisher's Weekly* reviews of books on health and nutrition. I found a pattern of deceit. Bad reviews of good books suggested that few of the reviewers had expertise in the subject matter. Quackery-promoting books were never identified as such, even if the reviewer obviously knew the book was unreliable. Some

reviews recommended that libraries purchase "controversial" books because of reader interest. None recommended avoidance because a book was misleading or dangerous. I suspect the editors did not want to print the truth, perhaps because skeptical reviewers were incompetent, and/or because negative reviews would offend major advertisers.—*Stephen Barrett*

Weird Things: A Review

How to Think about Weird Things: Critical Thinking for a New Age

By Theodore Schick, Jr., and Lewis Vaughn. Mountain View, CA: Mayfield Publishing Company, 1995. Softcover. Pp. 299. Price \$18.95.

This is a genuine self-help book: both a superb primer on applied rational skepticism and a comprehensive yet compact refresher for experienced skeptics. In such a book, one might expect dryness or preachiness or a lack of evenhandedness. But—*notwithstanding its overly chatty, vaguely condescending intro—Weird Things*, with quotations in its margins (e.g., from Annie Besant, the Buddha, Kurt

Butler, Confucius, and Carl Gustav Jung), and boxes focusing on specific beliefs or claims (e.g., a purportedly astrologically formulated vitamin supplement), is fine *edutainment* and invites browsing. I especially enjoyed the chapter titled "Mystical Knowing," which lays bare the rock-bottom incompatibility among Christian mysticism, Hinduism, and Buddhism. (Buddhism comes out looking reasonable.) The authors state: "Once we admit that only certain mystical experiences are revelatory, we have abandoned the claim that all mystical experience yields knowledge." The following chapter centers on medical alternativism. In short, *Weird Things* is a readable antidote to the deluge of pseudoscience.—*J.R.*

Physicians & Healers: A Psychiatrist's View

Veva H. Zimmerman

Health practitioners, including nurses, nurse practitioners, physician assistants, and some alternative "healers," are taught *pattern recognition*—which is what computers do. Physicians, on the contrary, are trained in science. The reason is that, to serve their patients well, physicians must cultivate a neutral, information-seeking posture—be unbiased observers. They must be prepared to collect information that does *not* fit a pattern: disparate information.

Although physicians do not *practice* as scientists (human illness is too complex), they must approach information as scientists, without preconceptions. This is the central skill we try to teach medical students. We say:

You must approach the information you gather in the patient's history and medical examination without *any* preconception. You must listen to patients in a neutral mode, and not rush to judgment. You may need to hear the same information over and over again, not making any decisions, until you clearly understand what is going on.

This, of course, drives away some patients, who want answers *now*. This is also what makes alternative "healers" so appealing. For them, personality is paramount. They listen intently. Then they lay on the hand. Neither they nor their patients need deal with uncertainty.

Patients may not care if, later, this help is found worthless. People don't approach healthcare, especially their own, as an intellectual problem.

But, sooner or later, the patterned responses of the alternative practitioner will fail the patient, perhaps fatally. The hope for a correct diagnosis and for specific medical interventions lies with a scientific approach to the patient and his or her ills. Only a physician can provide it.

Veva H. Zimmerman, M.D., is a dean at the New York University School of Medicine. The article above is an adaptation of one published in the June 1, 1995, issue of *Probe* newsletter. Readers' responses are welcome.

QUESTIONABLE CANCER TREATMENT NUTRITIONAL, HERBAL, AND BIOLOGICAL APPROACHES

STEPHEN BARRETT

The American Cancer Society (ACS) defines questionable methods as "lifestyle practices, clinical tests, or therapeutic modalities that are promoted for *general* use for the prevention, diagnosis, or treatment of cancer and which are, on the basis of careful review by scientists and/or clinicians, not deemed to have real evidence of value." Under the rules of science (and appropriate federal laws), proponents who make health claims bear the burden of proof. It is their responsibility to conduct suitable studies and report them in sufficient detail to permit evaluation and confirmation (or disconfirmation) by others. An ACS committee evaluates methods by asking three questions: (1) Has the method been objectively demonstrated in the peer-reviewed scientific literature to be effective? (2) Has the method shown potential for benefit that clearly exceeds the potential for harm? (3) Have objective studies been correctly conducted under appropriate peer review to answer these questions?

Current questionable methods include corrosive agents, plant products, special diets and dietary supplements, drugs, correction of "imbalances," biologic methods, devices, miscellaneous concoctions, psychological approaches, and worthless diagnostic tests. Many practitioners combine methods to increase marketability. A 1987 ACS investigation found that 452 (9%) of 5,047 cancer patients identified through a telephone survey had used questionable methods. Of these, 49% had used "mind therapies" (hypnosis, mental imagery, psychic therapy) and 38% had used diets. The dangers of using questionable treatments include delaying appropriate treatment, interference with proven treatment, decreased quality of life, direct physical harm, wasting valuable time, financial difficulties, and psychological damage.

Cures...or Lures?

Proponents of questionable methods typically claim that marketplace demand and testimonials from

satisfied customers are proof that their methods work. However, practitioners almost never keep score or reveal what percentages of their cases end in failure. Cancer cures (real and alleged) attributed to questionable methods usually fall into one or more of five categories: (1) the patient never had cancer; (2) the patient was cured or put into remission by proven therapy, but a questionable method was also used and erroneously credited; (3) the cancer is progressing but is misrepresented as slowed or cured; (4) the patient has died of cancer (or is lost to follow-up) but is pronounced cured; or (5) the patient had a spontaneous remission (very rare) or slow-growing cancer, but the method is credited as a cure.

Promoters of questionable methods generally couch their approach in a veneer of straightforwardness: (1) cancer is a symptom, not a disease; (2) emotional, dietary, and other environmental factors cause symptoms; (3) proper mental attitude, nutrition, and physical activity enable a biologic and mental defense against cancer; and (4) conventional therapy weakens the body's reserves and affects symptoms rather than the disease. Proponents portray questionable methods as natural and nontoxic, and standard (responsible) methods as very dangerous. They tend to play on patients' desire for power over the disease process. Motivators of proponent physicians or scientists may include adulation from clients, deep-seated preconceptions, delusional self-importance, financial vested interest, media attention, and misinterpretation of personal experience.

Recent favorites among questionable methods include the following.

Cancel

Cancel, originally called *Entelev*, is a liquid claimed to cure cancer by "lowering the voltage of the cell structure by about 20%." This allegedly causes cancer cells to "digest" and be replaced with normal cells. Accompanying directions have warned that bottles of *Cancel* should not be allowed to

touch each other or be placed near any electrical appliance or outlet. *Cancell* has also been promoted for the treatment of AIDS, Alzheimer's disease, amyotrophic lateral sclerosis (Lou Gehrig's disease), multiple sclerosis, "extreme cases" of diabetes and emphysema, and several other diseases. In 1989, the FDA reported that *Cancell* contained inositol, nitric acid, sodium sulfite, potassium hydroxide, sulfuric acid, and catechol. Subsequently, its promoters professed to be modifying the formulation to make it more effective. They have also claimed that *Cancell* can't be analyzed because it varies with atmospheric vibrations and keeps changing its energy. Laboratory tests conducted between 1978 and 1991 by the NCI found no evidence that *Cancell* was effective against cancer. The FDA has obtained an injunction forbidding its distribution to patients.

Essiac

Essiac is an herbal "remedy" that Canadian nurse Rene M. Caisse (1888–1978) prescribed and promoted for about fifty years [see NF 11:54–55, 1994]. Shortly before her death, she turned over the formula and manufacturing rights to the Resperin Corporation, a Canadian company that has provided it to patients under a special agreement with Canadian health officials. Several reports state that the formula contains burdock, Indian rhubarb, sorrel, and slippery elm, but there may be additional ingredients. *Essiac*® tea, allegedly Caisse's original formulation, is marketed in the United States. Several animal tests using samples of *Essiac* have shown no antitumor activity; nor did a review of data on 86 patients performed by the Canadian federal health department during the early 1980s.

Gerson Therapy

Gerson therapy proponents claim that cancer can be cured only if toxins are eliminated from the body. They recommend "detoxification" with frequent coffee enemas and a low-sodium diet that includes more than a gallon a day of juices made from fruits, vegetables, and raw calf's liver. This method was developed by Max Gerson, a German-born physician who emigrated to the United States in 1936 and practiced in New York City until his death in 1959. Still available at a clinic near Tijuana, Mexico, Gerson therapy is actively promoted by his daughter, Charlotte Gerson, through lectures, talk show appearances, and publications of the Gerson Institute, in Bonita, California. Gerson protocols have included liver-extract injections, ozone enemas, "live cell therapy," thyroid tablets, royal jelly capsules, linseed oil, castor-oil enemas, clay packs, laetrile, and vaccines made from influenza virus and dead bacteria (*Staphylococcus aureus*).

In 1947, the National Cancer Institute (NCI) reviewed ten cases selected by Dr. Gerson and found his report unconvincing. That year, a committee appointed by

the New York County Medical Society reviewed records of 86 patients, examined ten patients, and found no evidence that the Gerson method had value in treating cancer. An NCI analysis of Dr. Gerson's book *A Cancer Therapy: Results of Fifty Cases* concluded in 1959 that most of the cases failed to meet the criteria (such as histologic verification of cancer) for proper evaluation of a cancer case. A recent review of the Gerson treatment rationale concluded: (1) the "poisons" Gerson claimed to be present in processed foods have never been identified, (2) frequent coffee enemas have never been shown to mobilize and remove poisons from the liver and intestines of cancer patients, (3) there is no evidence that any such poisons are related to the onset of cancer, and (4) there is no evidence that a "healing" inflammatory reaction capable of seeking out and killing cancer cells exists [JAMA 268:3224–3227, 1992].

Between 1980 and 1986, at least thirteen patients treated with Gerson therapy were admitted to San Diego area hospitals with *Campylobacter fetus* sepsis attributable to the liver-extract injections. None of the patients was cancer-free, and one died of his malignancy within a week. Five were in a coma due to low serum sodium, presumably a result of the "no sodium" Gerson dietary regimen. Gerson personnel subsequently modified their techniques for handling raw liver products and biologicals. However, the Gerson approach still has considerable potential for harm. Deaths also have been attributed to the coffee enemas administered in the Tijuana clinic. [See NF 3:9–12, 1986. It is ironic that coffee, which contains dozens of naturally occurring toxicants, is considered benign and curative.—M.K.]

Charlotte Gerson claims that treatment at the clinic has produced high cure rates for many forms of cancer. In 1986, however, a Gerson publicist admitted to me that patients were not monitored after they left the facility. Although clinic personnel later said they would follow their patients systematically, there is no published evidence that they have done so. A naturopath who visited the Gerson Clinic in 1983 tracked 21 patients over a 5-year period (or until death) through annual letters or phone calls. At the 5-year mark, only one was still alive (but not cancer-free); the rest had succumbed to cancer.

The Greek Cancer Cure

The main proponent of the Greek cancer cure (also called Alivizatos therapy) was microbiologist Dr.

Nutrition Forum (ISSN 0748-8165) is published bimonthly for \$35.00 (individuals in U.S. and Canada) or \$50 (institutional, overseas) per year by Prometheus Books, 59 John Glenn Drive, Amherst, NY 14228-2197. Second-class postage pending at Buffalo, NY. POSTMASTER: Send address changes to Prometheus Books at address above. Manuscripts and all editorial correspondence should be directed to: Jack Raso, 71-11 60th Avenue, Maspeth, NY 11378-2908.

Hariton-Tzannis Alivizatos, of Athens, Greece, who died in 1991. He claimed to have a blood test that could determine the type, location, and severity of any cancer. He also asserted that his "serum" enabled the patient's immune system to destroy cancer cells, and that it helped the body rejuvenate parts destroyed by cancer. Knowledgeable observers believe that the principal ingredient of the so-called cure was niacin [also called vitamin PP (pellagra-preventative) in some older publications]. The ACS and the NCI asked Alivizatos several times for detailed information on his methods, but he never replied. A Mexican clinic now offers the treatment.

Hoxsey Treatment

Naturopath Harry Hoxsey promoted an herbal treatment consisting of a topical paste or powder and an oral tonic. The external preparations contained corrosive agents such as arsenic sulfide. The tonic, allegedly individualized, contained potassium iodide and such herbs as burdock root, cascara, licorice, and pokeroor (which is nontherapeutic and dangerous). Hoxsey said that the formulas were developed in 1840 by his great-grandfather and bequeathed to him by his father while the latter was dying of cancer.

Clinics offered the Hoxsey treatment in the United States from 1924 until the late 1950s, when Hoxsey closed his main clinic, in Dallas, because of repeated clashes with the FDA. Since 1963, it has been available only at a clinic in Tijuana, Mexico, operated by Hoxsey's former chief nurse, Mildred Nelson. Hoxsey himself had prostate cancer in 1967 and underwent surgery after treating himself unsuccessfully with his tonic. He died in 1974. Most of the herbs in the tonic have been tested for antitumor activity in cancer, with unremarkable results. The NCI examined case reports submitted by Hoxsey and concluded that, because of their inadequacy, no assessment of the method was possible. [See NF 4:89-91, 1987.]

"Hyperoxygenation Therapies"

"Hyperoxygenation" therapy, also called bio-oxidative therapy and oxidative therapy, is based on the misconception that cancer is caused by oxygen deficiency and can be cured by exposing cancer cells to more oxygen than they can tolerate. The most publicized agents are hydrogen peroxide, germanium sesquioxide,

and ozone. Although these compounds have been the subject of legitimate research, there is little or no evidence that they are effective for the treatment of any serious disease, and each has demonstrated potential for harm. Germanium products have caused irreversible kidney damage and death. The FDA has banned their importation and seized products from several U.S. manufacturers.

Kelley Metabolic Therapy

In the 1960s, William Donald Kelley, D.D.S., developed a program for cancer patients that involved dietary measures, vitamin and enzyme supplements, and computerized "metabolic typing." Kelley classified people as "sympathetic dominant," "parasympathetic dominant," or metabolically "balanced," and he made dietary recommendations for each type. He claimed that his "Protein Metabolism Evaluation Index" could diagnose cancer before it was clinically apparent and that his "Kelley Malignancy Index" could detect "the presence or absence of cancer, the growth rate of the tumor, the location of the tumor mass, prognosis of the treatment, age of the tumor and the regulation of medication for treatment."

In 1970, Kelley was convicted of practicing medicine without a license after witnesses testified that he had diagnosed lung cancer on the basis of blood from a patient's finger and prescribed dietary supplements, enzymes, and a diet as treatment for the cancer. In 1976, following court appeals, his dental license was suspended for five years. However, he continued promoting his methods, through his Dallas-based International Health Institute, until the mid-1980s. Under the institute's umbrella, licensed professionals and "certified metabolic technicians" throughout the United States would administer a 3,200-item questionnaire and send the responses to Dallas. The resultant computer printout provided a lengthy report on "metabolic status," plus detailed instructions covering foods, supplements (typically 100-200 pills per day), "detoxification" techniques, and lifestyle changes.

Reportedly similar treatment is provided today by Nicholas Gonzales, M.D., of New York City. Gonzales claims to have analyzed Kelley's records and drafted a book about his findings. The manuscript has not been published, but experts who evaluated its chapter on 50 cases found no evidence of benefit. Gonzales says that he offers "10 basic diets with 90 variations" and typically prescribes coffee enemas and "up to 150 pills a day in 10 to 12 divided doses."

Laetrile

Laetrile, the object of considerable popular attention during the 1970s and early 1980s [see NF 5:33-40, 1988], is the trade name for a synthetic relative of amygdalin, a constituent of the kernels of apricot pits, apple seeds, bitter almonds, and some other stone fruits and nuts. Many laetrile promoters have called it "vitamin B₁₇" and falsely claimed that cancer is a vitamin-deficiency disease curable with laetrile. Efficacy claims have varied. First, laetrile was claimed to prevent and cure cancer. Then it was claimed to "control," not cure, cancer, and to increase patients' feelings of well-being. More recently, laetrile has been claimed to be effective not by itself, but as a component of "metabolic therapy" (see below).

Laetrile was first used to treat cancer patients in the 1950s, in California. According to proponents, it kills tumor cells but leaves normal cells alone. Although laetrile has been promoted as safe and effective, clinical evidence indicates that it is neither. When subjected to enzymatic breakdown in the body, it forms glucose, benzaldehyde, and hydrogen cyanide. Some cancer patients treated with laetrile have suffered nausea, vomiting, headache, and dizziness, and a few have died from cyanide poisoning. Laetrile has been tested in at least twenty animal tumor models and found to have no benefit either alone or with other substances. Several case reviews have found no benefit for the treatment of cancer in humans.

In 1982, in response to political pressure, the Mayo Clinic and three other U.S. cancer centers, with NCI sponsorship, began a clinical trial. Laetrile and "metabolic therapy" were administered as recommended by their promoters. The patients had advanced cancer for which there was no proven treatment. Of 178 patients, not one was cured or stabilized, and none had any lessening of any cancer-related symptoms. The median survival rate was about five months from the start of therapy. In those still alive after seven months, tumor size had increased. Several patients experienced symptoms of cyanide toxicity or had blood levels of cyanide approaching the lethal range.

In 1975, a class action suit was filed to stop the FDA from interfering with the sale and distribution of laetrile. Early in the case, a federal district court judge in Oklahoma issued orders allowing cancer patients with a physician's affidavit that they were "terminal" to import a six-month supply of laetrile for personal use. However, in 1979, the U.S. Supreme Court ruled that it is not possible to be certain who is terminal and that, even if it were possible, both terminally ill patients and the general public deserve protection from fraudulent cures. In 1987, after further appeals were denied, the district judge (a strong proponent of laetrile) yielded to the higher courts and ended the affidavit system. Now there are few U.S. sources of laetrile, but several Mexican clinics use it.

Livingston-Wheeler Therapy

Virginia C. Livingston, M.D., who died in 1990, postulated that cancer is caused by a bacterium she called *Progenitor cryptocides*, which invades the body when "immunity is stressed or weakened." According to Livingston, one could combat this (alleged) bacterium by strengthening the body's immune system with: (1) vaccines (usually derived from the patient's urine); (2) "detoxification" with enemas; (3) digestive enzymes; (4) a vegetarian diet that excluded chicken, eggs, and sugar; (5) vitamin and mineral supplements; (6) visualization; and (7) stress reduction. She claimed a very high recovery rate but published no clinical data to support this. Attempts by scientists to isolate the organism Livingston posited were not successful. Researchers at the University of Pennsylvania Cancer Center compared 78 of its patients with similar patients treated at the Livingston-Wheeler Clinic. All had advanced cancers for which there was no proven treatment. As expected, the study found no difference in the average survival time of the two groups. However, Livingston-Wheeler patients reported more appetite problems and pain.

Metabolic Therapy

Practitioners of "metabolic therapy" profess to diagnose abnormalities at the cellular level and to correct them by normalizing the patient's metabolism. They regard arthritis, cancer, multiple sclerosis, and other "degenerative" diseases as the result of metabolic imbalance caused by a buildup of "toxic substances" in the body. They claim that scientific practitioners merely treat the symptoms of the disease while they treat the cause by removing "toxins" and strengthening the immune system. The "toxins" are neither defined nor objectively measurable. "Metabolic" treatment regimens vary from practitioner to practitioner and may include coffee enemas, a "natural food" diet, vitamins, minerals, enzymes, "glandulars," laetrile, and various other nostrums that are not legally marketable in the United States. No scientific study has ever shown that "metabolic therapy" or any of its components is effective against cancer or any other serious disease.

The most visible proponent of "metabolic therapy" was biology professor Harold W. Manner, Ph.D., who died in 1988 [see NF 1:9-10, 1984; and NF 5:61-67, 1988]. In 1977, Manner announced that he had cured cancer in mice with injections of laetrile, enzymes, and vitamin A. (Actually, he disintegrated the tumors by injecting them with digestive enzymes, which cannot cure cancer that has metastasized.) During the early 1980s, Manner left his teaching position and affiliated himself with a clinic in Tijuana, Mexico. Although he claimed a 74% success rate in treating cancer, there is no evidence that he kept track of patients after they left his clinic, which is still operational.

Pau d'Arco

Pau d'arco (pronounced "pow darko"), which reportedly comprises a group of trees from two genera (*Tabebuia* and *Tecoma*), is also called ipéroxo (pronounced "eepayrosho"), ipés (pronounced "eepays"), lapacho, lapacho colorado, lapacho morado, and taheebo. Tea products made from the herb are sold in health food stores and by mail. Proponents claim that pau d'arco tea is effective against cancer and many other ailments. *Tabebuia* wood contains lapachol, which has been demonstrated to have antitumor activity in a few animal tumor models. However, no published study has shown a significant effect on cancer in humans. Studies during the early 1970s found that lapachol is not as readily absorbed by humans as by rats, and that anti-coagulant effects would accompany plasma levels high enough to influence tumors. Even low doses can cause nausea and vomiting and can interfere with blood clotting. Some researchers believe that lapachol should be studied further, with vitamin K to inhibit its anticoagulant activity.

[Editor's note: On July 16, I conversed by phone with Varro E. Tyler, Ph.D., Sc.D., author of *The Honest Herbal* (1993), who stated:

No one really knows, but the original pau d'arco products should have been from the genus *Tabebuia*. What passes for pau d'arco is supposed to come from *Tabebuia* or *Tecoma*...but whether it does or not, who knows? There's no control over these sorts of things....

There are other lapachol derivatives in the bark....No one has tested them...but I think they probably would also be toxic like lapachol at doses that were effective for anticancer treatment.

"This is a hoax, as far as I'm concerned," Dr. Tyler concluded.—J.R.]

Revisi Cancer Control

Revisi Cancer Control, also called lipid therapy and biologically guided chemotherapy, is based on the notion that cancer is caused by an imbalance between constructive ("anabolic") and destructive ("catabolic") body processes. Its main proponent, Emanuel Revisi, M.D., prescribed caffeine, iron, zinc, and lipid alcohols, all of which he classified as anabolic; and fatty acids, magnesium, selenium, and sulfur, all of which he classified

MIRACLES that Weren't

- During the 1980s, Anthony Sattilaro, M.D., wrote books and appeared on talk shows promoting macrobiotics [see NF 7:17-21, 1990] as a cancer cure. In the bestseller *Recalled by Life* (1982), he described how he had undergone conventional therapy for prostate cancer, yet he credited macrobiotics for his improvement. In *Living Well Naturally* (1984), he said his doctors had pronounced him in a state of permanent remission. He died of prostate cancer in 1989.

- Lawrence Burton, Ph.D., who died in 1992, offered "immuno-augmentative therapy" (IAT) at his clinic in the Bahamas. Burton claimed that IAT would cure cancer patients by influencing an immune defense system he postulated. In 1979, CBS-TV's "60 Minutes" gave Burton a tremendous publicity boost when a prominent physician stated that one of his patients apparently had recovered miraculously with Burton's treatment. The patient died twelve days after the broadcast, but "60 Minutes" refused to inform viewers of this fact. In 1990, oncologist Wallace Sampson, M.D., analyzed a booklet of 35 case histories used to promote Burton's clinic. He concluded that 30 had undergone standard or near-standard treatment and had had a significant probability of living as long as was recorded in the booklet. The other vignettes did not provide detail sufficient for sound judgment.

- Lucas Boeve, proprietor of a clinic in the Dominican Republic, has claimed that ozone gas administered at his facility has cured AIDS, Alzheimer's disease, arthritis, cancer, Parkinson's disease, and

many other diseases. He has also claimed that he provided an ozone machine responsible for curing "Magic" Johnson of AIDS. In 1994, the staff of "Dateline NBC" investigated all the cancer and AIDS patients in a list of success stories provided by Boeve. Of 13 cancer patients: 2 had died; 3 could not be found; 2 refused to be interviewed; 3 were alive but still had cancer; and 3 said they had been helped, but their doctors said they probably had been cancer-free before receiving ozone therapy. Of two AIDS patients, one said he felt well but was still HIV-positive, and the other had not been retested for HIV. Johnson's representatives said that he had had nothing to do with Boeve (or ozone therapy) and was still infected with the virus.

- Stanislaw R. Burzynski, M.D., who operates a clinic in Houston, Texas, claims his "antineoplastons" can "normalize" cancer cells and have helped many people with cancer get well. In 1988, talk-show host Sally Jesse Raphael presented four "miracles": patients of Burzynski who she said were cancer-free. The patients stated that Burzynski had cured them when conventional methods had failed. In 1992, "Inside Edition" reported that two of the four patients had died and that cancer had recurred in another. (The fourth patient had bladder cancer, which has a good prognosis.) The widow of one of Raphael's guests stated that her husband and five others from the same city had sought treatment after learning about Burzynski from a television broadcast—and that all had died of their disease.

As featured on 60 Minutes

Finally, What The World Has Been Waiting For... A Major Cancer Breakthrough

SHARKS DON'T GET CANCER

In 1983, two researchers at MIT published a study showing that shark cartilage contains a substance that significantly inhibits the development of blood vessels that nourish solid tumors, thereby limiting tumor growth. Working independently, researchers at Harvard found that if one could inhibit the development of a new blood network, one could prevent the development of tumor-based cancers and metastasis.

Tying together these two important findings, author Dr. I. William Lane traces further the pioneer work performed in this area and recounts his own involvement in the search for a truly effective treatment of tumor-based cancers. As events and research continue to unfold, shark cartilage may prove to be the first momentous step toward preventing and conquering cancer. *Sharks Don't Get Cancer* is the story of this amazing breakthrough.

Natural Foods Merchandiser published this ad shortly after the "60 Minutes" promotion of shark cartilage. It states that "shark cartilage may prove to be the first momentous step toward preventing and conquering cancer"—a statement that would be illegal in marketing a shark-cartilage product.

as catabolic. His formulations were based on his interpretation of the specific gravity, pH (acidity), and surface tension of one-shot samples of the patient's urine. Scientists have offered to evaluate the Revici method, but they and Revici couldn't agree on procedures to ensure a valid test. In any case, his method of urinary interpretation is obviously invalid: The specific gravity of urine reflects the concentration of dissolved substances and depends largely on the amount of fluid a person consumes. Its acidity depends mainly on diet, but varies considerably throughout the day. Thus, even when these values are useful for a metabolic determination, information from a single urine sample would be meaningless. The surface tension of urine has no scientifically recognized diagnostic value. Recently, after a long struggle with New York State licensing authorities, Revici's medical license was permanently revoked.

Shark Cartilage Therapy: "Jaws" of the Nineties?

Powdered shark cartilage allegedly contains a protein that inhibits the growth of new blood vessels needed for cancer to spread. Although a modest anti-angiogenic effect has been observed in laboratory experiments, ingestion of shark cartilage has not been demonstrated to significantly inhibit angiogenesis in patients with cancer. Even if direct applications were effective, oral administration would not work because the protein would be digested, not absorbed intact.

Nevertheless, in two broadcasts during the spring of 1993, the TV newsmagazine "60 Minutes" promoted the claims of biochemist and entrepreneur I. William Lane, Ph.D., coauthor of *Sharks Don't Get Cancer*. The segment highlighted a Cuban study of 29 "terminal" cancer patients who received shark-cartilage preparations. Some of the patients were shown exercising, and narrator Mike Wallace reported that most of them felt better several weeks after the beginning of treatment. Unmentioned was the fact that "feeling better" does not indicate whether a cancer treatment is effective. Also unmentioned was that sharks do get cancer, even of their cartilage. NCI officials subsequently reviewed the Cuban data and concluded that they were "incomplete and unimpressive."

Health food industry publicists had a field day after the broadcast. They began suggesting that shark-cartilage preparations could not only prevent and treat cancer but were effective against arthritis and several other health problems. Many supplement manufacturers market products that sell for \$25 to \$80 for a one-month supply. The market leader, Cartilage Technologies, has been advertising in medical journals and distributing information packets stating that it is sponsoring an FDA-approved Phase II clinical trial that began last year.

[Editor's note: Is it safe to go back into the health food store? In the October 1994 issue of *Alternative Medicine Digest*, editor Betty Kamen, Ph.D., stated:

For serious problems, large quantities of shark cartilage are imperative. Recommended amounts are about a gram per two pounds of body weight, so an average of 100 capsules [per day] would be necessary where need is critical. Liquid vials make much more sense than capsules—they work faster and are more potent. One vial is the equivalent of 80 to 100 grams!

Kamen further stated that shark cartilage was available from Allergy Research Group, in San Leandro, California, and she provided its toll-free number. I phoned the company on July 14. The woman who answered the phone said the product was available in frozen vials. She asked me if I was a doctor. After I told her I was a chiropractor, someone named Bill took my call. Bill asked me if I was a "medical professional," and I said I was a "Doctor of Chiropractic." "Well, that certainly counts," he responded. He stated that shark cartilage

was for sale in 7-cc vials, that most patients took 7 cc per day, that this amount was equivalent to 80 grams of powder, and that the cost of the product to me would be \$290 per unit of 24 vials. That's \$12 a day before markup!—J.R.]

Vitamin C

The belief that vitamin C is useful against cancer is largely attributable to Linus Pauling, Ph.D. [see NF 11:52, 1994]. During the mid-1970s, Pauling began alleging that high doses of vitamin C could prevent and cure cancer. In 1976 and 1978, he and a Scottish physician, Ewan Cameron, reported that a group of 100 terminal cancer patients treated with 10,000 mg of vitamin C daily had survived three to four times longer than historically matched patients who had not received vitamin C supplements. However, Dr. William DeWys, chief of clinical investigations at the NCI, found that the patient groups were not comparable. The vitamin C patients were Cameron's, while the other patients were managed by other physicians. Cameron's patients were started on vitamin C when he labeled them "untreatable" by other methods, and their

subsequent survival was compared to the survival of the "control" patients after the latter patients were labeled untreatable by their doctors. DeWys found that Cameron's patients had been labeled untreatable much earlier in the course of their disease. This means that they entered the hospital before they were as sick as the other doctors' patients and, therefore, would naturally be expected to live longer. Nevertheless, to test whether Pauling might be correct, the Mayo Clinic conducted three double-blind studies involving a total of 367 advanced-cancer patients. All three studies found that patients given 10 grams of vitamin C daily did no better than those given a placebo. Despite many years of taking huge daily amounts of vitamin C, both Pauling and his wife Ava died of cancer—she in 1981, he in 1994.

Stephen Barrett, M.D., a retired psychiatrist, is a board member of the National Council Against Health Fraud. His 38 books include *The Health Robbers: A Close Look at Quackery in America* and *The Vitamin Pushers: How the "Health Food" Industry Is Selling America a Bill of Goods*, both published by Prometheus Books.

HEALTHCARE ESOTERICA

Here's the 7th installment of descriptions of mystical and/or supernaturalistic alternativest methods.—J.R.

Advanced pranic healing: Subject of a "serious reference work" of the same name, written by chemical engineer and "Master Pranic Healer" Choa Kok Sui. The method allegedly uses "color pranas" and "chakral" techniques to effect "very rapid healing." It includes "divine healing." Sui is also the author of the bestseller *Pranic Healing* (1990) and its companion piece, *Pranic Psychotherapy* (1993) [see NF 11:49, 1994, and NF 11:60, 1994].¹

Blood crystallization (diagnostic blood crystallization): Pseudodiagnostic method involving the introduction of a blood sample to a copper chloride solution. "Crystal signs" of illness in the resultant "blood-crystal picture" allegedly express the guidance of "a higher functional plane coming to expression." "Organ-signs," for example, purportedly indicate dysfunction of an organ or a bodily system. Supposedly, each so-called organ-sign reflects a "multi-layered organ principle" (which includes "the organ-bound 'soul organ'") and, on "the psychic plane," is the foundation for related "soul qualities."²

Breathwork: "Working with breath inhalation and exhalation patterns to achieve physical, emotional, and spiritual change," according to *The New Age Dictionary* (1990).³

Breema: "A form of laying-on-of-hands healing that came from Afghanistan," according to Sybil Sanders, of Nine Gates, Inc. (See "Nine Gates Training Program," below).^{4,5}

Healing touch: "A way of moving energy around" manually, according to a 1995 edition of "The Other Side." Therein, an alleged beneficiary of the method stated: "It feels like having a complete massage without being touched." The method posits an "energy field."⁶

Kum Nye (Kum Nye relaxation): "Holistic" system reportedly based on Tibetan medicine and Buddhist "mind-body disciplines." It involves breathing exercises, self-massage, slow movements, and visualization; posits "energy centers" (e.g., the "head center" and the "heart center") and "energy blockages" (e.g., "sexual blockages"); and purportedly is usable as a "healing process." The practice allegedly "vitalizes" the senses and conduces to alertness and limberness.^{7,8,9}

Nine Gates Training Program: "Essential training for daily life inspired by ancient mystery schools," according to its provider, Nine Gates, Inc. The program involves Breema (see above) and reiki (a variant of the laying on of hands). It posits a soul, "powerful energies of the third eye," and "energy centers" of the belly, knees, feet, and base of the spine. The "belly center" allegedly stores a "deep serene power" usable for healing.⁵

Swedish-Esalen: A "light/relaxing" and "nurturing" form of massage that allegedly reintegrates the body and soul.¹⁰

Wu Ming Qigong: "Unique energy system" and "self-healing practice" that allegedly helps users connect body, mind, and spirit.¹¹

Seven Alternativist Schools

Below I describe some nonaccredited providers of nonstandard healthcare credentials.—J.R.

- In 1989, the **American Association for Parapsychology** (AAP), in Canoga Park, California, offered "A Complete Course in Parapsychology." This correspondence program led to a certificate of membership and a diploma. It featured such subjects as radiesthesia ("used in medical diagnosis"), psychometry (object reading, a form of divination), and "spiritual healing." In July 1995, AAP was offering a Doctor of Metaphysics "external degree" program through the **American International University** (A.I.U.), a nonaccredited organization with which it shared a P.O. box. The program led to a Ph.D. degree.
- For its 1991–1992 academic year, the **Atlantic Academy of Classical Homeopathy** (AACH), in New York City, offered a 500-hour classroom program that culminated in a "Certificate in Homeopathy (C.Hom.)." Previously, the academy had offered a "certification system" leading to a "Certificate in Homeopathic Therapeutics (CHT)." The academy was founded in 1989. In August 1995, it had an "Off Campus" C.Hom. program.
- In 1990 and 1991, the **California School of Herbal Studies** (CSHS), in Forestville, California, offered an 8-week program on the West Coast that led to a "Certificate in Therapeutic Herbalism." The school also offered a correspondence course titled "Therapeutic Herbalism" (previously "Medical Herbalism") to "anyone interested in herbal health care." It described this course as similar to the former and as the cornerstone of "developing a practice as a medical herbalist." The school was founded in 1978. In mid-1995, CSHS offered an on-site "intensive training program" comprising two semesters: "Foundations of Herbalism" and "Therapeutic Herbalism." On July 14, 1995, I called the school, and the woman who answered the phone told me that the program led to a "certificate of completion."
- For its 1992–1993 academic year, the **Institute of Transpersonal Psychology** (ITP), in Palo Alto (previously in Menlo Park), California, offered two "M.A." correspondence programs: (1) the 21-month "Master of Arts in Transpersonal Studies (MATS)" program and (2) the 27-month Master of Transpersonal Psychology (MTP) program. Transpersonal psychology is a combination of Eastern mysticism, Jungian psychology, and psychosynthesis [see NF 12:49, 1995]. ITP was founded in 1975. By 1994, it attained a "preaccredited status" recognized by the U.S. Secretary of Education, and "Candidate for Accreditation" status with CORPA. On July 12, 1995, I phoned ITP, and someone in the admissions office told me that "hopefully" the institute would achieve accreditation in 1998.
- In early 1995, **The New Seminary**, an interfaith "National Academy of Wisdom" in New York City, offered "The Physician of the Soul Program," a videotape course whose subjects included such "spiritual approaches to healing" as: creative visualization, "Homeopathic Healing," hypnotherapy, "Kabbalistic Healing," "Quantum Healing," rebirthing, reiki (a variant of the laying on of hands), shamanic healing, shiatsu, and "Therapeutic Touching" (sic). The course required attendance at a "one-day Intensive Retreat" and led to certification as a modern "Physician of the Soul." The seminary was founded in 1981.
- In early 1994, the **University of Metaphysics**, in Los Angeles, California, offered self-paced, "ALL HOME STUDY" doctoral programs that led, for example, to a Ph.D. degree in "healing" and degrees in "holistic science" (Hsc.D.®) and "metaphysical science" (Msc.D.®). It advertised that its programs had but one prerequisite: "a sincere desire to improve the quality of human life." On July, 7, 1995, I mailed a check for \$5 to the organization's "communications address," in Studio City, California, for a "detailed Research Report" and "full details" of the "Doctoral Degree Program." The mailing I received about a week later included a letter from dean Paul L. Masters, Msc.D., in which he said a "Student Enrollment Drive" was in progress, enabling enrollment before August at half the regular tuition. According to the so-called research report, titled "A Doctoral Career in Metaphysics" (© 1994): (1) the International Metaphysical Ministry is the university's parent body; (2) the doctoral program is self-paced, and enrollees can meet degree requirements in less than a year; (3) upon successful completion of the first six months of study, enrollees receive the Ministerial Ordination Diploma, which "gives one the legal right" to "practice spiritual healing," and the "Practitioners Ordination Diploma," which "protects one's right legally to practice Spiritual Healing"; and (4) to those who successfully complete the "Doctoral Degree Program" and have "Ministerial standing" with the International Metaphysical Ministry, the "university" gives one of three "Ph.D." degrees: Doctor of Metaphysics, Doctor of Metaphysical Counseling, and Doctor of New Thought Ministry.

Reflexology: Science or Scam?

Jack Raso

The term "reflexology" is generic and, in activist circles, broadly refers to any method whose essence is the stimulation (especially digital) of areas below the skin (especially appendages) to benefit a specific part of the body not proximate to the stimulated area. Reflexology, also called reflexology therapy, is also an alleged means of diagnosis. It is vitalistic and has ancient roots. Its "reflex points" (also called reflexes, reflex areas, and reflex buttons) and "zones" (also called reflex zones) are analogous, respectively, to the "acupoints" and meridians of traditional Chinese medicine. Forms and variants of reflexology include auricular reflexology, body reflexology [see NF 12:47, 1995], chakra energy massage, the Laura Norman method [see NF 12:29, 1995], the metamorphic technique, the Original Ingham Method™ [see NF 12:30, 1995], the reflexology workout [see NF 12:30, 1995], vita flex, and zone therapy [see NF 12:31, 1995]. Proponent and quasi-proponent identifications of reflexology vary substantially, for example:

- zone therapy
- a descendant of zone therapy
- zone therapy, comprising:
 - (1) macroreflexology, e.g., acupressure and acupuncture; and
 - (2) microreflexology, e.g., ear reflexology, foot reflexology, and hand reflexology
- foot reflexology
- a type of shiatsu that focuses on the hands and feet

I first experienced foot reflexology in 1993. The practitioner, evidently a teacher of the Laura Norman method, applied lotion to my feet before massaging them. She stated that she generally used lotion even though the method excluded it. The form of reflexology she performed during the one-hour session consisted of manual massage, almost exclusively

of the feet. I rather enjoyed it. The reflexologist told me I had "some tightness" in my intestines and remarked that many reflexologists have no compunctions about rendering diagnoses. My second reflexology experience, which I describe below, was very different.

Later that year, the journal *Obstetrics & Gynecology* published a report of a double-blind, randomized, placebo-controlled study of reflexology. The authors, Terry Oleson, Ph.D., and William (Bill) Flocco, founder of the American Academy of Reflexology, in Burbank, California, defined reflexology therapy as "the application of manual pressure to reflex points on the ears, hands, and feet that somatotopically correspond to specific areas of the body." What somatotopic correspondence is, is unclear. According to the report, the objective was to determine whether reflexology, relative to placebo treatment, could significantly reduce premenstrual symptoms. All 35 subjects individually attended one half-hour session per week for eight weeks. "Trained reflexology therapists" pressed specific "reflex points" and two specific acupuncture points of subjects in the "true" group; but, to subjects in the placebo group, they gave "uneven tactile stimulation" to areas (on the same appendages) "not considered appropriate" for the treatment of premenstrual syndrome (PMS). The researchers concluded that their findings "support the use of ear, hand, and foot reflexology for the treatment of PMS." However, they described the placebo treatment as "either overly light or very rough," leading me to suspect that it had been tactually inferior to the reflexology performed. (Enlisting nonreflexologist practitioners of a tactual method, such as craniosacral balancing or *jin shin do*, to treat subjects in the placebo group would eliminate the difficulty the researchers said reflexologists had when they pseudo-treated

Diagram in copy of Minarik's introductory so-called book
(on display in a health spa on July 30, 1995)

subjects.) At all events, the study certainly does not validate any theory of reflexology. One of the most cockamamie reflexology theories posits "crystalline deposits" linked to disease: allegedly, crystals form subcutaneously in the "relevant" foot zone when a physical disturbance occurs, and their breakdown relieves the affected part of the body.

Star Collector?

Brochures distributed between mid-1990 and August 1995 stated that foot reflexologist "Dr. Richard Minarik, N.D.," of Rego Park, New York, had treated various celebrities and talents with foot reflexology, including the following.

- triple world heavyweight champion Muhammad Ali
- world heavyweight contender Gerry Cooney
- prizefighter Ken Norton
- Michael Spinks (one hour before the match that would make him world heavyweight champion)
- Jackie Onassis
- President Ronald Reagan
- New York State Governor Mario Cuomo
- talk-show host David Hartman
- radio disc jockey Ted Brown
- Miss Universe Margarete Gardner
- five New York Mets players
- many of the Radio City Music Hall Rockettes

In 1990, the brochure included a photo of Minarik and Mario Cuomo, shoulder to shoulder in front of a gas station. The caption described Cuomo as looking "very contented after getting his ailing back cured with a foot reflexology treatment" from the "famed" foot reflexologist. However, in August of that year, Governor Cuomo responded that he "in no way" endorsed "Mr." Minarik's work and that Minarik had never treated him. Brochures distributed between late 1993 and August 1995 do not mention or depict the former governor.

I first laid eyes on Minarik on July 29, 1995, when I chanced upon him in a steam room. This was in a large health spa in Woodside, New York, that had displayed his promotional materials for years. I recognized Minarik from a photo in a copy of a tabloid clipping I had recently seen at the club. The man sitting beside him asked about his cellular phone, perched just outside the window ahead of them. Minarik told the man he was expecting a call from a patient. Before I left the club, I obtained his brochure from a display case.

The cover of the brochure stated:

Foot Reflexology is a science which deals with the principle that there are reflexes in the feet relative to each and every organ and all parts of the body.

As a person gets older, inorganic calcium builds up on these nerve endings causing a shortage of nerve energy back to the corresponding parts of the body. By skillfully stimulating these reflexes, these inorganic calcium deposits can be gradually dissolved enabling renewed nerve energy and blood circulation to previously sluggish glands, organs or other parts of the body. Even after the first treatment, the patient experiences a profound sense of well-being and euphoria.

These assertions are scientifically *footless*. The cover further states that foot reflexology has "successfully alleviated" anxiety, arthritis, back pain, bursitis, constipation, depression, fatigue, "female problems," glandular disorders, headaches, intestinal ills, neck stiffness, sciatica, and more than a half-dozen other health problems.

Footage of a Naturopath

That Saturday afternoon, I phoned Minarik and made a next-day appointment

for a 45-minute "treatment" at the "SPECIAL INTRODUCTORY FEE" of \$15. Minarik's office, apparently an apartment, was on the first floor of a seven-story apartment building in Rego Park, Queens (a borough of New York City). The bicycle ride from my home took less than eight minutes. "Treatment" took place in a living-roomlike space that contained a central massage table, a couch that afforded an adjustable massage, a reclinerlike armchair, two footrests, an exercise machine, an electric roller apparently designed to massage the buttocks, a pile of flyers promoting *Super Blue Green Algae* [see NF 12:44 & 51, 1995], and about a dozen celebrity blowups, including the aforementioned shot of Minarik and Cuomo.

Minarik stated that he had been practicing there for 18 years and that he saw four or five patients every day. "I've been treating people for twenty years already," he said. He wore a white lab jacket throughout the session and came across as a moderately affable professional.

DR RICHARD MINARIK OF REGO PARK, QUEENS IS PROUD TO ANNOUNCE HIS INVENTION

of a simple device that can stop any pain in the body within minutes, and immediately relieve nervousness and depression. The device is called the *Acupresser* and is truly the most exciting and phenomenal invention in the history of alternative medicine.

For 33 years, Dr. Minarik, a Naturopath and Wholistic doctor has successfully treated mental disease and all forms of physical disease such as Migraine headaches, Bursitis, Arthritis, Poor circulation, Cold hands and feet, Numbness of extremities, Carpal tunnel syndrome, PMS, Tumors of different nature including Fibroid, Sciatica, Gout, Varicose veins, Digestive problems, Gas, Bloating, Constipation, Ulcers, Nervousness, Depression, Insomnia, Chronic fatigue, and Candida. Dr. Minarik believes you should first treat the body's built-in God given healing system and then the body will heal itself. Daily use of the *Acupresser* is the next best procedure.

Dr. Minarik's treatment includes foot reflexology, Chinese Acupuncture, Rolling, high colonic irrigation, and Acupressology, all of which he does himself. Daily use of the *Acupresser* has almost the same effect.

Dr. Minarik's amazing incredible invention *The*

Acupresser" is a simple inexpensive device that can be purchased and used at home. The *Acupresser* is fastened to various pressure points on the body. Within minutes you will be in a state of profound relaxation. This happens because endorphin is immediately released from your brain. Endorphin is a pain killing substance more potent than the drug morphine and as a sedative more potent than the most frequently prescribed tranquilizer. Using the *Acupresser* daily has the same effect as if you were to go to Dr. Minarik's office and receive his various therapies. The *Acupresser* may totally

change your life.

Dr. Minarik's staff will be giving free demonstrations of the *Acupresser* Monday to Friday 10:30 AM to 8 PM and Saturday and Sunday 10:30 AM to 4 PM. Demonstrations will be given every hour on the hour with a limit of 6 persons per demonstration. You must call at least one day in advance to reserve your free treatment.

Dr. Richard Minarik

Suite 1D, 61-61 Woodhaven Blvd., Rego Park, N.Y. 11374

718-429-2139

Call or Write for FREE Brochure

"What kind of problem do you have?" he inquired. I lied, stating that I had been diagnosed with high blood pressure a few years before but didn't have symptoms. I said that I was "supposed to" take medication but didn't, and that I treated my condition with exercise and diet.

"So, high blood pressure, you said?" asked Minarik.

"Yeah."

"Anything else? Any pains?"

"No."

The first phase of Minarik's "reflexology treatment" involved his placing "acupressers" on my hands and feet: (1) a plastic device, indistinguishable from a spring clothespin, on each little toe, (2) a plastic helmetlike device on each big toe, (3) a plastic screw-device with Velcro on each foot, and (4) a "screw-on" plastic clamplike device on each hand and foot. As I lay in the reclinerlike armchair, I looked at the blowup of Minarik and Cuomo and observed: "That's Mario Cuomo, isn't it?"

"Yeah," said Minarik. "He was one of my patients."

I told Minarik that years ago I had applied to the National College of Naturopathic Medicine; then I asked where he had studied.

"In California," he replied.

"Is the school still there?"

"Uh, no...."

I asked the name of the school, and he said: "William Fitzgerald School of Naturopathic Medicine and Zone Therapy."

Then I lay "adorned" for about twenty-three minutes. Minarik spent most of this time in what sounded like a kitchen. Six minutes before the end of the period, he declared that, whatever my blood pressure had been "before," it was now lower. As he removed the devices, he asked for how long had I had a blood-pressure problem, and I said ten years.

The next phase involved manual massage of my feet, calves, and shins; the next,

massage of my soles and toes with a vibrator that had a tapered head, and of the left and right sides of my feet with the Hitachi *Magic Twin-Head Massager*. The following phase involved my sitting on a footrest with my hands on the "roller"; the next, getting a massage from the mechanical couch; and the last, Minarik's cracking my neck. I somewhat disliked Minarik's cracking my neck, knuckles, and toes, especially since he had not stated his intention beforehand.

Minarik sold me the *Acupresser* for \$40: junk consisting of four plastic clamplike devices and a pair of Velcro devices. I asked him why the Velcro on one device was white and on the other, black. He said the difference balances yin and yang.

Minarik stated that he would thenceforth charge me \$30 per visit. He recommended two visits weekly for several weeks (purportedly to break up calcium deposits), followed by one visit per month.

On August 3, I again happened to meet the 63-year-old naturopath at the health spa. He asked me how I felt after the "treatment." I said "fine," omitting that I thought his treatment was irrelevant. Indeed, the euphoria his brochure had forecast had missed me with a vengeance. (The next day, the manager of a printing office that Minarik has patronized said he guessed the shop had been producing these brochures for about ten years.) Although Minarik had not given me any nutrition advice (I'd told him I had a degree in nutrition), he did remark that he took a garlic supplement daily and tried to eat vegetables four times a week.

The Bottom Line

Reflexology is a highly variegated practice whose theories lack scientific substantiation. It can be pleasurable or unpleasant, a massage or an invitation to quackery, or just a waste of time. In my opinion, it's not worth the trip.

Nutrition

Vol. 12, No. 6

ISSN 0748-8165

Editor's note: Since the late 1980s, a trend among nutrition popularizers has been to dichotomize food as healthy (anti-disease) and harmful. However, the beneficialness or harmfulness of ingesting a particular food depends on: (1) the amount consumed, (2) the frequency of consumption, and (3) the eater's health status, genetics, and long-term pattern of food consumption and physical activity. In any case, talking up cabbage, carrots, cranberries, garlic, onions, oats, olive oil, green tea, wine, yogurt, and certain other foods as nature's "medicinal wonders" tends to obscure, or at least to de-emphasize, the main problem: In a nation of underactive overeaters, a land of condensed milk and organic honey, where fast-talking fast food commercials target children and/or the disadvantaged, high-fat foods and highly sugared foods are "getting away with murder." Such foods,

though not intrinsically harmful, are generally harmful in this milieu. High-fat foods are, in my opinion, our dietary archvillain.

Many studies have shown that reducing blood cholesterol decreases the incidence of heart disease and mortality therefrom. The National Heart, Lung, and Blood Institute's National Cholesterol Education Program recommends that all Americans who are at least 20 years old routinely obtain a cholesterol determination. It classifies blood-cholesterol values below 200 mg/dl as "desirable," and values above 239 as "high."

This issue's lead article is an adaptation of a more extensive treatment of food, fat, and heart disease. Dr. Mirkin's no-nonsense, piscilactovegetarian diet features a fat allowance of 15 to 20 grams. Americans derive
(continued on page 72)

The Skinny on Low-Fat Dieting

Gabe Mirkin

Simply boosting one's intake of corn oil (for its unsaturated fat), olive oil (for its monounsaturated fat), and/or fish oil (for its omega-3 fats) cannot prevent heart attacks. Sensible low-fat diets restrict all types of fat.

Types of Fat

Fats, also called lipids, are chemical compounds (and mixtures of such) that are not water-soluble but dissolve in organic (carbon-containing) solvents (e.g., chloroform and gasoline). They include oils, phospholipids (e.g., lecithin), steroids (e.g., cholesterol and vitamin D), terpenes (e.g., beta-carotene), triglycerides, and waxes (e.g., beeswax). Triglycerides, which yield glycerol (glycerin) and fatty acids, constitute most of the fat in food and in the body. The main types of dietary fat are saturated, polyunsaturated, and monounsaturated.

While foods are classified by the predominant type (see table), all three occur in all natural food sources of fat. Below I describe some fats and fat substitutes relevant to the prevention and treatment of disease.

• Saturated fats

Saturated fats are dietary fats in which hydrogen-saturated fatty acids predominate. Meat, eggs, and tropical oils, such as coconut, palm, and palm kernel oils, contain saturated fats in large proportions. When caloric intake exceeds caloric need, saturated fats raise blood cholesterol more than any other dietary constituent. However, even with a marked increase in saturated-fat intake, appropriate caloric restriction lowers blood cholesterol. Although anything that reduces the intake of saturates will lower blood cholesterol, the decrease will be small if the reduction in saturated-fat intake is due to replacement by other types of fat.

- **Polyunsaturated fats**

Polyunsaturated fats are dietary fats whose predominant fatty acids have spare room for at least four hydrogen atoms. Vegetable oils are particularly rich sources of polyunsaturated fats. Substituting polyunsaturated fats for saturated fats will effect a small decrease in both LDL-cholesterol (which, in excess, is atherogenic) and HDL-cholesterol (which is beneficial). However, merely increasing one's intake of polyunsaturated fats raises triglycerides; the liver makes triglycerides when caloric intake exceeds the body's need. Moreover, consuming polyunsaturates in large amounts increases the risk of infections, gallstones, and cancer of the breast, colon, gallbladder, and uterus.

- **Monounsaturated fats**

Monounsaturated fats are dietary fats whose predominant fatty acids have spare positions for only two hydrogen atoms. Almonds and olives are particularly rich sources of monounsaturated fats. As with polyunsaturated fats, substituting monounsaturated fats for saturated fats conduces to a small reduction of blood cholesterol. However, unlike substitutive polyunsaturates, substitutive monounsaturates lower LDL- but not HDL-cholesterol. Replacing lard and butter with olive oil is reasonable; replacing them with air is ideal.

- **Omega-3 fats**

Omega-3 fats are polyunsaturates that occur mostly in fish oils. They do not lower cholesterol unless one reduces one's total fat intake. However, they do prevent the obstructive clotting that tops off a heart attack. Thus, persons with atherosclerosis or who have had a heart attack may benefit from increasing their intake of omega 3's; but plaque-reducing total fat restriction is more important. Eating fish twice a week provides the maximum anti-clotting benefit; benefits do not accrue with greater consumption.

- **Tropical oils**

Palm oil, palm kernel oil, and coconut oil contain saturated fats in large proportions. The main sources of these tropical oils are bakery products and prepared canned and frozen foods. The claim that palmitic acid, the principal saturated fat in tropical oils, does not raise cholesterol is incorrect. Only in persons with low cholesterol levels who ingest fewer than 300 mg cholesterol daily does palmitic acid not cause an increase in cholesterol.¹ With a typical American diet, palmitic acid raises cholesterol significantly.

- **Hydrogenated oils (trans fats)**

In response to public pressure, bakery manufacturers markedly decreased their use of tropical oils. But, since the shelf life of other vegetable oils is very short, bakers use hydrogenated fats, which have a much longer shelf life. In addition to *cis* fatty acids, which occur naturally, commercially prepared hydrogenated fats contain *trans* fatty acids, which do not occur naturally. The U.S. Department of Agriculture has shown that they increase HDL-cholesterol as much as saturated fats do. Worse, they tend to lower levels of HDL-cholesterol. "Fat free" breads, such as most brands of pita (pocket bread) and some bagels, are the bakery products of choice. [Although a cow's rumen (its first gastric compartment) may contain hydrogen, undergo pressurization, and hydrogenate fats, only *cis* fatty acids result. This is so mainly because no catalysts (enzymes) that occur naturally support reactions that produce *trans* fatty acids.—M.K.]

- **Fat substitutes**

Fat's contribution to a food's taste is due to its melty "mouth feel," a quality perceived through the palate and the tongue. Some synthetics have a feel similar to that of fat but supply fewer (or no) calories. Such fat substitutes include the following.

Olestra, which is nonnutritive, is a sucrose polyester (SPE), i.e., a "combination" (reaction product) of sucrose (table sugar) and fatty acids. Procter & Gamble has trade named it *Olean*.

Simplese is a low-calorie protein derivative of egg white and milk.

Maltodextrin is a nutritive derivative of starch.

Polydextrose (also called polyglucose and modified polydextrose) is a low-calorie derivative of glucose (grape sugar) and sorbitol (a sweetish derivative of fruit sugar).

Nutrition Forum (ISSN 0748-8165) is published bimonthly for \$35.00 (individuals in U.S. and Canada) or \$50 (institutional, overseas) per year by Prometheus Books, 59 John Glenn Drive, Amherst, NY 14228-2197. Second-class postage pending at Buffalo, NY. POSTMASTER: Send address changes to Prometheus Books at address above. Manuscripts and all editorial correspondence should be directed to: Jack Raso, 71-11 60th Avenue, Maspeth, NY 11378-2908.

In contrast, carrageenan (carrageenin), a soluble-fiber food stabilizer derived from seaweed, is not fatlike but can "juice up" a lean hamburger.

Lower-calorie appeasement of the desire for food is crucial to losing weight. Sugar substitutes do not facilitate weight loss.^{2, 3} Likewise, because they lack "satiety value," artificial fat substitutes probably do not facilitate weight loss or reduce cholesterol. The only noncaloric food constituent that conduces to "gastro-

nomic satisfaction" is fiber. Artificial-fat desserts are high in calories and very low in fiber. However, "fat free" salad dressings are acceptable because they encourage consumption of vegetables and fruit salads.

Simplified, the guiding principle of low-fat dieting is: To lose weight or to lower cholesterol, one's intake of fat of any kind should not exceed 20 grams per day. The fat intake of many Americans is closer to 100 grams.

Food Facts and Fat Lies

Consuming oat bran, walnuts, or wine does not prevent heart attacks. Eating bacon, butter, or pizza does not cause heart attacks. No single food prevents or causes heart attacks. Nevertheless, many newspaper and magazine articles extol this or that food as preventive or curative. Usually such articles stem from manufacturers' efforts to maximize profits. As a member of the media, I continually receive publicity packages from food producers' associations

Percentages of Types of Fat in Foods

FOOD	% SATURATED FAT	% MONOUNSAT. FAT	% POLYUNSAT. FAT	FOOD is classified as...
Meat (average)	52	46	29	Saturated
Chicken	36	42	22	Monounsaturated
Fish (average)	50	40	10	Saturated
Eggs	38	53	9	Monounsaturated
Whole milk	61	36	3	Saturated
Butter	61	36	3	Saturated
Olive oil	12	81	7	Monounsaturated
Corn oil	11	31	58	Polyunsaturated
Almond oil	9	70	21	Monounsaturated

and special-interest groups, touting studies that lend a semblance of distinction to their particular product. Eager writers and editors turn such press releases into sloppy, yet often authoritative-sounding, articles. While there are laws to control advertising claims, news articles and radio and television reports can heap praise without limit on even worthless products. I describe some glamorized foods below.

• Chicken

Madison Avenue has cast chicken as a low-fat food, but no matter how one cooks it, it's not especially "heart-healthy." The dark meat contains as much fat as beef. A cupful of skinless, trimmed dark meat contains 14 grams of fat. An 8-ounce skinless, trimmed chicken breast has 6 grams of fat (nearly a third of my 20-gram limit) and 146 mg cholesterol. Fried chicken has twice as much fat as beef.

• Fructose

Glucose (also called dextrose, grape sugar, and blood sugar) is the form of sugar circulated throughout the body. Insulin is necessary for its

EDITORIAL BOARD

Jarvis, Ph.D.; Ira Milner, R.D.; Grace Powers Monaco, Esq.; Zhixin (David) Xu, M.S. **CONTRIBUTING EDITORS:** Kurt Butler, M.S.; Johanna Dwyer, Sc.D., R.D.; Saul Green, Ph.D.; James J. Kenney, Ph.D., R.D.; Marilyn Larkin; William M. London, Ed.D.; James A. Lowell, Ph.D.; Varro E. Tyler, Ph.D., Sc.D. **SCIENTIFIC CONSULTANTS:** John E. Dodes, D.D.S.; Victor Herbert, M.D., J.D.; Gabe Mirkin, M.D. **INFORMATION CONSULTANT:** Inna Lipnitskaya, M.S.L.I.S.

entrance into most cells. Insulin also promotes the conversion of glucose to fat and the storage of fat. Some health-food fictioneers have claimed that, since fructose (also called fruit sugar or levulose) can enter cells without insulin, it's not fattening. This doesn't wash, because the body converts ingested fructose to glucose either before it enters the bloodstream or shortly after, in the liver.

Another dubious claim is that, since fructose is over fifty percent sweeter than sucrose, dieters can ingest fewer calories without sacrificing sweetness. However, the relative sweetness of fructose varies with the food it is sweetening.

In any case, fructose raises blood levels of triglycerides and uric acid more than sucrose does.⁴

- **Juices**

Infomercials and celebrity spokespersons have extolled juicers, claiming that fresh juices prevent or cure a host of health problems. Although evidence suggests that eating fruits and vegetables in large amounts decreases the risk of cancer or a heart attack, ingesting juices extracted from fruits and vegetables in preference to the solids is not healthier than simply eating the fruits and vegetables. True juices lack fiber, which helps to lower cholesterol and prevent constipation and gallbladder disease.

- **Lowfat milk**

Whole ("regular") milk must contain 3 1/4 percent fat by weight. Since milk is mostly water (which is calorie-free), 3 1/4 percent of its weight represents half of its calories. A cup of whole milk contains 8 grams of fat.

Lowfat milk (also termed partly skimmed milk) is a variation of skim (nonfat) milk. It contains fat in a fixed proportion of one or two percent. Two-percent lowfat milk is a high-fat food. Forty percent of its calories come from fat, and one cup contains 5 grams of fat—25% of my 20-gram limit. The only type of milk that is truly low-fat is skim milk, which is less than 0.5 percent fat and maximally contains 1 1/4 grams of fat per cup.

- **Nuts**

According to several newspaper reports, a study published in the *Archives of Internal Medicine* showed that eating nuts prevents heart attacks. The study showed no such thing.⁵ The researchers asked 31,000 Seventh-Day Adventists (SDAs) how often they consumed certain foods. Those who said they ate nuts more than five times a week had fewer heart attacks. All SDAs are vegetarians; many are ovolactovegetarians, but some are vegans (i.e., do not consume any foods derived from animals). Vegans (also called pure vegetarians and

total vegetarians) tend to substitute nuts and beans, which are low in saturated fat, for animal foods. Nuts do not prevent heart attacks, but excluding eggs and whole-milk dairy products is a protective step. [Furthermore, it is reasonable to suspect that nut-eating SDA vegans would be more likely than nonvegan SDAs to follow their church's proscription of smoking and the intake of alcoholic beverages, coffee, and certain drugs.—J.R.]

- **Oat bran**

A study published in the *Journal of the American Medical Association* was widely cited to support the claim that oat bran prevents heart attacks. Subjects with high cholesterol levels ate 1 1/3 cups of oat bran daily, and their average cholesterol level decreased from 223 to 218—an undramatic finding.⁶

Oat bran contains soluble fiber, which binds to bile acids—used by the liver to form cholesterol—in the intestines and prevents their reabsorption. High fiber consumption is beneficial to most people. Oat bran is a good, but decidedly nonspecial, source of fiber. Of course, eating high-fat oat-bran muffins is counterproductive.

- **Soybeans**

Some reports have claimed that soybean products such as tofu (also called bean curd) lower cholesterol. They won't without a reduction in fat intake. Soybeans are low in saturated fat but high in polyunsaturates. A cup of cooked soybeans contains 10.3 grams of fat. Substituting soybean products for meat or chicken can lower cholesterol a little,⁷ but incorporating them into one's diet will raise it. Recently, *The New England Journal of Medicine* presented a reconsideration of data from 38 previously inconclusive studies. The researchers found that ingesting soy protein lowers cholesterol—if soy protein replaces animal protein and one's cholesterol value exceeds 258.⁸

- **Wine**

I have received large publicity packets from the wine industry citing studies of the low heart-attack rates among the wine-drinking French. They have not convinced me that wine prevents heart attacks, because American and French customs differ in many other respects. For example, the French diet has a much larger proportion of fruits and vegetables.

Researchers in Japan isolated from wine a chemical (resveratrol) that tends to lower cholesterol in rats. However, there is no evidence that it does so in humans. In any case, the chemical is also present in purple grape juice.^{9, 10, 11} Eating grapes is more advisable.

Nuts and Bolts

Below are the essentials of my high-fiber, low-fat diet.

- The goal is to ingest 15 to 20 grams of fat daily. Collectively, the dieter counts as 15 grams daily the fat in all the following "basic foods."
 - (1) Fruits (except avocado and coconut)
 - (2) Vegetables
 - (3) Beans (except soybeans)
 - (4) Whole grains
 - (5) Low-fiber, low-fat foods, the daily number of servings of which ordinarily should not exceed five:
 - (a) "Fat free" dairy products (including at least eight ounces of skim milk or sugarless nonfat yogurt daily)
 - (b) Seafood (three or four 4-oz servings per week)
 - (c) Refined grain products containing no more than one gram of fat per serving (one serving \approx 100 calories)
 - (d) Sugars and "fat free" sweets (one serving \approx 100 calories)
 - (e) "Fat free" condiments, "fat free" mayonnaise, and noncaloric beverages
- One may consume ad lib all plant foods except sugars, sweets, breads, and the following. The diet excludes:
 - (1) avocado;
 - (2) coconut;
 - (3) nuts;
 - (4) seeds (e.g., peanuts);
 - (5) soybeans and soybean products (e.g., tempeh and tofu); and
 - (6) margarine, oil, and vegetable shortening.
- One should refrain from consuming all animal foods except skim milk and sugarless nonfat yogurt.
- One should refrain from consuming high-fat foods (i.e., foods containing more than 2 grams of fat per serving), including:
 - (1) avocado and coconut;
 - (2) butter, ghee, lard, margarine, mayonnaise (except "fat free"), salad dressings (except "fat free"), shortening, and vegetable oils;
 - (3) bakery products except "fat free" breads;
 - (4) crackers and chips;
 - (5) dairy products except (a) skim milk, (b) sugarless nonfat yogurt, and (c) "fat free" cheeses;
 - (6) eggs;
 - (7) fowl and meat (except fish);

- (8) nuts and seeds;
- (9) sweets that contain fat; and
- (10) most convenience foods.

- In addition to the 15 grams of fat from "basic foods," one may ingest 5 grams of fat daily from any "basic" source.
- To prevent vitamin D deficiency, one should drink vitamin D-fortified skim milk and eat fish, or take a supplement that provides 400 I.U.s of the vitamin.

Misconceptions

Below I address some common misconceptions about food and dieting.

- *Following a low-fat diet consisting mostly of fruits, vegetables, beans, and grains will result in a protein deficiency.*

Most of the protein Americans ingest comes from high-fat foods such as beef, chicken, and whole-milk products. However, all the protein one needs is obtainable from plants. Beans are the main low-fat source of plant protein. It is advisable to consume skim milk and seafood as well. A cup each of skim milk, breakfast cereal, beans, and corn (or whole grains) daily supplies plenty of protein. Protein deficiency is rare in countries with an ample food supply. Excessive protein intake can cause osteoporosis.^{12,13}

- *To prevent malnutrition, vegans must combine foods ("complement" proteins) at each meal according to their amino-acid content.*

Nine of the 22 amino acids the human body needs are termed essential or indispensable because the body cannot synthesize them. Protein-containing foods are categorizable as complete, weakly complete, and incomplete.¹⁴ Both complete protein foods (e.g., meat) and weakly complete protein foods (e.g., soybeans) contain all the essential amino acids; in the latter foods, however, the proportion of at least one essential amino acid is too small to support protein synthesis in the body. Incomplete protein foods completely lack at least one essential amino acid. Every plant food is either weakly complete or incomplete.

But protein completeness, incompleteness, and complementariness do not have any practical significance when variety marks one's diet. The absence of any one of the essential amino acids from the human body would cause the cessation of protein synthesis. However, bodily tissues constantly disassemble proteins and release amino acids into the bloodstream, whence tissues absorb them for protein synthesis.

- **Low-fat dieting entails risking a fat deficiency.**

The human body requires but cannot synthesize at least one fatty acid, linoleic acid, which is thus termed an essential fatty acid (EFA). Deficiency thereof causes drying and flaking of the skin but is rare in adults. Moreover, fat carries the fat-soluble vitamins, A, D, E, and K. However, a daily fat intake of 20 grams meets or exceeds the body's requirement. On average, Americans consume 85 to 100 grams daily. Unless one is starving, it is well-nigh impossible to develop a fat deficiency.

- **Drinking water in large quantities with meals facilitates weight loss.**

Drinking more water with meals than one usually drinks will not result in a decrease in food intake, much less weight loss. If one drinks several glasses of water with meals, it will only distend one's stomach and make one full for a minute or two.

- **One should avoid eating shellfish, which are high in cholesterol.**

In obsolete studies, all of the sterols, including dehydrocholesterol, in shellfish had contributed to the finding that shellfish were high in cholesterol. However, dehydrocholesterol does not raise cholesterol levels. Newer studies have revealed that shellfish contain much less cholesterol than researchers had thought. In any case, shellfish are a good, low-fat source of protein.

All diet-induced changes in one's blood-cholesterol profile occur within ten days of dietary modification. Most people can achieve a satisfactory profile with stringent fat restriction alone.

NF scientific consultant Gabe Mirkin, M.D., is a sports medicine specialist, a radio host, the author of *Getting Thin*, and the coauthor of *The Sportsmedicine Book* and *Fat Free, Flavor Full: Dr. Gabe Mirkin's Guide to Losing Weight and Living Longer* (1995). He publishes *The Mirkin Report*, a monthly newsletter.

HEALTHCARE ESOTERICA

Here's the 8th installment of descriptions of mystical and/or supernaturalistic alternativest methods. — J.R.

Arhatic yogaSM (arhatic yoga system): Syncretic form of yoga developed by "Master Pranic Healer" Choa Kok Sui. Sui is also an exponent of kriyashaktiSM (see below), pranic healing (see *Alternative Healthcare: A Comprehensive Guide*), advanced pranic healing [see NF 12:59, 1995], and pranic psychotherapy [see NF 11:49, 1994; and NF 11:60, 1994]. The purported design of arhatic yoga is to activate and align chakras, "safely awaken the 'sacred fires' of the body," and increase longevity. It posits "golden energy," kundalini, and "physical and spiritual bodies." The Center for Pranic Healing defines "arhatic" as "a highly integrated human being equipped with very developed intuition, advanced mental powers, highly refined emotions and engaged in a great contribution to the Divine Plan."¹

Celtic magic: Western European magical tradition. It is a form of ritual magic that involves numerology and "plant and herb magic"; allegedly utilizes "planetary and natural energies" (e.g., "Moon energy"); and supposedly promotes mental, physical, and spiritual health. Practitioners of Celtic magic must respect, befriend, and petition the "powers of the elementals and Elements."² (See "Norse magic" and "Wortcunning," both below.)

Christian positive thinking (CPT): Neo-Christian approach that embraces Pealeism, possibility thinking, and positive confession (see below for all).³

Christian psychology: Any form of quasi-psychology that involves biblical counseling.³

Dream counseling: Form of dreamwork that allegedly involves "dream telepathy" and interpreting "dream learnings" through "alchemy."⁴

Image magick (image magic, sympathetic magick): Ancient form of magic whose basic principle is that "like produces like." Specifically, it is a form of homeopathic magic (also called mimetic magic) that includes doll magic. Practitioners typically use "image dolls" (e.g., "voodoo dolls")—small clay, cloth, straw, waxen, or wooden representations of their targets. Apparently, image magick extends from black magic to "love magick" and white magic. For example, practitioners of white magic may use "image dolls" to effect healing or to increase fertility.^{5, 6, 7}

KriyashaktiSM: "The Art of Materialization," taught by Choa Kok Sui (see "Arhatic yoga," above). It posits chakras and "negative psychic energies."¹

Led meditation: Form of group meditation wherein someone (1) describes the process of relaxation and (2) outlines a situation that supposedly may conduce to the readiness of the meditators to meet their "inner guides," receive "higher wisdom," or find an answer to a question of immediate concern.⁸

Meta fitness: Subject of the paperback *Meta Fitness: Your Thoughts Taking Shape*. It is a combination of affirmations, "goal/task" note-writing, "self talk" (probably "intrapersonal communication"), and painless physical and mental exercises. Meta fitness allegedly unites emotional, mental, and physical "energies." According to meta-fitness theory, "storing anger from the past" can cause heaviness of the thighs.⁹

Metamorphosis: An apparent variant of reflexology [see NF 12:61-64, 1995] that involves touching "spinal reflexes" of the feet, hands, and head. The purported design of such touching is to free clients' "true nature" by releasing "patterns blocked" prenatally.¹⁰

Norse magic: Western European magical tradition. It is a form of ritual magic that supposedly enlists: (1) the Aesir ("Asa-Gods"), whose mythical home is Asgard; (2) "Light" (helpful) elves; (3) good dwarves; (4) the "rulers of the Elements"; and (5) dead ancestors. Norse magic allegedly promotes mental, physical, and spiritual health.¹¹

Pealeism (Norman Vincent Pealeism): The Christian philosophy of Rev. Dr. Norman Vincent Peale, who died in 1993. It is a descendant of New Thought. Peale authored the blockbuster *The Power of Positive Thinking* and *The Amazing Results of Positive Thinking*. The core of Pealeism is that positive thinking, avoidance of negativism, fervent praying to a personal God, and visualization of goals together make for improvements in health and finances.¹² In the booklet "How To Handle Tough Times," Peale held that "the most powerful force in this universe is a positive thought properly used," and that "Nothing Is Impossible."¹³

Personal totem pole process: Form of guided imagery (see "Alternative" *Healthcare: A Comprehensive Guide*) in which people "interact" with imagery that allegedly arises from chakras ("body energy centers").¹⁴ (See "Power animal imagery," below.)

Polarity reflexology: Part of polarity therapy (see "Alternative" *Healthcare: A Comprehensive Guide*), which draws on acupressure, ayurveda, craniosacral balancing, and yoga. Randolph Stone (1890-1981), a chiropractor, naturopath, and osteopath, developed polarity therapy, whose names include: Polarity, polarity energy balancing, polarity energy balancing system, polarity system, polarity energy healing, and polarity wellness®. Polarity reflexology posits (1) "Polarity energy currents" and (2) "reflex points" on ears, feet, and hands that practitioners purportedly use to "tonify" glands and organs.¹⁵

Positive confession (Word-Faith movement, faith movement): An alleged means of commanding blessings from God.^{3, 16}

Positive imaging: Part of Pealeism (see above) that comprises allegedly powerful methods whereby one (1) constantly and intensely visualizes one's goal and (2) prays to reinforce the visualization.¹⁷

Possibility thinking: Televangelist Robert Schuller's mode of positive thinking. It includes possibility thinking meditation (PTM) and emphasizes refraining from verbalizing negative emotions.³

Power animal imagery: "Method of exploring ways of knowing" that involves the personal totem pole process (see above) developed by E.S. Gallegos.¹⁴

Psycho-neuroaligning (PNA): System promoted by hypnotherapist and "Kinesiologist" Anthony Cimino, N.D., Ph.D. Its basic "procedures" include acupressure, "muscle testing" [see NF 12:26, 1995], "neuro-communion," "nutritional therapy," "past life investigation," and reflexology [see NF 12:61-64, 1995]. Practitioners reportedly use PNA to treat cancer, diabetes, drug abuse, dyslexia, heart disease, high blood pressure, and other health problems.¹⁸

Sacral/spinal energy balancing: Form of bodywork whose apparent main postulate is that, when the "sacrum or 'sacred bone'" and the spine ("the 'tree of life'") align, the cranium "opens like a flower."⁴

Wortcunning: The supposedly knowledgeable use, in witchcraft or Wicca (also called modern witchcraft), of alleged magical and "secret healing" properties of herbs.⁵ (The word "wort" means "plant.") According to Wiccan theory, the phase and zodiacal position of the moon are extremely important considerations in the planting of herbs.¹⁹

about 37 percent of their total caloric intake from fat. To normalize cholesterol levels, the American Heart Association (AHA) advises deriving: (1) 30 percent of total caloric intake from fat, (2) 25 percent if the 30% restriction is ineffective, and (3) 20 percent if the 25% restriction is ineffective. Research by Dean Ornish, M.D., suggests that limiting fat intake to 10 percent of calories is more effective and may remedy atherosclerotic narrowing of coronary arteries.

Gabe Mirkin, M.D., is another vigorous proponent of 10% fat dieting. When he was a skinny, 22-year-old med-school student, he learned that his cholesterol level was over 300. In *Fat Free, Flavor Full* (1995), he states:

You should definitely be on a low-fat diet if you have high blood pressure or are overweight; if you have diabetes, chronic constipation or gall bladder disease; or if you are at increased risk for developing a heart attack, diabetes, or cancers of the prostate, breast, uterus, colon or gall bladder. You may choose to be on this diet if you want to do all you can to prevent heart attacks and certain types of cancer, or just to look and feel good....

If you want to lose weight or lower cholesterol without taking drugs, don't depend on diets that tell you to reduce fat a little [e.g., the AHA diets].... You must get down to 10 percent

of your calories from fat, or 20 grams of fat per day, to lower cholesterol significantly.

Many physicians still recommend the AHA...diets because they believe that people won't put up with severe fat restriction. They are wrong. You can stick to a low-fat diet easily if you know how to make the food taste good.

Since August 13, 1995, I have been trying to limit my fat intake to 20 grams a day and watching my weight. On most days, my fat intake, which I estimate from labels, has been below the 20-gram limit (exclusive of "dark" coffee, prepackaged "fat free" snacks and bakery products, and low-fat, nongrain produce). However, about a week after I had adopted the restriction, I ate a salad with a "lite" dressing to the tune of 38½ grams of fat. The dressing contained 7 grams of fat per 2-tablespoon serving—not my idea of "lite."

In the context of an otherwise unrestricted diet, a 20-gram fat restriction does not, in my experience, substantially impair palatability. Despite my general adherence to this restriction, my diet has included Cajun-style chicken, cheese ravioli, pizza with pepperoni and sausage, shrimp marinara with linguini (buried in a nonfat grated topping), Swedish meatballs with pasta, corn with margarine sauce, low-fat "cherry bars," and "fat free" cheesecake, cupcakes, frozen yogurt, ice cream, and soft pretzels. There's the rub with Dr. Mirkin's diet: all of these foods are no-noes except the topping and the corn (sans sauce).—J.R.

Healthcare Pseudocredentialing

Jack Raso

What becomes a quack most? In the healthcare field, a quack is anyone who falsely claims medical skill. Some opponents of health fraud use the word to denote practitioners ranging from nonprofessionals bereft of medical skill who profess it, to physicians who make unfounded claims for methods they employ or preparations they administer. Nowadays, few quacks in the U.S. pretend to be M.D.s or osteopaths. Providing fraudulent medical degrees is a high-risk business, and medical licensing procedures are stringent. However, practicing and would-be quacks can become "doctors," or at least diplomates, through a variety of correspondence courses.

In this article, I convey the nature of credentials, define credentialism, describe pseudocredentialing and pseudocredentialism, summarize several relevant studies, report on a correspondence course I took recently, and list some suspicious characteristics of providers of alternative health education.

Credentials and "Credentials"

The healthcare marketplace is fraught with "credentials," some legitimate, some overrated, some dubious, and some far afield of science. A bona fide credential is any evidence that one is trustworthy or has authority. However, since authority does not guarantee trustworthiness, whether a credential deserves confidence depends ultimately on whether the tenets that underlie the credential are worthy of confidence. "Authority-type" healthcare credentials range from the science-based (e.g., podiatric [chiropracist, or "foot doctor"]

licensure) to the controversial (e.g., naturopathic licensure).

Credentials encompass (1) achievements and (2) documents that attest achievements. Many consumers mistake documentary credentials for proof of skill. Often, they are merely proof of past enrollment in an academic program, not proof of erudition or skill. Educational credentials are the professional standard because academic standing is more quantifiable than knowledge or skill.

The most commanding educational credential, and therefore the most tempting to would-be misusers, is the doctorate. There are many types of doctorates, but all are categorizable as "traditional" (e.g., a nonhonorary Ph.D. degree), "professional" (e.g., an M.D. degree), and honorary (e.g., a D.Sc. degree without academic status). Some types of doctorates in each category are considerably more doubt-

ful than others. For example, *Bears' Guide to Earning College Degrees Nontraditionally* (1995) lists as controversial "professional degree titles": D.Hyp. (hypnotism), Graph.D. ("Graphoanalysis"), and H.M.D. or "M.D.(H.)" (homeopathy). Many such degrees are available throughout the United States.

Another Brick in the Wall

In 1994, I met a lawyer who told me he had been seeing a "doctor" for nutrition counseling. Because very few science-oriented physicians specialize in this, I asked the practitioner's name. The name was not that of a physician, nor even that of a legitimate

Ph.D. or the like: The practitioner the lawyer had consulted was a "Doctor of Nutripathy" (D.N.). Nutripathy [see NF 4:57-61, 1987] is a theistic, vitalistic "religious science" that involves a variation of Bach flower therapy [see NF 12:26, 1995] and "biochemical analysis" of saliva and urine. I asked the lawyer if he would provide me with whatever printed material the "nutripath" had given him, and he sounded agreeable; but, later that year, he declined. The D.N.'s classified ad in the January/February 1995 issue of *Newlife* did not include the word "nutripath" or "nutripathy" but designated him a *naturopath* ("one who uses only safe, natural approaches"). On July 6, 1995, I phoned his office as an ad respondent and asked the man who had answered the phone what was the source of the D.N.'s (alleged) naturopathy degree. The staffer replied:

Uh, I'm not exactly sure of that. I can tell you that he's a clinical nutritionist, okay? Which means that he—we look for causes of symptoms and then deal with it in a natural fashion. Where he— Where he practiced or where he went to school, I'm not exactly sure.

After I expressed skepticism, the staffer asked me to wait a second and said he would "check the wall." Finally, he responded: "The American College of Nutripathy" (ACN) [see NF 12:15, 1995]. Founded in 1976, ACN, a nonaccredited* correspondence school in Scottsdale, Arizona, is *not* a school of naturopathy; it has never offered degrees therein. However, according to the last three editions of *Bears' Guide to Earning College Degrees Nontraditionally* (1989-1990, 1992, and 1995), ACN *does* offer doctorates in *nutripathy*. Yet, in a questionnaire he completed for me in July 1994, *nutripathy's* founder, Gary A. Martin, indicated that ACN offered only nondegree certificates. A year later, on July 6, I called ACN for clarification. I asked to speak with Martin, but the woman who had answered the phone told me that Martin did not take "incoming calls." In any event, since 1989, the American College of Nutripathy has offered more than a dozen kinds of quasi doctorates *indirectly*—through at least three nonaccredited organizations, one of which shares a toll-free number with both the school and a mail-order house that specializes in dietary supplements.

Apparently, the aforementioned lawyer lost only money. But there is much more at stake. In the late 1970s, Kurt W. Donsbach (pronounced "donsbah"), D.C., founded Donsbach University, which offered correspondence courses leading to bachelor's, master's, and doctoral degrees in nutrition. Electrical engineer Gary Pace obtained a Ph.D. degree from this nonaccredited school before it was renamed, in the late 1980s, the International University for Nutrition Education (IUNE). In 1985, Pace's ad in the Nassau County (New York) Yellow Pages stated that one could determine one's "true vitamins, minerals, enzymes & glandular needs" from such tests as "hair & diet analysis," "herbal saliva," and "computerized urine

& vascular analyzer." That year, then New York State Attorney General Robert Abrams filed a civil suit against Pace, accusing him of practicing medicine without a license, false advertising, and illegal use of educational credentials. Abrams said that at least 251 clients had paid Pace an average of \$317 in the previous four years. According to the lawsuit, Pace had massaged women's feet, had sometimes performed lengthy and/or private mammary and vaginal exams, and had routinely requested a hair specimen (sometimes pubic). Finally, an injunction prohibited Pace from practicing medicine unlawfully and from publicizing his doctoral status.

IUNE operates as a nonaccredited "distance learning" institution in Chula Vista, California. It offers, for example, programs that lead to a Ph.D. degree in "Clinical Nutrimericine and Biological Sciences." Majors include "nutri-medical dentistry," "nutri-medical eye and visual health care," "nutri-medical homeopathy," and "therapeutic nutrimericine." Five of the thirteen members of IUNE's core faculty hold graduate degrees from Donsbach University and/or IUNE.

Pseudocredentials Galore

Published studies conducted since the mid-1980s, an annual (the 1995-1996 *Holistic Health Directory*), and several books—notably the 336-page twelfth edition of *Bears' Guide* (see above) and the 200-page second edition of *The Common Boundary Graduate Education Guide: Holistic Programs and Resources Integrating Spirituality and Psychology* (1994)—suggest that healthcare-related pseudocredentialing is rampant. Pseudocredentialing includes: (1) providing certificates, degrees, diplomas, and titles in a particular field to persons who have not demonstrated competence, erudition, or expertise in that field; and (2) providing a paper facade of medical know-how to persons whose course of study in the field of the "credential" had inadequate scientific content.

Pseudocredentialism is a byproduct of credentialism, which is overemphasis on documentary (particularly educational) credentials as prerequisites to employment or as augmenters of upward mobility. In the healthcare field, where competence often is a life-or-death concern, emphasis on certificates, degrees, and licenses, which facilitate ruling out unqualified job applicants, usually does not seem undue. In some cases, however, it does

Nutrition Forum (ISSN 0748-8165) is published bimonthly for \$35.00 (individuals in U.S. and Canada) or \$50 (institutional, overseas) per year by Prometheus Books, 59 John Glenn Drive, Amherst, NY 14228-2197. Second-class postage pending at Buffalo, NY. POSTMASTER: Send address changes to Prometheus Books at address above. Manuscripts and all editorial correspondence should be directed to: Jack Raso, 71-11 60th Avenue, Maspeth, NY 11378-2908.

seem distorted. For example, between mid-1987 and 1993, I worked in two healthcare facilities where non-R.D. foodservice managers without graduate degrees had authority over chief dietitians who were R.D.s with healthcare-related master's degrees.

While credentialism shortchanges some contributors to society and inappropriately aggrandizes others, pseudocredentialism tends to cheat all consumers. It encompasses: (1) the "for-profit" use of "credentials" obtained from pseudocredentialing organizations and (2) the misuse of bona fide credentials (e.g., registration with the Commission on Dietetic Registration) in an area where these credentials have little or no importance (e.g., medical diagnosis).

"Credentials" listed uncritically as "professional titles" in *The Common Boundary Graduate Education Guide* include: Acupuncture Physician (Ac. Phys.), Certified Acupuncturist (C.Ac.), Certified in Classical Homeopathy (C.C.H.), Diplomate in Homeotherapeutics [i.e., homeopathy] (D.Ht.), Doctor of Acupuncture (D.Ac.), Doctor of Oriental Medicine (D.O.M.), Homeopathic Medical Doctor (H.M.D.), Licensed Acupuncturist (L.Ac.), Master of Acupuncture and Oriental Medicine (M.Ac.O.M.), Naturopathic Medical Doctor (N.D. or N.M.D), Oriental Medical Doctor (O.M.D.), and Registered Acupuncturist (R.Ac.). Because the predominant forms of most or all of the methods that underlie each of these "titles" lack scientific substantiation, I consider them pseudocredentials — signs of shaky philosophies that inspire little or no confidence in the scientific community.

Below I describe several relevant studies.

- In early 1986, the National Council Against Health Fraud (NCAHF) published the findings of its study of practitioner listings in the Yellow Pages under the headings "Dietitians" and "Nutritionists" within the preceding four years. The principal finding of this study, which covered 41 areas of 17 states, was that only 13 percent of 439 "nutritionists" appeared qualified. Furthermore, 46 percent of 24 physicians listed in a subsection titled "Nutrition" (under the heading "Physicians and Surgeons") were "clearly spurious," and none appeared qualified. Their offerings included acupuncture, chelation therapy, life extension, orthomolecular medicine, and orthomolecular psychology.
- In a comprehensive 1992–1993 Yellow Pages study sponsored by the NCAHF, Ira Milner, R.D., collected data from 64 areas of 32 states. The principal finding was that

consumers had less than a fifty-fifty chance of finding a reliable "nutritionist" through the directory. Task-force volunteers consisted of registered dietitians (R.D.s), public health nutritionists, dietetic interns, and postsecondary nutrition students. They categorized 21 (9 percent) of the 231 businesses listed under the heading "Dietitians" as "spurious." These included Diet Center facilities, health food stores, multilevel-marketing distributors, a nutritionist with a dubious doctorate who practiced iridology [see NF 6:4–5, 1989], and a former vitamin company salesman who used hair analysis [see NF 11:23–24, 1994].

The "credential" initials used by dubious nutrition practitioners included: CCN (Certified Clinical Nutritionist), CN (Certified Nutritionist), CNC (Certified Nutrition Consultant), NC (Nutrition Counselor), NMD (Doctor of "Nutrimedicine"), ND (Doctor of Naturopathy), OMD (Doctor of Oriental Medicine), HMD (Homeopathic Medical Doctor), CCT (Certified Colon Therapist), RCT (Registered Colon Therapist), CMT (Certified Massage Therapist), and MLD (Manual Lymph Drainage).

In September 1992, I telephoned all businesses listed under the headings "Dietitians" and "Nutritionists" in the 1992–93 NYNEX Yellow Pages for Queens, a borough of New York City. Only one of the 26 businesses listed seemed a reliable source of nutrition information; at least seven were health food stores or dietary-supplement distributors. A self-styled "certified eating-disorder specialist" told me he prescribed supplements. When I complained of tiredness, he declared that tiredness is "the first sign of illness." A practitioner of "holistic nutrition" also said he prescribed supplements and stated he had an N.D. degree "from Puerto Rico." (There were, and are, no accredited naturopathy degree programs in P.R. And any naturopathy degree is a telltale of pseudoscience.) I asked where I could buy the supplements, and he said he had a "warehouse" in his office.

- In early 1994, the publishers of NUTRITION FORUM sponsored a follow-up to the 1992–1993 Yellow Pages study. In the follow-up, Milner decided that 17 of the 24 self-described Ph.D.s listed under the heading "Nutritionists" held "phony" Ph.D. degrees. Apparently, eight of the dubious doctorates came from nonaccredited correspondence schools (five from Donsbach University or the International University for Nutrition Education); one came from a nonaccredited college that required attendance; and one came from the "Clayton School of Homeopathy."

Jarvis, Ph.D.; Ira Milner, R.D.; Grace Powers Monaco, Esq.; Zhixin (David) Xu, M.S. **CONTRIBUTING EDITORS:** Kurt Butler, M.S.; Johanna Dwyer, Sc.D., R.D.; Saul Green, Ph.D.; James J. Kenney, Ph.D., R.D.; Marilyn Larkin; William M. London, Ed.D.; James A. Lowell, Ph.D.; Varro E. Tyler, Ph.D., Sc.D. **SCIENTIFIC CONSULTANTS:** John E. Dodes, D.D.S.; Victor Herbert, M.D., J.D.; Gabe Mirkin, M.D. **INFORMATION CONSULTANT:** Inna Lipnitskaya, M.S.L.I.S. **EDITORIAL ASSISTANT:** Louis G. Liang

- In a spinoff of the 1992–1993 Yellow Pages study, I examined promotional mailings from diverse providers of alternative health education, which encompasses: (1) indoctrination in alternative healthcare (or occult medicine), in particular methods thereof, or in sectarian religious “healing”; (2) nontraditional academic programs that afford such indoctrination; and (3) nontraditional academic programs in science-oriented healthcare. Between mid-July 1994 and February 27, 1995, using NUTRITION FORUM letterheads, I mailed a one-page itemized request for perusable information and a one-page questionnaire to 50 “credentialing” organizations with addresses in 23 states. Selection of organizations was arbitrary. However, all had offered health-centered or customizable academic programs within the previous seven years. By February 26, my associates and I received course descriptions from 27 organizations, including questionnaire responses from eleven. Each of these organizations offered at least one academic program that: (1) covered human health and nutrition, or was adaptable to such a focus; (2) did not involve attendance, or required short attendance; and (3) culminated in a certificate (certification), a nondegree diploma, or a graduate degree.

The following findings pertain to the 27 organizations from which we received course descriptions during the aforementioned period.

- At least 21 (78 percent) offered correspondence programs. Degrees available through nutrition-related correspondence programs included: Doctor of Divinity (D.D.), Doctor of Holistic Health (H.H.D.), Doctor of Naturology (D.N.), Doctor of Naturopathy (N.D.), Doctor of Philosophy (Ph.D.), and Doctor of Science (D.Sc.). (“D.N.” also represents two other nutrition-related pseudocredentials: the degrees of “Doctor of Naprapathy” [see NF 11: 63–64, 1994] and “Doctor of Nutripathy” [see above].) A “Master Herbalist” (M.H.) diploma was likewise available through correspondence. Obtaining a “Health Educator” (H.E.) certificate required attendance at an institute for eight consecutive weeks. The H.E. certificate, the M.H. diploma, and all the aforementioned correspondence doctorates were not trustworthy.
- Twenty of the organizations (74 percent) lacked (and still lack) accreditation by an entity recognized by the U.S. Secretary of Education or the Commission on Recognition of Postsecondary Accreditation (CORPA).
- Six of the organizations (22 percent) claimed accreditation by entities not recognized by the U.S. Secretary of Education or CORPA.

Below I contrast two providers of alternative health education.

The Herbal Healer Academy
